Another powerful tool for focus group idea generation is a technique called guided imagery. A skilled moderator takes the group on an imaginary tour in which they solve a problem similar to the one they face but still very different. For example, a group trying to generate ideas for improving a company's Web site were lead on a guided imagery tour of the history of the compass. Next, they were asked to describe the ideal compass if they were modern day explorers, then asked to compare this ideal compass to the ideal Web site. Out of the session came a new "killer" application that led to a profitable income stream for the company.

The Stretch Target

A third tool is the stretch target. Create an apparently impossible target in market share, profitability, product features, productivity or cost. Then challenge your team to imagine any possible way to reach the goal. By forcing people to stretch their ideas almost to the breaking point, sometimes solutions come forward that would never have been conceived if the goals were more modest.

Testing Ideas in the Courtroom Laboratory

After the ideas have been generated, and the hypotheses formulated, it is time to test them. Begin by breaking into legal teams. Those assigned the role of supporting the idea become prosecutors while those assigned the opposition role will have to fight against it. Each strategic hypothesis consists of four things:

1. A set of givens or assumptions that are agreed upon. For example, an assumption might be that your company is losing market share to a newcomer in town.

2. The logic of the strategy, which must include a discussion of the supposed relationship between the "if" statement in the hypothesis and the "then" statement. The logic must be such that people who hear the "if" statement naturally believe the "then" portion should follow. For example, if Kmart undertook to revamp store images, it must have been because top management had a belief that there was a relationship between nicer stores and better merchandise and greater sales.

3. The fact-based reports that support the logic of the if-then statements. These could include customer comments and pilot studies.

4. Refutation of the assumptions put forth by the opposing team's logic or tacts. ■

UPS In-Depth and Sideways Exploitation

A classic example of taking a winning strategy and expanding on it is the UPS story. For years, UPS focused on a strategy that involved wringing the last drop of efficiency out of its system. It dominates the parcel delivery market through the relentless pursuit of logistical efficiency. Drivers are trained how to get into and out of their trucks, when to idle, even when to risk a parking ticket. Operations run with military precision. No one can touch UPS for small parcel delivery nationwide. Efficiency is number one and lets UPS reach into communities that other carriers couldn't afford to reach.

By the mid-1980s, UPS realized it had wrung as much efficiency out of its strategy as it could. It then moved its strategy sideways into rapid air delivery of smaller parcels, and into the overseas market.

Strategic Breakthrough: Making the Right Choices and Choosing the Right Tools

Once your strategic hypothesis has survived a "trial," it is ready to use. At this crucial juncture, there are choices top management must make to take advantage of a breakthrough hypothesis and eliminate those that aren't going to work as hypothesized. Management must then make some tough choices about asset allocations in order to take advantage of the breakthrough ideas.

It's time for a real-world test. Come up with an implementation strategy. Focus all efforts on a single, real-world realization of the hypothesis. In the Kmart store revitalization example, this phase would include creating a portfolio of floor plans and merchandise selection

(continued on page 8)

Strategic Breakthrough: Making the Right Choices and Choosing the Right Tools

(continued from page 7)

followed by an all-out effort in a few stores to implement the revamp. If the stores do as well as the hypothesis suggests, it's time to use the Hammer. Commit resources from a Pivot and get the rest of the stores up to the level of the trial stores.

Exploitation of a winning strategy means looking at the results and tweaking them. Do some store layouts produce greater sales than others? If so, modify the plans. This is sideways exploitation of the strategy (see box on page 7).

At some point into your strategy you will face the choice of going deeper or expanding sideways. Be careful. You may not be strong enough to deeply exploit your strategy while you also expand it sideways. Make a conscious choice of which path to take, realizing that going deeper exploits the Hammer while expanding sideways means using your newfound strategic strength as the Pivot.

Deploying Resources

The appearance of a real-world, money-making success signaling a hoped-for strategic breakthrough is one of the most exhilarating and most dangerous moments in a company's history. That's because a true breakthrough demands the wholesale commitment of resources to its exploitation. At this point in your strategic plan it becomes crucial to focus on asset mobility and creating reserves.

Asset mobility means that the assets of your company can be used to exploit varying opportunities and can be shifted as breakthroughs are achieved. Resources must be withdrawn from less promising endeavors and shifted where the strategy says they are needed. Of course, asset mobility means that those assets have to be flexible or adaptable. The problem is that building in flexibility may mean those assets aren't as efficient as they could be. Perhaps the classic example of inflexible assets is the ultramodern Mazda plant built in Hiroshima, Japan in 1992. At the time it was the most modern and efficient plant in the world. When sales of the models the plant was designed to produce efficiently dried up, the assets weren't flexible enough to allow retooling. As a result the efficient plant sits largely idle.

Hard assets aren't the only ones that have to be flexible; so do soft assets like human resources. The best way to gain a flexible human resource pool is to stop the typical corporate behavior of hiring only from within the industry. That's a guarantee of inflexibility.

To maintain maximum flexibility, smart companies create a reserve similar to what the military has done. This rapid deployment force can then be counted on to be moved into position when a strategic hypothesis turns out to be a winner. Your rapid deployment force (or RDP) should be as flexible as possible to allow deployment into new and difficult areas. Creating an RDP isn't as difficult as it might at first seem. In fact, most companies already have a force. These are the few trusted executives who can always be counted on to take on really important or onerous missions.

If you are going to succeed at exploiting the opportunities you have created, you also need to create financial reserves. Without them, you won't be able to efficiently exploit opportunities you discover. ■

Born Allies and Sworn Enemies: Corporate Strategy Meets Corporate Culture

To succeed, a company needs a robust strategy vigorously executed. Strategy is the cerebral side of success. The other side is hands-on implementation of strategy. Implementation puts a premium on a responsive organization and its culture. Successful implementation makes two demands on a company's culture.

First, the culture must have enough confidence to be both a bold, fertile creator and a stern tester of hypotheses. Second, the culture must be strong while remaining flexible, prepared to play offense in crucial, targeted areas and an unyielding defense in others. The problem with corporate cultures is that they often produce behaviors that trip, ensnare and defeat strategies that could be winners. Culture routinely sabotages strategy.

The key to success is to make sure your top management team understands the cycle of strategic hypothesis generation, implementation and exploitation. They then drive the rest of the workforce.

Top Management Teamwork

If the key to successful strategy implementation is a committed top team, companies need to know how to assemble that team. The top management team (TMT) is the vital bridge between company culture and strategic vision. To create the team, create these conditions:

- ✓ **Make the fate of the individual the fate of the unit.**
- ✓ **Give the team common goals that are concrete and tough.**
- ✓ **Ensure high frequency of association.**
- ✓ **Ruthlessly weed out untrustworthy team members.**
- ✓ **Create exit barriers to leaving the team.**
- ✓ **Make the team as small as possible.**
- ✓ **Choose generalists for top team positions.** ■

STRATEGY MAPS

THE SUMMARY IN BRIEF

More than 75 percent of the average company's market value comes from intangible assets that traditional metrics don't measure. The Balanced Scorecard is a revolutionary performance measurement system that allows organizations to quantify critical intangible assets, such as people, information and culture. Now the people who first developed the Balanced Scorecard, Robert S. Kaplan and David P. Norton, have created a powerful new tool based on their ongoing research. The strategy map allows companies to describe the links between intangible assets and value creation so all aspects of strategy can be implemented in a manner that ensures sustained value creation.

The strategy map allows managers to align investments in people, technology and organization capital for the greatest impact. By paying close attention to improving internal processes such as operations, customer relationships, innovation and culture — and making proper investments in intangible assets — human capital, information capital, and organization capital management can implement a structured plan to achieve strategic success.

What You'll Learn In This Summary

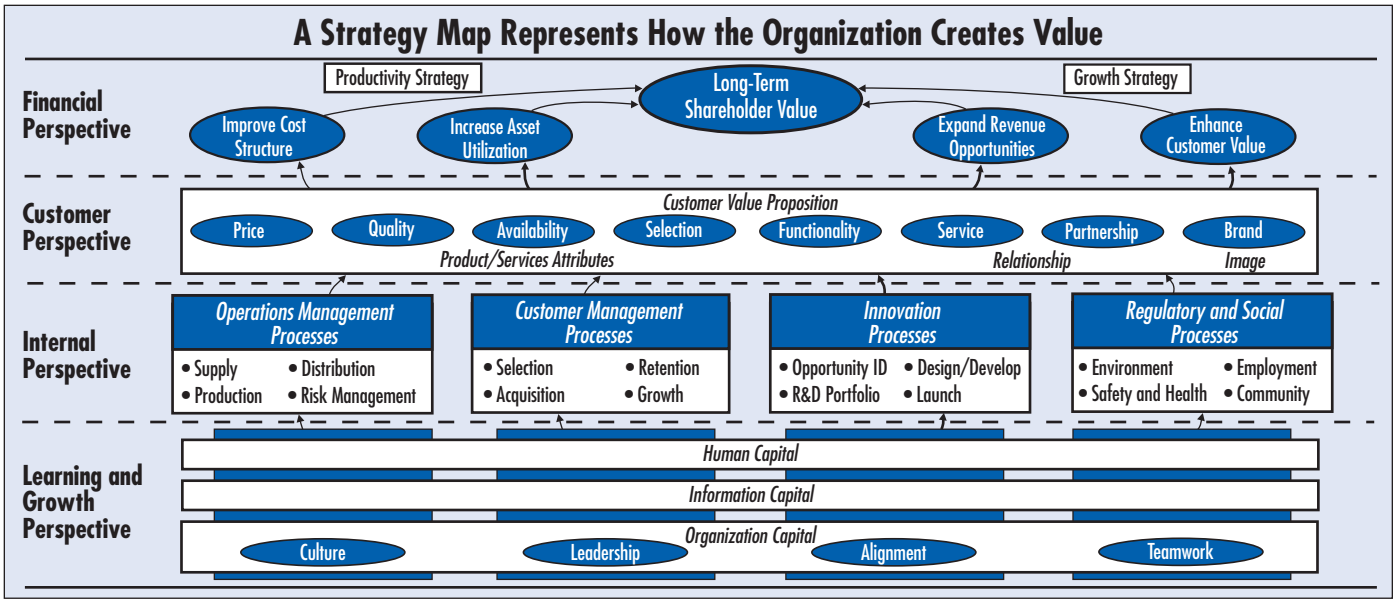
✓ Which organizational processes are most critical for enhancing productivity.

✓ How to understand a strategy map and the cause-and-effect relationships between processes and intangible assets.

✓ How to manage internal processes to achieve your differentiated value proposition.

✓ How to define and measure intangible assets and then integrate and align them with strategy for true value.

✓ How to develop a customized strategy map for your company based on your unique strategy and goals.



✓ How to plan an implementation campaign based on the strategy map.

STRATEGY MAPS

by Robert S. Kaplan and David P. Norton

— THE *COMPLETE* SUMMARY

Strategy Maps

A strategy describes how an organization can create sustained value for its shareholders, customers and communities. Most organizations have different methods of communication, alignment and implementation, but the Balanced Scorecard (BSC) is an effective way for nonprofits and public-sector organizations to describe strategies for creating value. The BSC includes the lagging indicators of financial performance and customer value proposition, and the leading indicators of internal processes as well as learning and growth.

Measure With the Strategy Map

The strategy map is a visual framework of the cause-and-effect relationships among the components of an organization's strategy, and it is used to integrate the four perspectives of a BSC — financial, customer, internal, and learning and growth. It provides a uniform and consistent way to describe strategy so the objectives and measures on the BSC can be established and managed. It illustrates the time-based dynamics of a strategy and the relationships that link desired outcomes in the customer and financial perspectives to outstanding performance in critical internal processes. These processes in turn create and deliver the organization's value proposition to targeted customers and promote productivity objectives in the financial perspective. The strategy map also identifies the specific capabilities in the organization's intangible assets that are required for delivering exceptional performance in critical internal processes. The strategy map is based on several principles, including the following:

- **Strategy balances the contradictory forces** of short-term financial objectives for cost reduction and increased productivity, and the long-term objective of profitable revenue growth.
- **Strategy is based on a differentiated customer**

Strategy Maps

(continued from page 2)

value proposition, because satisfying customers is the source of sustainable value creation.

- **Value is created through internal business processes.** Strategy maps and BSCs describe what the organization hopes to achieve, that is, strategic themes.
- **Strategy consists of simultaneous, complementary themes** or clusters of internal processes that deliver benefits at different points in time.
- **Strategic alignment determines the value of intangible assets.** The three components in the learning and growth perspective are human, information and organization capital. ■

Value-Creating Processes

There are a few processes that companies must focus on to deliver a differentiating value proposition and that are most critical for enhancing productivity and maintaining an organization's franchise to operate.

- **Operations Management.** Producing and delivering products and services to customers.
- **Customer Management.** Establishing and leveraging customer relationships.
- **Innovation.** Developing new products, services, processes and relationships.
- **Regulatory and Social.** Conforming to regulations and societal expectations and building stronger communities.

Executives practicing the art of strategy must identify the critical few processes that are the most important for creating and delivering their differentiating customer value proposition.

Operations Management Processes

There are four ways organizations can improve their operations management processes to deliver goods and services:

1. Develop and sustain supplier relationships. The best suppliers are low-cost, not just low-price. Lower the total cost of acquiring goods or services by: working with suppliers to achieve just-in-time capability; seeking their new ideas and suggestions; outsourcing; and establishing supplier partnerships to provide services directly to customers.

2. Produce products and services. Lower the cost of production by continuously improving process quality, process responsiveness, fixed asset utilization, and working capital efficiency.

3. Distribute and deliver products and services to customers. Deliver responsively to customers, lower the cost to serve them, and enhance the quality of delivery service.

4. Manage risk. Do more than just avoid income and cash-flow fluctuations. Create shareholder value in ways that investors cannot accomplish on their own. Reduce costs of financial distress, such as bankruptcy; moderate the risk faced by important nondiversified investors; decrease taxes; reduce monitoring costs; and lower the cost of capital.

Activity-based management (ABM) and total quality management (TQM) are two ways to help employees make fundamental improvements in operating processes by determining the cost of a process and then improving it. The five steps of ABM are:

1. **Develop the business case.**
2. **Establish priorities.**
3. **Provide cost justification.**
4. **Track the benefits.**
5. **Measure performance for ongoing improvement.**

Strategy maps can provide significant value to companies using other quality programs in these four ways:

1. **They provide explicit and testable causal linkages between strategy and reality.**
2. **They establish targets beyond existing best practices.**
3. **They identify entirely new processes that are critical for achieving strategic objectives.**
4. **They set strategic priorities for process enhancements.**

Customer Management Processes

In the past, customer management focused on transactions — promoting and selling the company's products.

(continued on page 4)

Manage Risk

Companies can manage risk by modifying operations. For example, Microsoft uses an operating policy of employing large numbers of temporary workers who can be laid off if business slows down. Disney built its major theme parks in areas where weather is generally pleasant and predictable: Anaheim, Calif., and Orlando, Fla. This lowers the volatility of theme park revenues due to weather conditions. Companies can also take operating actions to reduce the risk that their products or services will be made technologically obsolete by competitors or by employee actions that can damage their brand and company reputation.

For Additional Information about Activity-Based Management, go to: http://my.summary.com

Value-Creating Processes

(continued from page 3)

Building customer relationships was not a priority. Now that technology allows customers to launch their own transactions, the balance of power has shifted to them. Customer management processes must help the company acquire, sustain and grow long-term, profitable relationships with targeted customers.

Customer management must:

- **Select customers.** Identify attractive segments, craft a value proposition to appeal to those segments, and create a brand image that will attract those segments to the company's products and services.
- **Acquire customers.** Communicate the company's value proposition to the market, secure prospects, convert them to customers, and build dealer relationships.
- **Retain customers.** Ensure quality, create value-added partnerships, correct problems, and transform customers into highly satisfied raving fans.
- **Grow relationships with customers.** Get to know customers, build relationships with them, and increase the company's share in customers' purchasing activity.

Customer management processes focus on the relationship and image dimensions of the basic customer value proposition. Effectively acquiring customers improves the customer perspective of the strategy map. The effects of the financial perspective of the strategy come primarily through related revenue growth.

Innovation Through Operations

Identifying the specific functionality of a product or service that is of interest to the customer and being first-to-market are both important objectives for the innovation process to provide customers with the value proposition. For example, continuous reductions in the size of the basic memory or processing chip in semiconductors generate advantages in speed and functionality of the device. And for innovative companies, being six months late in product innovation could be more costly than a 20 percent overrun. A third customer objective is to innovate by extending existing or new products into new markets. Honda's excellence in engine performance was originally developed for motorcycles and cars. Now the company has entered other segments such as lawnmowers and backup engines for utilities. Canon's product leadership in optics for cameras has been leveraged into products for printers, copiers and medical electronics. E-Bay expanded its consumer auction capability into a powerful tool for selling used and reconditioned commercial equipment.

Financial measures include *sales from new products* and *revenue mix versus target*. Learning and growth linkages require strong support from information technology, such as databases; employee competencies, such as customer marketing and service; and a customer-centric culture and climate.

Innovation Processes

Maintaining competitive advantage requires continual innovation to drive customer acquisition and growth, margin enhancement, and customer loyalty. Despite its importance, innovation is often overlooked in favor of other management processes.

Managing innovation should include four important processes:

1. Identify opportunities for new products and services. Anticipate future customer needs by consulting external sources and customers. Develop new, more effective, or safer products to meet their needs.

2. Manage the research and development portfolio. Actively manage the product/offer portfolio that includes a mix of different kinds of projects: new science and technology; entirely new products; the next generation of existing products; enhanced features for specific market segments; and alliance projects through acquisitions, licensing or subcontracting.

3. Design and develop new products and services. Use a specific development process with explicit goals to bring new concepts to market. Develop a concept, plan a product, and engage in detailed product and process engineering. Manage the project portfolio, reduce development cycle time, and manage development cycle cost.

4. Bring new products and services to market. When new products are developed, manage a rapid launch, effectively produce the new products, and effectively market, distribute and sell the new products.

Excellent innovation processes affect different areas of the strategy map. They offer *customers* a value proposition by supplying specific performance attributes in a timely manner and extending existing or new products into new markets. The *financial* aspect of the strategy map achieves revenue growth and enhanced margins from innovative products and services that offer distinct advantages over competitor products. For innovation, the *learning and growth* perspective of organizations needs expertise in the underlying science and technology for new products; a high-level information technology to create and deliver products; teamwork both within the company and with external idea sources; and a culture that

(continued on page 5)

For Additional Information on structured innovation processes, go to: http://my.summary.com

Value-Creating Processes

(continued from page 4)

emphasizes innovation, disruption and change.

Regulatory and Social Processes

At a minimum, companies must comply with national and local regulations on the environment, employee health and safety, and hiring and employer practices to avoid shutdowns or litigation. They should also strive to enhance their reputations among customers, investors, their community, and potential and current employees. Be as rigorous in assessing returns from community investments as other investments.

1. Environment. Because of extensive regulation, organizations are forced to consider issues like energy and resource consumption, water emissions, solid waste production and disposal, and aggregate environmental measures. To leverage their environmental capabilities to create shareholder value, organizations reduce costs with waste management, differentiate their products by offering environmentally friendly products, manage their competitors by creating voluntary standards, redefine their markets with recycling programs, and manage risk by providing their people with better information.

2. Safety and health performance. Different measures include Occupational Safety and Health Administration (OSHA) requirements, lost workdays, accidents and illnesses per hours worked, off-the-job injuries, or employee exposures to hazardous compounds. Determine what makes the most sense to your organization given your strategy and other processes.

3. Employment practices. Much of the quantitative reporting about employment practices focuses on achieving employee diversity. Companies should not just have employee practices on their BSC to comply with regulatory reporting standards, but to explicitly drive the strategy toward enhancing shareholder value.

4. Community investment. This can be achieved through employee volunteerism, corporate foundations, and other philanthropic efforts. Though many companies report on the investments they make in community-based organizations, there are no measures for evaluating the outcomes. Executives should demand tangible returns from community-based programs as they would from any other investment. ■

Triple Bottom-Line Strategy Map

Amanco is a company in Latin America that produces and markets plastic pipes and fittings for fluid transportation. Its mission is to profitably produce and sell complete, innovative, world-class solutions for the transportation and control of fluids while operating in a framework of ethics, eco-efficiency and social responsibility. In 2002, the company revised an earlier sustainability scorecard to align better with the BSC framework.

The company's strategy map shows Amanco's commitment to triple bottom-line performance:

1. **Create economic value sustainably.**
2. **Generate value through a system of corporate social responsibility.**
3. **Generate value through environmental management.**

The financial, customer, process and technology dimensions support this strategy with specific objectives and targets: 10 percent annual sales increases; measuring on-time delivery; adding a screening phase to product development to determine health and environmental impact; using e-business to create a deeper knowledge of customer needs; and measuring job satisfaction.

Amanco adds a fifth dimension: environmental and social. The environmental performance objectives are to reduce per-unit inputs and wastes from products and processes by measuring per-unit energy and water consumption and the waste and scrap of raw materials. Its social impacts objectives relate to community development projects throughout Latin America; each operating company must implement at least one project with a nongovernmental organization (NGO) in a local community.

The company now communicates the strategy more objectively and clearly, so executives and employees better understand strategic goals and the triple bottom line.

Intangible Assets

Intangible assets are invaluable to sustainable value creation, but their value derives from their interrelation and cannot be measured independently. Their soft nature makes measurement more subjective than financial measurements of organizational performance. The learning and growth perspective of the BSC shows how an organization can align its intangible assets to its strategy. There are objectives and measures for three components of intangible assets: human capital, information capital, and organization capital. They must be *aligned* with the objectives for the internal processes and *integrated* with each other so there are synergies among them. Three targeted approaches are strategic job families, the strategic IT portfolio, and the organization change agenda.

(continued on page 6)

For Additional Information on a Strategic Readiness Report, go to: http://my.summary.com

Intangible Assets

(continued from page 5)

Aligning Intangible Assets to Strategy

Strategic alignment is the dominant principle in creating value from intangible assets. Even if IT and HR are both well developed in your company, they are probably not strategically aligned. The strategy map and BSC enable organizations to describe intangible assets, align and integrate them to the strategy, and measure the assets and their alignment.

The typical strategy maps and BSC focus on strategic competencies, strategic information, culture, leadership, alignment and teamwork. The strategy map creates alignment and integration by providing a common point of reference for the enterprise strategy. The internal perspective identifies the critical few processes that create desired outcomes for customers and shareholders. Identify the strategic job families, define their competencies, their portfolio of technology investments, and the culture they need. Then, by developing, aligning and integrating your intangible assets to these few strategic processes, you can create the greatest returns.

Finally, you measure the intangible assets. Their value does not come from how much they cost, but how well they align to the strategic priorities of the enterprise. Prepare a Strategic Readiness Profile based on the principles of a balance sheet, where assets are ranked by their liquidity. Strategic readiness, analogous to liquidity, describes the status of intangible assets and their ability to convert to higher sales and lower spending — cash. Strategic readiness is converted into tangible value when internal processes increase revenue and profit. A Strategic Readiness Report shows consolidated snapshots of the ability of each class of intangible asset to fulfill its strategic role by defining the asset, aligning it to the strategy, and measuring the degree of readiness.

Human Capital Readiness

Companies must develop a measure of human capital readiness to represent the availability of employee skills, talent and know-how to perform the internal processes critical to the strategy's success.

To do this, companies must:

Step 1: Identify strategic job families. All jobs are important to the organization but some jobs have a much greater impact on the strategy than others.

Step 2: Build the competency profile. One way to do this is to interview those who best understand the job requirements of a job family and create a competency profile detailing the knowledge, skills and values required by successful occupants in a position. Use the profile when recruiting, hiring, training and developing people for that position.

Step 3: Assess human capital readiness. Drawing from approaches ranging from self assessments to 360-degree feedback, evaluate an individual's performance and potential in these critical job families. Provide individuals with a clear understanding of their objectives, meaningful competency and performance feedback, and a practical approach for future personal development. If a strategy map reveals the need for strategic job families that don't exist yet, create new job profiles based on the competencies required for the new processes.

Step 4: The human capital development program. Under the *strategic job family model*, the organization concentrates HR programs on the critical few jobs that are pivotal to the strategy. This focus creates speed of action and efficient spending, but this approach implies that many jobs are nonstrategic. The *strategic values model* assumes that strategy is everyone's job and part of everyone's objectives and actions. Both models are legitimate, but don't work well as one integrated program. They should be segregated and funded separately. Closing competency gaps in strategic job families should be the basis for reporting on strategic human capital readiness. The strategic values model provides the basis for a revised performance management program for setting objectives for the entire work force.

Information Capital Readiness

Information capital (IC) is the raw material for creating value in the new economy. IC includes systems, databases, libraries and networks, and makes information and knowledge available to the organization. IC has value only in the context of the strategy.

To align IC with the company's strategy:

1. Describe information capital. IC has two components: technology infrastructure, such as mainframes and communication networks; and information capital applications, a package of information, knowledge and technology. Information capital applications build on the infrastructure to support the organization's key internal processes. They can affect business transactions, analyze information, or transform the prevailing business model of the enterprise. Together, technology infrastructure and information capital applications form the *information capital portfolio*.

2. Align information capital to the strategy. Typically, 90 percent of the sizable annual expenses for a typical IT budget go to existing applications, with lit-

(continued on page 7)

For Additional Information on strategic job families, go to: http://my.summary.com

For Additional Information about describing information capital, go to: http://my.summary.com

Intangible Assets

(continued from page 6)

tle left for the discretionary investment that funds strategic alignment. Companies can increase operating efficiencies to provide more discretionary money, but too much new informational capital too quickly cannot be effectively absorbed. Depending on the strategy, 5 to 15 percent of the budget is the goal for total information capital spending. This spending can either replace obsolete systems with state-of-the-art technology or apply totally new technology to new applications.

3. Measure information capital readiness. Information capital strategic readiness measures the degree of preparedness of the organization's information capital to support the enterprise's strategy. The most frequently used approach is a numerical indicator that identifies the status of each application. Management provides the subjective judgment for where to invest resources to create strategic readiness. Greater rigor can come from more quantitative, objective assessments of their application portfolios, such as surveying users about their satisfaction with each application, financial analysis of each application, and technical audits of the infrastructure of each application.

Organization Capital Readiness

Organization capital is the *ability of the organization to mobilize and sustain the process of change required to execute the strategy*. It provides the capability for integration and alignment of intangible and tangible assets with the strategy by changing behavior based on the strategy map.

Organization capital is typically built on four components:

1. Culture. The predominant attitudes and behaviors that characterize the functioning of an organization should back up the organization's strategy. The BSC forces the ambiguous replies to employee surveys to be defined more precisely. There are models for measuring culture and climate, but all are imperfect due to their incredible subjectivity. One option is to design a questionnaire specifically to evaluate the company's value proposition.

2. Leadership. Leadership to manage transformational change is a core requirement for becoming a strategy-focused organization. Two approaches have been used to define the role of leadership. The *leadership development process* focuses on how leaders are developed in an organization. The *leadership competency model* focuses on what a leader should be by describing appropriate traits. Process developments use objective, verifiable indicators, such as key positions without successors or number of external hires. Companies focused on the development process must have a leadership competency model to guide the development process, and companies focused on leadership competencies must have leadership development programs.

3. Alignment. Alignment requires all employees to be empowered in the same direction. First, leaders must create awareness of the high-level strategic objectives to all employees in ways they can understand. Next, they must ensure that individuals and teams have local objectives and rewards that contribute to achieving targets for high-level strategic objectives.

4. Teamwork and knowledge sharing. There's no greater waste than a good idea used only once. Companies must generate, organize and develop knowledge, and distribute it through a "push system" or by providing easy access when people are searching for existing information relevant to their immediate needs.

The strategy map and a BSC should focus on these attributes as they relate to the company's change agenda. Use the strategic objective and the measure you are using for each attribute to create an organization capital readiness report and determine the organizational changes required to implement the strategy. Management should create targets for each of the measures that represent a significant improvement from existing performance. HR can then develop a program that aligns HR organization investments to the enterprise strategy. ■

For Additional Information about measuring climate and culture, go to: http://my.summary.com

Building Strategies and Strategy Maps

An organization's strategy map and BSC should tell a story that differentiates the organization from competitors. It should show the interrelationships among the organization's internal processes and intangible assets that create sustainable competitive advantage.

Customizing Your Strategy Map

No organization can excel at every internal process and learning and growth objective. They differ in priority based on the strategy. Keep in mind Michael Porter's argument that "[p]ositions built on systems of activities are far more substantial than those built on individual activities."

A sustainable strategy seeks to capture the most value from the entire value chain.

Total value creation can be split into three segments:

- **Value captured by supplier.** The prices paid to

(continued on page 8)

Building Strategies and Strategy Maps

(continued from page 7)

employees and suppliers less opportunity cost for providing products and services to the company.

- **Value captured by company.** Net price received from customers less prices paid to employees and suppliers for products or services sold.
- **Value captured by customers.** The difference between the maximum price customers are willing to pay for products and services and the actual prices they paid.

Value created is distributed among these three value participants depending on their relative strength and bargaining power.

Strategies position the company where it can capture value and make an attractive profit. Undifferentiated products allow customers to capture most of the value created. No matter what sustainable strategy a company uses, it should develop a customized strategy map that represents its value proposition, and its alignment of internal processes and learning and growth capabilities that will deliver superior financial performance.

- **A low total cost strategy** requires delivering consistent quality, reduced product acquisition time for customers, and a somewhat limited selection. These companies should focus on operation management processes.
- **A product leadership strategy** requires being first-to-market, capturing high market share where switching costs are large, and extending superior functionality of their products into multiple market segments. These companies should highlight innovation processes.
- **A complete customer solution strategy** requires building long-term relationships with customers, developing complete customer solutions, providing excellent service, and forging quality relationships. These companies need to focus on customer management processes.
- **Lock-in strategies** require creating high switching costs for customers, creating industry standards, or selling an initial product that needs endless upkeep, such as a razor that continually requires new blades. Companies relying on this strategy need to put attention into many types of internal processes.

Planning the Campaign

A strategy map is a one-page representation of the cause-and-effect linkages among the objectives for both the outcomes and drivers of strategy. The objectives in the map are converted to the BSC of measures, targets and initiatives. But the strategy map is only a static representation. In order to create a dynamic strategy, managers must **quantify** by establishing targets and validating the cause-and-effect relationships in the strategy map; **define the time line** by determining how strategic themes will create value in short-, medium- and long-term horizons to create sustained value creation; and **select the initiatives**, the ultimate drivers of change that will close the gaps between projected and current performance.

Planning the campaign is a six-step process to conduct scenario planning exercises while the strategy map is being built:

1. Define the shareholder/stakeholder value gap. Define the overarching objectives and measures, identify the targets and value gap, and allocate the value gap to growth and productivity goals.

2. Reconcile the customer value proposition. Clarify target customer segments and customer value propositions, select measures, and reconcile customer objectives with financial growth goals.

3. Establish the value time line. Show how the value gap will be closed over the established planning horizon by allocating it to different themes.

4. Identify strategic themes. Identify the critical few processes that have the greatest impact and establish measures and targets.

5. Create strategic asset readiness. After defining the human, information and organization capital required to support the strategy, assess the readiness of the assets to support the strategy, and establish measures and targets.

6. Identify and fund the strategic initiatives. Clarify and secure funding for the strategy after establishing specific initiatives required to support the processes and to develop the intangible assets. ■

IBM's Complete Customer Solution

IBM dominated the computer industry from 1960 to 1980. The company did not offer the lowest prices; it did not often deliver its new products on time; and its products were not the most technically advanced, most powerful or fastest. But IBM did offer its customers a complete personalized solution to their problems. The company provided hardware, software, installation, field service, training, education and consulting. Bonding with the customer in this way enabled IBM to earn exceptional returns over a long period of time until technology changed and the company could not keep up.

Management: Project

A Manager's Guide to Project Management

Learn How to Apply Best Practices

by Michael B. Bender

THE SUMMARY IN BRIEF

As an executive, you know there's only one reason to start a project: to add value.

In *A Manager's Guide to Project Management*, top project management consultant Michael Bender reveals how to make sure all your projects fully support your goals and run effectively from start to finish.

Bender shows how to use balanced portfolio techniques to get maximum value from every project, systematically reduce risk in tough-to-manage global environments and improve organizational performance through strategic outsourcing.

Drawing on decades of experience, Bender illuminates the executive's role in establishing the conditions for successful project delivery and presents specific tools and techniques for ensuring that projects meet the strategic goals of the organization.

Bender shows how to structure organizations to support more effective project communication and decision-making, integrate project processes with other processes and oversee projects more effectively. He also presents a discussion of understanding and managing projects as capital investments, including detailed coverage of managing balanced project portfolios.

As an executive, you realize the rewards or suffer the penalty of project results. Here are the tools to get the results you're after — and get them consistently.

IN THIS SUMMARY, YOU WILL LEARN:

- How to align project management with business strategy.
- How to choose the right projects and oversee them effectively.
- How to structure your organization to promote better project decision-making.
- How to manage multiple projects in complex environments.

Understanding Projects and Project Management

Ultimately, both projects and project management have only one goal: to add value to your organization. You, as an executive manager, establish the values important to the organization. You then communicate these values and establish a strategic plan to foster and improve the organization along these values.

To manage projects, you hire project managers and pay them a salary. They then add more activities to the project for planning, management and oversight, which all add to the cost and time of the project. However, these costs and activities must reduce both the cost and time for the project by increasing efficiency and reducing rework.

Specific Goals for Project Management

Other specific goals for project management are:

- **You're making your clients happy.**
- **You're making money and being fiscally responsible.**
- **You're achieving your strategic objectives.**
- **You're optimizing your resource usage.**

Things Are Getting Better

No matter where you are, no matter what condition your projects might be in and no matter how well your organization manages its projects, you want things to get better. Fortunately, improving project management is as simple as improving any business process. Also fortunately, the techniques are the same.

Project management is an evolving discipline. Historically, the discipline concentrated on itself — focusing on the tools, processes and techniques for successfully executing projects. Now that these are well developed, the discipline must look outward, focusing on its environment. Executive management shoulders the responsibility to conceive, design, implement and manage the organization's overall objectives, culture, environment and processes for all disciplines, including project management.

Focusing on these key areas will help you drive your organization's success in projects and programs:

- **Foundations.** Establish an understanding for sound project management practices.
- **Alignment.** Ensure that projects align with all the organization's activities.
- **Management.** Track, measure and improve project management as an organizational discipline.
- **Investment.** Ensure that the capital and resources invested in project activities yield valuable results.
- **Resource optimization.** Use outsourcing and advanced technologies to improve resource optimization.

Project and Program

A project can be an activity that takes 30 minutes or 10 years, as long as it's unique, temporary (has a beginning and an end) and creates a unique, well-defined product.

Although the concepts we apply to project management are appropriate regardless of size, the classical tool sets presented here and in most seminars assume that you're managing a project that's typically several months long or longer and involves at least a small handful of people.

The distinction between a project and a program is sometimes merely semantic; other times the distinction

is clear. Let's consider two program examples.

The first is a new product launch program. Here the organization engages in several eclectic projects to effect the new product launch. The technical team must develop the product, the marketing team must develop advertising and marketing materials, the sales team must be trained, a production line development project is required and logistics must be handled. These are all very different projects, but they must be managed in a coordinated way to successfully launch the new product.

The second example is an air traffic control system. This system involves developing several computer-based systems: one for the airport control areas, one for the en route controllers, a separate system for the towers, another for communications management and finally one for radar management. The project plans to develop all these systems will be similar because they are all real-time computer-based systems. You can manage this program as a single, large project, blurring the distinction between project and program.

Programs consist of two or more projects that require coordination. The projects might relate in two key areas. In the previous examples, the projects require coordination because they share a common high-level goal. Projects can also relate because they share a common resource pool. When that occurs, the project managers must coordinate the use of the resources to provide efficiency across the program.

Whether your organization calls this a project or program is irrelevant. What is relevant is that everyone in your organization uses the terminology consistently.

Project Management Terminology

Here are some additional terms that are important to the project manager:

*A **portfolio** is the entire collection of projects and programs an enterprise, organization, division or department of an organization undertakes to achieve its overall objectives.*

***Scope** is what's included and not included in the project.*

***Goals** include any generic goal, objective, requirement, specification or target.*

***Objectives** are business-level or organizational-level goals.* These are the primary reasons to undertake a project, including such items as market share, return on investment (ROI), sales objectives and membership drive objectives.

***Requirements** are the measurable characteristics of a product or service.*

Three Key Project Definition Concepts

There are three concepts that are key to successful project definition:

- The project charter is the one project document that cannot change.
- The charter is a contract between executive management and the project manager.
- Appropriate project management and subject matter expertise must be employed in developing the business case, to ensure a balance of scope, time and cost.

Project Definition and Planning

The purpose of project definition is to make sure the project builds the right things. The purpose of planning is to make sure the project team builds them efficiently. Project definition is not formally part of the project. Perhaps for this reason, it is the least understood and most poorly implemented part of the project environment.

All projects begin with some stimulus, such as a competitor announcing a new product, the cost of some raw material suddenly increasing or the strategic planning committee wanting to increase market share by 20 percent.

The stimulus initiates an analysis to determine whether it warrants becoming a project. This analysis creates a business case for the project. The business case is summarized in the form of a project charter. The charter is an executive-level summary of the business case that contains, at a minimum, the essential items executive management needs to make a decision on whether to proceed with the project.

The key purpose of project definition is to:

1. Identify the benefits the organization expects out of the project.
2. Define the project sufficiently for a qualified project manager to begin developing a project plan.
3. Determine the organizational viability of the project.
4. Identify and communicate risks, assumptions and issues currently known about the project to both executive management and the project management team for planning purposes.
5. Formally sanction the project and assign the project manager. ●

Aligning Project Management With the Organization

The benefits derived from aligning projects with organizational objectives seem intuitive, yet few organizations either enforce or encourage such alignment. The issue might be a misunderstanding of the true effects of misalignment, a lack of skills or know-how to enforce alignment or simply an assumption that the staff will automatically align projects themselves. Misaligned projects waste valuable resources at best and can rip organizations apart at worst.

Strategic Alignment

Integrating project management into the organization requires you to align it three ways:

- **Strategic alignment.** Project objectives align with organizational objectives.
- **Organizational alignment.** Project resources integrate seamlessly with resources engaged in other business processes, research and operations.
- **Process alignment.** Project activities interface seamlessly with other business processes.

Conditions for Successful Alignment

Whether you encourage some level of competition to generate new ideas or strive for a more cohesive planning structure, successful project alignment relies on six factors:

1. Balanced and comprehensive objectives. Successful and stable portfolios require a balanced, cooperative environment in which projects and personnel work together for the organization's benefit. The portfolio of projects must balance both project objectives and resources based on an agreed-upon strategy — the strategic plan.

2. Specific and durables objectives. The efficient organization focuses resources on durable objectives designed to move the organization toward its vision.

3. Hierarchical framework. A well-developed hierarchical framework — essentially, a clearly established and understood objectives pecking order — translates high-level objectives to the appropriate level for the task performers, project managers, program managers and other management and technical functions.

4. Measurable objectives. Measurements and metrics offer business analysts, project managers, product marketing managers and other project stakeholders clear guidelines for balancing project objectives.

5. Stakeholder agreement. If stakeholders disagree with the objectives of the organization (or project), conflict will disrupt progress, even to the point of project sabotage — a situation that exists much more frequently than many realize.

6. Environmental and organizational assumptions. We know the influence assumptions can make on a project plan. We write them down, confirm them and store them. We then identify risks in case the assumptions are wrong or change.

Strategic alignment is not a passive event. Senior management must actively pursue project and portfolio alignment. Your quest for alignment begins with quality and stable organizational objectives, a strategic plan and the buy-in of that plan. You must constantly communicate these items and develop processes to enforce alignment with strategic direction. Hierarchical frameworks and durable and specific objectives provide clarity at all levels of the organization. Finally, a stable portfolio keeps resources working efficiently, helping to ensure project success. There's a time and place for conflict, prioritization and infighting; there's also a time and place for productivity.

A Framework for Strategic Alignment

The **goals breakdown structure (GBS)** is a process that translates organizational objectives into project and product requirements and, ultimately, component specifications. This tool can be used to create a framework for aligning all projects with strategic objectives.

The GBS in project management originates from an advanced concept known as **requirements traceability.** This concept requires the project team members to demonstrate how the products and services they create will support and map to the project's requirements. This concept ensures that the final product will meet the project's requirements. The GBS is a more structured and proactive approach. Use it as a planning tool in addition to an analysis tool.

When we expand the concept to the organization as a whole (let's refer to this as the **organization goals breakdown structure [OGBS]**), we start with the highest goal in the organization: the vision statement. We then determine the characteristics that the organization must portray and the actions it must take to achieve that vision. We present this information in the form of mission statements, value statements, quality statements and so on. We then use these statements to create the organization's strategic plan. The strategic plan identifies the organization's objectives or goals for the foreseeable future. These goals may include market penetration for product lines, developing patents in new technologies or

expanding into new foreign markets. The goals defined in the strategic plan then become the business objectives for projects.

Process for Constructing an OGBS

The process for developing an OGBS is easy:

1. Start with a high-level objective. The OGBS starts with the highest-level objective. For a project, this is the project goal or mission statement; for an organization, this is the vision statement.

2. Break it down into smaller objectives. The next step is to decompose the objective into smaller, more detailed objectives.

3. Ensure layer integrity. Ask the question, "Is this tier complete and sufficient to ensure the success of the above layer?" If not, more goals are needed or existing goals require elaboration. The second question is, "Are any objectives not needed to ensure success of the above layer?" If so, remove or adjust the unnecessary goals to prevent waste.

4. Add measurements. As you complete each tier or subdivision, establish the targets, metrics or other measurements needed to balance, monitor and track success.

5. Continue the process. As you complete each tier, continue progressively, decomposing the layers into more detailed and elaborate goals.

Organizational Alignment

Organizations' cultures, structures and infrastructures must accommodate a variety of work, including projects, processes, operations and research. Each organizational structure exhibits benefits and problems. As an executive manager, you must design the organization to accomplish all work.

There are many different types and permutations of organizations. The key to success lies less in the structure and more in the formal delineation of roles and responsibilities. True ownership — having a person, department, team or group that is completely responsible and accountable, with full authority — forms a cornerstone for defining the organization. Ensure that each project, process and deliverable has an owner, and your organization will be fine, whatever its structure.

Process Alignment

Successfully implementing project management depends on clearly defining the deliverables for decisions and information exchanges between the project management processes and other ongoing processes.

Project work is not ancillary to an organization; it's an integral part of it. Viewing projects as a normal business process helps integrate them into the organization, smoothes the interfaces between project activities and ongoing activities and improves overall organizational efficiency. Creating a deliverables-based interface between project work and ongoing work further enhances overall efficiency. ●

Project Management Oversight

A sound **project cost management system** is a strategic tool for the executive manager for three reasons:

1. It helps manage projects as investments.
2. It helps evaluate project management at the organizational level.
3. It offers tools that aid in strategic outsourcing.

Earned Value

The recognized standard for project cost management is called **earned value management (EVM),** or simply **earned value (EV).**

EVM offers three additional benefits:

1. It can track and manage both costs and progress across multiple projects, programs and even the portfolio.
2. It is a primary aid in determining root cause for project management issues.
3. It is compliant with the Sarbanes-Oxley Act, which is required for fiscal project tracking.

Project Cost Management

The name EV originates from its core concept that each project has a value. In EVM we deem that the value of a project is its burden cost. Although the true value is likely greater than the cost, this value is both speculative and immaterial to EVM's purpose; therefore, it is not considered. If we deem that the value of a project is its burden cost, then the value of each work package in a project is worth its burden cost. As a work package completes, we "earn" its "value" toward the project. These values then become the basis for project cost and progress tracking.

At any point in time, the project plan tells us which work packages should have been completed. The sum of their estimated burden costs gives us the **planned value (PV).** The work packages we actually completed by that date tell us our EV. The difference between the two values tells us whether we're behind or ahead of schedule.

After the project starts, the project manager and finance group have the primary responsibility for project cost management and tracking. They must report progress periodically and escalate exceptions as they

occur. The project communication plan describes how to escalate the exceptions.

Project Oversight

Project management oversight involves three perspectives: product quality, performed by the quality control department to ensure that the products meet their requirements and specifications; project quality, where the quality assurance department and project management office (PMO) make sure that the project team performs the right actions; and projects linked to the executive team, which ensures that the two previous perspectives are defined and performed, and ensures that the projects support the organization's strategic plan.

Project management oversight involves defining doctrine and the level of discipline to be performed in both quality control and quality assurance. It also demands that executives get reports on projects to keep the processes on track.

Finally, executives need to ensure that the projects', programs' and portfolios' objectives align with the organization — incorporating appropriate organizational changes, excluding inappropriate changes and focusing on the organization's vision.

Project Management Oversight

Executive management plays a key role in making sure that project management supports the organization. Using existing and well-defined procedures, executives can develop a simple structure to monitor and track how the organization manages projects, handles problems and improves project management over time. These key tools include earned value management (EVM), change management and standard continuous process improvement technologies.

Successful project management also requires both executive direction and oversight. It is your responsibility to define project management's role within the organization, to provide organizational structure and resources to succeed in project management, and to make sure those resources are doing their jobs. ●

Projects as Capital Investments

The purpose of any project is to add value, and the value must outweigh the project cost.

The value doesn't need to be purely monetary. Consider a project to finish a basement. Although you certainly hope to add real value to your house, you recognize that the financial value added will likely be less than your investment. The additional value comes from enjoying the basement while you live in the house.

Organizations are no different. Not-for-profit organizations' goals are not monetary (presumably). For-profit organizations recognize the need to invest in the organizations' culture — to develop mores that inspire honesty, hard work, respect and personal growth. You also recognize that many projects offer financial benefits that might be difficult to quantify. Information technology (IT) infrastructure projects often fall into this category.

This discussion leads us back to the balanced portfolio: a portfolio designed to cover all aspects of the organization. A stable, balanced portfolio demands that we consider all goals for a project before work begins. We recognize that changing our mind midstream is highly disruptive and inefficient, not only at the project level, but also at the portfolio level.

Grade and Cost of Quality

Grade refers to the number and type of features in a product. A high-end product (high grade) might have many features, and a low-end product (low grade) might have few. However, each product would have equal quality if the number of defects is identical.

In project management, *quality* is defined simply as meeting requirements and specifications.

In a product-oriented company, the product marketing managers or other marketing subject matter experts determine the market niche and, therefore, product grade. However, the project manager has a clearly defined mandate: to ensure that the product meets quality standards by reducing or eliminating defects so that the product meets defined requirements.

Developing a Balanced Portfolio

A balanced portfolio contains all programs, projects and activities required to ensure the success of all strategic value tracks.

One concept is critical to budgeting for a balanced portfolio: Project budgets must include all costs associated with the project.

Each organization is different. As an executive manager, you must work with your colleagues to determine an approach that satisfies your needs. Codify the results of that collaboration in the form of a portfolio doctrine. Consider these points:

- Use project archives to determine appropriate budgets for mandatory and consequential projects.
- Consider outside money sources for opportunistic projects.
- Properly fund strategic projects.

- Look for creative projects that satisfy multiple value tracks, balancing the remaining time and money.

Translating Value Tracks to Financial Benefit

Many non-monetary value tracks translate easily into financial benefits in both for-profit and not-for-profit organizations. Concepts such as cost-of-quality enable project and process designers to achieve optimum financial gains regarding quality. Increasing customers translates to increased profits using predictable and easy-to-build models; efficient improvements translate into specific cost reductions.

Frequently, however, establishing these metrics is difficult and relies on assumptions, which must be both acknowledged and documented. Define a corporate culture tailored to your organization's vision. Certainly, an excellent culture is much more productive than a poor culture. So if you spend money on a project designed to improve your culture, the issue becomes establishing the productivity gain versus the investment capital relationship. Just because you might have difficulty establishing clear target metrics doesn't mean you should avoid the project.

When all else fails, you can compare projects using a benefit-cost ratio. If, for example, you are a museum and you want to compare projects that will increase membership, you can compare projects using a ratio such as new members/$1,000 of project cost.

Establishing standard practices, aligned with the organization's portfolio doctrine for conducting these translations, further enables project and portfolio designers to properly select and reject projects.

Basic Project Selection Methods

We can now use our building blocks to develop simple methods for selecting and rejecting projects. These include:

- **Net Present Value (NPV) Tables.** NPV tables are one of the simplest forms of portfolio project selection methods. The portfolio designer simply enters appropriate projects into a table and sorts the projects from highest NPV to lowest.
- **Internal Rate of Return (IRR) Tables.** IRR tables work identically to NPV tables, except that you sort the projects by decreasing IRR or modified internal rate of return (MIRR). Most organizations that use IRR or MIRR have a minimum value that they will accept for a project.
- **Benefits/Cost Ratio.** Benefits/cost ratios are useful for selecting projects in which the direct financial benefits might be unimportant or difficult to calculate. Calculate the benefit/cost ratio by dividing the desired target metric by project cost. The target metric should map to the strategic plan or organization value statements.

Balancing a Portfolio

Achieving an optimized project portfolio involves more than a strictly financial perspective. Our quest to balance the organization's portfolio and eliminate frequent project reprioritization demands a balanced suite of projects/programs that achieve all organizational objectives.

Two simple tools are useful for balancing projects across multiple objectives: balanced and weighted scorecards.

Balanced scorecards are tools designed to establish strategic objectives. The benefit of using a balanced scorecard for portfolio management is that the scorecard establishes a complete set of clear, measurable objectives for the portfolio designer.

Weighted scorecards are valuable when projects offer multiple objectives. The portfolio designer creates a matrix in which the organization's benefits run down the left column and the projects run across the top. The strategic plan assigns a weight to each benefit based on its importance. The portfolio designer then determines the relative contribution for the projects for each objective.

The only criterion to determine whether a tool is useful is to determine whether it helps you define and manage projects that increase your organization's value while minimizing resources.

Portfolio Management

Value tracks are specific, well-defined areas where the organization intends to benefit.

The challenge in developing a balanced portfolio stems from balancing resources against the potential benefits. A single project might benefit the tax reform value track, but it might absorb so many resources that the health care and education value tracks suffer. Balancing resources across the value tracks becomes the challenge. We can approach this problem from two perspectives: using a creative approach or using a strategic approach.

The **creative approach** involves generating project ideas from the staff. The organization considers a suite of projects that aim to provide value along the defined value tracks.

The **strategic approach** uses the organization's objectives as the primary driver. This approach is analogous to developing a strategic plan for a for-profit organization. The organization defines short-, medium- and

long-term objectives, and then defines projects to meet those objectives.

Experts generally recommend a **mixed approach**, in which the strategic planning committee defines the core strategic projects and allows the staff to design the rest of the value track projects.

Maintaining a Balanced Portfolio

The portfolio manager, the project management office (PMO), or another tactical authority can manage a well-balanced portfolio using tactical means. If the portfolio was well designed, the designer can pipeline the projects based on resource availability and strategic need. The PMO or portfolio manager can initiate projects at designated times with little or no strategic review or intervention. However, even in the most efficient and predicable environments, senior-level management must review the project status periodically, if just as a check and balance. ●

Globalization and Resource Optimization

We cannot fully discuss outsourcing without addressing globalization. Globalization has opened up new markets and ideas, and offers new and less expensive vendors. However, the rush to capitalize on globalization has cost many organizations money, clients and respect. Many organizations that outsourced their IT or customer service activities overseas are now pulling them back. Other companies that outsourced their manufacturing overseas are reeling from quality issues and lawsuits. As with any other discipline, globalization and strategic outsourcing must mature.

Globalization and Strategic Outsourcing

Successful outsourcing begins with clear, measurable performance requirements.

The goal in specifying performance requirements for research is not to restrict the research, but to ensure that the research is done professionally and produces true, accurate results.

Globalization Factors

The organization should commit to a country or region where it plans to outsource. You should put sufficient structure in place to support outsourcing to that country or region:

- Train appropriate staff on the culture, customs and language for the region.
- Plan trips to the region regularly to establish face-to-face relationships.
- Start slowly, make small mistakes and resolve them before making major commitments.
- Consider outsourcing in the same countries where you're planning to sell.

The final step to ensure a successful outsourcing strategy is providing sufficient oversight. Consider these tools for management and oversight for outsourced work:

- Your work package is the vendor's project.
- Write the right contract. Consider these three major contract types: fixed price, cost plus and time-and-materials (T&M). You should outsource well-defined work packages with a fixed-price contract.
- Verify productivity and progress.
- Payment considerations. Vendors should demonstrate true progress before receiving payment.

Globalization and strategic outsourcing can add a significant advantage to most organizations. However, you must carefully consider and plan your strategy to ensure success. With maturity, you'll develop a virtually infinite resource pool and portfolio agility, enabling you to capture new opportunities or prevent disasters without impacting your strategic plans and organizational direction. ●

Project Portfolio Reviews

Consider these typical portfolio reviews:

- **Regular portfolio reviews.** As with all ongoing activities, senior management should review project portfolios on a regularly scheduled basis.
- **Phase gate reviews.** The project management office, steering committee, portfolio manager or specially designated gate review teams should review projects at phase gates to determine progress and authorize subsequent phases.
- **Exception meetings.** Exception meetings can be conducted as needed to handle special situations.

Management: Strategies

Always a Winner

Finding Your Competitive Advantage in an Up and Down Economy

by Peter Navarro

THE SUMMARY IN BRIEF

Most companies make a lot of money during economic expansions and lose a lot of money during recessions, but it doesn't always have to be that way.

In this summary, economist and author Peter Navarro shows you how your organization can be a winner over the course of its *entire* cycle — not just when economic times are good. *Always a Winner* arms you with all the strategies, tactics and forecasting tools you will need to profitably manage your organization through every business cycle season — from the best of boom times to the worst economic slumps.

Practical and insightful, in *Always a Winner* Navarro offers immediately useful advice to help your company survive and thrive in the increasingly risky conditions of the 21st century.

Navarro's call to action is simple: If you really care about your organization, you will learn to strategically manage the business cycle to create a powerfully competitive and sustainable advantage over your rivals. In the end, you will attain the superior financial performance sought by every executive team in the world.

IN THIS SUMMARY, YOU WILL LEARN:

- How to forecast movements and key recessionary turning points in the business cycle.
- How to implement a set of "battle-tested" strategies over the course of the business cycle.
- How to rebuild your organization with a broader strategic business cycle orientation.
- How to make your organization more recession-resistant and resilient over the long term.

A Big Picture View of the Always a Winner Organization

A recession can do far more damage to your organization than any 10 competitors. Without question, it is one of the most important lessons this business executives around the world have all-too-painfully learned in the wake and carnage of the crash of 2007 to 2009.

Contrary to a popular view before that historic crash, the business cycle is not dead. Nor has this highly volatile and often destructive cycle even been tamed. This is a lesson sharply underscored by the culpability of America's own Federal Reserve and central banks around the world in helping to trigger the crash of 2007 to 2009 by first creating, and then perpetuating, a bubble global economy.

Because recessions can do far more damage to your organization than your competitors and because recessions will continue to be as inevitable as death and taxes, the 2007-2009 crash should serve as every business executive's epiphany about the need to recession-proof one's organization.

By learning to strategically manage the business cycle, your organization will be able to create a powerful competitive and sustainable advantage over your rivals and thereby find the grail sought by every executive team in the world: superior financial performance. In this way, you will be "always a winner."

What Are the Three Steps to Becoming an Always a Winner Organization?

In order to always be a winner, your organization must become a Master Business Cycle Manager by following these three steps:

Step One. Develop and deploy strong forecasting capabilities to anticipate movements and key turning points in the business cycle and effectively disseminate that forecasting information to key decision makers.

Step Two. Apply well-timed business cycle management strategies and tactics across the functional areas of your organization in a synergistic and integrative fashion in response to your forecasting data.

Step Three. Over the longer term, build your organization with a strong business cycle management orientation, an executive team with a high degree of economic and financial market literacy, and an organizational structure and culture that strongly support and facilitate all strategic business cycle management activities.

By following these steps, your organization will not only recession-proof itself when the business cycle comes crashing down, it will also gain a competitive advantage over its rivals while minimizing costs, maximizing profits and increasing market share. In this way your organization will achieve superior financial performance and always be a winner over the entire course of the business cycle.

How to Strategically Manage Through the Business Cycle Seasons

Here is a broad overview of each of the major principles of strategic business cycle management:

• **Production, Inventory and Supply Chain Management.** The astute strategic business cycle manager is even more vigilant about the dangers of a recession when economic times are at their very best. In anticipation of a recession, the strategic business cycle manager begins to trim both product inventories and the inventories of the raw materials and components necessary to produce the products.

Rebecca S. Clement, Publisher; **Sarah T. Dayton**, Editor in Chief; **Andrew Clancy**, Senior Editor; **Edward O'Neill**, Graphic Designer; **Chris Lauer**, Contributing Editor

• **Human Resources Management.** If the desire is to trim labor costs during a recession, the time to start doing that is well before the recession hits. The Master Cyclist (short for "Master Business Cycle Manager") executive team uses the deepest and darkest days of a recession to cherry pick the very best new employees for its company from a talent pool now swollen with some of the very best and brightest from the industry.

• **Advertising and Marketing.** There is a mound of research indicating that counter-cyclically increasing advertising during a recession is one of the fastest ways to build brand and seize market share. Not only are advertising rates cheaper, but there is far less congestion in the advertising market, and messages are thereby heard much more clearly.

• **Pricing the Cycle and Credit Management.** Price elasticities generally become *more elastic* as a recession takes hold, thereby making products more sensitive. That's why, as a Master Cyclist rule, you always want to be cutting your prices as the economy softens.

• **Capital Expansion and Modernization.** By counter-cyclically increasing your capital expenditures to build new plants and modernize existing ones, your organization will be first to market with products that reflect the latest innovations and styles.

• **Acquisitions and Divestitures.** "Buy low and sell high." That's the Master Cyclist mantra when it comes to executing your organization's acquisition and divestiture strategy.

• **Capital Financing.** Shave a couple of hundred basic points off your capital costs over the course of the business cycle and save your organization millions of dollars. That's the mindset every Master Cyclist brings to the capital financing table. In this critical dimension, corporate finance teams have at least two parameters to optimize: the organization's debt-to-equity ratio and its ratio of short-term to long-term debt.

Step I: Becoming Your Own Economic Forecaster

Before learning how to become your own economic forecaster, it's useful to learn about both how and why the business cycle moves and the various forces that can trigger a recession. A useful starting point for this discussion is to introduce one of the most powerful forecasting tools, the GDP (Gross Domestic Product) forecasting equation.

The economic growth of any nation is measured by its GDP. As a practical matter, GDP growth is driven by only four components: consumption, business investment, net exports and government spending. By using a select set of leading economic indicators and reports to track each of these major GDP components, any business executive can develop a very keen sense of the movements and key turning points of the business cycle.

GDP Changes Chart the Business Cycle

The real, inflation-adjusted percentage changes in the GDP not only help us chart business cycle movements, the quarterly and annual GDP growth rates also provide a very useful benchmark for the health of any economy.

The GDP forecasting equation may be usefully represented as follows:

$$GDP = C + I + (X - M) + G$$

In this equation, **C** stands for consumption and **I** stands for business investment. The term **(X – M)** represents net exports, which is simply the difference between the amount of exports, **X** (what a country sells to other countries), and the amount that country imports, **M** (what a country buys from abroad). Finally, **G** stands for government spending, and often, during a recession, the government is called on to be the spender of last resort to stimulate an economy out of the doldrums.

Understanding that any given recession can alternately be consumer-led, business investment-led, export-driven, triggered by misguided fiscal or monetary policies or precipitated by a major exogenous shock such as a steep oil price hike, is a critical step toward developing your own forecasting capability.

How to Forecast the Business Cycle in Four Easy Pieces

While any organization that is serious about forecasting the business cycle should use one (or both) of the traditional forecasting tools — an in-house model or an outside subscription service — this is merely the start, rather than the end, of your organization's forecasting duties. Indeed, the task of forecasting the business cycle cannot be delegated to a remote group of economists. Rather, *every executive must learn to become his or her own business cycle forecaster.*

A relatively simple but very powerful forecasting method relies on these tools:

1. Monitoring the shape of the bond market's yield curve.
2. Assessing the stock market's bullish or bearish trend.
3. Following the corporate earnings calendar and, most important:
4. Tracking the GDP forecasting equation.

Why the GDP Equation Is Your Most Important Forecasting Tool

By using a relatively select set of leading economic indicators and economic reports to track all five major components of the GDP equation, any business executive can anticipate movements and key expansionary and recessionary turning points in the business cycle.

By individually tracking consumption, investment, net exports and government spending, you will become a much more accurate forecaster and be able to spot recessions much sooner. Any given recession may be triggered by any one of the four forces driving the GDP. In this sense, tracking each of the individual GDP components serves as an early warning system.

Another important reason to track the individual components of the GDP equation may be gleaned from this critical point: Even if the broad economy does not succumb to a recession, a fall in any one of the GDP components might hit your own organization very hard.

Why Tracking the Consumer Is the Ultimate Confidence Game

In order to properly track the consumption component of the GDP equation, it is useful to think in three dimensions:

1. How much is the consumer willing to spend? This is a function of the consumer's mood and confidence.

2. How much can the consumer afford to spend? This depends on the consumer's "budget constraint," which is a function of *both* the consumer's income *and* wealth.

3. What is the consumer actually spending his or her money on? Is it big-ticket items, such as cars and houses, or, fearful of a recession, are consumers shifting their spending patterns toward nondurable goods, such as food and medicine?

Why Taking the Pulse of Business Investment Is as Simple as ISM

Conceptually, business investment can be divided into two categories: fixed investment and inventories. *Fixed investment* includes everything from new factories and office buildings, to computer equipment, machine tools and assembly-line robots. *Inventories* are what pile up when a recession hits and what gets depleted during a robust economic boom.

In general, it is the fixed investment component of the GDP that strongly drives economic growth; inventory levels help signal the relative strength or weakness of the economy.

The Institute for Supply Management is the largest supply chain management association in the world, and the monthly release of its ISM index data is eagerly awaited by business and government leaders as well as the financial markets. This is because the ISM index has had an excellent track record of signaling business investment-led recessions.

Because of its success in signaling past investment-led recessions, the ISM index should be one of the most important weapons in your personal forecasting arsenal.

How Falling Exports Can Flatten an Economy in a Flat World

Properly analyzing America's International Trade report and, more broadly, understanding the roles of differing trade patterns as potential recessionary triggers require a much higher degree of economic and financial market literacy than interpreting other elements of the GDP forecasting equation.

To understand the messages of the International Trade report, it is critical to understand such complex relationships as those that exist among interest rates, inflation, oil prices, exchange rates and trade flows as well as basic economic concepts, such as the price elasticity of demand.

This is precisely why, in an era of globalization, every business executive must commit not just to becoming his or her own economic forecaster but also to improving his or her own economic financial market literacy.

Why Uncle Sam Is the Spender of Last Resort

The best way to monitor government spending is to review the U.S. Treasury Budget report on a monthly basis. This report provides a running estimate of the annual budget deficit as economic conditions change.

Today, as the U.S. government and governments around the world continue to up the fiscal stimulus ante dramatically — and the U.S. debt burden rockets past $12 trillion — the world is faced with a ticking budget-deficit time bomb of unprecedented proportions. The bottom-line implication of this gloomy longer-term picture is that, over time, *chronic budget deficits are increasingly likely to threaten your organization's ability to borrow capital at reasonable interest rates*.

Budget deficits can also be highly inflationary; and once such deficit-induced inflation hits, the Federal Reserve must respond with interest rate hikes that will hamper your ability to raise capital and will likely trigger a recession. For all these reasons, it is critical that you and your executive team closely monitor the U.S. Treasury Budget report on a monthly basis.

How Do I Fear Thee, Inflation? Let Me Count the Ways

While *demand-pull inflation* comes from too much money chasing too few goods, *cost-push inflation* comes about when the economy suffers from an energy price shock or a food price shock. Here's why this distinction is so important: While any increase in demand-pull inflation is likely to increase the chances that the Federal Reserve will *raise* interest rates, any increase in cost-push inflation actually *reduces* the possibility of a rate hike.

Core inflation represents demand-pull inflation while non-core inflation represents cost-push inflation. And note, the reason why energy and food prices are excluded from core inflation is that they are considered to be highly volatile. While food and oil prices may rapidly go up, they also often rapidly go down.

Follow the inflation indicators as part of your GDP forecasting equation protocol because inflation can trigger a recession both directly and indirectly. And know the difference between demand-pull and cost-pull inflation and how the Fed is likely to react to each.

Why the Bond Market Is Not a Casino

If the price of a bond goes *up* and the interest rate paid on that bond doesn't change, the effective yield of the bond has to *fall* because the bond buyer has paid a higher price for the right to earn the same return. From this example, we see a relationship absolutely critical to understanding how yield curves invert. In particular: Bond yields are inversely related to bond prices. Thus, if investors drive the price of, say, the long bond up through increased demand, the yield of the long bond will fall.

The bond market is decidedly *not* a gambling casino. Rather, the bond market is much more like a very sophisticated forecasting tool.

The intelligent speculations of a myriad of very informed investors can reveal the likely direction on the business cycle. Given the yield curve's remarkable accuracy in predicting key recessionary turning points in the U.S. economy over the last 40 years, any business executive who ignores the collective wisdom of the yield curve does so at his or her own peril.

Why Forecasting a Recession Is No Bull (Market)

In general, the earnings of most companies rise in economic expansions and fall during recessions. Accordingly, any stock market investor who believes the business cycle will be in an expansionary mode is likely to be bullish and buying stocks. If the majority of investment dollars in the stock market reflects this bullish position, the stock market trend will be up on the consensus speculation that the economy will continue in its expansionary mode.

If, however, stock market investors anticipate that a recession is on the horizon, they will begin selling stocks. If enough stock market investors become net sellers, any bullish uptrend will quickly morph into a dangerous bearish downtrend. Any such downtrend may signal concerns that a recession may be on the way — or that a recession in progress may continue for the foreseeable future.

Together with the bond market's yield curve spread, the stock market provides business executives with extremely important information with which to guide their companies through an up-and-down economy. Accordingly, any executive who ignores the messages of the stock and bond markets is just plain foolish.

How the Corporate Earnings Calendar Literally 'Guides' Your Strategy

Like clockwork, every quarter on Wall Street, the earnings season rolls around; and during this season, every publicly traded corporation must publish a quarterly earnings statement. For stock market investors interested in individual companies, the earnings season provides a wealth of information.

In using the corporate earnings season as a forecasting tool, there are two important questions to ask:

1. Did the majority of the companies meet, miss or exceed their earnings targets?

2. Did the majority of firms "guide" their forecasts higher or lower, or leave their guidance unchanged? (The term *guidance* refers to the fact that most companies also provide in their earnings announcements whether they expect next-quarter earnings to be above or below the levels previously forecast.)

How to Follow the Always a Winner Indicators and Reports

The best way to follow the leading indicators and reports is by doing something that every business executive should do every business day anyway: Read the financial press. The recommended indicators and reports are covered extensively in publications such as *Barron's, the Financial Times, Business Daily* and the *Wall Street Journal* as well as by financial news networks such as CNBC and Bloomberg.

Step II: Always a Winner Strategies Through the Business Cycle Seasons

Now that we have finished Step One in the Always a Winner management process and you have learned to become your own economic forecaster, it's time to put your ability to anticipate movements and key turning points in the business cycle to work. That's where Step Two comes into play.

In Step Two, we learn how to implement a very powerful set of strategies at key points in the business cycle.

The Always a Winner strategies can be grouped according to seven specific functional activities:

1. Production, inventory and supply chain management.
2. Human resources management.
3. Advertising and marketing.
4. Pricing and credit management.
5. Capital expenditures.
6. Acquisitions and divestitures.
7. Capital financing.

Production, Inventory and Supply Chain Management

In anticipation of a recession, Master Cyclists begin not only to cut production and inventory. They also cut their purchases and stockpiling of whatever raw materials, components and other production inputs they might need for their factories and facilities.

The Master Cyclist executive team is always seeking to balance the costs of holding inventory versus the costs of not having enough inventory on hand — so-called stock-out costs. In this regard, as a recession looms, the downside risks of holding too much inventory quickly overtake the rewards of having enough products on hand for distribution and sale.

It's not just the bottom recessionary part of the business cycle that the Master Cyclist worries about in managing the supply chain. The Master Cyclist also understands that: It is equally important to ramp up production and begin building inventories during a recession as soon as a recovery appears to be on the horizon. In this way, the Master Cyclist will be first to market with the most innovative goods that it is able to produce.

Why Cherry Picking the Talent Pool During Recessions Is Your Quality Key

The Master Cyclist executive team not only avoids the recessionary trap of exuberantly over-hiring and any attendant mass layoffs and blows to morale. It uses the deepest and darkest days of a recession to cherry pick the very best new hires for its company from a talent pool, which includes laid off talent. In this way, this well-timed strategic business cycle management strategy exploits recessions to improve the quality of the organization.

An excellent example of such cherry picking is offered up by Microsoft's rapid response to Yahoo!'s mass layoffs and plunging morale during the 2007 to 2009 crash. In one brilliant move, Microsoft hired Qi Lu, a former top Yahoo! search and marketing executive and pioneer in search engine technology. He wound up as the president of Microsoft's Online Services.

Why Countercyclical Advertising Is the Best Way to Build Brand and Market Share

Recessions are the best time to increase your advertising for at least two reasons:

1. Advertising levels are generally down so there is far less congestion in the advertising market. This allows your advertising messages to be heard far more clearly and far more sharply — particularly if your rivals are in full retreat.
2. Here the laws of supply and demand work very much in your favor: Advertising rates are a lot cheaper so your company and its products get a lot more bang for the advertising buck.

Strategically, it is of course important for your advertising campaign to continue to focus on increasing unit sales during a recession. However, it is strategically even more important to broaden your advertising campaign in a way that focuses more on the longer-term goal of building your brand.

Why Companies Often Price Their Products and Manage Credit Exactly Wrong

While most business cycle management strategies are implemented countercyclically, the rule for properly pricing the business cycle is to do so *procyclically*. As a general rule, you should raise your prices when the economy is expanding to boost revenues. Even more critical to protecting your bottom line — and market share — you should cut prices when the economy is entering a recession.

Master Cyclist organizations never allow their accounts receivable to get out of hand. At the first sign of any possible recession, these organizations begin to pull in their accounts receivable more aggressively even as they begin to tighten credit. In this way, the Master Cyclist credit manager pre-empts any problem of uncollectible receivables.

How to Not Get Run Over by the Capital Expenditures Bandwagon

When it comes to capital expenditures, your Master Cyclist management mantra should be:

- Cut capital expenditures in anticipation of a recession to build up your cash position and avoid overcapacity.
- Increase your capital expenditures during recessions so as to be first to market with products that reflect the latest innovations and styles.

Far too many organizations engage in just the opposite kind of investment behavior.

Why You Should Buy Low and Sell High Over the Stock Market Cycle

It is essential that any executive team obey this all-important maxim: *Any acquisition must be accretive to earnings.*

In a Master Cyclist and an Always a Winner context, this maxim means that no matter how attractive an acquisition may seem from a strategic perspective, if its purchase price is too high, that acquisition will *never* be accretive to earnings. To put this crucial point another way: Any overpriced acquisition — no matter how many benefits it may convey — will never overcome its high costs and add to the company's bottom line.

One Always a Winner point should be abundantly clear: If you conserve your cash and are patient during a bullish upward trend of the stock market cycle, you will be loaded for bear once a bear market hits.

How to Minimize Your Capital Financing Costs Over the Interest Rate Cycle

Shave a couple of hundred basis points off your capital costs over the course of the business cycle and save your organization millions of dollars. That's the mindset every Master Cyclist brings to the capital financing table.

In this critical Always a Winner dimension, corporate finance teams have at least two parameters to optimize: the organization's debt-to-equity ratio and its ratio of short-term to long-term debt. Both of these parameters change over the course of the business cycle and the related stock market and interest rate cycles. Only by strategically exploiting these cyclical changes in the debt-to-equity and short-term to long-term debt ratios over time will your capital financing costs truly be minimized.

Step III: Building the Always a Winner Organization

For you to engage in truly effective strategic business cycle management over the many different functional areas of the organization and over the longer term, it is critical that you learn to rebuild your organization to reflect its new strategic intent.

Strategy and Structure

The reigning authority on both the necessity and virtue of organizations adapting to reflect their changing strategy is the noted Harvard Business School historian Alfred Chandler. In his classic book *Strategy and Structure,* Chandler astutely noted that structure must always follow strategy.

To become a truly effective strategic business cycle manager, an organization needs to possess these four characteristics:

1. A strong business cycle management orientation.
2. An executive team that facilitates the flow of forecasting data and timely decision making.
3. An organizational structure that facilitates the flow of forecasting data and timely decision making.
4. An organizational culture that supports business cycle management activities.

What Is a Business Cycle Management Orientation?

The term *business cycle management orientation* refers to the recognition by the organization's executive team that recessions represent not only potentially extreme dangers. More broadly, movements and key turning points in the business cycle represent potential sources of competitive and sustainable advantages as well as important determinants of both the flow and stability of future earnings.

Beyond an overriding awareness of business cycle movements and the strategic opportunities that recessions in particular present, a strong business cycle orientation also emphasizes this critical point: Truly effective strategic business cycle management is ultimately a learning process based on an organization's cumulative experience with dealing with past adversity.

How Every Executive Team Can Boost Its Economic and Financial Market Literacy

Regardless of why far too many members of America's business executive corps may be characterized by a relatively low level of economic and financial market literacy, it is critical that the literacy bar be raised. To raise this bar requires both a commitment to the daily discipline of reading the financial press and a longer-term commitment to training programs that systematically upgrade the business cycle management skills of the executive team.

In reading the financial press, it is essential for every business executive to very *quickly* and *intelligently* read at least three newspapers a day: the *Wall Street Journal*, the *Financial Times* and *Investor's Business Daily*. *The Economist* offers the latest in global financial news.

Why a Facilitative Structure Must Follow Your Business Cycle Management Strategy

What kind of structure must your organization develop to strategically manage the business cycle effectively and efficiently over the longer term? The answer may be found in three specific structural dimensions:

1. Your organizational structure must facilitate the timely acquisition, processing and dissemination of forecasting information.
2. Your organizational structure must facilitate the equally timely, synergistic and integrative implementation of strategic business cycle management principles.
3. Both your forecasting and strategy-setting capabilities must be integrated across the firm and not segregated in separate shops far from the centers of power and command.

The bottom line is that building an organizational structure that is fully capable of supporting your strategic business cycle forecasting and management activities is absolutely critical to the long-term success of your organization. Time spent on this critical task will be time very well spent indeed.

Why a Supportive Organizational Culture Is Essential to Always Being a Winner

When it comes to cultivating a supportive organizational culture for its strategic business cycle management activities, no company does it better than Intel — except perhaps the big-rig truck manufacturer Paccar.

Paccar operates in one of the most cyclical of industries. Nevertheless, the company has been able to turn a profit consistently for almost 70 years. As evidence of both its business cycle orientation and its high degree of business cycle literacy, Paccar's top management team has adopted a strategy of geographically diversifying risk. Paccar's team also closely follows key industry indicators (e.g., freight tonnage) and prides itself on its almost accordion-like ability to ramp up and ramp down its production at the first sign of recovery or recession.

A major part of Paccar's nimbleness may be attributed to the company's own pragmatic and supportive organizational culture. As one assembly line operator described it: "Workers appreciate how [executives] don't go into denial or stonewall when a downswing is coming. They are frank and open about cuts, and … relations between the company and its unions seem to be good."

To build this supportive culture from the ground up, at every new employee orientation, workers are warned that the truck business is cyclical and some layoffs are almost inevitable. It is in large part because of this early warning and frankness that once the economy recovers, loyal workers typically find their way back to Paccar's factories rather than those of the competition. In this way, Paccar's organizational culture allows it to retain much of its highly skilled work force even though many of its members are laid off periodically. The cultural payoff: considerable savings in recruitment and training costs and its accordion-like ability to control labor costs during downturns.

How to Protect Your 401(k) in an Up-and-Down Stock Market

The best way to completely diversify diversifiable risk is simply to hold the broad market, for example, by holding a mutual fund or exchange-traded fund representing the S&P 500 Index.

While holding the broad market may do an excellent job of protecting your portfolio from diversifiable company and sector risks, it does nothing whatsoever to protect you from the market risk associated with holding a portfolio through the up-and-down movements of the business cycle!

By learning how to be your own business cycle forecaster and by following stock market trends, you will not only learn how to manage your organization much better. You will become part of that small elite group of smart money and thereby manage your own money and retirement funds much better.

If you become your own economic forecaster, you will not only develop a much better sense of the broader economic conditions within which your business operates. You will also ensure that a recession never again catches you and your organization by surprise. ●

Management

Change with Confidence

Answers to the 50 Biggest Questions That Keep Change Leaders Up at Night

by Phil Buckley

THE SUMMARY IN BRIEF

Change management is about helping people decide to change successfully. If you have been charged with leading a change initiative, chances are you were chosen for the job — that is, you didn't volunteer but rather were tapped to lead or manage a large change project. You may have been given a short briefing and left to your own devices to succeed or fail in an uncertain, often threatening environment. You may find yourself struggling to adapt your skill set to unfamiliar and anxiety-inducing conditions, conscious that your performance will affect your future career paths.

Change with Confidence addresses the biggest questions that change leaders ask time and again and provides the context, examples and advice to answer them well and to enable successful, sustainable change. Whether you're trying to figure it out, are in the planning stage, are actively managing, or are working to make it stick, you'll find guidance for a wide range of issues.

Although every change has its own circumstances, there are proven processes, tactics and behaviors that lead to lasting success. *Change with Confidence* offers practical, experience-based advice on how to handle the challenge of change.

IN THIS SUMMARY, YOU WILL LEARN:

- How to analyze previous change initiatives to see what worked, what didn't, and why.
- How to find out who can influence your success or failure, help you, or trip you up.
- How to determine what resources you'll need and how to get them.
- How to overcome change fatigue and opposition to change.

THE COMPLETE SUMMARY: **CHANGE WITH CONFIDENCE**

by Phil Buckley

The author: Phil Buckley is a senior change management professional with over 20 years of experience developing and executing change strategies to achieve aggressive business goals across global businesses in Canada, the Americas and the UK. He has managed 27 large-scale change projects, including co-leading global change management for the Kraft Foods acquisition of Cadbury with a team of 40 change leaders across 60 countries.

PART 1: FIGURING IT OUT

All change projects require you to move people from how they currently think and act to new ways of thinking and acting. The underlying rationale for change must be that it will lead to better performance, but this starting point is rarely enough for people to make them change. They are usually set in their ways and need to be constantly motivated and supported in order to take on new ways of working.

Often, change leaders make commitments regarding a big organizational change before doing their homework. They don't spend enough time understanding where colleagues currently are and where they need to be. Comparing these two positions will deliver a sense of what needs to change (mind-sets, behaviors, skills, processes and systems), how big of a change is required and how difficult it will be to make. In total, assessing all of these aspects of your change project will give you a sense of exactly what you have been asked to do.

The Plan

What Do I Bring to the Project?

Often, people become paralyzed by the magnitude of a big change project regardless of the role they've been given. They compare the project goals with the status quo, become anxious, and allow comments like, "We've never done this before" to fuel doubt, fear and panic. Before this happens, think of what you can draw upon to help the organization make the change. Based on your initial briefing, what past experiences, knowledge, skills and relationships are relevant to the project?

What Works:

• Note the colleagues you know in the areas of the business experiencing the change. They will give you insider perspectives on needs, concerns and cultural norms.

• Think of what you have in common with the impacted groups. Personal credibility and trust are important when supporting teams through change.

• Review what projects you have worked on and what you learned from them.

• Read past performance appraisals, and record the skills and capabilities you have been recognized for. Ask peers to add to your list.

How Do I Identify What Needs to Change?

Any big change will affect how people do their work. A critical initial step is to thoroughly map out what needs to be different for the change to be successful. This will give you a sense of how difficult your change project will be for individuals and teams to adopt.

It's critical not to underestimate the changes required. Your assessment will directly affect the resources needed to implement change, and misestimating the resources required will lead either to a mid-project request for additional funds (not pleasant) or an understaffed implementation (not wise). Moreover, missed requirements will distract and frustrate your team because they come as a surprise and might put the quality of your plan or even worse your leadership in question.

What Works:

• Engage people early in the assessment process so that they feel part of the initiative and take ownership of the change process.

• Make sure someone is accountable for each aspect of the change project. Any unaccounted-for areas either will not be attended to or will be seen as extra work by those who eventually have to handle them.

• Chart the required changes by groups responsible for them. Describe the current and future states in terms of the mind-sets, behaviors, processes and systems that need to change.

What Other Change Projects Are Going On?

One critical factor in your project's success is the amount of change going on when you implement the project. People have limited capacity for change and the extra work that comes with change projects. Generally, the more change initiatives in play, the more challenges a project has to overcome, and each initiative can derail your project as it draws on limited resources and takes up executives' time.

In 2004, Cadbury Adams USA harmonized its enterprise operating system, a major project requiring significant resources. When certain milestones were in danger of being missed, the project team discovered that key people were not living up to their time commitments. Further investigation revealed that most of them had been assigned to projects totaling over 150 percent of their available time. It was impossible for them to honor their commitments. Certain projects were reprioritized, reducing commitments for these colleagues, and additional resources were added where this was not possible. Further delays were avoided by ensuring that sufficient resources were made available to manage the work. Insufficient resources is one of the biggest causes of project failure. ●

Communication

What Is the Water Cooler Talk About Your Proposed Change?

"Water cooler talk" is a great metaphor for what colleagues think and say when not pressured to toe the company line, and understanding such uncensored beliefs will enable you to amplify positive perceptions and refute negative ones.

Addressing colleague concerns in project communications will increase the credibility of your project and the level of trust in the project team. Furthermore, differences between "water cooler" exchanges and executive interviews will help you assess how in touch leaders are with the feelings of their team members and what views may need reconciling before the project gets underway.

What Works:

• Informally poll colleagues to get an accurate picture of how they feel about the ways of working you intend to change.

• Ensure you have input from every group impacted by the change.

• Quickly dispel any incorrect information, identify areas where there are negative reactions to the change, and provide ongoing opportunities for people to raise concerns. ●

Getting Results

What Do I Need to Know Before I Commit to Deliverables?

Big change projects are rarely managed in perfect conditions. You need to ensure that the expectations of the various team leaders are aligned with the conditions surrounding the project by weighing the deliverables against the level of change involved, resource availability and the environment in which the impacted colleagues are working.

What Works:

• Ask your stakeholders, your team and yourself, "What has to be true to be successful?" Then gauge how aligned these requirements are with the environment in which you're working.

• Confirm the amount of decision-making power you will have in the project. Your degree of autonomy will impact the outcomes you can realistically sign up for.

How Do I Measure Success?

Defining how success will be measured is critical at the start of your project. These metrics will measure how your change project is performing, along with you as a leader.

In 2000, when Cadbury Chocolate Canada acquired Trebor Allan, the newly merged company became the largest confectionery company in Canada. The project team had combined the two businesses as planned, but after 14 months, it was missing its goals. A new leader asked the team if the merger was successful, and the members said, "yes." He then asked, "How do you know?" Since the team had not identified specific measures of success for the merger other than annual financial targets, members could only claim that the plan was exe-

cuted (citing anecdotal evidence), which didn't answer the question. The silence in the room was palpable.

Defining clear and obtainable metrics will confirm your achievements, simplify reporting, and provide you with data to verify when the project is on track or when remedial actions are necessary. Once you have all the information required to get your head around the project, you need to review everything you have discovered to make sure that the change will achieve the desired outcomes. ●

PART 2: PLANNING FOR CHANGE

Once you have finished "figuring it out," you have to develop a sense of the nature of the change and a set of expectations for deliverables and create a plan that defines how you will transition colleagues and the business through to your desired post-change state. This involves breaking down the change into sequenced activities, defining the resources required to implement them, selling the plan to your stakeholders, and communicating it to your organization.

The Plan

What Does a Good Plan Look Like?

It is far easier to implement a change once you have a strong plan to guide your actions — a detailed plan that maps out the project activities and provides a framework for leaders and the project team to follow. It should operationalize the project charter and include details on deliverables, budget, resources and timelines.

What Works:

• Create a project summary to test your understanding of details and to guide the project's shape before others try to do so. You don't want stakeholders planning for you or spending time assessing other people's ideas.

• Allow for flexibility in implementation, and leave the minute details to the teams that have to make the change.

• Calibrate your plan with the resources available to deliver it. Don't take on what you can't deliver with your project team.

The following topic areas will provide a solid basis for your plan: context/background, objectives, scope (in/out), outcomes/deliverables (including measurements), approach (required changes to behaviors, process, capabilities and technology), assumptions, risks/interdependencies, governance, timeline, resources and budget.

What Governance Is Required to Run the Project?

"Governance" in this context means the managerial rules that guide how work is done. Structure and order are necessary at the start of a big change project: people need to understand how their roles contribute to the project and what is expected of them. Establishing how the project will be governed is the first discussion you must have with the leadership team or project steering committee (which may include additional people who can guide and support the project). Fight hard to enforce principles, and be flexible about everything else.

What Works:

• Demonstrate governance in a visual format as doing so shows how things are connected and is easy to understand.

• To ensure leaders are clear on decision rights, present real-life scenarios to demonstrate how decisions will be made and what the consequences of potential decisions will be. Outline who has input and who makes the final call. ●

Resources

How Do I Know What Resources I Need?

It is critical that you dedicate sufficient time to map out the number and types of team members you need. You also have to fight for required resources at the beginning of a project as the fight gets harder and more stressful when additional resources are needed midstream. Cutting corners in a budget might look good on paper, but doing so rarely delivers the outcomes you need.

What Works:

• Create a resource plan that identifies the number and type of resources your change project requires. It is helpful to link these requirements to your impact assessment and to document the qualifications required for each role. This resource plan will support discussions with leaders, and trade-off scenarios can be explored if the business can't accommodate your recommendations.

• Secure enough resources so that you don't compromise stakeholder management. If you're working on the activity-level details, you will be distracted from this important leadership role.

Building the right-sized team with the right skills is critical to your change project. It must be large enough to complete planned tasks but not so large that roles overlap and team members become idle. With the right

team in place, you can consider what skills are required for you or someone else to manage the project.

What Makes a Good Project Manager?

The project manager has the greatest impact on day-to-day project operations. He or she must have the organizational skills necessary to construct and manage the project plan, be able to uncover missed tasks, have the relationship skills necessary to align and influence diverse stakeholders, and have the critical thinking skills to solve problems. Also, this individual needs to be able to courageously tell the truth and demonstrate grace under pressure in times of difficulty.

What Works:

• Select someone who has past experience working on a project team. This experience is essential to understanding the natural flow of big projects.

• Select someone who is a good listener, facilitator, negotiator, mediator and motivator.

A good project manager is like a modern-day Renaissance man or woman who draws upon strong technical and people skills to maintain momentum regardless of circumstances. They are quick to diffuse concerns and solve problems so that the project does not get bogged down or go off track. With the project manager in place, you can start filling key project roles.

Communication

How Do I Get Leaders to Personally Commit to the Project?

Leaders can make or break a big change project. Given the power of their positions, they can reward the behaviors and actions they support and punish those they don't. Without their full support, a project has little chance of succeeding.

What Works:

• When you do get agreement from the leadership team members, thank them for their support and reinforce that the project is owned by all members of the team.

• Get the head of the organization to commit to your change project and to share with the leadership team members the reasons why he or she did so.

• Establish roles for leaders that keep them busy and visible. Keep them active on your project.

How Do I Describe the Better Future My Project Will Bring?

The best future visions appeal to the hearts and minds of colleagues. Winning over hearts ensures personal investment and engagement; winning over minds ensures alignment with the need for change from a business perspective. Individuals need to see themselves having roles in the future picture you create, and the company rewards for creating change need to be seen as their rewards.

What Works:

• Establish a connection between your change project's vision and your organization's overall strategy.

• Discuss how the change will impact customers, consumers, suppliers, government and the community.

• Communicate through stories and metaphors. People learn through simple narratives and around goals, challenges, actions and outcomes.

PART 3: MANAGING CHANGE

Once you've created your plan and it's been approved, you need to take action as quickly as possible. Ideally, you will implement your plan as it has been written, completing each activity and achieving each milestone on schedule. What typically happens, however, is that roadblocks appear along the way, changing timelines and the sequence of events. You will need to marshal your resources to address these challenges while managing stakeholders to ensure they remain supportive of the project and your leadership. You'll need to ensure your team has the resources it needs, inform and coach stakeholders, and resolve issues.

The Plan

How Do I Manage My Day Job, a Change Project and Life?

High-performance individuals usually fall into the trap of trying to do everything and either fail to do so over time or maintain everything poorly. They find it hard to focus on the task at hand because they are so distracted by everything else they must do.

Leaders who successfully balance their many life roles tend to develop mechanisms to keep on track. Although each one is different, they hardwire priorities into their schedules and ensure that the important things in their lives are honored and done first.

What Works:

• Assign many of your day job tasks to team members as soon as you are assigned to lead a big change project.

• Create a to-do list with all of the different aspects of your life represented.

• Be selective about the meetings you attend. Consider sending a team member to represent you if there's not a specific reason for you to be there.

Change leaders need to plan their schedules as rigorously as their change projects. A reasonable life balance will help you stay focused on all of your priorities.

When Is the Organization Ready for Big Change?

You need to be confident that all parts of your organization are ready to take on new ways of working. If people aren't fully prepared, they will revert back to old ways of doing things, which in turn will probably lead to business disruptions.

What Works:

• Get leadership teams to sign off on the questions that will be used to assess readiness for the change.

• Ask leaders the following "killer questions": What have you personally done to prepare your team? How have you prepared your team to be aware of risks, to know what to do if things go wrong, and know how to trigger contingency plans if required?

• Ask colleagues the following "killer questions": What should we be worried about? Are issues getting the right level of attention? How confident are you that you will be able to perform your job on the appointed date?

How you prepare colleagues to take on new ways of working must be a core element of your project plan. ●

Resources

How Do I Get More Resources If I Need Them?

Creating a resource request process based on predefined criteria will increase the probability that you will receive approval, and building these requests into project governance will change the focus of the conversation from "Why didn't you know?" to "What is the business need?"

What Works:

• Include a protocol that states you will review project resources at the beginning of each phase.

• Create a process for reviewing resources based on assessing opportunities and risks.

• Include a fact-based rationale for each resource request. This should include opportunity realization, risk management and new scope accommodation.

How Do I Keep the Project Team Energized?

Big change projects tend to exact more emotional strain than nonproject roles. There is constant pressure to drive forward on a difficult course that is heavily monitored. It is essential to balance the negative effects of stress with positive recognition, opportunities to recharge and rewards. Acknowledging people's efforts and pacing their work will give them the energy needed to succeed over the long haul.

What Works:

• Be as energetic and optimistic as you want your team to be.

• When faced with problems, show confidence that the team can solve them, and reinforce the idea that teams win together.

• Pace your team so team members don't burn out. ●

Communication

How Do I Overcome Resistance?

Identifying the reasons for resistance — everything from passive compliance, indifference or apathy to outright sabotage — and addressing them up front will neutralize these roadblocks.

What Works:

• Discuss potential reasons for resistance with colleagues when you describe the project vision to the organization, and reinforce the positive benefits of the change.

• Build in as much certainty as you can — what is going to happen and when, what aspects will change and what will stay the same, and so on. Reduce stress and fear by reducing the unknown.

• Identify "early adopters" who support the change. Ensure they have the necessary information and are invited to forums where they can influence other colleagues.

• Avoid publicly challenging people who show resistance.

What Do I Do When I Don't Know What to Do?

Your career is on the line when managing big change projects, and you will be positively regarded as someone with future potential if you demonstrate grace under pressure. How you manage difficult situations will be remembered long after people forget what you did.

What Works:

• Keep calm. Acts of desperation imply that the situation is out of control and you are not in command of it.

• Keeping people busy on doing the most important things will avoid distraction and maintain performance.

• Assign responsibility for gathering data you don't have, and request help from experts who have managed similar challenges.

• Don't blame people for problems, especially in public forums.

PART 4: MAKING CHANGE STICK

As a change leader, your role is to ensure that plans are in place so that the change lasts. If this doesn't happen, it's likely that old ways of working will seep back into the business, you will lose some of the benefits of the change, and the project will not be deemed a complete success.

The Plan

How Do I Prevent the Return of Old Ways of Working?

Old behaviors can progressively reemerge across the business, creating an inefficient and constantly mutating hybrid organization operating on inconsistent procedures. Some leaders ignore evidence of the reemergence of old practices, hoping they will just go away. If not addressed, just the opposite happens, and people will do more and more things the way they used to. You need to reward new behaviors (and challenge old ones) by building them into ongoing organizational processes, including human resources processes such as performance reviews and colleague rewards.

What Works:

• Build the leadership team's awareness of the dangers of old behaviors reemerging, and ask for their commitment to support the new ways.

• Remove access to old ways of working.

How Do I Hand Over Responsibilities to the Business?

The project team needs to transfer its responsibilities to the business operating teams once the new procedures are running smoothly. At this time, the operating teams take over, providing ongoing support activities and controlling future enhancements. A thorough handover process is necessary for a smooth transition between the two teams, and sufficient time for them to discuss project background, new roles and ongoing needs is necessary.

What Works:

• Appoint people responsible for new processes and systems at the beginning of the project, and invite them to checkpoint meetings to build their awareness of project details.

• Create a project handover plan to ensure that the colleagues with new responsibilities are properly briefed, and include in it a checklist itemizing the steps for completing a thorough transition. Track the plan's completion.

A project team's effectiveness in transferring responsibilities to operating teams often dictates the level of long-term adoption of new ways of working. A thorough handover process ensures that new owners of post-launch responsibilities have the knowledge, tools and confidence to complete their mandate.

How Do I Record Lessons Learned?

The project manager needs to drive the process of recording and sharing knowledge so that future projects can benefit from it. Understanding lessons learned helps build change capacity and skill and dramatically improves organizational knowledge on how projects work within a certain culture.

What Works:

• Create a simple "what worked" and "what could have been done better" chart to document lessons learned in a format easy to present to stakeholders.

• Interview all stakeholders and project team members, asking them the following questions: What was difficult to accomplish? What would you do differently? Were there any surprises during the project? How could they have been avoided?

The capturing and reviewing of lessons learned needs to be valued by project and leadership teams.

Resources

How Do I Plan for Post-Launch Support?

Experts are often created during a big change project, and finding ways to use these capabilities after the project closes will greatly increase the probability that new ways of working will stick. Also, doing so rewards colleagues who have helped build the business.

What Works:

• Set a concrete end date for the project. At this time, the project team will officially disband and ongoing accountabilities will shift to colleagues in the business.

• Request that project team members take on post-launch duties. They are the most knowledgeable and emotionally attached to the new ways of working.

• Assign people responsibility for each new process. This will ensure accountability for ongoing maintenance, upgrades and education — all necessary, especially in regard to new software packages.

How Do I Reward the Team?

Leaders and colleagues tend to remember two parts of a project most vividly: the beginning and the end. The middle is a gray area that is usually forgotten unless something major went wrong. People have a need to be recognized for their commitment and engagement, and by doing so, you not only acknowledge their hard work but encourage similar efforts in the future.

What Works:

• Hold a final dinner meeting for the project team to acknowledge the hard work of the team.

• Help team members transition back to operating roles. You need to make this a priority because it is the right thing to do and because people will not want to leave their operational roles in the future if colleagues have been penalized for doing so. ●

Getting Results

How Do I Keep the Change Alive?

An effective way of keeping the change alive is to determine what needs fixing or enhancing so that the change works for colleagues and the project realizes its intended benefits (or even uncovers new benefits) and full potential. Each modification should make colleagues' lives easier and improve effectiveness, so the more you can identify, the better the change will be.

What Works:

• Schedule face-to-face meetings to assess how the new ways of working are being adopted and which elements need modification.

• Set up ongoing user groups to manage challenges, record wins, and recommend upgrades.

People who are using the new ways of working are your main source of improvement ideas. They know their jobs and what needs to happen to be effective and efficient. You must provide them with opportunities to share what works and what doesn't, and listen carefully to their recommendations. Many of them will be practical and cost effective. Encouraging feedback and quickly acting on suggestions will motivate people to stick with new procedures.

How Do I Show That the Project Was a Success?

When presenting results, it is best to start with the measurements agreed to at the outset. Facts and data outlined before and after results are the best evidence of goal achievement. Then you can share additional evidence that speaks to the quality and effectiveness of your teams' work. Verbal testimonials from leaders and colleagues also are effective, but without fact-based documentation, you run the risk that these general perceptions may change over time, which can change how the project is viewed.

What Works:

• Hold a final leadership team project review meeting to demonstrate the project's achievements based on preset measurements. The most effective reviews are short and tight, conveying momentum and professionalism.

• Create an end-of-project review document that provides an overview of the project — its objectives, accomplishments and lessons learned — and schedule short meetings with all stakeholders not present at the leadership meeting to review project results.

• Ensure that high-level results are communicated to the business. This provides an opportunity for colleagues to celebrate success and reaffirms that change projects are necessary to achieve higher performance.

• Submit your project to an industry awards program. This will provide exposure for your organization and externally validate your team's accomplishments.

Facts and data are critical to showing that your project is a success, but the story behind the success will be remembered long after the numbers are forgotten. Make sure your project's success is broadcast across the organization: It is good for morale and provides another opportunity for your team (and you) to be recognized. After all the hours, days, weeks and months of hard work, it is time to celebrate. ●

Management: Strategies

Chaotics

The Business of Managing and Marketing in the Age of Turbulence

by Philip Kotler and John A. Caslione

THE SUMMARY IN BRIEF

In *Chaotics*, noted business strategists Philip Kotler and John Caslione present the intriguing, if unsettling, argument that the troubled times that challenge businesses today are not an aberration, but the new face of normal. In fact, the economic downturn is part of the Age of Turbulence, where both risk and opportunity are quickly felt around the world, now inexorably linked by globalism and technology. It's a world that chews up the unprepared, but rewards the prepared — those robust companies that have the ability to quickly anticipate and effectively respond to potential threats.

Chaotics provides deep insights and practical strategies for not only surviving the current economic downturn, but also thriving amid the many slumps and spurts of prosperity that lie ahead. At the heart of the book is an innovative Chaotics Management System for minimizing vulnerability and exploiting opportunities. The system helps you completely rethink how you manage and market during recession and other turbulent conditions.

Chaotics is a timely, practical, indispensable guide for business leaders striving to survive today's economic storms and to prosper through the inevitable turbulence of tomorrow.

IN THIS SUMMARY, YOU WILL LEARN:

- How to develop early warning systems for identifying the first signs of upheaval.
- How to construct detailed worst-case, best-case and most-expected-case scenarios.
- The strategic behaviors necessary to weather the storm in each specific operational area of your business.
- How to secure your market share from core customer segments — without decimating customer research and marketing budgets.
- How to compress strategic planning into shorter time cycles.

THE COMPLETE SUMMARY: **CHAOTICS**

by Philip Kotler and John A. Caslione

The authors: Philip Kotler is one of the world's foremost experts on the strategic practice of marketing, and was voted the first Leader in Marketing Thought by the American Marketing Association. He is the S. C. Johnson Distinguished Professor of International Marketing at the Kellogg School of Management at Northwestern University and the author of several influential books.

John A. Caslione is one of the world's most accomplished business strategists, serving as advisor to numerous large and middle market companies, and having executed global business development strategies in 88 countries on six continents. He is the founder, president and CEO of GCS Business Capital LLC, a global mergers and acquisitions advisory firm.

The World Has Entered a New Economic Stage: From Normality to Turbulence

Your instincts — or maybe your paranoia — will tell you to remain ever vigilant because you don't know when a strong and sudden wind will hurl your company or your whole industry into unwanted chaos. Sometimes the turbulence is minor. Other times it is more dramatic, such as when the great global financial meltdown of 2008 had nearly everyone gasping for breath as the markets experienced unpredictable and uncontrollable free fall from one day to the next.

Today's economy, with its heightened turbulence, is markedly different. Today, and for the foreseeable future, the *new normality economy* is more than just normal times of up and down business cycles. We can expect more big shocks and painful disruptions, causing heightened levels of overall risk and uncertainty for businesses at both the macroeconomic and microeconomic levels.

Factors That Can Cause Chaos

- **Technological Advances and the Information Revolution**

  Information technology (IT) is one of the key driving factors in the process of globalization. The information revolution is probably the single greatest contributor shaping the new global economy.

  The Internet has transformed and globalized commerce, creating entirely new ways for buyers and sellers to conduct transactions, for businesses to manage the flow of production inputs and to market their products, and for job recruiters and job seekers to connect with each other.

  The impact of Web-based services will be felt on a macroeconomic level, as cloud computing makes small firms more competitive with larger ones. And it will help developing economies compete with developed economies. These two factors alone will contribute greatly to increased market turbulence for companies of all sizes.

- **Disruptive Technologies and Innovations**

  The concept of disruptive technology continues a long tradition of the identification of radical technical change. The entire basis of disruptive innovation is that it creates dramatic change in the market, causing the status quo technology to be quickly rendered obsolete. Disruptive technology has the potential to be the ultimate "game-changer" that can create chaos in an entire industry.

- **The "Rise of the Rest"**

  A new chapter in global economic history has begun, one in which the United States, and to a lesser extent Europe, will no longer play their former dominant roles. What *Newsweek's* Fareed Zakaria calls the "rise of the rest" attests to the turbulence and chaos caused by one of the most compelling new forces — the world's rising emerging market powers, most notably the BRIC countries (Brazil, Russia, India, China)

and countries in the cash-rich Middle East.

These rising, globally aspiring upstarts from distant lands will do all that it takes to create as much chaos as necessary to trip up or buy up incumbents from the developed world to level the competitive laying field.

- **Hypercompetition**

  Hypercompetition occurs when technologies or offerings are so new that standards and rules are in flux, resulting in competitive advantages that cannot be sustained. Speed of the disruptive turbulence created by hypercompetition is driven by globalization, more appealing substitute products, more fragmented customer tastes, deregulation and the invention of new business models — all contributing to structural disequilibrium, falling barriers to market entry and the dethronement of industry leaders.

- **Sovereign Wealth Funds**

  A sovereign wealth fund (SWF) is a state-owned investment fund made up of financial assets like stocks, bonds, property, precious metals or other financial instruments. During the global financial crisis of 2008, several U.S. and European financial institutions avoided bankruptcy by accepting SWFs from the Chinese government and various Arab kingdoms.

  Ultimately, through corporate acquisitions and the investments of SWFs in the U.S., Europe and other Western economies, the role of the state (often an undemocratic one) in the global economy is rapidly expanding, and with it comes the inevitable "push back" from Western governments and businesses, creating new sources of turbulence and chaos with which businesses will need to contend.

- **The Environment**

  All companies face increased pressure to conserve scarce natural resources and reduce pollution to ward off global warming so that life on the planet is not irreparably damaged. These requirements add to the cost of doing business overall, irrespective of any investment returns. The "green movement" is growing; it is gaining clout.

  Ultimately, the value of companies is likely to change as environmental factors begin to affect their performance. To preempt any disruption or chaos promoted by environmental issue turbulence, the best companies will ultimately bring all stakeholders — both public and private — together to help shape the company's Business Enterprise Sustainability (BES) strategy so that environmentally effective "green" solutions also provide attractive returns on "green" investments.

- **Customer and Stakeholder Empowerment**

  Customers and other stakeholders are no longer passive agents in the marketing process. They can learn as much about a company, product or service as they choose. Beyond that, customers and all stakeholders can use what they have learned and tell others in their network by blogging, podcasting, e-mailing or chatting.

  Today, businesses in all markets must be able to manage and market in environments exposed to some level of turbulence. What's needed now is *a new strategic framework for operating in the face of intermittent and unpredictable turbulence.*

Management's Wrong Responses to Turbulence Now Become Dangerous

Turbulence in the business world leads to all the wrong responses from management. Many businesses and their executives subscribe to one of two conventional approaches to turbulence and the resulting chaos: They take few (if any) precautions, acting as if the storm will blow over, or else they run for cover, either slashing costs or, desperately, caught in "magical thinking," investing in new and often unrelated businesses to hedge their bets.

Here are some of the most common mistakes that business leaders make when turbulence hits:

Resource Allocation Decisions

During times of turbulence, the decisions a leader makes will be far-reaching. Never lose sight of your company's core values. Undermining the culture and reallocating resources can have long-term damaging effects. Not only can it weaken the fundamentals of the company, but it may tarnish its brand.

The harsh reality is that companies will need to cut costs somewhere when the economy is down, and there are times when a company's very survival demands dramatic cuts that absolutely must be made to save the company.

But it's essential that cost-saving measures do not impair the company's uniqueness quotient, fall short of customer needs and expectations, or place the culture and values in peril.

Cuts Versus Focused and Measured Actions

Turbulence, and the resulting chaos it brings, places every company in a different situation — some with

greater risk than others — when it comes to finances and overall liquidity. There is no one-size-fits-all strategy. This is why it is essential to avoid across-the-board cuts and instead look for measured and focused cuts.

When looking at measured and focused cuts, companies need to keep in mind how any cuts they make affect the different aspects of the business so that their value propositions are not compromised.

Quick Fixes Putting Stakeholders at Risk

Key strategic mistakes may become expensive when companies look for quick fixes to preserve cash flow. Being profitable is the endgame; every decision has to be weighed against its effects on cash flow. But when quick fixes are made to deal with the here and now, management risks jeopardizing the company's future growth.

Cutting staff, unnecessarily selling off assets, decreasing M&A activities and slashing investment in R&D can set a company up for a hard landing. As recovery comes, the scarce resource for most companies will be talent, not capital.

Reducing Marketing Expenses

When it comes time to make cuts, marketing always seems to get the first swipe and new product development the second. This is always a mistake because it destroys market share and innovation.

Failing to invest in product development is guaranteed to hinder future value creation for the company and its stakeholders. When companies neglect or reduce the importance of product development in an effort to save money, it not only limits potential growth, but curbs innovation and gives competitors who've taken the risk the upper hand.

Declining Sales and Price Discounting

Price discounting is always a risk, but when done incorrectly it can have ominous and paralyzing effects on a business. Discounting takes a toll on profits. Instead of cutting cash out of the deal, ask yourself if there is a way you can add value to your product or service. This "value added" proposition means you can "give away" something that won't come out of your profits.

When turbulence is so highly volatile, management that isn't constantly re-evaluating the cost and profitability of its transactional customers will find that it will lose money and, eventually, market share.

Studies have shown that unprofitable and highly transactional customer relationships should be reassessed during a recession. Moreover, just because the economy may be slow, management cannot neglect the threat of new entrants to its industry of the possibility of product substitutes luring away customers.

Additionally, training just doesn't simply affect the bottom line. It gives businesses an opportunity to identify weaknesses or areas where a company needs to improve before the chinks in the armor become apparent to competitors and threaten growth. Conversely, training and development allow a company to keep employees on the cutting edge.

Management that doesn't realize the value of its suppliers and distributors could actually be costing the company money. Suppliers and distributors can help lower near-term costs and give a company sturdy footing when turbulence hits. Chaos seeks to undermine this relationship.

The Three Biggest Marketing Mistakes

During times of turbulence, the most important thing is to stay alert and focused. Avoid committing the three biggest marketing mistakes that companies often make:

1. *Stretching to attract new customers before you've secured the core.* Trying to broaden your core product or service appeal to please a wider audience is risky.
2. *Cutting marketing.* Cutting your marketing spending is guaranteed to give your competitors — who don't cut budgets — the edge they need to take away your most valued customers.
3. *Neglecting the 900-pound gorilla.* During down markets, especially when turbulence and chaos reign, your customers and all of your company's stakeholders know that business isn't great. Ignoring this fact and, worse, not keeping them updated is dangerous.

The Chaotics Model: Managing Vulnerability and Opportunity

Going forward, the new age — The Age of Turbulence — will be characterized by times of a newly defined "normality" punctuated by spurts of prosperity and of downturn. Turbulence can arise at any time, in any form and anywhere — creating varying degrees of disruption and chaos for businesses.

Turbulence may alternatively open up opportunities for your business that can be exploited with your present business model or with a revised model. Chaotic situa-

tions will occur time and again, creating opportunities and/or crises. Organizations will have to learn how to seize opportunities that arise during periods of immense uncertainty.

Strategic inflection points occur in all businesses as a direct result of specific forces affecting particular businesses. Often they render your business strategy obsolete and demand a new game-changing strategy.

Once a strategic inflection point is reached, business leaders are forced to deal with their companies' previously unexposed vulnerabilities or their newly revealed opportunities — and do so with deliberate and sometimes bold action that oftentimes requires developing a new mindset, which is needed to push past now-obsolete strategies and business models. Here's just a short list of new behaviors that should be considered:

1. Business leaders and top executives must begin to see change first-hand. As the rate of change increases, so must the personal commitment by senior executives to understand it.

2. Executive management must eliminate filters. Business leaders must make sure their views are not censored and their access to unpleasant truths not blocked by anyone in their organizations who may be motivated to protect them.

3. Business leaders must accept the inevitability of strategy decay. While it is easy to admit that nothing lasts forever, it is more difficult for top executives to admit that one of their strategies is beginning to lose steam.

Beyond developing a new mindset, business executives must drop their reliance on a two-playbook strategy — one for up-markets and the other for down-markets — and continuously fine-tune their strategies or even discard them when the environment demands it.

What follows is a framework for such a new system: the *Chaotics Management System*.

Chaotics management is a systematic approach to detecting, analyzing and responding to turbulence and its chaos.

Constructing an Early-Warning System (EWS)

Business executives and their organizations must prepare steps to move their business strategies forward and execute them during turbulent times. The first step is to develop an EWS that will detect as much turbulence as possible, as quickly as possible and as far in advance as possible.

The key areas to be watched are customers and channels' competitors and complementors; emerging technologies and scientific developments (disruptive innovations and technologies); political, legal, social and economic forces; and influencers and shapers.

Business leaders should begin by answering eight key questions, and then create ongoing discussions around these questions at the opening round of meetings to kick off any EWS development:

1. What have been our past blind spots? What is happening in these past blind spots now?
2. Is there an instructive analogy from another industry?
3. What important signals are we rationalizing away?
4. Who in our industry is skilled at picking up weak signals and acting on them ahead of everyone else?
5. What are our mavericks and outliers trying to tell us?
6. What future surprises could really hurt (or help) us?
7. What emerging technologies could change the game?
8. Is there an unthinkable scenario?

Construction of Key Scenarios

A core strategic discipline of the chaotics management system is that the leaders of a business must draw together the views of top executives from all departments, as well as other subject matter experts and company stakeholders (internal and external), to begin to construct highly probable key scenarios that the company could confront.

At the very least, there should be a worst-case scenario, a most-expected-case scenario and a best-case scenario. And in times of increased turbulence, business leaders need to push their groups to investigate and analyze more possible situations, including the most feared scenarios.

Effective scenario construction requires identifying the turbulence drivers in the environment that could create chaos.

Here is one effective and efficient approach to scenario construction:

1. Decide on the key question to be answered by the scenario analysis.
2. Set the scope and time of the analysis.
3. Identify major stakeholders.
4. Map basic trends and turbulence, and the consequent chaotic forces.
5. Find key uncertainties resulting in chaos.
6. Define the key scenarios.

7. Assess the key scenarios.
8. Converge toward decisions scenarios.

Scenario and Strategy Selection

Following the construction of key scenarios, business leaders need to meet and select the most probable ones. For each scenario, they should work out the most appropriate strategy response. They will want to adopt a strategy that satisfies the amount of risk and opportunity they are willing accept.

There is too much uncertainty to know which scenario will occur. But the exercise of searching for a strategy that would do fairly well against whatever happens is worthwhile. ●

Designing Management Systems for Resilience

Whether business leaders believe the new environment presents more opportunities or threats, increasing turbulence is now a fact of business life. The most effective way of dealing with the new reality is with a pragmatic, highly disciplined approach — an approach of well-defined systems designed around a robust, resilient and responsive management framework upon which each key business operation should be based. In this way, business leaders mitigate the chances of being taken by surprise during times of crises.

Business leaders need to recognize that the environment is now changing in ways that are becoming increasingly difficult to predict. Business leaders need to confront the inevitability of economic turbulence and chaos head-on and to do so boldly by developing new strategic behaviors — chaotics behaviors — for each of the key functional departments.

The goal is for business leaders to create organizations that are responsive, robust and resilient — in short, organizations that have the ability to live and thrive. These are organizations that aspire to and attain Business Enterprise Sustainability (BES).

Here is the chaotics strategic behaviors execution plan:

1. Reconfirm the current business model and strategy.
2. Assess the organization's ability to execute strategy under chaos.
3. Define the strategic behaviors execution processes.
4. Execute the chaotics strategic behaviors.
5. Reassess and revise.

By boldly implementing the prophylactic protections of chaotics strategic behaviors, department by department, business executives will move forward to secure their companies' futures against the increasingly unpredictable environment that lies ahead. Moreover, implementing such strategic behaviors will begin the long and steady process of creating newly evolved cultures. Finally, such organizations will possess the collective knowledge and skills to create cultures that have the necessary underpinnings deeply embedded in them to attain long-term BES well into the future. ●

The Chaotics Management System

The Chaotics implementation cycle is as follows:

1. Identify sources of turbulence and chaos.
2. Identify management's wrong responses to turbulence.
3. Establish early warning systems.
4. Construct key scenarios and strategies.
5. Prioritize key scenarios and select strategy.
6. Implement chaotics strategic management behaviors.
7. Implement chaotics strategic marketing behaviors.
8. Achieve business enterprise sustainability.

Designing Marketing Systems for Resilience

Great marketers don't just rebound from crises. They build the internal capacity to expect the unexpected. They continuously reinvent business models and marketing strategies during chaotic times so that they can adapt quickly as circumstances in the marketplace change.

The company needs to revisit and revise its marketing policies and tools. The first task is to recognize the major changes that have been taking place in the marketing landscape:

1. Customers are better informed than ever. They are empowered. They can find out almost anything about any product, service or company by searching on the Internet and contacting others in their social networks.
2. Customers are increasingly ready to buy and trust well-known store brands when they are priced lower than well-advertised national brands.
3. Competitors are able to copy any new product or service faster, thus shortening the innovator's return

on investment (ROI). Competitive advantages have a much shorter life today.

4. The Internet and social networks have created radically new media and information sources, as well as new means for direct-to-customer selling.

These changes call for radically new thinking by managers and marketers. Marketers need to develop a new mindset of always being on hot standby to activate automatic response marketing programs when the turbulence whips up and chaos reigns. Marketers need to keep in mind the following eight factors as they create their chaotics marketing strategies:

1. **Secure your market share from core customer segments.** This is no time to get too greedy, so be sure your first priority is to get your core customer segments firmly secured.
2. **Push aggressively for greater market share from competitors matching up to your core customer segments.** Slashing marketing budgets and sales travel expenses is a sure sign that a competitor is buckling under pressure. Push aggressively to add your core customer segments at the expense of your weakened competitors.
3. **Research customers more now because their needs and wants are in flux.** You don't want to find yourself relying on old "tried-and-true" marketing messages that no longer resonate.
4. **Seek to increase — or at least maintain — your marketing budget.** You need to add to this budget, or take money away from those forays you were planning to go after totally new customer segments.
5. **Focus on all that's safe and emphasize core values.** Do everything possible to communicate that continuing to do business with you is safe. Sell customers products and services that continue to make them feel safe — and spend whatever it takes to do it.
6. **Quickly drop programs that aren't working for you.** If you are not watching your spending, rest assured that someone else is, including all your peers whose budgets couldn't be protected from the ax.
7. **Don't discount your best brands.** If you want to appeal to more frugal customer needs and wants, then create a new, separate and distinct product or service offering under a new brand with lower prices.
8. **Save the strong; lose the weak**. There's no time or money to be wasted on marginal brands or overly fragile products that are not supported by strong value propositions and a solid customer base. Tie in the need to appeal to safety and value to reinforce already strong brands and strong service or product offerings. Remember, your brands can never be strong enough, especially against the strong waves of a turbulent economy.

From a strategic point of view, companies must remain focused on satisfying their target customers, paying particular attention to their best customers. In many businesses, a small percentage of customers account for a disproportionate percentage of sales. ●

Thriving in the Age of Turbulence: Achieving Business Enterprise Sustainability

We need to merge new insights with pragmatic steps that business executives can take. Here are three specific actions:

1. Make strategic planning more dynamic, interactive and compressed into shorter time cycles — sequenced in three-month intervals, rather than reviewed and adjusted once a year. In these shorter cycles, responsibilities, authorities, accountabilities and performance measurements may be realigned as needed.
2. Facilitate cross-functional decision making at key levels to drive better, faster decisions. Key decision makers must be in closer proximity and connected with more frequent and faster interactive communication channels. More stakeholder representatives should be included in the discussion and decision-making process.
3. Break large organizations down into smaller, flatter groups and subgroups to facilitate and achieve faster reaction times. Responsibilities, authorities and accountabilities should be driven down to the lowest possible level. Hard and soft skills must be raised significantly to improve the quality of decisions. The smaller groups must be able to reach other relevant groups on a global basis.

Business Enterprise Sustainability (BES)

BES is essentially focused on *all* issues integral to extending the life of the business enterprise for as long as possible. Business enterprise sustainability aims for a comprehensive strategy to maximize the underlying value of companies in the extended long term, while

optimizing company performance and value in the short and medium term — but never to compromise long-term value.

Growth is certainly important to the sustainability of any business, but longer-term sustainability should override any short-term or even medium-term ambitions — especially in turbulent and unpredictable environments where chaos, if not managed well, could cause irreparable harm and even sink a business permanently.

Here are some of the characteristics of those companies that have achieved BES in the long term:

Dual Vision

Companies need to operate with one eye focused on the short term and the other eye focused on the long term. We call this managing with "dual vision." The need is to balance both visions in normal as well as in turbulent periods.

A focus on *today* shapes the business to meet the needs of today's customers — and it does so with excellence and authenticity. A focus on *tomorrow* projects a reshaping of the business to compete more effectively in the future. Often, this demands bold moves away from the present to reorganize and reshape for future challenges.

Triple Planning

Companies need to work at three planning levels: short term, intermediate term (three to five years) and long term. Short term is about *managing the present*. It should include projects related to improving the core business.

Mid-term is about *selectively forgetting the past*. These projects are not about performance improvement as much as filling the opportunity gap. The company needs to exploit nonlinear, discontinuous changes, such as the Internet, new media, customer empowerment and the rise of emerging companies, such as China and India. Long term is *entirely new space*. Projects of this kind are characterized by a high ratio of assumptions to knowledge. But, by working slowly on these concepts and learning more, the ratio of assumptions to knowledge will fall over time.

Company Reputation

What goes into a company's reputation? What factors must a company manage to be viewed favorably by its stakeholders in good times as well as in turbulent times?

The most important factor in a company's reputation is the customers' and stakeholders' perception of the company's *Products and Services*. The second most important factor is *Vision and Leadership*. The third factor in order of importance is the *Workplace Environment*. The fourth most important factor is the company's *Financial Performance*. The fifth factor is *Emotional Appeal*. The sixth factor is the company's *Social Responsibility*. The seventh factor is *Innovation*.

Reputations are built over time. Reputations can easily be damaged and in much less time than it took to build them. A company that wants to live for a long time must manage these factors — and manage them carefully and diligently — in good times and, especially, in bad times.

Customer Enthusiasm and Advocacy

It is easier to sell more to the same customers than to have to search for new customers. Loyal "customer advocates" or "customer evangelists" can be very important in the success of a company. In marketing terms, we say that the company must do better than just satisfying the customers: It needs to *delight* the customers. Some companies succeed in doing this — and doing it well — year after year.

Ethical and Authentic Behavior

Over time, companies acquire different reputations for ethical and authentic behavior. A company's internal and external behavior leaves a legacy that affects the stakeholders' future mindsets and behavior toward the company. Oftentimes this reveals the absence of the company's authenticity, a quality that is becoming increasingly important to consumers.

Because of the shift to the "experience economy," products and services are no longer enough for companies to create and sell; today's consumers and businesses want *experiences* — memorable events that personally engage them.

Business today, especially as everyone and every company is being racked by turbulence, is increasingly becoming all about being real, original, genuine, sincere and authentic. ●

Management: Team

Divide or Conquer

Bonus Summary

How Great Teams Turn Conflict Into Strength

by Diana McLain Smith

THE SUMMARY IN BRIEF

Conflict is inevitable. But whether it makes or breaks your team depends only on the strength of the relationships within it.

Ever been on a team where people can't get along to save their lives? These relationships are corrosive not just to the people involved but to the entire group — and their results.

This summary offers a new way to think about teams: not as a bunch of individuals, but as the sum of their relationships. Great teams don't assume everyone will get along. They *anticipate* conflict, and use it to strengthen their relationships. In contrast, dysfunctional teams avoid or work around conflicts, which only ends up harming their relationships and their ability to get things done.

Every team is only as strong as its weakest relationship. When teams neglect key relationships, they do so at their own peril.

Relationships are not a matter of personal chemistry too mysterious to decode or too difficult to change. This summary shows that it's possible both to understand how relationships work and to change their course — before it's too late.

IN THIS SUMMARY, YOU WILL LEARN:

- How to use a powerful, step-by-step approach to building a team that's flexible and strong enough to master its toughest challenges.
- How to use practical and profound ideas and tools that have been tested and honed in the real world for years.
- How to inspire your team or a new employee who needs to start building relationships.
- What it takes to succeed together.

Introduction

Every team is only as strong as its weakest relationships. How well and how quickly teams make decisions, inspire innovation, tackle performance problems or learn from mistakes depends on the strength of relationships within a team. Some relationships give teams the courage to face tough truths and make bold changes.

A team's performance, even a firm's, turns on the quality of its most important relationships.

Relationships

A relationship is the way in which two or more people or organizations regard and behave toward each other.

Relationships are such an integral part of everyday life they're like the air we breathe. Until something unpleasant or unexpected happens, we give them little notice; even then, we're often at a loss as to what to do. We can spot difficulties easily enough and feel their effects even more easily, but few among us can pinpoint their cause and still fewer know what to do about it. Like a firm's culture, relationships are part of the informal side of organizational life — the soft stuff that's hard to see, grasp or change.

Research shows two things: first, that relationships have an informal structure that can be mapped and changed, and second, that relationships may be the single most underutilized lever for transforming the performance of teams and organizations.

Organizational Fault Lines

This is especially true for relationships that operate along *organizational fault lines* — interfaces where coordination is as essential as it is difficult: research and marketing at Merck; manufacturing and design at Herman Miller; the president and the faculty at Harvard; business units competing in the marketplace; executive and legislative branches at the federal and state levels; and top management and middle management everywhere.

At each interface, interests collide and conflicts erupt. Whether people can put these conflicts to work — so they create value rather than destroy it — depends on the nature and the quality of their relationships.

Ideas and Tools

Given the right tools, it's possible to build relationships flexible and strong enough to sustain stellar performance in teams — both over time and under pressure. This summary helps by giving you ideas and tools for *understanding relationships, transforming relationships* and *making change practical*.

Because two-person relationships are the DNA that shapes how a team operates and evolves, the summary's three parts focus on these basic building blocks. The first part explores how relationships work and develop; the second, how you can change them over time; and the third, how to make that change practical.

PART I: UNDERSTANDING RELATIONSHIPS

The Life and Death of a Relationship

More than 20 years have passed since Steve Jobs and John Sculley's much publicized breakup at Apple. Yet it still serves as a cautionary tale. In two short years, their celebrated camaraderie turned into an antagonism so great it escalated hostilities between divisions, put the firm at risk of a takeover and sent Steve Jobs into a 12-year exile, from which the firm has only recently recovered. How these leaders went from soul mates to adversaries in such a short time shows how relationships, even those touted as a perfect match, can self-destruct under pressure, leaving a firm to pay the formidable price of a failed relationship.

When the Jobs and Sculley relationship fell apart, most people chalked it up to personalities: Jobs was too volatile, Sculley too cautious. Others cited circumstances: Mounting competitive pressures put otherwise kindred spirits at odds. Still others said their chemistry wasn't right: Sculley was way too corporate, Jobs too iconoclastic. While each explanation holds merit, all overlook the most intriguing and instructive aspect of what happened: the way their relationship developed over time.

Only by understanding how relationships form, develop and die can you see *why* people form ill-fated matches, *why* certain personalities clash, and *why* some relationships break down so quickly and completely under pressure. And only by understanding how relationships form, develop and die do you stand a chance of altering the course a relationship takes. By looking closely at how the Jobs-Sculley relationship developed over the course of three stages, we can extract timeless lessons about the life and death of a relationship — and its impact on the firm.

Stage 1: How a Relationship Forms

We all bring to relationships our own characteristic ways of interacting with others, given our *behavioral repertoires*. Built out of experiences, these repertoires are organized around key themes, such as power, conflict, control or success.

When people first meet, their themes intersect to give rise to distinctive patterns of interaction. Acting like DNA, these themes shape the way a relationship's patterns of interaction evolve over time, defining the formal and informal sides of a relationship. One strand of DNA defining the relationship between Sculley and Jobs was a shared preoccupation with power, leading each of them to see in the other a form of power he coveted.

Stage 2: How a Relationship Develops

In the second stage of development, people renegotiate their formal and informal roles, as initial impressions give way to more stable interpretations and people come to know each other for "who they really are."

These more stable interpretations — called *frames* — inform people's negotiations about who should do what and turn early patterns of interaction into more stable informal structures.

Those who pay attention to how the informal side of a relationship develops during this stage understand that what they see is what they'll get, giving them room to maneuver if they don't like what they get. Those who ignore the informal side, as Sculley and Jobs did, believe that what they see is the only way it is, leaving them disillusioned and trapped.

Stage 3: How a Relationship Dies

By the time the Jobs-Sculley relationship broke down, their degrees of freedom were so constrained that they could only imagine one solution: Get rid of the other.

When people ignore the informal side of their relationships, they're more apt to create ones that leave them little choice. By the second stage of their relationship, Jobs and Sculley had created a structure that significantly reduced their degree of freedom; by the third stage, that structure had eliminated their freedom altogether.

Formal and Informal Relationships

All relationships develop at formal and informal levels. At a formal level people define and redefine their formal roles, including responsibilities, decision rights and rewards. At an informal level, people define and redefine their informal roles: the emotional responsibilities they'll assume and assign, the interpersonal rights they'll claim and relinquish, and the psychological rewards they'll want to give and get.

All relationships develop over a series of stages, as people adapt to each other and the circumstances around them. Some adaptations are better than others. Jobs' and Sculley's adaptations generated vicious cycles that gave rise to structures that reduced their degrees of freedom until they had none left. In two action-packed years, they moved from idolizing to demonizing each other, acting in ways that brought out the worst in both of them. By the time they discussed their troubles, their views were so entrenched they were impervious to change, making it impossible for them to create a different future. In the end, they *had* to call it quits.

It need not be this way. With the right tools, it's possible to see, map and change the informal side of a relationship so it grows stronger, not weaker, over time. ●

The Anatomy of a Relationship

Once a relationship gets into trouble, it can be awfully hard to get out. We're so riveted on the other person — on divining his motives or on avoiding his impact — that we don't take a close look at what we ourselves are doing to create a relationship neither of us wants. Unaware, we wait for others to make life easier for us, while we make it harder for them to make it easier for us. In the end, like Sculley and Jobs, we're left with little choice: Either end the relationship or settle for one that doesn't work.

To change the course of a relationship, people need to slow down and look at what they're actually feeling, thinking and doing with each other, so they can see that

they're not nearly as helpless as they think they are.

An Informal Structure

Underlying all relationships is an informal structure. This structure includes four interlocking elements: actions, frames, contexts and repertoires.

If our interlocking frames and actions are the engine that drives a relationship, our social contexts — along with behavioral repertoires — provide the fuel that keeps that engine running. These four elements combine to give a relationship its distinctive character, one we intuitively recognize but have difficulty seeing or changing.

The Anatomy Framework

All relationships have an informal structure made up of four interlocking elements:

1. Actions and Reactions. Actions refer to what someone actually says and does, while reactions refer to what someone actually thinks and feels in response to what the other person says and does, each person's actions making the other person's reactions more explicable.

2. Frames. These are the interpretations embedded in our reactions, making some actions seem obvious, others impractical.

3. Social Contexts. These provide the contextual backdrop — formal roles, time constraints, historical events — against which some triggering event occurs, prompting the need to respond.

4. Behavioral Repertoires. These are the largely unconscious *experiential knowledge* and *interpretive strategies* that define the range of responses people have at their disposal for framing and acting in different social contexts, once triggered by some event. People's behavioral repertoires both shape and are shaped by their *social contexts*. Together the two govern the way people frame situations, leading them to react and act toward each other in some ways and not others. ●

The Key to Resilience

When people focus on relationships, *they assume responsibility not just for themselves but for the relationships they together create and for the impact those relationships have on their firm*. Far from diluting responsibility, then, a relational perspective actually takes excuses off the table. Instead, people together take responsibility for building relationships resilient enough to weather the troubles they'll face.

The best way to avoid waiting games — where each person waits for the other to calm down and see things his way — is for people to *help each other shift perspective, so they can regain their collective cool*. While shifting perspectives won't make feelings go away, it will make it easier for people to use their emotions to think things through together.

Reflect and Reframe

To shift perspective, it helps to reflect and reframe, first alone, then together. Over time these two cooling strategies build a relationship's cool system by adding maps to that system that are tightly connected to the hot buttons triggered by stressful events. Once developed, that system makes it a lot easier to handle even the hottest topics and the most tumultuous troubles.

Taking a relational perspective goes against the grain of an either/or world, in which there are good guys and bad guys, evil empires and mighty kingdoms. ●

PART II: TRANSFORMING RELATIONSHIPS

Disrupt Patterns of Interaction

When a relationship critical to a firm's success could put that success at risk, it may be time for a change. Fifteen years into their relationship, Dan Gavin and Stu Fine suspected their time had come. For two years, the firm's top leadership had been transforming their company from a professional-services firm into a group of businesses that combined these services with innovative new products.

CEO Gavin was now looking to Stu, the firm's marketing expert, to launch the firm's first product business. As one of the firm's most respected thought leaders, Stu had driven much of the firm's innovation, and he welcomed the chance to ensure that those innovations took root. At the same time, Dan and Stu both recognized that this new challenge would put a lot more pressure on their relationship. Dan knew he'd have to rely more heavily on Stu. Whether their relationship was up to these tasks, neither could say for sure.

Three Steps

To find out, they took three steps with the help of an expert:

Step 1: Assess the Relationship. When assessing a relationship, it helps to take stock of a relationship's assets and liabilities relative to the pressures that the relationship is likely to face. This way people not only anticipate what might cause them difficulty under pressure, they also identify the assets they can use to deal with any difficulties that do arise.

Step 2: Map Patterns of Interaction. This second step zeros in on interactions that shed light on the concerns Dan and Stu raised in their assessment. To take this step, use a tool called the Ladder of Reflection to do

Mapping the Pattern

Mapping is a technique that helps you understand patterns of interaction that produce outcomes that neither person in a relationship consciously wants or intends. A map portrays in graphic form *how each person's actions help to elicit reactions that produce the next step in a sequence that makes up the interaction.* This helps people see how their actions and reactions interlock to form an identifiable pattern, allowing them to step outside the pattern, see how it works and imagine how it might work differently.

three things: Capture key interactions, describe them in concrete terms and map the patterns underlying them.

Step 3: Design Action Experiments. To change patterns, you have to throw a monkey wrench into the works by thinking — and then acting — outside the pattern. It's best not to take this step until you've mapped the pattern that concerns you. Go back and look at the interlocking actions and reactions depicted in the map, and ask the question: *What actions can I take to make it hard for the other person to react the way he or she does?* Usually this question will require you to invent actions that are "counterintuitive" — actions that lie outside of your intuitive way of seeing and doing things. The perspective of a skilled third party often helps.

As straightforward as these steps may seem, people face a funny kind of paradox before taking even the first one: *They know each other so well, they no longer know each other at all.* All they see are the caricatures in their heads — he's so sensitive, she's so competitive. The very efficiency these caricatures give, they also take away, because they make a person's underlying complexity — sure to emerge under stress — harder to understand or to handle. That's why, early on, the single most important thing people can do is *slow down and take a closer look at each other and at how their relationship works.* This helps people figure out where their relationship is up to the challenges it will face, and where it's not.

Reframe How You See Each Other

All too often and much to our dismay, frustrating patterns of interaction persist despite our efforts to change them. The reason is simple: We give short shrift to the interpretations that keep them going. Left to their own devices, these interpretations have a nasty habit of getting stuck in one gear. No matter what someone does, we see him or her the same way. Soon, our emotional reactions get caught in a rut, and our interactions start spinning their wheels. From this point on, we're trapped.

Create a New Pattern

As long as Dan sees Stu's blocking as irrational, and Stu sees Dan's lecturing as an effort to impose his will, they'll continue to re-enact the same push-block pattern day in and day out. While new actions might disrupt the pattern briefly, the only way they can create a significantly new pattern is by transforming the way the two see each other. In this second stage, Dan and Stu do just that by taking three steps:

- **Step 1: Freeze Frame.** Bring each person's frames into the foreground. See how, under stress, their frames are pulling them back into old patterns and preventing new ones from emerging.
- **Step 2: Invent New Frames.** Help each other invent frames that will create a new pattern. The best frames are those that make it easier for both of you to be at your best. Come up with things that you can say to yourself in the heat of the moment to bring the new frame to mind.
- **Step 3: Design Frame Experiments.** *Frame experiments* are experiments designed to create experiences that alter their frames, allowing new patterns to emerge.

To complete these steps successfully, Dan and Stu will have to tackle the central paradox of this second stage: *They will have to act as if they believe to be true those interpretations they "know" to be false.* People will shift frames only if they believe it's warranted, and they will believe it's warranted only if they see evidence to that effect. It's not enough, then, simply to imagine a different way of seeing. People must try — through their actions — to *create* experiences that make a new way of seeing come true.

That's why each step in this stage is designed to build just enough confidence for Dan and Stu to *act* — not merely think — outside the box. Only by seeing things differently will they be able to create a new pattern.

Results

By the end of this stage, Dan and Stu's frame experiments have led them to reframe how they see themselves in relation to each other. Stu now sees that when Dan starts debating and lecturing, he's usually feeling helpless and anxious, prompting him to help Dan rather than freeze or block. This leads Dan to revise his view that Stu needs a lot of protection, and it opens up the possibility of getting emotional support from Stu. This relaxes Dan and makes it easier for him to talk about his anxieties directly, which makes them less mystifying and troubling for Stu.

These experiences — experiences they couldn't create within the confines of their old frames — give rise to new ways of seeing and set in motion a more virtuous cycle of interaction.

Revise What You 'Know' to Be True

Dan and Stu came by their quirks honestly: They learned them. Over the years, they converted one experience after another into knowledge about how to handle different people and situations. When they first met, they drew on this experiential knowledge to set the structural foundation of their relationship. Now it is only by restructuring that knowledge that they can reset it.

This brings us to the third and last paradox of change: *To move forward, they must go back and revisit the knowledge they bring to their relationship.* They did this by taking three steps:

Step 1: Revisit Past Events. To revisit past events and capture their experiential knowledge, identify the historical events that most remind you of the relationship. Write down what happened in those earlier moments and what you took or learned from them. Put aside what you wrote for 24 hours. Go back and read what you wrote; then extract from your account any stories, propositions, values and practical strategies you see. Explore how the knowledge you've built out of past experience is affecting your development and your relationships, including this one. If you think your past is jeopardizing your success or the success of key relationships, proceed to Step 2.

Step 2: Restructure Outdated Knowledge. Reset the basis of your relationship by restructuring the experiential knowledge you bring to it. Consider two questions: Where is your experiential knowledge breaking down, and how can you restructure it so that it better fits your current circumstances and abilities?

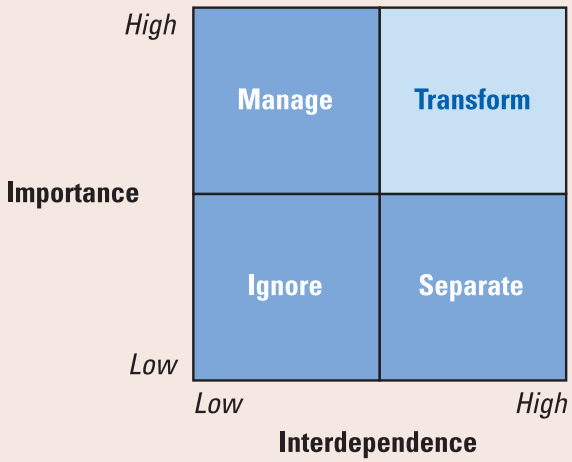
Step 3: Return to the Future. This step addresses the question of sustainability under pressure by turning our attention back to the future. Here we consolidate the gains we've made, define new objectives, anticipate new challenges and set the terms of a new relationship.

By revisiting historical events in the context of the relationship, each person is able to create new knowledge out of current events. By the end of this stage, you will be able to use this knowledge to accelerate your growth and the growth of the organization.

PART III: MAKING CHANGE PRACTICAL

Focus the Change Effort

Not all relationships within teams require or deserve the same *amount* of effort, or the same *kind*. To help you decide *which* relationships to invest in and *when*, two tools can help: an Investment Matrix that tells you where to focus your investments, and a Sequencing Matrix that tells you when to invest in which ones. Together these tools give you a way to think strategically and practically about developing greater resilience at the top of your organization.



The Investment Matrix

Just as you can reduce the costs associated with outdated formal systems by upgrading them, so can you reduce the costs of relationships by transforming the informal structures underlying them.

In each case, you replace the outdated, inefficient system with a more effective and efficient one. Only, in the case of relationships, you seek to redesign a relationship's informal structure so it's better able to handle even the most difficult of relationship tasks as well — whether it's recouping when things go wrong or reviving a relationship that's dying.

To make change practical, people need a framework that can help them focus their investments. The matrix groups relationships in terms of their relative importance and interdependence, identifying four segments, each one calling for a different approach.

Investment Matrix

Four Approaches

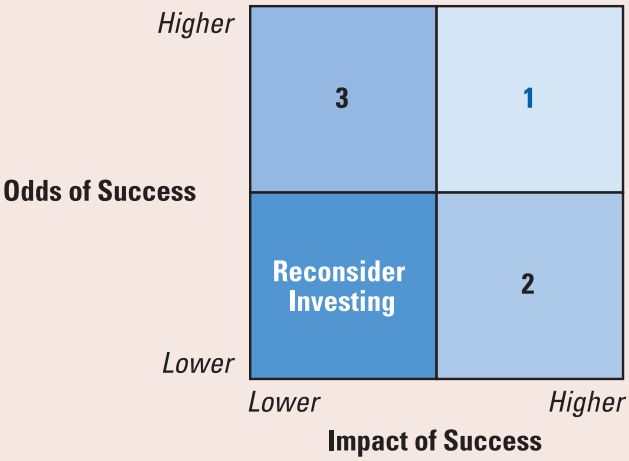
The matrix identifies four different ways of approaching relationships, depending on their degree of importance and interdependence: *ignoring, separating, managing* or *transforming*. Which approach is the most effective and the most efficient depends on the circumstances.

The basic idea behind the Investment Matrix is simple: *Invest in transforming only those relationships that are both highly important and highly interdependent.* All other relationships can be handled through more conventional approaches.

The Sequencing Matrix

Once you've identified those relationships most in need of investment, you can use the Sequencing Matrix to sequence those investments over time. As the Sequencing Matrix implies, it's best to start with the high-impact relationships that stand the best chance of succeeding.

In terms of impact, you can assess any relationship along two dimensions: *impact on people* and *impact on the business*.



In terms of success, you can assess a relationship along three dimensions: *motivation, readiness* and *difficulty*.

Change the Odds of Success

Keep in mind that odds can and should be changed. So while you're focusing on relationships in the first cell of the matrix, you might turn your attention to increasing the odds of success for those in the second cell — for example, by pointing out the changes that people in the first cell are making. Soon after, you might launch some type of programmatic intervention for people in the third cell.

In theory, no one should show up in the fourth cell. But chances are, when pressed to choose among the chosen, some will show up here. If so, you might reconsider whether these relationships really are worth the investment. ●

Sequencing Matrix

Choose the Right Strategy

The FREE model describes a set of three strategies you can use to intervene when two or more people on your team get caught in a conflict that's jeopardizing the quality of substantive discussions *and* the fate of key relationships:

- **Facilitate:** Shift patterns that slow progress without stopping to discuss them.
- **Reflect and Reframe:** See and interrupt patterns that continue to stall progress.
- **Engage:** Transform patterns that repeatedly prevent progress.

By drawing on these three strategies — facilitating, reflecting and reframing, and engaging — people can make changes in their relationships while attending to business. Each strategy varies in terms of its obtrusiveness and impact. To figure out which strategy to use, you must first stop (to gain perspective), then look (to map patterns in your head) and listen (to explore competing views). Only then can you choose wisely and, having chosen wisely, implement well. ●

Motivate Change

Everyone likes what change promises, but few relish what it demands: the time and effort it takes; the sacrifices we have to make; not knowing whether we'll succeed (or, if we succeed, whether we'll like what we get). Change is hard — so hard that many people give up before they even start. Yet as hard as change is, three common mistakes make it even harder: setting unrealistic expectations, failing to anticipate and to help each other overcome predictable barriers, and micromanaging the pace and direction of change. You can counter these mistakes by following these three principles:

- **Setting your sights using dual vision.** Be ambitious and realistic, and set goals that are practically important and personally meaningful.
- **Building resilience while taking stock.** Build confidence by continually assessing progress, and put setbacks, mistakes and failures to work.
- **Putting the fun back in the dysfunctional.** Laugh at the unlaughable and manufacture hope when there's none to be found.

When you put these principles into practice, you generate the motivation and energy needed to sustain change over time. ●

CODA: RELATIONAL SENSIBILITIES

Sensibilities for a Change

No leader operates alone. Not Jack Welch, the much celebrated former CEO of General Electric Co., as he himself points out. Not the iconic leaders of great movements, as the many friends of Dr. Martin Luther King Jr. have testified. Not even the president of the United States, as historian Doris Kearns Goodwin's account of Abraham Lincoln's wartime Cabinet reveals.

Leading Through Relationships

Every leader, no matter how powerful, leads through relationships. Those leaders who are especially adept at doing so demonstrate a set of highly developed *relational sensibilities*, among them curiosity and courage, humility and hope, appreciation and acknowledgment, nuance and novelty, generosity and generativity, and empathy combined with a sense of accountability. Within these pairs, each sensibility tempers or bolsters the other, serving leaders in much the same way aesthetic sensibilities serve the artist — by significantly enhancing the way they perceive, experience and respond to the world around them.

We can see these sensibilities at work and witness their power in a speech that comes from a very different time and context: Abraham Lincoln's second inaugural address. In this address, delivered as the American Civil War came to a close, Lincoln sought to win the peace by tending to the shattered relationship between North and South. Considered by many to be his finest speech, this seven-minute address illustrates well what Doris Kearns Goodwin observed: "In the hands of a truly great politician the qualities we generally associate with decency and morality ... can also be impressive political resources."

Setting the Stage for Peace

In four paragraphs, Lincoln sets out to recast the war and, in recasting it, set the stage for peace. Far more than rhetorical technique is at work here — far more than a masterful politician attuned to his audience's needs and preferences. Behind Lincoln's mastery is a finely honed set of sensibilities. These sensibilities informed the way he put his rhetorical skill to use and determined the political ends toward which he developed his mastery:

- **Curiosity and Courage.** With enough curiosity to ask tough questions and enough courage to face tough answers, Lincoln distinguished himself from all other politicians — in his day and in our own.
- **Hope and Humility.** These two sensibilities — hope and humility — make for mighty strange bedfellows. While one rests on an abiding belief in our ability to create a better future, the other leans on an equally abiding belief in the limitations of human actions.
- **Appreciation and Acknowledgment.** Lincoln knows that the charity he asks for in the end "might be too much to expect of those who encountered such great losses." Even so, he doesn't seek to reassure or comfort. Rather, he invites his audience to come along with him as he recounts events, explains causes and contemplates the war's deeper meaning.
- **Nuance and Novelty.** Nuance (the ability to pick up on subtleties, not just patterns) and novelty (the ability to construe things in a fundamentally new light, not simply rehash old positions) make it possible for leaders to resolve even the most intractable conflicts.
- **Generosity and Generativity.** "I don't like that man," Lincoln once said, then added, "I must get to know him better." In this comment, Lincoln exemplifies two other sensibilities that informed the way he conducted himself in relationships *and* the way he conducted the war: *generosity* (the ability to see the best in others) and *generativity* (the ability to develop and to bring out the best in others).
- **Empathy Combined With Accountability.** In Lincoln's address, empathy and accountability work hand in hand. One moment, he's empathizing with what everyone's up against or with what they're feeling, thinking and intending. The next, he's confronting everyone with the moral and practical consequences of their collective actions. Had Lincoln's empathy been untempered by accountability, he could not have looked at what both sides did to create consequences they later regretted.

Had Lincoln vilified the South or relished in the North's triumph, he still would have won the war, but he could not have set the stage for peace. The power to create a lasting peace in part resides in the softer sensibilities that Lincoln brought to his leadership. With these sensibilities, Lincoln was able to reach across the divide that separated him from his followers, so they could reach across the divide that separated them from each other. In an age when neither geography nor borders can stop the spread of violence, it may be an idea whose time has come. ●

Extreme Toyota

Radical Contradictions That Drive Success at the World's Best Manufacturer

by Emi Osono, Norihiko Shimizu and Hirotaka Takeuchi with John Kyle Dorton

THE SUMMARY IN BRIEF

To the casual observer, Toyota's ascent in the global auto industry reads like a rags-to-riches story, from its early struggles in the 1950s to its status today as one of the world's largest automakers. The company is rightly recognized as a paradigm of superior performance among the world's best-run, most successful manufacturing companies. With its rich history of putting a premium on the human energies that drive industrial production, Toyota stands out in many significant ways.

Industry observers, however, have long pondered the contradictions at the company's core. Toyota, to put it plainly, thrives on paradoxes; it harnesses opposing propositions to energize itself. It balances great advances with long periods of experimentation, resource frugality with extravagance in personnel and project decisions, operational efficiency with human resource redundancy.

In this summary, three business strategy scholars identify six contradictory forces that keep Toyota on the move, enabling the company to realize continuous innovation and constant renewal.

IN THIS SUMMARY, YOU WILL LEARN:

- How Toyota stimulates employees and pursues new opportunities by setting impossible goals.
- Why experimentation is crucial to Toyota's corporate culture.
- How Toyota remains sensitive to the needs and requirements of the countries and regions in which it does business, while maintaining its global position and reach.
- The ways in which Toyota's founders' philosophies still drive the company.
- Why Toyota's nerve system of open communication works.
- How Toyota's overall development and growth are enabled by an "up-and-in" human resource management system.
- How to grow a culture of contradiction and success.

THE COMPLETE SUMMARY: **EXTREME TOYOTA**

by Emi Osono, Norihiko Shimizu, and Hirotaka Takeuchi with John Kyle Dorton

The authors: Emi Osono, Norihiko Shimizu and Hirotaka Takeuchi are business school graduates of the University of California, Berkeley; The George Washington University; and Stanford University, respectively. They are professors at one of Japan's top business schools, Hitotsubashi University Graduate School of International Corporate Strategy. Hirotaka Takeuchi works closely with Professor Michael E. Porter of Harvard University, with whom he co-authored *Can Japan Compete?* (2000).

Six Opposing Forces

Figuring out what makes Toyota a success is like peeling back the layers of an onion but never reaching the center. The degree of contradiction and paradox is distracting as one looks for the fundamental reasons the company has achieved so much. These paradoxes, however, are central to such an endeavor.

Very quickly, a larger pattern of expansion and integration begins to emerge — a pattern consisting of three expansive and three integrative forces unique to Toyota. The expansive forces lead Toyota toward new challenges and greater diversity and complexity, whereas the integrative forces allow the company to weave together and internalize these experiences and perspectives and make sense of the complicated environment in which it operates.

Expansive Forces

• ***Impossible goals:*** Toyota sets goals for itself that most would consider impossible to achieve, and it does this knowing full well that the means to achieve them may not yet exist.

Impossible goals infuse the organization with the motivation to break free of established routines and try new things. This is usually what starts a cycle of evolution at Toyota.

When Toyota rivaled General Motors as the world's largest carmaker in unit sales in 2007, it was not because Toyota had set for itself the goal of becoming number one. Rather, this was a by-product of its aim for a 15 percent global market share by the year 2010, a goal it had set in 2003 and called the "Global 15." As former Toyota President Fujo Cho explained, the Global 15 was actually a dream goal meant to inspire employees rather than express a commitment to a specific numerical target. Year after year, Toyota's market share crept upward, aided by incremental sales averaging 650,000 units per year since 2002. The inspiring Global 15 dream is expected to become a reality by 2010, demonstrating how effective impossible goals are as a driver of Toyota's expansion.

Other examples of impossible goals at Toyota include meeting the needs of every customer by having a full line of vehicles in every market and ensuring that a Lexus with 50,000 miles on the odometer would not look, feel, sound or perform any differently from one fresh out of the factory.

• ***Experimentation:*** Toyota encourages a high level of experimentation and learning from failure.

The company's eagerness to experiment is an expansive force that has helped it scale the hurdles in achieving its impossible goals. Toyota operates on the premise that every original plan for a project is imperfect and incomplete and will only be completed by the project's successors. If the original plan does not work, they learn from the experience, modify the plan and try again. If it does work, they create a new routine from this successful practice and share it across the organization, aware that even new routines eventually will become obsolete. The organization then turns to chasing another challenging goal.

An example of experimentation can be seen in the development of the Scion in which one of the objectives was to shorten Toyota's product development process. The executive in charge mandated the team to develop the *bB*, later adapted for the U.S. market as the Scion *xB*, at half the development cost of similar cars. This forced the team to eliminate expensive prototyping and make extensive use of computer simulations instead. As a result, the *bB* was developed in just 15 months, rather than the

usual 24 months. After experimenting with change to develop the Scion, they were able to transfer whatever improvements this yielded to the rest of the company.

• ***Local customization:*** Toyota customizes products and operations to incorporate the sophistication and diversity of local markets around the world.

Local customization acts as an expansive force on Toyota in ways that are different from other firms because it doesn't just adapt to local needs. Toyota's customization approach concentrates product development and manufacturing preparation processes at its headquarters in Japan, while bringing in a high level of local input to tailor products for each market. This increases the operational complexity of the organization exponentially, while expanding the boundaries of Toyota's knowledge base as it incorporates intelligence gathered from the various markets into the central process.

An example of Toyota's local customization is found in its customization of the IMV (Innovative International Multipurpose Vehicle) which had to meet the diverse needs of consumers in more than 140 countries. Toyota designed a platform that broadly addressed the need for a vehicle that was both smooth to drive and rugged enough to handle difficult driving conditions. It produced five IMV models in the four main assembly countries of Thailand, Indonesia, Argentina and South Africa, while countries such as India, the Philippines and Malaysia manufatured IMV vehicles for their respective local markets. By using a single platform and limiting the number of models, Toyota minimized the design and production costs of the IMV.

A drawback of exponential expansion is that effective communication deteriorates, and it becomes increasingly difficult and costly to efficiently coordinate operations. How does Toyota cope with the hazards of constant expansion and growth?

While the expansive forces extend Toyota's organizational and knowledge boundaries, a set of integrative forces weave the company together and keep it from spinning out of control.

Integrative Forces

• ***Founders' philosophies:*** Historic words of the founders represent core values, shared and practiced by all, that are the foundation of Toyota's unique corporate culture.

• ***Nerve system:*** Toyota's intricately layered network of open communication promotes a cross-pollination of knowledge and practice that ensures "everyone knows everything."

• ***Up-and-in:*** Toyota's human resource management policy guarantees job security while emphasizing continuous development of individual creative potential through learning and improvement. This approach is in stark contrast to the more conventional "up-or-out" management policy where those who fail are shown the door. ●

The Force of Impossible Goals

Like the navigators of early times who grew restless when in port too long, Toyota is restlessly in pursuit of new horizons and conscious of the ship's potential to run aground. This expansive pressure stimulates employees to set goals that seem difficult or even impossible to achieve, pushing them beyond conventional practices and driving Toyota's continuous self-reinvention and growth.

Make no mistake — with continuous improvement as a pillar of the organization, Toyota remains a stickler for detail in day-to-day operations. At the same time, the company is eyeing its next revolutionary step forward. Even when business is successful, senior executives are out exploring for the next source of propulsive force to power evolutionary change.

Setting tough goals to actualize the future may not be unique to Toyota, but how it sets those goals and resolves contradiction to achieve them sets Toyota apart from all other companies. Three examples that illustrate how impossible goals have driven Toyota's evolution include the following: meet every customer need; the finest cars, the finest dealers; and bypassing Japan to make a global car.

Meet Every Customer Need

It is, of course, impossible to meet every customer need in every market. Philosophically, however, Toyota is bent on meeting the needs of every customer, as stated in its internal document *Toyota Values*: "For Toyota to carry out [the policy of] 'customer first' globally, it is essential ... to respond to the needs of every customer quickly and thoroughly." This philosophy extends beyond the customer to include the supply partners; the workers on the assembly line; and the distributors, dealers and service centers.

Toyota publicly declares, in that same document, its impossible goals to raise the social consciousness of its employees, "always optimizing to enhance the happiness of every customer, as well as to build a better future for people, society and the planet we share." The goal of developing new cars for every customer segment in each country or region arises out of this sentiment.

Indeed, Toyota caters to all customer segments, with no trade-offs, especially in its two most developed markets, Japan and the United States. It makes the Corolla for the utility-minded customer, the Sienna for the family-oriented customer, the Prius for the environmentally conscious customer, the Scion for the young customer and

so on. This approach stems from the firm belief that a car helps make people happy.

The Finest Cars, the Finest Dealers

The goals Toyota set for the Lexus not only were difficult, but seemed irrational. The primary goal was to develop "the finest cars ever built." The Lexus required Toyota to move into areas where it lacked knowledge and experience, forcing a re-examination of its basic technologies, from manufacturing and body techniques to procurement, and it did so in the United States — only the most competitive market in the world.

The company established far-fetched targets for the car that pushed the envelope with respect to speed, fuel efficiency, noise level, air resistance and weight. These goals resulted in a number of technical contradictions that had to be resolved, without compromise or trade-off.

Bypassing Japan to Make a Global Car

In 1998, Toyota created the Innovative International Multipurpose Vehicle (IMV), a family of global cars in a production network that bypassed Japan to produce at bases in Thailand, Indonesia, Argentina and South Africa. The IMV would render the concept of "Made in Japan" irrelevant to the Toyota brand. Many Toyota executives thought it was either too risky or impossible. Former Senior Managing Director Zenji Yasuda, one of the originators of the IMV, reminded the naysayers that they would never accomplish anything if they just harped on the risks.

For IMV production to succeed, components had to be procured locally. Toyota embarked on initiatives to reduce cost, such as using the same platform and shared parts where possible and producing at overseas plants rather than in Japan. It developed a logistics network of international parts production, concentrating production of major components in a few key locations to gain economies of scale. When it was time to start production, the company dispatched several hundred members of the Japanese production preparation team to plants in Thailand and Indonesia, who coached workers and local suppliers.

The Six Lexus Compromises

Ichiro Suzuki, chief engineer of the LS400 development project, created a list of six technical contradictions that had to be resolved to build the car:

1. Outstanding high-speed control and stability/excellent riding comfort.
2. Fast and smooth ride/outstanding fuel efficiency.
3. Superb noise reduction/lightweight.
4. Elegant styling/outstanding aerodynamic performance.
5. Warm ambience/functional cabin.
6. Outstanding high-speed stability/excellent air resistance (low coefficient of drag).

Suzuki insisted that all the contradictory elements had to be achieved. Once the team could see that they could resolve contradictions, they were motivated to higher levels of achievement.

Eagerness to Experiment

Toyota's eagerness to experiment is embodied in the problem-solving routines or processes that have become a normal part of everyday business. The company evolved the Plan-Do-Check-Act (PDCA) model, which is a generic, continuous improvement process practiced widely throughout the business world, into the eight-step and A3 reporting processes, which are unique to Toyota. These are both an expression of the culture at Toyota, in which problem solving is considered to be a critical capability that is implanted in all employees early in their careers through rigorous training.

Eight Steps

The eight-step process, referred to as the Toyota Business Practices (TBP), helps employees develop the necessary problem-solving skills. The eight steps are as follows:

1. Clarify the problem.
2. Break down the problem.
3. Set a target.
4. Analyze the root cause.
5. Develop countermeasures.
6. See countermeasures through.
7. Monitor both results and processes.
8. Standardize successful processes.

A3 Reporting

The A3 reporting process is named for the 11x17-inch-size paper known in Japan as the A3. Only the most essential information needed to solve a problem is summarized on this one sheet of paper and communicated throughout the company. A3 paper was the largest size that would fit into a facsimile machine, which was the common method of communication within Toyota until the advent of the personal computer.

A lot of information can be condensed onto a sheet of A3 paper, but simplified into the company's A3 form, the information flows according to the problem-solving process, from problem definition and description to future steps.

Think Deep, Act Small

The eight-step process and A3 reporting process lay out the path for employees who are challenging the status quo, testing a hypothesis, and discovering what works and what doesn't. Toyota has discovered that the most practical way to realize mission impossible is to think deep but act small, taking measured steps and never giving up — the quintessential traits of an experimenter.

What sets Toyota apart from other companies as an experimenter is the way it thinks in this process and organizes it, as follows:

• *Think of the "objective of the objective."* Clarify the ultimate objective in relation to the more immediate aims. Toyota employees are trained to think about the true objective, or the "objective of the objective."

• *Break down the problem.* After identifying the true objective, break down the larger problem into smaller, more concrete issues and pinpoint the specific cause of each.

• *Start small and take incremental steps.* This is a historically proven approach to experimentation. Toyota's launch of its youth-friendly Scion model in the United States reflected this thinking. The launch was executed using a cascade approach — first in California (which tended to be receptive to new things), then in the South, on the East Coast and finally in the Midwest. Along the way, Toyota learned what worked and what didn't and made many incremental improvements.

• *Repeat experiments, even if they fail.* Toyota used earlier experiments in the youth market to learn what not to do with the Scion.

• *Institutionalize successful practices.* Toyota builds benefit from success and failure. When an experiment is successful, it devotes time and effort to institutionalizing the successful process and building it into daily work routines. When an experiment fails, it learns from the experience, modifies the plan and tries again.

• *Continue to raise the standard.* While Toyota institutionalizes what works, it does not assume that those new practices are effective forever. Both the eight-step TBP and the A3 reporting processes emphasize the importance of monitoring the effectiveness of a successful practice.

Experimentation Software: Values

The preceding practices constitute the hardware of experimentation. The values and principles supporting these logical routines are the software, and they can be traced back to the founders of Toyota. Mottos like "Let's give it a try" and "Don't be afraid to make mistakes" are integral to the corporate culture that enables experimentation. There are five values that serve as enablers of experimentation:

• **Value 1: Taking Decisive Action.** The mind-set of experimentation requires a willingness to take decisive action to produce results. Toyota employees are constantly encouraged to get their hands dirty with the motto "If you're 60 percent sure, take action." Taking action and not succeeding is considered OK, because doing nothing is worse.

• **Value 2: Tolerating Failure.** Toyota has a high tolerance for failure. In fact, failure is viewed as an everyday event at the company, a sentiment originating with the founders about learning the hard way. Toyota does not just tolerate failure — it embraces failure as a mechanism for learning, recognizing that you have to fail to progress. When something goes wrong, it is viewed as an opportunity to take corrective action and learn from that experience.

• **Value 3: Being Honest.** Toyota relies on the results of experimentation to learn what works and what doesn't, but this process cannot succeed if employees feel they have to hide bad news or fabricate positive results. A unique feature of Toyota's work culture is the way it encourages all employees to admit that problems exist, to make them visible, to see them as opportunities for improvement, to identify their root causes and to take concrete countermeasures to prevent problems from recurring over the long term.

• **Value 4: Doing Good.** Trying new things and staying ahead of the times form the basic rationale for experimentation. At Toyota, these practices are not only a motivating force, but also the *duty* of employees, enabling the company to be of service to humankind.

• **Value 5: Never Giving Up.** Even though Toyota is highly tolerant of failure, it is still not easy for employees to initiate the experiment, and even more difficult to shut down an experiment that is ridden with setbacks. The key that determines whether worthwhile experiments will have a reasonable chance of any measure of success is the determination and commitment of project leaders, who never give up in the face of adversity.

Local Customization

Despite its global presence, Toyota remains a local company at heart, remaining sensitive to the needs and requirements of the countries and regions in which it does business. This sensitive approach to local operations is a creative contradiction as Toyota strives to be global and local at the same time and exerts an expansive pressure in the organization. The local customization process starts with the way Toyota innovates for individual markets. It then rolls these innovations into a global process that benefits every market, while maintaining local preferences and demands.

By catering to unique sets of local preferences, Toyota is pushed to new customer targets, new business relationships, new ways of marketing, and new supply chain management systems and process technologies. Like the expansive force of impossible goals and experimentation, local customization also drives Toyota to try new things in response to the demands of local markets around the world.

Product Development and Manufacturing

The challenges of local customization are the same for every car manufacturer. Success hinges on proper handling of the economics of product development and manufacturing. The chief hurdle is figuring out how to scale vehicle design and manufacturing to yield cost benefits while satisfying local needs for customization. Toyota achieves both without compromising one or the other.

As challenging as local customization may be, it has benefits in auto manufacturing. For one, it exposes Toyota to the diversity of perspectives it needs to overcome the limitations of its own provincial origins. Learning to understand and accept these differences is the first step in facilitating local customization. Local customization also exposes Toyota to conditions unheard of in its home market that help it to further stretch the envelope in vehicle engineering.

Finally, local customization exposes Toyota to the sophistication of local tastes, as in Europe, where it was a latecomer. Virtually all new European cars introduced after the 1979 Frankfurt Motor Show were FF models: front-engine, front-wheel drive cars offering excellent handling and performance as well as comfort and a sporty look. The wide array of competitive products in Europe put Toyota on the defensive. To survive, it had to develop products that met local market demands on all these fronts.

Disseminating Local Best Practices Throughout the World

Toyota has developed new practices and processes as a result of incorporating the unique demands of customers in specific local markets. Local customization has worked because Toyota recognizes the value that diversity brings to the whole company and therefore entrusts its local operations with significant autonomy.

The challenge for Toyota was how to preserve that diversity and autonomy while encouraging each country to share its best practices for mutual benefit. As the automobile industry became globalized, Toyota pursued both localization and global commonality, through the establishment of its Global Knowledge Center, which disseminated innovation from specific local markets into a global process, to benefit the whole company. ●

The Founders' Philosophies

The power of the founders' philosophies is the glue that binds employees, dealers and suppliers and connects their aims. It acts as an integrative force in concert with Toyota's two other binding forces, the nerve system and up-and-in human resource management. The company's relentless pursuit and dissemination of the values expressed in these philosophies have effectively aligned the core values of Toyota employees, dealers and suppliers.

'Tomorrow Will Be Better Than Today'

The shared belief at Toyota that "tomorrow will be better than today" grows out of institutional memory from the difficult experience of entering the international automobile market about 50 years behind the dominant American producers and 100 years behind the established European manufacturers. Behind this phrase is the attitude that Toyota will make it a better day, as embodied in the routine practice known as *kaizen*, a Japanese word meaning "continuous improvement" that is now part of the vernacular of manufacturing industries around the world.

Kaizen is the habit of wanting to do a little better every day by eliminating waste and continuously becoming more efficient. It is an attitude of never being satisfied with the status quo, which helps explain why Toyota is continuously and persistently conducting experiments.

Everybody Should Win

The second philosophical value that serves as an integrative force within Toyota is the notion that everyone should win. As a guiding principle, it moves everyone forward together. For founder Kiichiro Toyoda, the word *everyone* includes society at large, and this is central to Toyota's mission, "To contribute to society through the manufacturing of automobiles."

On a micro level, Toyota succeeded in getting its factory workers to buy into this aim. What differentiates Toyota from its rivals even today is its view of the factory worker not only as a pair of hands on the assembly line, but as a knowledge worker who accumulates *chie*, the wisdom of experience that can only be gained on the factory floor.

The company also views its dealership network as the "Radar for All of Toyota." This mission gives dealers the responsibility to communicate their knowledge of their specific market and customer needs to the rest of the Toyota group. In contrast to the atomistic view of business relations that builds silos and limits interaction, it is a broadly interactive approach that recognizes interdependency in a business ecosystem. Dealers are partners in Toyota.

'Customer First, Dealers Second and Factory Last'

In Japan and overseas, "customer first" is a popular phrase but Toyota has been practicing it for more than 70 years, ever since the idea was first articulated by the Master of Sales, Shotaro Kamiya.

This concept has shaped the company's unique relationship between distributors and dealers and between dealers and customers globally. This mind-set runs through everything Toyota does, from upstream activities such as research and development to the rank and file on the factory floor.

Genchi Genbutsu

The fourth philosophical value that is ingrained at Toyota is *genchi genbutsu*, which means "go and see things for yourself, firsthand." The inference is that if you have not seen something firsthand, then your view of that thing is not credible. Toyota's top executives are proud to be the *first* ones to ask, "Have you seen it?"

Toyota's Nerve System

Toyota's top executives operate on the assumption that "everybody knows everything" because the culture of communication is open and personal. Communication flows freely up and down the hierarchy and across functional and seniority levels, extending outside the organization to suppliers, customers and dealers.

Toyota's interconnected world in the digital age is primarily analog, based on the belief that e-mail cannot replace real, human communication in the flesh. The result is an accumulation of relationships in an analog web or "nerve system," which, in many ways, outperforms even the most advanced computer. Toyota views its people as its nerve cells that produce and transmit signals or impulses for action.

Five Characteristics of Toyota's Nerve System

As a system, it is never complete because Toyota keeps growing and producing new nerve cells that transmit different impulses in the ever-changing business environment. There are five characteristics of this system:

• **Open and lateral dissemination of know-how.** To facilitate teamwork, employees are encouraged to engage in *yokoten*, short for *yokoni tenkaisuru*, which literally means "unfold or open out sideways." This approach encourages everyone to share their individual know-how and expertise openly with others.

• **Freedom to voice contrary opinions.** The organization should also be open to criticism and contradiction for the nerve system to function properly. This means everyone has to feel free to voice contrary opinions, even to top management and headquarters.

• **Frequent face-to-face interaction.** Rarely do managers at Toyota reach senior positions without acquiring and embracing the skill of listening thoroughly and intently to what employees have to say and continually questioning and probing to find a better way.

• **Making tacit knowledge explicit in the Toyota Way.** Tacit knowledge is converted to explicit knowledge every time someone verbalizes or writes down the knowledge he or she has.

• **Formal and informal organizational support mechanisms.** Formal and informal support mechanisms have been established in the organization to contribute effective functioning of the nerve system. The Toyota Institute, the Global Knowledge Center and the University of Toyota are formal organizational mechanisms supporting the nerve system that enables everyone to know everything.

Capturing *The Toyota Way 2001*

Under the presidency of Fujio Cho, Toyota embarked on an initiative to put into writing the wisdom of its founders that had been passed down verbally through many generations. The result was *The Toyota Way 2001* (known as the "Green Book" within the company), which kicked off a larger effort to disseminate the founders' wisdom throughout the organization.

Up-and-In Human Resource Management

The phrase *up-and-in* is derived from the opposite practice of up-or-out that is common in most professional firms. In the up-or-out system, a professional employee is either successfully promoted up the ladder or gradually forced out of the company. Toyota rarely forces out so-called underperformers, focusing instead on *upgrading* their capabilities *inside* the company through various on-the-job training (OJT) and evaluation schemes.

The up-and-in resource management system is the enabling environment for development and growth, and it is particularly applicable to industries like automobile manufacturing, where learning from experience is important.

Knowledge-Creation Management

There are five key aspects of an up-and-in human resource management system as practiced at Toyota. It is part of a system of knowledge-creation management that can be emulated by other companies in the

How Toyota Reinforces Teamwork Goals

At Toyota, the principle "respect for people" is interpreted as "respect for the individual realizing that power is consolidated in a team."

To actualize this sentiment, everyone above the management level of *kacho,* or section chief, submits a "mission statement" at the beginning of each fiscal year. Managers jot down their personal goals and conduct self-evaluations according to the behavioral requirements of the job. The evaluations are reviewed by supervisors who also serve as coaches in a one-hour session held three times a year.

knowledge-based business environment and has the following characteristics:

• **Stable, long-term employment.** A mutual, long-term commitment between a company and its employee in the form of stable, long-term employment is an essential aspect of up-and-in human resource management and knowledge-creation management in general. It justifies the investment of resources needed to develop organizational capabilities that only show benefits over time. Acquiring experience in several job functions or aspects of business operations equips managers to make better systemwide decisions.

• **Emphasis on training.** To build a multiskilled work force, Toyota institutionalized a number of training programs, both on and off the job, that teach problem-solving skills. During their first 10 years at the company, employees are thoroughly trained in the fundamentals of thinking their way out of problems.

• **Power in teamwork.** Individual self-actualization is emphasized at Toyota as a function of teamwork. The exemplar employees who serve as teachers and mentors are not seen as hotshots separate from the group but as a reflection of the group in which leadership is distributed. Toyota depends on all the workers in the company bringing their strengths into play to demonstrate their power as a team.

• **Action orientation.** The preference for action is a quintessential Toyota trait. The value of taking action is passed on though generations in popular phrases such as "If you're 60 percent sure, take action" or "It's better to fail doing something than doing nothing." What matters more than the results is the "process" of taking action to achieve results.

• **Learning-based evaluation.** Toyota has developed a unique set of criteria for evaluating managers. For top managers, the company bases 100 percent of remuneration on performance related to results as well as process. To evaluate process performance, the company looks at how goals are achieved; how issues are handled and resolved; how organizational skills are fostered; and how people are developed, motivated and empowered.

What Your Organization Can Learn From Toyota

How can other companies emulate Toyota, one of the world's best-run, most successful organizations? Certainly, emulating Toyota is not easy. It takes time. It also requires abundant resources.

For starters, however, an organization can do three things to emulate Toyota's extreme performance model of business management:

1. Embrace contradictions as a way of life. Reaching new customers, new segments and new geographic areas and tackling the challenges posed by competitors, new ideas and new practices trigger the changes and improvements needed to break down rigidities. Companies must embrace these challenges and create their own contradictions to achieve higher levels of performance.

2. Develop routines necessary to resolve those contradictions. Unless companies teach employees how to tackle problems rigorously, they will not be able to harness the power of contradictions.

3. Let all the employees and outside constituents come up with solutions. Leaders must be open to criticism and contradiction if they want to source new ideas from any point in their organization's ecosystem. This requires time, patience and frequent face-to-face interaction.

Conclusion

Toyota's extreme performance model is a very human model of business management where each employee forms a vital part of the organization whole. Being human, it is an incomplete model. Being incomplete, there is room for change and renewal.

Contradictions, opposites and paradoxes are a way of life within Toyota and Toyota relentlessly pits opposing forces against each other to realize continuous innovation and constant renewal.

Management: Team

Great Business Teams

Cracking the Code for Standout Performance

by Howard M. Guttman

THE SUMMARY IN BRIEF

Everybody knows that great organizations start with great teams. But it turns out that there is a code for standout performance within great teams that applies to every organization, regardless of size, type or industry affiliation. Cracking this code does not guarantee a perfect outcome every time companies engage in competitive play, but by changing the game, companies can acquire a sustained competitive advantage and the ability to excel in a very difficult marketplace.

The code is the horizontal organization — an organization in which everyone operates according to a clearly defined set of decision-making protocols, where people understand what they are accountable for and then own the results. In *Great Business Teams*, renowned business consultant Howard M. Guttman draws on his decades of experience inside some of the world's most successful corporations to show how that powerful new high-performance horizontal model has changed the way leaders lead, team members function, challenges are met and decisions are made.

Though "going horizontal" requires leaders to fulfill certain imperatives, behave in certain ways and be responsible for aligning their teams with company goals, it also requires every employee develop the skills and characteristics of a "leader": become more intellectually invested in group performance, embrace accountability and handle conflict well. It's for these reasons that great teams do more than improve a company's performance; they continually raise the bar and redefine what "high performance" means.

IN THIS SUMMARY, YOU WILL LEARN:

- The five key characteristics of great business teams.
- How leaders of high-performing teams behave.
- How members of high-performing teams behave.
- What teams and leaders need to do to align themselves around a goal.
- How great teams make decisions and overcome challenges.

Cracking the High-Performance Code

Whether it's a CEO and top-management team charged with setting strategy; a plant manager and shop-floor personnel committed to getting a defect-free product out the door; or a cross-functional, global project team dedicated to a worldwide product launch, teams are today's locus of power, responsibility and action.

Great business teams share five characteristics:

1. Great business teams are led by high-performance leaders who:

- *Create a "burning platform" — an energizing principle — for fundamental change.*
- *Are visionaries and architects.*
- *Know they cannot do it alone.*
- *Build authentic relationships.*
- *Model the behaviors they expect from their team.*
- *Redefine the fundamentals of leadership.*

2. Members of great business teams are *us*-directed leaders. On a great business team, no one's performance — not even the leader's — is exempt from scrutiny and feedback.

3. Great business teams play by protocols. Ambiguity kills effective decision making. It also wastes precious time. Great businesses are specific about what decisions they need to make, who will make them, and how.

4. Great business teams continually raise the performance bar. No matter how much it achieves, a great business team is never satisfied. On a great business team, self-monitoring, self-evaluation, continuous improvement, and raising the performance bar are the norm.

5. Great business teams have a supportive performance management system. Whether your aim is to create a single great business team or an organization made up of great teams on every level, the shift is not merely structural but profoundly cultural. In order to effect permanent behavior change, a team's performance management system must support the new expectations. Team and individual goals have to be crystal clear; the necessary technical and interpersonal skills have to be provided; performance has to be monitored; and feedback has to be timely and well thought out. ●

The New High-Performance Leader

Leadership Imperative: Develop and Drive the Horizontal Vision

Within Australia's fast-moving, competitive dairy industry, consumers have become more and more sophisticated, with ever-increasing wants and needs. In 2004 the industry was also witnessing dairy production declining, international farm gate milk prices skyrocketing to historic highs and at record global fuel costs.

That same year, Robert Gordon took over as CEO and managing director of Dairy Farmers, an Australia-based milk and value-added dairy company. Financially the company was not performing at capacity. There was unnecessary product proliferation and too much complexity. Organizationally, the company was largely siloed. Each function operated independently and was run by a general manager, sometimes competing with other functions for resources. It was time for a radical change.

Gordon was convinced that the only bet was to go horizontal, which to him meant moving to an organization in which everyone operates according to a clearly defined set of decision-making protocols, where people

Rebecca S. Clement, Publisher; **Sarah T. Dayton**, Editor In Chief; **Chris Lauer**, Senior Editor; **Christine Wright**, Senior Graphic Designer; **Tina Orem**, Contributing Editor

understand what they are accountable for and they own the results. "It means moving to an action- and results-driven workforce at every level — not one that waits around for instruction or trips over functional boundaries. It means giving employees the opportunity and skills to decide who needs to be involved in solving problems and making decisions, dividing responsibilities, then stepping aside to allow people to implement."

Three years later, Dairy Farmers saw a dramatic turnaround. It became significantly leaner: reducing its product portfolio by more than one-third, closing four of 15 sites and 17 distribution depots and divesting noncore businesses. The new, lean, horizontal organization chalked up a number of significant successes, including significantly reducing time to market for new products. Dairy Farmers closed out 2007 leading the growth rate in every retail market in which it participates, improving market share in every category.

For an organization to raise its level of performance, every team, on every level, must be a great team. It must be aligned, or in sync, in five key areas:

1. ***Business strategy.***
2. ***Business deliverables coming from the strategy.***
3. ***Roles and responsibilities at individual and business unit or functional levels.***
4. ***Protocols, or ground rules, for decision making and conflict resolution.***
5. ***Business/interpersonal relationships and interdependencies.***

Leadership Imperative: Create the Right Mindset

On a great business team, candor is king. Candor requires leaders to walk the talk. They do this most convincingly by listening to critiques of their own performance and acting on them, and by changing behavior that the team tells them is unacceptable, by not cutting off dissenters or denigrating their opinions, by not pulling rank when it is time to make a decision. High-performance leaders have an up-or-out approach: Those who cannot adapt and thrive should take their game elsewhere.

Leadership Imperative: Provide the Right Skills

Working horizontally is something of an unnatural act, given most people's experience in working hierarchically. This creates another leadership imperative: Ensure that everyone in the organization not only wants to contribute but can contribute. Great leaders immediately develop an action plan to close skill gaps through formal skill-development workshops, an ongoing search for opportunities to apply the skills and individual coaching as needed.

Leadership Imperative: Keep the Game and Guard the Ground Rules

One of the most important tasks of a team leader is to serve as keeper of the high-performance game. It is up to him or her to make sure the team remains on track. "On track" means that everyone is clear about and committed to the business strategy and the operational goals that flow from it; understands his or her roles and responsibilities; and adheres to the agreed-upon protocols, or ground rules, for decision making and for interpersonal behavior, especially those relating to conflict management.

Ultimately, when the leader is keeper of the game and guardian of the ground rules, he or she is looking at the team and asking important questions. Are the members of my team playing for real, or are they just going through the motions? What's the best way for me to hold up a mirror to members of my team to accurately reflect their behavior? How do we change?

Leadership Imperative: Raise the Bar

One of the characteristics of all great business teams is that they continually raise the performance bar. But the performance-improvement attitude is an acquired one, which often requires not-so-gentle prodding from the leader.

When Helen McClusky joined Warnaco as president of its Intimate Apparel group in 2004, revenue had fallen by 50 percent and profits had declined over the previous five years. McClusky began the turnaround by stripping the team's priorities down to one: Intimate Apparel must reach the company's average profitability. If the company generated an average 10 percent operating margin/profitability, the Intimate Apparel division had to do the same.

She began holding regular monthly staff meetings with agendas. They started on time, with or without laggards. She also role-modeled meeting behavior, showing up on time and remaining throughout the meeting. She worked with the team to establish protocols for meetings, and disseminated them broadly. Line-management approval processes were put in place. Specific margin targets, which had to be hit during the product-development cycle to make sure profitable business was being delivered to the bottom line, were identified.

Leadership Imperative: Be Player Centered

High-performance leaders seek to *leverage* power, not to monopolize it but to put it to use to drive up their team's or organization's performance. As a means to driving up results, high-performance leaders favor *"distributive power"*

Let's Follow a Leader

Believing that a picture can be worth a thousand words, here is a brief "snapshot" of one high-performing leader, Grant Reid, in action. Before he became global president of Mars Drinks, Reid was executive vice president of sales and customer care for Mars Inc., Snack. When he assumed full responsibility for snack sales, he faced a significant leadership challenge. Sales had not met expectations in this key strategic unit, and a quick turnaround was needed. His experience can be distilled into six principles that guided him during this plight.

1. *Don't bury the past; build on it.* They were going to put the past behind them, but not before they had learned all they could from it.
2. *It's all about relationships.* Reid learned that people wanted reassurance that their futures were secure.
3. *Don't just lead your team — be a part of it.* Reid also believes that leaders should not ask others to do things they would not do themselves.
4. *Help everyone become a high performer.* Everyone was encouraged to hold one another — and Reid — responsible for achieving snack results.
5. *Show how it's done.* In front of his team, he is comfortable challenging his boss when he feels things are moving too slowly, role-modeling the upward confrontation that he expects from the players on his team.
6. *Park your ego.* Effective leaders in a high-performance environment possess a special kind of self-confidence — the ability to admit to not having all the answers.

— putting power and authority in the hands of teams and their members, provided the conditions are right, the protocols in place and the players sufficiently evolved to deliver maximum payoff. ●

The New High-Performance Player

As organizations evolve horizontally, the traditional leader-follower paradigm is no longer a fruitful construct. On great business teams, "followers" assume many of the same behaviors and traits previously ascribed only to leaders.

On any team, players require three types of skills: technical, strategic and leadership. But, as a member of a team of leaders, every player on every great team needs the same degree of proficiency in leadership skills, including the ability to influence others.

Assessing Where Others Stand

Look around you, both at members of your team and at others in your organization with whom you interact. Following is a short description of each type of individual, along with some tips for influencing them:

Double Dealers agree with you at the business-concept level, but have for some reason decided to withhold their support. Focus on listening to their concerns, encouraging them to speak candidly and working to build trust between you.

Foes neither agree with your goal, nor are they among your supporters. Encourage candor, "story" sharing and the forging of new agreements for moving ahead.

Members of the Loyal Opposition support you while disagreeing with your point of view. Present a strong business case as objectively as possible to turn your colleagues around.

Partners and Middle-of-the-Roaders present opportunities. The former group supports and agrees with you. Partners can have a positive influence on others, especially the Middle-of-the-Roaders.

As a player, the skills you need will vary according to the circumstances. For example:

- When another player's needs are pressing, you need *active listening skills*: the ability to clarify, understand and acknowledge another's point of view.
- When your needs are pressing, you need *assertion skills*: the ability to state your case from a position of strength rather than being passive or running over others.
- When both players' needs are pressing, you need *conflict-management skills*: the ability to manage each party's perceptions to defuse emotions, create a common understanding of the real issues at hand and work toward a collaborative solution in which everyone "wins."

The Player as Coach

One of the hallmarks of a great business team is the willingness of team members to assume accountability for the success of their colleagues. This can take many forms, from tough questioning to providing resources to coaching.

While leaders are ultimately responsible for making the call on the coachability of their players, every team member has an obligation to turn the table on him- or herself by asking, "Am I up to the task of continually

reinventing myself to meet ever-more-demanding performance standards?"

The thorniest coaching issue is how to deal with team members who are nearly or fully uncoachable. Players resist change for many reasons. Some do not see what's in it for them; others disagree on the need for change; still others are distrustful and suspect a hidden agenda. The challenge is to part the curtain to see what is behind the resistance to change. *Intention* is paramount. Is a team member's intention to change stronger than the lure of remaining comfortable with past ways of operating?

When it comes to dealing with the uncoachable, timeliness is crucial. When do you press the "eject" button? Once you determine that a player is *unwilling to change*, there is little else that can be done. ●

Aligning for High Performance

When a team is clearly committed to a common direction, when it focuses on business deliverables that evolve from that direction, when it is clear about its roles and responsibilities, when decision-making protocols are in place, and when business relationships are open and avoid siloism, then it acquires new performance muscle and the will to win. This is what is meant by "getting aligned." The alignment process is made up of two phases: *making the diagnosis* and *gaining agreement*.

Phase 1: Making the Diagnosis

Whether the team leader is the CEO, a division president, a general manager, or a functional head, here is the basic question that he or she must address at the outset: *What would the team look like if it could be taken to the next level of performance?* It is here that the leader communicates with his or her team members, allays their fears, secures buy-in, and generates excitement for the new world of significantly higher performance. Finally, there needs to be a segue to data collection, the next phase of alignment and team transformation.

Phase 2: Gaining Agreement

During this phase an alignment session is held during which new patterns of behavior in the five key areas — business strategy, business deliverables, roles and responsibilities, protocols for decision making and conflict resolution, and business/interpersonal relationships/interdependencies — are agreed on.

The end result of alignment in the first three areas is agreement among the players and their leader about *what* the team as a whole is going to accomplish and *what* each individual will contribute to those results. Alignment in the fourth and fifth areas deals with agreement about *how* the group is going to carry out its tasks and *how* the players and leaders are going to interact with one another. ●

Accelerating to High Performance

Whether the team coach is employed by the organization or is an outsider, he or she needs to be alert to common red flags that indicate that the team is veering off course:

- Team leaders who retreat to Grand Inquisitor or Solomon mode.
- Too many "grey beard" issues that hang around forever.
- Sidestepping delicate issues.
- Protocols that fall by the wayside.
- Failure to hold one another accountable for underperformance.
- More "me" than "we" in the air.

Skilled team coaches are masters at giving feedback. First, they depersonalize feedback, presenting the facts without judging them. Second, effective team coaches carefully formulate their comments. Third, effective team coaches present the facts and then ask the individual or team to confirm or refute them, keeping the coach from being perceived as judgmental. ●

Following the Protocols at Chico's

CEO Scott Edmonds describes the toughest struggle that he had as the leader of Chico's top team during the move to the high-performing team model:

"The hardest part of the transition was following the model all the way up to the point of terminating those who refused to abide by the new rules. One of the senior vice presidents on my team wasn't being honest with me and kept going underground. In the prealignment interviews, the other players made it clear that they believed she had to go. I realized that I had to terminate her immediately or I wouldn't be playing it straight, and the day after the alignment, I asked her to leave. As a leader you must say, 'Okay, these are the new rules of the game.' To use a baseball analogy, it's like saying, 'Three strikes you're out is no longer the rule. It's now only two strikes.' If I allow someone three strikes, I'm not playing by the rules and neither are they."

Whether or not you institute a "two strikes" policy is situational and beside the point. What is important is having in place — and sticking to — agreed-upon rules of behavior for handling contentious situations.

How Great Teams Make Decisions

Keep in mind three overarching points that help to explain why great teams are well primed for decision making. First, great teams are strategically focused. Second, the high-performing model counteracts the social pressure on group members to conform to the majority view. The third point about great decision-making teams: The high-performance decision-making model is built for speed, quality, maximum accountability, and engagement.

The Challenges

In observations of leaders and teams who have gone through the process of distributing decision-making authority, there are a number of traps into which teams typically fall:

- Team members accustomed to working in a hierarchical organization will tend to defer to the leader. Team leaders must refuse to play Solomon or Monkey in the Middle.
- When assigning members to subteams, remember that *value added* is the key criterion.
- Technical knowledge or a certain position in the organization does not automatically qualify a person to be the decision maker.
- Do not permit a subteam to try to lobby other players; do make sure that everyone on the team makes a public commitment to abide by the decision once it is made. ●

How Great Teams Manage Meetings

Great business teams set basic protocols for meetings:

- How often will the team meet, and how long will meetings last?
- Where will the team meet?
- Who will lead meetings?
- How and by whom will the agenda be set?

Here are several behavior-related protocols that great teams insist on:

- The meeting starts on time, with or without you.
- If you can't make a meeting, send a substitute.
- Cell phones are off; laptops and hand-helds are out.
- There are no digressions from the agenda; if someone raises a new issue, it is "parked" for later discussion.
- There are no side conversations.
- Everyone participates.
- Everyone follows the agreed-upon protocols for conflict resolution.
- All players hold all others — and the leader — accountable for promised deliverables and results.

Issue Management

There are many ways to go about managing key issues. The method outlined here — using issue definition, issue identification, clarifying issues, priority setting and action planning — has been adopted by many great business teams.

The most efficient way to keep track of issues is to create and maintain an issues log, or list of action items. Designating a point person or issue owner for each issue ensures that the job will get done. ●

How Great Teams Communicate

Great teams cannot be bothered with pseudocommunication. Here are the 10 common elements that make up the pattern of high-performance communication:

1. Clarity
2. Authenticity
3. Accuracy
4. Efficiency
5. Completeness
6. Timeliness
7. Focus
8. Openness
9. Action orientation
10. Depersonalization

Traits of High-Performing Communicators

Communication involves implicit and explicit messages. High-performing speakers make it easy for listeners; they do not play games or encode their messages. Whenever possible, they back up their statements with facts. They refrain from using emotionally charged language. They do not resort to euphemisms or doublespeak.

Here are 10 rules of thumb that great teams follow in whole or in part to help them manage virtual communications.

1. *Use the right medium for the message.* It is unacceptable to use e-mail to either raise an issue of concern/conflict or to engage in negotiations.
2. *Substitute active-reading for active-listening skills.* First ask, "Is the content of this message clear?" Then ask, "What are the underlying feelings being conveyed or implied?"
3. *Practice the Golden Rule.* In other words, think before you send.
4. *Respect confidentiality.* High-performing players never pass along a confidential e-mail to anyone not authorized to read it.
5. *Know when — and when not — to "cc."* Teams should agree on protocols for keeping others in

the "cc" loop.

6. *Do not retain a rescuer.* Just as great teams do not permit face-to-face triangulation or recruitment of supporters, they frown on anyone circulating e-mails to third parties.
7. *Acknowledge the recipient.* High-performance players look for opportunities to congratulate or thank one another whenever possible, and e-mail can be a very effective medium for delivering positive feedback.
8. *Get to know your e-mail correspondents.* Electronic communications with team members you have never met in person are often easier when you build your relationship by sharing a personal detail or two.
9. *When in doubt, do not send.* Waiting 24 hours, then opening and rereading the message can prevent embarrassment and regret.
10. *Pack a parachute.* Great players are not afraid to bail out of e-mail, especially when they sense the undertow of strong emotion. ●

From Great Teams to a Great Organization

As you think about moving to a new leadership and operating model for your organization, consider the following five requirements for success:

1. *Keep it simple, stupid!* In our experience, organizations that have succeeded in going horizontal take a direct, straightforward path.
2. *Leaders must lead.* If the change to a high-performance, horizontal organization does not begin with the top leader and his or her leadership team, there is no point in continuing the process.
3. *Talk it up — and down — and every which way.* Any team within arm's length of a newly aligned team must be brought into the circle.
4. *Do what works.* The organization's needs should dictate the sequence in which high-performing teams are replicated.
5. *Create a high-performing culture.* Take stock of your values. Be a role model. Continue to communicate. Celebrate and reward success. And make it visible. ●

Great Leaders and Teams: Challenges, Responses and Remaining Issues

Overcoming Resistance to Change: One way to keep future shock from undermining your efforts to go horizontal is to make sure that people have sufficient time to understand and absorb the change — and plenty of opportunities to ask questions.

When the Leader Gets a New Team: A word of caution for high-performing individuals attacking new roles: Do not try to conquer the world; start in your immediate area. Following are four practical tips taken from great leaders who have successfully met the onboarding challenge:

1. *Start at the beginning.* Great leaders play it straight right from the start by letting candidates know what to expect.
2. *Stay close.* One way to do this is by putting in place a weekly feedback session to answer questions and address needs and concerns.
3. *Role-model.*
4. *Provide mentors.*

Measuring Results: Revenue, profitability and return — the *what* of results — are important indicators of the value of the high-performance, horizontal model. But so is the *how* by which you achieve them, which is why great leaders are attentive to both the hard and soft factors and insist on measuring both.

Sustaining Momentum: The need to sustain high performance is a significant challenge, given all the forces at work in an organization — from strategic change to turnover — that can slow or even reverse momentum. Soul-searching and gathering like-minded souls represent an effective one-two combination for keeping energy up and momentum going. ●

Player-Centered Leadership

Great leaders know that there is no one "right way" to lead. Here is a brief description of each of the four leadership behaviors:

1. Prescribing/Directing. In horizontal, matrix organizations, where managers often need to get results from those over whom they have no direct authority, the ability to influence — to persuade others to change their points of view and behaviors so they are aligned with yours — is a critical skill.
2. Coaching/Instructing. By coaching players through tough issues, leaders help them develop the skills they will need to operate effectively on their own.
3. Collaborating/Partnering. While collaborating in a problem-solving or decision-making session, the leader can take the opportunity to do some additional coaching, increasing the skills and

Building a Great Organization the Redken Way

When L'Oréal bought Redken USA in 1993, the brand had slipped from number one in hair-color sales to number three or four. Four years later, despite a flurry of effort, not much had changed in terms of Redken's overall market position and bottom line. It decided to make a radical shift to the high-performance, horizontal model.

As a result, the senior team and the directors began to work together more seamlessly. By 2007, Redken had achieved 10 years of double-digit sales and profit growth — a record no other hair care company matched. Roles and responsibilities have become clearly delineated, eliminating interdepartmental tugs of war. People no longer hesitate to admit a mistake. Communication to customers has become more focused and on point. Customers view Redken as an organization that knows what it is doing.

confidence of those involved.

4. Inspiring/Empowering. Once again, it is the responsibility of the leader to make sure that those who will be held accountable for results are set up for success and not failure. ●

The Skills of a Great Team Member

When another person's needs are pressing, you need active listening skills. When your needs are pressing, you need assertion skills. When both people's needs are pressing, you need conflict management skills.

Using Active Listening Skills

Not focusing on those who come to us with a concern can bruise egos, but we add insult to injury by continually interrupting. In our desire to help someone — or cut short the conversation — we may come in too rapidly with our own opinion. Withdrawing is another deadly response. Body position, facial expression, and gestures such as head nodding and hand movements provide cues that you are tuned in — or out. "Say more" responses are phrases that encourage the speaker to tell you more about his or her ideas and feelings.

Using Assertion Skills

There are four skills that enable people to move toward the mid-point of assertion:

1. Persistence. It works best with salespeople, contribution seekers, telemarketers — people with whom you are not trying to cultivate lasting relationships,
2. Sidestepping. When you sidestep, you acknowledge that the other person may have a good point.
3. Straight talk. Put your statement into the following format: I want/need _____ because _____ .
4. The three-part "I" response. When you deliver the message, it is most effective if you use the following formulation: When you _____ I feel _____ because _____ .

Using Conflict-Management Skills

In every conflict situation, there are four options available:

1. Play the victim: say nothing, act powerless and complain.
2. Leave: physically remove yourself from involvement.
3. Change yourself: move from your position, and shift to the other party's view; "let it go."
4. Confront: address the issue openly, candidly and objectively; communicate with the other party.

Use an overall strategy — the Four C's approach — for confrontation:

1. Connect: Establish a rapport with the other party by addressing the issue between you openly and candidly and asserting yourself.
2. Clarify: Seek to understand by active listening and exploring all points of view.
3. Confirm: Reach mutual agreement as to what each party wants and needs and establish your willingness to collaborate.
4. Contract: Negotiate agreements for future interaction. ●

Management: Hands-On

How Did That Happen?®

Holding People Accountable for Results the Positive, Principled Way

by Roger Connors and Tom Smith

THE SUMMARY IN BRIEF

Accountability? Everybody talks about it, shareholders demand it, taxpayers want it and stakeholders insist on it. But exactly what is accountability and how do you get people to take it? Roger Connors and Tom Smith have spent more than 20 years studying and teaching accountability because they believe that no other attribute of individual or organizational life contributes more to the success of individuals, teams and organizations.

In *How Did That Happen?,* Connors and Smith examine how to hold people accountable for results in a method that conquers all the damaging behaviors that permeate so many organizations today. The authors show you how to hold others accountable for delivering on expectations in the positive, principled way that produces results.

By following the steps in the Accountability Sequence,® you will learn how to avoid the unpleasant surprises that plague almost every project and discover the key to getting things done through others. Accountable cultures produce results. The positive, principled approach to holding others accountable guarantees results.

IN THIS SUMMARY, YOU WILL LEARN:

- How to establish clear expectations and manage the unmet ones.
- How people at every level can enjoy greater productivity, profitability and job satisfaction.
- How to define accountability and how to get people to embrace it.
- How to hold people accountable the positive, principled way.
- How to avoid ever again wondering "How did that happen?"

Introduction

What do you hold people accountable for? At the end of the day, you hold people accountable for one thing: the expectations you have of them. Whether the expectation is for someone to turn in a report on time, make a sale this quarter, build a product according to certain specifications or ship a part by a certain time of the day, they are all expectations and they are all things you need other people to do for you. The very process of managing those expectations is the act of holding them accountable.

The positive, principled way to hold others accountable is by using a simple set of steps called the Accountability Sequence, which is divided into two parts: the Outer Ring and the Inner Ring. In the Outer Ring, you form, communicate, align and inspect expectations. In the Inner Ring, you engage in an Accountability Conversation® to determine the best way to deal with unmet expectations. ●

The Outer Ring®

The definition that drives the Outer Ring of the Accountability Sequence empowers people in a practical and powerful way to influence results *before* things go wrong. To hold someone accountable means "to effectively form, communicate, align and inspect the fulfillment of an expectation in the positive, principled way that enables people to achieve results now and in the future."

The steps in the Outer Ring, as well as the methodologies within each step, provide a basic pattern you can tailor to each person in a way that works for him or her.

The Three Axioms of the Outer Ring

Three axioms form the foundation for holding others accountable the positive, principled way and set the stage for taking the steps in the Outer Ring:

The Accountability Fallacy. The Accountability Fallacy captures a common mistake people make when they assume that others fail to follow through because there is something wrong with them. When leaders fall prey to the Accountability Fallacy, they not only assume that their people are flawed, but that they themselves can do little or nothing to change those flaws except punish people for having them.

The Accountability Assumption. The Accountability Assumption dictates that you should always begin with the assumption that, in any given circumstance, people are doing their very best to fulfill your expectations. It allows you to begin with the view that people want things to work just as much as you do and that they are doing all they can to make that happen.

The Accountability Truth. The Accountability Truth provides a more effective way of looking at the problem when people fail to follow through and deliver on expectations. "Truth" means that when things go wrong, there is usually something wrong with what "I" am doing. When you embrace this principle, you take control of future outcomes and internalize the continual need to improve your effectiveness with respect to holding others accountable. When you see yourself as part of the problem, you empower yourself to join the team that will do whatever it takes to solve the problem.

The Accountability Connection™

As you experience holding people accountable, you

form a unique connection with each person in your Accountability Connection. If someone feels that you have dealt unfairly with them, they will undoubtedly see the connection as negative. If they think you have treated them fairly and in a supportive manner, they will most likely view it as positive.

Most people intuitively know whether the accountability connection is positive or negative, but few pay much attention to managing it effectively. The more positive your connections, the more successful your efforts will be to hold them accountable for achieving results.

Seven Clues for Detecting a Negative Connection

1. You visibly detect the other person's frustration during your conversations.
2. You note that they tend to offer excuses even before you get into the subject.
3. You hear virtually no positive feedback about their working relationship with you.
4. You recognize that they talk freely when things are going well and clam up when things are going poorly.
5. You can tell they are avoiding you.
6. You wait in vain for a proactive report on their progress.
7. You find that your conversations with them usually focus on what's not working.

If you detect three or more of these clues, then, no matter how positively someone may claim they feel about their connection with you, it more than likely hinders your ability to hold them accountable.

Accountability Styles®

Your own Accountability Style will reflect a natural preference for one of two different sides of a continuum. The continuum describes the extremes of two common styles: Coerce & Compel and Wait & See.

Leaders on the extreme left operate with the traditional "Command & Control" style of management, acting like generals directing an army toward victory. To get results, they think they need to use the force of rank to make good things happen.

In sharp contrast, those on the extreme right will sometimes bend over backward to do the work themselves and fail to involve others sufficiently to get the job done.

Everyone, to one degree or another, has an Accountability Style and leans toward one of these two categories. Neither style is right or wrong, and both have strengths and weaknesses. However, it is important to understand that you will not improve your ability to hold others accountable if you do not understand your particular style and how it affects the way you work with the steps in the Outer Ring. ●

The Top Five Reasons People Don't Hold Others Accountable

Interestingly, it is not uncommon for people to have misgivings about holding others accountable. The top five reasons why people don't hold others accountable are:

1. A fear of offending someone or jeopardizing a personal relationship.
2. A feeling that they lack the time to follow up effectively.
3. A lack of faith that the effort will make enough of a difference.
4. A worry that, by holding someone else accountable, they may expose their own failure.
5. A reluctance to spark any potential retaliation.

Form Expectations

You cannot effectively hold someone accountable if you have not first formed clear expectations. Forming "best" expectations is what the first step in the Outer Ring is all about. Individuals and companies who fail to think through their expectations clearly, often pay an enormous price.

For a good example, take a look at the large modern office building with a strikingly different design that stands on the outskirts of London just beyond Heathrow Airport. The impressive "Ark" building, fashioned after an architect's idea of Noah's biblical ship, is constructed of glass and modern materials. It has won numerous architectural awards. However, at the time of this writing, no tenants occupy the building. Why? Because the inside of the building fell short of the expectations created by its unique and engaging outer shell. Its exterior captivated the eye, but its interior lacked the user-friendly features tenants demand. A disconnect occurred somewhere in the planning process of the "Ark Project." At the outset, the Ark's owners surely must have expected that this unique design would draw tenants like a magnet. As it turned out, prospective tenants just couldn't imagine themselves working there.

When it comes to forming key expectations that must

be fulfilled, you simply cannot afford to settle for anything less than "best." The "best" expectation in this case, if properly formed, would have empowered everyone involved, from the design team to the leasing office, to deliver an office building that would attract tenants and turn a profit.

Managers can form expectations all on their own, but they will always get better results when they form "best" expectations with the input and collaboration of those involved in making it happen.

The Expectations Chain™

The Expectations Chain consists of all the people who are connected to each other to fulfill your expectations and deliver the results you want. As you form expectations of others (at least if you want to form the kind of expectations that help ensure the result), you must consider everyone up and down the chain.

Everyone is part of a chain of expectations in the business world. We all have a boss — someone who has expectations of us, usually high expectations that we wish to fulfill. That boss can be a supervisor or manager, a parent company, headquarters, the customer or the shareholders. Whatever the case, someone defines what is expected of us. We, in turn, form links in the chain by defining expectations for others based on what is expected of us. All of these links form a chain of expectations upon which everyone involved depends for success. Understanding how we are connected and linked together in this chain is critical to forming expectations that help people deliver what we need.

When you form your expectations, you must carefully weigh the specifics of what you want to have happen, as well as the specific people who will be required to take accountability to make it happen.

When you set about establishing best expectations, apply the FORM Checklist™, which includes four characteristics that are fundamental to forming effective expectations:

Is it Framable? To ensure the expectation is consistent with the current vision, strategy and business priorities.

Is it Obtainable? To ensure that the expectation is achievable in terms of current resource and capacity constraints all the way through the Expectations Chain.

Is it Repeatable? To ensure that the expectation is portable and can be clearly communicated through the Expectations Chain.

Is it Measurable? To ensure that progress toward achieving the expectation can be tracked and that ultimate fulfillment of the expectation can be measured. ●

Communicate Expectations

The Why-What-When® approach to communicating your well-formed expectations provides a powerful tool for taking the next step in the Outer Ring of the Accountability Sequence.

Making the "Why" Compelling

To be most effective, the "Why" needs to speak to people as individuals and convince them that accomplishing the "What" and "When" matters to them on a personal level.

First, tailor the "Why" to your specific audience. The more personal you can make the "Why," the more compelling it will be. Second, make it short, simple and clear. Third, be candid, honest and forthcoming. Fourth, make it a dialogue, not a monologue. Fifth, create the hook that catches people's attention and persuades them to buy in. Sixth, frame it in a strategic context.

When you craft a compelling "Why," you create a dialogue that draws people into the cause. They become motivated and can't wait to start making it happen.

Making the "What" Clear

Once you have communicated the "Why," you can prepare to talk about the "What."

Making the "What" clear involves three discussions: communicating the expectation you have formed, clarifying the boundaries and establishing available support.

Understanding the boundaries up front can help everyone avoid unpleasant surprises and costly mistakes. Making sure that people are not inhibited by boundaries that don't really exist may be as important as spelling out those that do. Defining boundaries builds and sustains trust by clarifying important aspects of the "how," removing imagined boundaries that can serve as obstacles, and giving people a greater sense of freedom. The boundaries conversation also allows you to manage the natural human tendency to allow "scope creep," an expansion of a task that can cause people to lose focus on delivering what you really want.

The next discussion speaks to the support available to those who must deliver on the expectation. The support discussion should clarify exactly what support people can count on.

When people know about available support, including your encouragement to seek input on what more they can do to overcome obstacles, they can save you time and money in the long run by more easily and quickly fulfilling your expectations.

Making the "When" Concrete

With the "Why" and the "What" clarified, you can set about framing your expectations in terms of time. You should attach a "by-when" to every key expectation. Never assume that people grasp the urgency of a particular expectation.

Creating an environment in your team, your department, your entire organization and even with outside stakeholders, where concrete deadlines really matter, greatly facilitates everyone's ability to deliver on expectations.

Implemented effectively, Why-What-When puts in your hands a powerful tool that sets the stage for getting people aligned with what you want to accomplish. Alignment is essential to the fulfillment of key expectation and getting results. ●

Align Expectations

There are different levels of alignment. The highest level, the level that brings full ownership and personal investment is "Complete Alignment." All other levels, with their lower levels of buy-in, fall into the category of "Complyment."

Complyment occurs when people decide to move together toward a destination, not because they agree with the course of direction, but because they have determined that moving forward and complying with what you want them to do will satisfy their own best interests.

In contrast, Complete Alignment brings people to a level of agreement where they believe in and completely commit themselves to fulfilling expectations. Not only does Complete Alignment energize people in a way that engages their hearts and minds to deliver on expectations, it ignites a chain reaction, because the presence of completely aligned people improves everyone else's alignment.

Complyment may "get it done," but Complete Alignment gets it done better.

The Alignment Dialogue™

The Alignment Dialogue eliminates the danger mere Complyment poses to key expectations. Consisting of three simple steps, this dialogue helps you determine the current level of alignment (or Complyment) and what else you can do to gain Complete Alignment.

Step One: Score It. Restate the expectation, agree to use the Alignment Dialogue and then have people rate their alignment with this key expectation on a scale of 1-10.

Step Two: Evaluate It. Determine what else is needed by asking: Is it clear? Is it achievable? Is it needed? Is it linked?

Step Three: Resolve It. Resolve concerns and confirm the original expectation or revise using Why-What-When.

You will find the power of persuasion especially valuable in situations where you are trying to create Complete Alignment around key expectations. Certainly, you could just "require" everyone to fall into line and, most likely, they would. But you can't require them to get excited, to buy in enthusiastically, to bring their utmost creativity to the undertaking. You must earn that and the best way is through the power of persuasion.

Alignment with challenging expectations often requires a discussion of the "How." This does not mean telling people exactly what to do. It simply means hearing their concerns about "How" they will get it done and helping them see that they can figure it out for themselves.

People's ability to get aligned with a specific expectation depends, to a large extent, on how overloaded with work they feel. You should routinely explore how well people are "keeping up" with the work.

If you want to ensure Complete Alignment all along the Expectations Chain, you must consider the weakest links in the chain and engage in Alignment Dialogues at all crucial points in the path. ●

Inspect Expectations

The last crucial step in the Outer Ring of the Accountability Sequence is: Inspect What You Expect.™

During the inspection step, people clearly begin to see accountability at work. As you begin to inspect how closely expectations are being fulfilled, people begin to validate that you are entirely serious about holding them accountable. At the same time, you manifest your own accountability and your personal dedication to doing everything you can to get the result.

Forming an expectation around how you will inspect, communicating that expectation using Why-What-When and ensuring you have alignment about doing it will help get everyone invested in the inspection process.

You can maintain alignment best through an ongoing series of checks — and not just a onetime dialogue — through Alignment Meetings.™ The inspection process affords opportunities to check for that alignment and make sure everyone remains on the same page, thus allowing you to correct any misalignment before things

get too far off track.

Rather than a "test" to see if people are doing what you asked and will deliver what you need on time, the inspection should function as a "check-in" to discuss progress, problems and solutions.

Facilitating solutions means providing coaching, mentoring, training and resources that can help move things along and make people successful. Ultimately, your people are accountable for figuring it out and succeeding, but your ability to help that process along can often make the difference between success and failure.

While good managers keep their eyes open for weaknesses, threats or potential risks, the best ones do so within the context of observing and reinforcing progress. Smart managers know that every time they hold someone accountable they are, in essence, holding the entire organization or team accountable. ●

The Inner Ring®

Sometimes even the most painstaking efforts to Form, Communicate, Align and Inspect your expectations cannot prevent disappointment. That's when you move into the Inner Ring of the Accountability Sequence and implement its strategies for dealing with any surprises.

Skillfully managing unmet expectations is a characteristic of any organization that enjoys or aspires to greatness. The idea that a business can improve performance, and even achieve greatness, by eliminating nonperformers who may require too much effort to turn around may tempt frustrated and busy managers, but it does not always make sense. Sometimes it makes much more sense to invest a similar amount of time and energy in helping people become successful, thus rendering it unnecessary to let them go.

The Reality Window®

When it comes to holding people accountable and managing unmet expectations, accurately diagnosing the problem so that you can do something about it requires a clear sense of reality; it requires you *to see things as they really are*.

But what is reality? The *Phantom Reality*™ is an inaccurate description of how things really are. The *Reality* is an accurate description of the way things really are. The *Desired Reality* is what you want to have happen.

Perform a Reality Check by asking yourself some simple questions aimed at determining whether you are seeing reality or laboring under the influence of a Phantom Reality. These questions might include: "Am I ignoring or discounting the obvious?" or "Have I made a false assumption that may come back to hurt us later on?"

Asking these questions from time to time to test the validity of your assumptions, and getting everyone else to do it as well, will help you recalibrate your activities in order to keep from wasting valuable time, energy and resources.

Solving Unmet Expectations

To manage unmet expectations and get people back on the right track, you must provide more training and/or more motivation.

Often, organizations are populated by talented people who are anxious to succeed and want to be a part of an enterprise that makes a difference in the world, but who, for some unknown reason, just do not deliver the results. They are willing and they are able, but they either lack accountability or are operating in a culture ("the way we do things around here") that hurts their chances of succeeding.

The four variables of motivation, training, culture and accountability, provide direction and clarification to those who hold others accountable. They make up the Inner Ring Solutions and are fundamental to the Accountability Conversation that allows you to deal effectively with people who are falling short on expectations, whether they report to you or not.

When you deal with unmet expectations, you can choose one of three courses of action: One, you can lower the expectation to accommodate people who are not delivering; two, you can replace those people; or three, you can engage them in the Accountability Conversation with an eye toward helping them produce the results you want through the Expectations Chain.

Key to solving unmet expectations in the Inner Ring are the three steps of the conversation: Make sure the problem is not on the Outer Ring; select an Inner Ring Solution and use the Outer Ring to implement the plan. ●

Examine Motivation

While there are times when it may prove difficult to isolate the one variable that has led to the disappointment, in certain cases you may quickly spot lack of motivation as the primary culprit.

Consciously and deliberately enrolling people in the cause can greatly influence their motivation to rise up and meet expectations.

What more can you do? To capture the hearts and minds of people in your Expectations Chain you can

master four simple steps: Define It, Sell It, Advocate It and Celebrate It.

Define It means crafting a compelling story that captures people's imaginations and inspires them to achieve the objective. A compelling story creates context and gives people a vehicle they can use to readily pass the information on to others in a powerful and persuasive way.

Sell It means becoming a storyteller with the objective of persuading people to buy into the cause. Selling it means answering the "why" questions. You need to address the "whys" behind the task in a way that speaks to your particular audience. (Why is it important? Why me — and not someone else? Why now? Why do it this way? Why would I want to do this?)

Advocate It means continuing to support the cause publicly, reinforcing the story with additional supporting evidence, and telling and retelling the story over time.

Celebrate It means publicly acknowledging success. You should not only praise people for achieving the ultimate goal, but you should also reinforce all the progress made along the way. ●

Evaluate Training

The second of the Inner Ring's four solutions is targeted training. If you suspect that people are failing to meet expectations because of a deficiency in training, then, ideally, you will want to provide training that not only addresses the current problem, but also increases the capability of everyone in the Expectations Chain to deliver over the long term.

Most organizations struggle to recruit and retain the right amount of talent. Even if they succeed in doing so, they still must equip that talent with the direction and development required for focusing their efforts in a way that produces desired results.

Whether you have recruited the right talent or not, you should make developing capability and skill throughout your Expectations Chain a top priority. Countless organizations have infused their own Expectations Chains with targeted training that has turned around performance and reversed downward trends.

Training Triggers

If you decide that you can best solve unmet expectations with a training solution, you will first want to identify the level of intervention needed to help others succeed. There are four levels of training intervention, each dependent on two factors: how much effort it will take to improve the performance of those who need training and how often they fail to deliver results.

Level One requires coaching to the Problem. The person generally performs well and only occasionally fails to deliver. Such a situation triggers a training intervention you can implement quickly.

Level Two requires coaching to the Pattern. You detect a more consistent pattern of missed deliveries; you need to invest more time and effort in the training.

Level Three requires coaching to the Performance. A serious pattern of problems persists, making it clear that the person will never succeed without developing much greater capability. Applying training at this interim level can produce a payoff, albeit not always an immediate one. A person at this level may need off-site formal schooling, training courses offered by professional groups and a lot of after-hours studying.

Level Four requires coaching to the Placement. This includes those who have not responded at all to your attempts to develop and train them. Their continued missed delivery triggers the only solution left: coaching to placement. You can place them in another job better suited to their abilities or you can counsel them out of the organization.

The training triggers enable you to think through what it will take to help others succeed, and they stimulate others to identify their own developmental needs. ●

Assess Accountability

Accountability is not something that happens to you when things go wrong, but something that you should continually embrace with every new task. The truly accountable person doesn't ask "Who can I blame for this problem?" but "What else can I do to achieve the result?" The principle of positive accountability enables people to rise above their circumstances and overcome the obstacles they face.

The Oz Principle (also written by Connors and Smith) defines accountability as "a personal choice to rise above one's circumstances and demonstrate the ownership necessary for achieving desired results — to See It®, Own It®, Solve It® and Do It.®"

Managing the Accountability Current

An Accountability Current flows in every organization and through every Expectations Chain. The current is the directional flow of accountability and identifies where the accountability originates and the direction it moves.

Top-down accountability keeps everyone at the top of

the Expectations Chain busy trying to regulate all the important activity in the organization. What is the problem with a top-down flow? Everyone below the top may feel as if they must obey orders or suffer the consequences.

While the bottom-up approach requires a greater investment of time up front, it pays off handsomely in the long run because when people invest themselves in accountability, those at the top of the chain will expend far less energy and effort sustaining a results-producing effort throughout the organization.

When an Accountability Current flows in a bottom-up direction, people take accountability and proactively report to their boss, their teammates and their peers. Follow-up becomes a natural, ingrained habit.

With a bottom-up flow, people at all levels in the Expectations Chain hold everyone upon whom they depend accountable. This includes the people to whom they report, the people who report to them, peers, customers, vendors, suppliers and all other stakeholders. This is 360° Accountability.® ●

Consider Culture

Sometimes you can attribute unmet expectations to problems with an organization's culture.

Since an organization's culture can either help or hinder people as they work to fulfill expectations, learning to recognize the symptoms of a cultural malady will set you on a path toward curing it.

The first step toward strengthening your company's culture requires an accurate appraisal of just how and why people have come to think and act in unproductive ways.

The Results Pyramid®

The Results Pyramid model identifies how and why people draw conclusions about what to do and what not to do in their daily work.

Results. At the top of the pyramid are "Results." Accountability begins by clearly defining the results you want. With specific results in mind, you can ask yourself, "What are the actions people must take to produce those results?"

Actions. The next level, "Actions," might include a list of considerations like taking more initiative, searching for innovation, cutting costs, reducing cycle time, hiring and training the needed sales staff, thoughtfully planning the product launch or learning how to work in a dedicated team environment filled with highly skilled and trained colleagues.

Beliefs. The next level of the pyramid prompts you to ask: "What are the beliefs people must hold to drive those actions?"

Experience. Finally, there's the foundation of the pyramid and the key question, "What are the experiences people must have to form those new beliefs?" While it is often hard to do it well, nothing helps shift a culture more swiftly than providing new experiences that reinforce new beliefs.

A Culture of Accountability®

A Culture of Accountability is "a place where people think and act, on a daily basis, in the manner necessary to develop successful solutions, find answers, overcome obstacles, triumph over any trouble that might come along and deliver results."

People in a Culture of Accountability follow through to make sure they do what they say they will do, commit themselves to getting to the truth, no matter what, and feel free to say what needs to be said. ●

Conclusion

People at every level of an organization, in every sector of the economy and in every type of business imaginable struggle with the same fundamental question: "How do I effectively hold other people accountable for results?" Experience shows that it's not an easy question to answer. However, when you get accountability right, people respond. When you get it wrong, they rebel.

The positive, principled way paves a simple, rational and fair path to getting it right, a path you can take time and time again to hold people accountable in a way that builds morale and gets results. When that happens, people willingly invest their hearts and minds to meet and exceed expectations and deliver extraordinary results, the kinds of results that never leave you wondering, "How did that happen?" ●

Journey to the Emerald City

Achieve a Competitive Edge by Creating a Culture of Accountability®

by Roger Connors and Tom Smith

THE SUMMARY IN BRIEF

An organization will perform at its highest potential if, and only if, each of its members assumes personal accountability and ownership for achieving the organization's results. When people assume personal accountability for achieving the results, powerful transformations occur: A goal becomes an *organizing principle*, a job becomes a *mission*, a task becomes a *challenge*, a company becomes a *team*, and a manager becomes a *leader*. Nothing can benefit an organization more than creating a culture imbued with this kind of ownership and accountability.

To create a Culture of Accountability you must lead people in a way that fundamentally impacts the way they think and act. Introducing The Results Pyramid® Model as the key culture management tool, co-authors Roger Connors and Tom Smith build on the foundation laid in their bestselling book, *The Oz Principle*,® by documenting exactly how leaders dedicated to needed culture change have reaped the rewards of record sales and their largest gains ever in market share, profits and stock prices.

Journey to the Emerald City, describes the process for Creating a Culture of Accountability® that energizes every level of the organization, from the senior management team to the front-line worker, and, most importantly, it outlines the best and fastest way to create that culture so that you can quickly begin enjoying the results of a greater competitive advantage.

IN THIS SUMMARY, YOU WILL LEARN:

- How to manage the cultural environment of your organization more actively.
- How to accelerate the transition to a new, more effective culture.
- Practical methods for gaining people's wholehearted commitment to achieving organizational results.
- A powerful framework for understanding and changing a company culture.

PART ONE: UNDERSTANDING COMPANY CULTURE

Before you can change something as interwoven as organizational culture, you must first understand its components and how they work together. Effective leaders, consciously or unconsciously, manage the beliefs and actions of their people so they will produce the results that the organization must achieve. The Results Pyramid, a practical model of organizational culture, will help you accelerate desired and needed shifts in your culture.

Accelerating the Journey

Continuing the metaphor of Frank Baum's story, *The Wonderful Wizard of Oz*, used in *The Oz Principle*, the journey that every successful organization must take includes laying out a clear and simple path that accelerates any needed change in the culture of a team or organization, one that will produce the right organizational results.

Anyone who wants to work in an effective organization needs to understand that consistently achieving results — usually more and more difficult results to achieve — requires an organizational journey that channels individual and group efforts, energy, actions and thought in a targeted, precise manner.

Creating a culture that achieves an ideal level of precision is not only **obtainable**; it is **mandatory** in today's difficult economic environment.

A Company's Culture

Four central principles drive the cultural transformation from the wrongheaded ways that reinforce all the wrong messages about how someone should think and act to the ways that empower people to achieve great results:

- An organization's leader must create its culture.
- The organization's culture will create its results.
- A Culture of Accountability is the most effective culture and is defined as people at every level of the organization who feel accountable to think and act in the manner necessary to achieve organizational results.
- Accelerating the transition to a Culture of Accountability creates competitive and organizational advantage.

Culture Creates Results

An organization's culture determines the results it achieves. Since leaders should build their company's culture around targeted results, they may need to change their culture as business conditions change and they define new results for the organization.

Recognizing the link between desired results and needed culture is the first step in the journey along the path to achieving and sustaining success.

Management must accept creating the right culture as one of its most serious responsibilities. That best culture, a Culture of Accountability, requires a heightened sense of personal accountability shared by everyone at every level of the organization.

Many managers misunderstand accountability when they rely on the Webster's dictionary definition of the term: "the state of having to report, explain or justify." But that definition only motivates *blamestorming*, an all-too-frequent corporate behavior.

A better definition of accountability is "proactively seeing the reality of a situation, personally owning the existing circumstances, relentlessly looking for ways to solve the problem and consistently following-through to make things happen before it's too late."

When that kind of accountability drives a Culture of Accountability, it greatly influences the way people think and act in order to achieve desired organizational results, and it quickly begins to propel progress and increased profits.

In a Culture of Accountability, everyone in the organization assumes a high level of personal ownership to change what needs to be changed and to do what needs to be done, even if that means a dramatic departure from past practices and behavior that once served the organization well but no longer do so.

Every organization creates its own unique Culture of Accountability, depending on the results and actions it needs to achieve its current objective and long-term mission. Knowing how to identify and accelerate the shift to that culture, is embodied in the simple and powerful Results Pyramid model.

The Results Pyramid®

The Results Pyramid model spells out the key elements and workings of organizational culture. It consists of three simple interrelated components that form the culture of any organization: ***Actions***, ***Beliefs*** and ***Experiences***, all of which work together to produce the company's culture, which, in turn, produce the company's results, the fourth and final element of the model.

Results are the outcome of the actions we take — and our actions always produce results, whether they are the results we want or not. These results appear at the very top, or point, of the pyramid.

Our actions stem from our beliefs about what we should and should not do in the organization, and our experiences, both inside and outside the organization, shape our beliefs. These experiences form the broad base of the pyramid, with beliefs, then actions, stacked above.

Hypothetically, suppose R^1 describes the results your organization is currently achieving. According to the Results Pyramid, your current Culture (C^1) produces R^1. C^1 includes the Actions (A^1) people currently take; the Beliefs (B^1) people currently hold about how to think about their work and what to do and not do in the organization; and the Experiences (E^1) that form the basis of those beliefs — real occurrences that people experience either directly or indirectly, ones that have happened years ago or just yesterday, that form their impressions about everything from how to handle a disgruntled customer to whether or not to ship a product on time.

One president of a major pharmaceutical firm liked to say to his team, "Every one of us is creating the culture of this company every day. As a manager, everything you do, everything you say, everywhere you go in the organization leaves a footprint on the culture of this place."

Each person's passage through a company will affect people in it for better or worse, every single day.

Results and Culture Change

The following four criteria will help you determine if you have a significant culture change effort in the making:

- Difficulty. If R^2 (future results) will require a lot more effort to achieve than past results, then you will probably need to make significant shifts in some aspects of your culture.
- Direction. If R^2 signals a change in direction for the organization, then this may also require significant cultural change.
- Deployment. If R^2 demands a large-scale redeployment of people or other resources, then a significant change in at least part of the culture may be necessary.
- Development. If R^2 suggests developing a new capability, then then you are likely to face a significant culture shift.

PART TWO: SHIFTING TO A NEW CULTURE

There are practical steps you can take to identify and implement the shifts that must occur in your organization. Before you can get people to embrace new culture, you must shift the four major culture components — Results, Actions, Beliefs, and Experiences.

Defining Results That Lead to Success

When managers effectively lead an organization to a new culture, they move people through a series of sig-

nificant shifts driven by the need to stop doing certain things and to start doing other things. Most management teams are working to achieve some set of future results (R^2), which represent a change from the *status quo* (R^1). Seldom can an existing Culture (C^1) achieve R^2 without changing the ways people think and act (i.e. shifting to a new Culture (C^2).

If R^2 involves an ambitious increase in revenue and margins and/or major cost reductions, you must ask yourself, "Will the C^1, produce R^2?" If not, then you must ask another crucial question, "What shifts need to occur in E^1, B^1 and A^1?"

By defining E^2, B^2, and A^2, you define the new culture, C^2, which will produce R^2.

Quite simply, a culture shift changes the way people think and act in order to achieve a new result. Once you define the new result, you can then identify and create the actions that will produce those results, the beliefs that will motivate those actions and the experiences that will foster those beliefs.

Results That Create Alignment

When beginning the shift from C^1 to C^2, you specify results that create and maintain alignment at every level of the organization. Keeping a culture aligned around results involves three steps:

Step 1: Clearly define the targeted result. Clear goals create focus. People know what they're working for, and they know when and if they succeed. They also develop a sense of what they need to do and a willingness to do what it takes to achieve a clearly defined result. Unclear goals promote cynicism. People are not fooled by managers who avoid setting clear, meaningful goals due to incompetence or a desire to dodge accountability.

Step 2: Drive the result throughout the organization. At times, management has a clear result in mind but fails to communicate it effectively or completely to everyone in the organization. For an organization to get and stay aligned around a result, everyone must recognize and understand it. They must understand what the result is and see clearly how their own work will contribute to the achievement of that result.

Step 3: Hold people accountable for achieving results, rather than for doing their jobs. Organization charts and job descriptions push people into boxes. They give people the idea that they are getting paid and using their skills to perform a defined function or set of tasks. This can lead people to believe that if they perform their functons they've done what they're supposed to do, whether or not the result was achieved. Effective leaders manage their people so that their "job" is to achieve results. The daily activities that comprise people's jobs must align consistently with the targeted results.

If you take these three steps and actively foster a sense of personal accountability for the results you want to achieve, you will have taken a major stride in the journey toward Creating a Culture of Accountability, where everyone holds everyone accountable for results. ●

What About Backsliding?

Behaviors do not change overnight. Some people will comprehend and act on the new set of beliefs more quickly and effectively than others. Yet even those people may backslide from time to time.

Clear and constant feedback will go a long way toward curbing any tendency to revert to old behaviors, while at the same time helping people a maintain a high level of buy-in and follow-through with respect to the new behaviors. That's the only way you can confidently change the way people think.

And changing the way people think is what culture shifts are all about. If you want to shift your culture quickly and effectively, work with the bottom of the pyramid — Beliefs and Experiences!

Generating Action That Gets Results

Accelerating a shift in the way people act requires a clear understanding of what you need to stop doing, what you need to start doing, and what you need to keep doing. Determining these actions will help you identify what you need in C^2. When doing so, you should ask yourself, "How will your ability to achieve R^2 results be compromised if we do not generate the stops and starts on our list?" The answer to that question will enhance your motivation to make the right things happen.

If you think this sounds easy, think again. It is tempting to think that management can list everything that people need to stop doing, start doing, and continue doing and feel that they have achieved a level of definition necessary to enact a culture change. It may be a good start, but it is not enough to generate action that gets results and will accelerate the culture change.

Figuring out and staying focused on what to start,

what to stop, and what to keep doing requires vigilance and hard work.

Management must create an environment in which people at all levels continually ask themselves, "Given the results we are seeking, what should I stop, start and continue doing?" This approach will create the necessary ownership not only for determining the right answers, but also for buying-into and following-through on doing whatever it takes to achieve the results. ●

Identifying Beliefs That Produce Action

Organizational culture is comprised of a system of beliefs. You can't come up with just one belief, promulgate that belief and expect it to motivate the right actions. Rather, you need a set of beliefs that work together as a system.

Every company must go through its own journey of self-discovery in order to understand its current beliefs and to develop new, needed beliefs. One useful product of that process is a Beliefs Statement, which every company should develop before undertaking a culture shift.

Shifting Beliefs

Every organization operates with a set of commonly shared beliefs about how the organization functions, what people should and should not do, and how they should and should not do it. Shifting those beliefs boils down to changing how people would describe "the way things are done around here." If you can accelerate the transition from B^1 to B^2, you will more quickly shift the accompanying actions people will take all across the organization and obtain the competitive edge you seek. In a nutshell, successful cultural transition hinges on shifting beliefs.

Creating the Road Map: A Cultural Beliefs® Statement

Consider the last new hire in your organization and imagine that you could script what people would say to this newcomer during a get-together at lunch on their first day. The recruit asks, "How do things really work around here?"

What would you want your veterans to say to this new employee? What are they saying? Do they offer views that describe behavior you need people to stop demonstrating all throughout the organization, or do they state shared beliefs that describe the actions you need people to start taking today?

Management teams dedicated to accelerating a needed cultural shift capture the beliefs they need people to hold, the beliefs they need people to share with every "new hire." A clear, concise and compelling Cultural Beliefs® Statement can make that happen — a cultural road map for how you need people to think and act in order to get the desired R^2 results.

No one person crafts a good Cultural Belief Statement. Rather, it is the product of group interactions in which the management team describes the key B^2 beliefs that the organization needs to create. The statement may also include any key beliefs that already exist in the organization that must remain in place to perpetuate your success. It must, however, capture what will propel your organization, department, group, or team to progress toward R^2 results. ●

Creating Experiences That Instill the Right Beliefs

Of course, culture change involves much more than merely crafting and distributing a Belief Statement. Real change requires that leaders (and eventually everyone in the organization) create experiences aimed at shifting, creating or maintaining desired beliefs. Experiences, more than anything else, convince people of the power and validity of beliefs.

Effective leaders create useful, consistent, powerful experiences for people at all levels in the organization. Managers who cannot do so invariably find themselves at the mercy of their culture, particularly when the going gets rough. *Manage your culture, or it will manage you.*

Four Types of Experiences

To transform an organizational culture or to add new elements to a fairly solid one, you need to start creating new experiences consistent with desired beliefs.

Not all experiences are equal. Many leaders attempting major culture shifts have found that, at first, the experiences they created did not change people's beliefs. With a little coaching, however, they learn to appreciate the four basic types of experiences, each of which impacts results differently:

- **Type 1:** A meaningful event leading to immediate insight. Type-1 Experiences are so clear they need no interpretation in order to foster desired beliefs.
- **Type 2:** An experience that needs to be interpreted in order to form the desired beliefs.
- **Type 3:** Experiences that will not have an impact on prevailing beliefs because people perceive them as insignificant.

- **Type 4:** Experiences that people will always misinterpret, regardless of the quality of the explanation that is given.

To help people shift their thinking and adopt new B^2 beliefs, you must generate Type-1 and Type-2 experiences.

Type-1 Experiences establish beliefs powerfully and unmistakably. Most cultural shifts require several of these. In reality, you will undoubtedly create quite a few Type-2 Experiences, which require careful interpretation. If you provide accurate and convincing interpretations, your people will learn what they need to learn from those lessons.

PART THREE: ACCELERATING CULTURE CHANGE

There are some proven tools and practices that can enable you as a leader to consciously accelerate the cultural transition and focus effort to speed the journey. Leadership is the act of managing the culture and accelerating the change. Leaders can successfully make the shift happen when they use the right tools.

Using Focused Feedback® to Accelerate Change

Focused, ongoing feedback is a tool that can speed your organization to a new, more effective culture, provided you relay the right kind of feedback and use it well. To accelerate culture change, you must give frequent, focused and unfiltered feedback.

Frequent means daily, continual and ongoing.

Focused means concentrating on the beliefs the organization has agreed to adopt and the results it has committed to achieve.

Unfiltered means adopting an inviting posture to help people remain open to feedback.

You must take great care to give and ask for feedback the right way. When you ask for and offer reinforcing and constructive feedback, people will willingly and are even eager to correct any shortcomings. Such feedback emphasizes both what is working and what could be working better.

Ask for feedback by saying, "What feedback do you have for me?" and when you receive some say, "Thanks for the feedback!".

Evaluating Feedback

When evaluating the feedback you receive, always ask yourself, "Is this a belief I want people to hold?" and "If people do hold that belief, how will it affect their actions and our results?" Seek input from others objectively.

Feedback is simply the belief someone is holding — it's input, information, a point of view, and someone's honest opinion about what they believe. If that belief motivates the behavior and actions the organization needs, great. If it doesn't, then you need to work to change the belief that person holds, rather than deny its existence or punish the person who holds it.

Feedback is a tool for accelerating culture change only when people act on it. By employing feedback within the context of the Cultural Beliefs, you can help people gain a clearer sense of how they are demonstrating those beliefs and what they can do to further demonstrate them. In this way, they can adjust the experiences they create in a way that accelerates the transition to a Culture of Accountability.

Aligning a Culture for Rapid Progress

Organizational success depends a lot on creating and maintaining alignment during any organizational effort, especially when you are trying to effect a cultural transition. Because so many forces conspire to push the organization out of alignment, leaders must continually pay attention to alignment.

Effective leaders consider four levels of ownership and alignment:

- **Buy-In/Invest.** This top level represents a high degree of ownership; they are intellectually and emotionally committed.
- **Comply/Concede.** People intellectually disagree with or are uncertain about the endeavor, but they are emotionally invested enough to take action.
- **Exempt/Excuse.** People agree intellectually but do not involve themselves emotionally.
- **Resist/Resent.** People disagree intellectually and remain emotionally uninvolved with the course of action or desired result.

The strongest alignment occurs when people operate at the highest Level of Ownership, buy-in/invest. While a large percentage will reside in comply/concede, and that may be sufficient to get some things done, leaders should help all the people move to one of the top two Levels of Ownership. This will make the difficult task of culture change achievable by helping them understand the change

and getting them involved in it.

When people buy-in and invest, they engage their hearts and minds in the change effort and actively promote it. Their efforts will range from supporting or advocating the change to championing or even sponsoring it.

The Alignment Process

A reliable alignment process incorporates five key elements:

1. **Participation.** The appropriate people are involved. You need the right people engaged. You must help them to understand their roles.
2. **Discussion.** All participants are heard prior to reaching or implementing a decision. The participants need to understand that they are there to offer counsel, their advice, input, views and the benefit of their experience.
3. **Ownership.** All participants actively promote the decision.
4. **Communication.** The "message" regarding the decision is consistently communicated to all appropriate individuals.
5. **Follow-Up.** All participants follow-up to ensure alignment is maintained.

When cultural transitions or other major business initiatives do not succeed, you will often find that lack of alignment often contributed greatly to the failures. At some point, most often at the ownership or communication stages, a breakdown occurred. On the other hand, when management properly applies all five elements, the chances of accomplishing a shift to C^2 increase dramatically. ●

Employing Leadership to Move the Change Forward

The philosopher Georgi Ivanovitch Gurdjieff observed that most of us "sleepwalk" through life. When it comes to creating culture, many managers look like "sleepwalkers," and, for that matter, "sleeptalkers" as well.

If leaders move unconsciously through the organization, not paying attention to the experiences they create with both their words and actions, then they most likely will not create experiences that fuel a robust and effective corporate culture; but will create experiences interpreted by the organization in ways that actually undermine their goals and objectives for the organization.

Leaders, consciously or not, create experiences every

One Company's Belief Statement

DECISION MAKING	I step up to the plate and make decisions I should make and I take accountability for the results.
PEOPLE ORIENTATION	I treat customers, employees and suppliers as I want to be treated — with honesty, courtesy and respect.
COACHING AND FEEDBACK	I invest time seeking, understanding and giving honest feedback to people I work or associate with.
PURPOSE AND DIRECTION	My daily activities are aligned with the purpose and direction of our organization.
INVOLVE AND SHARE	I look everywhere to involve the right people, inside or outside my unit, in developing and implementing the best ideas and solutions.
CUSTOMER FOCUS	I seek to understand and to meet or exceed customer expectations 100 percent of the time.
COMMUNICATION	I communicate what's going on and why within my area of responsibility so that all people hear the same message.
OWNERSHIP	I own my budget. I focus my priorities to exceed my budget regardless of the obstacles that come up.
ACCOUNTABILITY	I operate Above the Line® by seeking opportunities to accept challenges and solve problems, realizing that I own the responsibility for the outcome.

(figure 5-7, from page 116, Journey to the Emerald City)

day, and these experiences can propel or derail their effort to establish a culture of high-achievement by either reinforcing the desired culture or not. Will you unconsciously create the wrong ones and court failure, or will you consciously create the right ones and enjoy unprecedented success?

A Methodology for Creating Experiences

Leaders take on a real challenge when they set about to create experiences that will facilitate a change to C^2: demonstrating the new beliefs in a way that fully enrolls people in the new culture who are steeped in C^1. Fortunately, they can do it relatively quickly with a proven methodology that opens up just the right kind of dialogue. That dialogue leads to the E^2 Experiences needed to reinforce B^2 Beliefs.

Modeling beliefs, that is, practicing what you preach and creating experiences that promote C^2 Culture, will come more easily to some managers than it will to others. Leaders who openly work on shifting the experiences they create, turn themselves into accelerators of change.

People find it powerful when leaders themselves shift. Leaders who do this well position themselves to help others make even the most difficult shifts and live the Cultural Beliefs. ●

Enrolling the Entire Organization in the Transition

Few culture change tasks prove more daunting than enrolling the whole organization in the change in a way that speeds up the transition, particularly for a company with multiple functions, locations, divisions and, perhaps, multinational operations.

Nine rules for accomplishing large-scale culture change and accelerating the transition will serve such organizations well:

1. Use an integrated process.
2. Start a dialogue with the organization.
3. Allow for subcultures.
4. Start at the relative top.
5. Work with intact teams.
6. Create a process control.
7. Apply the change globally.
8. Assist the walking wounded.
9. Align organizational systems.

In any large-scale change the challenge is to get everyone on board. When you have strong subcultures, foreign operations, or low morale, that challenge becomes even greater. Using at least several of these practices will accelerate your company's transition to the new culture.

No one in business today, or in any other endeavor, believes that organizations will be able to stop changing. In fact, the need for change can only increase.

Culture change happens one person at a time. You accelerate a change in the culture when you engage the hearts and minds of everyone in the endeavor and they begin to ask themselves: What are the results that are most important to achieve? How must I think and act in order to produce them? What do I want those around me to believe about how they need to think and act? How can I create experiences that foster those beliefs? Of course the process begins with you.

Managers get results through others. Yet they cannot simply ask or order people to take the actions they should. Instead, they must lead people to do them. Leading people, in the true sense of the team, means creating experiences that reinforce a Culture of Accountability. There is no power like the power of people who assume personal accountability for achieving a collective goal.

The process of creating and accelerating the shift to a Culture of Accountability is not an ambiguous or magical process that defies explanation. It results from taking the steps that engage everyone in the organization to live the beliefs, create the experiences and perform the actions that will produce results.

Creating this level of ownership and participation will certainly speed you on your way to a destination abundant with the results you now seek. ●

Methodology for Creating Experiences

Use these five steps to accelerate a shift in beliefs:

Step One: Identify the belief you need to change.

Step Two: Tell people the belief you want them to hold.

Step Three: Describe the experiences you're going to create for them.

Step Four: Ask for feedback on the planned experience.

Step Five: Enroll others in giving you feed back on your progress.

Management: Hands-on

Managing

by Henry Mintzberg

THE SUMMARY IN BRIEF

Managers are idolized like few others in society. Newspapers are filled with stories about their exploits and the shelves of bookstores are teeming with books for their edification. We try hard to train huge numbers of students in MBA programs to become managers. Yet we know surprisingly little about what management means and what it means to be a manager.

In *Managing*, management expert Henry Mintzberg sets out to recover the essence of managing. Mintzberg observed 29 different managers at work in vastly divergent fields and settings, ranging from a refugee camp to a symphony orchestra. What he saw — the unrelenting pace of the job, the frequent interruptions, the dizzying variety of activity and the fact that e-mail now makes it all worse — led Mintzberg to develop a new model, one grounded in the fact that management is neither a profession or a science, but a *practice*.

Managing is vintage Mintzberg: iconoclastic, irreverent, carefully researched and mythbreaking. He considers the intense dynamics and untold variety of the job of managing, as well as its inescapable conundrums, and how managers become more effective. His objective is straightforward. Managing is important for anyone affected by its practice, which in our world of organizations means all of us. We need to understand it better, in order for it to be practiced better.

IN THIS SUMMARY, YOU WILL LEARN:

- Are leaders really more important than managers?
- Where has all the judgment gone?
- Has management style been over-rated?
- Is e-mail destroying management practice?
- How are managers supposed to connect when the very nature of their jobs disconnects them from what they are managing?

THE COMPLETE SUMMARY: **MANAGING**

by Henry Mintzberg

The author: Henry Mintzberg is Cleghorn Professor of Management Studies at McGill University in Montreal and the winner of numerous awards from the most prestigious academic and practitioner institutions in management. He is the author of 15 books, including *Managers Not MBAs, Strategy Safari, The Rise and Fall of Strategic Planning* and *Mintzberg on Management.*

Managing Ahead

Konosuke Matsushita, who founded the company that carries his name, claimed, "Big things and little things are my job. Middle level arrangements can be delegated." In other words, leadership cannot simply delegate management; instead of distinguishing managers from leaders, we should be seeing managers as leaders, and leadership as management practiced well.

By putting leadership on a pedestal separated from management, we turn a social process into a personal one. No matter how much lip service is paid to the leader empowering the group, leadership still focuses on the individual. Whenever we promote leadership, we demote others, as followers. Slighted, too, is the sense of community that is important for cooperative effort in all organizations. What we should be promoting instead of leadership alone are communities of actors who get on with things naturally, leadership together with management being an intrinsic part of that.

Managing as a Practice

It is time to recognize that managing is neither a science nor a profession; it is a practice, learned primarily through experience and rooted in context.

Science is about the development of systematic knowledge through research. That is hardly the purpose of management, which is about helping to get things done in organizations. Management is not even an applied science, because that is still a science. Management certainly *applies* science: managers have to use all the knowledge they can get. And they certainly use analysis, rooted in the scientific method (meaning here scientific proof more than scientific discovery).

But effective managing is more dependent on art and is especially rooted in craft. Art produces the "insights" and "vision" based on intuition. And craft is about learning from experience — working things out as the manager goes along.

Thus, managing can be seen to take place within a triangle when art, craft and the use of science meet. Art brings in the ideas and the integration; craft makes the connections, building on tangible experiences; and science provides the order, through systematic analysis of knowledge.

Most of the work that can be programmed in an organization need not concern its managers directly; specialists can do it. That leaves the managers with much of the messy stuff — the intractable problems, the complicated connections. This is what makes the practice of managing so fundamentally "soft," and why labels such as experience, intuition, judgment and wisdom are so commonly needed to describe it. Put together a good deal of craft with the right touch of art alongside some use of science, and you end up with a job that is above all a *practice*. There is no "one best way" to manage; it depends on the situation.

Not a Profession

Little of management practice has been reliably codified, let alone certified as to its effectiveness.

Because of their codified knowledge, engineering and medicine must be learned formally. And so the trained expert can almost always outperform the layperson. Not so in management. Few of us would trust the intuitive engineer or physician, with no formal training, yet we trust all kinds of managers who have never spent a day in a management classroom.

The patient does not argue with the surgeon or, for

that matter, the surgeon with the molecular biologist. In their own domain, each knows better. But managers who believe they know better get in the way of their practice, because it has to be largely one of facilitation. The manager, by the definition used here, is someone responsible for a whole organization or some identifiable part of it (which, for want of a better term, shall be called a *unit*).

Bringing Out the Best in Other People

To use that old saying, attributed to Mary Parker Follett in the 1920s, managers get things done largely through other people — those in the unit who formally report to them as well as others around it who do not. Managers have to know a lot, especially about their specific contexts, and they have to make decisions based on that knowledge. But especially in large organizations and those concerned with "knowledge work," the manager has to help bring out the best in other people so that *they* can know better, decide better and act better.

Is there something professional about the manager who treats his or her practice nobly, responsibly? Something important, yes, but let's not mix up acting responsibly with practicing a profession. Instead, let's recognize management as a *calling*, and appreciate that efforts to professionalize it and turn it into a science undermine that calling. ●

The Dynamics of Managing

If we wish to make significant headway in improving the practice of managing, we need to bring the covert reality in line with the overt image.

Folklore: *The manager is a reflective, systematic planner.*

Facts: Study after study has shown that (a) managers work at an unrelenting pace; (b) their activities are typically characterized by brevity, variety, fragmentation and discontinuity; and (c) they are strongly oriented to action.

No matter what they are doing, managers are plagued by what they might do and what they must do. To be superficial is an occupational hazard of managerial work, certainly compared with the specialized work most managers did before they went into this job. To succeed, managers have to become proficient at their superficiality.

Folklore: *The manager depends on aggregated information, best supplied by a formal system.*

Fact: Managers tend to favor informal media of communication, especially the oral ones of telephone calls and meetings, also the electronic one of e-mail.

Unlike other workers, the manager does not leave the telephone, the meeting or the e-mail to get back to work. These contacts are the work. The ordinary work of the unit or organization — producing a product, selling it, even conducting a study or writing a report — is not usually undertaken by its manager. The manager's productive output has to be gauged largely in terms of the information he or she transmits orally or by e-mail.

Folklore: *Managing is mostly about hierarchical relationships between a "superior" and "subordinates."*

Fact: Managing is as much about lateral relationships among colleagues and associates as it is about hierarchical relationships.

We might characterize the manager's position as the neck of an hourglass, sitting between a network of outside contacts and the internal unit being managed. The manager receives all kinds of information and requests from insiders and outsiders, which are scanned, absorbed and passed on to others, again both inside and outside the unit.

Folklore: *Managers maintain tight control — of their time, their activities, their units.*

Fact: The manager is neither conductor nor puppet: Control to the extent possible tends to be covert more than overt, by establishing some obligations to which the manager must later attend and by turning other obligations to the manager's advantage.

The effective managers seem to be not those with the greatest degrees of freedom but the ones who use to advantage whatever degrees of freedom they can find. In other words, these people do not just *do* the job; they *make* the job.

The Impact of the Internet

The advantages of the Internet are evident and quite astonishing. Managers can keep in current touch with people all over the world in ways that used to be unthinkable. They can also share large amounts of information with a great many people. These advantages enable them to greatly extend their informational networks and rather easily conduct their affairs across the globe.

It is important to note that this new medium remains thin. Like conventional mail, e-mail is restricted by the poverty of words alone: There is no tone of voice to hear, no gestures to see, no presence to feel — even images can be a nuisance to create. E-mail may simply limit the user's "ability to support emotional, nuanced and complex interactions." Managing is as much about all these things as it is about the factual content of the messages.

The danger of e-mail is that it may give a manager the impression of being in touch while the only thing actually being touched is the keyboard.

The Internet may be enhancing networks while weakening communities, within organizations as well as across them.

E-mail increases the pace and pressure of managing, and likely the interruptions as well.

The Lateral Nature of the Job

People who report to a manager are few and fixed, in contrast to the network of people outside the unit that is far larger and potentially unlimited. So this new medium that makes it so easy to establish new contacts, and to keep "in touch" with the ones already established, likely encourages the extension of managers' external networks at the expense of their internal communication.

The Internet may be driving much management practice over the edge, making it so frenetic that it has become dysfunctional: too superficial, too disconnected, too conformist. Perhaps the ultimately connected manager has become disconnected from what matters, while this overactivity is destroying the practice of managing itself.

A Model of Managing

A new model of managing puts the manager in the center, between the unit for which he or she has formal responsibility (by definition) and its surroundings, of two kinds: the rest of the organization (unless the manager is chief executive, responsible for the entire organization), and the outside world relevant to the unit (customers, partners, etc.).

The overriding purpose of managing is to ensure that the unit serves *its* basic purpose, whether that be to sell products in a retail chain or care for the elderly in a nursing home. This, of course, requires the taking of effective *actions*. Mostly other people in the unit do that, each a specialist in his or her own right. But sometimes a manager gets close to this *action*, as when Jacques Benz, Director-General of GSI, joined the meeting of a project team that was developing a new system for a customer.

One or Two Steps Back

More commonly, however, the manager takes one or two steps back from the action. One step back, he or she encourages other *people* to take action — the manager gets things done through other people by coaching, motivating, building teams, strengthening culture and so forth. Two steps back, the manager gets things done by using information to drive other people to take action. He or she imposes a target on a sales team or carries a comment from a government official to a staff specialist. Managing takes place on three *planes*, from the conceptual to the concrete: *with information, through people and to action directly*.

Two roles are being performed on each plane. On the information plane, managers *communicate* (all around) and *control* (inside). On the people plane, they *lead* (inside) and *link* (to the outside). And on the action plane, they *do (*inside*)* and *deal* (outside). Also, within their own heads, managers *frame* (conceive strategies, establish priorities, etc.) and *schedule* (their own time).

The Person in the Job

Positioned in the center of the model is the manager, who personally carries out two roles in particular: framing and scheduling.

- **Framing the Job.** Managers frame their work by making particular decisions, focusing on particular issues, developing particular strategies and so forth to establish the context for everyone else working in the unit.
- **Scheduling the Work.** Scheduling is important because it brings the frame to life, determines much of what the manager seeks to do and enables him or her to use whatever degrees of freedom are available.

Managing Through Information

We now turn to the three planes on which managing is manifested, beginning with that of information. To manage through information means to sit two steps removed from the ultimate purpose of managing: Information is processed by the manager to encourage other people to take the necessary actions.

Two main roles describe managing on the information plane: one labeled *communicating*, to promote the flow of information all around the manager; and the other labeled *controlling*, to use information to drive behavior mainly within the managed unit.

Managing With People

To manage *with* people, instead of *through* information, is to move one step closer to action but still to remain removed from it.

On this plane, the manager helps other people make things happen: *They* are the doers.There are two managerial roles on the people plane: *leading* people within the unit and *linking* to people outside it.

Managing Action Directly

If managers manage through information — concep-

tually, from a distance — and with people — closer, personally, with affect — then on a third plane they manage action directly: more actively and concretely. What does it mean for a manager to be a doer? Doing in the context of managing usually means *almost* doing — that is, getting close to the taking of action: managing it directly, rather than indirectly by encouraging people or processing information. So the manager as "doer" is really the person who "gets it done."

Key here is that the manager's involvement is not passive. This is not about sitting in an office and giving orders or making judgment on those actions. Nor is it about designing strategies, structures and systems to drive other people. All of that is controlling. In the doing role, the manager gets personally involved in those actions, "hands-on": he or she becomes part of the designing of actions that change the unit's output.

Well-Rounded Managing

We don't need people-oriented, information-oriented or action-oriented managers; we need managers who operate on all three planes. Only together do all these roles on all three planes provide the balance that is essential to the practice of managing.

Effective managers do not exhibit perfect balance among the roles; they tilt toward certain ones, even if they cannot neglect the others. Over time, managing has to function in a *dynamic* balance.

The Untold Varieties of Managing

Spend a few hours with a variety of managers and you will likely be struck by how varied this job can be. Managing is almost as varied as life itself, because it is about so much that happens in life itself.

The External Context

Every managerial job is situated in some external context, which can be taken to mean its cultural milieu, its sector in general and its "industry" in particular.

Industry influences managing most where it gets close to the production of products and the delivery of services. At any level, however, tacit knowledge of the industry remains critical.

The Organizational Context

Next we look at the organization in which the managing is embedded. Examples include:

- *The Entrepreneurial Organization:* centralized around a single leader who engages in considerable *doing* and *dealing* as well as strategic visioning.

Getting in Deep Under Pressure

It has been said of great athletes, such as a Wayne Gretzky in hockey, that they see the game just a bit slower than the other players, and so they are able to make that last-second maneuver. Perhaps this is also characteristic of effective managers: Faced with great pressure, they can cool it, sometimes just for a moment, in order to act thoughtfully.

- *The Machine Organization:* formally structured, with simple repetitive operating tasks (classic bureaucracy), its managers functioning in clearly delineated hierarchies of authority and engaging in a considerable amount of *controlling*.
- *The Professional Organization:* comprising professionals who do the operating work largely on their own, while their managers focus more externally, on *linking* and *dealing*, to support and protect the professionals.

Although aspects of these and other forms can be found in most organizations, many tilt toward one form or another. For example, hospitals favor the professional form, with the physicians more as colleagues of the managers than as subordinates, while much of retailing is entrepreneurial, especially in its early stages.

The Job Context

When we think of managing, beyond the style of the person in the job, our inclination has been to focus on the job itself — specifically, its level and function.

Level refers to the location of the job in the formal hierarchy of authority — typically "top," "middle" and first-line supervision at the base ("bottom").

Basically, to be a top manager means to have everyone else in the organization reporting to you, which means to have formal responsibility for the activities of the entire place. To be a bottom manager, in contrast, means to have only operating workers — no other managers — reporting to you. So to be in middle management should mean that you have managers above and below you — some reporting to you and you reporting to others — although greater liberties are often taken with this term.

The Temporal Context

Next we come to the conditions of the moment, the situation at hand. These are difficult to categorize, because

they can relate to so many happenings: a strike, a merger, a lawsuit, a sudden competitive attack and so forth.

The appropriate conclusion from research seems to be that the pressures of managing are often not temporary but perpetual. The pace can be unrelenting.

The Personal Context

By far the greatest attention among all the factors has been accorded to managers' "style" — namely, how they approach their work, beyond the demands of the environment, the job, the organization and the situation at hand. Style, in other words, is about how the incumbent *make*s the job, as opposed to just *doing* the job. Put two people in the same job under the same circumstances, and the differences in their behavior can be attributed to their respective style.

Author M. Dalton, for example, described President Truman as having "loved to make decisions," which he did quickly, while President Eisenhower was "disposed" to keep away from them. But there is more to personal context than style. Background and tenure count too.

Personal Style of Managing

Now we turn to personal style, the predisposition of the person in the job, whether or not influenced by background and tenure.

In the academic literature, "task versus people orientation" has received the greatest attention, much of it under the unfortunate labels of "initiating structure" versus "consideration."

In the practitioner literature, the prize for the most popular dimension probably goes to "change and innovation versus status quo orientation," as in Miles and Snow's popular categorizing of managers as Prospectors, Defenders, Analyzers and Reactors.

The Many Styles of Managing

Effective managing requires some blend of art, craft and science, whether in the person of the manager alone, or else in a management team that works together. In other words, management may not be a science, but it does need some of the order of science, while being rooted in the practicality of craft, with some of the zest of art.

What you do as a manager is mostly determined by what you face as a manager. The effective manager is usually the one whose natural style fits the context, rather than the one who changes style to fit context or context to fit style.

So while every manager has to *make* the job, he or she also has to *do* the job. That is why managerial style cannot be considered out of context, independent of where it is practiced. ●

The Inescapable Conundrums of Managing

Managing is rife with conundrums. Managers need a better understanding of how to cope with what they cannot escape. Here are 13 conundrums of managing:

Thinking Conundrums

The Syndrome of Superficiality. *How to get in deep when there is so much pressure to get it done.*

Given the dynamic nature of their job, managers have to find time to step back and out; this has to become intrinsic to their work. Reflection without action may be passive, but action without reflection is thoughtless.

The Predicament of Planning. *How to plan, strategize, just plain think, let alone think ahead, in such a hectic job.*

Managers who deal best with the Predicament of Planning exhibit an engaging style by letting a thousand strategic flowers bloom in their organizations, and an insightful style to detect the patterns of success in these gardens of strategic flowers, rather than a cerebral style that favors analytical techniques to develop strategies in a hothouse.

The Labyrinth of Decomposition. *Where to find synthesis in a world so decomposed by analysis.*

The big picture has to be painted stroke by stroke, experience by experience. The painter may start with an overall perspective in his or her head, but from there the picture has to emerge from a host of little actions — just as a big strategy does. Few companies these days have a bigger or better strategy than IKEA, the furniture chain. *That* is one big corporate picture. It reportedly took 15 years to paint.

Information Conundrums

The Quandary of Connecting. *How to keep informed when managing by its own nature removes the manager from the very things being managed.*

The big problem today is macroleading: Managers who are disconnected don't know what's going on. "Hands off" too often amounts to "brains off."

The Dilemma of Delegating. *How to delegate when so much of the relevant information is personal, oral and often privileged.*

One way for managers to alleviate this conundrum: as regularly and comprehensively as possible, share the

privileged information with some other people in the unit. Brief them regularly and have them brief each other. And have a No. 2 who is as fully informed as possible. Then, when it comes time to delegate, at least half the problem is solved.

The Mysteries of Measuring. *How to manage it when you can't rely on measuring it.*

We have to cease being mesmerized by the numbers and stop letting the hard information drive out the soft, instead combining both whenever possible. Every manager has to find his or her own balance, not least by ensuring enough of each kind of information to check out the other.

People Conundrums

The Enigma of Order. *How to bring order to the work of others when the work of managing is itself so disorderly.*

So how is a manager to deal with this conundrum? Like all the others: by nuancing its two sides. He or she has to weave back and forth between letting the chaos reign and reining in the chaos.

The Paradox of Control. *How to maintain the necessary state of controlled disorder when one's own manager is imposing order.*

Sophisticated managers can turn the tables and promote change up the hierarchy. And managers at more senior levels can help by appreciating the consequences of passing down problems that are essentially theirs to resolve.

The Clutch of Confidence. *How to maintain a sufficient level of confidence without crossing over into arrogance.*

Honest friends and advisers can help a manager avoid the Clutch of Confidence. Perhaps the key to dealing with this conundrum is to ensure that more people who are confidently modest end up in management positions in the first place.

Action Conundrums

The Ambiguity of Acting. *How to act decisively in a complicated, nuanced world.*

The trick is to know when to wait despite the costs of delay, and when to act despite unforeseeable consequences. And for that there is no manual, no course, not even any convenient five easy steps — just good, informed judgment.

The Riddle of Change. *How to manage change when there is the need to maintain continuity.*

The trick is to get the balance right.

Author Chester Barnard said that "executive work is not that *of* the organization, but the specialized work of *maintaining* the organization in operation."

This means keeping the organization on track and getting it back on track when it goes off, alongside improving the track when necessary and sometimes building a new track to a different place.

Overall Conundrums

The Ultimate Conundrum. *How can any manager possibly cope with all these conundrums concurrently?*

These paradoxes and predicaments, labyrinths and riddles, are built into managerial work — they *are* managing — and there they shall remain. They can be alleviated but never eliminated, reconciled but never resolved. To try and escape them is to fall into the managerial dogma of which we have had more than enough already. Managers have to face them, understand them, reflect on them, play with them.

My Own Conundrum. *How do I reconcile the fact that, while all of these conundrums can be stated apart, they all seem to be the same?*

Maybe these are all just one great big jumbled management conundrum. In that case, you needn't be bothered by the previous, ultimate conundrum — just all the ones that preceded it.

Management Can't Be Taught

Management is a practice. Some of the best managers/leaders have never spent a day in an MBA classroom, while no shortage of the worst managers sat there obediently for two years.

Managing Effectively

So how should managers be developed? In 1996, some of the professors at McGill University in Montreal had serious reservations about MBA programs.

They teamed up with colleagues from around the world to create the International Master's in Practicing Management. This set the groundwork for a series of initiatives that followed. All of this can be thought of as *natural development:*

1. Managers, let alone leaders, cannot be created in a classroom. If management is a practice, then it cannot be taught as a science or a profession.

2. Managing is learned on the job, enhanced by a variety of experiences and challenges. No one practices surgery or accounting without prior training in a classroom. In management, it has to be the opposite.

3. Development programs come in to help managers make meaning of their experience, by reflecting on it personally and with their colleagues. Management development has to be about commitment: to the job, the people and the purpose, to be sure, but also to the organization, and beyond that, in a responsible way, to related communities in society.

4. Intrinsic to this development should be the carrying of the learning back to the workplace, for impact on the organization. Management development should also be about organization development: teams of managers should be expected to drive change in their organization.

5. All of this needs to be organized according to the nature of managing itself — for example, in terms of the managerial mindsets. Most management education and much management development is organized around the business functions. This is fine for learning about business, but marketing + finance + accounting, etc., does not = management. We have more than enough calculating managers already. We need ones who can deal with the calculated chaos of managing — its art and craft — which highlights the importance of reflection, worldliness, collaboration and action.

Managers have to learn primarily through their own efforts. We have seen how this can be facilitated in a classroom, but we have also learned how much more powerful this can be when it happens spontaneously at work, as managers reflect on their experience, learn from each other and together drive improvements in their organizations and societies.

The message is that nothing is quite so powerful, or so natural, as engaged managers who are committed to developing themselves, their institutions and their communities.

People Jams, Not Bear Jams

If management development can become more natural, then surely there is hope for management itself.

We are the species out of control. In the Banff National Park, Gord Irwin describes a "bear jam: a traffic jam caused by a bear." One ambles down to the highway and the tourists stop — some even get out of their cars to take pictures — while the truckers fume. In the parks, they refer to "managing the natural setting." But surely this is an oxymoron: That setting managed itself just fine for millennia without our "management." Now it has "bear management plans"!

If you really want to understand management, then you would do well to get down on the ground, where the elk graze in the towns and the truckers battle the tourists. Then maybe you can work "up" from there, to the abstractions of management that so mesmerize us — where people earn larger incomes ostensibly because their work is more important but perhaps really because they have to cope with more nonsense, no small measure of it imposed by their own formalized systems.

Supposedly developed to deal with the complexities, perhaps all of this is really a conceptual smokescreen for a species out of control, alien to its own natural environment. The bears know full well that the real problem is "people jams."

Managing Naturally

What could be more natural than to see our organizations not as mystical hierarchies of authority so much as communities of engagement, where every member is respected and so returns that respect? Sure, we need people to coordinate some of our efforts, provide some sense of direction in complex social systems and support those who just want to get useful work done. But these are managers who work with us, not rule us.

Managing is a perfectly natural act that we make unnatural by disconnecting it from its natural context and then not seeing it for what it is.

To be a successful manager, let alone a great leader, maybe you don't have to be wonderful so much as more or less emotionally healthy and clearheaded.

By the excessive promotion of leadership, we demote everyone else. We create clusters of followers who have to be driven to perform, instead of leveraging the natural propensity of people to cooperate in communities. In this light, effective managing can be seen as engaging and engaged, connecting and connected, supporting and supported.

We need to rethink management and organization, as well as leadership and communityship, by realizing how simple, natural and healthy they all can be. ●

RECOMMENDED READING LIST

If you liked *Managing*, you'll also like:

1. ***Leaders at All Levels* by Ram Charan.** Ram Charan takes aim at the current crisis in leadership. He offers a solution that outlines a new model for succession and leadership development.
2. ***Judgment* by Noel M. Tichy and Warren G. Bennis.** Regardless of industry, leaders are remembered for their best and worst judgment calls. It is a leader's judgment that can determine the fate of the entire organization.
3. ***First, Break All the Rules* by Marcus Buckingham and Curt Coffman.** Great managers know that conventional wisdom about human nature doesn't hold up. Learn what great managers do differently. Great for executives looking to hire powerful managers.

Management: Strategies

Outsmart!

How to Do What Your Competitors Can't

by Jim Champy

THE SUMMARY IN BRIEF

One day, while giving a speech in Monterey, Mexico, business author Jim Champy encountered a gentleman sitting in the front row. The man interrupted Champy to ask how the philosophy of Mexico's 19th-century ruler, Gen. Antonio Santa Anna, could be applied to management. The answer, which his interlocutor duly shared with all present, was a gem of pragmatism. Santa Anna, he told everyone, firmly believed that whatever worked was the right thing to do.

In *Outsmart!* Champy describes the very real and practical strategies that are working for today's most successful businesses, strategies that can sustain their success into the future. Because the primary goal of all good strategy is growth, the companies analyzed are among the world's fastest-growing enterprises.

Champy reveals the surprising, counterintuitive lessons learned by companies that have demonstrated super-high growth for at least three straight years. Drawing on the strategies of some of today's best "high velocity" companies, he identifies eight powerful ways to compete in even the roughest marketplace. You'll discover how to find distinctive market positions and sustainable advantages in products, services, delivery methods and unexpected customers with unexpected needs.

Champy provides an inside look at the success factors associated with numerous companies that outsmart their competition. He shares his insights into how these companies attained their successes, offers advice for ways to apply their experiences to your own situation and poses provocative questions as a springboard to action.

IN THIS SUMMARY, YOU WILL LEARN:

- How to compete by seeing what others don't.
- What it takes to turn around an established but moribund company.
- How changing your frame of reference can lead to a competitive advantage.
- Why doing everything yourself instead of outsourcing can sometimes lead to even greater success in the marketplace.
- How chaos can present great opportunity for business success.
- How to outsmart competitors by building a business that simplifies complexity.

THE COMPLETE SUMMARY: **OUTSMART!**

by Jim Champy

The author: Jim Champy is one of the leading management and business thinkers of our time. His first best-seller, *Reengineering the Corporation*, remains the bible for executing process change. His second book, *Reengineering Management*, another best seller, was recognized by *BusinessWeek* as one of the most important books of its time. Champy is also an experienced manager and adviser. He is the chairman of Perot Systems' consulting practice and the company's head of strategy.

It's a Smart, Smart, Smart, Smart World

What you are about to read is about real business life — namely, outsmarting the competition. As eminent scientist Charles Darwin might put it, businesses breed beyond available customers; companies with successful strategies have a better chance of survival; and successful enterprises force out weaker ones, creating whole new business models. In other words, the businesses that succeed not only survive but grow, gaining more of the supply of customers and forcing their rivals to adapt or die.

"Chaos Is an Opportunity"

Change is the very essence of business, of course — hence, its Darwinian imperatives. We live in a time of innovation and expansion — a world of smart and smarter strategic options. The catch is that the prize will go to the smartest competitor: In whatever field you're playing, you must outsmart your rivals. Shrewd competitors can stake out new territory, define the boundaries and even set new rules for the game.

Peter Drucker, the late, great management thinker, was famous for declaring in the fairly peaceful 1980s, "Chaos is an opportunity, not a threat."

Winners in the Growth Race

Businesses with exceptional growth rates are a fascinating lot, creative companies with unusual strategies that combine an irresistible promise to customers with an enviable record for delivering it.

Outsmarting the competition requires more than intelligence, experience and business sense; you also have to be quick, flexible and ready to adapt to the transforming world. The penalty for failure is Darwinian extinction, but the prize for success is survival, growth and the rich rewards of a life spent in the brave new world of business.

Taken together, the following companies represent what is really working in business today. ●

Compete by Seeing What Others Don't

Panos Panay is a guitarist who never made it but a talent agent who did — and he has never forgotten how tough it is for hungry musicians to connect with the promoters who might hire them.

Panay founded Sonicbids in Boston. The business ranks 88th on *Inc.* magazine's list of the top 5,000 privately owned businesses in the United States. Launched in 2001, Sonicbids had revenue of $248,000 in 2003, $3 million in 2005 and $8 million in 2007.

Making use of technology, Panay figured out how to connect thousands of aspiring musicians and small bands with promoters who needed their talents. Sonicbids is akin to a musical matchmaker. Some 10,000 promoters use the site to connect with Sonicbids' 120,000 musician members, a quarter of whom are from abroad.

In the process, Panay offers both the promoters and the musicians a proactive customer-service operation, which is, in effect, the character and personality of the business.

An Expanding Vision

Panay has proved both his capacity for difficult work and his ability to see what others don't. And his vision does not stop with the music business. He has only begun to tap what he sees as another neglected market.

Jugglers and magicians have already signed up as members of Sonicbids, and Panay has had inquiries from actors, supermodels and freelance writers. He suspects that speakers might be interested too.

Lessons From Sonicbids

Here are six ideas that spring from Panos Panay's success with Sonicbids:

• *Connect the dots.* Opportunities lurk in neglected fields everywhere, especially where people take dysfunction as the expected way of life. You can look within your own industry for the same kind of opportunity Panay discovered.

• *Think global.* Sonicbids has one office, but it is quickly becoming a global giant. Because of technology, your customers, business partners and competitors are everywhere.

• *Scale quickly.* Scale is important when you are building any kind of community-based business. But achieving scale is not just about signing up people. Your service has to offer value to all participants.

• *Keep checking your intuition.* Particularly in today's business climate, with its smarter, plugged-in consumers, you can't afford to take a chance with a major change. Check it out so that you can spot the pitfalls and profit thereby.

• *Pay attention to service.* High-tech businesses still require much human interaction. Panay points out that a little human touch can help define the character and feel of your business.

• *Don't stop thinking about tomorrow.* Panay's plans for expansion and his visionary notion of how large his neglected field might be are both bold and sensible. ●

Compete by Thinking Outside the Bubble

MinuteClinic gives patients — and insurance companies — an alternative to the emergency room. It is a classic example of a company whose founders recognized a significant unmet consumer need and seized the opportunity by borrowing an idea from a seemingly unrelated industry.

What began as a notion for a few partners in Minneapolis eight years ago has blossomed into a coast-to-coast operation serving more than 500,000 customers a year. And when CVS Caremark Corp. bought the company in 2007, the all-cash payoff for the founders was $170 million.

Why do some people easily spot opportunities where others see only obstacles, if they see anything? The answer begins with the human penchant for living in a bubble — an airtight cocoon of assumptions, beliefs or worldviews.

Inventive Minds

The good thing about business bubbles is that they invite inventive minds to stick pins in them. MinuteClinic's founders are bubble bursters, creative guerrillas who thrive on outsmarting complacent companies in industries that run on tired ideas. The MinuteClinic story is a lesson in outsmarting competitors by trying ideas that they think have nothing to do with their industry.

Jiffy Lube had the insight that you don't need a fully trained mechanic to change the oil in your car. Until MinuteClinic's founders came along, no one in the health care field would have dreamed that they could learn anything from the grubby business of auto maintenance.

Here's how MinuteClinic works: The company's kiosks are open seven days a week for a total of at least 72 hours. The kiosks clearly post the ailments that can be treated there, along with the fees. Generally, one nurse practitioner staffs each kiosk. Only verifiable, quickly identifiable illnesses are treated.

What MinuteClinic saw that others either didn't see or simply ignored were the fault lines in the health care delivery system. MinuteClinic addresses some of the system's dysfunctions by biting off the easiest, least complex chunk of the health care market.

Lessons From MinuteClinic

Here are some lessons MinuteClinic's founders learned along the way:

• *Widen your lens.* Retailing offered an obvious alternative to physicians' offices and hospital emergency rooms: Miniclinics could give shots, treat sore throats and prescribe flu medicine without a doctor on the premises.

• *Make friends.* MinuteClinic has gone to great pains to reach out to physicians and hospitals to explain its operations and earn their trust. MinuteClinic is reaping thousands of referrals from overworked full-service clinics and hospital emergency rooms.

• *Execute on the change.* For MinuteClinic, execution means building a company that delivers both high-quality health care and a high standard of service, and changes have to be made in people, processes and technology to get the job done.

• *Redefine the culture.* MinuteClinic's Michael C. Howe recognized that nurse practitioners are, by nature, caring, empathetic individuals, but they are not in the retail business. His understanding of the distinction led him to create a customer-centric culture that is exemplified by a program to teach MinuteClinic nurses to welcome complaints as a way of improving their service. ●

Compete by Using All You Know

In 2004, Michael Golden presided over the Kohler Co.'s cabinetry division. He knew nothing about the arms industry. When he was invited to become president and chief executive of Smith & Wesson (S&W), a 150-year-old firearms manufacturer that was in dire straits at the time, he took the job.

After Golden had been running S&W for less than three years, he had already achieved extraordinary results. The company's revenues had soared from $100 million in 2003 to $237 million in 2007. From its nadir of $1 a share, the stock had soared to about $23.

How did Golden bring about the turnaround? By leveraging everything he'd learned from more than two decades in business. In one way or another, all the strategies he employed at S&W — the new processes he put in place, the thinking that led to an acquisition and a leap into new markets — were an outgrowth of events encountered and actions taken in his previous corporate life. His achievement shows how using everything you know can help you outsmart your rivals.

Grander Goals

Smith & Wesson was both venerable and storied — but one of its problems was that it had forgotten or simply ignored the lessons of its own history. The strategy of Golden's predecessors had been to dominate a niche market, focusing entirely on handguns in the United States. Golden had much grander goals. Overall, he wanted to push the brand to ever-greater heights of recognition and approval so that it would support and advance all the company's projects.

At nearly every turn, Golden applied lessons learned at previous jobs. In January 2007, Golden announced the purchase of Thompson/Center Arms, a $65 million gun maker. Now, he's looking into businesses such as home security and law-enforcement products such as body armor.

Golden is intent on making the most of S&W's powerful brand. "I think we would be cheating shareholders and the employees if we didn't enhance the brand," he says. "But my number-one responsibility is to protect it." So far, he's done amazingly well on both counts.

Lessons From Smith & Wesson

Here are four lessons that can be taken away from Golden's experiences at S&W:

• *Hunt (the right) heads.* Golden had the perfect set of experiences — in both manufacturing and turnarounds — to prepare for the challenges at S&W.

• *Find what's truly valuable.* Golden knew that S&W was a much-respected name in the gun world. He insisted on extensive research to uncover what he perceived to be S&W's most valuable asset — its brand. What he found helped him to make a sharp turn in S&W's course.

• *Squeeze nickels.* Golden introduced new manufacturing techniques to reduce expenses and raise productivity. But he combined his understanding of dollars and cents with a skill for demand creation. The combination produced simultaneous high productivity and job creation.

• *Walk and talk.* Golden had the intelligence and business training to make the right moves in terms of reorganizing the sales force, hiring talented aides and leveraging the brand. He was both a no-nonsense, results-oriented boss and an empathic, open-minded leader — a walk-around guy. ●

How to Think Outside Your Industry's Bubble

Here are some questions that can help you think outside the bubble:

• Do you know where the breakdowns occur in your industry? Can you turn these breakdowns into a major business opportunity?

• Are you looking beyond your industry to discern how to deliver more value to your customers?

• If your business is not performing well, where are the breakdowns occurring and what management disciplines must you apply to fix your systemic problems?

• Can you see an opportunity to meet a neglected need by widening your company's frame of reference?

• Is the focus of your business narrow enough to enable you to target markets and build the capabilities needed to serve those markets?

Compete by Changing Your Frame of Reference

Jeffrey Housenbold, an eBay vice president with an MBA from Harvard, became CEO of Shutterfly, based in Redwood City, Calif., in January 2005. At the time, the company billed itself as just an online photo finisher. But within two years, Housenbold had turned Shutterfly into something much bigger and smarter — an Internet-based social-expression and personal-publishing service.

Housenbold had found one of the prime secrets of business growth: changing his business's frame of reference to expand its identity and compete on a new and much larger field.

Housenbold's insight called for a complete makeover of Shutterfly, which led to a sales explosion. In 2007

alone, revenues were projected to increase 45 to 50 percent, to more than $138 million. The company was on track to reach 7 million orders in 2007, a 37 percent jump from 5.1 million in 2006 and nearly double the 3.6 million orders received in 2005.

Building a Solid Community

Housenbold discovered the makings of a solid community at Shutterfly. Its clients are amazingly loyal — 77 percent of the company's revenue comes from active customers, who currently number more than 2 million. Housenbold reimagined the company's frame of reference, expanding it from photo finishing to a full range of products and services.

Housenbold envisioned Shutterfly as the premium lifestyle brand in the online photo-finishing business. But even as he widened his lens, Housenbold stayed focused on his primary business.

Many of the company's innovations have sprung directly from Housenbold's finely tuned sense of community. That sense of community extends to his employees, whom he views as fellow innovators.

Housenbold's performance was not a one-man show, of course. Others contributed their ideas. But it was Housenbold's ability to view the company in a broader context that encompassed societal trends and provided the springboard for Shutterfly's hugely successful reincarnation.

Lessons From Shutterfly

Here are a few things that can be learned from Shutterfly's success:

• *Look at the bigger picture.* How is the industry changing, and how can you change your frame of reference to compete on a wider field where you could develop an edge?

• *Build a community, but tend to business.* Much supposedly smart venture money is flowing into community-based Internet businesses, which derive their profits solely from advertising. A less risky business model includes marketing some of the thousands of products and services that can be sold to Internet communities. Shutterfly has achieved success through a fully integrated vertical operation.

• *Widen your lens, but narrow your focus.* Web sites that focus on a single market do better than those that spread themselves around, no matter how big they are.

• *Organize for ideas.* The ability to view your company in a new frame of reference is not limited to the executive ranks. Shutterfly has created a culture that puts a high value on employee suggestions.

• *Persist in your quest.* It takes courage to move out of your familiar boundaries and play a bigger game on a new field. But success belongs only to those with the courage to stand by their convictions and risk failure all the way. ●

Compete by Doing Everything Yourself

Engineer Dan Johnson started a company in 1992 in Loveland, Colo., called Special Application Robotics, which made tools that could substitute for humans in the dismantling of nuclear reactors. By spring 2003, Johnson's company had outgrown his Loveland garage and was now a 12-person operation. But with revenues having topped out at $12 million in 2001, S.A. Robotics was deeply in debt. Forced to seek help, Johnson found it in his old friend Mike Cappello, another engineer.

Cappello became co-owner and chief executive of S.A. Robotics. Within four years, revenues had skyrocketed 2000 percent to greater than $17 million a year, the work force had expanded to 140 and the company was fighting off venture capital investors.

Combining Visions

The company's success has been a joint effort. It was Johnson who had the initial vision and Cappello who had the new vision. Together they saw the opportunity others overlooked in the design and manufacture of customized robots for the decommissioning of nuclear plants and for similarly dangerous work in other settings. Virtually from the moment he arrived, Cappello insisted on bringing every aspect of the operation back into the company.

Admittedly, in this era of outsourcing, the one-stop shop business model seems old-fashioned. For a company to do it all, a great deal of internal discipline and substantial capital investment in labor-saving machinery and software is needed. It also requires a full measure of ingenuity and courage.

S.A. Robotics designs and manufactures its own technology. In this way, the company can be sure that everything that goes into its products is up to the stringent demands of the hard and perilous work they are made to do.

The company's success would have been impossible if it hadn't been able to hire and retain talented, highly motivated employees. Cappello keeps his people happy by encouraging them to speak their mind, giving them a chance to work on challenging projects from start to finish and making them feel like important parts of a proud, can-do culture.

Alluding to the fact that S.A. Robotics has just two shareholders (Johnson and Cappello), Cappello is proud

to note, "What we have here is a very capital-intensive business going through an exponential growth with absolutely no injection capital. All the growth was funded out of operating revenues."

Lessons From S.A. Robotics

Here are three lessons others can learn from the leaders at S.A. Robotics:

• *Control what matters.* If you manufacture a complex, customized product, the need for control is clear. The key is to know what you are really good at, what makes you distinctive, and therefore, what you need to keep in-house.

• *Hire the best and keep them.* That S.A. Robotics has managed to achieve near zero attrition is a tribute to the culture Cappello and Johnson have put in place and to the high-quality work they provide to their people.

• *Don't build to sell.* A business with a life and purpose of its own will have a better shot at success over the long term. Some investors would never buy a company that was built just to be sold.

Compete by Tapping the Success of Others

Eager to protect his new iPod's shiny white surface and scratchable screen, Jeff Grady tried to buy a carrying case, but no such item existed. So Grady made his own case out of plastic. Other iPod owners admired his case and wanted their own.

Grady obliged: He refined the design of his case, found a manufacturer, started the company Digital Lifestyle Outfitters (DLI), launched a Web site and, within weeks, mastered a new specialty — supplying iPod owners with accessories that Apple itself had either overlooked or dismissed as unworthy of its techie brains. In 2006, selling 100 ancillary products, DLI grossed $84 million. In three years, Grady's company has grown by an astonishing 4,385 percent. That growth attracted the attention of Philips Electronics, which acquired DLI in 2007.

Every so often, a new product or old brand is so novel or exciting that it creates a groundswell, a mystique, a whole subcult of loyal customers avid to buy anything related to the sacred brand.

People who identify with hot brands create secondary markets for businesspeople agile enough to piggyback on the original company's success. Piggybackers almost certainly benefit their target companies (and themselves) far more often than not.

Jibbitz Jewels

Jibbitz is another company that has mastered this accelerated strategy. Sheri and Rich Schmelzer outsmarted the competition because they had vision. Sheri looked down at her daughters' Croc-shod feet and saw an unmet need.

Sheri Schmelzer, a stay-at-home mom in Boulder, Colo., was crazy about Crocs, the soft-resin clogs that mold to the wearer's feet.

On a whim, Sheri stuck a silk flower through a hole in one of the clogs. She liked the effect and so did her daughters. By the time her husband Rich arrived home that evening, his whole family was wearing Crocs decorated with all sorts of baubles. He wasted no time in patenting the idea, organizing a company and coming up with a name for his wife's whimsy. Their company and decorations would be called Jibbitz, a homage to Sheri's nickname, Flibbertyjibbet.

Sheri and Rich set up a production line in the basement, charging $2.50 per Jibbitz. But as news of the decorations spread through Boulder, the multiplying orders forced them to move the operation to an office and hire some help. The Schmelzers took Jibbitz online. Then stores took notice of the market that was developing under their noses and began placing their own orders. The office gave way to a huge warehouse, and the manufacturing process was farmed out to a Chinese company.

Creating a Phenomenon

The Jibbitz phenomenon, of course, was riding the bow wave of the giant Crocs fad, and more Crocs wearers were clamoring to decorate their shoes. Sheri cranked out designs and Rich rode herd on the company's expansion. Rich knew full well that piggybacking on a fad could last only as long as the fad itself. So even amid the mushrooming demand for Jibbitz-enhanced Crocs, he and Sheri were developing a new line of products. Eventually, the Schmelzers moved beyond products with holes to introduce a line of charms for cell phones and bracelets.

By summer 2006, the company had 40 employees. Jibbitz were being offered in 3,300 stores in the United States and hundreds more in Europe and the Middle East. More than 6 million pieces had been sold. On October 3rd, Crocs announced the purchase of Jibbitz for $10 million in cash.

Jibbitz has since become a subsidiary of Crocs. It all came about because of Sheri's imagination and Rich's opportunistic eye for tapping the success of others and riding the Crocs' groundswell to fame and fortune.

Lessons From Jibbitz

Here are five lessons companies can learn from the founders of Jibbitz:

• *You can have too much of a good thing.* Rich Schmelzer understood that without the infrastructure to handle potential demand efficiently, he had to limit his commitments to customers.

• *Think big.* From the beginning, Jibbitz's growth potential was limited only by the soaring growth of Crocs itself, but not all new ventures are so lucky.

• *Don't neglect your infrastructure.* Jibbitz held its payroll to just 40 employees even as it grew in overseas markets and outsourced production to China. Keep your organization's structure simple; that way, if you do need to add people, you can do it easily.

• *Think targeted marketing.* One way Rich Schmelzer kept operations under control was by relying on word-of-mouth marketing and Jibbitz.com; he avoided spending on traditional advertising.

• *Take the long view.* Even as Sheri and Rich Schmelzer were trying to cope with the runaway success of their Crocs decorations, they were planning Jibbitz product extensions into anklets, wristbands and cell phone charms. ●

Compete by Creating Order Out of Chaos

Dean Summers managed a chain of retail electronics stores. Glenn Laumeister was a specialist in applying technology to solve complex business problems. Together they created an enterprise that would bring order and sanity to the chaos that was the parts business. They called it Partsearch Technologies.

From day one, Partsearch was dedicated to helping retailers, repairmen and consumers thread through a maze containing literally millions of parts. It was a market that had never bothered to organize itself; every manufacturer's parts list was configured differently. So Partsearch developed a catalog in which each model of home appliances and electronic goods was presented with a list of all it parts. Obvious, right? Yet it had never been done before.

Opportunities in a Chaotic Market

Today, the Partsearch catalog is not limited to retailers: Individual consumers, manufacturers and service shops turn to Partsearch for help. In 2006, the company had revenues of $63.7 million — plus an astounding compound annual growth rate since 2001 of 85 percent. And it all happened because two guys recognized the opportunity presented by a chaotic market.

Laumeister had a hard time convincing manufacturers that helping to create an efficient, consumer-friendly parts supply chain was worth their time. Finally, he sold a few retailers on the notion, and they, in turn, pressured manufacturers to get onboard.

Now that Best Buy and other major retailers have signed on and Partsearch has built a substantial customer base, only a few manufacturers continue to withhold their parts lists from Partsearch.

Partsearch has applied advanced information technology to reinvent the process of ordering and fulfillment, thus making sense of a market that had been running badly on automatic. Laumeister's overarching vision for his company is nothing less than to become "the glue that holds the whole parts business together."

Lessons From Partsearch

Here are a few lessons that can be learned from the founders of Partsearch:

• *Choose the right chaos to tame.* Laumeister's background was in creating and operating high-tech companies, and he knew how to use information technology to solve complex problems. Fixing the dysfunctional, disorganized parts market was a challenge suited to his skills.

• *Look for fragmentation.* Fragmented industries — those in which there are many operating parts that do not work well together — provide some of the best opportunities for high-growth strategies.

• *Go for scale.* If you can achieve scale early in the development of your business, you can become the resource of choice. The combination of ease of access, almost unlimited choice and competitive pricing is hard to beat.

• *Overcome inertia.* Manufacturers wouldn't cooperate with Partsearch until retailers pressured them, so Laumeister found a way to begin his catalog without the manufacturers and let Best Buy take the lead in converting them.

• *Expect and look for more complexity.* When Laumeister started out with Partsearch, his goal was to make it easier for customers to find a part. Things got more complicated when he realized that some customers were ordering the wrong parts for the job they wanted to do. He trained his call-center representatives to be on the lookout for such callers and to help them order correctly.

• *Pair value with values.* There is something liberating and inspiring about a business that makes a real contribution to society, not just for the owners and leaders, but for employees and customers as well. ●

The Smartest Companies

There are certainly differences between the smartest companies and the "incumbents" that operate in traditional ways. Here are a few of them:

- ***Ambition matters.*** Companies that outsmart the competition look for dramatic growth, while incumbent businesses are content with incremental growth.
- ***Intuition reigns.*** Companies that outsmart the competition make strategic choices based largely on intuition, whereas incumbent businesses often get bogged down in research and analysis.
- ***Focus prevails.*** Businesses that outsmart their competitors stay focused on what they do best.
- ***Customers rule.*** Companies that outsmart their competitors focus on how they can better serve customers; incumbent companies focus on their competitors.

Compete by Simplifying Complexity

Together, Becky Minard and Paal Gisholt have built SmartPak, a business dedicated to horses, health and simplicity. By creating preselected, premeasured and prepackaged medications and supplements for individual horses, and shipping them out in daily dosing packets, the pair has removed all the complexity that used to prevent animals from regaining or maintaining health.

Knowing that day-of-the-week pill containers help people track their drugs and dosages, Minard set out to design something similar for horses. What resulted was an easy-to-open plastic container with multiple wells, each containing the correct quantity of powders or pills and labeled with the horse's name.

Launching a Business

When Minard talked with Gisholt about launching a business based on her invention, he was enthusiastic. Using her skills as a marketer and his as a venture capitalist, they got to work. They further honed the packaging concept, came up with a name for their invention (SmartPak) and began raising the money needed to start production.

SmartPak.com was launched in June 2000. Today the couple presides over a nationwide $40 million business that encompasses nutritional supplements and gear for dogs as well as horses. The company's volume is soaring — up 46 percent in 2006 alone.

Minard and Gisholt have achieved outstanding business success by finding an ingenious way to simplify complexity.

SmartPak has found ways to stay competitive with the companies that supply supplements the old-fashioned way, in buckets. How have they managed to do it?

Simplification Proposition

Gisholt went to UPS with a simplification proposition that the shipping company couldn't refuse. With SmartPak's help, the UPS truck making 20 different delivery stops a month to hand over 30 separate packages of supplements is now able to make the same deliveries in just two stops. UPS gave SmartPak the break on shipping rates it needed to hold down prices.

Gisholt went to the manufacturers of their products as well. "We convinced the suppliers there would be a substantial amount of incremental income for them because of our autoship mode," Gisholt says, "and they have shared some of those gains with us."

Gisholt and Minard have paid close attention to customer service too. Three out of four orders are handled online. Gisholt and Minard established a call center manned by extremely well-qualified people.

"We use information technology for every single thing we can," Gisholt says, "not just to improve productivity, but to lift our quality and prevent error."

Lessons From SmartPak

Here are three lessons learned by the leaders at SmartPak:

- *Don't just cut your own costs.* Do the same for your suppliers.
- *Beef up your culture.* Gisholt and Minard first choose horse-smart call-center people; then they train them and give them a chance to make decisions on their own and learn from their mistakes.
- *Develop an appetite for technology.* If ever there was a company committed to leveraging technology in the service of simplicity, it is SmartPak.

Businesses that outsmart competitors stay focused on what they do best, while incumbent companies are often searching for new ideas and end up losing their sense of purpose in the process. Can incumbent businesses adapt and learn to behave as smart companies do? The answer is yes.

Management: Strategies

Predictable Results in Unpredictable Times

by Stephen R. Covey and Bob Whitman, with Breck England

THE SUMMARY IN BRIEF

If there's one thing that's certain in business, it's uncertainty. Still, there are great organizations that perform consistently and with excellence, regardless of the conditions. *Predictable Results in Unpredictable Times* discusses how to achieve predictable results in good times and bad by applying four key principles.

Unpredictable times create fear, stress and worry. These are all fatal distractions when you need total focus. Winning organizations entrust people with a mission they can believe in, channeling their anxiety into results.

Drawing on decades of experience working with thousands of private and public entities worldwide, authors Stephen R. Covey and Bob Whitman, with Breck England, suggest that there are a few basic principles that will never let you down — principles that help companies win, regardless of the turbulence of the ride or the shock of overwhelming change.

Great teams perform consistently and with excellence, regardless of the conditions. Great leaders anchor themselves in principles that are certain and solid, even in an uncertain and fluid environment. They know the world is unpredictable. Still, they get predictable results.

IN THIS SUMMARY, YOU WILL LEARN:

- Winning companies have "simple goals repeatedly revisited, together with clear targets and strong follow-through, including the measurement of results."
- Winning companies are capable of quick action "with the agility to respond ahead of, or at least stay even with, rapid changes in the new economic environment."
- Winning companies focus totally on value — they are not just cutting back, they are simplifying, reducing complexities that customers and employees don't value.

THE COMPLETE SUMMARY: **PREDICTABLE RESULTS IN UNPREDICTABLE TIMES**

by Stephen R. Covey, Bob Whitman, with Breck England

The authors: Stephen R. Covey is author of the historic bestseller *The 7 Habits of Highly Effective People*, and is co-chairman of FranklinCovey. He has worked for decades with presidents, corporate leaders and nonprofit leaders around the world.

Bob Whitman is president and CEO of FranklinCovey and a successful private-equity investor.

Breck England has 20 years experience consulting with major corporations on their strategic planning and communication challenges.

Predictable Results in Unpredictable Times

Every summer a colorful crowd of cyclists race each other in what is billed as the greatest human endurance test of all time — the Tour de France. On the flat, sunny terrain, they bunch up in a peloton, or platoon, some jockeying for the front, some coasting along in the slipstream of a rider inches ahead. But they mostly stay together. When the going is relatively easy, the peloton speeds along at a predictable pace. Then comes the severe test of the mountains. Uncertain weather hits. As the cyclists climb thousands of meters, the peloton strings out. Riders tire and drop away. Teams fall inexorably behind. It's in these extreme conditions that the great teams take the lead.

At times, your team or your company or your organization will face extreme conditions, with steep terrain and dramatic changes in climate. No one can see beyond the next hill.

Even in a turnaround, there's no likelihood of an easy ride — we've moved into a world where the measured risks of the past seem tame compared to what we face today.

Future crises might be more severe than anything we've experienced. From here on, everyone agrees, we may be "in the mountains."

Four Hazards of Unpredictable Times

Like the Tour de France cycling teams, companies trying to navigate in unpredictable times face four key hazards:

1. Failure to execute
2. Crisis of trust
3. Loss of focus
4. Pervasive fear

To succeed "in the mountains," like the great cyclists, you must anticipate these hazards. You can dodge the hazards and win if you:

1. Execute priorities with excellence.
2. Move with the speed of trust.
3. Achieve more with less.
4. Reduce fear.

You can rely on these four principles. They don't change. And they will never let you down. ●

Execute Priorities With Excellence

The landscape of your industry may be changing beyond recognition. Your resources may be stretched to the limit. What will you do now? You're thinking, "We've got our plan. Everybody knows what to do." But you should be asking yourself, "Does everyone understand and buy in to the goal? Does every team member know his or her role? Are they executing with precision?"

Today most business leaders are privately worried about execution. When about 150,000 workers were asked to name the top goals of their organizations, only about 15 percent could. Of that 15 percent, only 40 percent knew what to do about the goals. About 9 per-

cent felt a high level of commitment.

If yours is like most other organizations, only a small percentage of the people are actively working on the strategy for getting through the mountains. The others don't understand the strategy, nor do they know how to carry it out, just when it's more crucial than ever.

In a crisis, narrowing the focus is critical. The research shows that companies who win in tough times have "simple goals repeatedly revisited, together with clear targets and strong follow-through, including the measurement of results."

If you lead by these same principles, you'll dramatically raise your chances of getting predictable results, even in a radically changing environment.

Elements of a Good Execution System

Great organizations, like great racing teams, have an execution system that ensures the predictability of results. Here are four tips to help your organization move ahead with excellence in execution:

1. Focus on the top goals.
2. Make sure everyone knows the specific job to be done to achieve these goals.
3. Keep score.
4. Set up a regular cycle of follow-through.

Great teams meet regularly and frequently — weekly at least, often daily — to review progress on their goals. These meetings are simple. Team members start by looking at the scoreboard to see where they are. They report on commitments made. They discuss lessons learned. They plan what to do next and make new commitments. These are not ordinary "staff meetings." The meetings focus entirely on moving forward the key measures of success. When team members can count on being asked repeatedly about progress, they know their leaders care and they want to contribute.

Are You 'Moving the Middle?'

Your strategy and goals are in place, the team knows what to do and what the score is, and you're following through. You've done everything you can to ensure a predictable result. But then you look at performance across the organization and you inevitably see variations.

It's a fact of life. Some people and teams perform well, some don't perform well at all — and then there's the vast middle. There's a big bulge in the middle — these are people who could contribute much more if only they knew how. Now, think of the huge impact if that middle 60 percent performed more like the top 20 percent! What would it mean to your performance?

Winning Performance Depends on Precise Execution

For the Tour de France, the mountains are the toughest challenge. This is the hardest part of the race where so much gets decided. Here the advantage goes not necessarily to the physically strongest team, but to the team that executes with the greatest precision.

Think about Lance Armstrong's famous U.S. Postal Service and Discovery Channel teams that won the Tour de France seven times. In the mountains, the team became a "ruthlessly efficient machine." Day after day they consistently paced themselves at the front of the pack through the punishing Alps and Pyrenees. According to one observer:

- George Hincapie, once a weak climber, now powered the peloton up the middle climbs of each stage.
- Floyd Landis would take the lead at the foot of the final mountain, setting a pace that splintered the field.
- Landis then handed off to Jose Azevedo, whose climbing pace was so fierce that only the top few riders in the world could keep up.
- By the time Armstrong rode to the front, he could focus on defeating the handful of rivals who remained.

Obviously, each team member knew his role and carried it out exactly. The sevenfold achievement of Armstrong's Tour de France teams might never be surpassed. An observer called them "one of the greatest sporting teams of all time, and an example of what a brilliantly planned and flawlessly executing organization can achieve."

As a leader, your biggest opportunity might be to move the middle "right and tight" on the performance curve. You don't want to stay "left and loose," that means you get strung out in the mountain passes and lose your advantage.

How to 'Move the Middle'

To "move the middle" — to move your performance "righter and tighter" — you'll want to do two things:

1. **Identify islands of excellence**. Where in your organization are people already performing in exceptional ways? What can the "right and tight" ones teach the rest of the organization?
2. **Ask the team how to improve performance**. No one knows better than the team members what could be done better, faster and at less cost. ●

Move With the Speed of Trust

Great Ormond Street Hospital in London has earned a reputation 150 years in the making at the forefront of children's services in all aspects of care, especially critical surgeries.

But at one point some years ago, seven infants died in quick succession following heart surgery. The surgical teams involved were devastated. Clearly, something was wrong somewhere. Not only was the crisis causing the public to lose confidence in them, they were also losing confidence in themselves.

A great deal of researching — and soul-searching — went into the investigation of these failures. Soon they learned that the most dangerous time in the surgical procedure wasn't in the operation or the intensive-care unit, but in the journey between the two. After one discouraging day, the surgical team collapsed exhausted in the physicians' lounge. A Formula One auto race was on television when the surgeons noticed something remarkable on the screen. They became fascinated — not by the race itself, but by what was going on in the pit.

When champion driver Michael Schumacher roared into the pit, the team that serviced the Ferrari racer went to work as if they were one person.

"I got in touch with them," Dr. Goldman says. "And we then went to Italy and showed them videos of our processes." The Ferrari people were stunned at how chaotic it was — no one in charge, lots of conversation, lots of people in each other's way, unclear systems.

"This is fundamentally opposed to the way in which the Formula One pit crew works. They know their job. Each one does. Silently they do it, and they get out of the way. They trust each other."

A Crisis of Trust

Trust always affects two measurable outcomes: speed and cost. When trust goes down, speed goes down and costs go up. Distrust slows everything. Sales decelerate, customers grow cold, and team members get discouraged or drop out entirely. Distrust has hard costs. If you're distrusted, people will actively refuse to do business with you, your pipeline of revenue freezes and, in extreme cases, you shut down.

Distrust has grown to global proportions. A crisis of confidence has overwhelmed the economy. The World Economic Forum cites a "crisis of trust and confidence" as the number-one challenge facing organizations in this decade.

Business confidence is one of the top concerns of CEOs in the latest Conference Board Report of 2009 — earlier in the decade, it didn't even show up.

Just as distrust slows everything down and raises costs, the opposite is also true. Trust speeds everything up and lowers costs. You can do business in minutes on a handshake with a person you really trust.

Trust Taxes and Trust Dividends

When things get intense, there are enormous parallels between a Formula One pit stop and your own teamwork. You have to make complex decisions fast among team members doing different jobs under time pressure. And you've got to be absolutely trustworthy or people quickly lose confidence in you.

An authority on the subject of trust, Stephen M. R. Covey, puts it this way in his book *The Speed of Trust*:

The serious, practical impact of the economics of trust is that in many relationships, in many interactions, we are paying a hidden low-trust tax … Mistrust doubles the cost of doing business.

Covey also suggests that, just as the tax created by low trust is real, measurable and extremely high so the dividends of high trust are also real, quantifiable and incredibly high. When trust is high, the dividend you receive is like a performance multiplier, elevating and improving every dimension of your organization.

Here are four key points to help your organization understand the importance of trust:

1. The evidence shows that when the economy slows down, the companies that succeed actually get faster.
2. Breakthrough companies confront crises by actively and deliberately building trust, showing more transparency than ever before. Also, they act swiftly.
3. They are able to leap hurdles that impede less trusted companies.
4. During the market plunge of 2008, the stock of a group of such companies appreciated in value 24 percent!

Rebuilding Trust

The Formula One team that inspired the doctors of Great Ormond Street Hospital was a team of unbelievable speed and precision. But it didn't used to be that way. In the mid-1990s, Ferrari was a losing team. They had not won a Formula One title in nearly 20 years. Often criticized by the press for "notorious backstabbing," no one trusted anyone else on the team. At the same time the team was known for its "unfounded optimism"; carrying the noble name Ferrari, they believed themselves to be the best in the world, despite their mediocre record and against all evidence: "The perfor-

mance of the Ferrari pit crews was considered a running joke."

Then, in 1996, everything changed. New CEO Lucadi Montezemolo decided to revive the once-great Ferrari racing tradition. Some of the best people in the sport were lured to Ferrari to accomplish this miracle, and they made it happen. What turned this once-struggling team into the most successful in Formula One history?

The first thing they did was eliminate infighting and posturing by facing realities: a poor track record, outdated technology and a culture of complacency.

Soon they succeeded at building "a cohesive structure devoid of the polemics which were so rife." Champion driver Michael Schumacher then took the team to six straight world titles, an unprecedented achievement.

Building trust requires high levels of both character and competence. The Ferrari CEO knew he could only achieve predictably good results with predictably capable people.

In a crisis, you need your best performers around you and they need your trust. Montezemolo turned Ferrari's auto sports division over to the best performers he could find, and trusted them to keep their commitment to get back on top of the racing world.

The "cohesive structure" of the new team meant careful alignment of their systems and processes with the job to be done.

Three Trust-Building Behaviors

Asked what companies should do in difficult times to build trust, Stephen M.R. Covey suggests three trust-building behaviors:

1. **Create transparency** — "This is telling the truth in a way that people can verify and validate for themselves."
2. **Keep your commitments** — Failing to keep a commitment depletes trust — fast.
3. **Extend trust to your team** — Great performers want to be trusted, and they will deliver.

A Trusted Character

These and other trust-building behaviors — such as demonstrating respect, listening and continuously improving your operations — are essential when you're facing a crisis of trust. But even more fundamental to your trustworthiness is your own character. Your capabilities might even fail you from time to time, but good character never fails. There are times when you might not know what to do, but you will still know what is right.

No one leads without followers, and just as your team trusts your competence, they must also be able to trust your character — or they won't follow.

You're probably in your leadership position because of your skills, and your team will defer to your positional authority up to a point. They will not, however, trust you unless you also have moral authority. The economic breakdown is about a breakdown in moral authority.

Moral authority comes from two commitments: to act with unshakable integrity and honorable intent.

One of the most respected leaders in business is Bill George, former CEO of Medtronic. Under his guidance, the firm's value rose from $1.6 billion to $60 billion between 1989 and his retirement in 2001. About today's crisis of trust in leadership, he says:

I think we've had way too many leaders who are in it for themselves. They're more focused on charisma, style and image than they are on character, substance and integrity. We need leaders of genuine integrity who are committed to building the organization and will inspire others to step up and lead. There's no doubt that failed leadership is at the heart of the crisis on Wall Street.

Achieve More With Less

In the mountains, it's not enough to do more with less — you need to do more of what matters. Imagine what it takes to climb the highest peak on each of the seven continents, including Mount Everest. Now try doing all of that blind. Erik Weihenmayer has done it. The first blind man to reach the seven peaks, he knows perhaps more than anyone living what is required to succeed in extreme conditions.

What do you really need to have with you when the going gets nearly impossible? Here's his advice:

Talk about packing for a mountain, you're carrying your house on your back, and you can't carry everything you want. So you pack light.

As you get higher up the mountain and it gets harder, you have to become more strategic and focused and drop a lot of the extraneous stuff that weighs you down and becomes a distraction, all those obligations that you thought defined you.

You have to strip yourself down and become more nimble so you can achieve the thing you really want. And when you're on the side of Mount Vinson in Antarctica and it's 50 below, you might have to drop your pack altogether.

Everyone knows that in a crisis, you have to do more with less. We all have to "pack light." But the important thing is to pack strategically. And the more challenging the times, the more "strategic and focused" we need to be.

Building Customer and Employee Loyalty

When you're trying to do more with less, the real question is "more of what?" Shouldn't it be more of what customers value and will pay for? Shouldn't it be more of what employees value and will stay for?

A crisis tempts us to take the focus off customers and employees and onto the finances. Getting buried in budgets and balance sheets can lead to mindless cutting rather than focusing on value. Companies that succeed in unpredictable times focus totally on value. They don't just cut fat; they simplify and reduce complexities that customers don't value or even understand.

There's a difference between customer satisfaction and customer loyalty. Merely satisfied customers find no reason to complain. Loyal customers, on the other hand are emotionally connected to you. They represent the biggest share of your business because they repurchase. They would miss you if you were gone.

The principle here is to focus on the job customers really want you to do for them — and that doesn't necessarily mean more of what you've done before.

Of course, companies that put the emphasis on the customer enjoy higher levels of customer loyalty. Intriguingly, they also enjoy higher levels of employee loyalty. When times are bad, employees will stay with you, but this doesn't mean they want to.

The research shows that when companies "align the customer experience with the employee experience, they create employees who are passionate about what the company stands for. Passion and engagement go hand in hand."

Research at FranklinCovey shows that people, on average, are less motivated by money than by the feeling that their contribution is valued.

Knowledge workers — the new majority — want meaningful work.

Even in tough times (perhaps especially in tough times), people want to contribute, they want to help, they want to make a difference

The leader's task in a crisis is to create a "contribution-focused" workplace.

Pushing the 'Reset' Button: Aligning the Organization to Customer Value

The steeper the climb, the lighter the pack needs to be. Doing more with less does not mean saying yes to more things. It means saying no to more things and yes to only the most important things.

As we've seen, in a crisis, it's essential to focus the organization more on customer value — the job the customer wants done. Once you have narrowed down the job to be done, your task is to realign the organization to provide that value.

Unfortunately, many companies simply cut people and resources without rethinking the job to be done. According to Watson-Wyatt research, a weak economy "forces companies to do more with less. Supervisors and managers often turn to their top performers, pressuring them to carry more of the productivity burden. The additional stress can cause burnout, disillusionment and disengagement."

Besides the stress of more work, even top performers suffer when their focus is divided. Research shows that high-engagement employees rate "unclear job definition" as their top stressor. Faced with several jobs to do, they can't excel at any of them and soon "crash and burn."

Now is the time to reset your culture from "slow and heavy" to "lean and mean." FranklinCovey research shows there's plenty of room for a reset. Here are some key statistics about streamlining your organization:

- Only 9 percent of workers feel a very high level of commitment to organizational goals.
- Only 22 percent agree that there is a clear line of sight between their own work and the organization's top priorities.
- Workers spend 23 percent of their time on "urgent but irrelevant activities."
- Workers spend 17 percent of their time on "counter-productive activities."

A crisis is an opportunity to push the reset button and start dong more of those things that really matter. Listen once more to Erik Weihenmayer, the champion mountain climber, who knows something about adversity:

It's a great time to examine your priorities and ask yourself what life you really want to create. It's time to make those hard choices, to scale down your distractions, to take a hard look at your losses and see if there's a nugget that can propel you forward and make a change in your life that you've wanted to do anyway and been too scared or too slow to do it. ●

Reduce Fear

"In the mountains," fear is the great enemy. Threatened jobs, disintegrating retirement, mortgage problems, high prices, eroding health care — it's all "piling on" people. Economic recession produces a debilitating psychological recession. What *The Economist* calls "an endless series of hobgoblins" takes its toll.

Your valued people are not immune to this perfect storm of fear.

Actually, any major change produces fear, such as new strategies, industry fragmentation or disruptive technologies. So here are a few provocative questions:

- What does the psychological recession cost you?
- Is your organization fatally distracted by fear? Are people paralyzed by uncertainty?
- Have you figured out how to redirect all this anxiety into productive energy?

What Does the Psychological Recession Cost You?

The costs of fear are heavy. Even in normal times, "distractions consume as much as 28 percent of the average U.S. worker's day … and sap productivity to the tune of $650 billion a year." In these confusing times, people are more mentally sidetracked than ever. When their homes, their families, their jobs, and their health are threatened, it's just harder for people to focus.

Of course, if we take the long view, there are no predictable times. Within recent memory, we have seen huge surges in global stock markets and huge collapses. The collapse of the Asian markets, the Dotcom Bubble, the Enron/Worldcom debacle, near total paralysis of world financial markets — obviously, we do not live in a smooth predictable world. As Nassim Taleb, author of *The Black Swan: The Impact of the Highly Improbable* says, "History does not crawl, it jumps."

"Fear wears us out, and it undermines our health and well-being. When that happens, we're less able to hope," says Shane Lopez, a researcher into the psychology of hope. "Managing this fear has to happen in a big way at the beginning of a crisis, and then it needs to be mini-managed every day."

Is Your Organization Fatally Distracted by Fear? Are people paralyzed by uncertainty?

So how do you manage fear? Olivier Blanchard, chief economist of the International Monetary Fund, advises leaders to give absolutely clear direction. "First and foremost, reduce uncertainty … Above all, adopt clear policies and act decisively."

With a clear, unmistakable mission, people can transform anxiety into action and productivity. Even if they're not sure what to do, leaders can defuse a lot of fear just by communicating clearly about the situation. In crisis time, "communication carries more significance and requires greater transparency." And yet only 13 percent of leaders have talked to their people about the turbulent times we live in. Nearly half of respondents say that their "leaders have taken no actions to respond to the economic anxiety in the workplace."

Be transparent and simply tell the story. Don't assume everybody already knows how the turbulence is affecting the organization. Talk about what's next. If you have a strategy, lay it out in clear terms.

Have You Figured Out How to Redirect All This Anxiety Into Productive Energy?

Clear direction can go a long way toward reducing fear. But the roots of fear still remain. Like a weedy vine, fear comes up from under the surface and saps emotional energy that could be used productively. It's not enough to ignore it or tell ourselves to snap out of it. An effective leader uproots it.

To do that, you have to recognize that fear is an emotional response. As a leader, you're now in the business of managing other people's emotions.

You successfully uproot debilitating fear by changing the paradigms that produce fear. You don't do it by exhorting people to get over it or to walk straight into the storm. It will crush them — privately, silently perhaps, but inevitably. If you really want to help people, don't work on their behavior, work on their paradigms.

The Root of Fear

The paradigm at the root of the psychological recession is the widespread belief that people have no control over what happens to them. The forces of change are so crushing that people simply wilt. What Martin Seligman calls "learned helplessness" is a psychological condition in which people act helpless, even when they have the power to change an unpleasant or even harmful circumstance.

A feeling of futility causes people to disengage from their work. They see themselves as victims of the economy, of the company, of their co-workers, of an unfair boss or of the "system." Judith Bardwick describes it this way:

A psychological recession is an emotional state in which people feel extremely vulnerable to economic hardship, leading to a dour view of the present and an even bleaker view of the future, which often is not based on current reality.

Your task as a leader is to help people uproot this mindset, and the only way to do that is to replace it with another mindset. Seligman says, "Habits of thinking need not be forever … individuals can choose the way they think."

Work within your Circle of Influence, not your

Circle of Concern. Everybody has worries ranging all over the place — job, family, the national debt, the possibility of a comet hitting the earth. We call this range of worries the "Circle of Concern."

So the trick is to shift your mindset from the Circle of Concern to the Circle of Influence. By doing so, you become proactive — taking charge of your own future, exercising your own resourcefulness and initiative.

Within the Circle of Influence are those measures you can take to tame unpredictability.

By focusing your time and energy on the Circle of Influence, your power to control your future increases.

Adopt a 'Knowledge Age' Paradigm of Leadership

Many leaders still hold an "Industrial Age" paradigm of leadership. To the Industrial Age leader, people are like machines to be efficiently controlled. Supervisors stand over them to ensure closer and closer compliance with orders from the top down. It's a work environment where the consequences of stepping out of line are fearful.

Why does this kind of environment generate fear in people? What kinds of fears? Fear of loss, primarily — loss of job, personal dignity, security, status or self-esteem. Perhaps even more deeply, they fear the meaninglessness that comes from being treated as a mindless cog in a machine rather than as a creative, thinking, purposeful human being.

A far more effective paradigm is "Knowledge Age" leadership. In the Knowledge Age, people are valued for their unique contribution — their ability to learn, to adapt, to innovate, to capture opportunities entrepreneurially. They are no longer just machines to be switched on and off and discarded on schedule.

To lead in the Knowledge Age, you need a paradigm of releasing, unleashing, valuing the different (even disruptive) viewpoint. You motivate people with zeal for the mission. ●

Closing Thoughts

In the Tour de France, the race is won in the mountains. In the same way, whether in business, education or government, the successful organization is the one that gets predictably good results in uncertain times.

Consider the case of two camera makers. Both Polaroid and Canon were giants in consumer photography. And a few years ago, they both hit "the mountains" — the disruptive technology of digital cameras.

In the 1990s, Polaroid looked like a big winner. Their time-honored instant camera was the razor, the film the razor blades. A flood of new models boosted sales — a Barbie camera for girls, a Business Pro camera for the office and the I-one for teens, among others. The old business model of virtually giving away inexpensive cameras to make big profits on expensive film never looked better.

By 2001, Polaroid was bankrupt. Share price had fallen nearly 100 percent, from $60 in 1997 to 28 cents. All remaining assets were sold off.

By contrast, Canon moved systematically into digital photography in the late 1990s and thrived. In 2001, Canon issued its first mass-market digital cameras — inexpensive, reliable and independent of the film business. The cameras were a hit. Share values rose predictably as Canon shares had pretty much always done since the day Goro Yoshida sold his first "Kwannon" camera in Japan in 1933.

In the midst of the 2008-09 recession, a Canon share was worth twice what it was in 1997 at the height of the technology boom. Even while suffering a drastic slowdown in sales, Canon's profit margins far exceeded those of its competitors.

Principles That Will Never Let You Down

The times are, by their nature, unpredictable. You can't begin to compute all the uncertainties of the future into a set of certainties. But there are certain principles you can rely on even in volatile times:

- You can pack only a few things in the mountains — so they'd better be important things.
- You'll be trusted only as far as you are worthy of trust.
- If customers really must have what you sell, they'll find a way to pay for it.
- The only thing stronger than fear is purpose — so make your purpose strong.

These principles will never let you down. ●

Profit or Growth?

Why You Don't Have to Choose

by Bala Chakravarthy and Peter Lorange

THE SUMMARY IN BRIEF

Conventional wisdom dictates that a firm cannot have both sustained growth *and* strong profitability — it must choose one or the other. Conventional wisdom is wrong. In *Profit or Growth?*, Bala Chakravarthy and Peter Lorange share their extensive experience and research in identifying the core strategy required to achieve both growth and profitability — continuous renewal — and the efforts needed to put this strategy into action.

Top management carries a large burden in these efforts. The roles that senior executives — business, regional and functional heads — play in making the vision of continuous renewal a reality are critical. They are the ones who identify the right blend of efforts centered on organic growth, alliances and acquisitions. The firm's organizational context is also set by them. Finally, the firm's entrepreneur-managers are the prime drivers of renewal efforts.

Drawing on extensive research with world-class companies, *Profit or Growth?* introduces four proven strategies for continuous renewal. You'll discover powerful ways to protect and extend your core businesses, capture new opportunities distant from them, and "bridge" these two strategies with two others to evolve towards profitable diversification. By following these strategies and properly executing them, you will learn how to achieve both superior growth and profitability in any business environment.

IN THIS SUMMARY, YOU WILL LEARN:

- What performance dilemmas are and how to manage them.
- How to find and nurture managers who are renewal-minded.
- The four essential renewal strategies: protect and extend your core business, leverage the core, build the core, and transform the core.
- How to use the complementary means of organic growth, acquisitions and alliances to achieve the goal of continuous renewal.
- How a firm's leadership — including executives and entrepreneur-managers — can foster, sponsor and direct renewal.

The Performance Dilemmas

Many believe profitability and growth to be mutually supportive, the two elements of the holy grail of business success. Research, however, has since uncovered discomforting tension between the two. Of the firms surveyed, more than 40 percent that achieved sustained profitability or growth failed to achieve the other. Instead of being mutually supportive, many organizations find that growth and profitability are rival challenges. Indeed, sustaining growth can actually work *against* sustaining profitability, and vice versa. The odd thing about such a business dilemma is that both alternatives are equally valued; the unpleasantness lies in not giving one of the goals the attention it deserves.

Managing Performance Dilemmas

Enhancing value for a firm's shareholders is not as straightforward as it might first appear. It requires management of twin dilemmas — driving growth and profitability and seeking short- and long-term performance. No magic formula yields all four of these performance goals simultaneously. Tensions exist between them and must be continuously balanced.

A popular way to address the performance dilemmas is to tolerate periodic imbalances and try to correct them over time. For example, a company may focus on profitability for a period, and then focus on growth after it has accumulated a fair surplus. One often hears the expression, "We first have to earn the right to grow," to euphemistically describe a "first-profitability and then-growth" approach to managing performance dilemmas.

While such a sequential approach might be unavoidable for some organizations, research has found that a singular pursuit of either profitability or growth makes it difficult to subsequently balance the two. Pursuing growth requires exploring for new opportunities and competencies, taking risks, and entrepreneurship, while profitability is helped by exploiting existing opportunities and competencies already present at the firm. Systems and processes fine-tuned to maximize profitability cannot nurture entrepreneurship.

The Simultaneous Pursuit

Conversely, firms that focus on growth alone have trouble gearing their systems for operational excellence and improved profitability. Also, the talent pool required to develop each is often deemed incompatible. Under normal conditions, firms should strive simultaneously for both profitability and growth. The idea is never to lose the momentum for either growth or profitability, but always to balance the two.

Firms that have sustained both growth and profitability have, on average, achieved higher profitability and higher growth rates than firms that focused on one goal at the expense of the other. Paying balanced attention to both profitability and growth can actually enhance both.

A Question of Strategy

A persistent dilemma for leaders is to offer a strategy architecture that allows the firm to exploit its existing opportunities while simultaneously pushing it to explore new opportunities and capabilities that will be needed to compete successfully in the future.

Winning today's competitive battles calls for investments that strengthen the firm's current capabilities. Invisible assets such as customer relations, or the network of resources and information that a firm commands, might not often make the list of a firm's core capabilities, but they should — they are important growth platforms. Resources must also be allocated to initiatives that

exploit these capabilities in geographies, products, value chains and customers that are adjacent to the firm's current opportunities. The question is whether such a strategy will serve the firm well in the future.

What the firm needs is a process that brings the discipline of external financial markets inside the firm and forces it to adapt speedily and radically to the changes in its environment. Leaders should be ready to cannibalize the firm's products, make its core competencies obsolete, and retire physical capabilities and resources that are not needed. The firm should launch creative new products and services that can disrupt the market position of competitors, even if this means disruptions inside the firm, too.

A firm can engage in a dramatic transformation through an evolutionary process. The present does not have to be discarded; it can be morphed into the future. This is the preferred way to transform the firm without taking undue risks — it is called *continuous* renewal.

Renewal-Oriented Managers

Managers who have become good at optimizing performance under today's business model might be reluctant to try anything new. One way to address this problem is to insulate new renewal initiatives from a firm's core businesses, and staff these with new hires who can connect more easily with new customers and build new capabilities. This essentially creates two classes of management — one for generating near-term profitability and growth through the current business model, and one for sustaining profitable growth into the future by nurturing new opportunities and building new capabilities.

This segregation makes sense in extremely turbulent business contexts, but not all industries face discontinuous change. Even when they do, there are always pockets of continuity within them. In these situations what the firm needs are *entrepreneur-managers*, managers committed to changing the core by building onto and leveraging useful elements within the core. ●

Renewal Strategies

Opportunities and capabilities can erode over time. Commitment to profitable growth is also a commitment to continuous renewal.

Seeking sustained profitability triggers the reengineering of a firm's business processes and the trimming of its business portfolio. Moreover, sustained profitability is possible only if the firm has distinctive capabilities that remain superior to that of its competitors. Its managers must strengthen/complement the firm's failing competencies with new ones. A focus on sustained growth, on the other hand, helps the firm to look beyond current opportunities and to explore new markets. Continuous renewal is about renovation, innovation and more.

Renovation and Innovation

Renovation is about protecting and extending a firm's existing market share. It is achieved through continuous improvements in operating performance. It also calls for new product introductions, new approaches to servicing the customer and new ways of segmenting the existing market, all without diversifying the competence base of the firm or the markets in which it competes. Renovation provides profitability and growth in the short run.

Innovation is about entering new markets and serving them using competencies that are also new to the firm. It stakes out a new business domain for the firm to grow profitably in the future.

The Strategies for Profitable Growth

A well-managed firm should pursue the following four renewal strategies to sustain profitable growth, albeit with differing emphases as appropriate to its business context. Renewal is not only a matter of exploiting available markets and distinctive competencies, but also about exploring for new ones.

Strategy 1: Protect and Extend the Core. Protect and extend is a base strategy that ensures that a firm's core businesses remain strong. It is in part a defensive strategy. Improving operational efficiency is a key element of this strategy. At Nestle, for example, under the auspices of a company-wide initiative called GLOBE (Global Business Excellence), the company has launched a number of efficiency initiatives. GLOBE is also aimed at sharing best practices quickly across the many countries in which Nestle operates.

Continuous improvements in operational efficiency are a must for renewal. Protect and extend is also a proactive strategy aimed at keeping the firm's competencies distinct from those of its competitors and at continuously improving the firm's market share both through product innovations and market repositioning.

It is also necessary to keep competencies distinctive. A competence is distinctive in a firm only if it is hard for its competitors to easily procure, imitate or substitute that competence. In time, a firm's competencies will be matched by its competitors.

It is a useful practice for corporate leaders to ask the following during each strategy review for a business:

- What competencies are required for competitive success?
- What is the business leader doing to keep these distinctly superior to that of the firm's competitors?

Obvious as these questions might appear, often they are

not asked. Another set of questions worth asking has to do with fully exploiting all available opportunities in the market:

- Is the business cross-selling and bundling the products that it offers to increase its market presence?
- What is the track record of product innovations? Is the business able to hold on to loyal customers?
- Is there a way to further segment the market? Are there microsegments that offer opportunities for profitable growth?

Strategy 2: Transform the Core. In sharp contrast to the protect and extend strategy, a transform strategy does not seek to strengthen the core, but to move away from it. This strategy can be pursued in two different ways.

If the goal is to abandon the current core and seek something entirely new, it is best to pursue transformation through mergers, acquisition, and divestitures, or by "buying" a new identity. Firms can also pursue a less ambitious transformation by developing separate ventures with distinctive business models to deliver new products or services to a different market or market segment than their typical core.

Between the two extremes of protecting and extending the core and transforming it, there are two other renewal strategies, leverage and build, that bridge these two.

Strategy 3: Leverage the Core. For a leveraging strategy to succeed, the firm must add new competencies in product design and in distribution appropriate to this diverse range of markets. Leveraging is typically followed by the build strategy and vice versa.

Geographic diversification is an obvious leverage opportunity. The firm seeks to take its strengths in its home market to adjacent geographies, both nationally and internationally.

Entering new markets is not enough. The distinctive competencies that help a firm's superior performance in its home market might not suffice to give it sustained competitive advantage in host countries. Joint ventures give the company a distinctive local presence and help build a professional foundation of local employees in each major country, contributing new skills and competencies to the firm and positioning it as a strong marketer in these countries, not only for its own products, but also those of other global companies.

A healthy growth opportunity also lies in adjacent market segments that can be served at least initially with many of the distinctive competencies that the firm already has.

Strategy 4: Build the Core. Unless the firm builds complementary distinctive competencies to defend its new leverage initiatives, it will have merely introduced a new opportunity for other companies to copyright and make money. Research suggests that this is a common failure. Build is a strategy through which the firm adds new competencies both for defending its existing market franchise and growing into new markets. Unlike the protect and extend strategy, the intent here is not to strengthen a competence that already exists but rather to build a new distinctive competence.

Investments in building the core are hard for any single business unit to justify given the long time delay between these investments and financial results. Sharing the investment with other potential business users makes it possible to build. They all share the risk. Corporate funding and oversight might also be needed to supplement these build projects.

Another advantage of sharing in a build strategy is that there are multiple users of the competence who are waiting and will visit as soon as it is built. Leverage follows naturally from build. ●

Dell Entering New Market Segments

Dell Computers grew impressively by initially focusing on the business customer and selling direct. It eventually ventured into selling through discount retailers and wholesale clubs, but retail sales never grew beyond 10 percent and became a major loss for the company. Dell quickly withdrew from this segment temporarily. As part of its direct-selling strategy, the company embraced the Internet early, leveraging it later to reenter the home-user segment. By 2006, the company's revenue had grown to $56 billion.

For additional information on the risks of the protect and extend strategy, go to http://my.summary.com

Continuous Renewal

In continuous renewal, the firm is transformed over time but through a sustained sequence of leverage (leading to build) and build (leading to leverage) strategies.

Best Buy provides an interesting example of continuous renewal. It has transformed itself from relative obscurity and has become the unquestioned industry leader in retailing consumer electronics in North America, with an eye on replicating that success in China. It has done so over four decades through six distinct renewal initiatives, each called a concept.

Finding a Niche: Concept I (1983–1988)

This was a leverage strategy, seeking to launch a chain of superstores offering discount consumer electronics and relying on competencies that Best Buy had built in its Sound of Music stores. Concept I sought to expand the company's

geographic reach to cover the entire state of Minnesota. In implementing Concept I, Best Buy learned how to service a chain of stores spread across hundreds of miles and acquired new competencies in managing quick inventory terms.

Becoming a Cost Leader: Concept II (1989-1994)

Although Concept I had helped to build skills in managing inventories, Concept II required a lot more. It was primarily a build strategy. Under this new strategy, all available merchandise was on display in the store. The company used a self-service, discount-style format with everyday low prices. There were no more commissions for the sales force. Sales people were put on straight salary and were there only to help or advise customers when approached. The aim was to create a "no-pressure" shopping experience for the customer and grow revenue. Despite improved operational efficiency, profitability continued to get squeezed.

Attempting a Hybrid Approach: Concept III (1995-1998)

With Concept III, Best Buy sought to provide under a single roof both low-end commodity merchandise, such as video recorders, and higher-end products that still retained a lot of "myth," such as big-screen TVs and car stereos. The idea was to launch a hybrid store that, in addition to traditional commodity products, would carry high-end merchandise with their better margins. Margins would also be helped by the sale of extended warranties for these high-priced products.

Even though Concept III was largely a build strategy, it also had elements of leverage. It helped the company expand its geographic reach and start serving the needs of an entire family.

Moving Beyond Discrete Products: Concept IV (1998-2000)

With Concept IV, Best Buy sought to be the place where people could learn about the latest digital products and decide what would best suit their specific needs. Digital products were displayed creatively in a new "digital imagining area." The company also developed a Web-based distribution channel to provide a seamless connection between the physical stores and the virtual one.

Best Buy had become a company that had unique competencies in bundling consumer electronics products with associated services and in seamlessly blending the online experiences of customers with their in-store experiences.

Selling Solutions: Concept V (2001-2003)

This was both a build and leverage initiative. In-store consultants handled complicated transactions and sold packages (product, services, warranty). The stores were made more modular, enabling quick reconfiguration. This flexibility was considered necessary both for adapting to the changing needs of the customer and for matching the latest retailing innovations offered by competitors. A modular store gave Best Buy the ability to shrink or expand its different departments at will.

The company also leveraged its retailing competencies to open smaller and multistoried inner-city stores in large cities on both coasts and in Canada.

Getting Closer to the Customer: Concept VI (2004-Present)

Best Buy aimed to quantify the profitability of each of its customers. Using insights from analyses generated by its marketing team, the firm came up with five potentially profitable segments for the company, defined in terms of consumer needs and behaviors.

The next challenge was to find ways to reengineer the customer experience and address the specific needs within each segment and its subsegments. New value propositions were formulated for each subsegment, each with a well-planned store strategy. A store-operating model was then designed to help implement the selected strategy.

The Result

Each concept has helped the company expand its market scope or grow its distinctive competencies. In addition, the momentum for each concept has come from the previous one, with a steadily accelerating pace. The various renewal strategies have reinforced each other. The company has sustained profitable growth over the past decade. ●

A Blended Approach

When the exploitation and expansion of a firm's market opportunities and distinctive competencies happen primarily through efforts internal to the firm, these are said to be *organic*. The firm can also *acquire* the market access and distinctive competencies that it needs instead of developing them on its own, or form a *strategic alliance* or partnership with another firm to gain access to its markets and distinctive competencies instead of purchasing those elements outright.

Organic growth, acquisitions and alliances are not strategies; they are complementary means for implementing the four renewal strategies.

Impacts on Performance

The impact of acquisitions on firm performance has been studied extensively. The predominant finding is that in more than two-thirds of the cases, mergers and acquisitions do not create value for the acquiring company's shareholders (there are, however, a few studies that support the role of acquisitions in value creation).

The impact of strategic alliances on firm performance has been less well studied, but has shown similar poor performance. Of the strategic alliances struck worldwide between 1988 and 2004, only about a third were winners, generating a positive announcement effect in the share prices of the participating companies of four percent or better.

The story associated with organic growth is more positive. Investments in organic growth are typically measured by looking at research and development (R&D) expenses and capital expenditures — two primary internal vehicles for driving growth. One annual British survey indicates that companies that make major acquisitions have the propensity for underperformance, while those that make investments in R&D have a more positive effect on shareholder returns.

Taking a Blended Approach

Acquisitions and alliances can complement organic growth in supporting a firm's renewal strategies. How these are managed depends on the strategy being supported.

Acquisitions can support all four renewal strategies, but are particularly useful in support of a transformation strategy. Acquisitions are very helpful in supporting a build or leverage strategy as well, though success depends on having a well-planned organic growth effort to follow. Acquisitions can also help a protect and extend strategy, consolidating a firm's presence in its industry. Acquisitions cannot be implemented strictly as a financial exercise.

Alliances are useful in support of a leverage or build strategy, but are also used more routinely to protect and extend a core business. If a firm is seeking to move away from its legacy (in a transformational move), however, partnering with another company offers no particular advantage. If it is the partner who brings both access to the new market that is being sought and the missing competencies, the firm has no influence in this relationship.

When the motive is to leverage or build, there must be a deep commitment. What the firm needs is more durable access to the complementary strengths, either in new market access or in new distinctive competencies that the partner has.

Acquisitions, alliances and organic growth are not contending but complementary means of realizing a firm's renewal agenda. It is the job of the corporate leader to ensure that there is a broad template for coordinating the three, using each appropriately and coordinating them for maximum effect.

The Entrepreneur-Manager

Senior executives, with the help of staff experts, must define the renewal agenda for their organizational units, specifying the relative emphasis on protect and extend, leverage, build, and transform goals (and whether acquisitions and alliances will be used to serve these goals). For the goals targeted for organic growth, the firm's business and functional managers are invited to propose strategies. They shape these strategies in conjunction with senior management and take responsibility for their implementation.

A dedicated and special kind of manager is needed to execute the leverage, build and transform strategies. The entrepreneur-manager, a hybrid between an external entrepreneur and a good operating manager, must have the external focus and risk-taking ability of the former and the discipline around delivery of the latter.

Skills

The entrepreneur-manager must possess a specific set of skills and personality traits to be most successful:

- **See the big picture and shape strategy.** Entrepreneur-managers are always loyal to the company's vision. Unlike external entrepreneurs, they do not march to their own drum. Within this guiding vision, however, the entrepreneur-manager finds the freedom to develop strategies that can help in the firm's renewal. Entrepreneur-managers also manage their ventures by anchoring them either in a firm's distinctive competencies or in a market opportunity that the firm dominates.
- **Communicate and market the strategy.** A difficult challenge for the entrepreneur-manager is to communicate the value proposition of his venture to key stakeholders.
- **Manage stakeholders, gain support and mobilize resources.** Selling a build/leverage/transform project to key internal stakeholders is difficult. Even though we would expect the business and functional heads whose units are affected to take an enterprise-wide view, parochial considerations do exist. The entrepreneur-manager must have the ability to deal with these competing interests.

An Entrepreneur-Manager in Action at Dow Chemical

Ian Telford, a director in the epoxy products division of Dow Chemical, developed the idea for an Internet site devoted solely to purchasing epoxy products from Dow at low price points. After recognizing the seeds of resistance to his project, Telford started an e-mail rumor claiming a major announcement about a similar Web-based business from two competitors was imminent. He even arranged to have a spoof newscast about the faux venture videotaped and distributed to internal stakeholders. By visually alerting these stakeholders of external competition in the Web sphere, Telford was able to get buy-in and move forward.

• **Assemble and motivate a team of experts.** The entrepreneur-manager has to be a skilled manager of human talent, even more so than his peers in operations. This is because he does not have any special carrots to offer his team in exchange for the risk that they must take in working for him, in negative career consequences and/or salary or bonuses risked should the project fail. Also, most corporate reward systems insist on a forced ranking of employee performance. In a small, high-performing team, this will cause several talented individuals to be rated as par or even subpar. This is the risk that an employee takes in joining a renewal project.

Personality Traits

The entrepreneur-manager must also possess certain personality traits to be most successful.

• **Propensity to take risks.** Entrepreneur-managers usually display an appetite for risk both in their personal and professional lives. A prior record of adventure travel, working for voluntary organizations in difficult conditions or any such experience in one's personal life is a good predictor of an appetite for risk in a corporate context. Those special entrepreneur-managers are much more likely to take career risks in the pursuit of projects that they are passionate about.

• **Passion and inner fire.** Entrepreneur-managers will only sign on to projects that they care about, and after they commit, they invest themselves fully and emotionally in the project's goals. They own their projects and act out of an inner conviction in all aspects of their work.

• **Action orientation.** Entrepreneur-managers are not big on planning, but they will take whatever action is required to get funded. Executing the venture is more important to entrepreneur-managers than researching or talking about it. When confronted with obstacles, entrepreneur-managers are also not averse to challenging the bureaucratic ways of large corporations.

• **Self-confidence.** Entrepreneurial projects are risky and they can fail, but entrepreneur-managers learn from their mistakes and come back with immense self-confidence in their own abilities. ●

For additional information on professional traits of entrepreneur-managers, go to http://my.summary.com

Sponsoring Renewal

Behind every successful entrepreneur-manager is a strong sponsor. Sponsors are senior executives — usually heads of business divisions or regions, or heads of functions. Good sponsors are well-respected senior executives with an excellent track record at delivering results. Sponsors are also distinguished by the skills that they display in performing five critical roles: 1) defining the scope of a renewal project, 2) finding the entrepreneur-manager to run it, 3) locating a suitable organizational home for the project, 4) tailoring the firm's control and incentives systems to help with its implementation, and 5) coaching and supporting the entrepreneur-manager.

Defining the Renewal Agenda

Although entrepreneur-managers must be given the freedom to be creative, it is equally important to ensure that this creativity is properly channeled. A good sponsor understands the corporate purpose and strategy of the firm and translates these into a renewal agenda for the businesses that he manages.

Interactions in the planning process refer to the communication between the sponsor and the entrepreneur-manager in shaping the firm's renewal strategies. The greater the interaction, the richer the alternatives that are considered, and the better the alignment with the corporate vision. The more risky the project, the greater the need for repeated and rich interactions between the sponsor and the entrepreneur-manager.

Staffing the Project

Sponsors face two distinct challenges in staffing a renewal project:

• **Finding budding entrepreneur-managers.** Budding entrepreneur-managers announce themselves; they are self-confident and are always looking for new experiences. Senior managers must spot these individuals and help in their development.

• **Managing established entrepreneur-managers.** Finding the right project for an established entrepreneur-manager is not easy. The entrepreneur-manager need not be a subject-matter expert or technical authority for a given renewal project. The sponsor should determine whether the project will satisfy the learning and ego needs of the entrepreneur-manager, and/or whether the project will present new learning opportunities.

Locating the Proper Organizational Home

There are three types of homes for renewal projects, homes that provide varying balance between autonomy and connectedness:

• **Standalone subsidiaries.** These are established outside the mainstream businesses, primarily to give the renewal initiatives autonomy.

• **New venture organizations.** Sponsors must look at growth opportunities that are beyond the normal scope of a firm's core businesses.

• **Corporate projects.** Corporate project teams typically have four distinct characteristics: full-time members, face to face (nonvirtual) teams, diverse teams and corporate funding.

Tailoring the Context for Implementation

Detailing and implementing a renewal project is the responsibility of the entrepreneur-manager. The sponsor has an important role to play as well: setting a context that enforces the right discipline and providing the right rewards and recognition as is appropriate to the risk profile of the project.

Coaching and Support

Coaching is a role that is much celebrated but not often practiced, for one simple reason. Coaching takes time, and senior leaders don't have much of it. It's not necessary to draw up a long list of things that the leader should do as a coach, but it is necessary to look to sponsors not only to document the idea failures and ineffective behaviors of the entrepreneur-manager but also to offer counseling on how the manager can improve his skills.

Sponsors must also identify with the renewal project that they are sponsoring and be willing to cover for the entrepreneur-manager in dealings with top management and other business heads. This helps build trust.

Sponsors have to use the goodwill and personal credibility that they have built in the organization to support the entrepreneur-manager.

Ultimately, the important roles that strong sponsors play are mutually reinforcing. Through these, an effective sponsor helps develop both the entrepreneur-manager and his business and enhances the commitment that the entrepreneur-manager has to the firm. ●

Directing Renewal

The entrepreneur-manager and his sponsor shape and implement the firm's renewal strategies that must advance the firm's corporate vision; setting this vision is the responsibility of top management.

Although a new vision represents change, it is also the responsibility of top management to celebrate the thread of continuity that a firm has built through its core purpose and core values. Managing the tension between continuity and change is the first challenge for top management.

Core Purpose and Values

Companies that achieve sustained superior performance are guided by their core purpose and core values in their renewal. Core purpose demarcates a firm's renewal efforts, pointing both to the direction in which it should seek growth and to domains that it should not pursue. Core values define the approved behaviors for the firm's employees as they strive to serve its core purpose. Core values, like core purpose, are important elements of a firm's employee value proposition. An engaging core purpose and an appealing set of core values attracts voluntary contributions and superior firm performance.

Reinventing the Company

Just as important as core purpose and core values is the continuous reinterpretation of the core purpose into meaningful visions.

Corporate leaders recognize that balance begets balance and that their firms must start on this positive spiral toward sustaining both profitability and growth. However, their task is not easy. Demanding balanced performance has to be backed by a credible energizing vision. Whether it is for transforming the company or in its continuous renewal, periodic re-visioning of the company is important.

Visions that energize are simple and short. They have to evoke an imminent threat or highly desirable end state. They are appealing — the way is clear. The goals are tangible and can be broken down into credible milestones. Above all, they invite personal contribution from employees.

Jumping to a new vision prematurely can be just as detrimental to the firm's success as holding on to an existing vision that is getting stale. Timing should be based on a realistic assessment of the extent to which existing markets and competencies are losing their attractiveness and new ones are emerging. But visioning is not just an analytic exercise. It is also driven by the intuition of top management.

Providing a Strategy Architecture

Top management must also provide the strategic architecture for driving its vision, outlining the broad emphasis that it desires across the four renewal strategies of protect and extend, leverage, build, and transform. These strategies, in turn, can be executed through organic growth, acquisitions or alliances. It is the role of top management to ensure that the right blend of means is deployed. Top management has to be the chief change champion when advocating a new vision. ●

Rethink

A Business Manifesto for Cutting Costs and Boosting Innovation

by Ric Merrifield

THE SUMMARY IN BRIEF

In *Rethink*, consultant and business architect Ric Merrifield challenges business leaders to open their eyes and view the operation of their companies in a whole new way, free from the "how" trap of concentrating on *how* things are accomplished. Delving deep into every aspect of business activities, Merrifield shows readers how to escape this trap by looking past the "how" toward the "what." He also illustrates how successfully rethinking business goals and the methods used to reach them can lead to revolutionary new ways to cut costs and optimize the corporate structure.

Never has there been a more important time for company leaders to re-evaluate and reorganize their operations to maximize efficiency and productivity. Merrifield explains how successful changes to a company's business processes can only come from learning to predict potential behaviors, identify and categorize the important "whats" by value.

Merrifield also warns that before making any modifications, even to a seemingly low-value process, each factor must be carefully examined to find its connection to high-value "whats." These connections are often overlooked because they can be hidden in personal, emotional or technological relationships and, if severed, can bring disaster.

By using the tools of analysis illustrated by Merrifield, businesses will be able to anticipate the unexpected discoveries that will result from rethinking and will be able to rethink, find innovative new ways to achieve their "whats," best their competition and increase profitability.

IN THIS SUMMARY, YOU WILL LEARN:

- What the "how" trap is and how to avoid it.
- How to step back and identify what really matters to the organization.
- Why predictability can help a business successfully make changes.
- How to identify hidden connections that might be affecting a company.
- Why it's more than OK to outsource.
- How to unlock hidden sources of value from within your company.

THE COMPLETE SUMMARY: **RETHINK**

by Ric Merrifield

The author: For nearly 15 years Ric Merrifield has helped various organizations define and achieve their goals. Since joining Microsoft, he has spent more than 10,000 hours as a business architect and has filed 12 patent applications all with the goal of helping companies rethink their operating models and get out of the "how" trap. He is also the co-author of "The Next Revolution in Productivity," a June 2008 *Harvard Business Review* article.

How the 'How' Is Trapping You

In 2000, after a decade of growth, Home Depot's revenues were showing signs of wear so the board of directors hired a high-powered fixer-upper, Robert L. Nardelli, who had proven his mettle as a senior executive at General Electric. The new chairman and CEO thought he knew just what the company needed, a jolt of new-found efficiency. He simplified processes, slashed costs and invested $1 billion in new technology while doubling the number of stores. He promised investors that the company would reach new heights of sales and profitability, and he delivered. Between 2000 and 2006, annual revenues soared from $45 billion to nearly $80 billion and profits doubled. But amid that success, he also came close to destroying the single, most-important advantage the company possessed — its friendly, helpful store environment.

In pursuit of savings, Nardelli slashed employees' hours to the point that many seasoned people quit; they were replaced by less-knowledgeable and less committed part-timers. He also stripped store managers of their traditional autonomy. Before long, Home Depot had devolved into a generic big-box outlet run by nervous functionaries micromanaging unhelpful, uninterested salespeople. Meanwhile, Home Depot's chief rival, Lowe's, was staffing its stores with just the kind of outgoing, caring men and women who had originally given Home Depot its edge.

Value Is in More Than the Profits

In 2001, Home Depot and Lowe's held identical rankings among specialty retailers on the University of Michigan's American Customer Satisfaction Index (ACSI). By 2005, Lowe's was second and Home Depot was at the bottom of the list. Although revenues increased during Nardelli's reign (largely because of store expansion), customer satisfaction took a nosedive. From 2000-2006, Home Depot's ACSI score was a mere 1.7 out of a possible 100, and from 2000 to 2007 Home Depot's stock remained stagnant while Lowe's shares jumped more than 200 percent.

In January 2007, the board of directors handed Nardelli his walking papers. By conventional standards, he had done everything right: cutting costs, improving processes, and increasing efficiency and productivity. His mistake? Falling victim to the "how" trap. He had focused almost entirely on improving the efficiency (read: cost) of the work being done, the "how," rather than on the "what."

Nardelli's error is all too common. Leaders tend to devote their energies to thinking about the details, thereby missing the big picture. Management theory in recent years has pointed us toward a focus on process, on how efficiently a job is done as opposed to what the job is supposed to accomplish. Most of us haven't rethought which of our activities are most important to our companies, which are succeeding, and which are borderline or even redundant. Indeed, until now, there has been no way to accurately and efficiently rethink and measure these "whats" because we have been caught in the "how" trap, a pervasive and perverse human condition that allows us to sidestep blame for failing to reach our organization's potential.

Escaping the 'How' Trap

The activities of every business can and should be reduced to a fundamental, objective view of the totality of the work the company does. In any given company

the "whats" comprise 80 percent of its outcomes, no matter the industry.

When you rethink — forgetting about the "hows" to concentrate on the "whats" — you are creating an easily understood table of your company's essential components. And when you see them laid out in their logical sequence, you can determine the organizational value of each "what." Your rethought list of "whats" opens your eyes to the deep-down workings of your company presented in orderly fashion.

It makes you indifferent to how these elements have been traditionally arranged within the organization, freeing you to concentrate on what really matters: outcomes. After your "whats" have been defined, you can step back and determine whether and to what degree each of them contributes to your enterprise's success. Then, depending on your findings, you can eliminate some, outsource others and reorder ones that remain, just like those plug-and-play monitors and printers that arrive ready to use. You have escaped from the "how" trap. That's the beauty of rethinking.

Focus on Outcomes

Consider what happens when an insurance agent phones headquarters to assess a new customer's policy application and get a premium quote. A manager at the home offices, using some sort of actuarial algorithm in a spreadsheet, comes up with a quote and then sends it to the agent via e-mail. Ask the agent "what" he does, chances are he'll say he makes a phone call, waits and receives an e-mail. He's caught in the "how" trap. If that agent were to rethink and focus on his "whats," he'd see that the transaction in question breaks down into these desired outcomes:

- Request Customer Premium
- Calculate Customer Premium
- Prepare Customer Quote
- Customer Quote Communication

If the insurance firm's rivals are stealing market share, and if its managers cannot rethink what they do — that is, if they are caught in the "how" trap — they typically search for an explanation and a solution in such minutiae as the length of time an agent spends calling the home office or the efficiency of the company's e-mail system. Their tunnel vision can lead their organization to undertake expensive, disruptive process "improvements" — changing telephone providers or implementing new email stems that might or might not succeed.

If the company's leaders can rethink and examine the "whats," they can have the advantage of seeing the operation in its entirety, thus illuminating a pathway for getting to the root issues. They might ask: Should the agent be empowered to come up with the premium quote him- or herself? Or should the task be turned over to a vendor? ●

The Thinking Behind Rethinking

The information technology revolution of the early 1990s dramatically lowered the cost of computers and communications, making the flow of voluminous information across departments economically feasible.

A new wave of operational improvement theorists, such as James Champy and Michael Hammer, realized that this new capability allowed work to be reorganized across departments or functions. Thus, the cross-functional process became the unit of analysis for operational improvement. Champy and Hammer called their operations-improvement method *re-engineering*, and it sparked a revolution in productivity. Another revolution, this time in software known as *enterprise resource planning* (ERP), followed shortly thereafter.

Many companies continue to use re-engineering to achieve productivity gain. But over the last decade, the confluence of three major advances in information technology has set the stage for a new, more powerful *unit of analysis* or element of focus — not the tasks performed by a worker or a department, the "hows," but the desired outcome of those tasks. Today, the key to increased productivity is rethinking the "whats."

The Cloud

The rapid rise of the Web in the second half of the s, combined with the dot-com era's proliferation of cheap bandwidth — powerful communications networks for transmitting a tidal wave of digital information around the world — has made it inexpensive for the departments of a global company to be plugged into the same information anywhere in the world. Yet another key technological advance has been the rapid growth in the number of business activities that are now software-based, particularly those aimed at gathering, manipulating and processing information.

Given these developments, achieving major productivity improvement now depends in part on reducing the cost of the new software and the computers that run it.

The Internet offers a solution. It allows corporate divisions to share the same software inexpensively across great distances by using applications that reside on the Web, referred to as *the cloud*, and corporate networks rather than on individual computers. But for a sharing

solution to work properly, the software must be based upon a common set of design principles.

Another requirement must also be met for Web-based software to achieve its potential: The various and varied operating divisions within a company need to define their business operations in a common way. If five divisions of a company are to plug into one accounts receivable software application on a corporate intranet, each division must define the way in the same way.

Rethinking an organization and considering its "whats" fills that need. Now managers in each division of a company can agree on how to define the word of, say, collecting customers' payments in terms of the outcome — the "what" — that the employees are trying to achieve rather than in terms of "how" they perform the tasks that produce that outcome.

Companies that adopt the rethought "what" approach not just as a way to adapt to the demands of Web-based sharing, but also to achieve greater productivity and efficiency will succeed because it gives company leaders a detailed, actionable view of the workings of their organization — the activities that need to be streamlined, improved, outsourced or dropped altogether. ●

First — Identify the 'Whats' That Are Truly Valuable

To begin the process of identifying and examining the desired outcomes of your "whats" and judging how to improve their performance, you need to determine which "whats" are truly generating high value for your company. To be clear, a given "what" that is described as having a high value contributes to overall performance or differentiates your company from its rivals in some significant way. For example, Ship Product may be a high-value "what" in your company because its outstanding performance sets your company apart from its competitors. Even if its performance is nothing special, it still might provide high value simply because it satisfies customers — and customer satisfaction helps keep costs constant.

Determining High-Value 'Whats'

To identify a high-value "what," look for the answers to three basic questions:

- Does it directly correlate with any of your company's key business goals? (It can be helpful to use a scale of 1 to 5, where 1 is low or no correlation and 5 is high correlation; the numerical quantities come in handy when prioritizing your "whats.")
- Does it have a strong connection to your company's brand or corporate identity? Is it one of the reasons why customers feel comfortable with your brand or why your employees and partners might decide to work with you?
- Is an effort to increase the performance of the "what" likely to cause it to become high(er) value?

After you've rethought your enterprise and completed your search for high-value "whats," another series of questions arises: If a given "what" passes muster, how is it performing today? Why is it performing at that level? How can you enhance its performance? Should you? Or, if the "what" in question does not generate value, how can you trim its associated costs? Would automation or outsourcing do the job? Does the "what" duplicate work done elsewhere in the company, in which case could it be eliminated? ●

Second — Know What You Are (and Aren't) Good At

Michael Jordan is one of the best basketball players in the history of the game. No argument. But back in 1994, he made a serious mistake. He assumed he could be one of the best at another sport as well — major league baseball. After an underwhelming spring training season with the White Sox, he was sent to the minors. That summer he batted a modest .202 with the Class AA Birmingham Barons that rose to a .250 during the fall season with the Scottsdale Scorpions. Clearly, Jordan was not headed for baseball stardom. The following year, he entered an ego-restoration program by rejoining the Chicago Bulls and leading them to three more NBA championships.

Some critics saw Jordan's baseball humiliation as a simple matter of hubris run wild. Viewed through a "what" lens, though, it takes on an extra dimension. Jordan assumed his high-performing "what" was Play Sports when, in reality it was simply (albeit phenomenally) Play Basketball. Both his basketball and baseball "whats" could be measured by clear performance statistics — scoring and assist averages for one, batting average for the other.

For business leaders tackling the second step of the rethinking work, the task of measuring the performance of their "whats" is, as you might expect, a bit more complicated. You need to discover which "whats" operate at peak levels and if not, what you should do about it. And while it is important to forget the "hows" and focus on the "whats," you do need to have a clear sense

of the "how" behind every "what" before you begin rethinking your organization.

Analyzing Performance

In analyzing the performance of your "whats" and planning improvements, you need to know just how much value each "what" contributes. Essentially, there are four combinations to work through:

- **High value/low performance:** Pay serious attention.
- **High value/high performance:** Monitor.
- **Low value/low performance:** Consider automating, outsourcing or even eliminating it.
- **Low value/high performance:** Same advice; could be a major waste of resources.

As to the actual process of judging performance, use a scale of 1 to 5, with 1 being the lowest level. So your first task is to give the "what" under consideration a numerical grade. First, ask how it is currently performing. Then, ask three further questions:

- How is it currently performing today?
- Do we know and understand what causes performance today?
- Do we know and understand what it would take to improve performance?

If the performance level is under 3, and the answer to one of the last two questions is negative, you can safely put that "what" aside for future consideration to concentrate on improving those "whats" that are high in value and low in performance.

Third — Make (and Break) Connections

Companies are immensely complex organisms, intrinsically difficult to comprehend in their entirety and it's important to rethink the linkages of every "what," no matter its value or level of performance, before you start plugging and playing because connections between "whats" can take diverse and often unexpected forms. Interpersonal relationships, for example, might create a tightly woven, far-from-obvious web among several "whats." Such linkages might improve performance or impede it. Enterprise-wide software programs are, in and of themselves, a web of connections, linking virtually every "what" within an organization and the people and technologies that are part of it.

Not all "whats" are "connected" equally and it's much easier to manage and move them effectively if you understand precisely how they connect and how those connections affect their performance and the enterprise as a whole. If a particular low-value "what" is not tightly interconnected, for example, it might be a good candidate for automation, outsourcing or elimination. If a high value "what" is tightly interconnected it might be wise to change it only slowly, if at all. By the same token, "whats" that seem tangential and better performed by a vendor might nevertheless have to be kept in-house because their disappearance would hinder the workings of the more valuable "whats" to which they closely link.

Interconnectedness

Interconnectedness is a powerful and necessary aspect of a successful organization. These relationships are often ignored when companies set about making operation improvements because leaders become so intent on the immediate details of a job, the "hows," that they overlook the connections as well as the "whats." That can lead to disaster.

When considering a plug-and-play approach with any given "what," you need to get a fix on its interconnectedness. Is it intimately, somewhat or lightly involved with other in-house "whats" or with the "whats" of partners, suppliers, regulators or even customers? If the "what" you've targeted for improvement or automation is highly interconnected, that extra complexity is likely to add to the project's cost and risk.

The Manufacture Product "what," for example, requires a large number of inputs from various sources, and its outputs go in many directions. All those human and mechanical connections need to be factored into the improvement or automation equation.

A highly connected "what," even if it has been previously defined as low-value and low-performing, might be difficult to outsource because it breaks virtually all the relationships that have been built up over the years. On the other hand, a "what" such as Pay Employees has a low level of connectedness to other "whats." It's an important activity, of course, but it doesn't, in and of itself, contribute high value. So if you plan to improve its operation, there will be relatively few complications because of links to other "whats." In fact, its limited connectedness and low value make it a popular candidate for outsourcing.

Don't underestimate the importance of the personal factor. If there are family ties between the head of payroll and a high-level executive, any move to outsource the pay-employees "what" is likely to encounter static.

And you should think twice about any improvement plan that would negatively affect a supplier whose CEO is best friends with your major customer.

Fourth — Understand What Can (and Can't) Be Predicted

The next step is to train the lens of predictability on your stakeholders — customers, suppliers and partners — to anticipate their responses to the plug-and-play changes you want to make.

Predictability is one of the most treasured business qualities. Uncertainty is anathema because it's risky; it doesn't make sense to gamble when you don't know the odds. So in the course of rethinking, the ability to predict how your key "whats" will behave under the different circumstances becomes critical to your planning.

Before you embark on a rethinking initiative to alter your "whats," especially those that generate substantial value for your company, you'd better have a clear sense of what the effects will be. Those predictions should help you decide whether to pursue the changes or, if your do go ahead, how to prepare for negative impact. Leaders who fail to predict and prepare for worst-case scenarios of their "whats" are inviting disaster.

Predictability

You need to determine how predictable your target "whats" are. How sure are you that these "whats" will actually achieve their desired outcomes?

To the degree that you're unsure, you need to ask why. Is the unpredictability attached to a particular "what" caused by some common, well recognized factors that you can control or easily make allowance for? Or is it caused by unknown factors or those beyond your control? If the latter, you would be well advised to back off, at least until your understanding and control improves.

Not every twist and turn can be predicted with ironclad certainty. That's unrealistic. But you can become much more aware of the possible reactions, good and bad, of various "whats" as they undergo change, removal or automation. Beyond that, there is enormous value in knowing what you cannot predict. Just like knowing the odds in gambling, understanding what you are getting into and the predictability of the outcome can inform your appetite for that risk/gamble.

The greater complexity of the "what" (intricacy adds variation), the more unpredictability and longer timeframe.

Limiting Risk

To limit risk and maximize benefit, you should look first to "whats" that have high business value (so they're worth improving), poor performance (so there's room for improvement) and high predictability (so the risk of failure is slight).

The greater your ability to control the variables in the operation of your company's "whats," the better you can predict how they will react to improvement, outsourcing or automation. Some elements of any business, though, are virtually control-proof.

Fifth — Unravel (and Follow) The Rules

The laws and rules set forth by the various government branches have long loomed large in every company's business plan and daily operation. Companies are sometimes stung by a new action of a duly constituted government agency or legislative body. Auto manufacturers are intermittently slammed by new state or federal emission rules. Unexpected changes in labeling rules have caused havoc in the food industry and, of course, many of us have experienced the impact of added security regulations in airports.

For people in every industry, the message should be clear: Be prepared. A thorough understanding of your company's existing or potential compliance issues is essential. And before you rethink and perhaps make major changes to one of your company's "whats," you had better be aware of how they might alter its compliance with relevant laws. In today's world, virtually all "whats" of any consequence are subject to one or another regulation.

Global Compliance Difficulties

Compliance has been made even more complex and difficult by globalization. For example, after Congress passed the Internet gambling law, the World Trade Organization (WTO) ruled the measure illegal under the 1994 General Agreement on Trade in Services. The European Union filed a protest. Critics charged that the new law, promoted as an effort to reduce the social damage caused by gambling addiction, was actually intended to protect traditional American betting interests from competition by new online operations. As of late 2008, the conflict remained unresolved.

Categorizing Compliance

To cope with government rules and laws, start by dividing your "whats" into three categories: those that

have compliance issues, those that don't, and those that you're uncertain about and require further study. Simply recognizing which category a "what" belongs in is an important step, because it can reinforce or upset tentative decisions you've reach based on the lenses of value, performance, interconnectedness and predictability.

It would be wise not to proceed with a change after discovering that the target "whats" have existing or potential compliance problems. The existing issues have to be eliminated and the potential issues clarified. When there remains some uncertainty as to compliance, the predictability lens of the "whats" should come into play. If a "what" is also unpredictable, the risk of an unpleasant surprise that might move it out of compliance might be too high to proceed.

Note: In analyzing the legal status of your "whats," do not limit the examination to high-value ones alone. Being noncompliant in a low-value "what" can inflict major damage on your business.

Rethinking at ING Direct

Based in Wilmington, Del., ING Direct USA is a division of the Dutch conglomerate ING Groep NV, an insurance and banking colossus. Launched in September 2000 by its chairman, president and CEO Arkadi Kuhlmann, ING Direct was envisioned as the fast-food version of banking: high volume, low margin. There would be no branches — all business would be conducted by phone or Internet — and the only product at first was a savings account with an annual interest rate of 6.5 percent, far higher than a customer could finagle at a more traditional "branched" institution.

Beyond that, there were no fees, no required minimum balances, no ATMs, no perks for big depositors and definitely no handholding for difficult customers. Those who complained too much or stayed on the phone too long were invited to take their business elsewhere. As Kuhlmann explained it: "The business is not based on relationships; it's based on a commodity product. We need to keep expenses down, which doesn't work when customers want a lot of empathic contact." That policy initially saved the bank an estimated $1 million a year.

Banking — Redefined

At the time, branch banks were falling all over themselves to offer customers a dizzying array of products and frills, ranging from gaudily personalized checks to extended lobby hours. But Kuhlmann took the opposite track. Given that prior to the emergence of the ATM, location had been one thing that differentiated players in the commodity banking business. Kuhlmann saw the Internet as making location totally irrelevant to retail banking.

Seeing opportunity, he looked at how retail banking was done and ditched formerly important "hows" in favor of focusing on more important "whats." He slashed costs by forgoing brick-and-mortar branches, lowering customer-support performance measures and revolutionizing operations through the introduction of easy online customer transactions.

By rethinking the lackluster model of traditional retail banking and its accompanying "whats" and "hows," ING Direct's parent company hoped to expand globally without a huge investment in a bank network, using a unique stripped-down business model — and the required "whats" and "hows." That meant no "whats" involving paper checks (ordering, printing, processing and so on) and no "whats" related to branches (locations, construction, employees and such). Nor did it invest in extensive customer support; instead, the focus was on giving customers the highest savings rates, the best online experience and protection from annoying overdraft fees.

Focused on the "What"

In short, the only "whats" that mattered were those that helped the company make money and its customers save it. Kuhlmann increased targeted investments in innovation to nurture the specific type of relationship he sought to have with customers. For instance, to guarantee the fastest and smoothest experience possible, the company paid special attention to buying and leasing state-of-the-art technology, regularly updating it, and keeping its people well versed on its use.

The company's constant monitoring of the performance of its "whats" — in particular, Fulfill Demand — gradually led Kuhlmann to modify the business model. Customers wanted more products. So Kuhlmann added mortgages then checking accounts — in each case finding ways to make the most of ING Direct's existing "whats" while developing new ones only as needed.

The ability to add and remove "whats" easily gives companies a degree of agility that was all but nonexistent just a decade ago.

Despite all the changes, Kuhlmann still insists that ING Direct's basic strategy remains the same: "Our mission is to lead Americans back to savings."

Morph Again and Again

When Shakespeare wrote Hamlet's great soliloquy, "To be or not to be," he not only defined the human ambiguity, he also foreshadowed the uncertain future of the play. No other drama has been more often recycled, re-imagined, reinterpreted or rethought by successive generations of critics and dramaturges.

When it comes to business, the unprecedented uncertainty and volatility facing leaders today create turbulence as great as any that buffeted Hamlet.

Companies must constantly monitor and massage how they do what they do to adjust to new technologies, new competitive threats and ever-changing market conditions. They must continually rethink, discover new ways to expand their trove of "whats" and further exploit those they already possess. Otherwise, they will fall victim to more flexible, proactive rivals demanding "your money and your life."

P&G Soars by Morphing

In 1999, when A.G. Lafley was named CEO of the Procter & Gamble Company (P&G), sales and earnings were shrinking. After supplying consumers with a seemingly endless supply of new products and services for 162 years, the company was running out of ideas. New technologies and new competitors had sped up the pace of business while globalization had fragmented its processes and procedures. To stay in the race, P&G had to churn out innovations much faster but without jeopardizing profitability — it had to rethink. Success in managing its Innovate Product "what" would be central to the company's very survival.

At the time, P&G was getting barely 10 percent of its product ideas from outsiders. But Lafley knew that his company could no longer go it alone. "We don't care where the ideas come from," said Lafley, decreeing that, henceforth, P&G would work to source 50 percent of its Create New Product from outside the company.

Refocusing Their Strategy

Nabil Y. Sakkab, senior vice president for corporate research and development, says experience shows that 1,000 ideas must be filtered to find one "big idea," the kind that will return, say $100 million of new business. To create $4 billion in new business, the goal Lafley laid out, the company would have to access and vet 40,000 ideas.

To get things started, Lafley rethought P&G's Research and Develop Product "whats" by reframing them as "connect and develop," or C&D. That seemingly small change in terminology set product developers and marketing people to think about their jobs in a new way. No longer were they researching and creating in solitude, the new mind-set was outward-looking, and it encompassed an estimated 1.5 million innovators around the world who could help P&G solve problems and think up ideas for new products. Alliances were no longer part of the company's strategy; they were its strategy, making a previously unimportant "what," Manage Partner Relationships, crucial to P&G.

Five years after Lafley's groundbreaking directive, innovating innovation had notably increased the efficiency of the company's R&D investments. In fact, P&G's innovation success rate had doubled, and when translated to an income statement, the newfound efficiency looked like this: a 19 percent jump in 2004 sales and a 25 percent rise in earnings, a remarkable achievement for a company P&G's size.

Success Through Rethinking

Today, P&G has regained its cherished spot as the most innovative packaged-goods marketer.

Thanks largely to rethinking and ideas generated from outside its walls, the company has won some 27,000 patents, while 23 of its quality leadership brands have met its benchmark for success by reaching or exceeding $1 billion in annual sales. C&D is up by 60 percent, and innovation success rates, as measured by projects meeting financial criteria, hover around 70 percent.

All of this is a testament to Procter and Gamble's mastery of Manage Talent "whats" and to A.G. Lafley's innovative idea for innovating innovation.

If you succeed in identifying, analyzing and understanding your "whats" as your rethink and go forth to best your competition, you'll discover a whole new way of looking at your own business and at business in general. You will be liberated from the blinder-like tunnel vision of a narrow focus on cost, procedure, sequencing and all the other "hows" of the game. ●

The Complexity Crisis

Why Too Many Products, Markets and Customers Are Crippling Your Company — And What To Do About It

by John L. Mariotti

THE SUMMARY IN BRIEF

In their quest for double-digit growth in single-digit markets, many companies are finding themselves in a crisis — one that they often don't realize is of their own making. They have created more products, customers, markets, suppliers, services and locations, but increasing complexity has destroyed the fruits of their labors.

Make no mistake, companies need new products to compete, but how many, and how they are developed, introduced and managed, makes a huge difference in how complex they should be. After all, in most organizations, people feel the need to create new products, processes, facilities and systems, *but no one is designated to kill off the obsolete or unproductive ones!*

The Complexity Crisis demonstrates how new metrics and deliberate, disciplined managerial control can reduce profit-sucking complexity — or turn complexity into a competitive advantage. Author and management veteran John Mariotti shows how to contain the slow, almost invisible creep of complexity into organizations and how companies can create profitable growth without creating and then having to manage new complexity. He also explains why innovation, while essential, should be "managed innovation" rather than rampant proliferation.

John Mariotti covers these topics and more as he reflects on his personal battles with complexity at the helm of Rubbermaid and Huffy, and he illustrates how other prominent companies have fought and won their own wars on complexity.

IN THIS SUMMARY, YOU WILL LEARN:

- Why complexity can be the kiss of death.
- How to measure the overall complexity of your company.
- How to detect needless complexity in different areas of your business.
- How several major companies have rooted out and eliminated complexity.
- How several major companies have used complexity to their advantage.

What Is the Complexity Crisis?

Companies all over the world are struggling with a crisis and most don't realize that it is a crisis of their own making. This crisis — the Complexity Crisis — is crippling them, destroying their profits and draining their resources. In the quest for high growth in low- or no-growth markets, companies have proliferated nearly everything: products, customers, markets, suppliers, facilities, locations, etc. Some of the time, the proliferation actually does lead to top-line revenue growth, but as the top line goes up, the bottom line — profit — doesn't. This is worsened by the fact that none of today's pervasive accounting systems identify complexity costs until it is too late because the causes are obscured, buried in variance, special charges, increased overhead and other "catch-all" categories.

What can you do about it? Take this occasion to go on a company "diet" of sorts. Prune low-profit, low-volume and unnecessary products. Lose unprofitable customers. Eliminate the outdated reports, unused screen formats and obsolete software. Finally, institute new metrics and modifications to existing management cost-control systems to know when to drive complexity out and when to capitalize on it. Last, and most important: Keep the management of complexity as simple as possible, so whether you "use it or lose it" you solve the problem and keep it solved.

Peter Drucker wrote about concepts related to the Complexity Crisis in his classic 1963 *Harvard Business Review* article "Managing for Business Effectiveness." In essence, Drucker said that clarity of focus is critical in allocating resources, which is the essential job of management. A company that tries to chase too many ideas will only encounter another form of the Complexity Crisis and drown in work, but not in profits. The hard part of innovation is sorting out which ideas should make the cut and then undertaking the job of successfully commercializing them.

For information on how Apple Computer eliminated its complexity in the PDA market, go to: http//my.summary.com

The Bottom Line — Where Complexity Hurts

As companies struggle for growth in sales revenue, they try to drive the "top line," which is where sales revenue shows on the income statement. Many companies succeed in gaining top-line growth but introduce costly complexity along with the growth. When the results are compiled at the end of a month or quarter, only then do they discover that the top line may have indeed gone up nicely, but the bottom line went down — often dramatically.

How could this have happened? Typically, nobody considered the economic impact of the complexity on new customers, new products, new distribution, new suppliers, working from new specs, doing business in new states and countries with different regulations and legal practices, and added costs of relocation, special commissions, freight, etc. And all this was made worse by trying to do it all too fast.

Unintended Consequences of Complexity

The goal of consistently good quality is dependent on the reduction of variability. In naturally occurring events, and especially in the processing of materials by machinery, natural variation in dimensions and characteristics will occur. As long as the items produced fall within

acceptable tolerance range, they are in conformance — and usable. But when the process varies more, some items produced fall outside the acceptable tolerance range and are considered nonconforming or defective. These items usually must be sorted out.

One process is easier to improve than several. One process is easier to keep in control than several, too. When a company uses multiple processes and/or multiple suppliers — even with each of them aiming at the same targets for dimensions — each process introduces new variability, and complexity's role in creating crises, by undermining quality, becomes painfully evident.

Service is impacted by complexity, too. Forecasts are predictions. The more items a forecast must predict, the more chances to make errors. The more locations where the demand originates, the more chances for error. The more people involved in the forecasting process, the more accurate it is — not. The more customers for whom demand must be forecast, the greater chance of error. This is why complexity adds to forecast error, and forecast error undermines customer service. In order to service a volatile demand by a customer, the best solution is to have more, flexible production capacity — in order to respond to forecast errors and changes in demand as rapidly as possible.

Globalization also increases vulnerability to the Complexity Crisis. Problems don't go away when they are moved far away to a new home. The longer a supply chain extends, and the more complex it is in makeup, the slower it will react to changes.

For information on how Titleist handles the complexity of "acceptable variation," go to: http//my.summary.com

Two Essential Steps

The two steps to solving any problem are: define the problem first, solve it second. The problem is relatively simple to state. Companies are adding complexity faster than they are improving their ability to recognize it, measure it or manage it. This problem also presents a great opportunity. The opportunity is to understand what we are doing and devise ways to make complex things simpler or make that complexity create competitive advantage.

If you suspect that complexity is a problem and not an advantage, then it is time to find that complexity and "fix it," which means drive it out of the business. On the other hand, if a high-variety, complexity-rich solution appears to yield competitive advantage, it is time to determine how the structure, processes and culture/relationships of the company must be altered to execute such a strategy profitably.

In its "War on Complexity," Motorola addressed both its portfolio complexity and its product complexity. To control the process and monitor complexity in new designs, Motorola created a "Complexity Index" (CI).

CI is a company- and product-specific (or service-specific) matter. Different aspects of product/service designs add complexity and others add value. This CI concept sets an impersonal but agreed-upon criteria for a design to meet.

How to use a CI: Create a test metric, one that rolls multiple design factors into one measurement. Use it as a gatekeeper to disqualify overly complex designs and send them back to the drawing board.

How Motorola Did It

The story about Theresa Metty coming to Motorola from IBM as head of its supply chain management and finding a mess is one that could be retold many times over, at many other companies. And while many of the solutions adopted by Motorola in its War on Complexity were not new, the combination used to defeat complexity was a new solution set. Most of these time-proven disciplines had been forgotten or overlooked in the scramble to chase new products and regain lost market position.

- Create "platforms" around which products can be built with variations, making it unnecessary to completely redesign the product to meet different market segment needs.
- Have standard component lists. Having standard spare parts is also crucial.
- Use fewer suppliers to automatically reduce variability.
- Long-term agreements can be negotiated, creating greater stability and lessening complexity in supply chain relationships.
- By holding components in a semi-finished condition, much of the complexity otherwise introduced by model-to-model variations can be reduced.
- Mass customization allows companies to use mass-production techniques until the product reaches a nearly finished state and the differentiators that "customize" the product are added at the latest possible time.
- A Complexity Index can use weighting to denote the relative importance of the various factors in its makeup and arrive at a single numerical index.

How to Recognize It, Measure It and Begin to Fix It

The problem of complexity that plagues today's businesses, managers and executives is an insidious result of their own actions. It lurks in many parts of the business, unmeasured, while draining resources, focus and energy. Now it is time to expose it, learn to both measure and control it, and then decide whether to lose it or use it — specifically, reduce it by driving out complexity or develop a strategy to compete based on complexity, with structure and processes to do just that.

There are only five ways to grow faster than the market is growing. First and most obvious is to try to take market share from competitors, as it involves participation in the same markets, competing with familiar competitors, products, etc. Choosing this path to growth usually doesn't add complexity unless the share you go after is a different kind of product, customer, distribution, etc. This approach is also one of the most difficult from the perspective of profitability and likely competitive retaliation.

The second choice, expanding the market through innovation, sounds great. It's just much easier to say than to do. Innovations are not too predictable and are subject to copying, knockoffs or product life-cycle limitations.

The third option, changing the mix to sell higher-priced products, is a very effective way to impact profitability and would be a great solution for growth if everyone else wasn't also trying to do the same thing. This is also a strategy that is less likely to cause more complexity and might actually lead to simpler product and customer combinations.

The fourth choice, entering new markets, has appeal because "the grass is always greener on the other side of the fence." Remember, however, that while new markets may be new to you, they are some incumbent's current market, and that incumbent will defend its market position.

Finally, the fifth option, creating an entirely new product and market, is a wonderful one. It is also the most difficult and uncertain, and contains elements of the prior four. ●

A New Metric for Tracking Complexity

A useful management tool to understand where a company makes money and where it loses money is the *descending-order list*. Rank customers by annual sales from highest to lowest. Calculate the percentage each customer contributes to total sales and then create a cumulative percentage column. Then rank those same customers in descending order by annual profit contribution. Next, rank these same customers in descending order by percentage of gross margin. The names at the top of the first two lists should be similar.

Next go to the top and bottom of the sales and margin lists and find the 20 percent cumulative and 80 percent cumulative points and draw lines across the list. You have now identified the most valuable and least valuable customers from a sales and profit contribution perspective. Among these lowest volume and least profitable customers is where complexity usually hides.

Do the descending-order ranking on suppliers and annual purchase dollars too. Complexity exists on both the sell side and the buy side. Finally, repeat this ranking process for finished products by annual sales volume, gross-margin dollar and gross-margin percentage contributions in descending order. The customers and products that occupy the bottom of these lists are those that add complexity without the redeeming feature of adding profitability.

The last of the more common metrics, but still only used sparingly, is to compute sales (revenue) per employee and profit per employee. Complexity requires added staff to manage, and this shows up in higher head count without a correspondingly higher level of sales.

There is another metric, the Complexity Factor (CF), which is more complex to compile but quite revealing in its relative simplicity:

CF = Number of Finished Products (SKUs) x Number of Different Markets Serviced x Number of Company Legal Entities x Number of Significant Facilities x (Number of Employees + Number of Suppliers + Number of Customers) ÷ Sales Revenues.

The CF is not an absolute measure — it is an indicator that provides information about the likelihood of a company suffering from complexity or benefiting from the lack of it. Drive down the CF; drive up the profitability of the company. ●

The Examples

Complexity is everywhere. Make no mistake, companies need new products to compete, but how many, and how they are developed, introduced and managed, makes a huge difference in how complex they should be.

Subs and Sundaes

In its small, make-to-order, deli-style restaurants, **Subway** uses a limited number of basic ingredients and

can produce a nearly infinite variety of sandwiches. This is a perfectly simple and familiar example of the principles of adapting the structure and processes to the "use it" strategy of competing on intentionally created complexity. Complexity that is driven by consumer choice at the time of demand is a competitive advantage.

The **Dairy Queen** franchise was built around the custard-dispensing machine, which took the liquid custard and froze it into a semisolid and then dispensed it through a nozzle into cones, sundae dishes and milkshake cups. From a small array of sweets and the platform of the frozen custard machine, a wide variety of confections could be created. Although frozen yogurt stores like TCBY and regional ice cream chains have taken market share from DQ, its original principle of competing on complexity remains virtually unchanged. Competing using complexity works well if the structure and processes are designed for it.

Cars: How Many Models Is Just Enough?

There are few places in the history of industrial development where one could find a better example of complexity's impact than the past century in the U.S. auto industry. Complexity evolved, became a competitive advantage, reversed itself and is now beginning to rise again.

For example, **Henry Ford** invented the equivalent of the modern-day assembly line. Then he decided to abandon the common industry practice of producing many different models and instead make just one model, and to make it in just one color. Ford proved three things. First, a strategic, systematic lowering of prices could boost volume and increase profits. Second, the elimination of complexity had a wonderful effect on efficiency and productivity. Third, the elimination of complexity in jobs allowed workers to remain stationary and perform repetitive tasks faster and faster, as the chain-driven assembly line speeded up the production pace.

Alfred Sloan's strategy at General Motors was to use the purposeful addition of complexity as a competitive weapon against Ford's concentration on a single model. Sloan wisely decided to create a reason for people to replace their cars before they wore out. It was called the "annual model changeover." This added considerable complexity in parts, production, dealer inventories and more, but it also shot GM to the top of the U.S. auto industry.

Planes, Computers and Credit Cards

In their zeal to charge as much as possible yet fill the plane as full as possible, most airlines don't have any (quantifiable) idea how much complexity costs in lost productivity, systems complexity, confusion and customer ill will. Air travel is an inherently complex business in the first place, and this is complicated by the fact that it is weather dependent. The marketing departments add to the complexity — with the best of intentions — by devising new promotions to drive traffic into particular markets, each of which gets layered atop all the others.

A few airlines, most notably **Southwest,** seem to have "broken the code" by simplifying how they operate to thwart the worst effects of complexity. What Southwest must avoid are the mistakes that killed the first "simple" airline, People's Express, a couple of decades ago — adding complexity to an inherently simple business model.

When **Dell** did it differently, using postponement and mass customizations along with the interactive power of the Internet to build a myriad of computers to match individual customers' wishes, it revolutionized the selling and building of personal computers, and it did so more cost effectively than anyone else. This was a "use it" complexity strategy superbly executed.

Capital One realized that people don't all want the same kind of credit card. Thus a nearly infinite menu of credit cards — for every use and every situation — was born. The key insight is the importance of designing the structure and processes such that many variations can be added with little or no systemic or transaction cost.

Fast Food

McDonald's was the Henry Ford of fast food. All regular hamburgers and cheeseburgers were made the same: ketchup, mustard, pickle and onion, done on an assembly-line process next to the grill. The temptation to add more choices was irresistible, so along came the Big Mac. McDonald's felt compelled to at least match Burger King with a bigger burger, and the Quarter Pounder was introduced.

Japanese Carmakers Defeat Complexity

From the teachings of American quality gurus J. M. Juran and W. Edwards Deming, the Japanese realized that complexity undermines quality, which led to Japan's quality strategy. Japanese carmakers realized that offering only a few variations — perhaps four exterior colors and two interior colors — and equipping all cars with the most popular options made it easier and more economical to build cars, which led to higher build quality. This is the essence of eliminating the Complexity Factor — the "lose it" version.

Suffice it to say that everything else it added to the menu to combat competitors' offerings added more complexity than profit. This caused McDonald's serious problems, the most vexing of which was that the food no longer came out fast. At the heart of the matter was the fact that over the years McDonald's had layered complexity after complexity on its restaurants but had not changed the structure, process, culture and relationships in a comparable manner. ●

Too Many of Everything?

A simple trip to the grocery store, home center, electronics store or supercenter will tell you all you need to know about how complexity is creating huge inefficiencies in all walks of life. About 10 percent of the items do about 90 percent of the sales. There will be about 30,000 items, give or take a few, in a supermarket these days. Each year some 10,000 to 20,000 new ones will appear. Complexity runs rampant in dozens of brands. But does it pay to line-extend so extensively until every niche of every segment is covered? No! You are just dividing up the business and multiplying the costs — and that is bad math — with or without the Complexity Factor.

Industries may vary but the Complexity Crisis hits them all. The principles of the Complexity Factor and the "use it or lose it" strategy are equally applicable to hotels, restaurants, service businesses and so on. The primary variable is how to define a "product SKU" and how to define a "served market." Once that is resolved, similar companies can readily benchmark their progress using their own calculated CF and the other metrics discussed. ●

Strategies and Solutions

The purpose of any company should not be to stifle growth through innovation. It should be to make growth productive and profitable. The key objective is to find complexity if it exists and decide whether to keep it and use it as a competitive weapon, or to eliminate it and the hidden costs it is creating. If a company is to contain the growth of complexity without stifling innovation, it must have a crystal-clear focus on how it wishes to compete and what it must do to succeed in that approach.

The best framework for thinking about complexity follows a sequence through five distinct, but related, dimensions of a business: purpose, structure, processes, relationships and culture.

Purpose

In a business's infancy, someone decided that there was a need that could be fulfilled, and thus a business was created to serve a customer. The wise founder took the time to decide, "Just what is the purpose of this business?" If it was recorded, tested, communicated and sustained, then the purpose fulfilled the first dimension of the business. Once the purpose is set, it should remain largely unchanged until or unless there is a formidable need to alter it.

Structure

To create value, which is the key to creating and keeping customers, a business must have a structure that is consistent with its strategy and vice versa. The structure is how it is set up, organized and configured. Structure decisions are usually longer-term considerations and are harder to change quickly such as closing facilities, firing people, liquidating assets, etc. Structural decisions must be made with strategic intent. The problem, however, is that few managers or executives connect the need for such structural parts to the causes of complexity — products, customers, suppliers, markets and services — each of which made sense by itself, but now conspire to create a tangled web of problems and costs that spin out of control.

Processes

As the company grows, the structure grows/evolves and the processes spread like the tendrils of a vine. Process mapping exposes waste, delay and inefficiency, and sometimes it exposes the imminent risk of total breakdown as well.

Relationships and Culture

To conquer complexity — or to use it for competitive advantage — one of the key ingredients to use is organizational trust and openness. If people inside the company don't trust one another, they won't work together effectively, and that adds unproductive complexity and gets in the way of planned strategic complexity. The same goes for relationships with the outside organizations of customers, suppliers, consultants, etc.

Contrasting strategies of "lose it" and "use it" take two different approaches. In the former, complexity is driven out, and simplification and efficiency are used to reduce hidden costs. This requires one sort of culture — one of simplicity. In the "use it" approach to embracing complexity, the systems, structure, processes, technology and culture are intended to consciously capture customers through variety, customization and intentional proliferation. ●

Complexity's Impact on Organizations

Industry is full of examples of how complexity has impacted organizations. One of the most devastating effects is that the workload goes up dramatically, but the results do not improve (or they actually get worse). These interactions, combined with the workload, lead to organizational stress, discontent and errors. A common attempt to fix the problem is not to remove the complexity or stop its causes, but to reorganize, restructure or rearrange the way work is done and the people doing it.

How do you know how far to push innovation versus controlling complexity? The only way to know that answer is to understand what complexity costs, where to find its impact and what effect it has on quality, service, profit and growth. Fortunately, most of the raw data needed is already available somewhere in those corporate computer systems we all know and love and rely on. The challenge is in knowing what to look for in those computer systems.

Just as standard cost accounting ignored activities that necessitated the development of activity-based accounting, there must be a new set of entries that capture and assign the costs of complexity where they belong. To start any such process of change, it is useful to identify the likely causes and the places to look:

• **Transactions.** Accumulate the annual department expenses for order entry and order management and divide by the number of orders processed in a year. Do the same thing for the department that processes invoices and applies the cash. It will be surprising how much it costs to process and complete an order from beginning to end.

• **Customers.** Whereas in the last metric we divided by the number of transactions, in this one we will divide by the number of customers. Once again, go to the departmental budgets for sales and gather the expenses that are incurred by sales (don't forget commissions). The challenge is to identify which customers caused those big expenses to be incurred.

• **Suppliers.** First, do the transaction analysis for purchase orders and payments just like the one for processing customer orders. Next, repeat the process of identifying what it costs to set up, buy from and maintain a supplier, just as you did for a customer.

• **Competition.** Someone must have the job of accumulating and tracking competitive intelligence, and that person's cost and support costs can be tracked as complexity-related costs too.

• **Obsolescence.** An important analysis is to see if a large proportion of obsolescence is attributable to specific customers or product lines, distribution channels, etc.

• **Forecasting.** The more complexity there is in the business, the more likely the forecasts will be wrong. In addition, the less familiar the areas are where complexity has grown, the less accurate those forecasts will be.

• **Shipment.** More interactions and more transactions involving more locations inevitably lead to more opportunities for error and more administrative costs. Analyze errors by the destinations, routes, type of material, mode of work required, and so forth.

• **Staffing Costs, Learning Curve and Training Costs.** Express the staffing level of each meaningful division of the business in full-time equivalents (FTEs) and track the trend over the past two to three years. Divide the sales revenue and the profit revenue by the head count to come up with sales per head count and profit per head count.

• **Information Systems.** Measures of information system costs are best done on a large (macro) basis, such as a percent of net sales for the division or enterprise, and then at a closer (micro) level, for utility costs and maintenance (hardware and software) costs, to see how the percentage of net sales for the individual user locations vary.

• **Currency Rates.** The more places you do business, the more chances there are for currency fluctuations alone to cause unexpected economic impacts that were not planned, and in many cases these are largely uncontrollable.

• **Tax Returns.** The greater the number of states and countries, the higher the cost to manage tax matters. The need to know banking and financial regulations and requirements adds complexity for financial officers.

• **Regulations.** The more-developed countries tend to have more regulatory compliance, while less-developed countries tend to have more cultural or local custom issues to understand and with which you will have to comply.

• **Intellectual Property.** Today's global business environment and rapid product life cycles require careful management of the few legal intellectual property protections that exist for new and innovative products and services.

• **Human Resources.** If you have too many people, you fire some, or lay them off to be called back later. This is not nearly so simple in many other countries. These costs, of course, are buried among many other unrelated ones in the overall administrative expenses of the company.

The Big Picture

There are six major topics that must be understood to compete and succeed in spite of complexity in this competitive, global 21st-century business environment.

1. The Current Environment

Even if there is not an alternate competitive source now, there could be one, and very quickly. All it takes is a large market opportunity — or a large customer like Wal-Mart — to motivate a new producer to enter the market. What's more, given a little time, companies around the globe can learn how to make almost anything (or provide almost any service).

2. The Curse of Complexity

It is a devilish choice: Go after markets where the money is, but where intrinsic growth is low or zero; or go after huge potential markets where there is precious little money to pay for the goods, thus stifling growth a different way. The solution for too many companies is to sell everything, everywhere, every way they can, and in doing so, these companies drown in complexity.

3. Strategic Outsourcing — Boon or Bane?

Companies often err by giving away what is core during outsourcing. For example, companies choose to move a problem to a faraway supplier in hopes that the supplier will fix the problem. Another misguided reason to add complexity via outsourcing is to gain competitive advantage.

4. The Value Network

The term "supply chain" is both a misnomer and an obsolete characterization of what it tries to describe. The right term for the configuration is a "network." Next, realize that "supply" isn't the end goal, "value" is. Wherever and however the value network consistently creates and delivers the best value, you will find the global winners.

5. Partnerships in an Era of Growing Complexity

Find the best people — those with talent, experience, expertise, skills and imagination — and bring them together with strong leaders who will infuse them with passion. The four powerful partnership types in the value network can be easily recalled by the acronym CAST: Customers, Associates, Suppliers and Truth-Tellers.

6. Leadership — Creating a Path to the Future

Even with the strongest of partners, the right leadership is critical to success. The leader's role has three parts:

- To create a clear understanding of, and healthy dissatisfaction with, the current reality
- To build a shared vision of a new, better reality as a goal
- To create an environment in which people are motivated to move from the former to the latter.

There are four key responsibilities of a leader in this role:

- To provide and/or ensure that the necessary resources are available
- To clear obstacles, maintain progress, develop metrics to measure progress and stay on track
- To go along on the journey
- To celebrate wins, mourn losses and never give up striving for the shared vision of the goal.

When complexity afflicts an organization, it is easy for people to lose their bearings. To manage that complexity, a leader's toughest decisions involve setting priorities.

What Will You Do Differently, and Better?

Sometimes the hardest thing to do is to get started. Think big, but try small, then adjust based on what you learn, and get going. Don't let complexity slow you down. Complexity tends to make prioritization difficult. A specific framework for thinking helps clarify what is important. The five elements any business needs to consider carefully are: purpose, structure, processes, culture and relationships.

As you try to manage complexity, there is another essential concept you must take into account: value. Value is the ultimate metric of the 21st century, and whoever can create and deliver the best value wins. If we accept that value can be defined by just five attributes (quality, service, speed, cost, innovation), it can become the basis for part of the shared vision that all leaders must create.

RECOMMENDED READING LIST

If you liked *The Complexity Crisis*, you'll also like:

1. ***Green to Gold*** **by Daniel C. Esty and Andrew S. Winston.** Based on the authors' years of experience and hundreds of interviews with corporate leaders around the world, the book shows how companies generate lasting value by building environmental thinking into their business strategies.
2. ***The Starfish and the Spider*** **by Ori Brafman and Rod A. Beckstrom.** A spider has legs, a central body and a tiny head. Chop off the spider's head and it dies. That's what happens in a centralized organization with a clear leader in charge. A decentralized organization is more like a starfish — no head, only a decentralized network of cells. This book addresses the differences between the two organizational styles and why a smart business model contains parts of both.
3. ***The Age of Speed*** **by Vincent Poscente.** In a time-starved era, you need to stop listening to everyone who tells you to slow down and begin paying attention to authors like Poscente who give you the necessary tools to get ahead of the rush once and for all.

Bonus Summary

by Peter M. Senge

THE SUMMARY IN BRIEF

There are ways of working together that are vastly more satisfying and more productive than the prevailing system of management. Organizations work the way they do because of how we work, how we think and how we interact; the changes required ahead are not only in our organizations but in ourselves as well. In building learning organizations there is no ultimate destination or end state — there is only a lifelong journey.

In the long run the only sustainable competitive advantage is your organization's ability to learn faster than the competition. The leadership lessons demonstrate the many ways that the core ideas in *The Fifth Discipline* — many of which seemed radical when the book was first published in 1990 — have become deeply integrated into people's ways of seeing the world and their managerial practices.

In this summary of the revised and updated edition of *The Fifth Discipline*, author Peter M. Senge describes how companies can rid themselves of the learning "disabilities" that threaten their productivity and success by adopting the strategies of learning organizations — ones in which new and expansive patterns of thinking are nurtured, collective aspiration is set free and people are continually learning how to create results they truly desire.

IN THIS SUMMARY, YOU WILL LEARN:

- How to reignite the spark of genuine learning driven by people focused on what truly matters to them.
- Ways to bridge teamwork into macro-creativity.
- How to free yourself of confining assumptions and mindsets.
- How to determine if your organization has a "learning disability."
- What the 11 laws of the fifth discipline are.
- How to identify the patterns that control events.

THE COMPLETE SUMMARY: **THE FIFTH DISCIPLINE**

by Peter M. Senge

The author: Peter M. Senge is a senior lecturer at the MIT Sloan School of Management and the founder of the Society for Organizational Learning (SoL). In addition to *The Fifth Discipline*, he is the co-author of *The Fifth Discipline Fieldbook*, *The Dance of Change*, *Schools That Learn* and *Presence*. Senge is widely known as one of the most innovative thinkers about management and leadership in the world. He received a B.S. in engineering from Stanford University, as well as an M.S. in social systems modeling and a Ph.D. in management from MIT.

How Our Actions Create Our Reality … and How We Can Change It

As the world becomes more interconnected and business becomes more complex and dynamic, work must become more "learningful." It is no longer sufficient to have one person learning for the organization, a Ford or a Sloan or a Watson or a Gates. It's just not possible any longer to figure it out from the top and have everyone else following the orders of the "grand strategist." The organizations that will truly excel in the future will be the organizations that discover how to tap people's commitment and capacity to learn at all levels in an organization.

Learning organizations are possible because, deep down, we are all learners. Learning organizations are possible because not only is it our nature to learn, but we love to learn.

Perhaps the most salient reason for building learning organizations is that we are only now starting to understand the capabilities that such organizations must possess. What fundamentally will distinguish learning organizations from traditional authoritarian "controlling organizations" will be the mastery of certain basic disciplines. That is why the "disciplines of the learning organization" are vital.

Disciplines of the Learning Organization

Today, five new component technologies are gradually converging to innovate learning organizations. Each provides a vital dimension in building organizations that can truly "learn," that can continually enhance their capacity to realize their highest aspirations.

- **Systems Thinking.** You can only understand the system of a rainstorm by contemplating the whole rather than any individual part of the pattern. Business and other human endeavors are also systems. They, too, are bound by invisible fabrics of interrelated actions, which often take years to fully play out their effects on each other. Systems thinking also fuses the other four disciplines into a coherent whole that keeps them from turning into fads or gimmicks, and that is why it's the all-important "fifth discipline."
- **Personal Mastery.** Personal mastery is the discipline of continually clarifying and deepening our personal vision, of focusing our energies, of developing patience and of seeing reality objectively.
- **Mental Models.** Mental models are deeply ingrained assumptions, generalizations or even pictures or images that influence how we understand the world and how we take action. Very often, we are not consciously aware of our mental models or the effects they have on our behavior.
- **Building Shared Vision.** If any one idea about leadership has inspired organizations for thousands of years, it's the capacity to hold a shared picture of the future we seek to create. When there is genuine vision (as opposed to the all-too-familiar "vision statement"), people excel and learn, not because they are told to, but because they want to.
- **Team Learning.** When teams are truly learning, not only are they producing extraordinary results, but the individual members are growing more rapidly than they otherwise would have.

The Fifth Discipline

It is vital that the five disciplines develop as an ensem-

ble. This is challenging because it is much harder to integrate new tools than to simply apply them separately. But the payoffs are immense.

This is why systems thinking is the fifth discipline. It is the discipline that integrates the disciplines, fusing them into a coherent body of theory and practice. It keeps them from being separate gimmicks or the latest organization fads. Without a systemic orientation, there is no motivation to look at how the disciplines interrelate. By enhancing each of the other disciplines, it continually reminds us that the whole can exceed the sum of its parts.

Does Your Organization Have a Learning Disability?

In most organizations that fail, there is abundant evidence in advance that the firm is in trouble. This evidence goes unheeded, however, even when individual managers are aware of it. The organization as a whole cannot recognize impending threats, understand the implications of those threats or come up with alternatives.

It is no accident that most organizations learn poorly. The way they are designed and managed, the way people's jobs are defined, and most importantly, the way we have all been taught to think and interact, creates fundamental learning disabilities.

Structure Influences Behavior

Here is the first principle of systems thinking: *When placed in the same system, people, however different, tend to produce similar results.*

The systems perspective tells us that we must look beyond individual mistakes or bad luck to understand important problems. We must look beyond personalities and events. We must look into the underlying structures that shape individual actions and create conditions under which types of events become likely.

The Fifth Discipline: The Cornerstone of the Learning Organization

The fifth discipline — systems thinking — is the cornerstone of the learning organization. Here are the laws of the fifth discipline:

1. Today's problems come from yesterday's "solutions." Solutions that merely shift problems from one part of a system to another often go undetected because those who "solved" the first problem are different from those who inherit the new problem.

Multiple Levels of Explanation

The systems perspective shows that there are multiple levels of explanation in any complex situation. In some sense, all are equally "true." But their usefulness is quite different.

"Event" explanations — who did what to whom — doom their holders to a reactive stance.

"Pattern of behavior" explanations focus on seeing longer-term trends and assessing their implications. Pattern of behavior explanations begin to break the grip of short-term reactiveness.

"Structural" explanations, the least common and most powerful, focus on answering the question, "What causes the patterns of behavior?" They address the underlying causes of behavior at a level which patterns of behavior can be changed.

2. The harder you push, the harder the system pushes back. Systems thinking has a name for this phenomenon: "compensating feedback" — when well-intentioned interventions call forth responses from the system that offset the benefits of the intervention. The more effort you expend trying to improve matters, the more effort seems to be required.

3. Behavior grows better before it grows worse. Low-leverage interventions would be much less alluring if it were not for the fact that many actually work, in the short term. In complex human systems there are always many ways to make things look better in the short run. Only eventually does the compensating feedback come back to haunt you.

4. The easy way out usually leads back in. Pushing harder and harder on familiar solutions, while fundamental problems persist or worsen, is a reliable indicator of nonsystemic thinking — what is often called the "what we need here is a bigger hammer" syndrome.

5. The cure can be worse than the disease. Sometimes the easy or familiar solution is not only ineffective but addictive and dangerous. The long-term, most insidious consequence of applying nonsystemic solutions is increased need for more and more of the solution.

6. Faster is slower. Virtually all natural systems, from ecosystems to animals to organizations, have intrinsically optimal rates of growth. The optimal rate is far less than the fastest possible growth. When growth becomes excessive the system itself will seek to compensate by slowing down, perhaps putting the organization's survival at risk in the process.

7. Cause and effect are not closely related in

time and space. There is a fundamental mismatch between the nature of reality in complex systems and our predominant ways of thinking about that reality. The first step in correcting that mismatch is to let go of the notion that cause and effect are close in time and space.

8. Small changes can produce big results — but the areas of highest leverage are often the least obvious. There are no simple rules for finding high-leverage changes, but there are ways of thinking that make finding them more likely. Learning to see underlying structures rather than events is a starting point. Thinking in terms of processes of change rather than snapshots is another.

9. You *can* have your cake and eat it too — but not both at once. Sometimes the knottiest dilemmas, when seen from the systems point of view, aren't dilemmas at all. They are artifacts of "snapshot" rather than "process" thinking, and appear in a whole new light once you think consciously of change over time.

10. Dividing an elephant in half does not produce two small elephants. Living systems have integrity. Their character depends on the whole. The same is true for organizations; understanding of the most challenging managerial issues requires seeing the whole system that generates the issues.

11. There is no blame. We all tend to blame someone else for our problems. Systems thinking shows us that there is no separate "other"; that you and the someone else are part of a single system. The cure lies in your relationship with your "enemy."

A Shift of Mind

Systems thinking is a discipline for seeing wholes. It is a framework for seeing interrelationships rather than things, for seeing patterns rather than static "snapshots." It is a set of general principles — distilled over the course of the 20th century, spanning fields as diverse as the physical and social sciences, engineering and management. It is also a set of specific tools and techniques, originating in two threads: "feedback" concepts of cybernetics and "servo-mechanism" engineering theory dating back to the 19th century. And systems thinking is a sensibility — for the subtle interconnectedness that gives living systems their unique character.

Systems thinking is the fifth discipline because it is the conceptual cornerstone that underlies all of the five learning disciplines. All are concerned with a shift of mind from seeing parts to seeing wholes, from seeing people as helpless reactors to seeing them as active participants in shaping their reality, from reacting to the present to creating the future. Without systems thinking, there is neither the incentive nor the means to integrate the learning disciplines once they have come into practice. As the fifth discipline, systems thinking is the cornerstone of how learning organizations think about their world.

Reinforcing and Balancing Feedback and Delays

There are two distinct types of feedback processes: reinforcing and balancing. *Reinforcing* (or amplifying) feedback processes are the engines of growth. Whenever you are in a situation in which things are growing, you can be sure that reinforcing feedback is at work. Reinforcing feedback can also generate accelerating decline — a pattern of decline in which small drops amplify themselves into larger and larger drops, such as the decline in bank assets when there is a financial panic.

Balancing (or stabilizing) feedback operates whenever there is a goal-oriented behavior. A goal can be an explicit target, as when a firm seeks a desired market share, or it can be implicit — such as a bad habit — which, despite disavowing, we stick to nevertheless. In addition, many feedback processes contain *delays*, interruptions in the flow of influence that make the consequences of actions occur gradually.

Identifying the Patterns That Control Events

Structures of which we are unaware hold us prisoner. Conversely, learning to see the structures within which we operate begins a process of freeing ourselves from previously unseen forces and ultimately mastering the ability to work with them and change them.

One of the most important, and potentially most empowering, insights to come from the young field of systems thinking is that certain patterns of structure recur again and again. These "systems archetypes" or "generic structures" embody the key to learning to see structures in our personal and organizational lives. The systems archetypes — of which there are only a relatively small number — suggest that not all management problems are unique, something that experienced managers know intuitively.

The systems archetypes reveal an incredibly elegant simplicity underlying the complexity of management issues. As we learn how to recognize more and more of these kinds of archetypes, it becomes possible for us to see more and more places where there is leverage in facing difficult challenges, and to explain these opportunities to others.

Mastering the systems archetype starts an organization on the path of putting the systems perspective into practice. For learning organizations, only when managers

start thinking in terms of the systems archetype does systems thinking become an active daily agent, continually revealing how we create our reality.

Self-Limiting or Self-Sustaining Growth

It's hard to disagree with the *principle* of leverage. But the leverage in most real-life systems is not obvious to most of the actors in those systems. The purpose of the systems archetypes, such as limits to growth and shifting the burden, is to help people see those structures and thus find the leverage, especially amid the pressures and crosscurrents of real-life business situations.

We all know the metaphor of being unable to "see the forest for the trees." Unfortunately, when most of us "step back" we just see lots of trees. We pick our favorite one or two and focus all our attention and change effort on those.

In effect, the art of systems thinking lies in seeing through the detail complexity to the underlying structures generating change. Systems thinking does not mean ignoring detail complexity. Rather, it means organizing detail complexity into a coherent story that illuminates the causes of problems and how they can be remedied in enduring ways.

Mastering such basic archetypes as growth and underinvestment is the first step in developing the capability of seeing the forest *and* the trees — of seeing information in terms of broad and detailed patterns. Only by seeing both can you respond powerfully to the challenge of complexity and change.

The Core Disciplines: Building the Learning Organization

A small number of organizational leaders are recognizing the radical rethinking of corporate philosophy that a commitment to individual learning requires. Kazuo Inamori, founder and president of Kyocera (a world leader in fine ceramics technology and electronics) until his retirement in 1995, says: "Whether it is research and development, company management, or any other aspect of business, the active force is 'people.' And people have their own will, their own mind, and their own way of thinking. If the employees themselves are not sufficiently motivated to challenge the goals of growth and technological development … there will simply be no growth, no pain in productivity and no technological development."

Personal Mastery

"Personal mastery" is the phrase we use for the discipline of personal growth and learning. People with high levels of personal mastery are continually expanding their ability to create the results in life they truly seek. From their quest for continual learning comes the spirit of the learning organization.

The way to begin developing a sense of personal mastery is to approach it as a discipline, as a series of practices and principles that must be applied to be useful. These include:

- **Personal vision.** The ability to focus on ultimate intrinsic desires, not only on secondary goals, is a cornerstone of personal mastery.
- **Holding creative tension.** Creative tension is the force that comes into play at the moment when we acknowledge a vision that is at odds with current reality. An accurate, insightful view of current reality is as important as a clear vision.
- **"Structural Conflict": the power of your powerlessness.** If structural conflict arises from deep underlying beliefs, then it can be changed only by changing the beliefs.
- **Commitment to the truth.** Commitment to the truth means a relentless willingness to root out the ways we limit or deceive ourselves from seeing what is, and to continually challenge our theories of why things are the way they are.

In addition to clarifying the structures that characterize personal mastery as a discipline (such as creative tension, emotional tension and structural conflict), the systems perspective also illuminates subtler aspects of personal mastery such as integrating reason and intuition, continually seeing more of our connectedness to the world, compassion and commitment to the whole.

Mental Models

New insights fail to get put into practice because they conflict with deeply held internal images of how the world works, images that limit us to familiar ways of thinking and acting. That is why the discipline of managing mental models — surfacing, testing and improving our internal pictures of how the world works — promises to be a major breakthrough for building learning organizations.

Case studies suggest three facets to developing an organization's capacity to surface and test mental models: tools that promote personal awareness and reflective skills, "infrastructures" that try to institutionalize regular practice with mental models, and a culture that promotes inquiry and challenges our thinking. It is the connections among them that matter most.

Skills of reflection involve slowing down our thinking

processes so that we can become more aware of how we form our mental models and the ways they influence our actions. Inquiry skills concern how we operate in face-to-face interactions with others, especially in dealing with complex and conflicting issues. Together with the tools and methods used to develop these skills, these constitute the core of the discipline of mental models:

- Facing up to distinctions between espoused theories (what we say) and theories-in-use (the implied theory in what we do)
- Recognizing "leaps of abstraction" (noticing our jumps from observation to generalization)
- Exposing the "left-hand column" (articulating what we normally do not say)
- Balancing inquiry and advocacy (skills for effective collaborative learning).

Just as "linear thinking" dominates most mental models used for critical decisions today, the learning organizations of the future will make key decisions based on shared understandings of interrelationships and patterns of change.

Shared Vision

Shared visions emerge from personal visions. This is how they derive their energy and how they foster commitment. Caring is rooted in an individual's own set of values, concerns and aspirations. This is why genuine caring about a shared vision is rooted in personal visions. Organizations intent on building shared visions continually encourage members to develop their personal visions.

Personal mastery is the bedrock of shared visions. This means not only personal vision, but commitment to the truth and creative tension — the hallmarks of personal mastery. Shared vision can generate levels of creative tension that go far beyond individuals' comfort levels. Those who will contribute most toward realizing a lofty vision will be those who can "hold" this creative tension: those who can remain clear on the vision and continue to inquire into current reality. They will be the ones who believe deeply in their ability to create their futures, because that is what they experience personally.

Team Learning

Within organizations, team learning has three critical dimensions. First, there is the need to think insightfully about complex issues. Here, teams must learn how to tap the potential for many minds to be more intelligent than one mind. While that's easy to say, there are powerful forces at work in organizations that tend to make the intelligence of the team less than, not greater than, the intelligence of individual team members. Many of these forces are within the direct control of the team members.

Second, there is the need for innovative, coordinated action. The championship sports teams and great jazz ensembles provide metaphors for acting in spontaneous yet coordinated ways. Outstanding teams in organizations develop the same sort of relationship — an "operational trust" in which each team member remains conscious of the other team members and can be counted on to act in ways that complement the others' actions.

Third, there is the role of team members on other teams. For example, most of the actions of senior teams are actually carried out through other teams. Thus, a learning team continually fosters other learning teams through inculcating the practices and skills of team learning more broadly. ●

Collective Discipline

The discipline of team learning involves mastering the practices of dialogue and discussion, the two distinct ways that teams converse.

In dialogue, there is the free and creative exploration of complex and subtle issues, a deep "listening" to one another and suspending of one's own views.

By contrast, in discussion, different views are presented and defended and there is a search for the best view to support decisions that must be made at this time.

Reflections From Practice

Reflective openness is the cornerstone of the discipline of mental models. None of us has a company in our heads, or a family, or a country. But our life experience shapes a rich mix of assumptions, feelings and at best some well-formed hypotheses about these systems.

Foundations

The nurturing of reflective openness leads to a willingness to continually test these views. It is characterized by true open-mindedness, the first step toward deeper listening and real conversation. This is easy to say but not so easy to do — because, as master practitioners know, building an environment of reflectiveness starts with our own willingness to open ourselves, to be vulnerable, to be "exposed." This is unlikely to happen in any organizational environment that does not have a deep commitment to helping people grow, and to creating the trust

and spirit of mutuality this requires.

Creating an environment where people can grow starts with "having a purpose worthy of people's commitment," says Goran Carstedt, former president of Volvo Sweden and Ikea North America. "Business leaders often ask their people to be committed to the organization's goals," says Carstedt, "but the real question is what is the organization committed to, and is that worthy of my time?"

Ironically, equating a business's purpose with the economic bottom line dooms the enterprise to financial mediocrity, as countless studies of long-term business performance have shown. In a world where more people have more choices about where and how they work, it matters that an organization stands for something.

Impetus

There seem to be three overlapping but distinctive motivations that compel people to take on the difficult work of building learning organizations. Some seek a better model for how to manage and lead change. Some are trying to build an organization's overall capacity for continual adaptation to change. All seem to believe that there is a way of managing and organizing work that is superior in both pragmatic and human terms, that significantly improves performance and creates the types of workplaces in which most of us would truly like to work.

When people become more engaged in and committed to their work, they are usually willing to confront more difficult issues. They are willing to risk doing things beyond their comfort zone. They are even willing to fail in pursuit of goals that really matter to them rather than be trapped like "those cold and timid souls who know neither victory nor defeat," as Theodore Roosevelt put it.

If we live our lives in pursuit of what matters most to us, and we do our work with people whose friendship we value, we will have all the happiness we need. In this sense, happiness is simply a byproduct of a life well lived. This is what motivates practitioners of organizational learning.

Strategies

The eight strategies and examples that follow should give a sense of the state of practical know-how today:

1. Integrating learning and working. A culture that integrates action and reflection arrives at better decisions to which people can genuinely commit, and its people are mentally more prepared.

2. Starting where you are with whomever is there. It is easy to think that the deep learning strategic framework only applies to top management. But in fact, thinking strategically is imperative for leaders at all levels.

3. Becoming bicultural. A subtle area of attitude and skill involves never losing touch with the larger organizational environment — something called "becoming bicultural." Management's and employees' failure to consider the greater environment has proven to be the undoing of many otherwise successful learning initiatives.

4. Creating practice fields. The idea of practice fields comes from a simple fact: It is very difficult to learn anything new without the opportunity for practice.

5. Connecting with the core of the business. For radical new ideas and practices to take root within an organization there must be fertile soil. Successful learning practitioners intent upon having a large-scale impact learn how to connect with the core of the organization — at the deepest levels of individual and collective identity — and how the organization most naturally creates value.

6. Building learning communities. When our own deep questions and aspirations connect with an organization's essence, community develops. Attunement to new learning communities, and networks of relationships based on common aims and shared meaning, becomes both a strategy and an outcome for leaders.

7. Working with "The Other." Diversity becomes a key guiding idea for leaders, beyond political correctness or mere sentiment.

8. Developing learning infrastructures. Learning infrastructures are often a key element of effective learning strategies. Learning infrastructures do not leave learning to chance.

The Leader's New Work

If people imagine their organization as an ocean liner and themselves as the leader, what is their role? For years, the most common answer received when posing this question to groups of managers was "the captain." Others might say, "the navigator, setting the direction." A few would say "the helmsman, actually controlling the direction." While these are legitimate leadership roles, there is another that, in many ways, eclipses them all in importance.

The neglected leadership role is that of the designer of the ship. No one has a more sweeping influence on the ship than the designer. Leaders who appreciate organizations as living systems realize that they can create organizational artifacts like new metrics, or formal roles and processes, or intranet Web sites, or innovative meetings — but it is what happens when people use the artifacts or processes or participate in the meetings that matters.

How do leaders help people see reality as a medium

for creating their vision rather than as a source of limitation? One way is to help people see problems in terms of underlying systemic structures and mental models rather than just short-term events. This can help in appreciating the forces shaping reality, and how we are part of those forces and can affect them.

Systems Citizens

Systems citizenship starts with seeing the systems that we have shaped and that in turn shape us. Being stuck in a system that is not working invariably leads us to feel frustrated and trapped — until we see the larger patterns and our own part in creating these patterns. Once we do, new alternatives become evident.

There are two fundamental aspects to seeing systems: seeing patterns of interdependency and seeing into the future. The ability to see interdependencies can be aided by tools like systems diagrams, but can also arise from stories, pictures and songs. Seeing into the future starts with knowing how to interpret signs that are present today but go unrecognized by those without a systems perspective.

It is easy to get lost when thinking about global issues like climate change, to feel that there is nothing you can do, and maybe even that there is nothing anyone can do. But global systems are not just global. They are also right here.

Herein lies a secret of the systems worldview. The system is not only out there, it is in here. We are the seed carriers of the whole in the sense that we carry the mental models that pervade the larger system. We are all actors in the global energy system, the global food system and the global industrialization process. We can either think and act in ways that reinforce the system as it currently operates, or think and act in ways that lead in different directions. Because the systems that shape our lives manifest themselves at multiple levels, we can work at multiple levels.

Supply Networks: The System Seeing Itself

In 2004, Unilever and Oxfam were joined by more than 30 multinational food companies, global and local non-governmental organizations (NGOs), major foundations and government representatives from around the world in a novel experiment called the Sustainable Food Lab. The aim was to bring "sustainable food supply chains into the mainstream," using a new process to foster collaborative learning across the supply chain.

The members of the Sustainable Food Lab understand that no economic system can remain viable that systematically destroys the social and ecological systems upon which it depends. How we organize the production and distribution of food could be considered humankind's first system. So it is fitting that it should also be the first of our global systems that we bring back into harmony with social and ecological reality.

This spirit of learning as discovery and embodying nature's patterns subtly infuses all the other innovations. When managers are committed to growing people in order to grow the enterprise or committed to utilizing conversation as the core process for change, their practices reflect insights into human nature — our innate desire to grow as human beings and to be in relationships with one another.

Consistent With Nature

The first principle underlying our work on organizational learning is simply to develop a system of management consistent with nature — human nature and the nature of the larger social and natural systems in which we always operate. Anthropologist Edward Hall calls the drive to learn the "most basic drive in the human species." What is this drive to learn other than our own innate personal quest to discover and embody nature's patterns in all aspects of our lives?

Many of the most important leaders in the coming decades will not be those whom we expect. A new order of things must be brought forward by a new order of leaders. It is no surprise that, wherever we see a new system of management starting to take root, we see leaders emerging from the periphery — people who do not come from the traditional centers of power but from the cultural, economic and demographic periphery: women, the poor and the young.

There are as many ways to characterize the essence of work as there are people doing it: It is a system of management consistent with nature, human nature and the nature of larger living systems; it is working together in ways that realize our highest aspirations; it is being the change we seek to create. Or, as Marianne Knuth so beautifully says, it is staying connected to the being that never stopped being connected. ●

Management: Strategies

The Granularity of Growth

How to Identify the Sources of Growth and Drive Enduring Company Performance

by Patrick Viguerie, Sven Smit and Mehrdad Baghai

THE SUMMARY IN BRIEF

While growth is a top priority for companies of all sizes, it can be extremely difficult to create and maintain — especially in today's competitive business environment and the overall economic climate. In order to achieve this goal, you need to think through the growth challenges your organization faces and follow a detailed approach that will allow you to uncover, understand and capture potential growth opportunities.

In this summary, top experts in the field of growth show readers how to do that and more. Based on an extensive quantitative study of corporate growth, this reliable resource offers powerful new insights on how companies can excel in this essential endeavor. It skillfully demonstrates the problem with the broad-brush way that many modern companies describe their business opportunities and discusses how real growth can be found at a much more granular level within all industries.

This summary is devoted to the key decisions you'll need to make in order to drive and sustain granular growth at scale: your growth ambition, your growth direction and your growth architecture.

IN THIS SUMMARY, YOU WILL LEARN:

- How to sustain superior value creation in the long run by choosing either to grow or to go.
- How taking on a more granular perspective allows you to gain real insight into the sources of competitive advantage and growth.
- How to ensure your organizational model is architected to deliver this granularity without giving away the benefits of scale.
- How to ensure that growth comes from multiple sources as you take both a broad and a granular view of your markets.

THE COMPLETE SUMMARY: **THE GRANULARITY OF GROWTH**

by Patrick Viguerie, Sven Smit and Mehrdad Baghai

The authors: Patrick Viguerie is a director at McKinsey & Co. and leads the firm's strategy practice in the Americas. Sven Smit is a director at McKinsey & Co., co-leading the company's strategy practice's initiatives on growth. Introduction: Grow or Go

"Grow or go" dynamics represent an unforgiving environment for large companies. The odds of sustaining performance and growth over the long term are indeed long ones: high-growth companies tend to have 5-6 times higher survival rates than low-growth companies.

Growth is a tricky topic, so it's important that your company should have a view on the best way to think about it. We all know intuitively that growth is good. It creates healthy companies, opens up opportunities, excites talent and rewards shareholders. But do we know how to achieve it?

Granular Performance

Performance is *granular,* which means it is **driven by growth in the sub-segments and categories of industries** in which a company competes as well as by the **revenues that it acquires through mergers and acquisitions (M&A) activity.** These drivers are generally **much more important than market-share gains** in determining how fast you grow.

This seeming counterintuitive finding has important implications. A typical management team needs to change the way it thinks about company resources, not least its own time. It needs to pay more attention to which businesses the company is in, and particularly the sub-segments in which it competes.

PART I: YOUR GROWTH AMBITION

A Granular World

Granularity isn't a term traditionally used in business. In the world of science and engineering, it is used to refer to the size of the components within a larger system. If we take what we might call a non-granular (or "course-grained") view of the system, what we might see is the system as a whole or perhaps the larger sub-systems within it. In a granular (or "fine-grained") view of the system, on the other hand, we might see more of the individual small components that go to make it up.

Why Granularity Matters

Granularity conveys two important and related ideas: first externally, a fine-grained understanding of markets and growth opportunities and, second internally, a sharply focused, precise and detailed way to manage discrete initiatives and activities across the corporation. Applying both these ideas greatly increases a company's chance of success in identifying and pursuing growth opportunities.

A company formulating its growth strategy needs to develop insights into trends, future growth rates, and market structures at much greater depth than the aggregate industry level. Insights into sub-industries, segments, categories and micro-markets are the building blocks of portfolio choices. They are indispensable for companies seeking to make the right decisions about where to compete.

Six Levels of Granularity

All of which poses a practical question: When you make these decisions, what level should you be looking at to get the insights you need? How deep should you go? A framework can help you find an answer. Here are the six levels of granularity:

- **Granularity level G0: *World Market*.** The global marketplace is the highest level of aggregation with the least granularity: the ultimate segment of one. The world economy is growing by roughly 6.2 percent a year in nominal terms.
- **Granularity level G1: *Sectors.*** If we want to investigate why some companies grow at a rate that is faster or slower than about 6 percent, the first step is to divide up the economy. The Global Industry Classification Standard (GICS) carves it up into 24 broad industry groups ranging from telecommunications services to energy to biotech.
- **Granularity level G2: *Industries.*** To get to a deeper level of granularity, we can break down the 24 groups into

151 industries by using other readily available GICS statistics. For instance, the "food, beverages and tobacco" group breaks down into the component industries "food," "beverages" and "tobacco." The resulting G2 segments have an average size of roughly $500 billion — much more granular than the G1 sectors, but still fairly large.

• **Granularity level G3: *Sub-Industries by Region.*** Each industry can then be divided up again both by sub-industry and by market (country or region). Within the food industry, for instance, two examples of sub-industries might include frozen foods or savories, oils and dressings. At the G3 level, market selection becomes more important than a company's ability to beat the market, and portfolio composition is the chief factor determining why some companies grow and others don't.

• **Granularity level G4: *Categories by Region.*** The definition of the G4 level of granularity varies slightly from industry to industry, but, in essence, it's the level of categories within sub-industries (such as ice cream within frozen foods) or customer segments within a broad product or service category (such as weight-conscious snackers). The G4 level is important: It represents the minimum level of granularity at which companies need to operate when setting growth priorities and making decisions about resource allocation.

• **Granularity level G5: *Individuals.*** This is a view of the world at the level of individual customers and transactions — the ultimate segment of one, numbering many billions. Although some companies have developed systems that permit highly personalized interactions with individual customers, few, if any, are able to allocate resources at this level of granularity. For most companies, most of the time, G5 will be a level too far.

Setting your growth direction requires you to move freely between the different levels of granularity while keeping your overall destination in view. Companies often describe their growth direction to the market at the G2 or G3 level, but specific granular strategies need to be put into action at the G4 and G5 level. ●

Understanding Your Company's Performance

A granular growth decomposition is a method of splitting a company's growth into three main components, or growth "cylinders": M&A, portfolio momentum and share gain.

Granular Growth Decomposition

M&A is the net inorganic growth a company achieves when it purchases or sells revenues via acquisition or divestment.

Portfolio momentum is the organic revenue growth a company achieves through the market growth of the segments represented in its portfolio. It includes the impact of acquisitions and divestments that affect the company's exposure to underlying market growth after the first year of each transaction. Portfolio momentum is, in a sense, a measure of strategic performance.

Share gain is the organic growth a company achieves through gaining or losing market share from its competitors. We define market share by the company's weighted average share of the segments in which it competes.

One other factor needs to be taken into account in the decomp: the **effects of currency fluctuation.** These can significantly distort growth measurements and, hence, perceptions of performance. A translation from one currency to another can allow companies to benefit from currency appreciation in overseas markets. To keep things simple, currency fluctuation is included in portfolio momentum. ●

Firing on Multiple Cylinders

It turns out that average performance on all three cylinders does not translate to shareholder value creation. Instead, what matters is distinctive performance on at least one.

When a company is described as "firing" on a particular cylinder, it is attaining a growth rate in the *top quartile* of the sample for that cylinder over a given time period. To give you a sense of what this involves for the companies in the author's granular growth decomposition database, you should know that:

• A company would need to achieve annual growth of **8.5 percent** or more from **portfolio momentum** over the period measured to qualify as firing on that cylinder.

• Similarly, to fire on the **M&A** cylinder, a company would need to grow its revenues inorganically by an average

Tailwinds or Headwinds?

It's abundantly clear from analysis of favorable markets — or what are called "tailwinds" — that a company's granular growth performance depends heavily on the markets in which it operates. So the next time a company announces stellar performance, it's worth taking a closer look to see how much of its growth came from better steering, and how much came from a favorable tailwind. What is driving performance: execution or strategic choices?

In much the same way, it's a good idea to ask questions about your own company's performance. Do you know your numbers on growth, and your peers', both by segment and overall? Do you use them in your planning, performance appraisals and external presentations? Are your plans consistent with your real sources of growth? Or are they based on possibly unrealistic hopes of gaining market share?

of at least **4.5 percent** a year.

• And to count as firing on the **share-gain** cylinder, it would need to grow the top line by at least **2.3 percent** a year from organic gains in market share.

Naturally these benchmarks refer to current threshold performance and will vary by industry and time period. Regular industry and peer comparisons ensure they are kept accurate and up to date.

Why Is Firing Important?

The idea of firing is important in two respects. First, it can help you articulate your company's growth ambition more precisely, as an intention to fire on certain cylinders over a certain period of time. Second, it's a compelling way to benchmark your company's track record on growth, and that of your competitors.

If we classify companies by the way they fire or misfire on their three cylinders, we can derive four categories of performance: exceptional, great, good and poor. The minimum standard for good performance is firing on one cylinder and misfiring on more than another. Only a handful of companies achieve exceptional performance by firing on all three cylinders. ●

A Granular Company

The cylinder-firing approach can be used to benchmark your growth both at the corporate level and at the granular level. In order to get a real sense of your growth performance, you need to judge how well you are firing on cylinders at a granular *segment* level, not just the overall corporate level.

The finer the granularity of analysis, the better the insights for informing the growth direction will be. To see why, consider a practical example.

Let's take a high-end European clothing retailer with a successful product line and store format for the mass-affluent segment. It is beginning to saturate the relevant parts of the European market (up-market commercial districts in major cities) and needs to find new ways to grow. It could set about this in several different ways:

• It could expand along the **geographic** dimension of starting to think of itself as a high-end *global* clothing retailer and trying to grow its existing business by **entering new markets.**

• It could expand along the **product** dimension by defining itself simply as a high-end European retailer and attempting to grow by **targeting other buying needs of the mass-affluent customer** through existing stores or new formats.

• It could expand along the **customer segment** dimension by defining itself as a European clothing retailer and **seeking to attract other customer segments** beyond its mass-affluent core market. Alternatively, it could stick with its high-end customers but segment this market more finely to find new opportunities for growth.

An Informed Choice

If it had the management resources and the luxury of time, it could experiment on a small scale with all three options, trying out different combinations and scaling up the ideas that work best. But if it can only focus on one big push at a time, the company will need to evaluate each growth path at a granular level to make an informed choice.

So what is the right choice for our retailer? Only it can tell — but exploring each of these three growth paths at a granular level will give it a much better chance to pinpoint the most fertile ground for growth, avoid the temptation to opt for the "usual suspects" and find the option that fits its capabilities and organization best. ●

PART II: YOUR GROWTH DIRECTION

Firing on Momentum

Making the right decision about where to compete is critical. Portfolio momentum accounts for almost half (46 percent) of an average large company's growth performance, and differences in momentum are large even within industries, often because of the heritage of different business segments. Catching a growth "tailwind" by participating in a fast-growing market segment is obviously an enormous help in achieving high growth.

Influencing Portfolio Momentum

In principle, a company can influence the momentum of its portfolio over time in three ways: by allocating resources internally to pockets of high growth (either within or beyond existing business boundaries); by selecting acquisitions and divestments that affect its exposure to underlying market growth; and by stimulating market growth, for instance, by introducing a new product category.

The biggest driver of momentum is the composition of your initial portfolio. Shifting your momentum is a marathon, not a sprint, and takes years, not months. Even so, the top momentum improvers manage to boost their annual momentum growth rates by mid-single-digit percentage point increases over five years. Nevertheless, it is truly helpful for long-term advantage. ●

Firing on M&A

The average large company gets 31 percent of its revenue growth from mergers and acquisitions (M&A). More than 50 percent of acquirers are rewarded in the long term even after paying a premium to the seller. M&A needs to be matched by judicious and timely divestments, especially of

How Nokia Caught a Growth Tailwind

For a good example of a growth tailwind, consider Nokia. If we break down the sources of Nokia's growth, we see that almost all of it is driven by portfolio momentum, although the company is also gaining some market share. It's clear that it is benefiting from a substantial tailwind: the growth of the mobile phone and mobile equipment markets.

Maintaining market momentum may sound effortless, but it is not an easy thing to do. In the past few years, Nokia has had its ups and downs in holding on to market share. It took real energy to build a business in an emerging market ahead of other players, and to introduce a huge range of successful phones.

businesses showing early signs of demise.

Both M&A and divestment are important tools for shaping the portfolio to facilitate more substantial growth. There is evidence that active and balanced M&A strategies create value. Yet surprisingly few companies make full use of divestment. The real question though is not whether or not doing M&A is good but whether you are good at doing M&A.

Private-Equity Firms

Companies can learn a lot from private-equity firms, which now account for almost 30 percent of buy-outs. Private-equity firms throw down a gauntlet for corporations: They have a highly aggressive, highly diversified model of both acquisition and divestment, and yet they still produce a decent return after paying substantial premiums. The success of their ventures suggests that corporations could create a lot more value through M&A than they might imagine. ●

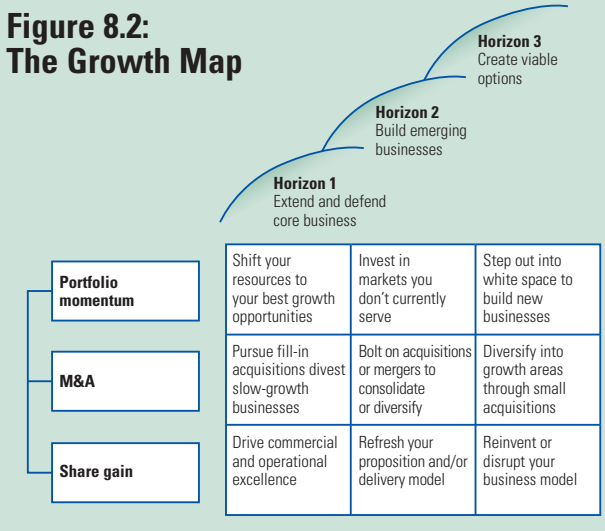
Firing on Share Gain

Market-share gain is not the main driver of growth and differential growth performance, but it is still important.

Before a company can fire on share gain, it obviously needs some kind of edge over those companies from which it takes share because it will need to gain share across the board in most of its segments. When the top 15 share gainers are analyzed, one thing stands out: They've all made big choices — strong on the basis of insights or distinctive advantages. Not all big choices are rewarded by share gain, of course. However, it does seem that fortune favors the brave.

Dell took its direct model into new markets and new products. Valero capitalized on its carefully constructed advantage in complex refineries. Toyota pushed its lean manufacturing system into new segments and countries. Centrica used its knowledge as a gas supplier to expand into electricity. Samsung exploited its ability to take new products to market at unprecedented speed.

If you're hoping to drive growth through substantial and sustained share gain, you'd better have some source of advantage that sets your company apart from the pack, whether it derives from truly superior insight or truly distinctive capabilities. If you don't, you'll find your competitors' execution soon matches yours; your market-share performance takes a dive; and your shareholders lower their expectations, stalling your growth program. ●



Mapping Your Growth Direction

The "three horizons" framework helps business leaders look 10 or more years ahead when they are formulating and articulating their growth direction. Companies seeking sustained and profitable growth need a pipeline of business creation that comprises actions across all three horizons at once, and the horizons could be cascaded down to leaders at all levels in an organization. These three horizons ascend over time and represent rising levels of profit:

- **Horizon 1.** Extend and defend core businesses.
- **Horizon 2.** Build emerging businesses.
- **Horizon 3.** Create viable options.

The three horizons encourage and assist executives to evolve their portfolios by acting on different time horizons at the same time. Companies need to assess how their sources of advantage in each of the three cylinders match the granular opportunities in the marketplace. How do you figure it all out? A new tool, the growth map, helps with this task. It provides a much more disciplined way of approaching the three horizons framework.

Figure 8.2: The Growth Map

The Growth Map

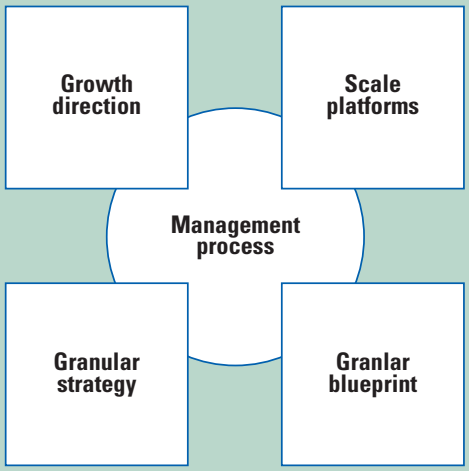
Each of the three cylinders can be used to drive growth in a company. If we combine the three cylinders with the three horizons framework, we arrive at the growth map: a tool for ensuring that we apply the necessary rigor when we set our growth direction and for charting the actions we must take to pursue it.

The growth map helps you to compare different options for improving your cylinder firing on the basis of your source of advantage, and to assess how effectively these options will derive revenue growth in each horizon. Here is how the growth map can help you set your growth direction horizon by horizon:

- **What will drive your growth in Horizon 1?** *Portfolio momentum:* Shift your resources to your best growth opportunities. *M&A:* Pursue fill-in acquisitions and divest slow-growth businesses. *Share gain:* Drive commercial and operational excellence.
- **What will drive your growth in Horizon 2?** *Portfolio momentum:* Invest in markets you don't currently serve. *M&A:* Bolt on acquisitions or mergers to consolidate or diversify. *Share gain:* Refresh your proposition and/or delivery model.
- **What will drive your growth in Horizon 3?** *Portfolio momentum:* Step out into white space to build new businesses. *M&A:* Diversify into growth areas through small acquisitions. *Share gain:* Reinvent or disrupt your business model. ●

To Move or Not to Move?

All growth strategies involve choices about moving — or where, when and how to evolve the portfolio mix over time. Whether you should move depends on whether you have low- or high-momentum growth.



Economic downturns create great opportunities for portfolio moves, yet few companies seize them. Adjacencies alone don't determine whether a move will succeed or fail; leveraging a distinctive advantage is what really matters.

Look at Momentum

In terms of where you grow, moving either within or beyond your core portfolio tends to pay if you happen to be a low-momentum company. On the other hand, if you're lucky enough to have a portfolio with high momentum, set a high bar for moving outside your core.

When you are evaluating potential moves, don't let yourself be seduced by high-growth segments in which you have no particular advantages. Ensure that your search process is sophisticated enough to consider the real power of your advantage, and not just the distance from the core. And don't let a downturn deter you; it offers a great opportunity to put a clear distance between your company and the rest of the pack that slow things down when times get rough. ●

Figure 10.1: The Architecture Framework

PART III: YOUR GROWTH ARCHITECTURE

The Architecture of Growth

To deliver both granularity and scale, a company must design its strategy and organization model to create an architecture for growth.

Architecture is the integration between design objectives (strategy) and design execution (organization). The term "growth architecture" describes a simple framework for ensuring that your strategy and your organization model are both designed to deliver granularity and scale. Most CEOs see themselves at the "architects" of their organization, working to develop the right strategies for their businesses and to design the organization they believe will best deliver them.

Architecture can be represented in terms of a simple two-by-two matrix, with strategy and direction on one side and scale and granularity on the other. To these four elements we add a fifth, disproportionately important element, management processes, which is represented as a circle to reflect the need for alignment and linkage between the other elements.

- The **growth direction** reflects the company's aspirations to fire on multiple cylinders across all three time horizons.
- The **granular strategy** describes "staircases" of moves, designed to capture granular growth opportunities and build real advantage.
- **Scale platforms** enable a large company to exploit the advantages of its size and distinct capabilities.
- The **granular blueprint** aims to create an organization that matches the texture of the market.
- **Management processes** such as strategic planning, resource allocation and performance management are used to link the other elements together.

A key element in any company's growth journey is the design of its architecture. Like the growth strategy, the organization model must deliver both granularity and scale.

Looking in the Mirror

CEOs intending to drive growth will benefit from a solid, fact-based understanding of their companies' current architecture. It's especially important to test how well the growth direction has been reflected in the other architectural elements. By "looking in the mirror," you can make a full and frank appraisal of each element, uncover any gaps and reflect on what you need to do to produce a unified and consistent design that will stimulate growth.

Three Common Patterns of Architecture

There are several common patterns of architecture that apply to companies at different stages in their growth journey. Here are three:

- **Out of Synch.** The elements of this architecture pattern are not aligned with its growth direction or with one another. The company may once have had an architecture designed for growth, but not any more. The top priority for a company with this pattern is to set a new growth direction based on granular market insights.
- **Ivory Tower.** This company has made thoughtful plans for its growth journey. It has used superior insights about the future of its industry to chart a compelling direction and has probably communicated it internally and externally. However, the direction has not yet been translated into the rest of the architecture, so that granular business strategies and an appropriate organization structure is lacking. The challenge for the ivory tower company is to identify leaders who can focus attention on translating the growth direction into granular strategies.
- **Top Down.** This pattern occurs when leaders have managed to commit the top level of their company to a compelling growth path and have even managed to builda set of central scale advantages, but haven't yet managed to push the growth agenda through to the operating levels. It is advisable for leaders to avoid making announcements that raise people's expectations too far, since fulfilling them may take a long time.

By looking in the mirror and making a full and frank appraisal of your architecture pattern, you can assess your own starting point more reliably.

A Blueprint for Granularity

How can you go more granular without drowning in complexity? It may seem downright impractical to try to manage everything at a G4 or G5 level. Aggregation is often needed to ensure that a unit has the critical mass for managing such things as its talent and its cost structure, as well as for controlling its resources so that it can justifiably be held accountable for its performance. Working through this tradeoff is the key challenge in designing an organization blueprint. Fortunately, you can use several organizational levers to help you.

Structure

Structure is the most obvious and often the most effective of these levers. Your organization blueprint will need to show how business units are grouped; how many layers of management are needed; and which functions are to be shared or centralized and which developed into the business units. The test here is whether the benefits of sharing and centralization genuinely outweigh the benefits of focus and unambiguous accountability.

There are various other ways of managing an organization at a granular level that don't involve breaking it up into ever smaller pieces. In some cases executives can be highly effective at making granular decisions within an organization that isn't granular in structure at all. They adopt nonstructural mechanisms such as incentives, management processes and cultural norms to support or complement the organization design and make the model work as a whole.

Talent

Another crucial nonstructural level is people. CEOs pursuing growth need to take a fresh look at their talent management. Because growth initiatives take time to deliver real impact, the managers chosen to lead them may need to stay in post for three to five years instead of the usual 18 months or so. Looking further ahead, companies need to create a leadership pipeline that will generate a sufficient number of growth leaders at the right level of granularity.

When you design the blueprint for your organization, your experience, judgment and insight into the texture of the market and the nature of your company are critical in making the right decisions.

Building Scale Platforms

CEOs frequently object that increasing granularity would undermine the advantages of scale. But it is possible for large companies to retain the benefits of scale while operating in a more granular fashion. They can do so by developing scale platforms that enable granular units to fire on more cylinders over time.

The role of the granular blueprint is to unleash the entrepreneurial energy and accountability of an army of small communities to pursue granular growth opportunities in the marketplace. The role of the scale platform is to ensure that a large company realizes the advantage that derives from its size by building systematic capacity across multiple business units to manage greater granularity.

Rethinking Scale

Designing your architecture for granular growth demands that you transcend traditional notions of scale. It's not simply a matter of lowering costs (though a low-cost position can, of course, be a critical driver of growth). Sometimes scale platforms are based on distinctive operating capabilities such as an outstanding supply chain. However, there are a few new types of scale advantage that are very important.

Insight into potential sources of growth is essential when companies are constructing and managing a portfolio of granular strategies. Without insight into future growth, companies will follow the growth trend rather than ride it from the start.

- **An insight engine.** Building an insight engine that systematically identifies opportunities ahead of your competition will help you fire on the portfolio momentum cylinder.
- **An M&A engine.** Building an M&A engine for systematically making and integrating acquisitions will boost your performance on the inorganic cylinder.
- **A scaling engine.** Cisco and a few other companies have managed to create a core competence in moving businesses systematically through the horizons; this is called a scaling engine.
- **A talent engine.** Talent is the fuel that powers most growth strategies. A talent engine is a systematic scale advantage in recruiting, developing and exciting top talent. ●

Cluster-Based Growth

All CEOs need breadth of vision, but they also need a clear view down through their organization.

What CEOs need is a design that adapts current practices so that their control screen shows a larger number of units in sharper focus rather than a fuzzy mass of complexity. This greater clarity will help business units focus on how to fire on more cylinders over time.

The Cluster-Based Growth Model

While there is no sure-fire recipe for success, some companies have found effective ways of redesigning their business processes to reinforce the elements of their growth architecture. Experts have had success with a new approach that they call the cluster-based growth model, which is based on four simple principles:

- **Segmenting the company into a larger number of more granular clusters which feel like purpose-driven communities.**
- **Articulating strategies for these clusters that provide the scaffolding for the profitable path to growth.**
- **Hardwiring performance management through progressive key performance indicators (KPIs) so that each cluster knows its most important priority at any given time based on its stage of development instead of a long balanced scorecard.**
- **Actively managing the portfolio at the cluster level to reallocate resources to the most appropriate clusters.**

The cluster-based growth model enables you to increase the granularity at which you manage your business without drowning in a sea of reports. In one case study, it generated a profit growth rate at over 8 times the industry average for four years. ●

Choosing to Lead Growth

Whether you are an incumbent leader with a few years of tenure still to run or a newcomer to your leadership role, by now you are reflecting on the big choices described in this summary: your growth ambition, your growth direction, and your growth architecture. All are decisions that leaders need to make for their companies. But there is a fourth big choice: your own personal decision to lead the growth journey.

Leading successful growth brings excitement and satisfaction. But other emotions can all too easily crowd them out. You may feel apprehensive about the hurdles you will face; worried about those quarterly results that lie just around the corner; anxious about the multitude of initiatives already clamoring for your attention.

Ignore Growth at Your Own Peril

For most executives, the commitment to lead a growth journey is not to be undertaken lightly. It's often tempting to postpone growth until your second term, or even leave it to your successor. Let's face it, you're bound to encounter opposition, the journey will take a long time and you'll probably have to make many personal sacrifices. These are all realities that you need to prepare for — and reasons not to undertake your growth journey without long and hard thought.

But try looking at your choice another way: What will happen if you don't take action? You ignore growth at your peril. Companies that don't grow run the risk of being toppled before long. On the other hand, if your company succeeds in mapping out a path of profitable growth, the rewards will be great.

Every company faces an inescapable strategic choice: to grow or go. In the same way, every CEO faces an inescapable personal choice: Should I embark on a growth journey, and do I have the resources to see it through? It's a choice that can be made only after deep reflection. ●

THE SOUL OF THE CORPORATION

How to Manage the Identity of Your Company

by Hamid Bouchikhi and John R. Kimberly

THE SUMMARY IN BRIEF

We live in a new Age of Identity in which your employees, customers, investors and stakeholders care about what your company *really* is. More than ever, your company's identity will shape the results it can achieve. Hamid Bouchikhi and John R. Kimberly will help you clearly understand your company's unique identity and how to leverage it for long-term adaptation and success.

Drawing on real-life stories from the world's most prominent companies, *The Soul of the Corporation* shows how identity can be an extraordinarily valuable asset — and how, if not managed properly, it can become a huge liability. Discover how your firm's identity is related to — *and different from* — its organizational culture, brand positioning and reputation. Learn how to manage the unconscious shared beliefs that give your organization coherence.

This summary will show you how to face the enormous identity challenges that arise in mergers, alliances, spin-offs and the creation of new brands, and above all how to lead and inspire in this new Age of Identity.

IN THIS SUMMARY, YOU WILL LEARN:

- How to master your company's "I*Dimension" using new tools for transforming identity into competitive advantage.
- Ways to manage the contradictory tensions that shape your company's identity.
- How masters of the I*Dimension are able to leverage their understanding of their company in order to achieve outstanding results.
- How to deal with narcissism, conflict, drift and fragmentation.
- How to protect what's precious to your company and change what needs to change.
- How to manage your company's identity through mergers, acquisitions, spin-offs, alliances and change.

Leadership Challenges in the Age of Identity

Welcome to the Age of Identity. We are in the midst of a transition on a global scale from an era in which the vast majority of individuals and human groups lived with a sense of clarity, continuity and consistency about their identity — their notion of who they were and how others viewed them — to an era in which identity is increasingly problematic across all levels of human organization, from the individual person to entire nations and civilizations. This shift has profound implications for leaders in all walks of life, particularly in business.

Using Identity as a Competitive Advantage

If you are tempted to use the identity of your firm as a basis for competitive advantage, you need to be aware of some common risks and pitfalls:

1. Be sure that the organizational identity projected through branding efforts is real. If it is mere sloganeering, your competitors, or other unfriendly stakeholders, may turn these branding efforts against you.
2. Ensure the consistency of corporate branding efforts targeted at various stakeholders. The risk in adapting each message to its recipients is that multiple, and sometimes conflicting, images may be projected, leading to confusion in the marketplace.
3. Carefully align your own behavior and decisions with the organizational identity claims you make inside and outside the firm.
4. Strive to realize synergies between handling identity at the level of the organization as a whole and at the level of the individual brands under which your firm's products and services are marketed.

Facing Identity Issues

In the Age of Identity, businesses of all kinds are facing identity issues that they do not fully understand and are often ill-equipped to deal with.

There are a number of trends that together constitute significant challenges for firms doing business in the Age of Identity — challenges that confront leaders of these firms with tough questions about the essence of the organizations for which they have responsibility. These trends include: globalization; mergers and acquisitions; spin-offs; disruptive innovation; deregulation; strategic alliances, organizational networks and boundaryless organizations; a society of organizations; reputation and accountability; the advent of alternative social identities in the workplace; a self-aware, empowered consumer; and the pervasiveness of branding.

Although these trends represent different phenomena, they have one thing in common: They are about changes in the business environment that leaders cannot respond to by merely adjusting business strategies or operating systems and routines.

To respond effectively to these changes, leaders have to reach much deeper into the firm's identity and determine whether it is an asset they can leverage to bring change or a liability they must address to avoid being obliterated by new competitors. To assess how much of an asset or a liability your firm's identity might be, you first need to know precisely what identity is. ●

The I*Dimension

The visible elements of a firm are held together by a set of shared beliefs — sometimes implicit, sometimes explicit — that define its essence. This set of shared beliefs — the ***I*Dimension*** — gives the visible elements

of the firm coherence and puts boundaries around how much change is possible without altering its essence.

The I*Dimension typically lies in the collective unconsciousness of stakeholders because organizations, like most individuals, have a natural tendency to take their identity for granted and to go on with their daily business without wondering who they are, if they are satisfied with who they are, or who they should or want to be.

When identity becomes problematic, leaders need to understand that they are confronting issues beyond strategy and that invariably involve struggles over the soul of their organization. When these issues arise, leaders need to understand how the identity of their organization is anchored and what the implications may be.

Identity Anchors

Just as an individual's identity can be anchored in gender, nationality, social group, educational credentials or particular skills, an organization's identity — its I*Dimension, — resides in multiple anchors, such as core business, knowledge base, nationality, operating philosophy, a legendary founder, a governance structure or a combination of these.

Any aspect that key stakeholders (employees, owners, suppliers, customers, bankers or shareholders) view as central, enduring and distinctive about an organization is part of its identity. The weighting and salience of different identity anchors may vary considerably from one organization to another. For example, technological innovation is more central to Apple's identity than it is to McDonald's.

Balancing Contradictory Tensions in Identity

The identity of an organization is intrinsically and inevitably subject to multiple and conflicting tensions: external identity and inner identity, uniqueness and sameness, convergence and divergence, and aggregation and fragmentation. These tensions are inevitable because identity is open-ended and can never be considered as an aspect that is set for an organization.

The tensions are contradictory because they push the firm in opposing directions. Instead of seeking to suppress contradictory tensions, managers must balance them and ensure that the identity of their firm is not pushed too far, and for too long, on any of the dimensions. A firm whose identity is insulated from the outside world is set dangerously for detachment. Conversely, a firm whose identity is defined from the outside never develops a distinctive personality.

Too much emphasis on uniqueness can harm a firm's legitimacy, as outsiders cannot see where, or to which category, it belongs. Conversely, too much eagerness to look like other legitimate members in a given category leads to loss of character. Too much convergence does not allow healthy appraisal of a firm's identity in light of evolving circumstances, but too much divergence leads to paralysis.

Finally, too much fragmentation threatens internal cohesion and identification with a collective self, while too much emphasis on aggregation favors cloning and turns away the individuals and groups who do not accept seeing their self-identities melded into an overly homogeneous organizational identity mold. ●

For additional information on the weight of identity anchors, go to: http://my.summary.com

The Bright Side of the I*Dimension

Think of companies as diverse as IKEA, The Body Shop, Harley-Davidson, Southwest Airlines, Starbucks, Ben & Jerry's and Toyota. All operate in intensely competitive markets by offering increasingly commoditized products or services. Yet all are enduring global leaders in their respective industries.

These companies have remained out of the reach of their competitors because, during several decades of consistent behavior vis-à-vis their internal and external constituencies, they each have acquired a unique and enduring identity that sets them apart from their competitors and makes them difficult to imitate.

As technologies and industries mature, and as products and services become increasingly comparable, sustainable competitive advantage cannot be built on easy-to-imitate business strategies or operating systems. The more comparable products and services are, the more managers will have to build competitive advantage on inimitable attributes of a firm or its identity.

Internal and External Benefits of Strong Identity

Here are the internal benefits of clear, consistent and valued identities:

- **Identification**
- **Loyalty and commitment**
- **Cooperation**
- **A guide for problem solving and decision making**
- **Legitimacy.**

The external benefits of identity are not fundamentally different from those that are primarily internal, and the two are mutually reinforcing. Here are the external benefits of clear, consistent and socially valued identities:

- **Recognition**
- **Attractiveness and loyalty**
- **Trust and predictability.**

The Virtuous Cycle

The companies mentioned earlier have all achieved a high level of clarity and consistency between their internal and external identities. These companies are taken in a virtuous cycle in which external reputation fuels internal pride and vice versa. The question now is whether managers can proactively shape the identity of their firm and create the kind of virtuous cycle enjoyed by the likes of Starbucks and Southwest Airlines.

The Dark Side of the I*Dimension

The multiple benefits of a consistent, distinctive and enduring identity — its bright side — can become liabilities if top management is unwilling or unable to see beyond issues of strategy and operations and appreciate its potential dark side. There are a number of common dysfunctions, such as narcissism, identity conflict, drift and fragmentation, and ways to address them.

Narcissism

Organizations are prone to narcissism when their owners, employees and key stakeholders converge around a clear and consistent identity of the organization, draw pride from belonging to or dealing with the organization, and remain committed to their definition of the organization despite signals, weak or strong, that the organization's identity may no longer be adequate or viable.

Managers can help their firms avoid chronic narcissism by maintaining feedback channels and forcing internal and external stakeholders to acknowledge dissonant information from the environment. IBM CEO Louis Gerstner will be long remembered for forcing IBM to admit that it was no longer the sole rainmaker in the information technology sector and broadening its self-concept beyond mainframes.

Identity Conflict

Identity conflict occurs when influential stakeholders have and are committed to equally clear but mutually exclusive views of the soul of the organization. As a result, the firm is continuously torn between conflicting objectives, business strategies and operating principles.

Managers can cope with identity conflict either by maintaining a workable balance between the forces in presence or by weighing clearly in favor of one view of the firm. Conflict is not necessarily a bad thing. It is common for different parties to hold somewhat different views of the same organization. The presence within the same organization of different views of identity can enable it to present itself in different ways at different times to different constituencies.

Drift

Drift occurs when an organization with a clear and consistent identity progressively loses focus and its original sense of self. It usually happens when managers develop new activities, enter new markets, acquire other firms and involuntarily blur the clarity and consistency of the firm's identity.

Managers can cope with drift by working to clarify the firm's identity. They can, for example, put an end to drift by reaffirming the organization's historical identity. Steve Jobs' comeback at the helm of Apple has reconciled the company with its historical identity, anchored in innovation and design.

The opposite strategy for treating drift is to articulate clearly a new identity for the firm and to pursue its implementation forcefully and consistently.

Fragmentation

Organizations experience identity fragmentation when individuals and groups come to identify more with subunits than with the organization as a whole. When this occurs, the bonds between employees and the organization as a whole are weakened. The typical consequences of high levels of fragmentation are a loss of common purpose and mutual support across units and the inability of the firm to deal with being recognized by its environment as a single organization.

Managers should understand and accept that some level of fragmentation is inevitable and corresponds with the universal tendency of human beings to identify with their immediate work or social groups. To enable multiple identities to thrive within the same organization, leaders must ensure that the different identity layers present in their firm complement and fit well with each other so that the same employee can identify with a professional community, with a business unit and with the overall company, yet experience these identities as mutually supportive.

Casualties of the I*Dimension

What do Hewlett-Packard's Carly Fiorina, Vivendi's Jean-Marie Messier, Bertelsmann AG's Thomas Middelhoff and Dean Witter's Philip Purcell have in common? All four had outstanding credentials as business leaders. All four were highly visible and widely acclaimed in their roles as chief executive officer (CEO). The firms they led were seriously challenged in the business and technological environment of the 1990s. All articulated compelling strategic visions for their firms, and their strategies were initially hailed as sound, bold and necessary. All four, however, lost their jobs in astonishingly

public fashion for failing to deliver, in one way or another, the change they promised.

Failure to Understand the Significance of a Firm's Identity

The leaders had something else in common as well. They were all casualties of the I*Dimension, of a failure to understand and appreciate the significance of their firms' identities. Each became entangled in, and overwhelmed by, identity issues they did not intend to trigger. Their efforts were perceived, internally and externally, as detrimental to the soul of their firms and were openly resisted. As a result, the four executives found themselves at odds with the organizations and people they were supposed to lead. As their change initiatives stalled and became, in all four cases, a matter of public controversy, the performance of their firms suffered and much of the shareholder value evaporated.

Although the four leaders were abruptly removed from office by their boards of directors, their dismissals were seen in the press as logical and long awaited. Their fate shows that when the heart and soul of a firm are put at risk in the eyes of key stakeholders, it is not enough for the CEO to articulate a strategic vision and align the organizational structure and systems. Success in this context requires another set of senses and skills — those in identifying, understanding and managing a firm's identity. ●

Identity Integration in Mergers and Acquisitions

Addressing post-merger integration at the level of identity requires that managers think through and decide what to do with the legacies of merged organizations and how to build a common identity for the future.

There are four generic models of identity integration that correspond to a particular treatment of the co-existence between the past and the future of merged firms. Research suggests that there really is no "one best way" when it comes to identity integration.

• **Colonial Integration.** Colonial integration occurs when the identity of an acquired company is dissolved deliberately within the identity of the new parent.

• **Confederate Integration.** This is the opposite extreme of colonial integration. Here the merged organizations are allowed to preserve their historical identities and are not expected to meld into a new common identity.

• **Federalist Integration.** The key difference between federalist and confederate integration lies in preserving the identities of merged organizations while simultaneously developing an umbrella or overarching identity that each member organization can relate to, identify with and thrive within. The federalist approach seeks to develop a new layer of identity and identification on top of the existing layer.

• **Symbiotic Integration.** Symbiotic integration is the process by which the identities of merged firms are dissolved and fused into a new identity that did not exist before the merger. The key benefit of symbiotic integration is the avoidance of uncertainties and anxieties by people on all sides about who are the winners and losers in a merger.

The Four Models in Perspective

The four identity integration models offer alternative approaches to making one organization out of many. Each model represents particular trade-offs in how to deal with historical identities in building a common future.

There are two common mistakes in post-merger organizational design and management structure. The first mistake is the frequent involuntary ignorance of identity in the formulation of a post-merger organizational design and management structures. Leaders who focus exclusively on strategic and operational alignment of merged companies cannot anticipate what implications their decisions will have on the identities of the organizations involved in the merger.

Using language from one model and pursuing integration with a different one is another managerial mistake. Many CEOs, sincerely or cynically, use symbiotic or federalist language to cover the reality of a takeover of the colonial type.

To avoid sending conflicting signals, managers should keep in mind that, contrary to strategic and operational alignment, identity alignment is not a "one-off" task but a process that can take several years. Managers should be willing and able, under certain circumstances, to view identity integration as a gradual process. ●

Managing Identity in Spin-offs

When can a spin-off be considered successful? Although it may be relatively easy to enhance shareholder value in the short term through a financially driven spin-off, sustainable value creation is possible only when a spun-off firm has established itself as viable and distinct, with its own identity. Framed with reference to the often-used DNA metaphor, this means that a spin-off is successful when it works well for both parties — when the spun-off entity has successfully acquired its own DNA and when the former parent's DNA has been successfully recombined to support life without the spun-off entity.

How to Ensure Spin-off Success

To ensure smooth adjustment of identities, managers need to prepare the two organizations for life after the separation and ensure, through careful communication, that neither party to the spin-off feels that it is being punished or set up to lose in the process.

Second, managers should pay careful attention to the symbolic management of the spin-off. If they really mean to cut the umbilical cord definitively, managers should be careful about how they name the new company and about branding issues. A name that contains or evokes the former parent's name does not help the spun-off organization establish itself as an independent entity, and neither does the continuing exploitation of the parent's brand on the marketplace.

Ownership, Governance and Management

Special attention must be paid to the ownership, governance and management structure of the spun-off firm. When genuine separation is sought, the former parent should neither retain significant ownership in the spun-off firm nor keep a significant role in its governance. A successful spin-off requires a new leader brought in from the outside and a profoundly reshaped management team.

When managers are not under time pressure to perform a spin-off, traumatic consequences for both organizations can be significantly reduced if internal and external stakeholders are prepared for the spin-off several months before its actual implementation. In a successful spin-off, stakeholders on both sides come to see it as a natural and logical outcome. More importantly, they see the development of separate identities as a precondition for a healthy future for both. ●

Identity in Strategic Alliances and Joint Ventures

Managers can benefit from explicit consideration of the I*Dimension as they assess the rationale for, or design of, collaborative arrangements with other firms. Addressing the I*Dimension in the context of alliances means answering the following three questions:

1. How consistent or identity-threatening is a potential alliance for each partner?

2. Does the potential alliance require the creation of a separate organization (with its own employees, resources, customers, suppliers and so forth)?

3. How much of their own identities do the partners want to be visible in the alliance?

Joint Ventures

If the alliance requires a separate organization, managers can create a joint venture. They must be prepared to cope with the need for the new organization to develop a clear identity. This can be achieved by bestowing on the joint venture the identity of one of the parents, the identity of both parents, or an identity entirely of its own.

If an alliance does not require the creation of a joint venture, the partners can opt for collaborative agreements or consortia and must decide how much of their own identities they want to be visible through the alliance. Here the range of options extends from giving the identities of all the partners a prominent role in the identity of the alliance, to letting the identity of one partner only be visible in the alliance, or de-emphasizing the identities of all partners in the alliance.

Strategic Alliances

When the partners in an alliance are keen on preserving their respective identities, they must be clear about it and either promote the alliance through their own identities or give the alliance a low profile and leave their own identities backstage. On the other hand, when an alliance requires the establishment of a separate organization with its own resources and assets, the partners should be prepared to let it grow an identity of its own, give it the identity of one of the parents or give it the identity of both parents.

Of particular importance is the understanding that a strategic alliance sometimes needs to establish its own identity to realize its potential in the marketplace. In this case, managers and employees of parent organizations must accept a backseat and let the joint venture grow its own identity, internally and externally.

Stressful Conditions

Another lesson seems to be that joint ventures cannot develop viable identities and thrive if they are born under stressful conditions. When there is too much pressure on the people involved in a joint venture, the "us versus them" syndrome and tendency to blame each other impede the development of a collective self-concept. As a strategic alliance unfolds, the circumstances of the partners may evolve in ways that can make their collaboration problematic for one or both. When this occurs, it's important that the partners make the necessary adjustments. ●

Managing the I*Dimension at Organizational and Brand Levels

Managers who are I*Dimension-sensitive think deeply about the right amount of coupling between an organiza-

tion's identity and the identities of its brands. In weighing the options, they first need to know when customers care about the identities of the firm as a whole, when they care about the identity of its product brands, and when they care about both.

When customers only see and care about brands, investing time and money on corporate branding efforts to promote the identity of the firm can be pointless. Conversely, when customers need or want to know who stands behind a particular brand, efforts to conceal the identity of the firm may be counterproductive, especially when the firm's products may have negative health, ethical or environmental implications.

Managing Organizational and Brand Identities After Mergers and Acquisitions

Should managers retain all the brands previously operated by the merged companies? Should managers preserve the identities of the merged organizations? The answer to the first question depends on actual overlaps, or synergies, between the brands and on the ease with which a brand can be terminated or sold without losing the corresponding sales and profits.

The answer to the second question goes back to the four models of identity integration. Building on the identity integration framework, managers must consider two questions as they ponder the opportunity to preserve or delete organizational identities in the aftermath of a merger or an acquisition. First, how much do the retained brands depend on unique organizations for their future growth? Second, what are the potential benefits of organizational integration after the merger?

When potential gains from organizational integration are high, and the brands can thrive independently of the organizations where they were located before the merger, it is safe for managers to consider full-fledged identity integration, either of the colonial or of the symbiotic kind, depending on the balance of power between the merged organizations. For example, Volkswagen was right to use the colonialist model in the integration of Seat and Skoda (Spanish and Czech automakers, respectively), because the two acquired organizations were relatively weak performers and could not support the development of brands.

When potential gains from organizational integration are high but the brands need continued support from unique organizations, the federalist integration model offers a good compromise between the equally necessary imperatives of coordination and autonomy of merged organizations.

Finally, when the potential gains from organizational integration are moderate, and the brands are dependent on the organizations where they grew, confederate integration is advised. ●

Masters of the I*Dimension

Steve Jobs was called back to rescue Apple after the company faltered badly under two previous CEOs. Peter Saunders took the reins at The Body Shop after the company experienced serious performance problems for several years. Louis Gerstner was brought back from outside after his predecessor nearly grounded IBM. Carlos Ghosn took the driver's seat at Nissan after Renault took control of a virtually bankrupt company. These four have led remarkable turnarounds at their companies and have delivered impressive increases in shareholder value.

The Essence of a Company

All four CEOs are masters of the I*Dimension. Each in his own way understood something fundamental about the essence of his company, and each leveraged this understanding effectively to achieve outstanding results.

Steve Jobs *reconciled* Apple with its historical identity by re-emphasizing innovation and design. Peter Saunders *leveraged* the unique identity of The Body Shop and used it as a platform for revitalizing the firm and repositioning its brand. Louis Gerstner *broadened* IBM's identity as an information technology company where mainframes, once synonymous with IBM, became just one part of a much broader technology and solutions portfolio. Finally, Carlos Ghosn administered shock therapy to Nissan and sought, at the same time, to *preserve* its identity. ●

Diagnosing Your Firm's Identity

Identity can be an extraordinary asset for a firm; however, identity can also become a serious liability. Furthermore, although there can be convergence internally and externally of a given firm's identity, there can also be divergence.

To avoid becoming a casualty of the I*Dimension, you need to have some idea where your firm is located along these dimensions. Discovering or pinpointing a firm's identity is a real challenge, best met through conducting and *identity audit*.

A Methodological Guide for Conducting an Identity Audit

Uncovering the identity of an organization requires conducting a methodical search for the more or less clear, shared and consistent answers to the following questions:

- What is our identity?
- What is the degree of internal convergence on, and

commitment to, this identity?

• What is the degree of consistency between internal and external perceptions of our identity?

• To what extent is our identity an asset? A liability?

• Is our identity enabling us to keep up with external change? Will it in the future?

• Are there internal or external signals that our identity might be blinding us to technological or market trends or structural performance problems?

• Can we go on as who we are, or do we need to break away from our identity?

• Who would be threatened and who would be served by a change in our identity?

Tools for Exploring a Firm's Identity

To answer these identity audit questions, here is a set of tools that can be used together or selectively for a systematic exploration of a firm's identity:

• **Exploiting Secondary Sources.** The first step in an identity audit is the exploitation of available internal and external writings about the firm.

• **Interviews With Key Constituencies.** Through initial discussions with senior managers and a first round of readings about the firm, the auditor must be able to create a list of relevant constituencies whose views of the firm and, more importantly, behavior vis-à-vis the firm are of critical importance.

• **Survey of Stakeholders.** The qualitative insights gained through secondary sources and interviews can be used to form hypotheses to be confirmed in a large-scale survey of the firm's stakeholders. ●

Leading in the Age of Identity

We now find ourselves in the Age of Identity, an age in which identity issues are ubiquitous — at the individual, at the organizational and at the societal level. In all spheres of activity, and particularly in business, leaders who are aware of the significance of identity for their firm — either instinctively or through systematic investigation — have a distinct advantage over those who are not aware.

As identity issues become increasingly pervasive, the need for sophisticated leaders who understand how to manage through identity will multiply. These leaders can leverage their awareness to either further reinforce their firm's identity when conditions so warrant or alter their firm's current identity when it constrains performance or adaptive capacity.

For additional information on reinforcing the I*Dimension, go to: http://my.summary.com

Symbolic and Concrete Actions

When managers believe that the current identity of the firm is a key asset, they can contribute to its reinforcement through both symbolic and substantive actions. Symbolic reinforcement of identity can be achieved with positive discourse, collective events and involvement in the larger community.

To substantiate claims about what distinguishes their firm from others, managers need to give evidence that they are faithful to that identity in their concrete decisions and actions. This could be reflected in decisions made about people: recruitment, promotion, compensation or layoffs.

Common Ingredients of Successful Identity Change

Here are five ingredients for successful identity change:

1. Vision. The leaders of successful transformations articulate their visions of the changes needed to seize new opportunities and preempt the threats facing their firms.

2. Effective communication. Successful identity architects are able to create simple and easily communicable messages about the need to change and the direction in which they are driving the organization.

3. Consistency. Effective identity architects gain credibility, internally and externally, by aligning their daily decisions and verbal behavior with the vision they articulate for the company.

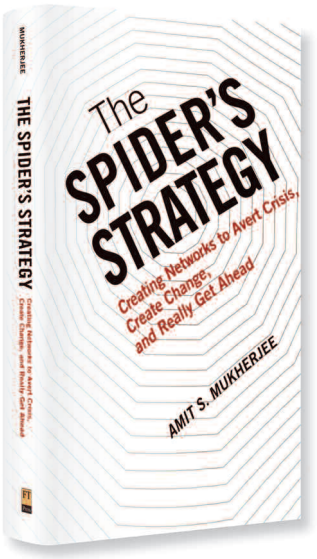
4. Leadership continuity. Continuity in leadership is necessary if the identity of a large and well-established company is to be successfully altered.

5. Luck and positive signals. No matter how necessary or attractive a new identity may be, if the firm experiences severe performance problems in the middle of a metamorphosis, the process could well be terminated.

Venturing on the journey into the I*Dimension can prove to be an arduous trek, but those willing to take on the challenge are almost always rewarded generously. ●

RECOMMENDED READING LIST

If you liked *The Soul of the Corporation*, you'll also like:



1. ***Corporate Agility*** by Charles E. Grantham, James P. Ware and Cory Williamson. In order to compete in the flat world, businesses must be willing to embrace a new strategic model. *Corporate Agility* provides the blueprint for this revolutionary move forward.
2. ***Good to Great*** **by Jim Collins.** The author takes on the question of whether a good company can become a great company.
3. ***Green to Gold*** **by Daniel C. Esty and Andrew S. Winston.** This book explores what every executive must know to manage today's environmental challenges. Based on the authors' years of experience and hundreds of interviews with corporate leaders around the world, the book shows how companies generate lasting value by building environmental thinking into their business strategies.

The Spider's Strategy

Creating Networks to Avert Crisis, Create Change, and Really Get Ahead

by Amit S. Mukherjee

THE SUMMARY IN BRIEF

In *The Spider's Strategy*, strategy advisor Amit S. Mukherjee uses his in-depth industry knowledge to warn readers that the influx of technology and the introduction of computer integrated networks bring with them an epochal transformation. The only businesses that will survive the latest industrial summit are those companies that acknowledge this change and actively seek to transform themselves into "Adaptive Businesses" that can easily navigate the challenges of the new, networked world.

Mukherjee provides executives with the necessary tools to prevent their companies from entering "The Execution Trap," as "good management" is no longer sufficient for success. Traditional models that focus only on plan-and-execute processes will be obsolete as they are expanded to include "sense and respond" capabilities and incorporate learning and technology to charter the changes and challenges caused by the fragmentation of work across time and space.

With implementation of four powerful "Design Principles," *The Spider's Strategy* shows executives that success is this new epoch is possible. The application of the Principles enables a corporation to become an Adaptive Business by changing the way they learn, promote knowledge sharing, discovery and dissemination, and how collaborating among networks produces win-win outcomes for all. Mukherjee also explores the key role of technological capabilities and how, without them, Adaptiveness cannot be achieved.

IN THIS SUMMARY, YOU WILL LEARN:

- Why becoming "Adaptive" is key to success during the latest epochal transformation.
- What makes the traditional "plan and execute" model inadequate for modern competition.
- How to implement the four "Design Principles" to become an "Adaptive Business."
- How "sense and respond" capabilities will change everyday processes.

THE COMPLETE SUMMARY: **THE SPIDER'S STRATEGY**

by Amit S. Mukherjee

The author: Amit S. Mukherjee founded Ishan Advisors in 2004. He has worked closely with senior executives of some of the world's best known companies, including Johnson & Johnson, Dunkin' Brands, SAP and Microsoft, to develop corporate and functional strategies. Prior to founding Ishan, he was the chief technology and strategy officer of TurboChef Technologies and a director at Arthur D. Little.

The Fire That Changed an Industry

About 8 p.m. on Mar. 17, 2000, a lightning bolt struck a high voltage electricity line in New Mexico causing a fire in the Royal Philips Electronics radio frequency chip manufacturing plant. Although the fire itself only destroyed eight trays of silicon wafers, the smoke caused the sprinkler system to activate, causing damage to millions of chips that had been stored for shipment.

Nokia and its archrival, Ericsson, accounted for 40 percent of the plant's shipments. When Philips announced that cleanup would take approximately a week, Ericsson did not perceive a need for concern or stepped-up action. Nokia's intensified tracking and communications with Philips did not raise Nokia's confidence that its partner had the problem under control.

Recognizing that Philips' problem could affect the production of several million mobile phones, Nokia took three key steps: one team of executives and engineers focused on Philips, seeking a major role in developing alternative plans; a second cross-continental team redesigned some chips so that they could be produced in other Philips and non-Philips plants; a third group worked to find alternative manufacturers to reduce pressure on Philips.

That year, the mobile phone, laptop and other electronics markets were growing at more than 40 percent per annum. In the third quarter, Nokia's profits rose 42 percent and its global market share rose to 30 percent. Their annual report did not even mention the fire. On the other hand, Ericsson reported a second-quarter operating loss of $200 million in its mobile phone division due to the fire and component shortages.

Nokia was able to thrive because it had the capabilities needed to survive the challenge built into its strategy, processes, values and technology. It was able to adapt rapidly to the huge changes to its business plans. Companies — like Nokia — that can intelligently and effortlessly adjust to major shifts in market or operating conditions are Adaptive Businesses.

Design Principles for Adaptive Business

There are four Design Principles that senior executives can apply to transform their companies into businesses that will thrive in a networked world:

1. Embed sense-and-respond capabilities within normal plan-and-execute processes. The ability to detect a problem or opportunity early and correctly, and the ability to react effectively are key determinants of competitive advantage.

2. Adopt strategies that promote collaborative action among network partners. As companies globalize and their supply-and-demand networks fracture, they tend to lose visibility into their competitive landscape. Unless they develop cooperative relationships with their partners, they will not get preferential assistance with either crisis or opportunity.

3. Value and nurture organizational learning. Companies must collect, analyze and share across their networks knowledge about what works and what does not. Without "intelligent knowledge sharing," they will lack information to act decisively and effectively.

4. Deploy technologies that enable intelligent adjustment to major environmental shifts. To effectively and efficiently adjust to changed conditions, companies must apply information technologies that support the prior principles.

Although easy to state, the difficulty of implementing

the four Principles is what gives them their great power: *Collectively, they change how work is performed on a day-to-day basis.* In order for the Principles to have a voice in top management deliberations, companies must consider appointing a Chief Network Officer. This executive will bear primary responsibility for the implementation of the four Design Principles. ●

Shadows of the Past

Ramchandran Jaikumarr — Jai — studied 500 years worth of meticulous business records from the Italian gun maker, Beretta. He noted that, by the end of the 1980s, Beretta had gone through several major paradigm shifts that Jai called "epochs." Each started with the introduction of a new, often deceptively simple technology.

In response to periodic epochal shifts, companies have modified how work is performed, how their organizations are structured and even their corporate ethos. Distributed computer networks are driving the present epochal change by fragmenting work across time and space, engendering extreme product customization and blurring industrial boundaries.

This epoch has already extended itself beyond the boundaries of manufacturers, tying them very closely to retail businesses.

The Three Megatrends of the New Epoch

Three megatrends accompanied the new epoch and changed the landscape of modern business.

The first major trend was the decomposition of work across time and space. It began with the emergence of global data communication capabilities. This decomposition caused companies to extend their creation of intellectual property to locations around the world. This gave companies the confidence to break up work across networks of temporally and geographically dispersed — and often financially independent — workgroups.

The second major epochal trend is an explosion in the variety of output being produced by companies. Distributed computer networks make outputs possible that far exceed the ability of most companies to effectively manage the variety.

The third major trend is a tug-of-war over the basic structure of industries. One side has received considerable attention; many industries that exist today did not in the past. The other side has not received as much attention, despite being just as important and powerful; the traditional demarcations between industries are increasingly blurring and sometimes getting erased.

The Execution Trap

Doctrines of good management that work beautifully in one epoch tend to be inadequate in the next. In the Adaptive Business epoch, simply planning well and executing brilliantly will no longer guarantee great results. Companies will fall into the execution trap if they believe that reliance on traditional good management alone will help them succeed.

The Execution Trap is a direct consequence of the collective adaptation of the three trends. They make work too complex to meticulously plan and flawlessly execute in accordance with the plan. Individually and collectively, they limit managers' visibility into their vast empires.

Unable to predict what the future will bring and lacking the ability to work with the unfolding reality, executives and companies find that what they desire has little resemblance to reality and that what gets done is at odds with what was desired. ●

Visions From the Present

During the mid-1990s, Nokia was going through unprecedented change. Under CEO Jorma Ollila, it was busy reinventing itself as a global player in telecommunications by selling off businesses and investments in all other areas, including electrical power, tires and chemicals. Nokia was also coping with the three trends of the emerging Adaptive Business epoch.

In parallel, it was growing its telecommunications infrastructure and mobile phones businesses at rates in excess of 50 percent annually. By year-end 1995, it had become the world's second-largest mobile phone maker.

Through all this change, Nokia followed an old-fashioned plan-and-execute model that did not even incorporate Lean Enterprise principles.

Although management recognized these weaknesses, they had not been able to make the necessary changes. Nokia seriously stumbled while introducing a new product portfolio; they had large inventories of the wrong components and a shortage of components needed for the new products. This stumble led to the beginning of their transformational journey. This transformation was responsible for their success after the 2000 fire.

The Power of Networks

Executives in this present epoch are urged to think of the network of companies that surrounds them, for their emergence is the defining organizational characteristic of our times. Marketers, salespeople, finance professionals

and logistic experts are all working with manufacturers or engineers to create products and services. To be successful, managers must ensure that these workgroups fulfill four distinct but interlocking roles:

- **Build markets.** These workgroups are essential for selling products.
- **Create technologies.** These workgroups create key, distinctive intellectual property.
- **Assure supply.** These workgroups obtain or manufacture critical components and systems.
- **Develop complementary resources.** These workgroups provide ancillary products and services that, although inessential, engender great success or, in their absence, instigate failure.

The New Capabilities of an Adaptive Business

Because of the need to fill different roles in environments separated by time and space, members of a network may radically differ in size, goals, values, cultures, organizational structures, processes, risk tolerance and other factors. Such mismatches mean that very often amorphous, uneven groups that march to the beats of different drums must work together. Their collaboration must deal in real time with the implications of such differences: what a given workgroup notices in its environment, what it considers important, whether and how it reacts to these, and what it does.

Members of networks win or lose together; rarely can a company succeed while its network is failing. Individual workgroups — and the network as a whole — must develop three *additional* capabilities that complement plan-and-execute: the ability to *sense* unexpected changes, the ability to *respond* to the unexpected change and the ability to *learn* from experience. Together, these capabilities, working in concert with plan-and-execute, enable a company to consistently, effectively and efficiently deal with small and large changes in its environment.

Whether or not a company transforms itself quickly has an enormous impact on its financial performance. Financial markets are holding top managers accountable for perceived failures more than at any time in the past. If the transformation does not find room on top managers' agendas, their financial legacies could well be at risk. ●

Transform Everyday Work

The first Design Principle for Adaptive Businesses: *Embed sense-and-respond capabilities within normal plan-and-execute processes.* Without the ability to initiate a response to deal with normal business problems, a company cannot be considered able to effortlessly adjust in response to market changes.

The Importance of Being Earnestly Adaptive

Plan-and-execute processes deal with what is known and/or expected; sense-and-respond capabilities must address the unknown and/or unexpected. Normal work processes and systems must enable people to do both. Absent such integration, people (and processes) may not be able to identify and address the unusual, unexpected or spectacular as they execute the mundane. Such a disconnect may give rise to crises or missed opportunities. Well-managed companies may be able to react to these, but they won't be able to proactively exploit them.

Companies stumble when their planning-and-execution processes cannot match the pace with which changes propagate in a networked world. Businesses cannot simply rely on downstream execution to drive upstream work. They must be constantly vigilant for signals about actual events, wherever they may come from.

Embedding sense-and-respond capabilities within normal plan-and-execute processes is the modern-day equivalent of giving workers, not just masters, access to standard planes, micrometers and engineering drawings. Doing so makes sensing and responding everyone's responsibility.

What Must the Company Sense?

A company should seek to sense *predictable surprises*, a term coined by Michael Watkins and Max Bazerman. A predictable surprise is a problem with three characteristics: at least some people know that it exists; it is worsening with time; and, if unaddressed, it might become a crisis.

To perfect its role as a filter for focusing the company, the definition of predictable surprises must be expanded to cover opportunities that, if ignored, would not be exploitable. Second, it must cover events that are predictable not because they build up over time, but because they belong to known groups of recurring problems or opportunities.

Executives seeking to build sensing capabilities should review all predictable surprises in order to identify which ones deserve a response, and when and how to respond.

Companies have to identify their own predictable surprises based on their own particular situations. Moreover, it is important that as business conditions evolve, the predictable surprises that should be sensed may change. Therefore, executives must periodically

reassess their business needs and refocus their sensing capabilities on the new criticalities.

How to Design Sense-and-Respond Capabilities

Once executives use predictable surprises as filters to define what their companies must sense, they have to embed the sensing capability in plan-and-execute processes. They must decide what signals they should rely on, where the capability should reside and how the sensing will happen. Executives must assess how they would need to respond if the surprise actually occurred.

The developers of response capabilities must identify the key bottlenecks, capabilities, weaknesses or assets that could affect their ability to respond in their preferred manner and how work will be coordinated when a surprise materializes.

Finally, the designers must evaluate when the company must actually act if it senses an opportunity or challenge. This determination must be tackled last, simply because it takes into account the tasks covered by the prior three responsibilities and determine the time needed to actually execute these in a specific instance. ●

Succeed in a Dog-Eat-Dog World

The second of the four Design Principles for Adaptive Businesses is: *Adopt strategies that promote collaborative action among network partners*. Regardless of whether its creation takes massive amounts of time, energy and resources or the brilliant insight of one or more great minds, knowledge may be hard to decode, decipher and use without the active support of those who create and/or possess it. By acts of omission (suppressing key information) or commission (providing misleading information), those who create/possess knowledge can thwart its effective use by those who choose to appropriate it.

Why Companies Act Against Their Own Best Interests

Relationships between companies are often governed by assertions such as, "If we tell them what our true inventory levels are, they will take advantage of us." A game theory model called the Prisoner's Dilemma elucidates why companies behave like this.

The police arrest two suspects against whom they have weak cases. They hold the suspects in separate cells promising each leniency for implicating the other and harsh treatment otherwise. The prisoners do not realize it is an empty threat, but, unable to communicate with each other and concerned about being double-crossed, each one concludes that regardless of what the other does, he or she will draw a lesser sentence by implicating the other. Each then makes a perfectly rational decision to do so, thus giving the police the ability to convict both.

This scenario is repeatedly played by businesses acting as the prisoners; companies working together make rational decisions individually that produce bad outcomes collectively.

Companies fall into the Prisoner's Dilemma trap because their people lack critical information about the consequences of their decisions.

If businesses interact (work) with each other rationally and repeatedly, they should keep their partners' best interests in mind — not as an act of altruism, but one of enlightened self-interest. Over time, this will produce favorable outcomes for all parties.

Implementing the Second Design Principle

It is possible to evolve to win-win even in situations where the predominant perspective is win-lose. What is essential is a critical mass of people who believe in win-win. These people search out others who share their beliefs and, by working with each other repeatedly, over time they outperform those with a win-lose mindset. Their superior performance attracts the attention of others, who then join the group to gain the same benefits. So, to get the process started, a company must focus on the true believers.

Even with true believers leading the charge, companies should address immediate, practical issues of substantial value instead of initiating a crusade to change the world. Once people are convinced that win-win is beneficial to them in areas they care about, they become amenable to considering that by moving out of their comfort zones, they may create even greater value.

It is impossible to develop a win-win relationship with others without sharing critical information with them. Having critical information is of little value unless it is shared with those who need it to make key decisions. However, no company can tell all outsiders everything. The key question then is, "Who is authorized to share what information, with whom and under what conditions?" Sooner or later senior executives must develop policies to govern information sharing.

Of the four Design Principles, the second is most likely to draw skepticism, because its implementation requires people and companies to change not only what they do, but also how they behave. ●

Ensure That Work Teaches

The ability to learn from the experience of working across functional and/or organizational boundaries is critical to success. A company pursues organizational learning if it routinely and ethically enables its people to improve their knowledge of its environment and ensures that the private knowledge of an individual becomes the public knowledge of many. Five elements of this concept merit elucidation:

- **Routinely:** Every act of production should be an act of learning. This goal should be extended to all functions.
- **Ethically:** If a company behaves unethically by say, usurping someone's knowledge and then replacing him or her with someone cheaper — people will resist sharing their private knowledge and the company will not be able to learn continually.
- **Enables:** A company that simply encourages its people to learn, but does nothing to help them do so, is not pursuing organizational learning.
- **Environment:** This includes both the internal and external environment, which includes the work performed and the conditions that accompany its performance.
- **Private knowledge/public knowledge:** If an individual learns something valuable, he or she may benefit from it. For the organization to benefit, the individual typically must share that knowledge with others. Unless private knowledge is made public (within reasonable bounds of confidentiality) it is not organizational.

Distributed computer networks and their associated trends have increased the importance of managing learning. More generally, unless a company learns by collecting, analyzing and intelligently sharing knowledge, it can neither effectively design its network nor act decisively through it.

Companies that aspire to be adaptive must adopt the third Design Principle: *Value and nurture organizational learning.* This Principle is the energizing spark that drives all aspects of adaptive behavior.

To consciously implement the third Principle, executives must understand the range of learning styles that can be observed in business settings. Not every style is effective and knowing the range can facilitate behavioral change. Moreover, in order to move from encouraging learning to enabling it, executives must also know how organizational infrastructure supports or impedes learning.

How People Learn to Solve Business Problems

People usually learn to solve complex business problems by first observing more experienced colleagues tackle similar problems. They then develop their own instincts by trial and error, often under the tutelage of such a colleague. Such learning is called *experiential* to recognize the role of repeated contact with a diverse set of work-related situations. It teaches people two things; first, how to recognize events that require action and second, how to react to these events.

A less common way people learn to solve business problems is by first understanding *why* different elements of their work interact in particular ways. Such learning is called *conceptual* to recognize the critical role of theory. An "expert" can help elucidate a theory for the benefit of a novice. No one uses one or the other learning mode exclusively. We combine different levels of experiential and conceptual learning when we search for solutions to business challenges.

Creating a Learning Organization

The failure to learn keeps companies from intelligent and effortless adaptation. Executives must understand how they can improve their companies' ability to learn.

"Process" refers to a series of actions, changes, operations or functions that produce a result or create or modify a product or service. The most effective way to convert private knowledge into public knowledge is to embed the knowledge into a business process. Over time, Adaptive Businesses must re-evaluate processes to ensure that they: help the company become better over time, identify and resolve new and/or emerging problems, and see if the process itself can be improved.

"Organizational structure" can drive active knowledge sharing by indicating what knowledge exists and how learning can be managed. The key role that structure can play is as a gatekeeper and evaluating knowledge to assess whether it is valuable enough to retain. In this role, the gatekeeper is often a specific group of people formed for the purpose. The group may be temporary or permanent. The second role that organizational structure plays is as a repository of critical knowledge and an active facilitator of its use. This ensures that learning and managing knowledge are distributed across all managers of the organization.

The last of the elements that affect an organization's ability to learn is its ***"culture."*** The culture of a company is critically important. Adaptive Businesses must be open to outside influences and be willing to take risks.

To encourage people to constantly learn, a company must be open to outside ideas and open to try things that they have not done before. It is critical that a company be willing to learn from mistakes. Without this trait, post mortem analysis would turn into: Blame others while shielding yourself. This prohibits learning because it encourages people to "play it safe" for fear of consequences.

Implementing the Third Design Principle

Each of the three elements — process, organization and culture — collectively constitute the engine for organizational learning. Either by evolution or by design, they mutually reinforce each other's effect on a company's learning abilities.

The best way to become a learning organization is to build the right culture, organization and processes from the start. For established firms, this may seem to suggest that companies that are good at knowledge creation will continue to get better at it, while others will find it impossible to improve. However, this logic is not absolute. With care and effort, companies can become learning organizations by applying the propositions instead of fighting them.

Successful businesses inevitably enter new markets, launch new products and open new facilities. Executives should use such occasions to create learning organizations that are sheltered from the mainstream processes, organizations and culture. The key challenge is finding leaders who can simultaneously manage business challenges and the needs of a learning organization. The managers' other challenge will be transferring this new knowledge to those who need the knowledge but who are not members. ●

Make Technology Matter

The fourth Design Principle for Adaptive Business asks executives to embrace the marriage of technology and strategy: *Deploy technologies that enable intelligent adjustment to major environmental shifts*. There are four key capabilities that Adaptive Businesses need from technologies: provide visibility, support analysis, facilitate collaboration and enable mobility. Conversely, without these four capabilities, it would be difficult to be adaptive.

Provide Visibility

Visibility is the ability to "see" the what, how much, where and when of a company's internal and external environments. This gives you the ability to sense emerging problems and opportunities, but also provides the information that, if analyzed appropriately, enables the marshalling or cogent responses. Visibility technologies are the cornerstones of an Adaptive Business because they enable the effective application of the first and third Design Principles.

Support Analysis

Technologies for analysis look for patterns and anomalies in data. They often compare data against formal models or older data sets in the company's organizational memory. In the near future, analytical software could give individual managers and staff ready access to data and analyses that can corroborate or refute opinions or hunches.

In all fields of human activity, anything more that the simplest work requires collaboration among individuals with diverse knowledge, skills and experiences. As work fragments across time and space, it also requires collaboration among groups. Technologies that enable such collaboration are credited for all of the prior three Design Principles.

Mobility technologies give people on the move two overlapping capabilities: the capability to communicate with their primary places of work, and the capability to acquire information where they are and to manipulate or disseminate it as needed. These technologies increase their users' productivity. Information is not just not accessed or responded to, but is actually created in process.

This mobility directly enables all three Design Principles by enabling their support in various locations outside the company walls.

Implementing Adaptive Technologies

In effect, technologies that provide visibility, support analysis, facilitate collaborate and enable mobility go hand-in-hand with an Adaptive Business approach to managing a company. Each of these capabilities facilitates intelligent adjustment to changed environmental conditions by allowing companies to detect such changes, analyze them, respond to them through collaborative action, learn and disseminate what they have learned. Technology can play a key role in becoming an Adaptive Business but the fourth Design Principle, in and of itself, cannot make up for the absence of the first three. ●

Create the Organization

In each epochal change, work was transformed; the skills and capabilities valued by companies evolved; and consistent with the changes in work, skills and capabilities, organizational structures changed.

In prior epochs, people in staff positions served as the human drivers and coordinators of the work that arose

from the technologies powered by the epochs. It stands to reason, then, that in a world in which work is being performed by networks of workgroups within and outside individual companies, the staff must ensure that the network of workgroups thrives. They will thrive only if the workgroups individually, and the network as a whole, develop and use three new capabilities: the ability to sense, respond and learn, generalize and share. This implies that the staff must focus on creating, cultivating and ultimately institutionalizing the abilities to sense, respond and learn.

The Chief Network Officer

The overarching responsibility of the Chief Network Officer (CNO) is to provide top management and the leadership needed to make his or her company adaptive. The CNO must "'align the needles of the individual compasses" by leading a company's efforts in five key areas:

- **Prospecting:** Companies should constantly forage for potential partners who can not only provide key capabilities, but also can work effectively as partners.
- **Evangelizing:** The CNO must work hard to develop personal relationships with top executives of potential and actual partners.
- **Network building:** The third task is actually building the network.
- **Mediation:** A CNO should represent the overall corporate interests, particularly when conflicts, including those between partners, both internal and external, arise.
- **Knowledge transfer:** The final role that a CNO must play is to ensure that good adaptive practices developed in one part of the organization are transferred to not just other parts, but, whenever appropriate, also across partner organizations.

The CNO cannot do all the work. There must be a team. There are two viable options for the structure of this team. The first is creating a *corporate team*. As long as its own application of the third Design Principle keeps it from becoming inward-focused, such an organization can drive adaptive principles quickly through the company. The second team option is to create a *matrixed team*. In more complex environments, a strong matrix organization may be the best.

Top executives should look among their senior staff for CNO candidates who possess three main characteristics. The CNO, first and foremost, needs to be a *business executive*, not a functional specialist. This person must understand the company's products, markets, competitors, technology, processes, regulatory and socioeconomic environment.

To deal with the complexity of growing networks effectively, a CNO must have *collaboration and consensus-building skills* because leading a transformation requires a greater degree of complexity than simply overseeing "business as usual." The CNO must also be *imaginative and willing to learn*. At the beginning of an epoch no one has a monopoly on knowledge. If the CNO does not have the humility to admit he or she does not have all the answers, the CNO will also find it hard to fashion innovative solutions. ●

Introduce Change Holographically

There is no right answer for how a company should embark on the task of creating an Adaptive Business. Steps that may be perfect for one company may be disastrous for another. With this important caveat there are eight key recommendations for executives to consider:

- Introduce adaptive transformation holographically by satisfying three conditions: Define the core policies at the corporate level; introduce capabilities business unit by business unit, not Principle by Principle; actively transfer lessons learned across business units.
- Pick a business unit that wants to change.
- Start at or near the top of the organizational hierarchy.
- Build a master plan, even one on a small scale.
- Introduce the Design Principles in waves.
- Start with the non-customer-facing ends.
- Remember that incentives can be an executive's best friend.
- For the foreseeable future, let the results speak for themselves.

Adaptive Business has the power to help companies thrive. However, it is still years away from having the power to influence financial markets. This is actually a good thing. By introducing change under the radar of the financial markets, companies may make it easier for change to take hold. As such, CEOs who decide to take their companies down this path should leave the flamboyance to those who will follow them. ●

Management: Strategies

The Upside of the Downturn

Ten Management Strategies to Prevail in the Recession and Thrive in the Aftermath

by Geoff Colvin

THE SUMMARY IN BRIEF

Some businesses — and some people — will emerge from this downturn stronger and more dominant than when it started. Others will weaken and fade. It all depends on critical choices they make right now. In *The Upside of the Downturn*, Geoff Colvin, respected business journalist and best-selling author, says even the scariest recession has an upside.

The best managers know that conventional thinking won't help them win in these tough times. They're taking smart, practical steps that will not only keep them strong, but will also distance them from the pack for years to come. The dozens of top-performing leaders Colvin interviewed reject the common view that slashing costs and firing employees are all that matter. They see the recession as a rich opportunity to reinvent their organizations and lay the groundwork for future growth.

Colvin's 10 solidly grounded strategies will increase your company's competitiveness and build its long-term value. He shows how these strategies really work, using examples of major companies that have applied them with inspiring results.

IN THIS SUMMARY, YOU WILL LEARN:

- The structure of industries will change profoundly as various players disappear and others transform themselves.
- The six key categories that shape performance and viability are financial strength, competitive advantage, government intervention, the state of your customers, your reputation and your risks.
- The true costs of layoffs and whether they will actually get you the benefits you're counting on.
- One way to think through the matter of your strategy and business model in this recession is to answer three basic questions.

THE COMPLETE SUMMARY: **THE UPSIDE OF THE DOWNTURN**

by Geoff Colvin

The author: Geoff Colvin, *Fortune's* senior editor at large, writes the popular column "Value Driven." Colvin lectures widely and is the regular lead moderator for the Fortune Global Forum. He also offers daily business commentary on the CBS Radio Network. His first book, *Talent Is Overrated*, earned international acclaim and was a *Wall Street Journal, BusinessWeek* and *New York Times* business bestseller.

The Greatest Opportunity

It is easy to say that tough times are an opportunity, but much harder for most businesspeople to find anything attractive in trouble on today's scale. A global economic decline that in many nations is already the longest since the Depression, that has wiped out trillions of dollars of wealth, thrown millions of people out of jobs, caused hundreds of thousands of businesses to close, and is to most people just a mess, a curse, a plague.

But in fact, this historic downturn really does offer new, similarly scaled possibilities. The reasons are specific and hardheaded:

1. This downturn is worldwide, so your canvas of opportunity is huge.
2. This downturn is severe and painful, answering the prayers of every business leader who wants to make big changes in his or her organizations.
3. This downturn is deep, meaning it's affecting people's most fundamental economic behaviors — spending, saving, borrowing, investing — in ways that may last for years.
4. This downturn is long, which means that many companies won't survive it.
5. This downturn is novel, so most managers have never experienced anything like it and no one has an advantage in knowing how to manage for it.

This Downturn Will Test You Personally

Times of crisis present genuinely great opportunities not just to demonstrate leadership but also to develop it — to build leadership capabilities beyond what you or others in your organization now possess. Scientific research on great performance has shown persuasively that high abilities of all kinds are developed; they don't occur naturally. The question of whether great leaders are born or made is settled: they're made.

Everyone is facing the opportunities that are present, though sometimes concealed, in the global downturn. Only a subset of businesspeople will recognize those opportunities. Of those people, only some will get past fear and defensiveness and try to take advantage of the opportunities. And of that group, only some will succeed. ●

The New Normal

Seeing the downturn as a bunch of statistics is easy, tempting and almost useless. Seeing the recession as part of a story is our only hope of understanding it well enough to manage through it. And as fascinating as the story is, what we all really care about is our own narrative — what happens to me and my organization in this story?

It's also important to focus on the story's most important elements and, in the current portion of the world's economic saga, it's clear what they are. There are two: one is the behavior of American consumers; the other is risk and how economic players around the world have regarded it — a volatile love-hate relationship that is central to the story of the recession and what will come next.

The Day the World Changed

The day the world changed, though no one knew it at the time, was June 13, 2007. These turning points are never clear except in retrospect and no one can say exactly why they happen when they do. But on that day, for whatever reason, investors started waking up to

risk, and all the world-changing turmoil we're coping with today has followed from that.

Specifically, investors began to feel they weren't getting paid enough for making risky investments. At first the effects were barely noticeable, but by August they were unavoidable. That's when the subprime crisis began, for the simple reason that investors who had previously ignored the risks of subprime mortgages and the securities built from them were now demanding to be paid a more realistic — that is, higher — return. Just six months after investors came to their senses about risk, the recession had begun.

Not Since Genesis

Every recession is unique, and this one is different in many ways, including the bizarre nature of the financial securities that got banks into trouble and its interconnected global complexity. But for people in business, the most important difference centers on the strange behavior of the protagonists of our story, consumers.

- Ever since Joseph decoded Pharaoh's dream about fat cows and thin ones, consumers have followed his policy response: Save in the fat years to survive in the thin ones.
- In good times they put away some of the abundance because they know they'll need it in bad times to come.
- Then, when the bad times hit, they spend some of what they've saved.

That's what consumers have always done because it's so obviously prudent. But it isn't what they did this time.

For the first time since Genesis, consumers did everything backward. During the expansion from 2002 through 2007, the savings rate of U.S. consumers fell rather than rose. In mid-2005 it even went negative, and it stayed below 1 percent for most of the period until late 2008.

Then, with the recession really taking hold, consumers again did the opposite of what they've usually done and increased their saving. That is the reverse of how consumers behaved during the Great Depression. That's how this strange story has led to a recession of historic proportions. Now businesspeople need to know what will happen in the story's next episode.

The New Normal

Because this recession is so severe, and because of the unique way in which it happened, we can be sure that it will change the world in several big, long-lasting ways.

Firefighting: The Most Dramatic Form of Responding to a Crisis

In this time of crisis it's worth considering what a group of psychological researchers learned when they studied firefighters. They investigated what two groups of firefighters, novices and veterans, actually saw when they looked at a burning building.

- The novices noticed the obvious features: the height and color of the flames, which parts of the building were involved.
- But the veterans, looking at the same fires, saw something different. They saw a story. They noticed the clues that told them how and where the fire had started, why it was burning as it was, and what it would likely do next.

By seeing the fire as a story, not just a collection of traits, they could create a plan for managing it. That's what made them effective firefighters. It's the same with the economy.

The changes are already happening. The structure of industries will change profoundly as various players disappear and others transform themselves. We don't have to wait for the recession to end to see the new world that it's creating, to glimpse the next episode in the story. Specifically:

1. The U.S. economy will become less consumer driven and consumer focused.
2. Social attitudes toward working, saving, spending and borrowing will shift.
3. The world economy will become less U.S.-centric.
4. Investors will remain spooked by risk for a long time.
5. Government will play a much larger role. ●

Reset Priorities

Jamie Dimon is arguably the only major bank CEO who has come through the financial crisis looking good. As chief of JPMorgan Chase, he got the bank out of subprime mortgages in 2006 and kept it so financially strong that when other major institutions failed, notably Bear Stearns and Washington Mutual, Chase bought them and their still-valuable assets for minimal prices.

Now everyone wants to learn more about how Dimon manages and he's not bashful about explaining it. When a Harvard Business School professor asked him, in October 2008, how he was managing through the

crisis, Dimon was perfectly clear about what was most important: "You have to prioritize. I am shocked by the number of people who are watching that train coming down the track" — meaning the recession — "and they're still worrying about their strategic plan for 2009. We canceled all that stuff — all of it — meetings, travel, you name it, to focus on the fact that we're in the middle of a real crisis."

What's Your Specific New Reality?

The changes in your reality are probably much more extensive than you realize. To grasp them fully, examine how your company's world has changed in six key categories that shape performance — and viability:

1. Financial strength
2. Competitive advantage
3. Government intervention
4. The state of your customers
5. Your reputation
6. Your risks.

Making Smart Decisions Under Stress

Understanding all the elements of your new reality is a big job, but the great thing about doing it is that it creates a picture — a rich overall view of your business in today's new environment. Looking at that big picture, you'll probably realize that many of your pre-recession goals just aren't realistic anymore. Abandoning such goals for now isn't failure, it's facing reality and protecting the business. In their place you'll create new goals:

- Increase market share.
- Lower breakeven points.
- Create new customer value propositions.

But in a way, this analysis, this assessment of the new reality and revising of goals, is the easy part. The hard part is responding — getting yourself and others to embrace the new reality, make decisions in a stressful, fast-changing and uncertain environment, and take action.

How to Respond?

The best and clearest explanation comes from studies of the military, where stress is worst and the consequences most serious. Research by the World Health Organization has shown how soldiers avoid the harmful effects of the stress and uncertainty of combat. Note how each factor has a clear parallel in business.

- They feel in control.
- They have strong group cohesion.
- They trust their leaders.
- They have high motivation.
- They feel well armed and protected.
- They feel well trained.
- They have a reliable medical corps.

Overstressed decision makers are bad decision makers, so unless the stress problem is at least blunted, nothing else will turn out well. ●

Protect Your Most Valuable Asset

Toyota has never laid off anyone. It's not that Toyota is selling as many cars and trucks in 2009 as it was in 2007. On the contrary, its sales were whacked more heavily than at any time in the company's history, though not nearly as badly as the Detroit Three's sales were hit. Nor is the company continuing to turn out millions of vehicles and storing them unsold on some vast parking lot. Instead, Toyota has been doing what it has always done in recessions, continuing to pay workers who continue to come to work every day.

If they aren't needed to make cars all day, which in this environment they often aren't, then they do other things. They take classes in workplace safety or how to handle materials; participate in exercises, developed at Toyota over many years on how to improve productivity; go to seminars on diversity or ethics; and go through assessment exercises to see how much they're learning.

Toyota doesn't promise its employees that it will never lay anyone off. Its policy of keeping employees on staff during recessions and giving them extra training means that when the economy turns up, those employees are in the plant, ready to go and probably far better prepared than the employees of any competitor.

The New Importance of Human Capital

The best companies and the best leaders take a larger view of their people during a downturn. They avoid the reflexive responses that they may have grown up with and that may be traditional in their own company. When they stop and examine today's environment, they find that it's full of opportunities — to begin practices they always should have been using, to improve the quality of their people, to increase employees' loyalty and motivation, to build the culture.

The True Costs of Layoffs

Maybe you've tried everything and concluded that you're in one of those companies that honestly cannot avoid layoffs. But before you pull the trigger, consider the true costs of layoffs and whether they will actually get you the benefits you're counting on:

- Layoffs are expensive in direct costs. Severance payments and other benefit costs that may be contractually required can add up to a substantial total, and most of those costs are immediate.
- Valuable knowledge will walk out the door.
- Your company will lose productivity before, during and after the layoff.
- Your company will damage its brand as an employer.
- Your leadership pipeline will suffer years from now.
- Even the survivors will pay a price.
- Wall Street's reaction may be the opposite of what you expect.

Engage the Outside World

Public Attitudes Are Changing

Today's crisis is no Great Depression, but it too will change business's world for decades. Finding opportunity in that shift may seem tough when public attitudes appear to be moving massively against business. But remember, your company isn't businesses, it's one company. As an analogy, it has been shown many times that most people don't like Congress but do like their own congressman. Indeed, there's no better time to look good than when the competition is despised.

The New Relationship with Government

Only a few companies are big enough to influence government during this critical period. The challenge for most of us will be understanding what's coming, then thinking deeply about what it will mean for our businesses. Change is on the way in four broad categories:

1. New regulation of leverage, risk and risk markets.
2. Large-scale new regulatory frameworks.
3. Protectionism and other employment programs.
4. Greater government activism in areas less directly connected to resolving the crisis.

Get Right with the Street

We all tend to keep quiet when we don't have answers — to "hunker in the bunker," as American Express CEO Ken Chenault put it, until we feel we have something definite to say. That's exactly the wrong approach. A company's constituencies don't expect you to have all the answers. They just want to hear your view of the world, to understand how you're approaching your situation and to know that you're thinking about them. In bad times they need to hear all this much, much more than when times are good.

Reexamine Your Strategy and Business Model

Is our strategy going to work in this environment? What must we change — and what must we not change? Will the recession fundamentally change our industry and our place in it? Or will this downturn just throw us off the long-term trend line for a couple of years? Do we need a new business model?

Those are large and deep questions for any company, and reconsidering strategy can turn into a miasma that consumes endless time and yields nothing. Yet the process is manageable. One way to think through the matter of your strategy and business model in this recession is to answer three basic questions:

1. What is our core?
2. How is this recession changing our customers and their behavior?
3. Will this recession hasten — or even cause — a large-scale restructuring of our industry, and if so, how will it affect us?

Three Multi-Industry Trends

Knowing which kind of future your industry faces — a world-changing, once-in-a-lifetime revolution or an era of major adaptation — is critical before you can form your response. A danger in a recession as deep as this one is that it may accelerate trends that will affect your business but that weren't even on your worry list. Three broad, multi-industry trends, already well under way, are especially worth watching because a bad recession could fuel them significantly:

- **Cocreation.** The idea is that most successful companies no longer invent new products and services on their own. They create them along with their customers, and they do it in a way that produces a unique experience for each customer. In cocreation, the choices are infinite and the company neither imagines nor delivers them all.
- **Brand building in developing economies.** It has been apparent for some time that the next great phase of business development in China and other developing economies will center on brand building, but it was slow going as long as the world clamored for low-cost manufacturing as fast as these countries could provide it. Motivated by the current slowdown, they may become brand power-houses far more quickly than many Western companies expect.
- **Imagination-based business models.** As living standards decline in Western economies, a conven-

tional response is to urge greater achievement in science and technology, long the foundation of economic dominance. The vision of the right-brain future is appealing in the developed world because it plays to the West's strengths today. ●

Manage for Value

For every company, deciding how to measure itself in this recession is one of the most critically important decisions to be made. That's because the way you decide to measure your performance is the foundational decision. Once it is made, it guides virtually all of your other decisions. If it's wrong, it will lead to many bad decisions, which in this environment may be disastrous.

Your Real Goal

Our system is called capitalism for a reason: it's all about capital. Yet that bedrock reality gets obscured in all kinds of ways as a result of accounting rules, corporate shorthand, media reports and other factors.

Every company's goal is to create value, which means using capital to build a business that's worth more than the capital itself. And the way this is done is to *earn a return on the capital that's greater than the cost of the capital*, a measure that financial economists call economic profit.

Get to Know Your Capital

Many of the world's best-managed companies understand this rule and live by it, but many other companies don't. The resulting wrong decisions may be survivable in a growing economy, but they can be fatal in a deep recession. To understand exactly how, you must first explore two simple questions: How much capital is in our business? How much does our capital really cost?

Making the Right Decisions the Right Way

The decisions managers are making now can be put into three major categories:

- **Deciding what to manage for.** In this recession, when cash seems so especially dear, managing for value may show the way to finding additional cash that wasn't available prerecession. As managers evaluate operations against the standard of a higher capital cost, they will likely find that some no longer meet the test and should be stopped, thus freeing up more cash.
- **Mergers and acquisitions.** Merger activity typically plunges in a recession, and that has been happening this time. Yet a historic downturn is a terrific opportunity for companies to buy other firms at bargain prices, and it can even work out well for sellers.
- **Dividends.** Most companies that pay dividends hate reducing them, yet that's what many have been doing. Yet it's possible that those companies have been forced into doing something smart. Paying a dividend achieves nothing for shareholders. It merely gives them some money that they already hold, embodied in the price of the stock. Every time a company pays a dividend, the price of its stock drops by the amount of the dividend.

A wonderful thing about the principles of finance is that they don't change. In a deep downturn, when every company must operate within much narrower margins of error, observing them becomes much more critical. Yet many managers, disoriented by the unfamiliar conditions, lose sight of the basic principles at just this crucial moment. The opportunity is to chart a course that may seem contrarian — to avoid cutting costs that others are cutting, to do deals that others won't do — secure in the knowledge that you're actually pointed in the right direction, and when the storm ends, you'll be far ahead of your competitors. ●

Create New Solutions for Customers' New Problems

The most successful companies understand that through good times and bad, they're always creating complete experiences to meet their customers' changing wants and needs. The process doesn't start when a recession hits. Instead, these companies are constantly monitoring the state of their customers and are experimenting with new value propositions that could better serve customers.

Getting Creative in Meeting New Needs

As companies create new value propositions for their customers' new recessionary wants and needs, they can do so on several dimensions, giving companies more options than many managers may realize. The simplest approach to creating a recession value proposition is devising a new product or service that offers the customer a reduced experience, carefully defined, at a lower price. ●

Price with Courage

To say that price cuts aren't inevitable in a recession is an understatement. If you believe that you absolutely must do it, please consider fully all the potential dangers, which are much more extensive than many business people imagine:

- Price cuts rarely pay for themselves. They may even reduce profit more than holding prices steady.
- Price cuts can destroy brand equity that took years to

build and may take years to restore.

- Price cuts train customers to behave badly. Buyers of all kinds have a tendency to remember the lowest price they ever paid for your product or service.
- Customers hate price increases more than they like price cuts.

How Much Pricing Power Do You Really Have?

Pricing is a continuing process through good times and bad. It's just that in good times you probably don't have to get it exactly right, while in a serious recession the stakes are much higher. For a business, even the most skillful pricing won't produce financial success if the company hasn't met the challenges of the recession on the inside. If its operations aren't competitive, if it isn't efficient, then it could still be crushed by the recession; while if it is, the recession can be a time of triumph. ●

Get Fitter Faster

Reevaluating the economic value of customers — and of products, services, facilities and lines of business — is one of the most important steps a company can take in tough times. It's the nuts and bolts of business, the millions of day-to-day decisions that add up to productivity, efficiency and financial success. In a historically severe recession, they become more important than at any other time.

The most effective moves aren't always the ones that managers reflexively make. Sometimes they're exactly the opposite. The greatest rewards go to businesses that move fastest and best in the following ten practices:

1. Understand the new economic profitability of all your business's components.
2. Look at your world through a green lens.
3. Think twice before cutting the easy expenses.
4. Ask, what would we do if we had to sell this business?
5. Focus intensely on a few clear goals.
6. Make executive pay a help, not a hindrance.
7. Don't spread the cuts evenly.
8. Don't sacrifice cash just to improve reported earnings.
9. Take a fresh look at offshoring.
10. Ask the employees where the opportunities are.

Operational Excellence

Operational excellence isn't every company's strength. An excellent book, *The Discipline of Market Leaders*, even argued that it shouldn't be — that every company needs to focus on just one of three possible strengths (the other two are product leadership and customer intimacy).

But in a deep recession, when every dollar of profit becomes far harder to earn, the value of operational excellence multiplies, and every company needs to get better at it.

The truth is that in operations and every other aspect of running a business, the stakes become much higher in a recession. ●

Understand All Your Risks

Around the world, thousands of companies were analyzing their risks diligently, and plenty of them (not just in finance and real estate) believed they were well prepared. They just never considered the type of cascading systemic failure that actually occurred. Of course, now we'll all be preparing for that type of catastrophe, which means the greatest risk we face is something new that we haven't imagined.

Seeing the Risk You Never Imagined

The enormously destructive power of this recession teaches five lessons that every company can apply for much better understanding and control of its risks.

1. **Turbocharge your imagination.** Because the events that do the worst damage are the ones you never conceived of, effective risk management begins with an eternal quest to imagine possibilities you hadn't even thought about before.
2. **Build scenarios.** Cold-war military strategists originated scenario planning, so by now the technique is well developed. Properly guided, it can help managers see important possible events they wouldn't have imagined, because it's all about thinking through possible sequences.
3. **Think in probabilities while realizing their limitations.** The strength of thinking in probabilities is that it forces us to bring to the surface and confront thoughts that we may not realize we're carrying around.
4. **Use the power of markets.** Prediction markets, in which real people bet real money on the likelihood of specific events, have been around for years and attracted lots of acclaim after correctly predicting the squeaker 2004 U.S. presidential election.
5. **Create an organization and culture that adapts quickly to new realities.** This recession is an unprecedented opportunity to begin such a change. ●

Don't Forget to Grow Yourself

Crisis is the ultimate leadership opportunity, but not every leader rises to the challenge. A crisis like this recession demands five actions of a leader. They're simple to state and may seem simple to do, but they aren't. Finding the strength to do them will contribute significantly to any leader's growth.

1. Stand up and be seen.
2. Be calm and in control.
3. Be decisive.
4. Show fearlessness.
5. Explain the crisis in a larger context.

Now Is the Time to Build All Abilities

Because a recession demands so much more of leaders, it offers them an opportunity to build their skills to much higher levels. So we all face more and richer opportunities to grow than we do in normal times. In fact, these opportunities are even greater than most people realize.

Psychologists have found that humans do not make progress at a steady, even pace. Instead, we follow a pattern of surge and recover. A severe recession is obviously not a time for us to recover. It is rather the very best time for us to surge, to push ourselves ahead and develop the new skills and abilities that will change us and stay with us forever. ●

For Next Time

Even long recessions end and are followed by expansions, which eventually beget new recessions. The best managers never become so consumed by the present that they forget their place in the cycle. Just as Dimon was thinking of the inevitable bad times to come as the good times rolled, smart managers are planning now for what they'll do when economic growth returns. The landscape of possibilities is broad, so it's useful to think of them in distinct categories:

- **Engaging the outside world.** Good times are when you make the friends that you'll need in bad times.
- **Managing people.** The temptations to become lax on this critical issue are almost overwhelming during a boom. But in a world where human capital is every company's most valuable asset, it's one of the most critically important jobs.
- **Adjusting strategy and business model.** Just as every investing strategy works in a bull market, every business strategy may seem brilliant during an economic boom. That's the time to ask how well the strategy or business model would hold up in a recession.
- **Staying connected with customers.** The best companies never stop refining their customer value propositions — observing customer behavior, understanding how customer needs are changing and experimenting with hypotheses for new value propositions.
- **Managing capital.** When a company lands in a recession after years of poor capital management, the pain is extreme. All that misery can be avoided if a company manages capital rigorously when times are good.
- **Getting more efficient and productive.**
- **Adapting to changing risks.** For unsuccessful companies, risk is a hot topic at the depths of a recession. For great companies, it's a hot topic at the height of a boom.
- **Continuing to grow personally.**

Good Times Preparation for the Bad

Managing intelligently during the next expansion, vital as it is, will be less a chance to clobber competitors than a way of preparing the organization for the make-or-break environment of the next recession. That way of thinking may seem strange. It feels backward. Good times seen merely as preparation for the bad? But it is the inescapable result of thinking about your company as an institution that, with luck, will last longer than your career or anyone else's, persisting through the elation and challenges of economic cycles that will never end.

We've forgotten how to think about business as progressing through a series of cycles. Yet that's what it is and will always be. Now that we've been powerfully reminded of that fact, we can again appreciate a larger truth about life in business. Good times are when you'll experience your greatest success. But bad times are your greatest opportunity. ●

How the World's Most Powerful Company Really Works — and How It's Transforming the American Economy

The Wal-Mart Effect

by Charles Fishman

THE SUMMARY IN BRIEF

More than 60 percent of all Americans live within five miles of a Wal-Mart store. Ninety percent of Americans live within 15 miles of a Wal-Mart. Every week more than 100 million Americans shop at Wal-Mart — half the adults in the country. Each year 93 percent of American households shop at least once at Wal-Mart.

Wal-Mart is the world's largest company yet we know little about it. Charles Fishman removes some of the mystery about the retail behemoth and its often hidden impact on the U.S. economy in *The Wal-Mart Effect*. Using his award-winning investigative journalism skills, Fishman has gathered inside information from former employees and suppliers, academic studies, government reports and Wal-Mart's own data posted on company Web sites. *The Wal-Mart Effect* explores how the company achieves its mission of delivering "always low prices." The book reveals the impact those practices have on customers, suppliers and employees around the globe, — even on those who do not buy from or sell to Wal-Mart. Fishman argues that Wal-Mart touches every American, every day.

The Wal-Mart Effect shows, with documented examples, the depth of influence that Wal-Mart exerts on American life and why the company is either revered or reviled. Fishman probes Wal-Mart's place in the world economy, showing how its dominance creates a unique economic system and distorts economic data because of its size. He compares Wal-Mart to competitors and firms in other industries, giving names and validating his findings with solid research. Fishman goes beyond, "Is Wal-Mart good or bad?" to explain the ways Wal-Mart changes the world.

IN THIS SUMMARY, YOU WILL LEARN:

- How the world's largest company forms an economic ecosystem.
- How the "Wal-Mart effect" touches people who don't deal with Wal-Mart.
- Wal-Mart's effect on U.S. inflation data.
- The unintended consequences of "always low prices."
- How much larger Wal-Mart can grow.

Who Knew Shopping Was So Important?

Wal-Mart shapes where we shop, the products we buy and the prices we pay — even for those of us who never shop there. It reaches deep inside the operations of the companies that supply it and changes not only what they will sell, but how those products are packaged and presented, what life is like for the factory workers who make the products — it even sometimes changes the countries where those factories are located.

Wal-Mart reshapes the economic life of the United States — a single company that steadily, silently, purposefully moves the largest economy in history. Wal-Mart has become the most powerful, most influential company in the world.

Unchallenged in Groceries

When Wal-Mart first started nudging into the grocery business in 1990, everyone in the United States already had well-established grocery-buying habits. The supermarket business was dominated by well-established, deeply experienced, well-run national chains. In ten years, at the end of 2000, Wal-Mart was the number-one food retailer in the nation.

In groceries, Wal-Mart is unchallenged. Its prices are about 15 percent lower for exactly the same food sold elsewhere. That translates into seven weeks of free groceries a year.

Wal-Mart didn't just change the lives and spending habits of grocery shoppers, though. It changed the very ecosystem and rhythm of the supermarket business. In the same decade that Wal-Mart has come to dominate the grocery business in the United States, 31 supermarket chains have sought bankruptcy protection; 27 of them cite competition from Wal-Mart as a factor.

Free-Market Hero or Insidious Beast?

In the last five years, a national debate about Wal-Mart's impact has escalated into a series of skirmishes being fought in print, in the media, at zoning hearings and in the courtroom. The way the company treats its employees, its suppliers, and communities, as well as its motivation, are all subjects of such bitter contention that it is hard to imagine that partisans are actually describing the same institution.

Wal-Mart's birth in a remote corner of Arkansas is now the stuff of American business legend. The company was the creation of a single man, Sam Walton, who latched on to a single idea that he somehow knew in his gut was singularly powerful: Sell stuff that people need every day just a little cheaper than everyone else, sell it at that low price all the time, and customers will flock to you. That single idea drove Walton to keep the costs of his own company as modest as possible and soon caused Wal-Mart to ask whether its suppliers couldn't be more frugal too.

As Wal-Mart gained in scale, the questions to suppliers became a way of doing business, a culture of looking for every penny of cost savings that could be wrung out of designs, packaging, labor, materials, transportation, even the stocking of stores. It is that cascade of frugality, questions and pressure that creates the Wal-Mart effect.

The phrase, "the Wal-Mart effect," has made its way into the culture, shorthand for a whole range of impacts resulting from Wal-Mart's way of doing business. A second phrase captures the ill-defined fears that the Wal-Mart effect has come to stand for: "the Wal-Mart econo-

Rebecca S. Clement, Publisher; **Sarah T. Dayton**, Editor In Chief; **Athena Nicolaides**, Graphic Designer; **Carol Celeste**, Contributing Editor

my." This term describes the nagging sense that there might be some unseen but terrible cost to be paid for "always low prices."

Is Wal-Mart Good or Bad for America?

In the Wal-Mart economy, consumers buy too much just because it's cheap. We find the pull irresistible. In the last two years, Wal-Mart added more dollars in sales than Target's total sales. It is precisely that scale, built out of our own purchases, $5 and $10 at a time, that powers the Wal-Mart effect.

As the Wal-Mart effect has become more obvious and widespread, a new kind of question has arisen: Should I shop at Wal-Mart? It's hard to know even what kind of question it is: political? economic? moral? A values question? The question is really shorthand for the whole set of larger questions, the mystery at the heart of Wal-Mart: Is Wal-Mart good for America or bad? It is possible to get beyond the noise about Wal-Mart, to penetrate the wall of secrecy that Wal-Mart itself has imposed, and get at the truth of the Wal-Mart effect. ●

The Wal-Mart Effect

The Wal-Mart effect: When Wal-Mart starts selling groceries in a new area, bringing lower prices to its own shoppers and driving down the prices of established grocery stores as well.

The Wal-Mart effect: When Wal-Mart comes to town, reshapes shopping habits, and drains the viability of traditional local shopping areas.

The Wal-Mart effect: The relentless downward pressure on the prices of everyday necessities that a single vast retailer can exert on behalf of consumers.

The Wal-Mart effect: The suburbanization of shopping: the downward pressure on wages at all kinds of stores trying to compete; the consolidation of consumer product companies trying to match Wal-Mart's scale; the relentless scrutiny of unnecessary costs that allows companies to survive on thinner profits; the success of a large business at the expense of its rivals and the way that success builds on itself.

Sam Walton's Ten-Pound Bass

The bedrock values instilled by Sam Walton were all-American values: hard work, frugality, discipline, loyalty and a restless effort at constant self-improvement. The standard Wal-Mart headquarters staffer is working at least 15 percent more hours than competitors in a routine workweek, even if competitors are logging 50 hours. Vendors are required either to provide a toll-free phone number or to accept collect calls from Wal-Mart buyers. In the offices at headquarters, the furniture is often a hodgepodge of colors and styles, including samples of chairs from suppliers. Most Wal-Mart staffers who travel are reimbursed for tips at no more than 10 percent of the cost of a meal.

From all accounts, Sam Walton truly wanted his workers to be happy. Former employee Lowell Kinder remembers flying with Walton to visit a store in Victoria, Texas. He shooed the manager away, gathered the associates and had some frank talk about how things were going. On the flight home Walton asked Kinder what he did in his spare time. He said that Wal-Mart got his spare time, then added, "I do fish a little." Walton asked what his goal was with that, and Kinder said, "I'd like to catch a ten-pound bass someday." Walton said, "When we were fixing to leave the Victoria store and all those people were waving and hugging me, I caught my ten-pound bass right there."

Wal-Mart's relative isolation in Bentonville, Arkansas, and its disregard for outside opinion go a long way toward explaining the gap between how the public sees the company and how the company insists on seeing itself. That Sam Walton's core values seem to have become inverted is a sign that even worthwhile cultures need to question themselves constantly.

The Wal-Mart effect only starts with Wal-Mart employees. For the companies that supply Wal-Mart and their employees the impact is, if anything, even more dramatic. ●

Makin Bacon, A Wal-Mart Fairy Tale

When retailers showed no interest in Jonathan Fleck's Makin Bacon microwave dish, he talked his way into the offices of bacon-seller Armour, which decided to put a coupon offering the dish on the back of 15 million packages.

By the time Wal-Mart reached out to Fleck, after *Good Housekeeping* magazine ran an item on Makin Bacon, he couldn't keep up with the coupon's "4- to 6- week" delivery promise. Wal-Mart buyer Cheryl Knight told him they could only sell the item for less than the price on the Armour coupon. Fleck said, "Sorry, I can't do

that." Knight told him he was crazy. Fleck said when the promotion ran out he would come back. A guy whose entire company was running out of a mail-order fulfillment house in Grand Rapids, whose R&D adviser was a fifth grader (his daughter, who came up with the idea of a microwave bacon cooker) — that guy told the largest retailer in the United States to wait.

Many things go unappreciated about Wal-Mart. One is this: The company often is willing to wait to get what it wants. Six months later, the Armour promotion ended and the Wal-Mart deal was done over the phone.

Fairy Tale or Nightmare?

It was a great order — 200,000 Makin Bacon dishes — and it was a great day for Fleck. Except for one problem. "As soon as you get the order, you start to do the math," says Fleck. "Financially, going into Wal-Mart puts you on the brink of bankruptcy."

The Armour promotion was self-financing. Money came in with the orders to pay for production. For Wal-Mart, Fleck needed more than $100,000 in advance. He had to buy 60,000 pounds of plastic and have a package designed and manufactured in addition to the dishes.

Fleck went to his parents with his Wal-Mart blue stripers, the paper purchase orders used in the mid-1990s, and his father arranged a credit line for his son. It was the first time in the elder Fleck's life that he had borrowed money.

The loan was paid off in 60 days and Jon Fleck's business has never had to take another. He has sold about 1.25 million Makin Bacon dishes through Wal-Mart and more than 4 million nationwide. Makin Bacon world headquarters still occupies about a third of Fleck's basement, sharing the rest with a game room and sitting area. ●

The Squeeze

Wal-Mart is a genius at shifting work and costs that have traditionally been handled by retailers back to manufacturers. The company's own administrative costs and overhead are parsimonious compared to its competitors', and that gives Wal-Mart a real competitive advantage and, increasingly, a small image boost.

A significant reason Wal-Mart is able to keep its own costs down is not just basic frugality, but strategic cost — shifting to suppliers. The Wal-Mart effect means suppliers manage a chunk of Wal-Mart's business for Wal-Mart; it also means doing it smartly, and without self-interest, because Wal-Mart retains the power in the relationship.

Wal-Mart cascades data about its sales out to its vendors giving companies a remarkable window on the preferences of their own customers, but it gives those vendors the responsibility of analyzing those waves of data and reporting the insights back to Wal-Mart. That's what most of the thousands of Wal-Mart team members in hundreds of vendor offices in Bentonville are doing: poring over data, trying to understand why something is or isn't selling and how to help it sell better.

Chinese Send-out

To survive in the face of Wal-Mart pricing demands, some consumer products companies have had to lay off employees and close U.S. plants in favor of outsourcing products overseas. Of course U.S. companies have been moving jobs offshore since long before Wal-Mart was a retailing power. But there is no question that the chain is accelerating the loss of American jobs to low-wage countries such as China.

Wal-Mart, which in the early 1990s trumpeted its claim to "Buy American," doubled its imports from China between 1997 and 2002. In the next two years, Wal-Mart increased Chinese imports again by 50 percent.

Eventually, there are no more pennies to be saved with smarter distribution or reduced packaging or cheaper plastic. Eventually, the only way to lower costs is to manufacture products outside the United States, in countries with lower labor costs, fewer regulations and less overhead. This element of the Wal-Mart effect remains largely hidden from public view.

Wal-Mart benefits from the impression that globalization is some kind of unmanageable economic weather system out of the control of everyone. That posture avoids the challenging discussion about why the world is suddenly so flat economically and what role a globe-straddling company like Wal-Mart plays in the flattening.

The Job Defense

Wal-Mart has taken to aggressively defending its own business practices by pointing out the number of jobs it creates. Here's a completely unaccounted-for facet of the Wal-Mart effect: More than 70 percent of all new retailing jobs in the United States in the last seven years came just from the growth of Wal-Mart. The remaining new retail jobs amount to just 540 new retail jobs in each state, each year. Wal-Mart created new retail jobs for itself, while its scale and vaunted efficiency were sucking the oxygen away from job creation in the rest of the retail trade.

The connection to the elimination of manufacturing jobs is less direct but equally striking. While Wal-Mart was adding 480,000 jobs between 1997 and 2004, U.S. manufacturing jobs during those years fell by 3.1 million, a loss of 37,000 factory jobs a month, on average, for 84 straight months.

America's Addiction to Cheap

A remarkable milestone has passed all but unnoticed: In 2003, for the first time in modern U.S. history, we have more people working in stores than we do making the merchandise to put in them.

We find the abandonment of U.S. factories unnerving; we find cheaper stuff on store shelves addictive. And we don't connect the two.

Consumer spending accounts for two-thirds of the U.S. economy, and Wal-Mart's influence across the consumer economy is unrivaled, unprecedented and Wal-Mart's priorities unwavering. During the same period that U.S. manufacturing jobs fell by almost 20 percent, Wal-Mart's imports of inexpensive products from China alone increased 200 percent. ●

What Do We Actually Know About Wal-Mart?

If there is one place to turn for an understanding of the impact of Wal-Mart, one place where the many variations of the Wal-Mart effect on the businesses, wallets and behavior of Americans would be dissected with scholarly enthusiasm, it is the economics departments of the nation's universities.

Hiding in the Open

Emek Basker, an economist with a Ph.D. from MIT, wanted to answer two of the simplest questions you can ask about Wal-Mart. What effect does the opening of a Wal-Mart have on prices in the immediate area? What effect does the opening of a Wal-Mart have on the availability of jobs in the immediate area?

Basker needed a list of every Wal-Mart in the nation (3,811 stores) and the month each one opened in order to isolate and analyze the impact of Wal-Mart stores on prices and jobs by comparing data before and after the openings. Bentonville houses one of the two or three largest private databases in the world. In a footnote Basker writes, "Requests for store-opening data from Wal-Mart Corporation were denied." It took her one year to compile data on 2,382 stores using Wal-Mart annual reports, Wal-Mart editions of Rand McNally road atlases and annual editions of the Directory of Discount Department Stores.

Lower Prices, More Jobs?

Basker proved — proved! — that Wal-Mart lowers prices. "I find price declines of 1.5 percent to 3 percent for many products in the short run," she writes. "Long-run price declines tend to be much larger, and in some specifications range from 7 percent to 13 percent."

Her calculations on jobs show: In the first year after a Wal-Mart store opens, it adds 100 new jobs to the typical county. Basker immediately writes, "Recall that the typical Wal-Mart store employs 150 to 350 workers." Even at the low end of that range, 50 people who had retail jobs in that county before Wal-Mart arrived immediately lost their jobs (or went to work for Wal-Mart). Five years after Wal-Mart's arrival, there are only a total of 50 new retail jobs, again despite the fact that the new Wal-Mart store typically employs hundreds.

Basker also looked at jobs at companies that supply goods to retailers. She found that on average, a county lost 20 wholesale jobs after five years, lowering the total average county job gain five years after the opening of a new Wal-Mart to just 30.

Wal-Mart's Take on Basker's Study

Wal-Mart cites the study, to reporters and on its walmartfacts.com Web site, as "the most definitive look at this issue," noting the creation of the 50 new store-based retail jobs after five years. The very paragraph that cites Basker's study approvingly also asserts, "Studies show that new businesses spring up near Wal-Marts and existing stores flourish as they take advantage of the increased customer flow to and from our stores." No other studies are referenced, and Basker's study proved the opposite: that the arrival of Wal-Mart typically closes four existing businesses, and has little or no effect on at least some nearby businesses.

Wal-Mart and the Consumer Price Index

Each month the government issues the much-watched and much- relied-on Consumer Price Index (CPI). Modest as inflation was from 1998 through 2001, it may be overstated by 15 percent per year. That miscalculation comes to $6.6 billion that someone thinks we're spending on inflation-adjusted groceries that we're not in fact spending.

MIT economist Jerry Hausman and U.S. Department of Agriculture economist Ephraim Leibtag concluded that the government gets it wrong because the CPI

fails to take into account the impact of Wal-Mart's lower prices.

Such a striking and systematic failure to get a vital economic statistic correct shows two things. It shows the incredible hidden power of Wal-Mart across the entire economy and it also shows how hard it is to keep up with the range of the Wal-Mart effect, even for people who spend all their time and energy trying to do just that.

The folks at the Bureau of Labor Statistics (BLS) who compile the CPI follow this procedure: As Wal-Marts roll out in communities, they are substituted for other chain stores so that the market mix between Wal-Mart and competing supermarkets remains balanced city by city. Hausman and Leibtag say, "The BLS procedure does not recognize any price difference between the stores." They found, across 20 categories of food, that supercenter prices were on average 27 percent lower than at traditional groceries, an astonishing discount.

The Poverty Effect

The most surprising, and in some ways the most disturbing, conclusion from an academic study of the Wal-Mart effect was the result of idle curiosity on the part of Penn State University professor Stephen Goetz and a postdoctoral student. While finishing an analysis of poverty rates, Goetz was hearing about the battles in local communities over whether to allow a Wal-Mart store in or to actively woo Wal-Mart with tax breaks.

Goetz and his colleague examined changes in family poverty rates in every U.S. county from 1989 to 1999, a period that "coincides with the booming 'New Economy' decade." They controlled for a spectrum of known causes of poverty. According to Goetz's study, the New Economy lifted nearly one in five poor families out of poverty.

What the study discovered is so startling, it's hard to absorb: They found that once you control for everything else, U.S. counties that had a Wal-Mart just before 1989, or that added one during the decade, had higher poverty rates than counties that were Wal-Mart-free. In counties with a Wal-Mart, the rate of poverty fell 10 percent more slowly than it would have without a Wal-Mart during that decade. Goetz clarifies, "We're not explaining the poverty rate, we're explaining the change." He says it comes to roughly 20,000 American families in poverty because of Wal-Mart. The remarkable thing is how well that number matches up, at least in scale, with the results of Emek Basker's research on jobs and local businesses.

Wal-Mart's Reaction

One reporter asked Wal-Mart for a reaction to Goetz's poverty study, and Wal-Mart spokeswoman Mia Masten offered a glib defense: "Oftentimes, a study can say what you want it to say." Marketing studies do sometimes say what the companies want them to say. But peer-reviewed academic studies don't work like that.

"'You can show anything with the numbers,' that was the response," says Goetz. "Is that what they do when they tell us about their stores? About what their workers are earning?" ●

Salmon, Shirts and the Meaning of Low Prices

If prices are not just a way of judging whether something is affordable but also contain signals about supply, demand, prestige and even the conditions under which products are made, then salmon for $4.84 a pound is a new, unintended Wal-Mart effect. It is a price so low that it inspires not happiness but wariness.

Most of the farm-raised salmon we eat comes from Chile. The Atlantic salmon doesn't appear naturally anywhere south of the equator but more salmon are harvested in Chile now than anywhere else in the world.

Rodrigo Pizarro, a Chilean economist, studies the impact of salmon farming on Chile. "The issue is not the health conditions of the fish. It's the labor conditions of the workers," he says — long hours, a demanding pace using razor-sharp filleting implements, low pay. Farming also does environmental damage. The fish are packed close together and given a lot of antibiotics to prevent disease. The concentrated fish waste creates dead areas in the ocean around the pens.

The key to managing the impact of salmon farming, to making the business sustainable for Chile and its environment, isn't self-regulation or government regulation. It's the big corporations who buy salmon by the ton. Wal-Mart buys so much salmon that if it imposed and enforced a set of standards on how salmon were to be raised, and how salmon workers were to be treated, salmon farming and processing companies would comply, either to keep Wal-Mart's business or to stay competitive.

A Shirt Like Dad's

One of Wal-Mart's house brands in boy's clothing is a blue Oxford-cloth button-down shirt. It's a perfect miniature of Dad's. The label says "Made in Bangladesh." And the price is $5.74. How is it possible for Wal-Mart

to produce such a lovely shirt and sell it for less than the price of a child's movie ticket? If you could see a video of the factory where it is made, of the people who sewed it, would you still be able to button your two-year-old boy into it and smile?

Clearly, one of the ways companies are saving money isn't simply in wages. Factories in developing countries are cheaper because the whole superstructure of rules around those factories in the United States — the workplace, safety and pollution rules — can be left behind. In many countries, the factories don't even follow their own rules. S. Prakash Sethi is an expert on global factory conditions. "Because of the pressure of cost," Sethi says, "factories do everything possible to save on the third decimal of a penny. Wal-Mart is one of the primary, if not the most important, engines that pushes those costs down."

The Consumer Solution

From the outside, the changes look easier to impose than they actually will be. For Wal-Mart, it's not simply about adding a few new bullet points to the existing list requiring companies to deliver products on time, on price, packaged the way Wal-Mart demands. Using Wal-Mart's purchasing power to improve the environment and the working conditions under which those products are produced requires a radical shift in thinking at the home office, a willingness to admit that not every cost squeezed out is good.

Pizarro knows one point of leverage that Wal-Mart never ignores: shoppers. "I wouldn't think American parents would want to feed themselves or their children with something being produced by a worker who is miserable, and who works in terrible conditions," says Pizarro.

The Man Who Said No to Wal-Mart

The Snapper lawn-mower factory has been in McDonough, Georgia, for 50 years, and every Snapper lawn mower sold anywhere in the world is made in this factory. The Snapper lawn-mower factory hums with discipline and focus and urgency. It operates, literally, in Wal-Mart time. It must. It lives in the Wal-Mart ecosystem. But it does so in defiance of Wal-Mart. Because three years ago the then-CEO of Snapper's parent company pulled all Snapper products from Wal-Mart.

That CEO, Jim Wier, looked into a future of supplying Snapper lawn mowers to Wal-Mart and saw a whirlpool of lower prices, collapsing profitability, offshore manufacturing, and the gradual but irresistible corrosion of the very qualities for which Snapper was known.

But Shane Sumners, Snapper president, has to spur his factory on with the same tirelessness as if it were supplying Wal-Mart — with the efficiency of every factory worker measured every hour of every day — because Wal-Mart is setting the pace, even if you're not working for them.

Snapper was already selling lawn mowers through Wal-Mart when Wier's company, Simplicity, bought Snapper in November 2002. Almost immediately on taking over, Wier stopped shipping Snapper mowers to Wal-Mart, a move that instantly cut Snapper's sales by almost 20 percent.

One serious hazard to Wier's strategy is whether the independent lawn-equipment dealers can really survive all the same pressures that have hurt small, independent hardware stores. Says Wier, "I think we have a part in that outcome. Can Snapper, as a major supplier, continue to supply [the independents] with great product, and a product different than you can buy at Wal-Mart?"

One of the ways to compete with Wal-Mart, in fact, is not head-on but aisle by aisle — that is, category by category. The other way is to focus, even in the mass market, on things besides price: design, fashion, quality, cachet, the feel of the shopping experience and service. ●

The Power of Pennies

The average product we buy from Wal-Mart costs something less than $3. In fact, the real power of Wal-Mart doesn't come from selling the average consumable at $3. The magic of Wal-Mart has always been in selling the $3 item for $2.97 — that's the genius of Sam Walton. He realized that Americans would change their habits to buy a $3 item for $2.97, especially if it was $2.97 every day. And he figured out how to run a business that could be profitable giving up those three pennies.

How Much Does Wal-Mart Save Us?

The low estimate is that Wal-Mart saves its shoppers 15 percent on a typical shopping cart of food. In 2004, Wal-Mart shoppers spent $124 billion on groceries. That food, purchased at other supermarkets, would have cost $146 billion. So, Wal-Mart grocery shoppers alone saved $22 billion. If the rest of the merchandise Wal-Mart sells is just 5 percent cheaper than at competing stores, that's another $8 billion. A conservative estimate is that the people who shopped at Wal-Mart last year saved $30 billion — not accounting for the money saved as other

retailers lowered their prices to compete.

Low Price Trade-off

Shopping at Wal-Mart is not a delight. The only thing likely to make you smile at Wal-Mart is the price. It isn't really a place to shop; it's a place to buy things.

One ratio perfectly captures and contrasts the shopping experience across stores: how much merchandise a store sells for every employee. Wal-Mart sells $178,125 worth of stuff per employee. Target sells $156,506 worth of stuff per employee. Whole Foods sells $121,875 worth of stuff per employee. As those numbers go down, the pleasurability of the shopping experience goes up.

Wal-Mart sells so much more per employee because we buy more and because of the frugality. At Wal-Mart there just aren't that many workers. That's why you often can't find someone to open the jewelry cases. That's why half the checkout lanes are unstaffed.

American Attitude About Money

There is in the American character a deep strain of frugality going back to colonial and frontier times and sharply refreshed during the Depression and World War II rationing.

But we are also the country where the average credit card balances being carried by a family from month to month, excluding those who pay their balances in full, is $14,400. Despite all the money we save shopping at Wal-Mart, the family savings rate in the last year is below 1 percent. Our spending is growing faster than our income.

Waning Interest

The power of "always low prices" is waning. Since 1998 the growth rate of same-store sales has steadily decreased. Target, meanwhile, has been trouncing Wal-Mart in same-store sales. The reason is simple: style versus price.

Wal-Mart ads in *Vogue* magazine show happy and fashionable women, but the idea that you can assemble a style in a Wal-Mart women's wear department is at odds with the actual shopping experience.

Same-store sales growth is a sign of another problem. The nation simply doesn't need to buy much more from Wal-Mart than it already does. With only 16 percent of the nation's grocery business, Wal-Mart could one day have 30 percent. A few areas have growth potential: California has only 91 stores and based on population could support 460, New York City has not a single Wal-Mart. But that's all fill-in growth. America is nearly "full up" with Wal-Marts.

Growth Opportunities

The rest of the world, however, is mostly empty of Wal-Marts. So the company can continue to grow, even dramatically. It has fewer stores in China than in Alabama and no stores in India. Wal-Mart could easily be a half-trillion-dollar-a-year company by 2010.

Wal-Mart may well continue to dominate American retailing for years, or decades, to come. But it's likely that 20 years from now we'll look back on the early 21st century as the moment when Wal-Mart's real struggles began.

Low Price Addiction

The idea that Wal-Mart will somehow shake off its low-price soul, that it will gradually infuse style and other intangibles into a culture that measures how many items each cashier scans each hour — that kind of transformation runs counter to every instinct on which Wal-Mart has been built. ●

Wal-Mart and the Decent Society

With its dominance across a huge range of merchandise and geography, Wal-Mart is increasingly beyond the control of the market forces that capitalism relies on to enforce fair play. Wal-Mart isn't subject to the market forces because it is creating them.

In his letter to America printed in 100 newspapers in January 2005, Wal-Mart CEO Lee Scott wrote, "The question of how to assure that American capitalism creates a decent society is one that will engage all of us in the era ahead." He also said, "Our critics seem to have a broader, and, I believe, more troubling aim: to warp the vital debate the country needs in the years ahead about the proper role of business and government in assuring that capitalism creates a decent society." The most certain way to avoid a warped debate is for everyone to have a wealth of data, an openness Wal-Mart resists.

Wal-Mart mirrors our own energy, our sense of destiny, our appetite for bigness and variety and innovation. And Wal-Mart is not just a reflection of American society and values. It is a mirror of us as individuals. The Wal-Mart effect derives all its vast power from us and our spending. Both as individuals and as a society we have an obligation to answer the unanswered questions about Wal-Mart. Otherwise we have surrendered control — of our communities, of our economy, of some measure of our destiny — to decisions made in Bentonville. ●

Who's Got Your Back

The Breakthrough Program to Build Deep, Trusting Relationships That Create Success — and Won't Let You Fail

by Keith Ferrazzi

THE SUMMARY IN BRIEF

None of us can do it alone. We need the perspective and advice of a trusted team. In *Who's Got Your Back*, Keith Ferrazzi shows us how to put together our own "dream team."

Disregard the myth of the lone professional "superman" and the rest of our culture's go-it-alone mentality. The real path to success in your work and in your life is through creating an inner circle of "lifeline relationships" — deep, close relationships with a few key trusted individuals who will offer the encouragement, feedback and generous mutual support every one of us needs to reach our full potential. Whether your dream is to lead a company, be a top producer in your field, overcome the self-destructive habits that hold you back, lose weight or make a difference in the larger world, *Who's Got Your Back* will give you the road map you've been looking for to achieve the success you deserve.

Keith Ferrazzi, the internationally renowned thought leader, consultant and best-selling author of *Never Eat Alone*, shows us that becoming a winner in any field of endeavor requires a trusted team of advisors who can offer guidance and help to hold us accountable to achieving our goals. It is the reason Ph.D. candidates have advisor teams, top executives have boards, world-class athletes have fitness coaches and presidents have cabinets.

IN THIS SUMMARY, YOU WILL LEARN:

- How to master the mind-sets that will help you to build deeper, more trusting "lifeline relationships."
- How to get further faster by setting goals in a dramatic more powerful way.
- Why using "sparring" as a productive tool to make decisions will fuel personal success.
- How to replace the "yes men" in your life with those who get it and care — and will hold you accountable to achieving your goals.
- Why you should lower your guard and let others help.

THE COMPLETE SUMMARY: **WHO'S GOT YOUR BACK**

by Keith Ferrazzi

The author: Keith Ferrazzi, CEO of Ferrazzi Greenlight, has counseled the world's top enterprises on how to dramatically accelerate the development of business relationships to drive sales, spark innovation and create team cohesion. As a thought leader and advocate for corporate citizenship, he has rallied executives around initiatives to improve health care and education nationwide. Ferrazzi has been published in the *Wall Street Journal*, *Harvard Business Review*, *Inc.* and *Fast Company*, and has appeared on *Today* and other national TV shows. His previous book, *Never Eat Alone*, is a national bestseller.

SECTION ONE: WHO'S GOT YOUR BACK

Jean Nidetch was overweight. She was overweight as a child, she was overweight in high school and, despite endless diet regimens, her waistline kept expanding throughout her 20s and 30s. In 1961, at age 38, Jean started a diet sponsored by the New York City Department of Health. After 10 weeks she was 20 pounds lighter, but starting to lose motivation. She realized that what she needed was someone to talk to for support.

Her inspiration: Jean brought the "science" of the program to her friends' living rooms in Queens. She and her friends would all lose weight together. Out of those first meetings grew Weight Watchers, today widely recognized as one of the most effective weight-loss programs in the world. Nidetch's idea was simple: Losing weight requires a combination of dieting and peer support.

Behind every great leader, at the base of every great tale of success, you will find an indispensable circle of trusted advisors, mentors and colleagues. These groups come in all forms and sizes and can be found at every level and in nearly all spheres of both professional and personal life, but what they all have in common is a unique kind of connection with each other as *lifeline relationships*.

Know Who You Are and Where You Belong

Look at it this way: Success is the ability to create the results in life we truly seek and not, say, just the amount of money you make. People who have a clear picture of what makes them tick, who know their true inner motivations and priorities, simply don't get in their own way. They can focus with energetic intention on their goals. It's what allows ordinary people to live extraordinary lives.

Why Do We Need Lifelines?

Each one of us is a salesperson of ourselves and our opinions, if not of business products and services. And most of us come up against personal and professional problems that are just too big to solve alone. If we want to be as successful as we know we can be, we need the help of others. Reaching out to and connecting with others doesn't show up on the syllabus of most business schools. But one day it will. Here are eight things that are clear as day:

1. Life coaching, with its hazy self-helpish title, comes in for more than its fair share of ribbing in the media and elsewhere. But look past the snarky skepticism and you'll find a nearly $3 billion market of executive, life and career coaches. As individuals, we're looking for lifeline relationships anywhere we can get them, even if we have to buy them.
2. Those who have a few close, deep relationships are able to get the feedback, perspective and input that are the lifeblood of effective decision makers.
3. The Internet has provided the tools for sharing and cooperating on a global scale.
4. The Internet is an important tool, but it's not the answer. There are now countless ways to coordinate and connect us, but "connections" are not lifelines.

5. Considering the vacuum of skilled, effective front-line management in companies today, executives, managers and employees who are proactive in finding a team of advisors to help give them feedback, coaching, accountability and support are the ones who will flourish in today's challenging environment.
6. Like no other time in history, people are taking the search for meaning in their work more seriously. There is no easier or more effective way to gain that meaning in our jobs, and find work enjoyable again, than creating lifeline relationships.
7. According to Tom Rath's *Vital Friends*, only 18 percent of people work for organizations that provide opportunities for social bonding in the workplace. In fact, many companies actually forbid the practice.
8. From church basement support groups to the larger-than-life examples of successful bosses and their high-performing teams on the covers of magazines, there are groups helping to provide support and advice to improve the lives of others every day.

SECTION TWO: THE FOUR MIND-SETS

There are four core mind-sets — which can be learned and practiced — that form the behavioral foundation for creating lifeline relationships:

- *Generosity*. It's the promise to help others succeed by whatever means you can muster.
- *Vulnerability*. This means letting your guard down so mutual understanding can occur.
- *Candor*. This is the freedom to be totally honest with those you confide in.
- *Accountability*. Accountability refers to the action of following through on the promises you make to others.

Mind-Set #1 Generosity

Lots of people want to be generous in their lives but aren't quite sure what they have to offer. But we all have something to give. Viktor Frankl, the late Austrian neurologist and psychologist, was a Nazi prison camp survivor who, in his classic book *Man's Search for Meaning*, wrote about how he refused to let himself feel like a victim, even after he was separated from his wife and parents (all three later died in the death camps). This he accomplished through small, constant acts of generosity. If Frankl encountered someone hungrier than himself, he'd share his meager daily ration of bread.

Eureka!

I had started to think that because I was the boss and people looked to me as an expert, I was supposed to be the one with all the answers. But I didn't always have them. I needed people I trusted who understood my professional goals. I had those people in my life. I just never asked for their help.

What if, we hypothesized, we could adapt the don't-do-it-alone advice that is the bedrock of the 12-step programs, Weight Watchers, and faith-based support groups and apply it in the corporate environment? Leverage the same basic methodologies found in the most successful behavioral change programs in the world to keep organizations and employees focused on positive change and targeted goals? Empower people with the tools to help each other identify and resolve issues that hold them back personally and professionally?

Eureka! It was a triumphant moment.

There are many kinds of specialized currency, but two that are broadly applicable and among the most powerful are *universal currency* and *personal currency*.

- Universal currency refers to our innate human ability to connect to others, no matter who they are or who we are. We can all embrace intimacy with another human being by listening, empathizing or caring.
- Personal currency requires finding out what others need in order to be happy in every dimension of their lives, and then figuring out what you can do to get them there.

Now, Let Others Help You

On the surface, being generous seems easy: You just go out and help others. But the hardest part of generosity is receiving it. Whether we realize it or not, this willingness to "give and let give" creates a wonderful give-and-take in a relationship.

Mind-Set #2 Vulnerability

We can't afford to look weak in life, either at the office or in our personal lives — right? It puts a target on our back, or so we believe. But being vulnerable takes incredible courage. It is a crucial mind-set to master if you hope to build a circle of trusted advisors in your life. So what is vulnerability?

- It is the courage to reveal your inner thoughts, warts and all, to another person. Which is why it is critical to create a safe place first, where you can experience

deep intimacy — or intimacy to the point of vulnerability.

- It is admitting that you have doubts and fears — and that you need the support and encouragement of others to overcome what holds you back and achieve your goals.

The Eight Steps to Instant Intimacy

The eight steps to instant intimacy can be put into practice when meeting someone new or when you'd like to transform a relationship you already have into something bigger and better — a lifeline.

1. Create an authentic environment around you.
2. Suspend your prejudices.
3. Project the positive.
4. Share your passions.
5. Talk about your goals and dreams.
6. Revisit your past.
7. Talk about what's keeping you up at night.
8. Share your fears and concerns about the future.

Mind-Set #3 Candor

Candor is the ability to engage in healthy, caring, purposeful criticism — as opposed to turf wars, nitpicking, or simply turning our backs and not communicating about issues at all. Candor is the greatest gift you can give if it comes from a place of caring about the other person enough to want him or her to get better. It's a two-way street, too — we need to be able to tell others the truth and receive it in return.

Taking Candor to the Next Level

To make getting and giving candor a bigger part of your life, here's a list of things to keep in mind:

1. Find people you respect.
2. Create the opportunity.
3. Make it clear that any feedback you get is a gift.
4. Acknowledge your faults.
5. Tell the other person what you plan to do with the advice.
6. Don't tell the other person what you want to hear.
7. Ask specific questions.
8. Take it or leave it — but deliver on safety.
9. Pay the other person back.

Mind-Set #4 Accountability

The point is that peer-to-peer support is crucial for accountability and, in particular, for sustaining the behavioral changes we need to help us achieve our goals. The overwhelming majority of the most successful people on earth rely on advice, support, encouragement and forceful nudging from a few trusted people who help them when they stumble, falter or waver.

The Right Buddy, Not Just Anybody

It's important to understand the difference between a buddy and an accountability buddy. Whether you're dieting or trying to re-energize your career, sometimes your friends and family are too close to you to hold your feet to the fire, to hold you truly accountable for your goals. Regardless of whether your buddy is a friend or on the payroll, having someone hold you accountable for your goals is a powerful reinforcing mechanism.

SECTION THREE: BUILDING YOUR DREAM TEAM

The nine steps to creating the lifeline relationships that will help you get the advice and support you need to achieve your goals are:

Step One: **Articulate your vision.**

Step Two: **Find your lifeline relationships.**

Step Three: **Practice the art of the long slow dinner.** Practice how to turn those potential advisors into friendships and, hopefully, lifeline relationships that you can depend on.

Step Four: **Broaden your goal-setting strategy.**

Step Five: **Create your Personal Success Wheel.** This is the overall game plan behind your life strategy.

Step Six: **Learn to fight!**

Step Seven: **Diagnose your weaknesses.**

Step Eight: **Commit to improvement.**

Step Nine: **Fake it till you make it, then make it stick.**

Step One: Articulate Your Vision

One of our greatest "sins" is not maximizing the potential each one of us has, not fully using the talents and abilities we've been given. What prevents so many of us from making the most of that one shot at life is a failure to look deep inside ourselves to figure out who we are, where we are or what we want out of life.

You may not know right now what direction you want to go in. If you don't know what you're striving

to achieve, or the ways you want to grow and improve, you're less likely to find those who can help you on your journey.

Step Two: Find Your Lifeline Relationships

If you really want to leap ahead in your professional or personal development, you probably need to widen your circle. Your friends, colleagues, and family members may love you unconditionally, but they may lack the knowledge or experience to help you at work or in your personal life. Your ultimate goal in finding people who can help you change your life is to bring people on board with whom you can build trusted lifeline relationships. The support you are looking for from your advisors requires the 4 C's: commitment, comprehension (aka Know-How), chemistry and curiosity. And, there's one additional criterion: "diversity."

Step Three: Practice the Art of the Long Slow Dinner

One of the best tools for deepening a relationship is the "long slow dinner" named in honor of Greg Seal, who proposed just such a meal when first contacted for his help. Seal has always understood that getting people out of their daily environment and away from distractions is crucial to establishing a closer relationship based on genuine understanding.

"The essence of a long slow dinner is to build trust, openness and vulnerability," says Seal, "so that you can get the real stuff on the table and all the agendas off the table. A long slow dinner provides an intimacy that eliminates pretension, and allows the participants to look into each other's souls and share the truth. Only in truth can you put in place an action plan that's going to be successful."

Don't leave a long slow dinner without setting up another time to touch base or get together. This is an important step in making the process a success. Touch base with support partners regularly.

Step Four: Broaden Your Goal-Setting Strategy

Realize that with goal setting, as with everything else, two or more heads are better than one. Think of goal setting as a strategic plan for You, Inc. Take a personal lesson from the best companies, who know they need a team to figure out where they're going — no one person can do it alone. Great companies have always had strategic planning processes that include insiders, outsiders, market researchers and more. You should, too!

Create a 'Press Release' for Your Goals

Just the process of communicating your goals to your support partners, or really anyone else, can help you to achieve them. Sharing your goals with others forces you to clarify your vision. Your support partners will be able to spot flaws in your plan that you may have missed. And, communicating your goals isn't just about telling others what you're going to achieve — it's about telling yourself, over and over again, until you believe it.

Step Five: Create Your Personal Success Wheel

Having a solid grasp on your long-term goals is worth taking time to sort out. First, establish a combination of learning and performance goals that you want to achieve across seven sectors of your life: personal, professional, financial, wellness, intellectual, spiritual and giving back. Visually, this can be represented by the Personal Success Wheel. The elements aren't individual territories or fiefdoms. They should, and will, overlap. Your goals are simply a part of your schedule.

Personal Success Wheel from page 163 of *Who's Got Your Back*

The Who Factor

Next, come up with a list of people who are integral to helping you achieve your goals. This final element —

the "who factor" — is critical. And so few people do it. In fact, this is where even big companies miss out in their strategic planning process.

Step Six: Learn to Fight

When trusted partners get together to refine and debate goals, it is *sparring*. What is meant by that? Well, it's not an all-out competition; there's no winner or loser. Sparring is a vitally important exercise, one that's much more intense (and productive in achieving a specific goal) than a conversational long slow dinner. And while the back-and-forth of sparring can get heated, the give-and-take among you and your advisors is all about improvement and learning, changing and growing.

The Four R's of Listening

Much of successful sparring is really about listening. (Most people are better talkers than they are listeners.) Dr. Mark Goulston, a hostage negotiator and author, describes the way we listen in four different ways, which he calls the Four R's: removed, reactive, responsible and receptive.

- *Removed listening* is the kind of listening you do when you're actually engaged in something else, like using your BlackBerry.
- *Reactive listening* is when you're being somewhat more attentive.
- *Responsible listening* takes place when you not only react to what is said but reply with a further action or elaboration.
- *Receptive listening* is the deepest form of listening. This is the level of listening we all want to achieve in sparring.

Step Seven: Diagnose Your Weaknesses

We all have self-defeating behaviors that get in the way of our success. We also tend to fall back on them at the worst possible high-stress times, even though we know those behaviors or habits are bad for us.

By now, everyone knows that the first step to recovery is admitting we have a problem; once we do that, we can never fully go back to that same harmful behavior. Over time, we'll likely find the courage and ability to face and deal with it. But refusing to acknowledge a problem allows it to fester inside — and allows it to continue to control us.

What if you have more than one behavioral issue at a time to work on? Well, of course you do. We all do. So where should you start? Just pick one. It doesn't matter what you choose; the point is that when you go through this once and see the benefits, you'll have a great new tool at your disposal, and you'll pick another, then another, and on and on endlessly.

Step Eight: Commit to Improvement

The voluntary meaning of commitment — that is, committing ourselves by our own free will to some course of action or belief — is fairly modern. But the lingering sense of commitment as something that's involuntarily thrust upon us helps explain why the word still triggers a lot of negative emotion.

What is the upside of making a commitment?

1. First, it is enormously liberating. It takes a supernatural courage and conviction to commit to changing yourself.
2. Once you make a public commitment, there's no turning back. By committing publicly, you're far more likely to follow through on your promises.
3. Making a public commitment is one of the fastest ways to build intimacy with others.

Step Nine: Fake It Till You Make It — Then Make It Stick

The key to sustainability is contained in the word "daily." One of the big reasons for the success of twelve-step programs is that they talk about taking things one day at a time. Focusing on taking those small steps every day is a guiding principle of many self-help organizations and religions. In fact, focusing on what you can do right now is one of the most effective ways you and your trusted advisors can sustain change.

Twelve-step programs have a saying: "Fake it till you make it." In other words, try changing your behavior with the support of others even if you aren't ready to change your beliefs.

Faking Your Way to Mutual Support

But how does "Fake it till you make it" relate to mutual support? Enlist your advisors to help you "fake" your new behaviors. Take the necessary steps, even if you aren't yet convinced they will be effective.

Once, the members of the Billionaires' Club went out house-shopping in Beverly Hills for the sort of multimillion-dollar estates that only the truly rich can afford. They went to open houses and toured the marble foyers,

terraced gardens, apartment-sized closets, grand staircases and horizon pools. The point was to experience the rewards of what genuine wealth building could yield. They were faking it. But what a great idea!

SECTION FOUR: MAKE IT YOUR LIFE

According to a 2004 study conducted by Dun & Bradstreet for the executive support group Vistage, companies whose management joined Vistage almost tripled their rate of revenue growth within two years. "At Vistage, we help our members figure out what to do and then hold them accountable for doing it," says Rafael Pastor, chairman and CEO of Vistage.

At Ferrazzi Greenlight, they have seen astonishing results among their clients as well. At one of the world's most important global electronics and engineering companies, they decreased turnover by 30 percent among the 1,000 high-performing leaders in their training program. That training focused on creating cross-divisional peer support groups — what they now call Greenlight Groups.

There is a School for Every Fish in the Sea

There are countless existing peer support organizations, each with its own membership requirements and fees, that can relieve you of the burden of starting your own group from scratch. On the upside, getting started is easier, you'll be introduced to some amazing new people who are prescreened for their experience, and trained moderators will facilitate the experience and make sure that everything runs smoothly.

Do It Yourself

Starting your own formal support group is a lot like starting a company: you need "customers," a viable "product" and a way to connect the two to each other. You'll have concerns about loyalty, sustainability and management. One major difference (to carry the analogy further) is that you'll take your formal support group "public" right off the bat — that is, it will belong to all its members, no matter who started it. You're only the leader until you've added a second member.

Recruiting 101

Recruitment is a team sport. As soon as you add one member, the group is owned 50/50 by you and that other person. As you add more, ownership keeps subdividing equally. You don't have the right to any special pride or place as the founder. The group pursues growth and contributes to the growth of others, and everyone has an equal opportunity to lead in a powerful way.

Transforming the Workplace

You can choose to experience peer support with your colleagues, whether it's through a grassroots Greenlight Group, a functional team you work with every day or a special group brought together for a big project. You can start it with a new team or an old one. Sure, older ones have deeper prejudices to cut through. But the point is that your relationship going forward is always a choice. You can even do it — and, in fact, should do it — when there's a history of hostility among prospective members.

Lifeline Relationships Within the Corporation: What You're Working Toward

High-performance teams are a central driver of bottom-line success. Meanwhile, research tells us that strong relationships drive high-performance teams.

In a study published in 2007 in the *Harvard Business Review*, researchers statistically evaluated characteristics of 55 global teams at 15 firms, finding that the most successful have strong social bonds, formal initiatives to strengthen relationships and leaders who build strong relationships with their teams.

The Greenlight Method

At Ferrazzi Greenlight, they've created a systematic approach to building peer-supported teams within companies. The process is fairly similar to the creation of grassroots Greenlight Groups. But unlike grassroots groups, a trained moderator or an exceptional leader is critical. Why? A business team's members typically don't join of their own accord. And team members often come to the group with substantial prejudices or biases toward one another, particularly when the team cuts across departments.

Step One: **Make the case.** Whether your own team is newly formed or has worked together for years, the first step is to instill a belief in the potential promises of teamwork and peer support.

Step Two: **Raise the stakes.** Once you've opened your team up to the idea of peer support, help them articulate a vision of success.

Step Three: **Bond over the barbarians at the gate.** Clarify the external challenge for your people, and you'll be able to more quickly bring the team

together, change its mandate or rally the troops around a new leader.

Step Four: **Dial up the intimacy.** The key question to pose to your own team is this: What struggle from your past has most influenced who you are today?

Step Five: **Dig deeper in the now.** In the early stages of candor, the facilitator might need to act as the Yoda, speaking up when people are acting outside of the group's promises and principles.

Step Six: **Get candid.** What's needed is a safety net: the emotional security of knowing that speaking your mind won't destroy a relationship; the knowledge that straight talk won't hurt your career.

It's important to avoid turning team cohesion work into isolated "people stuff" meetings. You need to pick business issues with strong potential for group collaboration and then address them. "No one fails" sums up the tandem traits of generosity and accountability that a high-performing team requires — the accountability that comes not because someone kept checking in to ask, "Did you get that done yet?" but because there are deep social bonds, mutual support and widespread tell-it-like-it-is candor.

Pay it Forward and Keep it Going

In the middle of the most complex integration their industry had ever seen, the Thomson Reuters Markets leadership team agreed to continue their work on peer support, dedicating a formal three-hour part of their monthly senior meeting to the topic, and checking in between sessions, via teleconference, within their smaller groups. They made certain that the work of these meetings cascaded throughout the company by having everyone commit to taking the work to their own teams — then giving those teams the mission to do the same. That way, the work at the core would transform the entire company, from management to marketing to global sales — and, ultimately, to clients.

Today, the folks at Thomson Reuters know exactly who's got their back. And that has made all the difference in the world. ●

Never Sell Alone (For Salespeople Only)

Sales can be lonely. And that's exactly why the traditional model for sales — a lone guy, bag in hand, pounding the pavement or dialing for dollars — is radically insufficient for today's competitive, commoditized global marketplace; for that matter, it never really worked.

Mobile workforces, home offices, Con-Calls, voice mails, e-mails and text messages have replaced the regional office. At the same time, more and more products have become commodities; despite what everybody says, there's very little differentiation in the marketplace. And when you try to sell what differentiation you have, the client's eyes glaze over.

In essence, the salesperson these days is being asked to be a super-high-level strategist who can talk up and down the food chain with total aplomb. For some, it means becoming an entirely new animal.

We are entering a new era with new rules, where the road map to sales success has changed — an era where team selling isn't just a nice idea, it's becoming a pathway to survival.

Communication is Critical

In team selling, you have to get over the idea that the time spent holding meetings is time out of the field — time that could be used selling. With sales teams, there's no room for flexibility around weekly meetings; they must be a priority — no ifs, ands or buts. You'll need daily check-ins, too. Yes, it takes commitment, and you'll have to shift from a lone-wolf mentality to being a fully accountable teammate. ●

Coda: Escape Silo Nation

Work defines much of our lives. Regardless of whether and to what degree business is ultimately regulated, deregulated, taxed, controlled or allowed to run free, each of us has power to change the way the system works by investing ourselves and our co-workers in the notion of "one for all and all for one." From the corner store to the multinational conglomerate, it's time we have each other's backs. ●

RECOMMENDED READING LIST

If you liked *Who's Got Your Back,* you'll also like:

1. ***Never Eat Alone* by Keith Ferrazzi and Tahl Raz.** This book makes an excellent companion to *Who's Got Your Back* and features Ferrazzi's advice on relationship-building.
2. ***Great Business Teams* by Howard M. Guttman.** Guttman offers practical ways to develop high-performance teams in your organization. He offers insight into the dynamics of successful adaptation of a new horizontal model of team structure.
3. ***Leading at a Higher Level* by Ken Blanchard.** Blanchard has spent more than 25 years helping leaders attain a level of greatness. This book is the distillation of his quarter-century of experience.

Energize Your Organization from Top to Bottom

SUPERMOTIVATION

By Dean R. Spitzer

INSIDE

Eliminating Demotivators	2
Turning Desires into Motivation	3
SuperMotivating Production	4
SuperMotivating Planning	4
SuperMotivating Communication	5
SuperMotivating Training	6
SuperMotivating Evaluation	7
SuperMotivating Recognition and Rewards	8

THE SUMMARY IN BRIEF

No matter what you do, it seems, your employees do only what's absolutely necessary to get along. You've handed out raises across the board year after year. You've been as generous as you can be with various incentives. Now you're at your wits' end. You ask in frustration, "What will it take to motivate my employees?"

The answer is not in the workers, but in your organization.

Employee motivation is usually treated as a problem of the individual worker. Motivation programs and initiatives try to inspire employees to work harder, but they do nothing about the work conditions that continue to demotivate those same employees.

The result: As many as 50 percent of workers recently surveyed said they only put enough effort into their work to hold onto their jobs. And 84 percent said they could work better — if they wanted to.

If you want to buck these statistics, says author Dean Spitzer, don't try to fix your workers. Fix your company.

Discover the flaws in your organizational systems that are demotivating your employees and eliminate them. For example, if your reward systems reward speed over safety, then your employees aren't motivated to work safely. Eliminate unclear or conflicting expectations.

At the same time, add elements that motivate your employees. Delegating authority, for example, is a motivator.

In this summary, you will learn which demotivators to reduce and which motivators to add. From planning and production to evaluation and compensation, you'll learn how to build self-sustaining, long-term motivation throughout your organization.

Any motivation program, such as an inspiring speaker, can create an instant surge of motivation. But it soon dissipates. SuperMotivation takes a different approach. It creates a work structure that naturally leads employees to be — and remain — motivated.

Here's how you can do the same for your company.

I'd Rather Be Golfing

When you play golf, you spend half a day of your leisure time walking long distances just to hit a tiny ball into a little hole — again and again.

Doesn't sound very motivating.

What makes golf exciting is the *context* that surrounds the admittedly boring *task* of hitting a ball into a hole. Contextual factors include variety (different strokes, different terrain), competition, scorekeeping, challenge, social interaction, exercise, etc.

Work, like golf, is more than a single task or even a series of tasks. It is also surrounded by contextual factors, including interaction with co-workers and supervisors, the physical workplace, equipment, rules and regulations, training, and rewards.

As with golf, these contextual factors make the tasks at work motivating — or demotivating.

Imagine, for example, that golf was designed like a typical work task. Your assignment is to drive the ball off the twelfth tee. That's all you do, over and over again. And you're told exactly how, when, and where you are supposed to hit the ball.

Not very motivating, is it?

Identify and Eliminate Demotivators

Demotivators are the negative conditions surrounding tasks that decrease employee motivation.

The first step in creating the SuperMotivating organization is to rid your company of demotivators.

In most cases, demotivators don't result from explicit wrongdoing by the company. Instead, they are the result of normal operating practices whose negative influence on workers' motivation is unnoticed — or underestimated.

Common Work Demotivators

- *Office politics.* Why work hard when politics, not performance, is what gets you ahead?
- *Unclear expectations.* For example, don't push for speed at all costs, then demand quality.
- *Unnecessary rules.* Don't prohibit talking, for example, when talking doesn't hinder performance.
- *Poorly designed work processes.* Divide the process into boring, repetitious work, and you'll get bored, demotivated workers.
- *Unproductive meetings.* Forcing employees to waste time in useless meetings won't push them to be more efficient back on the job.
- *Lack of follow-up.* Flavor-of-the-month programs excite nobody.
- *Constant change.* A habit of last-minute changes will erode the patience of even the most motivated of employees.
- *Internal competition.* Internal competition is not healthy. It creates a mentality of us vs. them.
- *Dishonesty.*
- *Hypocrisy.*
- *Withholding information.* Employees who aren't trusted, or who are lied to, aren't inspired to work harder for the company.
- *Discouraging responses.* Naysayers in management eventually kill the drive to initiate.
- *Criticism.* Criticism is never constructive. Value mistakes, for in them lie the seeds of success.
- *Underutilization.* Idle workers lose drive and motivation.
- *Tolerating poor performance.* Other employees will ask: Why bother to perform well?
- *Being taken for granted.* Employees will make the extra effort if you show you appreciate it.
- *Overcontrol.* Don't treat employees like children or dummies and expect them to be responsible.
- *Unfairness.* Employees may not say anything, but productivity will take a dive.
- *Being forced to do poor quality work.*☆

Turn Desires into Self-Motivation

Traditionally, work motivation has depended on external rewards such as pay and promotions.

As a result, employees have become conditioned to wait for external incentives or threats before taking action.

External motivation is, however, temporary, depending on the potency of the reward or threat.

To foster long-term, sustained motivation, organizations must inspire employees to draw their motivation from inside rather than outside. They must push their employees to be self-motivated rather than externally motivated.

The Eight Desires

The key to self-motivation is tapping the eight human desires shared by all of us. From these eight desires will emerge the *motivators* — the work conditions that motivate employees (see chart at right).

1. Desire for activity. People want to be active and involved.

In our personal lives, most people avoid boredom and monotony. Yet at work, employees are expected to accept boring, repetitious, monotonous jobs happily.

2. Desire for ownership. Owning things makes people feel better about themselves. Psychological ownership is even more important than physical ownership. Employees want to psychologically "own" their work. They want input into their work and want to feel responsible for their jobs.

3. Desire for power. People want to control their destiny. They don't want to feel powerless over external forces shaping their lives.

Traditionally, employees have been helpless in the face of rigid, top-down, control organizations. Today, more and more, employees are demanding their freedom back.

4. Desire for affiliation. People are social creatures. They like to interact and socialize with one another. While the degree of sociability varies, almost everyone desires some sort of affiliation.

Social support and helping relationships are among the many benefits provided by work.

5. Desire for competence. Competence is at the core of self-esteem. People welcome opportunities to feel more competent. Work can provide those opportunities.

6. Desire for achievement. People want to accomplish something, to succeed at something.

Under the right conditions, employees will be willing to work hard and overcome obstacles to achieve a goal.

7. Desire for recognition. People want to feel appreciated by others, to be positively recognized for their merits. Recognition is a powerful force that managers can use to unleash energy and motivation.

8. Desire for meaning. People want a reason to do something. They want to feel that their efforts, however humble, are making a difference.☆

The Next Step

The chart below shows the motivators inspired by the eight human desires.

On the following pages of this summary, we will look in more detail at how you can add these motivators to the production, planning, communication, training, evaluation, and rewards systems in your company.

By adding these motivators, and removing the demotivators discussed on page two, you will transform your company into a SuperMotivating organization.

DESIRES	MOTIVATORS
Activity	Make work more active.
	Build fun into work.
	Add variety to work.
	Ask for employee input.
Ownership	Give employees a stake in the firm's success.
	Let employees make choices more often.
Power	Give employees responsibility for their work.
	Provide leadership opportunities.
Affiliation	Offer opportunities to socialize.
	Use the power of teamwork.
Competence	Use employees' hidden strengths.
	Provide learning opportunities.
	Tolerate mistakes.
Achievement	Provide objective performance measures.
	Let employees set goals for themselves.
	Encourage employees to improve.
	Challenge employees to stretch their limits.
Recognition	Encourage employees.
	Show your appreciation.
Meaning	Show workers the significance of their work.

Reengineer Processes to Motivate Workers

Transforming production processes is currently a leading concern of managers worldwide. Companies are launching reengineering initiatives to redesign the production processes and make them more efficient.

But processes must also be redesigned to make them more motivating. Traditional production systems, which treat employees as cogs in a machine, have been notoriously demotivating. Employees are little more than robots, simply doing an assigned task over and over.

Break with Tradition

Motivating employees means breaking from the employee-as-cog tradition. Encourage employees to be active, think and take initiatives, and enjoy their work.

Here are some ways to make this happen:

- *Keep employees productively busy.* In motivating organizations, employees should leave work feeling that they accomplished something worthwhile. Don't allow them to be passive.

Instead of letting them wait for assignments, for example, encourage them to use downtime to carry out self-improvement activities or ways to improve their jobs.

- *Make work fun.* SuperMotivating production systems encourage employees to have productive fun. For example, let employees jazz up the physical environment with personal decorations. Chances are productivity will go up.
- *Make variety a way of life.* Job rotations, job sharing, and temporary work assignments are some of the ways to add variety.
- *Let employees make more choices.* For example, let them choose work schedules, break times, special projects, or training.
- *Maximize employee input.* Employees are a great source of ideas. And they will be committed to a company willing to listen to them.
- *Encourage productive social interaction.* Interaction enhances communication and cooperation.
- *Encourage teamwork.* Working on teams motivates all members.
- *Encourage self-measurement.* Use performance measurement positively to encourage, facilitate, and guide — not to control, punish, or find fault. Allow employees to measure their own performance. It's the surest way of showing that the system is there to help them, not to "get" them.
- *Create a climate of appreciation.* Most traditional production systems provide a low level of positive recognition. Well thought out expressions of appreciation are powerful motivators.☆

Rule Number One: Just Think

Delegating responsibility and authority is one of the fundamental ways to motivate employees. With more responsibility and authority, employees will begin to act more like owners.

More and more organizations are giving greater freedom to employees to take initiatives and make decisions.

For example, at one large manufacturer, employees have taken on traditional staff responsibilities for scheduling, quality, safety, hiring, and training.

More informally, a department store chain tells its employees: "Rule number one is to use your good judgment in all situations; there are no additional rules."

Involve Employees in Planning

Traditionally, management does the planning while employees are simply asked to implement what management has planned. This separation between "thinkers" and "doers" is demotivating to non-management employees.

SuperMotivating planning systems involve all employees — from executive suite to shop floor — in both strategic and operational planning. This is a radical change from the past, and not always easily accepted by managers or employees.

Basic Steps

Here are some basic steps to involve employees in planning.

- *Maximize opportunities for employee input in planning.* This is not only motivating to the worker, but it also helps the company. Workers are often more knowledgeable about many of the technical aspects of their own work processes than most supervisors. And they are are often closer to the customer.
- *Start small.* Phase in employee involvement. Start them off as technical consultants and eventually involve them in complex strategic and operational planning.
- *Involve employees in goal-setting.* Employees will be much more committed to goals set by themselves.
- *Don't forget strategic planning.* Employees may be technical experts, but they will also have ideas on the big questions: Who are our customers? What are our strengths and weaknesses? How can we improve our long-term performance?
- *Provide recognition for planning efforts.* Let your employees know: "You are making a major contribution to the organization."

Involving employees in planning shows the company's respect for their skills, encourages employees to increase their contributions to the company, and gives them an ownership stake in what they will be asked to do in the future. The "doers" will do things better than ever before.☆

Communicate Openly and Positively

In most employee-attitude surveys, one of the most common concerns employees have is lack of communication.

In fact, lack of communication is a root cause of half of the demotivators listed on page two — and indirectly related to the other half. How employees perceive, and feel about, communication in their organization plays a large part in the motivational climate.

Communication done right, therefore, is one of management's key motivational tools.

Open Communication

When you're on an airplane and it encounters turbulence, or if the flight is delayed, you want to know why. Not knowing the whole story makes you nervous.

Employees also want to know what is causing the bumpy rides in their organizations. What people don't understand, they often perceive as a threat.

And if they can't find out what they want to know from you, they'll start looking elsewhere. That's why every organization has a grapevine or rumor mill to compensate for lack of information.

You will defeat the rumor mills and remove perceived threats to employees by communicating as openly as possible.

There is little that you should hold back. Employees want to be, and should be, aware of the company's strategy, goals, sales, costs, profit and loss, etc.

Also communicate frequently and promptly. If something of importance happens, don't wait to tell employees. They'll hear about it through the grapevine, will wonder why they weren't told, and start to distrust your communication.

Bad and Good News

Make a point of sharing the good news. When something good happens in a particular area, let the entire organization know about it.

Employees will be excited about working in a company where so many positive things are happening.

But don't just communicate the good news.

Employees know that the news is not always good. They will assume that you are keeping the bad news to yourselves if they never hear about it.

Once again, they'll lose trust in you.☆

Employee Suggestions: Avoid the Black Hole

One of the outstanding features of Japanese companies is the successful use of employee suggestions. Employee suggestions in some companies can actually number in the millions per year.

The reason that Japanese employees are ready to take the time to make suggestions is that they know their suggestions will be taken seriously.

Nothing is more demotivating than making a suggestion that gets stuck in a "black box" or a "black hole."

There's no use putting a suggestion box on the shop floor if you never implement suggestions. For employees, the suggestion box will only be a constant reminder that when it comes to communication, the company only pretends to listen.

The Trust Bucket

Companies must communicate openly and honestly to their employees — without exception.

Building trust is like filling up a bucket drop by drop.

It takes a lot of time to fill the bucket. However, a single act of dishonesty or perceived dishonesty can overturn the entire bucket and spill out the trust so painfully accumulated.

Interactive Communication Is Key

One-way communication sends an extremely demotivating message. It tells employees that their input is not valued or important.

Just proclaiming that management's "door is always open" is not enough. As one employee told author Spitzer: "Of course this company has an open-door policy. If anyone doesn't like the way things are done, management shows them to the open door."

Management must convince employees that they are truly interested in employee feedback.

For example, schedule regular "rap sessions" or "town meetings" in which senior executives sit down with employees in all areas of the company to discuss employee ideas and concerns.

It's a good idea to draft agendas for these meetings with input from employee participants. This will give employees more ownership in the meeting.

Another idea is to select communication coordinators to improve communications between senior management and departments.

Of course, two-way communication doesn't have to be formalized in meetings or communication-related job positions.

One high-tech company has an e-mail hotline directly to the CEO. This leads to straightforward, informal, "electronic" discussions between the CEO and his employees.

And one airline chief executive arrives at work each morning by 7:15 A.M. He spends the next hour in the flight-operations area talking informally with pilots and flight attendants before heading into his office.☆

Show Your Commitment to Training

More and more companies realize that ignorance is more expensive than training. They are ready to invest time and money ($50 billion per year in the U.S. alone).

Yet this commitment in funds is often not backed up by management attitudes.

For example, many managers underestimate the time and effort needed to learn new skills.

They drop their employees into brief training sessions, then plop them back on the job with unrealistic expectations of improvement. When these expectations aren't met, employers become frustrated and employees discouraged.

Often, managers are outright hostile to training efforts. Instead of encouraging employees to learn, supervisors often view training sessions as interruptions of work.

Employees return to their jobs and find that instead of using new skills they are simply pushed to catch up on the backlog.

Management attitude can be summarized as "OK, you've had your training, now get back to work!"

Under these pressures, employees are, understandably, less motivated to learn new skills.

Motivating Training

To motivate employees, managers have to show that they are committed to their employees' training.

Here's how:

- *Establish a supportive environment for learning.* Learning new skills can be an anxious experience. Managers can help employees learn with strong interpersonal support. Take the time to answer questions, and, most important, never criticize.
- *Schedule adequate time for training.* Training that is rushed is demotivating. It shows that training is an afterthought, not a priority.
- *Provide training just-in-time.* If employees know they will immediately be able to use their new skills, they'll be more motivated to learn.
- *Focus training on core competencies.* Don't let training deteriorate into information dumping provided to employees "just in case" they ever have to know. Focus training on a few core competencies to ensure employees really need what they are learning.
- *Concentrate on developing employees' strengths.* Too many training programs are focused on eliminating weaknesses.

When employees are operating in areas of weakness, they feel incompetent, and all the training in the world won't help much.

Don't try to put square pegs into round holes. Recognize employees' strengths and build these up. Instead of being frustrated at their lack of progress in an area not suited to them, employees will steadily improve their skills.

- *Give employees the time to practice.* Putting employees quickly on the firing line sends a message that their jobs (or training) aren't really that important, so it doesn't matter if they make mistakes.☆

The Privilege of Training

In some companies, training is seen as a punishment. Employees are made to feel they're not good enough at what they do. That's why they need training.

SuperMotivating companies tell employees — through words and behavior — that training is provided because they are valuable to the organization.

One firm requires regular education and training for everyone from the janitor to the CEO. In addition, it rewards top employees with additional education and training of their choice.

Training at this company is not a punishment, but a privilege.

From Training to Job

What happens after training is more important than what happens during it.

First, help employees adapt their newly learned skills to the job. Learning a new skill is motivating. Not using it on the job, or not knowing how to use it, is demotivating.

Group learning helps because employees support each other during the difficult on-the-job application of the new skills.

Follow-up meetings are also important as employees will have questions stemming from their on-the-job experiences with the new skills.

Also, get supervisors involved. One firm asks managers and supervisors to coach employees before and after the training sessions. Employees thus learn how to make their training applicable to the on-the-job requirements.

Ensure Early Success

Design your training so that employees master simple tasks before they go on to the more difficult ones.

Employees using the simple tasks on the job will be encouraged by their success — and motivated to continue the more substantial training ahead.

Self-Assessed Training Requirements

Employees involved in making training decisions that affect them are much more motivated to make the training work.

For example, at the beginning of each year, employees at one company rate their own skills on a self-assessment questionnaire.

Based on this self-assessment, employees, in collaboration with their supervisors, develop an annual training plan.☆

Evaluate the Right Things Objectively

There are two components to employee evaluation: measurement and feedback.

The first step in assuring that evaluations are positive and motivating is to create objective performance measures. No one wants his or her performance to be measured solely on the basis of another person's opinion.

If, on the other hand, objective measurement criteria have been defined, employees clearly understand what is expected of them — and when they are not performing up to expectations. They will thus be ready to accept the results of the evaluations without seeking to blame any failures on management or other factors.

Involve Employees

Involve employees in developing the measures on which they will be evaluated.

They are often in a better position to know which measurements truly reflect the quality of their performance. There's nothing more demotivating than to receive a poor evaluation because of misleading or poor evaluation criteria.

For example, a hotel chain traditionally used two key measures to evaluate reservation-agent productivity: number of calls answered and number of reservations made.

These measures were unpopular with the agents because they did not measure the complexity of the calls, and they even discouraged quality customer service.

When finally asked for their input, the agents suggested a conversion rate (the ratio of number of reservations to calls received.) This, they felt, more adequately measured the quality of their performance on the phones.

Because the new measurement system didn't reveal the number of calls taken, employees were motivated to sell reservations, not just answer calls. And they knew the performance criteria were fair; they could blame only themselves for any lack of performance.

Self-Measurement

The ability to measure and keep track of their own performance also motivates employees. They have a sense of ownership over the evaluation process that pushes them to perform at their highest level.

Self-measurement also demonstrates the trust and esteem of the company, further motivating the employees to live up to that trust.☆

Increase Positive Feedback

One of the major reasons employees view evaluations negatively is because of the feedback such evaluations generate.

If you want to motivate employees and not discourage them, then you must ensure that the evaluation feedback is as positive as possible.

First, encourage and praise your employees frequently. When employees do something right, make sure people know about it.

If employees are doing something wrong, you can still turn normally negative feedback into a positive experience. Here's how:

- Correct employees only when it will help improve their future performance.
- Correct employees' mistakes when they happen, not days, weeks, or months later.
- Give negative feedback in private.
- Focus on the solution, not the problem.
- Close the discussion on a positive note.
- Be sure to recognize progress whenever it occurs.☆

Personal Development, Not Appraisal

Performance appraisal is often demotivating because appraisals are linked to compensation concerns — and sometimes to disciplinary measures.

Even employees that generally perform well will be defensive and fearful about any negative feedback they receive.

The purpose of appraisals is to encourage development, not focus on compensation or discipline.

One company completely reworked its performance appraisal system to reflect an emphasis on development over reward and punishment.

The name of the new program, "Performance Development Process," reflects this new focus. By including the word "process," the company sends another message: that performance appraisal is a continuous exercise and not just a year-end tally.

The Performance Development Process consists of four steps:

1. *Performance planning.* Employees and their supervisors meet at the beginning of each performance period to discuss expectations.

2. *Regular feedback.* Employees receive ongoing, if informal, feedback — on a daily basis if possible, on a weekly basis at minimum.

3. *Interim reviews.* Employees shouldn't have to wait for the end of the year for comprehensive feedback. Interim reviews (weekly, monthly, or quarterly) remove many of the negatives associated with one-shot annual reviews.

4. *Annual reviews.* The company deemphasizes the annual review. Nothing new is included at this stage, which is more of a summary of previous reviews.

Recognition Is More Valuable than Money

Rewards play a pivotal role in how organizations motivate their employees.

However, organizations are increasingly discovering that traditional rewards are becoming more and more costly — and less and less motivating.

Demotivating Rewards

Reward systems include base pay, incentive pay (such as bonuses and commissions), nonmonetary rewards (such as gifts, celebrations, and personal recognition), promotions, and benefits.

Traditionally, organizations have linked the motivating effectiveness of their reward systems to monetary value. The more money involved, the more motivating the reward.

However, there is another part of the reward that is even more motivating than money: the recognition value. The recognition value concerns the emotional impact of the reward on the participant.

For example, if an employee receives an unexpected Christmas bonus of a week's pay as a reward for exceptional performance, the employee will be very pleased. The recognition value is high.

If all employees receive Christmas bonuses every year, they will not be pleased. They will be expecting the bonus, and thus will only be displeased if they don't get it.

The recognition value in this case is low.

Monetary value is irrelevant to recognition value.

> ***I can live for two months on a good compliment.***
>
> ***– Mark Twain***

Employees feel more recognized — and more motivated — when they are the only ones to receive a bonus *week's* pay, than when everyone receives an extra *month's* pay.

Nonmonetary Rewards

The best rewards can have little or no monetary value.

What's important is to show your employees that you genuinely appreciate their specific contributions.

In addition to verbally expressing your appreciation, you can communicate this appreciation in an endless number of nonmonetary ways.

Here are some examples from other companies:

- A supervisor brought a home-cooked meal to his night shift workers in appreciation of their extra efforts during a very stressful period.
- A senior executive installed a special telephone in his office so that purchasing agents could call him directly and tell him about the price concessions that they had won.

The executive thanked them on the phone and followed up with a personal congratulatory note.

- One company gives a stuffed koala bear to employees who contribute significantly to quality improvement.

The company calls it the Koala T. Bear Award.☆

Six Keys to Effective Recognition

1. **Do it often.** Don't keep waiting for something "significant enough" to happen.
2. **Do it promptly.** Late recognition is weak recognition.
3. **Be creative.** Make recognition fun and memorable.
4. **Make it easy for people to do.** Recognition is not always something people feel comfortable doing. Some companies give out pre-printed pads of recognition notes for supervisors to fill in.
5. **Involve all employees.** Recognition isn't the domain only of supervisors. Peers and team members should also be able to recognize their coworkers.
6. **Build it into the system.** Establish a "recognition culture" in your company. For example, giving recognition should be part of the job description of all supervisors — and their bosses. Thus supervisors who take the time to recognize employees will in turn be recognized themselves.

Motivating Paychecks

In future SuperMotivating companies, paychecks will become more motivating as the base pay portion of the salary is reduced and the performance-based portion is increased.

Performance-based pay is already standard for salespeople. But in other jobs, the performance-based portion is minimal.

Here are some performance-based pay options currently available:

- *Performance bonuses.* These bonuses must really be performance-based and not annual entitlements expected by employees.
- *Gainsharing.* The company rewards employees for improvements in the company's performance, for example in productivity, quality, or reducing costs. Reward amounts are based on a predetermined formula.
- *Profit sharing.* Each employee gets a percentage of the company's profits.
- *Employee Stock Ownership Plans.* Employees get company stock. (This option is less motivating because it is long-term and not tied to specific employee contributions.)

Whatever performance-based compensation system you choose, don't neglect the base compensation package. Low or inequitable wages is a major demotivator that no amount of performance-based pay will overcome.☆

THE SUMMARY IN BRIEF

Today, business is global from the moment you create a website. Billions of people around the world can theoretically discover your company, learn about your products and services, and form an opinion of your brand. As a result, the era in which companies focused on just one geography at a time has begun to disappear. Indeed, a growing number of companies today are not only "born digital" but "born global." This trend isn't just good for the companies, either. It has the potential to grow the world's economy overall.

Your company can become global sooner than ever before, which offers tremendous advantages and growth potential for your business. The problem with this new reality is that it can make international expansion even more chaotic and less predictable than before. If you're not careful about refining your expansion strategy, you may enter too many markets, too soon, before your company is ready. In ***Take Your Company Global: The New Rules of International Expansion***, author Nataly Kelly will help you achieve a balanced approach to taking your business global, helping you build new organizational muscles and skills that you will need along the way.

IN THIS SUMMARY, YOU WILL LEARN:

- How to prepare for global growth by aligning strategies
- What localization really means in practice
- How to determine how attractive a market is for your business
- Why a Global-First mindset is a key driver to international expansion

Part One: Prepare for Global Growth

Understand Market Intensification

"Market intensification" is a conscious choice your business makes to go deeper into a market, targeting more local customers, selling more effectively and at a bigger scale, finding the right channels, and further adapting your company's offerings to truly map to local market needs. More and more companies are finding ways to meet customers from many countries where they can all be found initially–online–addressing customers in many markets from the beginning stages of their business.

One major benefit of market intensification is that because it's more continuous, you can more easily adapt and adjust as you need to. You can throttle your speed and invest more or fewer resources in each local market based on factors such as performance, funding availability, and changing economic situations. Overall, under the new rules, you can adjust your international expansion strategy in a more continuous way, one that is more in keeping with today's ever-changing environments.

Today's leading technologies that are modernizing the world tend to be delivered in more continuous ways than in the past. Newer digital offerings that achieve success in today's reality tend to use what is known as a continuous integration model.

When you build things in a continuous way, responding to inputs and customer needs, you need to operate differently. And when you're doing this in multiple markets at once, the need to adjust and pivot in many directions at the same time can feel overwhelming. For this reason, it's impossible to overstate the importance of making sure you truly listen to local customers so that you'll know precisely where you need to flex, in order to make those local market adjustments as continuously as you can.

Here's the bottom line: if you're at a digital business going global quickly, and you need to figure out where to intensify your efforts, make sure to invest in data analysis and local insights by country as early as you can.

Only then can you truly paint a quantitative and qualitative picture of each local market and the opportunity it represents for your business. Otherwise you'll run a major risk of going into too many markets all at once, spreading your resources far too thin to make any real impact in any one market .

Align International Strategy with Corporate Strategy

There are many paths to growing your business, and ultimately, many of them will lead you toward international growth at some point. One or more of the classic paths to growth will form part of a corporate strategy for many businesses. So, at what point does international strategy become a priority?

Many companies take their eye off the international ball in favor of maintaining focus on their other growth strategies. While this is not a bad thing, one risk is that if you don't devote any attention to your international business whatsoever, you might struggle later to align your international strategy with your corporate strategy. At a minimum, you'll want to ensure that your international business does not pose any risk to your broader corporate strategy. In an optimal scenario, you'll want to leverage your international business in order to fuel your overall business growth.

As your business grows, an advanced question you need to ask is how much of your company's growth and your ability to meet your overall revenue targets is dependent on your international business. Basically, you need to know not only what percentage of your revenue comes from international, but how much uplift your international growth is adding to your overall growth rate. This will enable you to forecast future scenarios, so that you can determine whether creating an international strategy should be a priority.

Intensify Local Market Presence

While you can get started with global growth without needing to set up an office and officially enter a new local market, there comes a point where most businesses need to build their company's presence in a local market or they won't be able to scale in that market further.

There are five main triggers that typically cause companies to set up a local office along their international growth journey. On the surface, these triggers might seem to be the same today, in the digital age, as they were many years ago. However they tend to happen now at a different phase of a company's growth, and for different underlying reasons.

All of the reasons for setting up local entities in offices have to do with one core theme–access to talent. Companies usually expand their business outside of their home country to hire people who speak another language, who live in a time zone closer to customers, or are in an economy where the employer's cost will be lower.

When localization is poorly done, your customers can directly suffer, as can your company's relationship with them.

Five Reasons for Setting Up Local Entities and Offices:

1. Proximity to customers
2. Language
3. Time zone
4. Financial
5. Mobility

When a company decides to set up a physical presence in a local office in an international location, they need to create a playbook unique to the culture and business. The list of tasks you create will depend on your company, who does what, and how you decide to go to market in each place, but will include things like being able to actually hire and pay people locally, ensuring compliance with local employment and tax laws, and learning what benefits are attractive to local employees.

Enable Revenue with Localization

The term "localization" is often thrown around in conversations about international expansion, but for many business leaders, localization is an elusive area that isn't covered in management courses or in business school. Yet, it's a vital part of international growth for any company, so it's important for you to know what it means and why it matters for your business.

Localization means adapting an experience for a local market. The ultimate goal of localization is to enable an excellent customer experience for customers in a local market. The degree to which localization is successful depends squarely on several other processes that must occur either before it, or alongside it: translation, internationalization, and globalization.

- Translation means adapting a message, not just words alone, for a local market.
- Internationalization means adapting code, on any web-based or software experience, to enable localization.
- Globalization means adapting the underlying framework, on any web-based or software experience, to work for multiple local markets at the same time.

The customers who pay your company are the ultimate stakeholders that localization and its associated processes all seek to serve. Ensuring they have a delightful experience is imperative. When localization is poorly done, your customers can directly suffer, as can your company's relationship with them.

Localization is a vibrant and thriving profession. While it's a niche and specialized area, localization leaders can prove tremendously helpful to your company as allies, advocates, and key drivers of international growth. To ensure localization is done right, it's important to provide strong functional representation at the highest possible level of leadership that makes sense for your company.

Part Two: Determine Where to Focus

Apply the MARACA Model

There's no doubt that figuring out where to focus can initially be a daunting task. The purpose of the MARACA framework is to clear this fog. It provides a clear, at-a-glance view of the relative value of a given country to your business compared with others, in order to facilitate international strategy decisions and help you prioritize.

The MARACA model is made up of three areas that, in combination, can tell you how attractive a market is for your business at any given point in time. You'll learn more about each of these in the sections that follow. But to start, it's important to understand why you need to look at market attractiveness from these different lenses: market availability (MA), real-time analytics (RA), and customer addressability (CA).

- MA tells you how much opportunity the market offers. It matters because of revenue.
- RA tells you how you are performing in the market. It matters because it indicates traction.
- CA tells you how easily you can address this market. It matters because it impacts timelines.

Many companies find it helpful to turn these different areas of measurement into numbers, so that they can create a score, or ranking, to help prioritize markets. A 10-point scale

works well so that each area of the score–MA, RA, and CA–is worth 10 points. Those points can be broken down into the following key strategies that matter most for businesses, with 20 percent of the total available points available to each, weighted evenly and averaged to yield a score:

- Economy
- Packaging and pricing
- Ease of doing business
- Language
- Local market presence

The goal is not for any market to have a perfect score, but rather to use the score to prioritize markets and timing of intensification efforts, as well as to determine appropriate local market strategies.

Calculate Market Availability

If you hope to expand internationally, you'll want to know how much opportunity awaits. MA is a quantifiable number used to designate the size of opportunity for your business in a given country.

Three primary concepts come into play when calculating CA:

- **Total Addressable Market (TAM):** Number of total potential customers x average selling price
- **Serviceable Addressable Market (SAM):** Number of customers currently able to buy your produce x average selling price
- **Serviceable Obtainable Market (SOM):** Number of customers served currently by your company and competitors x average selling price

You can calculate these and arrive at your MA using internally derived or third-party data. No matter what formula you decide to use, it's important that you focus on a few important principles:

- **Seek data that is trustworthy and reliable, from valid sources.** Do not just resort to online search results. Purchase actual reports if they are available for your industry. If none exist, you'll need to come up with your own estimates.
- **Clarify what MA means for your business.** Make your formula as simple and clear as possible, so that everyone can understand how your market size estimates are derived.
- **Look for data that is geographically consistent.** Many research firms only offer regional estimates, not country-specific ones. You might need to come up with country estimates based on the regional ones.

For purposes of MA, pick the countries that make the most sense for your business. These will usually be the ones with the largest economies–ones where your industry is known to have a solid presence, or ones that your competitors are known to succeed in–and focus on those.

Pick Your Real-Time Analytics

Companies today have the advantage of analytics that are available in real time. Most businesses with a digital model use "funnel" or "flywheel" metrics to represent the various stages of a customer journey or life cycle. If you want to put your local customers at the center of your thinking, view the various stages of their interactions with your company not as static phases they "pass through," but as a more ongoing and continuous motion.

These metrics usually look at a few key areas:

- Attract: marketing
- Engage: sales
- Delight: customer success and retention

Beneath each category of metrics, there are usually many different pieces to look at. Ideally, you should choose only the top metrics in every area, and no more than three or four metrics per function. Once you have identified the top metrics that matter, you will need to calculate them separately for each different country.

Focus and clarity are hugely important for international expansion. Focus on fewer countries initially and look at them separately. Develop a playbook for those, and then apply that playbook to similar countries with adjustments. This will help you avoid spreading your company and its resources way too thin.

Measure Customer Addressability

Your company needs to understand the needs of, develop empathy for, and properly address your customers in a given local market. Barriers to payment are some of the highest risk barriers you need to surpass, because if you don't, potential customers will abandon you during the checkout process or upon signing a contract, simply because you failed to meet their needs at a critical moment: when it's time to pay. But these are not the only things that matter

No matter how big you are, and no matter how far your journey has gone, it's never too late to become a champion of Global-First thinking. . .

when it comes to determining your ability to truly address the needs of your local customers.

Categories to Calculate CA:

- Payment, inducing currency and type
- Product, including pricing and packaging
- Language, including existing proficiency or degree of localization
- Presence in the local market, including local employees, physical office, and partners
- Operations, considering the local market's economic development and ease of doing business

The more geographically and culturally distant a market is from your founding location, the more important it will be to pay close attention to CA in the new local market. Cultural distance barriers between you and your customers can be overcome by changing your internal company culture and the composition of your employees. Make sure you're hiring for international experience and cultural knowledge from the earliest possible phase.

Part Three: Go Global Within

Build a Global-First Culture

If you're an early stage founder or your company is still small, you have a great opportunity to be global from your earliest days and should consider this approach and whether it might work for your business. But if you've already started a company, or you are a business leader at any company, it's not too late to infuse a Global-First mindset into your business. No matter how big you are, and no matter how far your journey has gone, it's never too late to become a champion of Global-First thinking, so you can build it into your culture.

Global-First means creating things with global in mind from the beginning, but unfortunately that isn't enough. That's just the first step.

The next step, and what really makes something Global-First, comes down to (1) the details of how you execute to enable local flexibility, (2) the ability of teams to quickly connect with each other across GEOS, and (3) letting the local leaders make decisions about what is best for their markets, while ensuring they have the resources they need to turn plans into results.

Global-First also means connecting the dots, thinking through all the various pieces of how a given initiative will succeed–or fail–in each market based on a company's ability to connect those internal dots. Global-First not only means thinking globally from the start, but considering how to execute locally too.

Ultimately, make sure you advocate for everyone in your company to think globally, but execute locally. This is a hallmark of Global-First thinking and can make or break the success of your global business.

Amplify Local Customer Voices

By not tuning in early enough to key local markets, many businesses eventually hit a slowdown in growth because they're not listening carefully to their international customers early enough in their market expansion. Use customer insights to fuel your business, so that you can keep growing steadily over time without risk of slowing down.

Using a combination of quantitative and qualitative research is of great importance. Qualitative feedback from local customers is hugely important, but you run the risk of leaning too heavily on one-off anecdotes. Avert this by gathering qualitative input in a structured way. Gather local feedback with a qualitative approach, such as interviewing customers or otherwise capturing their verbatim feedback and then create a way of categorizing and coding this feedback. This moves it from anecdotal to structured qualitative feedback. Ideally you build this into your business so that isn't just a one-off but rather a continued initiative.

On the other side of the spectrum, some companies lean way too much into their data, letting it dictate every move they make. When it comes to local markets, data can be

very misleading. Talking with customers can accelerate learning and show what gaps exist in more tangible terms than just looking at the data alone.

There is no replacement for talking to customers. They will tell you which aspects of your product are appealing to them and which might need more work. Never assume that data gives you the full story, especially if you're using it to drive international expansion decisions. Small decisions early on can snowball, and if you're not careful, they can defocus your team and lead you down paths that ultimately are not the most advantageous.

Build a Globally Equitable Organization

The best motivation for building a global company is that you want your customers to be successful with your company, without geography becoming a barrier that prevents this from happening. Customers are happy to pay a price in exchange for value that they believe is fair. That's where creating an equitable experience comes in.

To ensure that your customers have an equitable experience with your business no matter where they are based, you'll want to strive to make local experiences equitable, but not necessarily identical.

In fact, where many companies go wrong is that they try to enforce a cookie-cutter approach onto all their markets in the name of global leverage but in doing so they miss out on the importance of local adaptations that are required to ensure their customers are equally happy with the value they're receiving in their local market, even if they define and derive that value in different ways.

Here are five guiding global principles your company may want to adopt, from the top down, bottom up, and across every function of your company, along with a mnemonic, GLOBE, to help make it easy for everyone to keep them top of mind:

Geo-agnostic: If you believe your market is the world from day one, you'll think, act, and grow in a way that naturally enables multiple markets.

Linguistically inclusive: Always build things in a way that makes language easy to access, understand, and ideally, localize.

Operationalized: Everything you do should be done in a way that supports international expansion and does not create blockers for your international customers.

Balanced: You have a fiduciary responsibility to your employees, shareholders or investors, and ultimately your customers. Make sound choices that won't destabilize your business.

Empathetic: Understand your customers' perspective and know what it's like to walk in their shoes.

Hire for International Knowledge

You can fast track some of the organizational learning–and minimize the global growing pains–if you hire the right types of employees from the earliest possible stage. The sooner you do this, the faster your company will evolve into a global business.

Start by prioritizing international experience, ideally as part of the hiring process, and your company will naturally have a strong global mindset built into its DNA. Here are some of the main categories of people you may want to consider hiring as early as you can to ensure you have less friction taking your company global when you decide to do so.

- Immigrants and refugees
- Children of immigrants
- Workers who speak other languages
- Employees with international work backgrounds
- People who demonstrate global curiosity

Multimarket is the New Multinational

International expansion is no longer reserved just for a special league or class of companies. Taking a company global can be accessible to anyone who wants to do it. Going global, quite simply, is something available and achievable for every entrepreneur, every business, every company who seeks customers and other markets.

You don't need to be a multinational to go global these days. What you do need is to have a multimarket mindset. Solve for more markets, sooner, to enable your company to go faster in more markets later on. By adopting this mindset and making it part of the way you operate, you'll build a business that can intensify your presence in more places when you decide to do so.

If you can't access or hire people with specialist knowledge and international growth right now, don't despair or think that you can't build a global company without this type of expertise. The hunger and drive to go global is often more important than any other factor in making international expansion actually happen.

Don't underestimate your organization's capability to learn what it takes to be a global success directly, by listening to your customers first. This is more powerful than what any international business specialist can tell you and in fact, if they are good, it's one of the first things they'll advise you to do. It's fine to hire people to help you with this, and it can put you on the fast track for expansion. But just know that this isn't your only option.

Remember that as a founder, entrepreneur, or business leader, you are operating from a special position. You already know your business and customers, and that is the foundation upon which all global success is built. Taking your business global is simply a matter of knowing a wider range of your customers and understanding how to adapt to reach more of them in new local markets. The key is to have a mindset of curiosity and an expectation that every market will have different needs to some degree.

Nataly Kelly is a seasoned business leader, international business expert, and longtime Harvard Business Review contributor on the topic of global business who is dedicated to empowering business leaders to strategically expand internationally. She is currently Chief Growth Officer at Rebrandly, a global software firm with customers in more than 100 countries. Previously, Kelly served at HubSpot as Vice President of Marketing, Vice President of International Operations and Strategy, and Vice President of Localization, where she helped drive international expansion.

Taking People with You

The Only Way to Make BIG Things Happen

by David Novak

THE SUMMARY IN BRIEF

David Novak learned long ago that you can't lead a great organization of any size without getting your people aligned, enthusiastic and focused relentlessly on the mission. But how do you do that? There are countless leadership books, but how many will actually help a Taco Bell shift manager, a Fortune 500 CEO, a new entrepreneur or anyone in between?

During his 15 years at Yum! Brands, Novak developed a trademarked program he calls Taking People with You. He spends several weeks each year personally teaching it to thousands of managers around the world. He convinces them that they'll never make big things happen until they learn how to get people on their side. No skill in business is more important. And Yum!'s extraordinary success (at least 13 percent growth for each of the last nine years) proves his point.

Novak knows that managers don't need leadership platitudes or business school theories. In *Taking People with You*, he cuts right to the chase with a step-by-step guide to setting big goals, getting people to work together, blowing past your targets and celebrating after you shock the skeptics. And then doing it again and again until consistent excellence becomes a core element of your culture.

In this book, Novak offers specific tools that will challenge you to reflect on how you're really doing on key aspects of leadership.

Get ready to change the way you think about leadership and, more important, the way you practice it every day.

IN THIS SUMMARY, YOU WILL LEARN:

- How to get inside the heads of your people.
- How to think big.
- How to practice "extraordinary authenticity."
- How to look for good ideas in unexpected places.
- How to choose a can-do mindset.
- Why you should cheer for first downs, not just touchdowns.

Introduction

We all need people to help us along the way. You can go only so far by going it alone. If you want to start a business, if you want a big promotion, if you are developing or launching a new product, if you want your company to move in a new direction, if you want to expand your sales territory, if you want to raise money for a good cause, even if you become the coach of your child's soccer team, which has lost every game so far, and you want to show those kids what it feels like to win, you're going to need people to help you get there. You'll never accomplish anything big if you try to do it alone.

Early in my career, I had an experience that changed how I thought about my own role as a leader and inspired me to accomplish what, for me, is my greatest example of taking people with you. I was working for PepsiCo at the time, making my way up through the ranks, and had recently become head of operations for Pepsi Bottling.

I was at a plant in St. Louis, conducting a 6 a.m. roundtable meeting with a group of route salesmen, when, over coffee and doughnuts, I asked what I thought was a pretty straightforward question about merchandising, which is all about the displays and visibility we get in convenience and grocery stores. I wanted to know what they thought was working and what wasn't. Right away, someone piped up, "Bob is the expert in that area. He can tell you how it's done." Someone else added, "Bob taught me more in one day than I'd learned in two years on the job." Every single person in the room agreed: Bob was the best there was. I looked over at Bob, thinking he must be thrilled by all this praise. Instead, I saw that he had tears running down his face. When I asked him what was wrong, Bob, who had been with the company for more than 40 years and was about to retire in just two weeks, said, "I never knew anyone felt this way about me."

The rest of my visit to the plant went pretty well, but I walked away that day with an uneasy feeling. It was such a shame that Bob had never felt appreciated. It was a missed opportunity for the business, too. We all could have benefited from his expertise and more people could have learned from him. This guy was clearly great at what he did, but who knows how much better he could have been in a workplace that recognized and rewarded his knowledge. I knew that if he felt overlooked and underappreciated, others at the plant did too.

Make It Happen

I've always believed in people, but that experience made me even more determined to be the kind of leader who would never let a person like Bob go through his entire career without being thanked for what he did and encouraged to find out how much more he could do. I wanted the people who worked for me to know that they mattered and I wanted them to enjoy coming to work every day. I also understood that none of this would happen unless I made it happen. It was my job to cast the right shadow of leadership because no one else was going to live up to these principles unless I lived up to them first.

I am now chairman and CEO of Yum! Brands, the world's largest restaurant company and owner of the brands KFC, Pizza Hut and Taco Bell. When I started in this position more than a decade ago, I thought of the Bobs of the world and made it one of my first priorities

to create a recognition culture in which everyone counted and to do it so successfully that our company would become renowned for it. That was no small task, considering we now have more than 1.4 million employees spread out over 117 countries. But while we're far from perfect, it's working. I know it's working, because I get proof of it almost every day. ●

An Insight-Driven Approach to Leading People and Achieving Big Goals

You have to begin by asking yourself three big questions that will drive your approach to leadership and allow you to take people with you. They are:

1. **What's the single biggest thing you can imagine that will grow your business or change your life?**
2. **Who do you need to affect, influence or take with you to be successful?**
3. **What perceptions, habits or beliefs of this target audience do you need to build, change or reinforce to reach your goal?**

Before I ask you to answer these questions, I need to explain the right way to approach them. When Roger Enrico, who was chairman of PepsiCo at the time, first asked me to develop a program on leadership, the request forced me to take a look in the mirror and ask myself what was my key to taking people with me. How, exactly, was I able to get people on the same page and marching toward a goal? I concluded that the core of my leadership success stems from my ability to think like a marketer.

In marketing, if you can get inside the minds of your customers, you have the opportunity to solve their problems for them in a way that can improve your business. You need to have a good understanding of what they're thinking and why they're thinking that way. In order to get people to buy your product, for example, you have to start by gaining insight into what will convince them that they can't or shouldn't live without it. To be a successful leader, one who gets big things done, you need to have the same kind of insight into the minds of those you lead.

Be Relevant

You don't just talk about what you're offering people; you make sure your brand or product is positioned in a way that is relevant to whomever you're trying to influence. This kind of insight-driven thinking works in all kinds of situations. Snickers achieved dramatic growth when it tapped into the consumer mindset that candy bars are not good for you and started touting their brand as "The Snack that Satisfies." Swatch did something similar when, instead of positioning themselves as simply another watch brand, they realized that consumers wanted to use their watches as clothing accessories. Swatch started offering a wide variety of watchbands, and soon their products became a fashion statement. And you may remember how Oldsmobile successfully countered its stodgy image by talking about its new model as "Not your father's Oldsmobile." You get the idea. Knowing how people are thinking gives you the insight you need to reframe your product in a way that gets people on your side. ●

PART ONE: GET YOUR MINDSET RIGHT

Be Your Best Self: Be Yourself, Know Yourself, Grow Yourself

People know and follow the real deal when they see it, those who walk through life on their own terms, who stay true to their beliefs and who don't back down. We can all name people like this, and there's often a pretty broad consensus that such diverse figures as Nelson Mandela, Mahatma Gandhi, Oprah Winfrey, Muhammad Ali and Winston Churchill are (or were) all real deals, which goes to show that authenticity can be demonstrated in many different styles.

I call this having "extraordinary authenticity," which means having the ability to be yourself even in the toughest situations. This requires living with a paradox: To inspire as a leader, you need to know your stuff, but you also need to be able to admit when you don't know stuff. You need to be both confident and vulnerable at the same time.

Allowing yourself to be vulnerable can be hard enough for most of us, but in the business world, the idea of being yourself is further complicated by the fact that it's also important to get along with all sorts of people while staying true to yourself. You obviously can't just say to colleagues or customers, "This is me being myself, take it or leave it." Not if you want to get ahead. Instead, you have to figure out how to be you in a way that broadens your appeal and impact versus turning people off or unnecessarily clashing with company culture. ●

Help Others Be Themselves

As the leader, you have to communicate to everyone you lead how important it is for them to be themselves. Here is some advice:

- **Believe in All People:** Celebrate individuality.
- **Provide Individual Development Plans:** There's no substitute for tailored, constructive feedback.
- **Create a Safe Haven:** Make it easy for people to speak up, share their points of view and express their individuality.
- **Openly Seek Knowledge and Perspective from Others:** Don't wait for people to speak up. Ask them what they know and what they think about your ideas.

Be an Avid Learner: Seek and Build Know-How

One of the most effective things you can do to continue to grow and be your best self is to always be learning. In fact, I believe that being an avid learner is the single biggest thing that separates a good leader from a great one. Someone with a voracious appetite for knowledge is bound to inspire others with their passion and curiosity and can energize an organization by bringing to it new ideas.

I will take good ideas wherever I can find them. In fact, some of the biggest successes of my career have been the result of building on the ideas of others, and I'm not too proud to admit that some of those ideas came directly from competitors. For example, when I went to Pizza Hut to run marketing in 1986, sales were down and the brand hadn't had any successful new products in years. One of the emerging concepts in the industry back then was specialty pizzas, and one of the places that was doing that better than anyone else was California Pizza Kitchen (CPK). They excelled at using known flavor combinations to make unique specialty pizzas, like barbecue chicken pizza, Thai chicken pizza and BLT pizza.

So one day I took my team to Los Angeles and we went to CPK for lunch. We ordered practically every specialty pizza on the menu and really enjoyed them. It was clear they were on to something, but we weren't CPK. Could we make this concept work at Pizza Hut without losing what makes Pizza Hut unique?

At first, we tried a Cajun pizza, but that didn't really hit a home run with our customers. They wanted new menu options, but they didn't really want strange new flavor combinations. Next, we decided on a specialty pizza that gave our customers more of what they already loved. First, was a Meat Lover's Pizza, which was such a hit that it led to our Cheese Lover's Pizza and then to a whole new "Lover's" line that has become a phenomenal success. Our Pepperoni Lover's Pizza, which is just a regular pizza with an extra helping of pepperoni on top, was one of the most successful new products in Pizza Hut history.

This kind of pattern thinking, where you look at what's working for someone else and apply it to your own situation, is one of the best ways to make big things happen for you and your team.

Unleash the Power of People

I believe leadership is a privilege. I also believe deep down in my bones that all people, when given a choice, have an inherent desire to do the right thing, to contribute and to make a positive difference through the work that they do. And I'm absolutely convinced that it's crucial to have this mindset in order to get the most out of the people you work with. As a matter of fact, I believe that there is potential in every person and, as the leader, it's my job to unleash it.

Establishing Trust with Your Team

If you can establish an environment where every single person feels that he or she is part of a team and has a chance to contribute, you've created a situation where people can do great things. To build an environment like this, you have to start with trust.

Reaching out to people and building relationships based on trust might seem like a natural idea, but how do you do it? This is not the sort of thing they typically teach in business school. Below are things you can do to show people that you believe in them and that you care.

1. **Know that people want to contribute:** Start with the right attitude: Realize that 99.9 percent of people come to work every day wanting to do good and try hard. So you have to go to work every day thinking about your people that way and appreciating them for it, not looking to catch the 0.1 percent who want to mess things up or don't act in good faith.
2. **Demonstrate that everyone counts:** It's been shown that the most successful companies have a culture where every person feels valued. No matter what their position, they all know they have a chance to contribute and make a difference.
3. **The more they know, the more they care:** One way to show people you trust in their abilities and intentions is to share what you know.

4. **Ask questions that promote insight:** To find out more about who people are and what they think, one of my favorite questions to ask is, "What would you do if you had my job?"
5. **Take Responsive Action:** Once you've found out what people think, you've got to act on that and show that you've taken them into account. ●

You Have to Believe It Can Be Done

Think for a moment about what you want to accomplish and ask yourself: Do you truly believe you can make it happen?

If the answer to that question is not an immediate and emphatic *yes*, then you have some work to do.

Seeing Success

I wanted to really understand how a person has to think in order to win in any competitive arena, so after touring restaurants in Williamsburg, Va., I stopped in to see Bob Rotella at his house. Bob, one of the world's leading sports psychologists and an expert on peak performance, really drove this point home: "If you think of yourself as able to do something, you probably will do it. If you think of yourself as incapable, you probably won't." But believing that you can succeed is not the same thing as knowing exactly how you're going to get there. It means having faith that you and your people will find a way. If you don't already have the knowledge, you can find it. If you don't already have the resources, you can get them. It means believing that you and your team have the capacity to figure things out. And if you don't believe that, you need to spend some time thinking about why you don't. By fully examining why not, you'll identify barriers to your goal. ●

PART TWO: HAVE A PLAN: STRATEGY, STRUCTURE, CULTURE

Strategy: Tell It Like It Is ... and How It Could Be

My mentor, Andy Pearson, was a master at establishing truth in his business. When he was chairman of our company, there was something he used to say over and over again, like a motto: "See the world the way it really is, not how you wish it to be."

Telling it like it is means more than just presenting the facts; it means showing what they mean — and what they could mean for the future — for your business or for any task you're working on.

Your strategy starts by getting everyone on the same page, but you can't stop there. You can't just tell people how bad things are and then leave them be. You can't even tell them how good things are and then leave them be. You must define reality while also showing people where that reality can take them. Defining reality and creating hope go hand in hand here. As Napoléon Bonaparte once said, "A leader is a dealer in hope." Or put another way by a less controversial figure, the late author and philosopher Sydney Banks, "Never forget that hope is a very important ally that leads to miraculous things."

Creating hope means showing people where the facts in front of them could lead. ●

Strategy: Create a Vision and Personalize It

Once you've defined reality for the people you lead, the next step is to develop a shared vision for where you want to go next. After a meeting with his team during which he had laid out an inspiring view of their future, a KFC franchisee from Tennessee, Charlie Middleton, said to me in his deep baritone, Deputy Dog-like voice, "A road to nowhere is hard to build." What he meant was that it's a lot easier to get somewhere if you know where you're headed. I couldn't agree more. When constructing a plan to achieve your goal, it's essential that you have a clear idea of the end point first, before you start drawing a road map for how to get there.

What do I mean by a vision? It's your idea of what the future will look like when you achieve your Big Goal, what the benefits are, what the outcome or results will be. If you can create a vision for what you want to get done and make it feel relevant to the people you lead, then you're going to be well on your way.

When creating a vision, think about your target audience, the people you have to take with you. You have to create a vision that the people you lead can look at and say:

1. **I understand it.**
2. **I know that my customers, or the people we need to win over, will like it.**
3. **I can get excited about it.**
4. **I can make it happen.**

For example, in 1998, after our spinoff from PepsiCo, I wanted to talk about my vision for where I saw us headed as a new company. When I thought about it (with the help and input of my team, of course), the success of our restaurant brands boiled down to one thing: making people happy. Good food makes people happy. If we can give them a great customer experience

on top of that, they'll be even happier. If we give them value for their money so they can keep a bit more in their pockets, well, that makes people happy too. So the vision we came up with was to "Put a YUM on people's faces around the world."

The vision I set forth satisfied each of the four points above and all of us, from our restaurant workers to our lawyers, could get behind the idea. ●

Strategy: Gain Alignment Every Step of the Way at Every Level

Once you've shared the business realities and your vision with your team, the third part of executing your strategy is to gain alignment. Alignment is hugely important. You can have the best idea in the world, but it won't matter if you can't get people onboard to help you make it happen. If you can't get alignment, your great idea is not an effective idea.

During the past 20 years, I've had the benefit of learning from a number of top-ranked change consultants. What they all have to say about alignment basically boils down to this: You have to make sure people understand three things.

1. **What do you want them to do?**
2. **What's in it for them?**
3. **Are you going to do it too?**

People will get on board with your goal when they understand it, they know what they'll get out of it and when they know that you are as invested in it as they are. Only then will they truly feel accountable for doing their part to make it happen. ●

Structure: Resources, Organization and Process Enable Execution

It's one thing to say you want to do something; it's another thing to get it done. Once you have your strategy for your Big Goal, you have to put structure in place to make it happen. That means having the resources, organization and process you need to execute your strategy. These things together provide a solid framework that drives accountability.

For example, a number of years ago, we wanted to expand our lunch business at Pizza Hut. Customers loved coming into our restaurants for dinner, but they didn't see us as a viable lunch option for three basic reasons: Our pizzas were too big, too expensive and took too long to make. It was the opposite of the quick, easy and affordable fare that most people were looking for when on their lunch hour from work.

To solve these perception problems, we put a dedicated team on a mission to develop the lunch daypart. The first thing the team decided was to launch a 6-inch Personal Pan Pizza at a low price point. That solved two out of the three issues, but then we had to figure out how to ensure that our restaurants would be quick enough for the lunch crowd. So we put a process in place to make sure that customers could eat their lunch and still make it back to work on time. We offered a "five-minute guarantee" and put an hourglass on each table to mark the time. If the wait staff didn't get customers their pizzas before that hourglass ran out, they had to give them a coupon for their next pizza free. Our franchisees, even those who weren't thrilled in the beginning at having to implement a new process in the restaurants, were won over by the results. The promotion was wildly popular with customers and we doubled our lunch business. ●

Culture: Make 'Winning Together' a Big Idea

The final part of your plan is your culture. This is a critical ingredient that many leaders forget to consider. Or they just ignore it. But having the right culture, one that breeds positive energy and success, is crucial not just to the success of your current goal, but to anything you and your team want to accomplish going forward. A great culture is what will allow you to get those hard results and get them consistently.

What is culture? What I'm really talking about here is the work environment. As a leader, what sort of values are you projecting? What kind of atmosphere do you create for your team? Is it one in which people are excited to go to work every day, feel supported and appreciated and know they can grow? There is a big difference between people working toward a goal because they are getting paid to do it versus working together toward a goal because it is a rewarding experience. That difference shows up in the hard results that we all care about.

At Yum! we have come up with a list of How We Win Together principles, which are the foundation of our culture. Such principles should always meet certain criteria:

1. **Are they relevant to your business?**
2. **Do they help make people feel as though they count?**
3. **Do they make your people happy to be working where they are, enough so that**

they'll ask themselves, *Why would I want to work anywhere else?*

4. **Do they inspire your people to satisfy the customer and achieve results?** ●

PART THREE: FOLLOW THROUGH TO GET RESULTS

Market the Change: Be a Bold Ad for Your Big Goal

What makes a good ad good and a bad ad bad? This is something that people in marketing think about all the time, but really, in this day and age, we are exposed to so many advertisements over the course of our lives, we all have a pretty good idea of which ones we like, which ones we don't and why.

Good ads are emotional and memorable. They are relatable and address a need in those they target. They also drive their audience to action, to go out and buy that product. You want to see a good ad again and again.

Bad ads are forgettable. They feel irrelevant or out of touch with their target audience. They don't make clear what they're selling. Sometimes they're even so annoying that they make you want to do the opposite of what they want you to do. You never want to see a bad ad again.

As a leader, do you want to be a good ad or a bad ad?

KFC's founder, Colonel Sanders, understood the importance of being a good ad for his goal. As his chicken became more popular, he and his wife, Claudia, would travel around to different towns and put on Kentucky Fried Chicken demonstrations in local restaurants. But they didn't rely just on the Colonel's tasty chicken recipe to make a good impression. Claudia greeted customers in an antebellum-style dress. And whenever he had the chance, the Colonel himself would come out from the kitchen in his distinctive white suit, which became his trademark, to do "a little coloneling."

You need to market your goal or your initiative in the same dynamic way you would a new product. You need to keep that goal front and center in the minds of your target audience. That means you need to get their attention, convince them of its importance and *keep* convincing them. ●

Understand and Overcome the Barriers to Success

I still believe it's important to have the courage to move forward with intentionality to achieve your Big Goal, but its just as important that you don't do it until you've listened to everyone's concerns and considered all the potential barriers to success.

The thing you *don't* want to do when someone expresses doubts is to plow ahead as if it never happened. But sometimes we do this without even realizing it because we're so sure of ourselves, so sure that we have a good idea. The following is a checklist of what you should do to make sure you really are seeing all sides and considering all valid opinions and objections:

1. **Listen and understand why:** Take each concern seriously and get to the bottom of it.
2. **Incorporate valid objections into your plans:** If you decide that the objections have merit, then it's time to adjust your plan. Doing this may take a bit more time and effort, but the result will be better for it.
3. **Listen, then lead:** After you've heard and considered all the different viewpoints, you can't get paralyzed with indecision. It's up to you, as the leader, to make a decision about what to do next.
4. **Do the right thing and the right thing will happen:** Follow your instincts. If you know you've done right by your team, listening to their concerns and doing your homework on your initiative, then have confidence in your decision. ●

Use Recognition to Drive Performance

If you're doing a good job of measuring your progress and the benchmarks of success are clear, then everyone knows when progress is made, and that gives you the opportunity to celebrate your accomplishments along the way. Celebrations are essential. They are shared experiences that keep people motivated and invested in achieving the ultimate goal.

Years ago, I was watching an AFC championship game between the Cleveland Browns and the Denver Broncos. It was an incredibly cold day made worse by wind and snow, a really difficult atmosphere in which to keep one's spirits up. With just five minutes left on the clock and the Broncos behind by a touchdown, they got the ball on their own 2-yard line. It looked as though they were sure to lose. But then the team, led by Hall of Fame quarterback John Elway, started moving the ball steadily across the field, play by play, first down after first down. They got nine first downs in all before finally scoring a touchdown with just 37 seconds left in regulation play. It was an incredible 98-yard drive to tie the

score and Denver went on to win the game in overtime.

It was an amazing thing to watch, but what caught my attention the most was the way the whole team celebrated each and every one of those first downs. The guys on the sidelines were clapping and cheering the whole way down the field. Research has shown just how important this is too. A recent study of soccer players, for example, found that the team that celebrated goals with the most enthusiasm typically won the game.

It's a great lesson for any leader: Don't wait for the win or until you cross the finish line. ●

The Change Is Never Over

This idea of your work never being over is true for your goal, and it's true for your business overall. As one of my board members, Massimo Ferragamo, said to me once, "If someone says that the changes are over, they are over. I personally believe that every arrival point is a departing point, and you have to always think that way."

Massimo's business is a family business, started by his father, so he's been in a unique position to witness just how true this is over the long term. When he started working in the United States, trying to make his Italian shoe brand popular in a new market, there was really just one major competitor in the ladies' shoe market and one in the men's shoe market. So his team studied every detail of those competitors, from pricing to positioning to incentives given to salespeople. He says, "We went after [those competitors] like they were our target. And the success story was that we beat them both by looking at exactly what they were doing and trying to do it a little bit better."

Focus On Your Big Goal

To drive the change you want, keep your Big Goal front and center in your own mind and in the minds of your target audience. Three ways to keep the focus are:

- **Persistence, persistence, persistence.** It's your job to figure out how to keep the focus on what really matters and not get sidetracked.
- **Relentless communication.** Help keep the focus on your goal by never stopping communication with your people.
- **Play as though you're behind.** You should be going to work every day believing that you'll succeed, but playing as though you're behind in the score. That's the attitude that will give you the best chance at success.

Massimo remembers it as a continual process of improvement to reach that goal, and they never stopped wondering how they could get another extra edge. But now other companies are targeting his and trying to evolve in the same way that it did. Less than a decade ago, no one was selling as many shoes in the United States as Ferragamo, but now the competition has just ballooned. "From being a company that was the leader out of maybe 10 brands, today we have big fights to keep our position out of 70 or 80 brands. So the landscape has changed completely, and we are back in a position that we have to think the same way we were thinking 20 years ago and getting back that No.1 spot." ●

Afterword

I truly believe that taking people with you is *the* job of every leader; it's not something that can be delegated. If you're one person getting big things done, that's pretty good, but it will take you only so far. If you can help a whole team or organization full of people to reach big goals, then there's no telling what you can accomplish together. It's up to you as a leader to make that happen.

As I close, I'm reminded of something I witnessed recently. It was a Saturday and I was reading the paper outside by the pool at my hotel. I looked up and saw a woman stick her toe in the cool water and then very gradually, almost painfully, lower herself in, barely making a current in the pool. Meanwhile, a young kid ran past her and jumped in, cannonball-style. He made a huge splash that got everyone's attention and resulted in ripples that went from one side of the pool to the other.

You have a choice: You can take the lessons you've learned here and dabble with them and probably not make much difference in your life or in others'; or you can jump in with abandon, put these lessons to work and create ripples that will help you and those around you achieve all that you're capable of. I hope you'll choose to be a ripple maker and receive all the joy and results that go with it. ●

How to Find and Fix Team Problems

TEAM TROUBLE-SHOOTER

THE SUMMARY IN BRIEF

There is no denying that organizations are becoming increasingly team-oriented in their approaches to doing business and managing their customer relationships. Accomplishing this, of course, is easier said than done; sometimes teams hit roadblocks that can sabotage their success.

In this summary, Robert W. Barner lays out some of the most common pitfalls for teams, such as conflicts between team members and the team leader, poor relationships between corporate teams and customers, and the inability of a team to anticipate problems.

Specifically, Barner offers the symptoms and then the treatments to help your team overcome challenges in four key areas:

✓ **Improving internal relationships.** Wherever two or more team members are gathered, there's bound to be conflict at some juncture. You must keep minor conflicts within the team from escalating into major ones and proactively address and resolve inevitable leader-member conflict before turning your attention outward.

✓ **Strengthening team focus.** It is important for your team to be able to anticipate challenges and to distinguish changes that threaten the team from those that provide opportunities for growth. It is also important to find and maintain a clear sense of direction, minimize change anxiety and establish focused priorities.

✓ **Dealing with the challenges of change.** Teams that respond to changes with flexibility will be better equipped to face the future than those that are too brittle to be effective. Keeping your team flexible is a major challenge, to be addressed with coordination and innovation.

✓ **Mending external relationships.** Without external partners, such as senior managers and customers, teams would have no reason for being. Yet, among the most contentious of relationships your team will have will be with those two groups. Differences must be addressed and fences mended before too much damage is done.

Are you ready to do some team troubleshooting? Turn the page and get started …

PART I: IMPROVING INTERNAL RELATIONSHIPS

Recognize Problems Within Your Team

It would certainly be a lot easier if we could lead teams as though they were some kind of logical, predictable machine. Unfortunately, that's not the way things work; teams are composed of people — unpredictable, contradictory, sometimes uncooperative people. Pressures to succeed in the team environment are many, and they come from outside the team (in the form of deadlines, productivity standards, etc.) as well as from within (in the form of burnout or the simple inability to forge a common approach to a task or project).

The question you must consider is not whether the members of your team sometimes find themselves enmeshed in conflict; at times, all teams experience internal conflicts. The true question is whether these conflicts are so pervasive and damaging that they could pose a serious obstacle to your team's long-term success.

Signs of Trouble

As team leader, you must not allow yourself to think the burden of resolving conflicts rests solely on your shoulders. In doing this, you are placing yourself in a patronizing, parental position that encourages your team members to abdicate personal responsibility for resolving conflicts — and denies them the chance to develop necessary skills to do otherwise. Your team must learn to detect and avoid potential conflicts and successfully manage those that cannot be prevented.

Some symptoms to look for are:

- **Rapid escalation of minor conflicts**. If relatively small, one-on-one disagreements swiftly expand to engulf other team members, the team leader or senior management, your team has a serious problem that demands prompt attention.
- **Self-imposed isolation.** Some team members may choose isolation in order to remove themselves from conflict situations, causing communication disconnects, work bottlenecks and turf wars.
- **Breakdowns in communication and personal relationships.** When there is little or no quality communication between team members, work processes are interrupted and people tend to look out for their own interests only, as opposed to their team's.
- **Use of intimidation.** Instead of refusing to engage one another, some team members may try to force coworkers to give into their demands by using arguments, veiled threats or other forms of intimidation. These tactics will often result in what looks like agreement, but which ultimately can lead to manipulation or withdrawal of support.
- **Formation of cliques.** Some team members may form alliances with other, strategically positioned coworkers, in order to out-maneuver or overpower opponents, or to isolate them from the rest of the team.

Treating Team Conflicts

While it is certainly true that teams can expect to, at some point, encounter issues that are potential sources of conflict, the things you do to promptly control the situation can make the difference in how the conflict is ultimately resolved, and how much productivity is sacrificed in the process. Consider these methods for treating team conflict:

1. Develop and model guidelines. Set the tone for preventing and resolving conflicts by laying down ground rules for your team members to follow. Some of those ground rules may include the following:

- **No personal attacks.**
- **No heated outbursts.**
- **No backbiting.**
- **Never assume hostile intent.**

Once you and your team have formulated guidelines, model them for the rest of the team, to show that you take the guidelines seriously.

Recognize Problems Within Your Team

(continued from page 2)

2. Identify areas of possible conflict. Map out locations of "organizational quicksand" — issues and areas within your team's objectives and projects where problems are most likely to occur. Once you've identified those areas, invite your team to discuss ways of addressing them.

3. Act immediately to control conflict. When conflicts arise, make an effort to contain them before they spread beyond your control by: reminding team members about the guidelines they developed; meeting with team members involved in conflicts to make sure they're trying to address the issue; and cautioning team members against inflammatory e-mail or voice mail.

4. Recognize agreement as it occurs. Each time your team reaches agreement on a point, summarize it verbally; it's easy for team members in the heat of discussion to forget points on which they've already agreed upon.

5. Perform periodic check-ins. When facilitating a conflict, stop periodically to determine how the team members think the resolution is progressing, and whether they feel their views are being heard. ■

Managing the Virtual Team

While we still tend to think of teams as groups of people occupying the same time and space, factors indigenous to modern business are increasingly causing teams to be constituted at least partially by virtual members — those who communicate via computer, fax, phone and other means, rather than being physically present with the team. Unfortunately, not all work professionals make an easy transition to the unique demands of virtual teams.

Signs of Trouble

If you're leading or participating in a virtual team, the following symptoms may indicate that your work group is experiencing transition trouble:

● **Communication problems.** Virtual teams that have not yet developed solid communication methods often find their decision-making process spotty, sometimes to the point in which they feel the need to go outside the group to get information on the group's internal activities. When this happens, your team is definitely moving toward a chaotic state.

● **Ineffective coordination of internal and external activities.** If effective check-and-control mechanisms are not built into a team's planning process, it is easy for virtual team members to unknowingly duplicate one another's actions, allow tasks to fall through the cracks, or grind to a halt because they don't know how far they can stray from the group's plans without problems occurring.

● **Lack of core identity.** Virtual teams that are also cross-functional sometimes have difficulty defining who constitutes the actual team. In these situations, multiple management layers typically feed into the team's decision-making process, leaving members confused about who reports what to whom. This renders them unable to establish the types of solidarity-building boundaries that build and maintain a team's identity.

Overcoming Challenges of Virtual Teams

When you see in your team effort the symptoms listed above, act quickly to address them by adapting your communication and planning process to the unique challenges encountered by virtual teams. Some suggestions include:

1. Ask your team members to provide input on the following communication issues:

- What communication avenues (for example, phone, videoconferences or face-to-face meetings) would work best for them?
- When can they make themselves available for regularly scheduled e-mail or phone discussions?
- What are the potential obstacles and challenges ahead in working together as a virtual team?

2. Develop ground rules for individual accountability. Work with your team members to generate a list of useful ground rules for keeping project activities on track when members are widely dispersed. Some of these rules may include the following:

- No team member should change milestone dates without first consulting the team leader.
- Determine which team members will keep executive stakeholders updated on team activities.
- Don't tolerate after-hour or weekend "hit and run" e-mails informing you that a portion of the project will not be completed as scheduled.

3. Develop a core team identity. Designate a core team that remains committed to the team throughout its life cycle, with support members (technical and knowledge experts) flowing through as required. ■

Use All Electronic Tools Available

Many team leaders are unfamiliar with electronic tools that can help them manage virtual teams. For example, many e-mail systems feature an electronic prompt that automatically notifies team members of important dates, such as the date of an executive debriefing. Another tool: an electronic whiteboard that displays written information at both ends of a videoconference.

Resolving Conflicts Between Members and Leaders

Even if team members have friendly personal relationships with the team leader, the team may still be headed for a conflict. The reason is that the member-leader relationship is not just based on personal issues, but also on issues such as:

- **how to balance member autonomy with leader control, and**
- **how to balance the need for fast decision making with the desire to achieve team consensus.**

In addition to these pressures, other factors can cause a deterioration in the relationship between a team leader and the members of the team.

Inappropriate leadership style is one such factor. Different leadership styles are suited to different work environments and cultures. For example, a leader who comes from a more formal frame of reference will likely have a difficult time handling employees who are used to a more laid-back management style.

A leaders who comes from a more formal frame of reference will likely have a difficult time handling employees who are used to a more laid-back management style.

Limited accessibility can be another problem. Team members and leaders sometimes have difficulty developing strong relationships because they are separated by geography, work shifts or schedules.

Relationships can also deteriorate because of a *lack of internal alignment.* Team members are not always aligned with their leaders regarding the value or feasibility of business objectives, the relative priorities that should be placed on competing projects, or the performance expectations used for member evaluations.

Signs of Conflict

Here are some signs that a team is headed for a conflict between its members and the leader:

- **The team leader practices micromanagement.**
- **The team leader communicates poorly with the team,** offering insufficient direction or vague instructions (this would be the opposite of the first symptom).
- **The team stress level rises,** which eventually leads to signs of burnout (for example, a low energy level).
- **Team members mistrust the leader,** greeting every suggestion or explanation with skepticism and suspicion.
- **The team acquires an "us versus you" mentality,** as team members no longer consider the leader as part of the team.

Preventing a Deteriorating Relationship

Here are some of the steps you, as a leader, can take to ensure an effective and productive relationship between you and your team members:

1. Recognize the needs of team members — and your needs. As circumstances change, team participants should continually redefine the support and assistance they offer each other. For example, if experienced members join the team or the team takes on a difficult project, the leader must be present and active. On the other

(continued on page 5)

Establishing Leader Expectations

One of the underlying causes of member-leader conflict is that members lack a clear understanding of the leader's performance expectations.

The following are seven performance areas in which a team often has difficulty discerning those expectations:

Work methods. Do your team members understand the work methods and procedures you expect them to follow when completing their jobs or projects?

Time frames. Do you communicate the due dates for completion of projects? How do you determine when dates have slipped, or which completion dates are final and non-negotiable?

Work responsibilities. Does each team member understand his or her role when he or she is assigned to a given job or responsibility?

Customer/supplier interface. Do your team members understand your expectations when dealing with supplier problems or customer complaints or requests? Do they understand how far they should go to build effective relationships with other work groups?

Work priorities. Do your team members understand which jobs take priority, and when those priorities change?

Performance expectations. Do your team members understand what you expect in the way of desired outcomes, what it means to do a good job, and the degree of effort expected to be put into a job?

Resources. Do your team members understand what resources (facilities, support staff, equipment, etc.) have been allocated to perform a job? Do they know how much control they have over resource decisions?

Resolving Conflicts Between Members and Leaders

(continued from page 4)

hand, if work procedures are familiar to the team or the team has built support networks in the organization, the leader can loosen his or her control.

2. Resolve personal conflicts. Act quickly, so that personal conflicts between individual team members do not draw in other neutral members.

3. Identify communication hot spots. For example, do team members believe that you act fairly when assigning choice tasks, allocating work and distributing resources? Find out.

4. Obtain feedback on your leadership style. Leaders are sometimes unwittingly creating problems. Feedback from team members can be an important wake-up call. ■

PART II: STRENGTHENING TEAM FOCUS

Developing Better Foresight

It's not uncommon for teams to run into occasional unanticipated challenges. However, if your team is repeatedly ambushed by unforeseen events, you may need to develop stronger skills in the areas of foresight and planning, and in recognizing significant changes as threats or opportunities.

Teams can be categorized by their ability to anticipate change. *Entrenched* teams live in denial, either ignoring major changes or convincing themselves the change is a temporary aberration. *Reactive* teams are slow to respond to change and usually take action only after the situation is obvious. *Proactive* teams try to get out ahead of change and consider the possible implications of events that are just starting to take place. Finally, *preemptive* teams have long-term vision, scanning the horizon to track trends and changes that affect both their own operations as well as the overall performance of their companies.

Which Type Are You?

Is your team a reactive team, or worse, an entrenched team? Here are some indications that you may have a problem in this area:

- Your team has a difficult time approaching problems or opportunities.
- Your team tends to focus on past situations, rather than the future.
- Your team members are unable to assess the impact of change on your team.

Why Teams Become Entrenched

- **They fail to establish or utilize a sensing array.** Some teams are heavily networked within their industries and thus wind up anticipating key trends in their fields. Others are detached from their industry and lose sight of the bigger picture.
- **They have victim mentalities.** Some teams talk as if they are passive victims of forces beyond their control. Their "woe-is-us" approach eventually renders them less prepared to anticipate change.
- **They resist new information.** Some teams hesitate to share new information that contradicts old information and might be contrary to the team's set objectives.
- **Their planning is static.** Lack of foresight may also be found in teams that formulate thorough plans by considering only a very narrow set of contingencies. Your team must understand that a plan is a living document, which should be continually reexamined in light of changing business conditions.

Improving Foresight

Team members and leaders can improve their team's ability to foresee and handle problems, and to take full advantage of opportunities, by implementing several strategies:

1. Create an early warning system. Help your team prepare for large-scale changes and possible associated problems by tracking emerging trends as well as business and organizational developments that could affect your team's performance.

2. Expose your team to other points of view. Create situations that force team members to question their assumptions about the future. Encourage them to attend meetings at other departments, or invite outside consultants in to troubleshoot team practices and processes.

3. Implement a thorough troubleshooting process. Identify the preventive and corrective actions your team should take to plan for the future, allowing you to shape the outcome or affect the likelihood of an event and manage changes once they are underway. ■

Finding a Sense of Direction

In today's volatile work environment, teams often must juggle hefty loads of projects and accountabilities and deal with internal and external changes — all within the context of a fast-paced organization that is rapidly changing its markets, services and structures.

(continued on page 6)

Finding a Sense of Direction

(continued from page 5)

These undeniably difficult tasks are ameliorated somewhat when the team has targeted long-term goals and clear priorities. On the other hand, when a team tries to function without a sense of long-term direction, the future can appear murky and uncertain.

Symptoms of a Broken Compass

Here are some symptoms that can indicate your team is navigating with a broken compass:

● **Big-picture blur.** If your team members are unable to visualize a scenario for success, they don't understand how their separate day-to-day activities feed into larger team objectives. They cannot respond to questions or address issues that lie outside their immediate field of vision, thereby discouraging team accountability in favor of more compact, personal projects or activities.

● **Excessive dependence on the team leader.** Team members who lack a sense of direction are forced to stop frequently and wait for marching orders, rather than taking the initiative on a task.

If team members feel they are working at cross-purposes, they may push personal objectives at the cost of the team's success.

● **High anxiety.** Because the team's future appears unpredictable and chaotic, members may experience a high degree of stress, anxiety and helplessness in the face of a bewildering future.

● **Conflicting priorities**. If team members feel they are working at cross-purposes, they may push personal objectives at the cost of the team's success, or hesitate to commit themselves to their projects because they don't see how those projects fit into the bigger picture. Because they are torn between these decisions, they tend to achieve very few of their goals.

Establishing a Sense of Direction

To help your team establish a clear direction, consider the following action steps:

● **Create a blueprint.** Get away from your daily routine. Take other members of your team off-site to exchange views on your team's core mission, its long-term vision, and your strategies for attaining success. From that dialogue, construct a four-part blueprint for guiding long term efforts consisting of a team mission statement, a mission document, team objectives, and written criteria for sorting team priorities. Once these elements are in place, your team can audit itself to determine whether projects and activities are aligned with the long-term strategy.

● **Audit performance criteria.** By what criteria does your team track its performance? As a standard rule of thumb, 80 percent of your team's efforts should be focused on no more than three criteria.

● **Create a scenario forecast.** This tool (see box above) encourages your team to think outside the box by trying to anticipate a variety of large-scale changes that could affect your organization and team. It also provides a valuable tool for building alignment among managers on future opportunities and threats, and helps team members better understand how their different assumptions about the future form the basis for team-stopping disagreements. ■

How to Create A Scenario Forecast

1. **Identify influencing factors.** With your team, brainstorm a list of external factors that are likely to shape your company's business environment.
2. **Rate influencing factors.** Rate each factor on a scale of 1 to 10 (with 10 being the highest) in terms of degree of impact (how intensely changes may affect performance) and scope of change (the amount of change the factor is likely to undergo in the next 10 years).
3. **Identify key influencing factors.** Multiply each factor's rating for degree of impact with that for scope of change, and select the two factors with the highest overall scores – these are your key influencing factors.
4. **Create alternative scenarios.** Describe two other possible scenarios for each factor – one optimistic and one pessimistic.
5. **Combine scenarios.** Integrate your scenarios in a combined matrix, creating titles that best describe the combined scenario represented in each cell of the matrix.
6. **Describe each combined scenario.** Create a short summary describing details of each combined scenario.
7. **Assess probability.** Use all available information to assess the relative probability for the occurrence of each combined scenario.
8. **Assess the implications.** Ask team members to jointly identify the implications of the combined scenarios for your business strategy.

PART III: DEALING WITH THE CHALLENGES OF CHANGE

Keep Your Team From Getting Brittle

Teams can react to change with flexibility (brought about by leaders who successfully manage change that they know they cannot control) or they can be brittle, lacking the resilience and tenacity to cope effectively with change. Certainly, within every team the inability to adapt to change reveals itself in many different ways.

Signs of Inflexibility

If your team has experienced the following, it probably lacks flexibility in dealing with change:

- **Anxiety about an unknown future.** While stress is a common factor for all teams, brittle teams exhibit an excessive amount of stress due to their anxiety over an uncertain and possibly threatening future. This anxiety becomes their prevailing, habitual response to any new and demanding situation.

- **Cognitive denial and self-imposed isolation.** Some brittle teams respond to change with a blanket denial, in spite of abundant information that a change will take place. Once the change does occur, they respond to the resulting stress by trying to ignore the process and cutting themselves off from the organizational flow of information. They're like organizational ostriches, their heads buried in the sand.

- **Slow or poorly coordinated response to change.** Members of brittle teams do not take the time to analyze changes, determine the factors behind them, or learn to adapt as a result of them. They are slow to respond to change and, when they do, their responses are weak and ineffective.

- **Active resistance to change.** Members of a brittle team have a difficult time distinguishing between changes that are just beginning to surface (and which, consequently, are most controllable) and those that are under way. Inevitably, the team fails to note (or ignores) an emerging change event until it is bearing down on them, at which point they leap into action and try to resist it — a futile action if ever there was one.

Making Teams More Adaptable

How do you remedy a brittle team? Here are some suggestions.

1. Conduct frequent fire drills. You can't prepare for every eventuality. However, you can help your team develop preventive and corrective actions for events that are highly probable and represent threats or opportunities.

2. Avoid creating unnecessary stress. If you're a type A person, make an effort to reduce your aggressiveness. Otherwise you may appear highly stressed and out of control — and the team, taking its cue from you, will begin to doubt its ability to handle change and adversity.

3. Learn from others who have been there. Most events have been experienced by other organizations. Use their experience whenever possible.

4. Overcome resistance to change. Some of the ways you can reduce resistance is by: building ownership and support; lowering the risk level for change; doing your homework; and choosing the right time and place for your battles. ■

Stuck in a Rut? Learn to Foster Innovation

Chances are, your team has exhausted its problem-solving resources or is overly complacent when it exhibits any or all of the following behaviors:

- **Loss of confidence when addressing new challenges.**
- **Ignorance of cutting-edge technology and work methods.**
- **Redundant actions and humdrum solutions to problems.**
- **Missed opportunities for new business.**
- **Defections from the team.**

Making Your Team More Creative

You can combat these and other limiting behaviors by fostering a spirit of innovation on your team. Among the ways you can accomplish this are the following:

1. Set the stage for creative thinking. Sit down with the members of your team and describe a work function or project that requires their full creative efforts. Let them know you encourage and welcome their ideas by asking to hear more; by recording ideas for later review; by giving everyone the opportunity to contribute; and by holding back on your own input until everyone else has had a chance to speak.

2. Brainstorm, but in a structured manner. When we think of brainstorming, we tend to think of a mighty rush of ideas emanating from team members, with each idea considered equally for review. As an alternative, ask your team to present only a single idea at a time; after multiple ideas have been discussed, see if there's any way to combine or modify certain ideas to create new ideas.

3. Import a fresh pair of eyes. Bring in an outsider — someone who has not been influenced by the team's thinking process — to ask questions that nudge team

(continued on page 8)

Stuck in a Rut? Learn to Foster Innovation

(continued from page 8)

members beyond their problem-solving assumptions. Focus on a problem or challenge facing your team, in order to get everyone to see that circumstance in a new light.

4. Review best practices. As a team, take a look at the best work processes, methods and procedures of world-class organizations, in order to discover those that can be imported into your own company.

5. Ask for more than one solution. Encourage creative thinking by asking for multiple solutions at the start of your discussion; usually the first solution will be routine while subsequent ones will be unique. ■

PART IV: MENDING EXTERNAL RELATIONSHIPS

Improving Relations with Management and Customers

You cannot overestimate the importance of both senior management and customers as factors in a team's success. Senior managers supply essential coaching and guidance for projects, and often have an in-depth understanding of the inner workings of your organization, giving you a big-picture view and even, on occasion, running interference for your team. Customers, on the other hand, are practically your entire reason for existence in business, whether they are internal or external. At the end of the day, the only way you can honestly assess the true value your team brings to the table is by determining whether it is meeting the needs of your customers.

While it's simple to surmise why those relationships are so important, the question of how to improve them is anything but simple. By focusing on the unique needs of each group, certain treatments make themselves apparent.

Senior Management

It is imperative to secure firm senior sponsorship if your team is attempting to implement major projects that are complex, address sensitive work issues, or require resources from other corporate units. The following approaches may prove useful in building that support:

● **Identify senior-level stakeholders.** You need to quickly identify those senior-level managers who are directly responsible for and have the greatest stake in the work your team is doing. These stakeholders may be actively or passively supportive or resistant of your efforts; it is important to determine where they stand, and adjust your team's direction accordingly.

● **Determine potential sources of resistance.** Resistance can come in many forms, and might not always be readily apparent; some people are very forthright about their criticisms, while others are reluctant to do so, or feel their opinions are self-evident. Unless you are able to detect pockets of resistance, you could be facing a few nasty surprises when it's time for your team to implement its objectives.

● **Keep your sponsors informed.** Once you have sponsorship from senior-level management, keep them informed of the issues and challenges facing your team. To do this, you must meet regularly with them; share important correspondence; ensure adequate lead time to support difficult issues; encourage senior managers to troubleshoot with you; and manage your team's relationship with senior management with sensitivity and respect.

Customers

Weak relationships between teams and their customers (whether internal or external) tend to develop from problematic work processes and attitudes — from a failure to understand the effect of a process on customers to downright team arrogance (taking a "we know what's best for you" approach to the relationship). There are just as many approaches for improving customer relationships, including the following:

● **Create opportunities for customer feedback.** Invite customers to your team meetings, and ask customers for permission to attend theirs. Create social gatherings or focus groups that enable your team members to solicit honest customer feedback on performance issues and products, and to share suggestions for improving that performance.

● **Put yourself in the customer's shoes.** Encourage your team members to do what they must to achieve a customer's-eye view of your products and services. This could mean using your own products, employing mystery shoppers to evaluate your service, or creating mock test areas for customers to use your products.

● **Keep track of your customers' customers.** Your customers' needs are largely determined by the requirements of their own customers. Staying informed about changing needs or markets for these groups will enable you to anticipate new developments of your own customers' expectations.

● **Audit your customer service regularly.** Sometimes, complaints are not caused by performance issues within your team, but by a lack of skill in forming positive relationships with customers. Get your customers' feedback on a number of relationship-related issues, from accessibility and responsiveness to requests to listening skills and conflict resolution. ■

Team Turnarounds

A Playbook for Transforming Underperforming Teams

by Joe Frontiera and Dan Leidl

THE SUMMARY IN BRIEF

In today's uncertain economic environment, teams are constantly asked to do more with less. Yet with resources stretched thin, turning around a struggling team has never been harder. Managers must work to identify and maximize whatever potential strengths a team already has. As sports fans already know, behind every great underdog story is a leader who roots out the competitive advantage that propels the team to victory.

In *Team Turnarounds*, Joe Frontiera and Dan Leidl share how this fine art of the turnaround really works, from how to inspire the team to the actual tools for change. Through interviews with team managers and turnaround masters in the NFL, MLB and the NCAA, as well as managers at the top global firms who have successfully reversed their fortunes, they show the six steps every team takes to make a 180 in performance.

Since every team's turnaround is unique, *Team Turnarounds* features the tools needed to start an organizational 180 — from leaders' action plans to thought-provoking group exercises — to help leaders and their teams create their own turnaround stories.

No matter how bad the circumstances, how awful the performance, or how far shares have plummeted, *Team Turnarounds* shows how any organization can make the climb back up to the top.

IN THIS SUMMARY, YOU WILL LEARN:

- A six-stage process for engineering a turnaround effort with your team.
- How to create a vision and establish guiding values for your organization.
- The methods to build resilience and embrace adversity as a valuable part of the turnaround process.
- How to create a culture of excellence that will help you continue to succeed after initial wins during the turnaround process.

Introduction

In 2009, the state of Michigan was in a downward spiral. Statewide, it was hemorrhaging jobs, and unemployment offices were receiving 800,000 to 1 million calls per day.

Governor Jennifer Granholm, then in her second term, recalled, "In our unemployment offices, people were in line down the street. [There were] people [who] had never collected unemployment before. The system was like a cancer patient that was breaking down everywhere."

Toward the end of her first year in office, Granholm had traveled to the 8,000-person town of Greenville, Mich., after learning that Electrolux, a refrigerator manufacturer that employed 2,700 people, had made plans to uproot its operations and move its plant to Mexico. In her typically confident way, she teamed up with the mayor, the local chamber of commerce, the company's union representatives and others to construct a comprehensive plan to get Electrolux to stay.

"We offered them zero taxes for 20 years. We offered to build them a new factory, $30 million in concessions annually and a $750 million package over 20 years. It was the most aggressive we had ever been — that Michigan had ever been."

After the presentation, the Electrolux executives left the room to confer. About 15 minutes later, they returned.

As Granholm recalled, one of the executives began, "This is really generous. We have never seen an offer like this. But," he continued, "there's nothing you can do to compensate for the fact that we can pay $1.57 an hour in Mexico, so we're moving."

With that, Electrolux was gone. Electrolux had manufactured its last refrigerator in Michigan and another Michigan community was left devastated.

Thousands of workers now needed to find a way to feed their families. Crushed as Granholm was, she also began to realize that the people of Michigan needed to change their mind-set — specifically, the ingrained belief that if they simply continued to do what they had always done, they would somehow turn things around and bring jobs back.

Turnarounds in the Modern Landscape

How can a governor change a culture, an ingrained belief system, in order to turn an entire state around? More broadly, how can any leader work to bring a team from the bottom to the top? This is the precise question we set out to answer as we embarked on our research project five years ago. Is it possible to transform a losing climate into one that fosters collaboration, innovation, and productivity, especially when leaders in all sectors are forced to do more with less?

We began our research in the world of professional sports. After our initial research was published in 2010, we expanded our questions to the world of business, talking to leaders at different levels. Some of our findings supported past research, but one amazing finding emerged. We discovered that, although the specifics of different turnarounds varied widely, and although they encompassed factors ranging from the size of the team to the scope of the challenge, there was remarkable consistency in the process that successful leaders in *all* sectors went through. We found six elements that were common to all the turnarounds we explored. These elements fit naturally into a six-stage model, one that we call the Team Turnaround Process. ●

Stage I: Leading Past Losing

Organizations in stage I are at the bottom. For those who are guiding organizations at this early stage, the diagnosis is obvious. Your team is failing as you consistently and unequivocally lose games, customers, profits and credibility. And losing can become a comfortable norm that team members cling to, accepting poor performance because winning simply isn't seen as possible.

Although organizations in stage I are largely defined by all they do wrong, they are full of promise. As you guide your group through this early stage, there has to be a distinct and narrow focus on understanding the team's losing ways. Observation and reflection are the keys to moving forward, and you are charged with asking questions, discerning the truth, and accepting the answers. Working to understand why the team is losing is the goal, and exploration and examination are critical.

Stage I is an investigation into why your organization is performing poorly. It's a time for neither judgment nor decisive action, but it's critical that a foundation for growth be laid. Throughout this stage, you are building a clear case for why changes need to occur and for what those changes should be. You should be prepared to gather evidence regarding where your organization is missing the mark, and regarding what a winning organization does differently. You also need to identify just how team members can be shifted into roles that best suit their skills.

Face Reality

Once you understand what's wrong, it's time to let the team in on the secret — to go beyond platitudes and face reality, no matter how disconcerting it may be. This process can be hard, and confronting the issues will make a lot of people uncomfortable, but it's necessary.

When Frank Esposito was named president of Kendon Industries, he walked into an organization that was mired in rationalizations and denial. Kendon is a small company with around 25 employees in Anaheim, Calif. Kendon is in the business of manufacturing and selling motorcycle lifts and trailers, and, at one point, these products were among the best in their field. Kendon was once an industry darling, but the company fell from grace while chasing the promise of quick growth and million-dollar profits. When the company committed to the strategy that it could build its trailers for 20 percent less, sell 50 percent more of them, and lower the price, the problems began. The culture at Kendon shifted from one of considerate, creative artisans to one of "make a lot of money, take costs out, be cheap, and get rich."

Kendon had been spiraling downward, but eventually the company had the presence of mind to face facts and reach out for help.

In January 2009, when Esposito came in to right the ship, he started strengthening the organization's weak sense of reality by taking a more objective approach.

"I'm a validator," he says, "I don't just grab my own opinion and run with it. I go validate things pretty thoroughly."

He started by interviewing team members, asking them about the direction of the company, where it was going, what needed fixing and what needed to be changed. For the first time in a long while, Kendon had someone who was going to rely on facts and seek proof. No longer would the group be vulnerable to easy rationalizations and convenient denials.

"The very common answer," Esposito says, "was that they wanted to be proud of the product, and they wanted to take their time and build the best. They were instructed not to do that."

It's taken a few years, but things are changing. Relationships with the top two distributors in the motorcycle industry have been restored, a performance-based pay system has been instituted, manufacturing is now housed solely in the United States, and the brand has returned to its original position, focusing on quality and value. As for the employees, "they believe in the company," Esposito says.

Kendon is on a new path. With the help of Esposito, the company is working to open up communication channels, to value honest and objective feedback, and to maintain its commitment to being a niche company that makes darn good trailers and lifts.

Define Roles and Responsibilities

Role clarity is vital for success in any organization, but teams in stage I lack it. Without clear roles and responsibilities, team members lose focus and motivation, and are left to wallow in mediocrity. Individuals who are insecure about what they should do and how they should do it are often reluctant to do anything. As role ambiguity increases, job satisfaction and influence decrease, anxiety grows, and performance and confidence decline.

Clearly defined roles give employees a level of stability, and promote more focused and productive efforts. In guiding teams through stage I, it is imperative that leaders identify necessary responsibilities and define clear roles for team members. Nevertheless, as with all the other components of this initial stage of turning a poor-

ly performing team around, leaders must first gather information.

The first stage is a cold shower of truth. It feels good only after it's over and, once it's done, the organization is revitalized and energized to move forward. With dysfunction out in the open, the real work can begin.

Stage II: Committing to Growth

In stage II, your team is poised to move forward. It's time for the team's focus to shift from what's wrong to what's possible. Team members are fed up with losing. They recognize that change is needed and are committed to growth. Your team has gone through the emotional exercise of confronting and acknowledging its inadequacies, but it now needs direction. It wants to progress and leave the losing ways behind, but it may not know where to go or how to get there. It needs something to believe in as it pushes out of the haze of failure, and it will look to you for guidance. The team at stage II needs a vision for where it's going, clear values to guide it, and a decisive plan of action that's chock-full of specific and attainable goals.

Launch the Vision

For a team to move from catastrophe to conquest, the group has to define a path forward. As teams rise up, they have to develop and embrace a vision for the future. What's possible? What are the hopes? What's next? What are the dreams? A vision is intended to provide direction, motivation and clarity. The vision focuses effort and inspires action by defining where the group is going. A vision is intended to capture possibility and may seem incredibly unrealistic to a team numbed by failure. Nevertheless, in spite of how ridiculous a vision may seem, it's the responsibility of the leader to articulate and sell it.

As far as visions go, few professionals in sports have proved better than Bill Polian at selling grandiose dreams under incredibly unrealistic conditions. Polian walked into the Indianapolis Colts at a time when it was one of the worst franchises in the NFL. He established a vision for winning the Super Bowl and then he got to work, leading one of the most dramatic transformations in professional football.

In stage II of the turnaround process, leaders need to inspire and guide. Polian's vision for the Colts was clear, and his efforts didn't waver. He was convinced that the franchise could win a Super Bowl (a feat they achieved in 2005), and he communicated that conviction explicitly with words and actions. As Polian defined this path at stage II, his vision gave the Colts a focus that eventually spun them around, guiding them from failure to unprecedented levels of success.

Adopt Guiding Values

In addition to articulating a clear and inspiring vision, leaders guiding teams through stage II need to answer questions about how advancements will be made. At this stage of the process, guiding values provide needed structure for how the group will work to move forward. People are stirred by values, and they want to invest in organizations that share their ideals. As the leader, your determining team values and making them explicit motivates those around you. You have to make it clear that the group stands for something, whether it's customer service, effort, innovation or something else entirely. When you do that, the shared commitment will motivate specific actions by providing a framework for what's important, what's expected, and what's needed to see that the larger vision is achieved.

Establish a Plan and Set Goals

If your vision and values are a bridge taking you to a new frontier, your larger plan and smaller goals are the bridge's girders and rivets. Goals hold the plan together, providing team members with guiding objectives and clear, measurable milestones. As with every other aspect

Four Keys to Clear Communication

The manner in which a vision is communicated can make or break a team's eventual success. Here are some recommendations that can assist leaders in their efforts to clearly communicate and inspire others with a vision:

1. Be concrete. Concrete statements that team members can digest and unequivocally understand are more apt to incite forward movement and eventual progress.

2. Ask for input. When opinions and ideas are solicited, followers are likely to feel that they have a voice and own a small part of the eventual vision.

3. Communicate consistently. Consistent and repeated action is necessary for a vision to take hold, and how a leader links his or her actions to the vision can effectively move things along.

4. Communicate effectively. As a leader strives to turn an organization around, the language and the crafting of a vision may actually influence others to see that leader as both more effective and charismatic.

of stage II, teams are looking for direction and carving a clear path forward. The vision provides the team with a direction, and values determine the manner in which the team will advance, but a plan with goals serves as the road map that guides the team to its destination, one stop at a time.

Some argue that making a strategic plan has become passe. Others say that strategic planning is a useless exercise that a team rarely follows through on. Yet few would make the argument that plans do not help to focus the direction of a team. Larger plans can keep people motivated when smaller goals aren't achieved. They also enhance the likelihood that goals will eventually be attained. Through plans and corresponding goals, teams and organizations are able to visualize a path forward while maintaining the focus needed to advance to the finish line.

In stage II, you will draw a blueprint for your team's future success.

Stage III: Changing Behaviors

Stage III is a time when you will define, model and reinforce the behaviors that are right for your organization's growth. Because every organization is different, it is critical that you focus on the behaviors that are appropriate for your team. Stage III is a stage of action and it represents a distinct shift from planning to doing.

In stage III, change is afoot, but as the team sets out in this newly defined direction, the old ways must be left behind. Ani Shabazian took over the Loyola Marymount University Children's Center (LMUCC) when it was in profound disarray. The center had degraded to the point where child safety was in question and turning it around was a formidable task. Shabazian was dedicated to teaching her team the behaviors needed for success. It was a tough sell, but Shabazian believed that with time and persistence, the group could provide world-class child care services to the Loyola Marymount University community.

In 2006, the behaviors of the staff at LMUCC were woefully suspect. During those days, concerns were warranted. Enrollment was down, the relationship between the facility director and parents was caustic, and programs were canceled. It wasn't that the teachers and administrators were intentionally neglectful or abusive — make no mistake, it was a caring and affectionate team — but it was as if they didn't wholly understand the toll of their mistakes, as if they didn't know better.

When Shabazian arrived, the situation was a mess, and she admits to feeling overwhelmed, but she had committed to changing the center and refused to back down. She initially relied on education. She set out to ensure that all the teachers at the center actually had the necessary education to perform their jobs.

Education comes in many different forms, and multiple efforts to communicate information are more likely to stick than one singular effort. With this in mind, Shabazian was committed to educating her staff in multiple ways. Although she insisted on a minimum education level, she also worked to personally convey information to her staff members in order to ensure that they would avoid falling back into poor habits.

The center slowly progressed from being an organization in crisis to delivering a reliable service to eventually becoming highly respected in the industry. When she arrived at the center, Shabazian held the seemingly farfetched goal of the center's becoming accredited. By 2010, LMUCC had joined an elite 8 percent of child care centers nationwide by receiving full accreditation.

For LMUCC and Shabazian, growth is the theme and progress is a continual effort. The turnaround has been dramatic, but in the early phases the focus on behavior change was critical. Through formal and informal education, the reassurance of organizational leaders and Shabazian's persistent encouragement of positive change, early goals were achieved. Throughout stage III, Shabazian and LMUCC were simply focused on adopting the right behaviors.

Stage III is characterized by the small and consistent behaviors that will add up to bigger successes.

Stage IV: Embracing Adversity

By now you're nearly halfway through a long and, most likely, arduous effort, but the big wins are starting to come. Stage IV represents a swing in attention away from daily behaviors and on to the obstacles that lie in front of you.

Leaders and organizations that perceive obstacles and change as an opportunity continue to advance by becoming stronger. In contrast, organizations that see similar situations as threats become overly focused on preservation. Oddly, these distinctions are simply perceptual. They represent thoughts that can actually be controlled and, at this stage of the turnaround process, organizations are capable of perceiving the more positive option.

Build Resilience

Challenges are opportunities for those skilled in identifying and capitalizing on them. When properly taken

advantage of, these moments can grow an organization and make it stronger. In addition to looking at challenges with an open and eager mind, those who are resilient to the debilitating potential of upheaval and impediments are likely to advance. Seeing challenges as opportunities is an important component of stage IV, but equally important to effectively turning your team around is the ability to take difficulties in stride and bounce back from things that are damaging. Resilience is essential. Fortunately, it can be developed and enhanced.

Bill Stoneman, former general manager (GM) of the Los Angeles Angels of Anaheim, is a poster boy for these qualities and drew on his resilient attitude to turn his team around.

In the 10 years leading up to Stoneman's arrival, the Angels had compiled a 738-817 win-loss record, winning only 47.5 percent of their games over the course of a decade. In 2002 and the four subsequent years, the squad finished with a 452-358 record — a 55.8 winning percentage. In that somewhat magical turnaround year of 2002, the Angels won the World Series. Stoneman clearly had turned the franchise around, but what's noteworthy is how he did it, and the attitude he did it with.

Optimism and positivity are key ingredients of resilience. Positive thinking allows an individual to perceive a situation as a challenge rather than a problem. When Stoneman first stepped into his role as GM, he walked into a culture that focused on problems and accepted mediocrity. "They accepted that they were a midmarket club," he says, "and you heard that a lot. The bar was set low." More than anything, for Stoneman, the acceptance of mediocrity represented a loss of hope, a pervasive negativity that didn't make sense.

Resilience is an emotional construct, tightly tied to happiness and confidence, and Stoneman looked for ways to support his players. He took care of distractions and concerns so they could focus solely on baseball. He changed the clubhouse atmosphere, brightening up the lighting and making it a place of focus. What had once felt like a dimly lit lounge became "a place where you can prepare to do something on the field, not a place where you go to relax."

The 2002 season wasn't simply a one-year blip on the organization's radar. From 2003 to 2011, the Angels were one of the most successful teams in the American League (AL), finishing first in the AL West while advancing to the playoffs five times. The Angels serve as a picture of resilience. They were a group of underrated but determined players who never backed down from a challenge, never gave in, and always believed they could achieve in spite of the obstacles.

For the Los Angeles Angels of Anaheim, the seeds of resilience may have been sown early in the turnaround process, but the Angels seemed to embrace the concept later in their development. Stoneman may have led the way with a naturally resilient disposition but, by 2002, the team had started to wholly buy in. Stoneman did not let the poor track record of the franchise deter him from taking chances on unproved but promising young guns, turning the team around, and ultimately taking the Angels to a World Series win. And the players, given the right leadership, were able to become passionate about playing baseball to the best of their abilities even though they needed to overcome a decade of losses. The Angels had a sad history, and a host of reasons to lose hope and back down, but, ultimately, they developed an unshakable belief in themselves and that proved to be all that mattered.

The resilience and willingness to take on adversity that come with stage IV will prepare your team for the even larger challenges presented in stage V. ●

Stage V: Achieving Success

In stage V, you will finally achieve success as an organization. You and your team have overcome obstacles, and achieved the goals and vision you set for yourselves and, finally, all your efforts will pay off as you become an up-and-coming industry leader, a conference or national champion, a recognized trailblazer, a great competitor.

The prospect of success stirs us. From Woody Allen's nonchalant perspective that "80 percent of success is showing up" to Winston Churchill's more slogging sentiment that "Success consists of going from failure to failure without loss of enthusiasm," we find inspiration in the hope that we can succeed. But what is success? How do we know we've succeeded, and how do we keep success going?

For many, success is framed as a fleeting moment — the lifting of a national championship trophy, the securing of a multimillion-dollar deal, the "I do" of marriage, the final push of labor and the first cry of the baby. We think of life, our efforts, our aspirations, as something like a movie, as if we work toward the one big goal, give everything we have to a single crowning achievement and, when it's complete, the credits roll. We become so fixated on the effort to achieve that we sometimes lose sight of what we're doing and how it relates to the bigger picture. We sometimes forget that there aren't any credits, and that there's no stop to the action after we hold up the trophy. Life keeps rolling even after our big wins.

Adapt

We continually redefine success, making it a personal set of ideals to constantly strive toward. Email marketing software firm iContact teaches us the value of adapting to renewed standards and expectations. As a small start-up that was succeeding in growth and profits, iContact could have continued on a prosperous path, but the company redefined what success should be and then adapted to the challenge. It changed itself and became a leader in sustainable business practices.

As you succeed and refine your understanding of what success means, you must also adapt. The game keeps changing, and your ability to adjust to new rules and goals will define your capacity to achieve, moving forward. Change is essential, and if you don't push yourself to adapt, you're likely to stop achieving. Adapting to the situation, changing in an effort to stay on top, may, in fact, be one of the most important tools in your arsenal, and few stories are as intriguing as the story of iContact.

Around 2007, in an effort to keep his organization alive and growing in a shifting landscape, iContact CEO Ryan Allis was crafting a broader plan for the burgeoning tech firm. Allis saw a play, one that was not only sensible and reflective of the changing times, but also something he was truly passionate about. Allis's business partner, the co-founder of iContact, had been fighting cancer during this period. Ultimately he survived, but he and Allis had been spending time discussing the importance of making an impact, staying true to yourself, and making the most of life. And so, in an effort to adapt to what business could and perhaps should be, Allis dedicated iContact to a more sustainable path. He began to consider the organization as a vehicle for positive impact, as a means of doing good for the community and the environment while also making money.

Becoming a B Corporation

One concept that has emerged in an effort to offer structure to companies like iContact, companies that are working to have a broader positive impact through business, is the Benefit Corporation, or B Corporation. These organizations are more tightly monitored than most other corporations, welcoming stricter standards and guidelines in an effort to more proactively contribute to sustainable business practices.

In early 2010, the first time iContact applied for the certification, the company didn't hit the mark. After iContact's first failure, corporate responsibility manager Matt Kopac and the company pored over feedback and critically assessed where iContact's efforts could be made better for the next try.

In June of 2012, only three months after that initial failure, iContact was awarded certification as a B Corporation. iContact was now one of a small number of North Carolina businesses to have attained such certification, and it was the only such company in the email marketing industry.

Companies and teams, who are focused on forward movement think and act in these terms. They are constantly filtering information to identify strategic advantages, are willing to experiment with adaptive concepts and ideas, and are capable of managing a variety of systems while pushing decisions and actions throughout the organization. An adaptive culture facilitates quick movement, creativity, and fluid decision making that will likely support larger trends while benefiting the advancement and progress of the organization.

iContact continues to grow in profits and outreach. This growth is certainly a function of hard work, but the company's success in turning its sustainability efforts around was largely determined by a willingness to adapt. iContact adapted to a larger, changing world, and the organization is changing itself as it strives to be the best it can be. iContact was already a company on the rise, a genuine success story, but the company knew it could do better. By adapting its focus and dedicating itself to a more sustainable path, iContact continues to evolve as it reaches for unimagined heights. ●

The Must-Have Abilities for a Changing Environment

According to Martin Reeves and Mike Deimler, senior partners and managing directors at the Boston Consulting Group, "Globalization, new technologies and greater transparency have combined to upend the business environment and give many CEOs a deep sense of unease."

They go on to outline four "abilities" considered necessary to adapt to a new or changing environment:

1. Identifying and reacting to pertinent information.
2. Experimenting.
3. Managing complex systems.
4. Thinking adaptively across organizational levels.

Stage VI: Nurturing a Culture of Excellence

Once you've reached stage VI, you're an indisputable winner. The turnaround is complete. It's not to say that you won't go through some hard times. No matter how good you become, you and your team will occasionally face setbacks. But stage VI is about bracing for those times by developing a winning culture that is both lasting and enduring.

Those who achieve over and over, the genuine winners, never stop learning and innovating. Organizations that stay at the top are always growing, always pushing, always striving to be just a little better, just a little more accomplished or proficient.

Jerry Weast is a decorated and revered superintendent who has garnered the attention of business and academic leaders alike. He served as Montgomery County Public School (MCPS) superintendent for 12 years and retired from his post in June 2011.

MCPS is one of the 20 largest school districts in the United States, serving more than 144,000 students, employing more than 22,000 professionals, and, as of 2011, managing a $2.1 billion operating budget. In addition to being the largest school system in Maryland, the Montgomery County school system is also the state's most diverse. A suburb of Washington, D.C., Montgomery County is home to a broad swath of cultural and socioeconomic types. The student population speaks nearly 200 languages, and 13 percent receive English for Speakers of Other Languages services.

When Weast first took over as superintendent in 1999, by all public accounts MCPS was successful. According to standardized tests, grades, college admissions, and other metrics, the students of Montgomery County were succeeding. In his efforts to better understand the statistics, Weast uncovered a reality that gave him reason for concern.

A Tale of Two Districts

As Weast explains, "We [essentially] had two districts, both of them large districts, both of them around 70,000 in size. One of them held almost 80 percent African American and Latino [students]. And the other one had 80 percent white and Asian [students]." Although the district was relying on around 20 percent of its students' achievements to satisfy state and national expectations and mandates, the high-performing Asian and white populations was diminishing in size, yielding to the ballooning populations of African American and Latino families. Something had to be done to instill equity in the community, not just to ensure that the county could continue to report positive statistics, but also to properly serve the growing population of underserved children who deserved a strong preparatory education.

He framed the problem as a countywide crisis that couldn't be denied by any single racial or socioeconomic group. Weast argued that everyone shared the issue because if the school system didn't improve, the county would be seen as less attractive for businesses and homebuyers, and the existing value of property owned by current residents would degrade. It was a clear financial issue that relied on the "we're only as strong as our weakest link" argument. It was not hard to buy in. Administrators, teachers, parents and students came on board in a short amount of time and committed to the vision of overcoming the existing challenge. Weast says, "I wanted 80 percent of kids college-ready by 2014."

MCPS's academic achievements continue to improve, despite increases in poverty, population and students who don't speak English. Weast is proud that the education gap has narrowed. Student achievements across the board have advanced, with low achievers advancing at a rate that's catching up to the ever-improving high achievers. For Weast and the MCPS team, even though the turnaround has been completed, the effort never stops. Through constant striving to learn and a near obsession with innovation, the system keeps advancing.

The Playbook for Nurturing a Culture of Excellence

Stage VI brings with it a host of challenges that will force you to question how you can continue to improve. Commit your organization to excellence and long-term success. Don't take your achievements up to this point for granted. Keep doing what you've done to get here. Continue to learn, dedicate yourself to innovation, and take time both to understand and further define a culture that will drive success for years to come. There are going to be dips in the road. Things are not always going to run smoothly. But if you establish a culture for sustained success, your organization will continue to excel. ●

THE SUMMARY IN BRIEF

The business world is full of statistics – statistics about failing, statistics about succeeding, and so on. Yes, the reality is that most startup businesses fail (to the tune of 20% in the first year and a half within five years), but the real story about a business is often hidden in another statistic – the number of people it employs. Natalie Dawson introduces this concept in the introduction of her book ***TeamWork: How to Build a High Performance Team***, saying that out of the 31.5 million small to mid-sized businesses in the United States, 25 million have one employee listed – their founder. The next 5.3 million businesses in the group have two to 15 employees, and only 600,000 businesses have more than 15 employees.

The statistics help lay the foundation that it is hard to build a business solely through the people – and while growing and scaling sound easy in theory – they are not and require going to bat against the odds. That is what Natalie's book provides readers; the whole system required to create a people process in a business, including the resources and the structure required for cultural, operational, and financial scale.

IN THIS SUMMARY, YOU WILL LEARN:

- How to lead a team and develop people to form a winning combination.
- How to use a process being followed by a successful business.
- What it takes to grow and scale a team for success.
- The true value of teamwork and what it means to your business.

Introduction

You can become an expert in leading teams and developing people; all it takes is the right teacher to help you develop your own skills. The tools presented in this book have been put into action and work in the real world – they are not just a set of theoretical ideas that may or may not work when implemented; these actually work in business. Everything presented in this book provides business owners with the tools they need to implement to get a better result – no fluff, just the right stuff.

Employee Engagement Cycle

Think of your team as an engagement cycle – employee alignment, employee development, and employee transition. If you look at the existing employee pool, and they are all in alignment, they are either new hires (within 90 days) or newly promoted (within 90 days). The goal is to see 20% fall in the alignment category. 60% of your team should be in the development phase, focused on being top performers in their roles, working on themselves, working on their goals, and adding to their ability to contribute.

You can get your team unstuck from their current phases, and it requires a reengineering process for your people. You should be consistently cycling your people through the engagement cycle, and when you don't, you get people problems, which are your fault. During the process, the things to keep in mind are that every piece is important and to keep the big picture in mind.

Mission Statement

The mission statement of your business is the very reason it exists. When asked, any employee should know exactly what the mission statement for the business is. This statement shouldn't just be a statement but a heartbeat about why you and your team show up every day to do the work you do. When you have a focused business statement, you can reduce the amount of friction that makes a business hard. It is important to remember:

Your mission statement is for your TEAM, and your brand statement is for your CLIENTS. The idea is to have a mission statement that creates confidence in the people you will need on your team by giving them the realistic expectations you have for their alignment within your business.

Vision Statement

Your vision statement should be used to help convey where you are going as a business to your team members. What often gets forgotten in the interview process is how that interviewee can help get the business where it needs to go, but instead focuses on the skills of that person in the present. The vision is forgotten.

Your need for a vision statement should help drive your future growth. There should be three versions – one for your team, one for your brand, and one for your revenue. You cannot have the same goals for all three areas, or you would not be able to facilitate any type of growth; they would be dependent on one another.

Core Values

Your business' core values define your culture. Before falling into a never-ending headspace full of questions about who you are and what you want - consider this:

Your core values should be a tool that helps you filter out who fits and who doesn't. There should be a distinct method – can you hire from it? Can you reward from it? Can you fire from it?

Your core values should reflect your vision and your mission, but also realize that no value lives on its own. As an example, Cardone Ventures has six core values – Inspirational, Disciplined, Accountable, Transparent, Aligned, and Results-Oriented. Each of these core values supports the previous value, which is intentional.

Where to Use Your Mission, Vision, and Values

Once you create your mission statement, vision statement, and core values – put them on everything. (Literally) By doing so, you make it perfectly clear what your organization is about and what you are looking for. Some popular places to put these statements include job posts, interviews, performance review conversations, your website, employee handbook, etc.

Job Post

According to Peter Economy's 11 Interesting Hiring Statistics You Should Know, there are five considerations

that employees consider important when looking at your job posting – salary and compensation, career growth opportunities, work-life balance, location and commute, and company culture and values. If you do not include this information in your job posting, you may miss out on the candidates you are trying to reach the most.

Interview Process

The process you use for interviewing could be as much a blessing as a detriment. If you are continually hiring the wrong fit for your business, then chances are that the interview tactics you are using are also wrong. You need to use a different approach – one that works most often is as follows:

The Cultural Interview Process: Do they have the behavioral attributes necessary to be culturally aligned? It is good to determine early on if the candidate will be a good cultural match for your goals.

The Operational Interview: Does the candidate have the technical skill set and experience to have a high level of effectiveness?

The Core Values Interview: This process determines if the candidate is on the same page with company goals – this should help you quickly determine if they are aligned with your business.

Onboarding

Set your new team member up for success by doing the following:

- Create a pre-arrival checklist so that you know you are prepared for them
- Finalize agreements
- Establish chain of command
- Send a welcome email
- Prepare their workstation (if applicable)
- Update job description
- Inform the team
- Prepare the onboarding plan

Once everything has been done and divided into stages for the new hire to learn the company's flow, set up a final onboarding meeting (approximately 30 minutes) to recap the process and to gain feedback from the employee.

Daily All-Team Meetings

It is hard to get this perfect at first, but starting the day the same way with the same meeting starts the day off on a structured foot. To begin an effective pattern of daily all-team meetings, begin by welcoming your employees to the meeting. Next, discuss the wins from the day before and the priorities for the day. When each area of the business shares something they are learning, it helps show that goals are being met and achieved. Finally, close out the meeting by reinforcing your core values. These values should be at the forefront of your teams' minds each day.

PPF Goals

Satisfying personal, professional, and financial (PPF) goals can be done by setting realistic goals for yourself. Personal, professional, and financial goals can change your life – whether you are 20 years old or 75 years old.

A great framework to implement a PPF conversation in your business is by using SMART:

- **S**pecific – What are you going to accomplish?
- **M**easurable – How can you track this progress?
- **A**ttainable – Are you able to accomplish this goal?
- **R**elevant – Why is this important to you?
- **T**imely – When will you accomplish this?

It is important to remember that you can't rush the PPF conversation, and you should allow the employee to take their time pondering these – they may not have thought about this before.

One On Ones

One on one meetings should be taken seriously within your company and conducted with the vision statement in mind. There should be a template for the meeting that is used across all departments and conducted no matter how many employees are on the roster. The one on one is a way to ensure that all areas of communication within the business infrastructure are open and operating efficiently.

Quarterly Team Meetings

Every business should be conducting a quarterly meeting consisting of a presentation deck that flows from cultural to

operational to financial (in that order). At the end of each meeting there should be a time for questions and answers – allowing the team members to address the questions that they have or any ideas that they want to address that have not come up in one on ones.

Employee Maturity Model

Every position in your business should be viewed as a potential career path and not just another job. An Employee Maturity Model takes the guesswork out of the equation for the employee (and you), because it lets the employee know what they can expect if they strive for greater things in their current position. The goal of this model is to provide clear boundaries and outlines for every position including the managerial roles, pay, etc.

Performance Reviews

Performance reviews should be a combination of employee review and employer review. The employee should have a time where they need to answer questions regarding their performance and then come together with the manager conducting the review to determine if everyone is on the same page. From most of these types of meetings, there should be some determinations made. Is the employee on the right path? Are they fulfilling their position? These are questions that may be brought up if there is a promotion or raise in question and may determine if the employee gets it.

Performance Improvement

If you are looking for improvement from an employee, you have to tell them. You cannot expect that they are going to see this on their own. The best form of helping get an employee back on the right track in terms of goals is by creating a performance plan – and following up on it. How are we going to change the situation? What can be done together to move forward to achieve goals?

Firing

No manager enjoys the firing process – but you should. The firing process helps to instill culture in the business, establishes stories, removes noise, and removes friction. The correct process or firing an employee is laid out in this chapter, yes, there is a right way and a wrong way to fire an employee. The goal is client success – you have to make sure you capitalize every opportunity without giving them too much room to stray from the stated mission and values.

Conclusion

Now is the time to begin implementing everything you have learned in these chapters. From creating the values and missions to interviewing and onboarding. Just remember that no matter how late in your business structure or how early – you can create the structure needed to be successful in your venture. Using this book as a strategy will help you increase the strength in your people and further your business goals.

Natalie Dawson is an expert in developing people and building scalable teams. She has interviewed, hired, trained, and led thousands of employees over the course of her career, most recently as Executive Vice President and Partner of Cardone Ventures, a management consulting, joint ventures, and private equity firm that helps business owners achieve their personal, professional, and financial goals through the growth of their businesses. Her specialty lies in aligning employees with business objectives—for measurable returns on investment.

Achieve "Massive Action" Results

There is a reason why some people achieve at super high levels and others never quite get where they want to go. The difference between success and failure does not lie in an individual's personality, education level, or luck. With the right discipline, anyone can get everything they ever wanted and more. Employing the 10X Rule is the way to do it. High achievers know how to employ exactly the right amount of action and engagement needed at exactly the right time to get what they are after. Anyone who desires success but falls short is failing to think or act in the right way or quantity.

Grant Cardone has spent his life studying success and he asserts that the 10X Rule is the most crucial ingredient to creating the career and life you desire. His book, ***The 10X Rule: The Only Difference Between Success and Failure***, should be used "as though your life and dreams depend on it." Cardone shows you how to set the right goals, figure out how much effort will be needed to achieve them, how to put yourself in the best frame of mind for success, and how to take action in the most effective way. When these powerful components combine, you will be living by the 10X Rule, operating at higher levels than you ever imagined.

What is the 10X Rule?

When people set goals, they often place limits on themselves before taking the first step. Living by the 10X Rule requires you to set your aspirations higher. The main focus of the 10X Rule is to "set targets that are 10 times what you think you want and then do 10 times what you think it will take to accomplish those targets." This is the 10 X Rule and it is an extraordinary way of thinking and doing. It requires "massive thoughts" followed by "massive action."

Attitude, as they say, is everything. There is no exception to that when it comes to the 10X Rule. Your "massive thoughts" begin with the way you perceive your place in the world and what attitude you bring to the table of your life. In order to achieve the results you desire, you have to have a "take-no-prisoners" attitude and an "in-it-to-win-it-whatever-it-takes" mindset. Cardone acknowledges that this may sound "aggressive" but he asserts that is a necessary component to living by the 10X Rule.

Taking Massive Action

People ask Cardone over and over again, "Exactly how much action is necessary to create success?" Cardone believes that most people are looking for the shortcut or easy way out. The truth is there are no shortcuts. You have a much better chance at success if you take more action, not less. "Disciplined, consistent, and persistent actions are more of a determining factor in the creation of success than any other combination of things." A solid business plan, amazing idea, or timely product launch will fail in the absence of the right amount and kind of action. To succeed, you need the right degree of action. Cardone breaks action down into "four simple categories or degrees of action." When deciding what to do, you have four choices:

1. Do nothing.
2. Retreat.
3. Take normal levels of action.
4. Take massive action.

We all "utilize all four degrees of action at some time in our lives, especially in response to different areas of life." For example, you may take massive actions with a particular project in your professional life but then do nothing when it comes to personal fitness. You may take normal levels of action in regard to your relationship with your children but then retreat in activities related to your spiritual growth. Every person is faced with the decision of how much action to apply to any particular pursuit, professionally and personally. Cardone says that you will excel in the areas where you "invest the most attention and take the most action." Doing nothing or retreating "are the basis for failure." Normal levels of action are required to create or maintain the status quo. Higher levels of success require massive action.

"Doing nothing" is a state in which you are no longer moving yourself "forward in order to learn, achieve, or control some area." You may be stuck in a state of doing nothing if you feel bored, lethargic, complacent, or lacking in purpose. Despite the way it sounds, "doing nothing" actually requires significant energy and effort. Instead of taking action towards a goal, you have to exert energy explaining yourself and making excuses. You may find that you are always insisting that everything is fine, when it is obvious to everyone around you that you "are not living up to your full potential."

The second degree of action is "retreat." When you are in this state of action-taking, you are moving in reverse. You are the embodiment of the "fear-of-success phenomenon." To get here, you may have tried to accomplish a goal, but ended up unhappy with the results. Rather than risk putting forth more effort to get less-than-desirable results, you decided to pull back. Patterns stemming back into childhood can make us get stuck in this state. As kids we are told to avoid things and stop certain behaviors in the name of safety. After years of being conditioned to "hold back" from things we are "curious about" it is a great challenge to "rebound" and "try new things later in life."

If there is any area of your life where you have failed and then determined that you will never try that again or that there is "nothing you can do," you are in a state of "retreat." Examples include never marrying because most marriages fail or never investing in something again because you experienced a loss. You are paralyzed in fear and unable to make forward progress when you are operating in "retreat" mode.

The most common degree of action in society is the "normal" level. This level of action provides just enough to maintain an average level of success. Cardone says that this level of action "creates the middle class and is actually the most dangerous because it is considered acceptable." If you have a normal life with a typical salary and average savings, a decent but not exceptionally healthy and exciting marriage, chances are you are taking "normal" levels of action. The problem, asserts Cordone, is that normal action only works under normal circumstances. If market conditions rapidly change, normal no longer works. In atypical situations, normal actions put you at risk for losses or worse. If a personal crisis happens, normal levels of action will not get you through it. Taking "only normal levels of action makes you more susceptible to challenges that are certain to come your way." The level of action that once worked for your life can "result in a serious degree of stress, uncertainty, or hurt" when circumstances are out of the ordinary.

The fourth degree of action is "the most natural state of action there is for all of us." Cardone says that we only have to look at the universe around us to see that "massive action" is the way life itself continues. The way children go full force in everything they do, the activity below the surface of the earth or in the ocean, or the buzzing life inside beehives and ant mounds—they are all perfect examples of massive action getting exceptional results. The problem is that you get off track from the natural state of things. Falling short, failing, becoming distracted, or having to deal with unexpected life events can all collude against you and throw you out of this state of "massive action."

Cardone shares that he spent a long period of his life from the age of 10 to 25 on the wrong track heading in the wrong direction. He had a turning point and from that moment on he put forth "constant, persistent, and immense" action towards his targeted goals. He refused to slip into retreat, no action, or normal action. And it paid off, in major ways, personally and professionally. Cardone sees success as a "duty, obligation,and responsibility." You have to treat this as if your "life and future depend upon it." Taking massive action is the "ace in the hole" that gets you there. He says you will know when you are at this level of action-taking when "people comment upon and admire your level of activity."

Interestingly, when you begin taking massive action, you will create problems for yourself. You may be thinking that anything that invites problems is undesirable. Not so, says Cardone. He says that "until you create problems, you're not truly operating at the fourth stage of action." In this state you will have to make "somewhat unreasonable choices and then follow them up with even more action." People will label you as "borderline insane" or a "workaholic" or "greedy." Cardone says that soon you will

> The harsh reality is that you will only achieve small things if you only set small goals."

understand that the only people placing such labels on you for your massive action are those that are operating at lower degrees. You will never find someone at your own level of success or higher who views your massive action as wrong. Those people know what it takes to reach the level of success you will achieve and will admire your action, not fault you for it. Operating outside of the "agreed-upon social norm" is exactly what you want and need in order to achieve the level of success you seek.

10X Goal Setting

Cardone believes that "one of the major reasons why people don't stick to their goals and fail to accomplish them is because they fail to set them high enough from the beginning." The harsh reality is that you will only achieve small things if you only set small goals. Unfortunately, most goal-setting books and seminars and the like teach you to "set realistic goals." Cardone says that is uninspired thinking and can only lead to mediocre results at best. If you want to achieve big things, you have to set big goals. If you want to get extraordinary results, you have to aim super high. Further, if you want to stay excited about what you are doing, you have to set exciting goals! If all you are going to get is an "at best average pay off," why would you work hard? In order to keep you motivated to keep moving, your goals have to be grand enough to "keep your attention."

Goal setting is linked to action-taking. If you are taking action as if your life and future depend on it, your goals need to be set often and they need to be huge. Cardone's method has two steps. (1) Write down your goals every single day and (2) set objectives that are "just out of reach." This method of aiming high ensures that you will open yourself up to your full potential and that you will take massive action towards that massive goal. Cardone recommends phrasing your goals as if you have already accomplished them, even if you have a long way to go to get there. The bottom line is that "average goal setting cannot and will not fuel massive 10X actions." You will meet resistance and challenges along the way. In order to have the energy needed to push through those obstacles, you need a "big reason to get there."

Setting a "big, juicy" goal is only the first step, however. In order to be successful, your goals have to be tied to something with a clear purpose. Cardone uses savings in a bank account as an example. You could set a big goal to "save $100 million in a bank account." That is definitely a big, juicy goal! However, if you do not tie that savings to a greater purpose, you may end up squandering it all away. Cardone points to the countless stories of people who got rich but died penniless as an example. Instead of simply having a certain amount of money in the bank, your goal could be focused to include using "that money to help my church and fund programs to improve conditions for mankind." Now your goal is combined with a greater purpose and will, therefore, have greater strength and influence over you.

Grant Cardone was not born into privilege. In fact, things were rough for him from a young age and he made some bad decisions that made things even rougher. He made a decision to change his life. He targeted his goals with laser focus and used every moment he had to get closer and closer to achieving them. And he succeeded, hugely. He is internationally recognized as an authority in sales training, appears regularly on major media outlets, has authored multiple best-selling books, and has financial wealth that landed him on a show with Joan Rivers called, "How Did You Get So Rich? His story and experience are a living testament to the idea of "go big or go home." If anyone can guide you on how to achieve your wildest dreams, it is Grant Cardone.

In The 10X Rule, Cardone shares his secret strategy with the world so that you, too, can attack life with massive action and get huge results. Far too often, people put forth what they think is a reasonable amount of effort and fail to get the results they were after. That's the problem! Cardone stresses that "normal" is not enough. To get results, you have to aim 10 times higher and put in 10 times the effort than you thought. If you are looking for a sugar-coated supportive type of motivational book, The 10X Rule is not for you. Cardone's message is delivered with the same ferocity he gives to all of his pursuits. If you want to achieve great things, you have to get up, go out, and get them.

Anyone looking to raise the bar on their personal and professional life will find the right way to think, act, and succeed in The 10X Rule.

Management

The 20% Doctrine

How Tinkering, Goofing Off, and Breaking the Rules at Work Drive Success in Business

by Ryan Tate

THE SUMMARY IN BRIEF

In this bold business title, journalist Ryan Tate offers new insight for CEOs and employees alike, revealing how innovation is being fueled by passionate workers and the companies that give them the time to explore what they care about most. At companies like Google, employees are encouraged to spend 20 percent of their work time on projects they're personally interested in, producing over the years incredibly successful new products such as Gmail and AdSense. Now other companies have adopted the concept, providing a path to innovation and profits at a time of peril and uncertainty, and offering employees creative freedom at a time when many are feeling restless.

The 20% Doctrine shines a light on the thought-leaders who are shaking up the corporate landscape, visionaries whose advice and experiences can deliver salvation for corporate America. With its emphasis on risk taking and experimentation, *The 20% Doctrine* is an ambitious new road map for shareholders, CEOs, and every worker who is critical to his or her company's success.

IN THIS SUMMARY, YOU WILL LEARN:

- How to provide creative freedom to develop successful new projects.
- How to complete projects with limited time and resources.
- How reuse of old systems can launch innovative products.
- Why fast iteration of innovations is key to success.
- How to connect with people's passions to drive innovation.
- A new process to recruit people to your 20 percent project.

Introduction

It's time for a change, and everyone knows it. The crises that have undermined the priesthood of American business are empowering what was once the underclass: the rebellious, the young and the marginalized.

Businesses have begun to do things differently and you can take advantage of that change. It first requires an understanding of Google's "20 percent time" policy.

So what is 20 percent time? It was invented at Google and works like this: Employees at the Internet company are allowed, and sometimes encouraged, to devote one-fifth of their time to projects they dreamed up themselves. It could be a day each week, four days each month, or two-and-a-half months each year. There are no hard-and-fast rules; the Googlers and ex-Googlers I've spoken to all made it clear that 20 percent time is, above all else, an *idea*, a practice that exists more as a widespread understanding than as a written policy.

3M was known for its "15 percent time" policy before Google even incorporated. The policy was instituted after a 3M engineer defied an order from the company president to stop trying to create a superior "Scotch" masking tape. In 1925, the engineer finished Scotch Masking Tape, which would become one of the company's most iconic products.

Google's adaptation of 3M's 15 percent time is helping it flower throughout Silicon Valley and well beyond. More and more organizations are experimenting with ways to empower individual workers to experiment, hoping to benefit from their innovative ideas in the process.

So-called Hack Days, where corporate programmers are encouraged to create a software prototype of their choosing within 24 hours, began as an attempt to spark 20 percent-style projects on the cheap. They have become wildly popular over the past five years, spreading to Google, Facebook, Twitter, eBay and other Silicon Valley powerhouses.

In another twist on the original 20 percent concept, some companies invite outsiders to participate in internal side projects, for example, by accepting open-source software patches from independent programmers, by inviting passionate citizens to become "citizen journalists" and by soliciting outside engineers to participate in company coding marathons.

After surveying an array of companies acting in the spirit of 20 percent time, I decided to home in on some of the more recent and successful among them, with an eye toward assembling a collecting from a diverse cross section of industries. Among them, I noticed a set of common tenets, which I'll refer to as the 20 Percent Doctrine:

Provide creative freedom. At their most basic level, systems like 20 percent time are about liberating people from the management structures that dictate their tasks the other 80 percent of the time. They provide mechanisms by which employees can develop ideas normally deemed outside the scope of their job or which are otherwise stifled.

Connect with people's passions. The things people are enthusiastic about and the things they work on every day sometimes diverge, to put it mildly. Twenty percent-style projects are a way to let employees work on projects they find emotionally resonant. Customers tend to notice when a product is built with passion by someone who cares.

Worse is better. People developing products in the margins — in the margins of their work week, in the periphery of their company — must cut some corners if

they are ever going to finish anything. Time is tight. Money usually is, too. And, in the meantime, there are lots of skeptical co-workers and mangers to convince. It's imperative to get something out the door. You can always improve upon it later.

Embrace reuse. Almost by definition, 20 percent projects are not about big-bang innovation. The best side projects tend to start as hacks, leveraging some existing product or technology in a cleaver new way.

Iterate quickly. Just as important as releasing something quickly is improving it quickly. Time and again, successful 20 percent-style projects have used iteration to snowball their way to success within the host company. Releasing a stream of improvements creates a positive feedback loop: Each improvement generates discussion, draws attention and encourages supporters.

Communicate lessons as you learn them. The unspoken agenda of every 20 percent-style project is to become a full-blown company initiative. The creators of successful side projects are, thus, always selling. They are selling to their bosses, from whom they'd like resources; they are selling to other employees, from whom they'd like help; and they are selling to their existing helpers, whom they'd like to keep around.

Embrace outsiders. Side projects tend to be especially allergic to insular thinking and especially receptive to outside ideas. Selling and realizing a disruptive vision is not an easy thing to do, especially when the people you're selling to are the ones you're trying to disrupt. Outsiders can help. Help can come in the form of actual work, advice, publicity or public affirmation. ●

Scratching Your Own Itch

At 3 a.m. one day in Mountain View, Calif., a software engineer named Paul Buchheit made a promise to his manager, Google Vice President Marissa Mayer, with whom he had been working late at company headquarters. He pledged not to press forward with his idea for "creepy and weird" text ads based on the contents of one's email inbox. "I remember leaving," Mayer later said, "and when I walked out the door I stopped for a minute, and I remember I leaned back and I said, 'So, Paul, we agreed we're not exploring the whole ad thing right now, right?' And he was like, 'Yup, right.'"

Buchheit broke his word almost immediately. Over the next few hours, he hacked together a prototype of "the ad thing," a system that would read your email and automatically find a related ad to display next to it. The advertising system would fund Gmail, an advanced new email system he had invented. When, the next morning, his co-workers saw what he had created, they called it blasphemy. Mayer thought about ordering Buchheit, asleep at home, to drag himself out of bed and pull the plug on his creation.

Luckily, she didn't. Buchheit's asystem, called AdSense, makes Google around $10 billion in revenue each year. You've probably seen AdSense's trademark blue-and-white ads in page margins all over the Web.

From Rogue Project to Public Demand

Through his long struggle to launch AdSense and its companion product, Gmail, which boasts hundreds of millions of users, Buchheit transformed Google from a company narrowly focused on search to one with a bigger vision of itself, a company expanding quickly into new markets by following the passions of its employees. The mild-mannered engineer proved to Google high command the value of letting programmers push the company into new markets, a practice codified internally as "20 percent time" and now widely emulated.

Gmail and AdSense addressed issues that, first and foremost, bothered Buchheit. Slowly but surely, they grew to address the needs of Buchheit's immediate co-workers. Then Buchheit set a goal of making 100 Googlers happy with his creations. Only later were they released to the public. By putting himself at the center of his development process, Buchheit created products beloved by millions of users to say nothing of Google's shareholders.

Build for Yourself

If you're trying to launch your own side project, the takeaway from Gmail and AdSense is that before you can sell the project to your boss, you first need to make something you yourself would buy into. Scratching your own itch provides the motivation to work on something above and beyond your regular duties.

It took just six months to launch AdSense to the public. The ad platform debuted in June 2003 as a standalone product and advertising widget that any publisher — from a lone blogger to a giant media company — could attach to any Web page. It generates around $10 billion per year, making it Google's second-biggest source of revenue after AdWords. AdSense's original reason for being, Gmail, launched on April 1, 2004, after a total of two-and-a-half years of development. Gmail became the fastest-growing Web mail service and now claims upwards of 200 million users. All because one determined engineer wanted to solve a problem he was having around the office.

Another thing Buchheit did was to manage horizon-

tally rather than just up the chain of command. In other words, he effectively reached out to his peers for ideas, feedback and support, and he recruited some of them to his cause.

On the one hand, sell your vision and the awesomeness of whatever you're working on. On the other hand, don't hide the fact that you need some help. Your best potential allies won't be scared off by that; they'll be excited. ●

20 Percent on the Cheap

Today, there's no doubt Flickr is a brilliant product; the world's first big photo website, it is home to more than 6 billion pictures and made a reported $30 million for its creators. But Flickr was almost shot down before it could take off. "The vote was actually tied," said Caterina Fake, remembering the referendum she and partner Stewart Butterfield called to determine whether their broke start-up should build what became Flickr. "There were six of us voting, but Stewart and I guilted Eric Costello into voting with us, so we got him to switch sides. … There was one guy who didn't like the Flickr idea and had voted against it, so he went to work on another [company] similar to classmates.com."

The divisive Flickr vote is just one illustration of how much more contentious it can be to launch a 20 percent-style project at a start-up: Resources are constrained; there is no capital, staff or time to spare; and there is no margin for wrong turns. By consuming precious attention, Flickr represented both hope and potentially lethal challenge to the Canadian video game company where it was born.

But tight resources ended up being precisely what made Flickr successful. An almost desperate hunger to win and win quickly, to accumulate users and revenue, motivated the Flickr team to listen closely to their user. A lack of money and a lack of other advantages opened them to the ad hoc and unconventional. The masterful way they turned desperation into a new beginning has since been given a name, "pivoting," and it has been widely embraced among Silicon Valley start-ups, including by the people who built Twitter.

Flickr was born as a last resort. "We were out of money," Fake told me.

She had begun her start-up a year and a half prior, with husband Stewart Butterfield and their programmer friend Jason Classon. Fake and Butterfield's honeymoon had just ended, and a sense of revelry suffused their new venture, which they dubbed "Ludicorp," after ludus, the Latin word for "play."

Ludicorp's sole product, a social Web adventure called Game Neverending, was inspired by the Internet games Fake and Butterfield had played as research for a kids' website Butterfield built for the Canadian Broadcasting Corporation.

Game Neverending was a tough sell; people weren't yet used to Web games or to nonlinear adventures. But venture capitalists were even more confused by Game Neverending than were consumers. Most games were sold on CDs or cartridges; Game Neverending was Web based. Most games involved straightforward missions and goals; Game Neverending was nonlinear and exploratory. Fundraising was as grueling as it was fruitless.

But there was an idea floating around the office of how the company might be saved. From their boredom, an idea emerged: Why not spin out the instant-messaging technology already baked into Game Neverending and do something novel with it? Instant-messaging programs were, at the time, all about text. There seemed to be a need for a program that transplanted Game Neverending's immersively graphical way of socializing into the real world. This idea, which ultimately evolved into Flickr, was the basis for Ludicorp's fateful referendum.

The Pivot

What Flickr was considering with its referendum was a "pivot" — a complete reorientation of a company around a new product or idea. The concept of the pivot has gained currency in Silicon Valley in recent years as tech advances continue to push down the cost of retooling. It's unlikely you'll be able to get your company to pivot, especially if (unlike Ludicorp) it's got more than a handful of employees. But the idea is still valuable. You should be willing to pivot your own side project when the conditions are right; if you're getting nowhere with your old idea and seem to have stumbled across one that's better. A side project pivot is especially well advised if you've attracted a significant number of team members and if they're enthusiastic about the change. As Fake and Butterfield showed, there are few better ways to get behind the creative freedom of your team than to put your future direction in their hands.

Reuse

Just as Buchheit had done with Gmail and AdSense, the Flickr team was adapting old work in a new and innovative way. This ethic of reuse is common among 20 percent-style projects. That's why the 20 Percent Doctrine says to build a prototype quickly ("worse is better") and to iterated new versions fast. Existing work contributes

directly to the former by giving you a head start and to the latter because it's easier to work on and improve something you're already deeply familiar with. ●

The Rise of Hack Day

In early 2005, a start-up called JotSpot found itself with a serous case of Google envy. The maker of corporated wiki software badly wanted to emulate 20 percent time — to empower employees to follow their passions, to make the workplace more intrinsically rewarding and to figure out radical new ways of helping its customers. But JotSpot was just seven months old, small and perpetually shorthanded. All its efforts fizzled. "In a start-up, it's very hard to introduce 20 percent time," former JotSpot VP and current Googler Kevin Norton told me. "You're always under the gun, and everybody's doing a little bit of everything, so 20 percent time ends up being 0 percent time, even with the best of intentions." JotSpot tried a bunch of different things; none of them worked. It seemed like every time the company allocated time for experimentation, something urgent would come up at the last minute.

JotSpot's Google envy persisted unabated until CEO Joe Kraus spotted an intriguing blog post out of Sydney, Australia. Like Kraus, Mike Cannon-Brookes ran a small software company, Atlassian. And like Kraus, he was fascinated by 20 percent time. "It's very intriguing," he wrote, but "letting your engineers run around wild one day a week is very scary indeed to any manager." So the Aussie entrepreneur came up with a compromise with his staff over lunch one day: His engineers could run wild *once* rather than one day per week, creating a prototype in eight hours and demonstrating it to the rest of the company. It would be a pressure cooker version of 20 percent time. Referencing the concept of one-day delivery, Cannon-Brookes called his event "FedEx Day — a mini, experimental, heavily bastardized version of Google's 20 percent playtime." He was thrilled with the results, he said, which included a task list maker, a flowchart generator, and tools for updating and debugging Atlassian's software suite.

Krause was sold, and less than two weeks after Cannon-Brookes's blog post, JotSpot staged its own version of the event, rechristened as a "hackathon."

Hack days are like 20 percent time on crack. They are cheaper, higher-pressure venues for employees to work on their own ideas.

For your own side project, Hack Days, as we'll see, provide a great environment for getting an initial design off the ground and for collecting feedback and inspiration. They give you a hard deadline and a shot of adrenaline when you need a burst of creativity. They can also help you get perspective and support from people outside your company. ●

A Side Project School Rises in the Bronx

There wasn't much structure in Joan Sullivan's household. With 10 children in her semirural New Jersey family, things could get chaotic. Sullivan's eccentric father actively encouraged this; the Jesuit priest turned Gestalt psychologist turned high-stakes poker player didn't believe in stetting rules. There was no bedtime. He didn't believe in traditional schools, either, reasoning that they stifled creativity. He encouraged the kids to attend anarchic "free school" and romp around on the homestead farm the family tended near Princeton. "He was constantly trying to remove me from school," Sullivan told me.

Sullivan's father didn't succeed in making her allergic to schools, but he did give her a free spirit, a sharp mind and an ability to meet intricate challenges in an anarchic environment. She would go on, starting at 29 years of age, to create one of New York's most successful high schools right in America's poorest congressional district.

Breaking Constraints of Bureaucracy

Sullivan's school, the Bronx Academy of Letters, stands as an example of how a large organization can graduate beyond conventional 20 percent time, creating a pipeline that allows gifted employees to turn their experimental ideas into stand-alone organizations within the larger institution. The New York City school system looks very different from Google, but under reform-minded schools chancellor Joel Klein it pursued a similar management philosophy. Klein facilitated the creation of many small schools with a diverse array of academic themes and clustered these schools in the city's poorest neighborhoods — not unlike Google's multitude of small fluid teams, its broad range of projects, 20 percent and otherwise.

Klein gave his small schools freedom to operate outside the tightly regimented rules that covered the city's older, larger schools. Much like 20 percent time projects at Google, they were driven by the visions of individuals; Klein gave principals like Sullivan wide latitude. They could hire and promote without as much regard for seniority. They could allocate their own budgets. And they could design their own curriculums. Like 20 percent project leaders at Google, his principals operated with minimal oversight. Klein held them account-

able with school report cards, based on relative improvements (or lack thereof) in student test scores during the time they attended the school. "We transformed the principal from an agent of the bureaucracy to the CEO of his or her school," was how Klein put it in one interview.

Of course, the stakes were higher in the New York public schools than at Google. Children's futures were on the line. So New York took a more developed approach to hatching innovation. Principals like Sullivan worked full-time, as did their teachers; for them the school was no 20 percent time project. But the staff enjoyed the same sort of devolved control that is the hallmark of 20 percent time and, as organizations, the schools were effectively side projects within the New York school system. Among its most successful was the school started by Sullivan.

Audacious Confidence

Urban Assembly, the nonprofit that set up the high school where Sullivan taught, was going to create another school. Sullivan spoke with Urban Assembly's CEO to see if she could get involved. Sure, he said. But the proposal was due in two weeks.

Sullivan hesitated. She was young, inexperienced in education and not even legal for the job of principal. It was audacious of her, with only two years as a teacher under her belt, to try to establish a brand-new academy. The idea of starting a school was, in her words, "crazy."

The school Sullivan applied to create was focused on reading and writing. She believed deeply that having the ability to communicate was a prerequisite to other academic accomplishments. Many of the city's other schools had narrowed the curriculum, discarding or reducing elements like, say, arts and athletics. Sullivan wanted to aim higher — to emphasize not just graduating students but graduating them into top colleges and exposing them to a broad curriculum. A school of letters was just broad enough to accommodate these lofty goals while being sufficiently focused for the Urban Assembly.

Daunting as it was for a teacher with barely two years in the system to attempt to launch a new school, or for a well-connected Ivy Leaguer and member of a distinguished literary dynasty to try to do so in one of New York's roughest neighborhoods, Sullivan pressed forward. This took extraordinary boldness, a boldness that has become the hallmark of Sullivan's career and, indeed, her life. The girl who defied her father's wishes to attend primary and secondary schools, and then Yale, became the woman establishing a school playing by its own, very different set of rules. For a 29-year-old, Sullivan had tremendously outsized ambitions.

This is the sort of confidence it takes to get noticed when you're working in the margins, when you're trying something different on a small scale — Sullivan started with just one grade — in and obscure corner of a larger institution. For people who believe in their idea enough to turn it into a passion project, Sullivan's confidence should be a template. What's the point of investing all your spare moments in something and then being meek about it? You need an obvious zeal for what you're doing and the ambition to seize big, daunting opportunities if you want to make your passion inspiring and contagious. ●

The Huffington Post Brings 20 Percent to the Masses

Until now, we've looked at employee side projects. In this chapter, we examine something different: a project that harnessed the spare time of people far beyond the host company, of thousands of volunteer contributors across the country. It was 20 percent time on a massive scale. Participants included students, teachers, actors, and computer technicians.

The project, Huffington Post's Off the Bus, was the first instance in which the idea of citizen journalism, in which amateurs report stories for free and bring the concerns of ordinary people into the news, was made to really work. By the end of the 2008 election, Off the Bus had changed media and politics forever.

Much of the credit goes to Amanda Michel, who commanded Off the Bus's daily operations. Her real-world experience organizing Internet volunteers for two presidential candidates helped her realize the vision of countless starry-eyed citizen journalism utopians who had come before. "Amanda's work on Off the Bus helped transform journalism in two big ways," said Clay Shirky, the New York University lecturer and Internet culture expert. "First, she showed that citizen journalism was not just possible, but practical, and, second, she showed that amateurs produce different kinds of value than the pros."

Adaptive Strategy

Michel's breakout success had a lot to do with the fact that she was a fish out of water at the Huffington Post, working in the cultural rift between journalism and politics. HuffPo's newsrooms in New York and Washington, D.C., operate in isolation from the publi-

cation's unpaid bloggers, creating stories through individual staff without coordination with outsiders. Off the Bus, in contrast, used a small handful of paid editors to orchestrate the efforts of thousands of amateur citizen journalists. Michel wanted to get as far away from the traditional newsroom model as possible. A long string of prior citizen journalism efforts had failed because they encouraged volunteers to become like unpaid full-timers, a fantasy Michel dubbed the Ideal Citizen Journalist, who can work all day, interview like a pro, turn in crystal-clear copy before deadline and do it all for free.

Michel thought it was smarter to adapt journalism to the lives of the volunteers than to ask the volunteers to remake their lives for journalism. That was how it worked in politics, where volunteer coordination was the norm rather than the exception. Michel's vision was to break down the production of news articles into distinct phases that could accept small contributions from an array of people.

Create an Experience

The transformative spirit of the project was reflected in its odd title, Off the Bus. It was at once a nod to and a rebuke of the tight-knit culture of political journalists described in the book *The Boys on the Bus*, a behind-the-scenes look at pack journalism in the 1972 election. Unlike the boys on the bus, who rode around the country with campaign entourages, Off the Bus's correspondents would remain in their hometowns, where no carpetbagging political reporter could match their knowledge of local issues. "We wanted them to do what journalists weren't positioned to do, or were too lazy to do, or structurally couldn't do, to take advantage of opportunities not afforded to journalist," Michel said.

This emphasis on fresh voices made recruiting Off the Bus's most crucial activity. The project started with a big advantage: the Huffington Post itself. By soliciting volunteers on the HuffPo front page and throughout the site's email newsletters, Jay Rosen and Ariana Huffington bestowed upon Michel a massive initial pool of recruits. "Immediately — literally immediately — we had a thousand people," Rosen told me.

A big pool of leads is no guarantee of success. Off the Bus wouldn't have been possible if Michel and her team hadn't created an amazing experience for their contributors. A pivotal lesson of Off the Bus is that a 20 percent project rises and falls on how well it provides such an experience.

Michel told her volunteers, repeatedly, that she didn't want them to imitate the mainstream media. Where old-school political reporters were trained to maintain a cold, objective voice and to hold the campaign at arm's length, Off the Bus contributors were instructed to be subjective, open about their feelings, and even, in the case of the Grassroots Correspondents, to get directly involved in electioneering. "We were always trying to break form," Michel told me. And she showed her volunteers how to do that, highlighting and promoting articles that embodied the fresh approach. ●

A Blueprint for Recruiting

Amanda Michel's recruiting process is an excellent blueprint for seducing people to help on any 20 percent-style project. In abstract terms, Michel did a handful of simple but highly effective things:

Cast a wide net. Michel didn't limit herself to people with experience in journalism or politics.

Ask specifically. Michel never beat around the bush, even when soliciting help from an audience of thousands.

Show them a good time. Michel tried to ensure all volunteers had a fun first experience, even if that meant depriving experienced volunteers of plum assignments.

Get close. Even with thousands of volunteers, Michel found ways to talk to people individually on the phone.

Corral the elite. Michel put a positive spin on asking people for additional help when she created teams with elite status.

How a Top Chef Started Over

By 2006, Thomas Keller was riding high. His new restaurant in New York, Per Se, had just received three Michelin stars. His flagship restaurant in Yountville, Calif., The French Laundry, was revered as the best restaurant in the country, maybe the world. His thriving chain of French bistros, Bouchon, had spread from Napa Valley to Las Vegas. But something was missing amid the jammed reservation lines, 500-plus employees, and high-tech videoconferencing screens that linked his New York and Napa Valley kitchens.

Keller looked back fondly to his more obscure days. When The French Laundry first opened in 1994, for example, there was barely enough money for a fresh coat of paint and some scraps of carpet; the chairs were donated, the silverware secondhand and the restaurant made do without a single sauté pan ("we sautéed in pots," Keller later said). He was ready for something new and, at the same time, ready for something very

old. "I wanted to have a small staff that worked together and had a real bonding experience with one another," Keller told me, "a throwback to the days when a five-day-per-week restaurant was normal. … Kind of like The French Laundry when I first bought it."

Keller's nostalgia would soon lead to the launch of a new restaurant, Ad Hoc. Intended to be a temporary side project, it flowered quickly and profitably into a mecca for California foodies and savvy wine-country tourists. Later, it became a franchise, with a line of products at Williams-Sonoma, a cookbook that sold 235,000 copies and went into 12 printings, and an eye toward expanding to other duties.

Embracing Constraints

One key takeaway from Keller's Ad Hoc experience, for other 20 percent time projects, is the importance of using constraints, especially time and financial constraints, to bust through perfectionism. Because Ad Hoc was intended to live a short time, Keller simply had to let go of certain details, no easy feat for such a famously obsessive chef. In this way, Ad Hoc had something in common with tech projects like Flickr, which were similarly energized by tight deadlines.

Hearkening back to childhood food memories and touching on fondness for family and staff camaraderie helped Keller fire up his employees. Ad Hoc succeeded in the marketplace, meanwhile, by resonating emotionally with customers. Keller and his team selected dishes by identifying "reference points" in customers' lives that dishes would touch on.

The service was stripped down but, at the same time, it added something to the mood. "It's meant to be like you're at home," Keller told me. "And you put the wine on the table and, yeah, you grab it, but you serve the person next to you and you pass it around. Same thing with the water, the food … It's a point of social engagement."

In the dining room, Keller's team just applied a clean coat of paint and furnished with secondhand items bought at a consignment store. Their butcher's block was an antique Keller had lying around at home; the maître d' stand was pulled out of storage, having been discarded from The French Laundry; and culinary director Jeffrey Cerciello picked up additional items at an antiques store and at a secondhand San Francisco shop named Cookin', famous for its surly service and "dusty," "dirty" and "precarious" piles of esoteric kitchen supplies, as described on Yelp.com. The bare-bones approach to Ad Hoc's interior was very much like the Spartan opening of The French Laundry.

The ethic of thrifty reuse at Ad Hoc mirrored the way Gmail, AdSense and Flickr were launched by slightly adapting old code (a discussion search engine, a porn filter and a video game chat system, respectively). Reusing old tools is a useful way to satisfy the 20 Percent Doctrine tenet of launching a prototype as quickly as possible, as Keller has discovered.

If Keller can find corners he's comfortable cutting in a pinch, you can, too. The best way to find those shortcuts is by using a forcing mechanism like the ones Keller used. Embrace small budgets, embrace tight deadlines and embrace the idea that what you make today will soon be undone, either because it's temporary or because it will be iteratively improved into something unrecognizably better. ●

Conclusion

We're seeing the flowerings of a movement toward more creative freedom in corporate workplaces.

For all that's known about how to develop a successful side project, it is early yet in the spread of the 20 Percent Doctrine. All the time, we're seeing new vehicles for tapping into workers' autonomous creativity.

More and more large organizations, like National Public Radio and Condé Nast, are finding they can successfully inject the energy and creative freedom of start-ups into their own teams using 20 Percent Doctrine principles. And why couldn't they? If a massive urban school district can devolve creative freedom, certainly they can, too. If a famously meticulous, 56-year-old chef can learn the art of the hack, then they can as well. If some of Silicon Valley's most hard-core nerds can turn a bit punk rock, surely they can follow their lead. As more and more 20 Percent Doctrine projects succeed, more people will try to follow their examples, and we should end up with more innovation, creativity, emotional touchpoints and, indeed, more humanity in the modern workplace. And that will be a true blessing. ●

THE SUMMARY IN BRIEF

If you are a busy executive, you may find yourself hiring executive assistants to try and fill the void that comes with the tasks at hand. In many countries around the world, executive assistants feel many of the same frustrations – the executive doesn't know what to do with them, leaders and HR do not know what assistants really do, and that they are thinking of quitting because they feel undervalued and bored. The biggest problem is that executives don't realize the real value of the executive assistants they hire and underutilizes their talents.

In ***The 29-Hour Work Day: A High Performer's Guide to Leveraging Your EA***, Ethan Bull and Stephanie Bull make a rock solid case for how executives no longer need to do everything themselves. When they hire an executive assistant (EA), there is much to learn about how to leverage their strengths and use them to one's advantage instead of trying to take on everything themselves. Through the book, the authors discuss how to find, utilize, and even the overall performance benefits of working side by side with your EA to their full capacity.

IN THIS SUMMARY, YOU WILL LEARN:

- How to unearth the superpowers of your executive assistant.
- How to find the executive assistant to drive your success.
- What to do when you find the right executive assistant.
- The importance of training and partnership with your executive assistant.
- The performance multipliers of utilizing your executive assistant's superpowers correctly.

Introduction

Whether you are the CEO of a large corporation or a former executive doing consulting or philanthropic work will sitting on boards, it is impossible to manage and grow your business yourself. In the story of a high-level actress, whose assistant ran city blocks to find her raspberry jam and got her to her hair and makeup appointment on time – it is a true testament of the dedication that an executive assistant has for their employer. Finding the right executive assistant who can provide the support needed in any circumstance can bring more benefits to your role as an executive. Statistics show that 51% of a good EA's job is concerned with soft skills – communication, service, emotional intelligence, and trust. The other 49% are hard skills – technology, calendar, data management, and organization. 100% of the time, an EA serves as a hospitalian, doing their jobs with finesse and aptitude by using their superpowers, so that an executive can achieve more.

Executive Assistant Superpowers

For many executives, learning to turn to and trust an executive assistant can be hard – especially if the relationship between the two lacks communication. Some executives will trust their EA from the beginning, making it easier to adapt. However, sometimes this trust is earned by using their EA superpowers and showing the executive just how capable they are at making their lives easier. There are four superpowers that an executive must pay particular attention to when working with an EA – ESP, synchronization, omniscience, and translation. These powers go above and beyond and provide the maximum amount of benefit, especially when growing for the future.

Finding "The One"

Before you can begin finding "the one," it becomes imperative to understand exactly what you need first. If you don't know what your needs are, it is next to impossible to find the EA that matches up with your needs. One of the best methods for finding the EA that completes your skillset requirements is a recruiter. Recruiters take care of all the legwork, screening applicants and finding the right fit for you to discuss your needs with. Recruiters require a fee, but if you are not looking to pay someone to find the EA that meets your needs, another option is searching through LinkedIn.

First impressions count when looking for an executive assistant. Executives should be looking at the way the candidate expresses themselves on paper and through other avenues like social media. Some big red flags can be gleaned from these sources – especially inconsistencies that may come up across these avenues. Although looking at their skills as they pertain to your industry might be relevant, the truth is that most EAs are chameleons with a slew of foundational capacities that may not be evident to the naked eye. However, seeing that they have remained in their current roles for more than a year speaks volumes of their dedication within a role.

In the end, it is your gut that will tell you what you need to know – as an executive, you have to trust your own judgment when selecting who will fulfill the role of your executive assistant. Once you have chosen the one, you need to fulfill your due diligence - checking references, background checks, etc. Once all of your ducks are in are in a row, then you can make the offer – but ensure you are paying them what they are worth. Now that you have found the one, you need to make sure you are using the one to their full executive assistant powers.

When You Have "The One"

The perfect EA brings about a mixture of hard and soft skills that will benefit you in your day-to-day tasks and help you fulfill the roles that you need assistance with. Communication with your EA is the only way to ensure that clear instruction and expectations are shared across the board. They are also hospitable; they are receptive of your needs and often fulfill them before you ask. When you are working in sync with your EA, be sure to work together, answering questions and providing communications back and forth that will further your business goals as well as take some of the extras off your plate.

Training And Partnering With Your Executive Assistant

The relationship that you create with your EA is important – from the beginning. If your EA does not have clear expectations set from the beginning, the relationship is doomed to fail. This is not fair to them, and it is not fair or beneficial to you or your business when the outlined needs are not addressed, or feedback is not given. It is unlikely that your EA will walk in and be well versed in all of your needs from the start, which is why it is important to not only train your EA, but to bring them in as a partner for the overall

betterment of the goals at hand. When training, sharing as much of your knowledge with your EA will be vital in their assistance to you. Once you are well on your way to performance multiplier status, it is important not to become a micromanager – you have trained your EA to handle things as you would – allow them to do so.

Performance Multiplier #1: Business Partner

When an executive looks at their EA as a business partner, it doesn't mean that you should sell half of your company and divide up the assets with them – instead, you should look at your EA as a partner who shares your concerns, knows how you think, and is loyal to representing your vision. When you look at your assistant through that lens, you'll discover a variety of ways you can team with them and have them take on some of the responsibilities a business partner would handle. You can empower your executive assistant in this role by equipping them with the background and information necessary so that they can sit in for you at the board meetings, fundraising functions, and even the occasional team meeting. Although they will not make decisions for you, they can be your eyes, ears, and sometimes your mouth so that you can make the decisions when you are able.

Performance Multiplier #2: Chief Of Staff

In a traditional sense, a chief of staff is hired at the direct report level to sit on strategy and C-suite meetings. They are expected to track progress and push toward quarterly and yearly goals. They know what KPIs to measure performance, who controls what, and what levers to push or pull to ensure expectations are met. This is not the chief of staff that you would be employing with your EA – instead they would share the same type of knowledgebase that a traditional chief of staff would have. They can track, guide, and ensure that progress is made – a more logistical and immediate role, less strategic. Instead of flooding your inbox or voicemail with contacts, you can use your EA as a gatekeeper for the information. They will cut out many hours spent handling these contacts and calls by screening them ahead of time and handling the relevant ones to you personally – that is what your EA as a chief of staff can do for you.

Performance Multiplier #3: Project Manager

Project managers are often responsible for taking a viable project and moving it through the production process. Many of these project managers hold degrees in project management and are familiar with Sigma Six or Lean manufacturing process tools. This does not mean that your EA will have the same role as the project manager, but they do have the ability to take ownership of a project or even to help you. For example, if your company is planning a retreat, you can employ your EA to take care of all the finer details of the trip, allowing you to enjoy it with your board members. In a project manager role, the EA can take on annual events, creating successes and can be your point person throughout the process.

Performance Multiplier #4: Assistant/ Scheduler

The more successful an executive comes in their role, the more responsibility falls on their plate. As much as you may want to do all or the majority of the work that comes your way, using your EA to schedule can help you stay on top of everybody and every project that comes across your desk. In this role, your executive assistant takes on the role of a traditional assistant, managing time slots, and doing whatever is necessary when things come up. Time engineering requires detailed, precise scheduling, and using their superpower of ESP, they can log pertinent information on your calendar invites or in an email you want to link a calendar invitation to. You have shared your priorities and goals with your EA and they know exactly what you need – making it easier to organize your day-to-day activities and doing so in a way that makes it easier to tackle everything that falls on your plate.

Performance Multiplier #5: Personal Assistant

The definition of a personal assistant varies depending on the needs of the executive. In general, this assistant helps to manage life outside of work and are closely tied to family, grocery, appointments, and other errands that make day-to-day life outside of the office feasible. Having already fulfilled multiple duties within the business structure, using an EA to help facilitate roles in life can be a refresher for some executives. Sometimes personal errands can blend with the workplace, like buying gifts for employees or arranging a

lunch for a business meeting – these are all things your EA is capable of handling for you and may have more inside knowledge on what someone would like than you would in an executive role. It is important to use discretion when assigning personal assistant roles to your EA, this being said, it is best to evaluate your relationship with your EA before assigning more personal tasks that may be sensitive.

Conclusion

As an executive, you have to be open-minded enough to do a little self-examination. Great leaders are humble and self-deprecating, and they use that to their advantage to make people below them feel comfortable expressing their ideas, thoughts, and opinions. When you do this with your EA in a proper way, you enable them to set their superpowers free. You create a safe space between the two of you to encourage them to be a performance multiplier. Whether you use your EA to boost your project management or as a personal assistant, leveraging their skills can help you work within the scope of a 24-hour work day instead of trying to work a 29-hour work day.

Stephanie Bull is ProAssisting's co-founder and former EA for J. Crew's CEO and the CEOs of two multibillion-dollar hedge funds. She proved herself an expert in the field and a vital addition to the C-suite by fulfilling a variety of roles, including chief of staff, estate manager, and investment liaison.

Ethan Bull is a longtime Executive Assistant and CoFounder of ProAssisting, a remote EA firm in the U.S. He has great advice for working remotely, managing multiple executives, and more.

THE SUMMARY IN BRIEF

Do you remember the last major initiative you watched die in your organization? Did it go down with a loud crash? Or was it slowly and quietly suffocated by other competing priorities? By the time it finally disappeared, it's likely no one even noticed. What happened? The "whirlwind" of urgent activity required to keep things running devoured all the time and energy you needed to invest in executing your strategy for tomorrow!

The 4 Disciplines of Execution, Revised and Updated can change all of that forever. It offers a simple, repeatable, and proven formula for executing your most important strategic priorities in the midst of the whirlwind. The original book sold more than 500,000 copies; in this revised and updated edition, the authors have refined 4DX based on 4,000 implementations, with content targeted to leaders' roles.

When a company or individual adheres to these disciplines, they achieve superb results regardless of the goal. ***The 4 Disciplines of Execution, Revised and Updated*** is the one book that no leader can afford to miss.

IN THIS SUMMARY, YOU WILL LEARN:

- To recognize a breakthrough strategy.
- The 4 Disciplines of Execution and how to use them to achieve results.
- How a leader of leaders and a leader of frontline teams can apply 4DX.
- To get leaders on board and sustain 4DX results and engagement.

PART I: LEARNING 4DX

The Real Problem With Execution

Whether you call it a strategy, a goal, or simply an effort at improvement, any initiative you as a leader drive in order to significantly move your team or organization forward will fall into one of two categories. The first mainly requires a stroke of the pen; the second is a breakthrough, requiring a change in behavior.

Stroke-of-the-pen initiatives are those you execute just by ordering or authorizing them to be done. Breakthroughs that require a change in behavior are very different. You can't just order them to happen, because executing them requires getting people—often a lot of people—to be highly engaged in a new or different approach to creating results. If it requires people to do something different, you are driving a *breakthrough strategy*, and it's not going to be easy.

The Whirlwind

It's natural for a leader to assume the people are the problem. But this is wrong. Certainly, lack of clarity, commitment, collaboration, and accountability exacerbate the difficulty of strategy execution.

But the real enemy of execution is your day job! This is the whirlwind. It's the massive amount of energy that's necessary just to keep your operation going on a day-to-day basis; and ironically, it's also the thing that makes it so hard to execute anything new. The whirlwind robs you of the focus required to move your team forward.

Executing in spite of the whirlwind means overcoming not only its powerful distraction but also the inertia of "the way it's always been done."

The 4 Disciplines of Execution are not designed for managing your whirlwind, and they are not designed to manage stroke-of-the-pen initiatives. The 4 Disciplines are the precise methods for accomplishing breakthrough results on your single most critical objective: your Wildly Important Goal.

The 4 Disciplines work because they are based on principles, not practices. Practices are situational, subjective, and always evolving. Principles are timeless and self-evident, and they apply everywhere. They are natural laws, like gravity. Whether you understand them or even agree with them doesn't matter—they still apply.

Discipline 1: Focus on the Wildly Important

The first discipline is to focus your finest effort on the one thing that will make the biggest difference. Execution starts with focus. Without it, the other three disciplines can't help you.

But how you apply Discipline 1 will differ depending on whether you are a leader of a frontline team or a leader of leaders.

Discipline 1 for the Leader of a Frontline Team

Discipline 1 requires that you identify the one objective that will be separated out from your whirlwind and given intense focus. This difference is signified by the name Wildly Important Goal. Your WIG is an outcome so significant that it cannot be accomplished without the finest efforts of your team and by performance that is above their day-to-day level. This is the one objective to which you apply 4DX.

When you've defined your WIG, you will then view the work of your team in two distinct buckets. The first bucket contains everything the team needs to accomplish in the course of their day-to-day work (their whirlwind). This bucket is substantial and will likely require 80 percent of their time and energy.

The second bucket is the Wildly Important Goal—the one specific outcome that represents the most meaningful breakthrough you'd like to achieve. Ideally, the WIG should be given the remaining 20 percent of the team's capacity.

Discipline 1 for Leaders of Leaders

The choice of the WIG at your level is critical. Whatever you choose as the Primary WIG can be like a compass for the teams—each leader of a frontline team can align their Team WIG to the direction you set. There are four primary rules for applying Discipline 1 as a leader of leaders:

Rule 1. No individual focuses on more than one WIG at a time. This rule acts like a governor on an engine. Keep this rule in mind as you consider the remaining three rules. If you violate this one, you will have lost your focus as an organization.

Rule 2. The battles you choose must win the war. It isn't enough that the Team WIGs just support or align with the Primary WIG. The achievement of the Team WIGs must ensure the success of the Primary WIG.

The key principle behind lead measures is simply this: leverage. Achieving your Wildly Important Goal is like trying to move a giant rock.

Rule 3. Leaders of leaders can veto but not dictate. While senior leaders will undoubtedly determine the Primary WIG, they must allow the leaders of frontline teams to have a significant role in defining the WIG for their own team. Senior leaders can then exercise their right to veto if the WIGs chosen will not achieve the Primary WIG.

Rule 4. All WIGs must have a finish line in the form of From X to Y by When. Every WIG at every level must contain a clearly measurable result as well as the date by which that result must be achieved.

Discipline 2: Act on the Lead Measures

The second discipline is to apply disproportionate energy to the few actions (or behaviors) that will have the greatest impact on achieving the Wildly Important Goal. These are called "lead measures" because they are the measurable drivers that actually lead to WIG achievement.

A lag measure shows you if you've achieved the goal. A lead measure tells you if you are likely to achieve the goal—meaning that the team is doing the things that are most critical to goal achievement. While a lag measure is hard for an individual (or a team) to directly affect, a lead measure is chosen to be both *predictive* of impacting the lag measure and within the team's control—referred to as *influenceable*.

Defining Lead Measures

The key principle behind lead measures is simply this: leverage. Achieving your Wildly Important Goal is like trying to move a giant rock; but despite all the energy the team exerts, it doesn't move. It's not a question of effort; if it were, you and the team would already have moved it. Lead measures act like a lever, making it possible to move that rock.

How do you choose the right levers? To achieve a goal you've never achieved before, you must do things you've never done before. Look around you. Who else has achieved this goal or something like it? What did they do differently? Use your imagination. What haven't you thought of that might make a real difference?

Then select the activities you believe will have the greatest impact on achieving the WIG: the 80/20 activities. Which 20 percent of what you do has as much or more leverage on the WIG than 80 percent of what you do?

The lead measures with the most impact come from a collaboration between the leader and the frontline team. The impact of the lead measures is greater when the top-down influence of the leader provides guidance and direction, and the bottom-up influence of the team provides clarity on which actions actually produce the greatest results.

And it is clarity on cause (lead measures) and effect (outcome on the WIG) that you are after. When done well, this collaboration creates a synergy that neither the leader nor the team could have created alone.

Discipline 3: Keep a Compelling Scoreboard

The third discipline is to make sure everyone knows the score at all times so that they can tell whether or not they are winning. Discipline 3 is based on the principle of engagement.

People play differently when *they* are keeping score. If the lead and lag measures are not captured on a visual scoreboard and updated regularly, they will disappear into the distraction of the whirlwind. People disengage when they don't know the score. When they can see at a glance whether or not they are winning, they become profoundly engaged.

Ask four questions when determining if a scoreboard is likely to be compelling to the players:

Is it simple? Think about the scoreboard in a sporting event. The scoreboard on the field shows only the data needed to play the game.

Can I see it easily? The results become personally important to the team when the scoreboard is displayed where it can be seen by everyone.

Does it show lead and lag measures? The team needs

to see both, or they will quickly lose interest. When they can see both the lead and lag, they can watch the bet play out.

Can I tell at a glance if I'm winning? If you can't tell within five seconds whether you're winning or losing, you haven't passed this test.

Although physical scoreboards are still an essential tool used by many teams, today the most visible and easily accessible location for a scoreboard is on your tablet or phone. The 4DX app provides the ability to display and update a scoreboard for your team that is constantly available, simple to use, and compelling to display.

Discipline 4: Create a Cadence of Accountability

In this discipline, you create a cadence of accountability—a regular and recurring cycle of accounting for past performance, as well as committing to move the score forward. Discipline 4 is where execution actually happens. Disciplines 1, 2, and 3 set up the game; but until you apply Discipline 4, your team isn't *in* the game.

In Discipline 4, your team meets at least weekly in a WIG Session. This meeting, which lasts no longer than 20 to 30 minutes, has a set agenda and goes quickly, establishing your weekly rhythm of accountability for driving progress toward the WIG.

WIG Sessions might vary in content, but the agenda is always the same. Here's the three-part agenda for a WIG Session, along with the language you should be hearing in the session:

1. Account. Report on last week's commitments. "I met with our VP but wasn't able to get the approval we wanted. Here's why . . ."

2. Review the scoreboard. Learn from successes and failures. "We're trending upward on our lead measures, but our lag measure isn't moving yet. We've agreed as a team to double our efforts this week to get the score moving."

3. Plan. Clear the path and make new commitments. "I'll meet with Julius on our numbers and come back next week with at least three ideas for helping us improve."

To prepare for the meeting, every team member thinks about the same question: "What are the one or two most important things I can do this week to impact the lead measures?"

Each commitment must meet two standards. First, the commitment must represent a specific deliverable. Second, the commitment must influence the lead measure. In addition, while the leader of the WIG Session is responsible for ensuring the quality of commitments, the commitments must come from the participants.

Let's take the example of Tomás, a member of a sales team whose lead measure is to send out two new proposals each week, Tomás knows that his list of prospects is running low, so for this week his commitment might be to acquire names and contact information for 10 additional prospects, ensuring he has enough to successfully move two of them to the proposal stage.

The level of importance you place on the WIG Session will directly determine the results your team produces. Based on your consistency, your focus, and your modeling of making commitments and following through, you will establish the WIG Session as either a high-stakes game or a low-stakes game in the minds of your team members.

PART II: APPLYING 4DX AS A LEADER OF LEADERS

Choosing Where to Focus

The most challenging question for the leader of leaders in 4DX: "What should we choose as our Primary WIG for the organization?" Your Primary WIG represents a breakthrough result that will require human engagement and a significant change in behavior.

Leaders rarely make this choice without rigorous debate and collaboration by an entire leadership team, with the most senior leader often in a facilitating role and, if needed, making the final decisions.

Identifying Your Breakthrough Result

The first question to ask is, "If every other area of our operation remained at its current level of performance, in which one area would we most want to achieve significant results?" This question naturally focuses the mind on the result that might represent a breakthrough by holding every other area constant.

Once you have a list of candidate WIGs, you should next discuss each candidate in terms of two categories: impact of failure and at risk of failure (without significant change).

Impact of failure. How mission-critical is the candidate

WIG? While this question might seem straightforward, it can actually require deep thought. Instead of simply focusing on a single short-term objective, evaluating it leads your team to ask the larger questions and to think about the longer-term impact before making a final decision.

> Gaining the full commitment of a leadership team is just as critical to your success as choosing the right strategy.

At risk of failure (without significant change). Next, the leadership team should consider how "at risk of failure (without significant change)" is the candidate WIG. Leadership teams are reluctant to discuss the possibility of failure of any sort. It's much easier to keep the discussion focused on the comfortable subject of importance rather than on the uncomfortable subject of risk.

But the decision to define and undertake a WIG is a decision to spend energy not dedicated to the whirlwind—a limited and extremely valuable currency. Waste that currency, and you will likely have lost time and energy that can never be recovered.

Here are four traps to avoid in the creation of your WIGs:

- Creating too many Primary WIGs.
- Choosing a Primary WIG that is too broad.
- Creating a Primary WIG that is aspirational but not measurable.
- Creating WIGs that are not aligned to the mission and vision of the organization.

Getting Your Leaders on Board

Gaining the full commitment of a leadership team is just as critical to your success as choosing the right strategy. To help you succeed in this important objective, this section presents the mindsets and skillets that have proven to be most successful. The ideas are presented from the point where the leaders of leaders have already developed a Primary WIG and their Key Battle WIGs. Now they are ready to engage the leaders of frontline teams who report to them.

In this critical next step, the leaders of leaders have three objectives: finalize the Primary WIG and the Key Battle WIGs; develop the draft Team WIGs for frontline teams; engage the entire leadership team in a committed effort to win.

Three leadership mindsets are essential if you want to create alignment and engagement across an entire leadership team.

Transparency mindset. While full transparency is not always organizationally possible, the mindset of transparency is, and there are few things that develop high trust more rapidly than authentic transparency. Leaders with a transparency mindset share their concerns openly, freely acknowledge that they don't have all the answers, and actively encourage feedback from others no matter where they reside on the organizational chart.

Understanding mindset. The key to influence is first to be influenced. An understanding mindset means that the leaders of leaders truly seek to understand the concerns and ideas of the leaders of frontline teams before making a final decision on the Primary WIG and the Key Battle WIGs. The more you adopt an understanding mindset, the more you will learn, the more you will lower resistance, and the better the decisions you will make.

Involvement mindset. When final decisions are made on the Primary WIG and the Key Battle WIGs, leaders of frontline teams play an essential role in understanding and, if possible, improving these crucial WIGs. But the final decision belongs to the leaders of leaders. However, when Team WIGs are chosen, leaders of frontline teams make their own decisions, subject only to final validation by the leaders of leaders.

Sustaining 4DX Results and Engagement

The greatest impact of 4DX is not simply the ability to produce breakthrough results; it's the ability to sustain (and even improve) those results over a significant period of time. This characteristic is rooted in building habits of execution, practices that become so ingrained that teams are no longer conscious of them as a requirement for performance.

Although the Primary WIG will always be the most immediate and most visible target, the greater achievement is

your ability to establish a culture of execution—one where WIGs can be achieved again and again, regardless of fluctuating conditions.

To crystallize this focus, a single indicator measures not only WIG results but also the habits of execution that drive them: the Execution Performance Score, or XPS. There are four components of XPS.

Establishing a cadence. This component indicates how well the team has established a cadence of meeting weekly to focus on the scoreboard.

Fulfilling high-impact commitments. This component indicates how well the team has consistently made commitments and followed through.

Optimizing lead-measures performance. This component indicates how consistently the lead measures are being performed.

Achieving lag-measure (WIG) results. This component indicates how effectively the first three components are enabling your team to achieve its WIG.

The calculation of your XPS consists simply of identifying the score for each component and then adding them together. Since each component has a maximum score of 1, a perfect score would be 4. Your XPS score can then be used to give you insights into your team's performance and the results it is producing.

PART III: APPLYING 4DX AS A LEADER OF A FRONTLINE TEAM

Applying Discipline 1: Focus on the Wildly Important

Superb team performance begins with selecting a single Team WIG. Focusing on a single breakthrough goal is the foundational principle of 4DX. Without it, your team will get lost in the whirlwind. Selecting the right WIG is crucial.

Step 1. Consider the possibilities. Begin by brainstorming possible WIGs. You have three options: Brainstorm with peer leaders, especially if you are all focusing on the same Primary WIG for the organization, brainstorm with your team or with a representative subset of the team, brainstorm alone. Ideally, both the leader and the team participate in defining the WIGs.

Step 2. Rank by impact. When you're satisfied with your list of candidate Team WIGs, you're ready to identify the one that promises the greatest potential impact on the Primary WIG. Calculating the impact of a Team WIG depends on the nature of the Primary WIG. For example, for an overall WIG that is financial, rank the Team WIG in terms of prospective revenues, profitability, investment performance, cash flow, and/or cost savings.

Step 3. Test top ideas. Once you've identified a few Team WIG candidates, test them against four specific criteria for your team's final choice:

- Is the Team WIG aligned to the overall WIG? Is there an unbroken line of sight between the candidate Team WIG and the Primary WIG?
- Is it measurable? A game without a clearly measurable score will never be a game that matters.
- Who owns the results—our team or some other team? Does the team have at least 80 percent ownership of the result?
- Who owns the game—the leader or the team? The Team WIG should depend primarily on what the team does, not just the leader.

Step 4. Define the WIG. Once you've tested your ideas and selected a final Team WIG, make it as clear and measurable as possible. Define the Team WIG according to the following rules:

- Begin with a verb. Simple verbs focus the mind immediately on action.
- Define the lag measure in terms of "From X to Y by When."
- Keep it simple. Most organizational goals are vague, complex, and pretentious.
- Focus on what, not how. The WIG should focus exclusively on what the team plans to achieve.

Applying Discipline 2: Act on the Lead Measures

Acting on lead measures is the single most difficult aspect of installing 4DX in your team. There are three reasons for this: Lead measures can be counterintuitive. Lead measures are hard to track. Lead measures often look too simple.

Here are the steps for arriving at high-leverage lead measures.

The key to engagement is a visible, continually updated scoreboard that is compelling to the players.

Step 1. Consider the possibilities. Begin by brainstorming possible lead measures. Resist the temptation to choose quickly. Ask, "What could we do that we've never done before that might make all the difference to the Team WIG?" For example, a grocery store has this Team WIG: "Increase year-over-year sales by 5 percent."

Step 2. Rank by impact. When you're satisfied with your list of candidate lead measures, you're ready to identify the ideas that promise the greatest potential impact on the Team WIG. The team must press hard on the lead measure to move the lag measure. Too many lead measures, and you dissipate that pressure.

Step 3. Test top ideas. Once you've identified a few high-leverage lead-measure ideas, test them against these six criteria:

- Is it predictive? If the idea fails this test, even if it's a good idea, eliminate it.
- Is it influenceable? Ask if the team has at least 80 percent control over it.
- Is it an ongoing process or a "one-and-done"? The ideal lead measure is a behavior change that becomes habitual and brings continuous improvements to the lag measure.
- Is it a leader's game or a team game? The behavior of the team must drive the lead measure.
- Can it be measured? If the Team WIG is truly wildly important, you must find ways to measure the new behaviors.
- Is it worth measuring? If it takes more effort than its impact is worth or it has serious unintended consequences, it fails the test of a lead measure.

Step 4: Define the lead measures. Answer these questions as you put the lead measures in final form:

- Are we tracking team or individual performance? Tracking team results allows for differences in individual performance while still enabling the team to achieve the outcome.
- Are we tracking the lead measures daily or weekly? Daily tracking creates the highest level of accountability because it demands the same performance from every associate every day, whereas weekly tracking allows for varying performance each day as long as the overall result for the week is achieved.
- What is the quantitative standard? In other words, "How much/how often/how consistently are we supposed to perform?" You decide based on the urgency and importance of the Team WIG.
- What is the qualitative standard? In other words, "How well are we supposed to perform?"
- Does it start with a verb? Simple verbs focus the mind immediately on action.
- Is it simple? State your lead measure in as few words as possible.

Applying Discipline 3: Keep a Compelling Scoreboard

Discipline 3 is the discipline of engagement. The key to engagement is a visible, continually updated scoreboard that is compelling to the players, whether it's a digital scoreboard in the 4DX app or a physical board constructed by the team.

Step 1. Choose a theme. Choose a theme for your scoreboard that displays clearly and instantly the measures you are tracking. You have several options: trend lines, speedometer, bar chart, andon, personalized.

Step 2. Design the scoreboard. The team should design the scoreboard with these questions in mind:

- Is it simple?
- Can the team see it easily?
- Does it contain both lead and lag measures?
- Can we tell at a glance if we're winning?

Step 3. Build the scoreboard. Let the team build the scoreboard. The greater their involvement, the better— they

will take more ownership of it if they build it themselves.

Step 4. Keep it updated. The design of the scoreboard should make it easy to update at least weekly. If the scoreboard is hard to update, you'll be tempted to put it off when the whirlwind strikes—and your Wildly Important Goal will disappear in the noise and confusion. The leader should make very clear who is responsible for the scoreboard, when it will be posted, and how often it will be updated.

Applying Discipline 4: Create a Cadence of Accountability

Even though you've designed a game that's clear and effective, without consistent accountability, the team will never give their best efforts to the game.

If you can instill the discipline of accountability in your team, they will beat the whirlwind every week. However, if you're casual about accountability for commitments as well as for results, the whirlwind will overwhelm the Wildly Important Goal.

Here's how Serena handled this important moment in a WIG session when Jeff couldn't keep his commitment.

Step 1. Demonstrate respect. Serena: "Jeff, I want you to know that the event last week was a huge success, and without you, it could have been a disaster." In this crucial first step, Serena shows Jeff that she respects him as a team member, but she also shows the team that she respects the whirlwind.

Step 2. Reinforce accountability. Serena: "Jeff, I also want you to know how important your contribution is to this team. Without you, we can't reach our goal. This means that when we make a commitment, we have to find a way to fulfill it no matter what happens during the week."

This is a challenging moment for both Jeff and Serena; but because Serena has made it clear that she respects Jeff and the demands of the whirlwind, Jeff should be able to see the importance of doing his best for the team.

Step 3. Encourage performance. Serena: "Jeff, I know you want to help us follow through. Can we count on you to catch up, by fulfilling last week's commitment as well as the one you were planning on making for next week?" Serena gives Jeff the opportunity to report with pride that all commitments have been fulfilled.

Discipline 4 keeps your team in the game every week, as the members connect their personal contributions to the most important priorities of the organization. With this comes not only the awareness that they are winning on a key goal but that they have become a winning team.

Which is the ultimate return on the investment you make in 4DX.

The 48 Laws of Power

By Robert Greene

Robert Greene is the author of the New York Times bestsellers *The 48 Laws of Power, The Art of Seduction, The 33 Strategies of War, The 50th Law, Mastery, The Laws of Human Nature,* and *The Daily Laws*. In addition to having a strong following within the business world and a deep following in Washington, DC, Greene's books are hailed by everyone from war historians to the biggest musicians in the industry (including Jay-Z, Drake, and 50 Cent).

A Book Review by Soundview

Learning the Game of Power

In his book, ***The 48 Laws of Power***, author Robert Greene attempts to help his reader gain power in the world. It is power, he believes, that most people aspire to and that they find its acquisition alluring. In the 48 laws he gives in this book, it becomes apparent that Greene is most concerned with power, not with morality or loyalty. High on his list of people to emulate in the acquisition of power are the courtiers of days past. After all courtiers spend their time getting as close to power as they can all while keeping up appearances and bolstering the ego of the ruler. Greene relies on lessons of the courtiers as well as those of powerful men and women throughout history to help explain his 48 laws. In doing so, he does not focus solely on those who were successful in the acquisition of power. He also focuses on those who transgress his laws and who suffer as a result of this. Greene also lets his reader know when reversals of the law are possible in certain circumstances although with some of his laws, he does not believe that anyone can reverse them and be successful.

Outshining the Master

Greene's first law dictates the relationship one should have with power as he states, "never outshine the master." In order to illustrate what happens when someone transgresses this law, Greene tells the story of Nicolas Fouquet who was the finance minister for Louis XIV. Fouquet had a grand taste for the finer things in life. It was suspected that he would become Prime Minister when the former Prime Minister died. This was not to be the case,however, as Louis XIV instead got rid of the position. This bothered Fouquet who started to worry that he was losing his position of favor with the king. To rectify this, he threw an elaborate party, inviting all the most powerful people in Europe as a way to honor Louis XIV. His plan did not work out as suspected as he was arrested the next day and spent the rest of his life in solitary confinement. While Fouquet was trying to honor the king, he did not understand the king's psychological needs. Louis XIV could not stand being upstaged, and he felt upstaged by this grand event that Fouquet managed. Greene, therefore, warns his reader to avoid Fouquet's fate by making sure that the master and leader always shines most brightly in all circumstances.

Greene believes, in fact, that "when it comes to power, outshining the master is perhaps the worst mistake of all" as he warns his reader that when it comes to power, not much has changed over the centuries. He then goes on to warn his reader against believing that they have free reign to do what it is they want just because the person in power favors them. This is too risky. He suggests people engage in flattery of the ruler, and he also recommends that his reader make him or herself seem less capable than the leader by purposefully making mistakes which the leader can then correct. These are ways to bolster the ego of the ruler.

Greene believes that power can actually be granted "by letting others outshine you." The exception to this is when a leader is falling in power. In such cases, Greene believes that it is okay not only to outshine the master but to hasten his or her downfall. He warns his reader against scruples in such regards by telling readers that the master does not have these scruples him or herself. He ends this law by saying, "your master will fall someday, and if you play it right, you will outlive and someday outshine him."

Associating with Infectors

Greene's tenth law warns his reader to "avoid the unhappy and unlucky" as he discusses infection. He tells a story of a nut told by Leonardo Da Vinci. In this story, a crow carries away a nut to a bell tower. The nut was never eaten by the crow, however, because it fell into a crevice. The nut then flatters the wall it fell into and asks the wall to shelter it. The wall obliges, but within a short amount of time, the nut opens up and its roots grow into the crevices, eventually tearing the wall apart. By this time, it was too late for the wall to do anything about its misfortune. Greene uses this story as an interlude to discuss those who bring destruction upon themselves. He believes that when people face hardships due to forces they cannot control, people should help them. He does not feel the same way about those who bring destruction upon themselves. He believes that it is unlikely that people can help those who face their own ruin of their own accord. He believes it is far more likely that those negative patterns will begin to infect those who try to help them, bringing on even more ruin.

Greene says, "The incurably unhappy and unstable have a particularly strong infecting power because their characters and emotions are so intense. They often present themselves as victims making it difficult, at first, to see their miseries are self-inflicted." He also believes that those who are constantly dissatisfied are also to be avoided. Greene believes that as well as being infected by negative attitudes, people can also suffer in the eyes of others if they are seen in the company of those who bring misery on themselves. Because of this, it is best not to be seen with those who suffer misfortune.

To avoid the pitfall of falling into an infector's trap, he suggests carefully judging people by the fruits of their actions rather than by what they attribute these fruits to. He believes "infectors can be recognized by the misfortune they draw on themselves, their turbulent path, their long line of broken relationships, their unstable careers, and the very force of their character, which sweeps you up and makes you lose your reason." Not all infections are negative, however. Good qualities and success can be contagious as well. He believes people should take advantage of this trait and focus on associating with people who have positive traits that counteract their own negative traits. This is much better than associating with people who have the same faults as you do because your own fault will only be exaggerated in such cases. He does not believe there is any exception to this rule. Much can be gained by associating with the successful, but associating with the less successful can be dangerous.

Creating Spectacles

While in his first law Greene advises against creating spectacles that can outshine a master, that does not mean that he despises spectacles in and of themselves. In fact, he believes they can be a powerful tool. He tells of the spectacle created by Dr. Weisleder and his wife in 1780s Berlin. They had many people coming to them to heal illnesses and maladies great and small. These were traditionally maladies that medicine could not cure. He claimed to use the power of the moon to heal people, and as such, he became known as The Moon Doctor of Berlin. Both he and his wife would claim to cure people in this manner. They would each take people into a room and bring them to a window and rub the exposed injured or defective area of the body while mumbling some words. People had great faith in this husband and wife team, despite the fact that the arrangement of the rooms and the layout of the house made it impossible for multiple people to experience the moon's rays at the same time.

Greene credits the success of the Weisleders to their understanding of human nature. They understood, Greene contends, that people often rely on their emotions and do not need or want explanations for the way things work. Therefore, appealing to people's emotions can be powerful. Green actually believes that giving an explanation would have hurt the credibility of the Weisleders because it could have decreased people's belief in the power of the moon to heal. He believes "the moon was strong enough – it was a magnet for fantasies, as it has been throughout history." The illusion they created is what convinced people they were healed.

Greene goes on to state that shortcuts must be taken in the quest for power, and visual spectacles are a great shortcut because they bypass people's suspicions. Ever since the Renaissance, out of all of the senses, people have relied the most on the sense of sight. Therefore, appealing to what people can see is a powerful tool. People can argue with words, but visuals and symbols are powerful in getting people's attention and convincing them of your messages. He mentions former Roman emperor Constantine. Constantine worshiped the sun until one day he saw an image of the Christian cross superimposed across the sun. This proved to Constantinople that Christianity was the superior religion, and he converted the entire Roman Empire to Christianity because of this one visual symbol. This demonstrates just how powerful symbols and images can be in attracting people to a message.

> *. . . today it is important to avoid employing too much flattery because this can wear itself out while also drawing negative attention from peers."*

Playing the Courtier

Throughout his book, it is evident that Greene looks to courtiers and their behavior to help inform his laws to acquiring power. In his twenty-fourth law, Greene turns directly to courtiers as he advises his reader to employ courtesan tactics in the pursuit of power. Courtiers are his perfect example because they "thrive in a world where everything revolves around power and political dexterity."

Court society was set up to both amuse the ruler as well as to keep the nobility in line. Greene says, "The court serves power in many ways, but most of all it glorifies the ruler, providing him with a microcosmic world that must struggle to please him." This was not always an easy job. For example, in 19th century Darfur, courtiers were obligated to do whatever it was the sultan did, going so far as being forced to injure themselves if the sultan injured himself. While staying close to the ruler could prove dangerous to one's health should the ruler himself be injured, straying from the ruler could be even more dangerous and often ended in death. Being a courtier required one to be a master of appearances and to never step out of line. Their very lives sometimes depended upon mastering this skill.

Greene then moves into a discussion of court politics and some of the guidelines those at court had to follow. The first of these guidelines that Greene mentions is that of avoiding ostentation. Courtiers had to be careful to avoid too much or the wrong attention to themselves. This could cause jealousy among other courtiers which could lead to one's ruin. Along similar lines, today it is important to avoid employing too much flattery because this can wear itself out while also drawing negative attention from peers. Paradoxically, while too much ostentation is a dangerous thing, it is also important to stand out to some degree. Otherwise there is no opportunity for advancement. Part of standing apart involves cultivating a distinctive style. The road to power can require a delicate balance.

Courtiers, according to Greene, matched their language and mannerisms with the people they were speaking with. Equality was not to be sought after and, indeed, is not to be sought after today either. Greene believes that talking as equals to people below oneself sounds condescending while talking equally with those above oneself appears offensive. Greene considers this sort of acting to be an art form. Along similar lines, he warns his reader "never affect friendliness and intimacy with your master." A superior can approach an inferior with an attitude of friendliness, but this is always the superior's decision. An inferior should never approach their superior in a similar manner. In addition, one should avoid directly criticizing a superior. When advice needs to be given, it should be both polite and indirect.

To express how too much honesty can prove dangerous, Greene tells the story of Callisthenes. Aristotle was a tutor to Alexander the Great, and Alexander complained that he had no one to talk about philosophy with when Alexander was out on his campaigns. Aristotle recommended that Alexander talk to Callisthenes on such occasions who Aristotle had schooled on court life. Callisthenes respected speaking truth bluntly and believed that Alexander would be able to handle this directness if he respected learning as he professed to. Unfortunately this was not the case for Callisthenes, and Alexander had him killed.

More successful were the courtiers during the Han Dynasty in China. Greene explains how during that time Chinese emperors were seen as forces of nature who everything revolved around. It would not be prudent for anybody to tell any of these emperors what to do. Because these emperors were not infallible, however, it was sometimes necessary for people to point out their errors. In order to do so without risking their own lives, courtiers would insert strange natural phenomena that they falsely reported seeing into their reports. Emperors would take these strange phenomena as signs that things were not as they should be, and they would change their behavior accordingly. This method avoided the pitfalls of criticism but still allowed for courtiers to point out errors when necessary. Greene recommends using similar approaches to "use symbols and other indirect methods to paint a picture of the problems to come, without putting your neck on the line." Sometimes it is necessary to speak out, but Greene recommends these roundabout ways to give feedback without bringing negative repercussions on the person speaking out.

Matching Behavior

In his thirty-eighth law, Greene encourages his readers to keep their minds independent and free but to match their behavior to those around them. He does not believe that this will get a person labeled a hypocrite because nobody will really know what it is they think in the first place. In other words, if you keep your opinions to yourself but match the outward behaviors of others, no one will really know what you think or believe.

Like with his other laws, Greene goes back in history to demonstrate how this both has and has not worked for others. He tells the story of Pausanias from Sparta who went out to conquer part of Persia. He was successful in becoming the leader of a portion of Persia, but this is where things started to go wrong for Pausanias because he fell in love with the opulence of the Persians which contrasted greatly with the austerity of the Greeks. He eventually developed a plan to work with Persia's King Xerxes to rule over all of Greece. Despite breaking with

Greek customs, when Pausanias is captured by the Greeks for transgressions, he is eventually let free because he was of noble birth, and they did not want to punish him too greatly. He ended up getting captured again immediately after being let go, however, when the Greeks learned that he still wanted to work with Xerxes to gain power. He went into a temple to hide from the Greeks. The Greeks did not go in to capture him, but they also did not leave. Eventually Pausanias died in the temple, refusing to meet his fate at the hands of the Greeks.

Greene notes that many people fall in love with other cultures, and this turns people from their own culture away because it generally involves a rejection of one's own culture and ways. This offends those who remain loyal to their ways as the person who deviates from their home culture generally places themselves above those who remain loyal. Therefore, Greene believes it is important to match outward appearances and language to that of those around you.

Greene goes on to discuss the Spanish persecution of Jewish people in the fourteenth century. Many of these people were forced to convert to Catholicism. They did so outwardly, and for three hundred years they gained access to the highest levels of Spanish society, displaying the outward signs of Christianity while retaining their Jewish beliefs privately. Greene writes, "if you stick to conventional appearances in public few will believe you think differently in private." He makes mention of a black sheep who is ultimately killed by wolves because it is shunned for looking different from the rest of the herd. Greene uses this as a warning about the importance of blending into one's surroundings. He does, however, admit that in very limited circumstances standing out can be beneficial, but this is only when a person already stands above those around them. As an example, he gives the fact that President Lyndon Johnson would sit on the toilet during meetings. Very few people have this level of power, however, and as such, the majority of people are best off allowing themselves to blend in.

This is only a selection of Greene's forty-eight laws. Included among the others are seemingly morally neutral suggestions such as "always say less than is necessary" and "use absence to increase respect and honor." Also included are rules that many people would consider to be morally suspect including "get others to do the work for you, but always take the credit," "pose as a friend, work as a spy," and "keep others suspended in terror." It is important to note that Greene does not try to make his readers morally admirable people or even happy people. He does not focus on living a well-rounded life or living with integrity. His purpose is to teach his reader how to get power and to keep power at all costs. Through delving deep into history as well as by looking at more recent examples of powerful people, Greene is able to exemplify his rules and show why they can lead one to power if that is where a person wants to find themselves.

THE SUMMARY IN BRIEF

In ***The Five Dysfunctions of a Team***, renowned author Patrick Lencioni turns his keen intellect and storytelling power to the fascinating, complex world of teams.

Using his familiar writing style of incorporating fables, Lencioni tells the story of Kathryn Petersen, DecisionTech's CEO, who faces the ultimate leadership crisis: How to unite a team that is in such disarray that it threatens to bring down the entire company. Will she succeed? Will she be fired? Lencioni's tale serves as a timeless reminder that leadership requires courage and insight.

Lencioni reveals the five dysfunctions that are at the very heart of why teams — even the best ones — often struggle. He outlines a powerful model and actionable steps that can be used to overcome these common hurdles and build a cohesive, effective team.

Lencioni's compelling fable offers a deceptively simple yet powerful message for all those who strive to be exceptional team leaders.

IN THIS SUMMARY, YOU WILL LEARN:

- How to overcome a lack of trust among team members.
- Ways to help a team engage in constructive conflict.
- How to follow a clear, concise and practical guide to using the five dysfunctions model to improve your team.
- What to do to achieve the real power of teamwork.

The Fable: Luck

Only one person thought Kathryn was the right choice to become CEO of DecisionTech, Inc. Luckily for her, that person was the chairman of the board.

And so, less than a month after the previous chief executive had been removed, Kathryn Petersen took the reins of a company that just two years earlier had been one of the most talked-about, well-funded and promising startup companies in the recent history of Silicon Valley. She could not have known just how far from grace the company had fallen in such a short period of time, and what the next few months had in store for her.

PART I: UNDERACHIEVEMENT

Aside from a brief reception on her first day and subsequent interviews with each of her direct reports, Kathryn spent almost all of her time walking the halls, chatting with staff members and silently observing as many meetings as she could find time to attend. And perhaps most controversial of all, she actually asked DecisionTech's former CEO and current head of business development, Jeff Shanley, to continue leading the weekly executive staff meetings, where she just listened and took notes.

The only real action that Kathryn took during those first weeks was to announce a series of two-day executive retreats in Napa Valley to be held over the course of the next few months. As though she needed to give them any more ammunition, none of her reports could believe she had the gall to take them out of the office for so many days when there was so much real work to be done.

And to make matters worse, when someone suggested a specific topic for discussion during the first retreat, Kathryn refused. She had her own agenda already set.

The Staff

Employees referred to the DecisionTech executives as "the Staff." No one referred to them as a team, which Kathryn decided was no accident.

In spite of their undeniable intelligence and impressive educational backgrounds, the Staff's behavior during meetings was worse than anything she had seen in the automotive world, where she had previously worked. Though open hostility was never really apparent and no one ever seemed to argue, an underlying tension was undeniable. As a result, decisions never seemed to get made; discussions were slow and uninteresting, with few real exchanges; and everyone seemed to be desperately waiting for each meeting to end.

PART II: LIGHTING THE FIRE

Kathryn chose Napa Valley for the off-site because it was close enough to the office to avoid expensive and time-consuming travel, but just far enough to feel out of town.

Kathryn smiled at her staff and addressed them calmly and gracefully.

"Good morning, everyone. I'd like to start the day by saying a few words. And this won't be the last time I say them".

"We have a more experienced and talented executive team than any of our competitors. We have more cash than they do. We have better core technology. And we have a more powerful board of directors. Yet, in spite of all that, we are behind two of our competitors in terms of both revenue and customer growth. Can anyone here tell me why that is?" There was silence.

Kathryn continued as warmly as when she started. "After interviewing with every member of our board and spending time with each of you, and then talking to most of our employees, it is very clear to me what our problem is." She paused before completing the thought. "We are not functioning as a team. In fact, we are quite dysfunctional."

The Speech

She continued. "I want to assure you that there is only one reason that we are here at this off-site, and at the company: to achieve results. This, in my opinion, is the only true measure of a team, and it will be the focus of everything we do today and as long as I'm here. It is my expectation that in the next year and the year after that, we will be able to look back on revenue growth, profitability, customer retention and satisfaction, and, if the market is right for it, maybe even an IPO. But I can promise you that none of that will happen if we do not address the issues that are preventing us from acting like a team."

Kathryn paused to let everyone digest the simplicity of her message, and then continued. "So, how do we go about this? Over the years I've come to the conclusion that there are five reasons why teams are dysfunctional."

She then drew an upward-pointing triangle on the whiteboard and divided it with four horizontal lines, creating five separate sections.

> If we don't trust one another, then we aren't going to engage in open, constructive, ideological conflict. . . we'll just continue to preserve a sense of artificial harmony.

Absence of Trust

"Right now I'd like to start with the first dysfunction: ***absence of trust.***" She turned and wrote the phrase at the bottom of the triangle.

She continued. "Trust is the foundation of real teamwork. And so the first dysfunction is a failure on the part of team members to understand and open up to one another. It is an absolutely critical part of building a team. In fact, it's probably the most critical.

"Members of great teams do not hold back with one another," she said. "They are unafraid to air their dirty laundry. They admit their mistakes, their weaknesses and their concerns without fear of reprisal."

Kathryn pushed on. "The fact is, if we don't trust one another — and it seems to me that we don't — then we cannot be the kind of team that ultimately achieves results."

Kathryn explained, "The only way to build trust is to overcome our need for invulnerability." She wrote the word invulnerability next to trust on the whiteboard.

Inattention to Results

Kathryn described the next dysfunction by writing the phrase ***inattention to results*** at the top of the triangle.

"We are going to the top of the chart now to talk about the ultimate dysfunction: the tendency of team members to seek out individual recognition and attention at the expense of results. And I'm referring to collective results — the goals of the entire team."

Nick, DecisionTech's chief operating officer, asked, "Is this about ego?"

"Well, I suppose that's part of it," agreed Kathryn. "But I'm not saying that there's no place for ego on a team. The key is to make the collective ego greater than the individual ones.

"When everyone is focused on results and using those to define success, it is difficult for ego to get out of hand," she added. "No matter how good an individual on the team might be feeling about his or her situation, if the team loses, everyone loses."

She wrote ***status*** and ego next to ***inattention to results*** on the whiteboard.

Fear of Conflict

Just above ***absence of trust*** Kathryn wrote ***fear of conflict.***

"If we don't trust one another, then we aren't going to engage in open, constructive, ideological conflict. And we'll just continue to preserve a sense of artificial harmony." She wrote artificial harmony on the whiteboard next to ***fear of conflict.***

Carlos, DecisionTech's head of customer support, weighed in. "But why is harmony a problem?"

"It's the lack of conflict that's a problem," Kathryn answered. "Harmony itself is good, I suppose, if it comes as a result of working through issues constantly and cycling through conflict. But if it comes only as a result of people holding back their opinions and honest concerns, then it's a bad thing. I'd trade that false kind of harmony any day for a team's willingness to argue effectively about an issue and then walk away with no collateral damage."

Lack of Commitment

Kathryn went back to the whiteboard. "The next dysfunction of a team is a ***lack of commitment*** and a failure to buy into decisions." She wrote this dysfunction above the previous one. "And the evidence of this one is ambiguity," which she wrote next to it.

"I'm talking about committing to a plan or a decision, and getting everyone to clearly buy into it. That's why conflict is so important," Kathryn explained. "When people don't unload their opinions and feel like they've been listened to, they won't really get on board. The point here is that most reasonable people don't have to get their way in a discussion. They just need to be heard, and to know that their input was considered and responded to."

Avoidance of Accountability

Kathryn went to the board for the last time and wrote ***avoidance of accountability.***

She explained, "Once we achieve clarity and buy-in, we have to hold each other accountable for what we sign up to do, for high standards of performance and behavior. And as simple as that sounds, most executives hate to do it, especially when it comes to a peer's behavior, because they want to avoid interpersonal discomfort."

"What exactly do you mean by that?" Jeff asked.

"I'm talking about that moment when you know you have to call one of your peers on something that matters, and you decide to let it go because you just don't want to experience that feeling of … interpersonal discomfort," Kathryn explained.

She wrote ***low standards*** next to ***avoidance of accountability*** on the whiteboard.

PART III: HEAVY LIFTING

Over the next two weeks, Kathryn began to push her team harder than ever before regarding their behavior. She chided Martin, DecisionTech's chief technologist, for eroding trust by appearing smug during meetings. She forced Carlos to confront the team about its lack of responsiveness to customer issues. And she spent more than one night with DecisionTech's CFO, Jan, and its head of sales, Nick, working through budget battles that had to be fought.

More important than what Kathryn did, however, was the reaction she received. As resistant as they might have seemed in the moment, no one questioned whether they should be doing the things that Kathryn was making them do. There seemed to be a genuine sense of collective purpose.

The only question that remained in Kathryn's mind was whether she could keep it going long enough for everyone to see the benefits.

PART IV: TRACTION

Over the course of the next year, DecisionTech grew its sales dramatically and met its revenue goals during three of the four quarters. The company moved into a virtual tie for the number one position in the industry, but had yet to separate itself from its chief rival.

With the substantial improvement in performance, the company saw turnover among employees subside and morale rise steadily, with the exception of a slight and temporary dip when the company missed its numbers.

Interestingly, when that happened, even the chairman called to encourage Kathryn not to get too disappointed in light of the undeniable progress she had made.

The March

With more than 250 employees, Kathryn decided it was time to trim down the number of executives who reported directly to her. She believed that the larger the company, the smaller the team should be at the top. And with the addition of a new head of sales and a human resources director, her staff had grown to a barely manageable eight. It wasn't that Kathryn couldn't handle the weekly one-on-ones, but it was increasingly difficult to have fluid and substantive discussions during staff meetings with nine people sitting around the table. Even with the new collective attitude of the members of the team, it would only be a matter of time before problems began to surface.

So more than a year after the final Napa off-site had ended, Kathryn decided to make a few organizational changes, which she delicately but confidently explained to each of her staff members.

The Team

A week later, another of Kathryn's quarterly two-day staff meetings took place. Kathryn told her staff, "Jeff won't be coming to these meetings any more." Jeff was DecisionTech's VP of development.

Everyone in the room was stunned by what Kathryn had said, and that she had said it with so little emotion.

She explained: "This was Jeff's idea."

That thought had not occurred to any of her executives. Kathryn went on. "He said that as much as he wanted to stay on the team, it made more sense for him to be part of Nick's sales group. I actually gave him a chance to change his mind, and he insisted it was the right thing to do for the company, and for the team."

Kathryn let the team members enjoy a silent moment of admiration for Jeff, their former CEO.

And then she continued. "I think we owe it to Jeff and everyone else at this company to make this work. Let's get started."

The Model

An Overview of the Model

Two critical truths are clear. First, genuine teamwork in

most organizations remains as elusive as it has ever been. Second, organizations fail to achieve teamwork because they unknowingly fall prey to five natural but dangerous pitfalls, which can be called the five dysfunctions of a team.

These dysfunctions can be mistakenly interpreted as five distinct issues that can be addressed in isolation from the others. But in reality they form an interrelated model, making susceptibility to even one of them potentially lethal for the success of a team. A cursory overview of each dysfunction and the model they make up should make this clearer.

Understanding the Five Dysfunctions

1. The first dysfunction is an **absence of trust** among team members. Essentially, this stems from their unwillingness to be vulnerable within the group. Team members who are not genuinely open with one another about their mistakes and weaknesses make it impossible to build a foundation for trust.
2. This failure to build trust is damaging because it sets the tone for the second dysfunction: **fear of conflict.** Teams that lack trust are incapable of engaging in unfiltered and passionate debate of ideas. Instead, they resort to veiled discussions and guarded comments.
3. A lack of healthy conflict is a problem because it ensures the third dysfunction of a team: **lack of commitment.** Without having aired their opinions in the course of passionate and open debate, team members rarely, if ever, buy in and commit to decisions, though they may feign agreement during meetings.
4. Because of this lack of real commitment and buy-in, team members develop an **avoidance of accountability**, the fourth dysfunction. Without committing to a clear plan of action, even the most focused and driven people often hesitate to call their peers on actions and behaviors that seem counterproductive to the good of the team.
5. Failure to hold one another accountable creates an environment where the fifth dysfunction can thrive. **Inattention to results** occurs when team members put their individual needs (such as ego, career development or recognition), or even the needs of their divisions, above the collective goals of the team.

And so, like a chain with just one link broken, teamwork deteriorates if even a single dysfunction is allowed to flourish.

Dysfunction No.1: Absence of Trust

Trust lies at the heart of a functioning, cohesive team. Without it, teamwork is all but impossible.

The kind of trust that is characteristic of a great team requires team members to make themselves vulnerable to one another and be confident that their respective vulnerabilities will not be used against them. These vulnerabilities include weaknesses, skill deficiencies, interpersonal shortcomings, mistakes and requests for help.

Overcoming Dysfunction No. 1

How does a team go about building trust? Unfortunately, vulnerability-based trust cannot be achieved overnight. It requires shared experiences over time, multiple instances of follow-through and credibility, and an in-depth understanding of the unique attributes of team members. However, by taking a focused approach, a team can dramatically accelerate the process and achieve trust in relatively short order. Here are a few tools that can bring this about:

- **Personal Histories Exercise.** This low-risk exercise requires nothing more than going around the table during a meeting and having team members answer a short list of questions about themselves.
- **Team Effectiveness Exercise.** This exercise requires team members to identify the single most important contribution that each of their peers makes to the team, as well as the one area that they must either improve upon or eliminate for the good of the team.
- **Personality and Behavioral Preferences Profiles.** Some of the most effective and lasting tools for building trust on a team are profiles of team members' behavioral preferences and personality styles. The best profiling tool is the Myers-Briggs Type Indicator (MBTI).
- **360-Degree Feedback.** These tools call for peers to make specific judgments and provide one another with constructive criticism.

The Role of the Leader in Building Trust

The most important action that a leader must take to encourage the building of trust on a team is to demonstrate vulnerability first. This requires that the leader risk losing face in front of the team, so that subordinates will take the same risk themselves. Team leaders must create an environment that does not punish vulnerability. Displays of vulnerability on the part of a team leader must be genuine; they cannot be staged.

Dysfunction No.2: Fear of Conflict

Teams that engage in productive conflict know that its only purpose is to produce the best possible solution in the shortest period of time. They discuss and resolve issues more quickly and completely than other teams do, and they emerge from heated debates with no residual feelings or collateral damage, but with an eagerness and readiness to take on the next important issue.

Overcoming Dysfunction No. 2

How does a team go about developing the ability and willingness to engage in healthy conflict? The first step is to acknowledge that conflict is productive and that many teams have a tendency to avoid it. As long as some team members believe that conflict is unnecessary, there is little chance that it will occur. But beyond mere recognition, there are a few simple methods for making conflict more common and productive:

- **Mining**. Members of teams that tend to avoid conflict must occasionally assume the role of a "miner of conflict" — someone who extracts buried disagreements within the team and sheds light on them. Some teams may want to assign a member of the team to take on this responsibility during a given meeting or discussion.
- **Real-Time Permission**. In the process of mining for conflict, team members need to coach one another not to retreat from healthy debate. One simple but effective way to do this is to recognize when the people engaged in conflict are becoming uncomfortable with the level of discord, and then interrupt to remind them that what they are doing is necessary.
- **The Thomas-Kilmann Conflict Mode Instrument**. This tool, commonly referred to as the TKI, allows team members to understand natural inclinations around conflict so they can make more strategic choices about which approaches are most appropriate in different situations.

The Role of the Leader in Overcoming the Fear of Conflict

It is key that leaders demonstrate restraint when their people engage in conflict, and allow resolution to occur naturally, as messy as it can sometimes be.

A leader's ability to personally model appropriate conflict behavior is essential. By avoiding conflict when it is necessary and productive — something many executives do — a team leader will encourage this dysfunction to thrive.

Dysfunction No.3: Lack of Commitment

In the context of a team, commitment is a function of two things: clarity and buy-in. Great teams make clear and timely decisions and move forward with complete buy-in from every member of the team, even those who voted against the decision. They leave meetings confident that no one on the team is quietly harboring doubts about whether to support the actions agreed on.

The two greatest causes of a lack of commitment are the desire for consensus and the need for certainty:

- **Consensus**. Great teams understand the danger of seeking consensus, and find ways to achieve buy-in even when complete agreement is impossible. They understand that reasonable human beings do not need to get their way in order to support a decision, but only need to know that their opinions have been heard and considered.
- **Certainty**. Great teams also pride themselves on being able to unite behind decisions and commit to clear courses of action even when there is little assurance about whether the decision is correct. They realize that it is better to make a decision boldly and be wrong — and then change direction with equal boldness — than it is to waffle.

Overcoming Dysfunction No. 3

How does a team go about ensuring commitment? By taking specific steps to maximize clarity and achieve buy-in, and by resisting the lure of consensus or certainty. Here are a few simple but effective tools and principles:

- **Cascading Messaging.** At the end of a staff meeting or off-site, a team should explicitly review the key decisions made during the meeting and agree on what needs to be communicated to employees or other constituencies about those decisions.
- **Deadlines.** One of the best tools for ensuring commitment is to use clear deadlines for when decisions will be made and honor those dates with discipline and rigidity.
- **Contingency and Worst-Case Scenario Analysis.** A team that struggles with commitment can begin overcoming this tendency by briefly discussing contingency plans up front or, better yet, clarifying the worst-case scenario for a decision they are struggling to make.
- **Low-Risk Exposure Therapy.** Another relevant exercise for a commitment-phobic team is to demon-

strate decisiveness in relatively low-risk situations. When teams force themselves to make decisions after substantial discussion but little analysis or research, they usually come to realize that the quality of the decision was better than they expected.

The Role of the Leader in Building Commitment

More than any other member of the team, the leader must be comfortable with the prospect of making a decision that may ultimately turn out to be wrong. And the leader must be constantly pushing the group for closure around issues, as well as adherence to schedules that the team has set. What the leader cannot do is place too high a premium on certainty or consensus.

Dysfunction No.4: Avoidance of Accountability

In the context of teamwork, accountability refers specifically to the willingness of team members to call their peers on performance or behaviors that might hurt the team.

The essence of this dysfunction is an unwillingness by team members to tolerate the interpersonal discomfort that accompanies calling a peer on his or her behavior and the more general tendency to avoid difficult conversations. Members of great teams overcome these natural inclinations, opting instead to "enter the danger" with one another.

Members of great teams improve their relationships by holding one another accountable, thus demonstrating that they respect each other and have high expectations for one another's performance.

The most effective and efficient means of maintaining high standards of performance on a team is peer pressure. More than any policy or system, there is nothing like the fear of letting down respected teammates to motivate people to improve their performance.

Overcoming Dysfunction No. 4

How does a team go about ensuring accountability? The key to overcoming this dysfunction is adherence to a few classic management tools that are as effective as they are simple:

- **Publication of Goals and Standards.** A good way to make it easier for team members to hold one another accountable is to clarify publicly exactly what the team needs to achieve, who needs to deliver what and how everyone must behave in order to succeed.
- **Simple and Regular Progress Reviews.** Team members should regularly communicate with one another, either verbally or in writing, about how they feel their teammates are doing against stated objectives and standards.
- **Team Rewards.** By shifting rewards away from individual performance and toward team achievement, the team can create a culture of accountability. This occurs because a team is unlikely to stand by quietly and fail because a peer is not pulling his or her weight.

The Role of the Leader in Instilling Accountability

One of the most difficult challenges for a leader who wants to instill accountability on a team is to encourage and allow the team to serve as the first and primary accountability mechanism.

Once a leader has created a culture of accountability on a team, however, he or she must be willing to serve as the ultimate arbiter of discipline when the team itself fails. This should be a rare occurrence. Nevertheless, it must be clear to all team members that accountability has not been relegated to a consensus approach, but merely to a shared team responsibility, and that the leader of the team will not hesitate to step in when necessary.

Dysfunction No.5: Inattention to Results

The ultimate dysfunction of a team is the tendency of members to care about something other than the collective goals of the group. An unrelenting focus on specific objectives and clearly defined outcomes is a requirement for any team that judges itself on performance.

Results are not limited to financial measures, like profit, revenue or shareholder returns. This dysfunction refers to a far broader definition of results, one that is related to outcome-based performance.

Every good organization specifies what it plans to achieve in a given period, and these goals, more than the financial metrics that they drive, make up the majority of near-term, controllable results. So, while profit may be the ultimate measure of results for a corporation, the goals and objectives that executives set for themselves along the way constitute a more representative example of the results it strives for as a team. Ultimately, these goals drive profit.

But what would a team be focused on other than results? Team status and individual status are the prime candidates.

- **Team Status.** For members of some teams, merely being part of the group is enough to keep them satisfied. For them, achieving specific results might be desirable, but not necessarily worthy of great sacrifice or inconvenience.
- **Individual Status.** A functional team must make the collective results of the group more important to each individual than individual members' goals.

Overcoming Dysfunction No. 5

How does a team go about ensuring that its attention is focused on results? By making results clear, and rewarding only those behaviors and actions that contribute to those results.

- **Public Declaration of Results.** Teams that are willing to commit publicly to specific results are more likely to work with a passionate, even desperate desire to achieve those results.
- **Results-Based Rewards.** An effective way to ensure that team members focus their attention on results is to tie their rewards, especially compensation, to achieving specific outcomes.

The Role of the Leader in Focusing a Team on Results

Perhaps more than with any of the other dysfunctions, the leader must set the tone for a focus on results. If team members sense that the leader values anything other than results, they will take that as permission to do the same for themselves. Team leaders must be selfless and objective, and reserve rewards and recognition for those who make real contributions to achieving group goals.

Conclusion

The reality remains that teamwork ultimately comes down to practicing a small set of principles over a long period of time. Success is not a matter of mastering subtle, sophisticated theory, but rather of embracing common sense with uncommon levels of discipline and persistence.

Ironically, teams succeed because they are exceedingly human. By acknowledging the imperfections of their humanity, members of functional teams overcome the natural tendencies that make trust, conflict, commitment, accountability and a focus on results so elusive.

Patrick Lencioni is founder and president of The Table Group, a management consulting firm specializing in executive team development and organizational health. As a consultant and keynote speaker, he has worked with thousands of senior executives in organizations ranging from Fortune 500s and high-tech startups to universities and nonprofits. The 80/20 Manager

The Secret to Working Less and Achieving More

by Richard Koch

THE SUMMARY IN BRIEF

Do you feel overwhelmed by an overflowing inbox? Are you constantly struggling to finish your to-do list? Do you stay at work longer than you would like and feel as though you never spend time on the things that really matter?

Bestselling author Richard Koch shows how the 80/20 Principle — the idea that just 20 percent of our time, effort and key decisions generates 80 percent of our success — can be used at all levels of business. Now, in *The 80/20 Manager*, he demonstrates how to apply this groundbreaking principle to management.

The Principle is predicated on a strange economic phenomenon first outlined over 100 years ago by Vilfredo Pareto. The "Pareto Rule" is at the heart of the 80/20 Principle. The Principle is that a small number of events give rise to the majority of effects. Therefore, *very few things matter at all; but those that do, matter enormously*. The Principle is not a theory. It came from observation — from examining the relationship between a number of causes and a number of results, both expressed as percentages.

How does this apply to management? A manager can be much more efficient and effective if he or she applies 80/20 to their own situations. The principle is weird and counterintuitive and based on the premise that most effort is a waste of time, but a few, well-chosen interventions can turn this upside down. The true value of the Principle is that it helps us to identify those few activities that we should pursue because they will lead to great results.

IN THIS SUMMARY, YOU WILL LEARN:

- How to achieve exceptional results without working so hard.
- How to focus on the issues that really matter and ignore those that don't.
- How to ask the right questions and find the right connections.
- How to find meaningful achievement by defining the core of the firm and yourself.
- How to value thought above action to create winning strategies.

THE COMPLETE SUMMARY: **THE 80/20 MANAGER**

by Richard Koch

The author: Richard Koch is the author of the bestseller *The 80/20 Principle,* which has sold over a million copies and been published in 34 languages. He is also a highly successful entrepreneur and investor whose ventures have included Filofax, Plymouth Gin, Belgo Restaurants and Betfair, the world's largest betting exchange. A cofounder of L.E.K. Consulting, he was a partner at Bain and Company.

PART I: The Question Are You Overwhelmed?

Would You Like to Simplify Your Work and Life?

Work is overwhelming. Do you find that? Does everything pile up in your inbox and on your desk? Do you feel like you're always behind? Do you have a sinking feeling on your way to work and a guilty feeling on the way home? Do you suspect that your bosses neither understand nor care?

If you can identify with any of these issues, I have some good news for you: *Work doesn't have to be that way*.

Unsurprisingly, the great majority of managers find work overwhelming — frenzied, stressful, complex, unrelenting, exhausting and demoralizing. But a small minority has managed to buck the trend. They are optimistic, confident, relaxed and happy. They keep their work and their lives simple.

Two Ways to Manage

There are two ways to manage. You were probably taught the standard way to manage, or maybe you picked it up by osmosis:

- You work hard, often putting in long hours, and are highly visible and available.
- You are continually busy, exhibiting a buzz of activity.
- You answer inputs in a timely and linear way. If someone sends you an email, you respond promptly. This seems perfectly natural and no more than good manners. However, it is time consuming.
- You have some discretion about what you're doing and the way it is done, but always within the constraints of company policy, teamwork and what your bosses want.
- There is an unspoken rule that you should not be too different in style or behavior from the bulk of your bosses and other colleagues.

In practice, this management approach quickly leads to overload. You slip behind with your work and never really catch up.

The other way to manage is much less prevalent, but the road less travelled is more peaceful. If you are one of these rare managers,

- You generally put in fewer hours than your colleagues.
- You are — unfashionably — not very action-oriented. You spend a lot of time thinking and a considerable amount talking face-to-face. Much of your time is spent out of the office.
- You focus on outputs, not inputs. You often do not feel the need to respond to incoming emails or texts immediately, only answering them at particular times of the day. Each morning, you work out the one thing you want to accomplish that day. Then, you do nothing else until that task is complete.
- You keep your work simple. You remove or ignore the trivial clutter that routinely strangles your colleagues. You work primarily on what can be done quickly yet will make a big difference. As far as possible, you delegate or overlook everything else.

Rebecca Clement, Publisher; **Sarah Dayton**, Editor in Chief; **Ashleigh Imus**, Senior Editor; **Amanda Langen**, Graphic Designer; **Janet Lloyd Murphy**, Contributing Editor

- In a quiet way, you're a non-conformist. You are still a team player, accessible and friendly, but you often say things that surprise your colleagues. You can be inconsistent, and you ask a lot of questions. You do things your way.
- You feel successful, although your definition of "success" may not match anyone else's!
- Superficially, you seem quite similar to your colleagues because you don't make a big deal about your differences. Only those who know you well realize how unusual you are. The biggest difference of all is that you are unstressed, unhurried and usually happy.

The difference is not a matter of temperament and personality. What makes these managers different is not what they feel but the way they think. They have a secret weapon … they understand the Principle.

The Secret Weapon

The secret weapon is the 80/20 Principle. It is the observation that the lion's share of results comes from a small amount of effort and energy. Only 20 percent of your time will generate more than 80 percent of your useful results. And 20 percent of your decisions will lead to more than 80 percent of your success and happiness — or the opposite. The amazing thing about the Principle is that very few things matter at all; but those that do, matter enormously.

The true value of the Principle is that it helps us to identify those few activities that we should pursue because they will lead to great results. Awareness of the Principle enables us to simulate, multiply and accelerate those things we want to happen.

Why Does the Principle Matter to Managers?

One of the most harmful, ridiculous, idiotic, yet enduring assumptions of the business world is that *all* sales are good, *all* revenue is valuable, and *all* sources of revenue are of roughly equal importance. They are not.

The delusion that all revenue is good drives the worst and most palpably absurd blunders in the business world. It leads to enormous amounts of energy and money being wasted in chasing totally unsuitable customers. It also drives expensive and sometimes fatal acquisitions. The same misguided assumption encourages expansion into new products that have limited appeal among the firm's core customers or don't fit its channels of distribution and brand positioning.

The assumption that all sales are good leads to profitless growth. So, why do otherwise good managers make these mistakes? Because they think the world is 50/50. They think that results flow from causes in a linear and roughly equal way. They think that all revenues lead to profits. They think in *averages*. They don't understand that the world is really 80/20.

It is likely that only about one-fifth of customers are worth around four-fifths of a company's value; which means that the other four-fifths are worth only one-fifth. If you do the sums, you realize that one core customer is worth *16 times* one ordinary customer.

The value of 80/20 thinking is that it can change your mindset from a widely accepted yet wholly inaccurate way of viewing the world to one that is harder to believe but infinitely more accurate. The Principle provides a new window on the world — one that is hard to accept and understand but gives us rare insight and radically improves our effectiveness.

PART II: The Answer
Ten Ways to Be an 80/20 Manager

Don't be daunted by the fact that there are 10 different ways. Think of them as a menu from which you can pick and choose, not a checklist of skills that you must master. In fact, being brilliant at one of the 10 ways will take you an awful lot further than being competent at all 10.

Way One: The Investigating Manager

What do you do when you know you have a problem but don't know how to fix it? The first thing is to investigate what is wrong.

A Questioning Mind

Children learn to ask questions very early on, opening new windows on their world. Questions enable them to piece together connections in the mystery of life and understand how they fit into the big picture.

As we grow older, though, we tend to stop asking questions and start offering answers — usually not especially original ones. We stop thinking. Because we stop asking questions, we lose the ability to uncover fresh patterns. Life becomes less mysterious, more dull. Detectives — and some scientists — are among the few adults who still think like children. They get their kicks by asking questions and increasing their knowledge as a result.

Managers should behave in the same way. Asking questions and not automatically believing what everyone else believes or accepting everything you are told — in other words, investigative thinking — is an 80/20 activity. It

yields occasional insights that turn reality on its head and enable you to move to a higher plane of existence.

In business, the most potent type of investigation looks beyond averages, because averages can be misleading. Business is not driven by averages; it is driven by exceptions, extremes. Beneath the average there are always a few good forces and a mass of mediocre or bad ones. The investigating manager's mission is to work out which is which.

What is Your Firm's "Core"?

Just a few products and a few customers really count, while most of the rest drag down your profits, so most of a firm's activities are largely irrelevant, while a few are extraordinarily important and give the business its reason to exist.

This is the concept of the "core." It consists of the 1-20 percent of what your company does (and what it is) that makes you different from any other firm in your sector and delivers most of your value to the world.

Firms without a strong core don't become well known. Nor do they last long. Firms with a strong core can change the world.

Harvard Business School professors David Collis and Cynthia Montgomery talk about a business's "core resources." The idea of core resources encompasses not just what the firm does well but its physical assets, such as great location, and its intangible assets, such as a great brand or the ability to work in a unique way. Collis and Montgomery provide five criteria for a core resource, all of which must be met:

- Hard to copy
- Depreciate slowly
- Controlled by the company, not by employees, suppliers or customers.
- Secure against substitution by a new product, service or technology.
- Clearly superior to any rival's comparable resource.

If you are ruthless in testing your own firm's resources against these criteria, you will typically find that it has only one or two core resources. Once you establish what they are, you can focus everyone's energy on building them up. As a result, your company will soon have a much greater impact on the world.

Way Two: The Superconnecting Manager

Weak Links, Powerful Effects

Who do you think can provide the most help in your work and life? Your close colleagues? Friends and family? Or people you hardly know and rarely see?

The answer is surprising. Great leaps forward in our lives — such as getting a fantastic new job or finding the key to transforming a business — are more likely to come out of the blue, from casual acquaintances, and fully utilizing the "weak links" we all have in profusion.

In a seminal paper, sociologist Mark Granovetter speculated why family and friends — who are strongly motivated to help — are usually less valuable than casual acquaintances in our career turning points. He came to the conclusion that our friends, family and close colleagues form a "closely knit clump of social structure" where most contacts are in touch with the others. These close contacts have access to the same information we have, but not much more. So we have to move outside our immediate circle and contact the distant extremities of our social network to gain fresh insights and learn new information.

How to Become a Superconnector

A superconnector links people from disparate backgrounds, acting as a bridge between people who would benefit from knowing each other but don't.

Here's how to become a superconnecting manager:

- Begin by improving your network of connections within the firm, especially with high-performing (80/20) managers and with "diverse" links — executives who are dissimilar to you and those who work in other departments or distant locations.
- Use travel for work business to get to know your acquaintances better.
- Join cross-disciplinary and cross-location project teams.
- If you can, work overseas for a time.
- Be willing to change firms even if you are feeling comfortable in your existing job, and then keep in touch with your former colleagues.
- Gravitate towards departments and jobs that require extensive external contact — for example, marketing or customer-facing roles.
- Form a dining club of external, friendly acquaintances.
- Learn about new ideas by reading magazines, trade journals and books that nobody else in the firm is likely to read.

Once you are open to the world, connecting people and ideas becomes second nature, and life takes on numerous delightful new dimensions.

Way Three: The Mentoring Manager

"Mentoring" and "being mentored" are just fancy terms for teaching and learning. Except that both can be very personal. Look back on all the jobs you've had — including different jobs in the same firm — and ask what you learned in each job and how. Chances are that your most valuable lesson came from a boss or colleague.

So, the question to answer is this: Are you willing to invest in *your* people? Their growth matters more than marketing, strategy, finance, technical skills, industry knowledge or customer intimacy.

How to Become a Mentoring Manager

Here are some of the ways in which the 80/20 Principle applies to mentoring:

- Fewer than 20 percent of managers are effective mentors, yet this small group of leaders probably accounts for more than 80 percent of the performance difference attributable to the human factor.
- Mentoring is a great example of how a small amount of energy can produce amazing results. Because people yearn for attention, direction and encouragement, a few minutes of your time can keep them motivated throughout the working week.
- You are likely to achieve the best mentoring results through the least effort if you tell your people about the Principal and the 10 ways to become a super-effective manager.
- Get everyone you mentor to agree to mentor at least two other people in the firm.
- Make raising the performance of the people they mentor an important part of performance appraisal for your managers.
- The Principle suggests that there will be only a few great mentors in any firm. So, identify the great mentors, analyze precisely what they do, and imitate them.

How to Find Great Mentoring

It doesn't matter who you are — the lowliest clerk, the CEO of a multinational corporation or the President of the United States — we all need support and coaching. We all need mentors.

Tips for acquiring and retaining a really good mentor include:

- Go for quality over quantity. One terrific mentor is worth five very good ones.
- Once you've found your mentor, don't demand too much of their time.
- Listen intently. Few people like to be brutally honest, so learn to read between the lines.
- The best advice is useless unless you act upon it.
- Give something back. Mentees can also introduce mentors to some angles they never would have found on their own.

Way Four: The Leveraged Manager

To be a leveraged manager, you should exploit as many levers as you can. A "lever" in this context is any simple device that has the power to multiply the effectiveness of your input and so allows you to achieve extraordinary results through ordinary effort. Here are the seven levers for great results:

1. **Caring and the power of the subconscious**
   The subconscious is better than conscious thought for solving all the really interesting problems. You have probably experienced an idea popping into your head seemingly from nowhere. But that happens only when you truly care about something.
2. **Confidence**
   Confidence has the power to generate a super-positive force field, life-saving energy, impossibility-defying ingenuity.
3. **Ideas**
   Every business starts with an idea. And if the business is to thrive, that idea has to be a good one. But every idea can be improved.
4. **Decisions**
   Without decisions, we drift rudderless on the sea of life. If we are decisive, we might well succeed. If we are indecisive, we never will. Focus on taking the few crucial decisions, those that could transform your business and your life, and let the rest go hang.
5. **Trust**
   The essence of trust is that you focus on the outputs, not the inputs, and you allow your people to do the same. A lack of trust requires constant supervision, which makes it horrendously inefficient. It is the antithesis of the 80/20 approach.
6. **People**
   Invest whatever money, time, energy and persuasion are necessary to recruit the very best in your industry. Recruiting the best staff is just as important as attracting the best customers, perhaps even more so.

7. **Money**
   As a manager with a good idea, you can afford to think big because the money for the project comes from the company. If the project takes off, so will you. If it fails, you won't have to pay back the investment. Launch the largest projects. This is what 80/20 managers do.

Using the seven levers is a little different from the other nine ways to be an 80/20 manager in that these levers naturally help and reinforce all of the other approaches.

Way Five: The Liberating Manager

A liberating manager must be utterly honest with his or her people, supportive and friendly yet very demanding. The liberating manager brings out the best in all of his or her people for the benefit of each individual and the firm.

Making Creativity Work for You

To get the best out of your people, you need to open up their creative side — the 20 percent of their abilities and personality that can lead to more than 80 percent of what they can deliver. You need to liberate them to achieve their full potential, which means identifying their few outstanding personal "spikes," then encouraging them to nurture and deploy these skills in ways that will benefit the team and the firm.

If someone's creative side is to flourish, they need to work in an honest, friendly, open environment. Historically, firms have been extremely bad at providing this, and big firms have typically been the worst of all. These organizations have been based on power, fear and tight supervision.

However, there is nothing soft and squidgy about being a liberating manager. It demands high rather than low standards. A performance culture without liberation is a pity, but a liberating culture without performance is unsustainable. The liberating manager chooses to work in one of the few firms that encourage high performance and personal liberation.

Way Six: The Manager Seeking Meaning

Nothing is more important than achieving meaning in your life. Viktor Frankl, the Austrian doctor and philosopher, said meaning derives from achievement — from creating something or performing a deed that derives from your unique imagination and talents. Happiness is a by-product of leading a life with meaning.

Achievement, and therefore success, in any field goes disproportionately to the few. The more results depend upon individual imagination, personality and unique skills, the more the Principle operates.

Unique accomplishments rest on finding meaning in work, and they give back compounded meaning to life. Real achievement makes you feel proud and useful. Yet meaning is also subject to the Principle. Very few people find true meaning in their lives, but these are the ones who fuel progress for the world as a whole.

Be Incredibly Selective

Choosing where to work is as important as what you do while you are there. This one decision — usually made very quickly — can have a bigger impact on your success and happiness than years of toil. Most managers allow the organization to select them. It should be the other way round. If you are looking for meaning, you must take a different approach which includes five aspects: the field in which you work must turn you on; the job must give you rare knowledge; the firm must inspire by love rather than rule by fear; you must like your colleagues and bosses, and they must like you; and finally, the firm must be going places.

Finding Your Core

Successful investigating managers understand the importance of identifying their firm's core, and this process is just as important for those managers who are determined to find meaning in their work. To do so, polish and hone your core attributes so that they become ever more powerful and appreciated. Consider these questions:

- What can I do faster, better, more elegantly and with less trouble than almost anyone else?
- What are the best results I've ever achieved in my life? How did I do it?
- Who are my core customers, the few significant people inside and outside the firm who are most impressed by what I can do and who most value my contribution?
- Do I naturally identify with these core customers, or is there a different group with whom I might identify more?
- Am I better at thinking or doing? What kind of thinking or doing?
- Which few things do I enjoy or intensely experience more than any others?

- When have I pointed in a direction different from everyone else and been proved right?

If you are uncertain what your core is, experiment with various jobs until you find your niche, the unique role that will allow you to reach glorious new heights. But make sure that your core is congruent (or at least overlaps and is compatible) with the core of the business where you work.

Way Seven: The Time-Rich Manager

Value is not related to time but to ideas, collaboration and the power of our intent as human beings to do what we do. The further up the value ladder we climb, the more this is true. In creative work — including that of all the best managers — value is hardly related to time at all. Once we realize this, we become free. Time itself does not create stress. We do, by thinking our value is constrained by the amount of time we put in.

Eight Ways to Become Time Rich

There are eight steps to working fewer hours and achieving better results. But before embarking on them, change your attitude. Are you prepared to focus all your energy on the vital few and ignore the trivial many? If so,

- Maximize your freedom to work how you want.
- Select just *one* priority each day and tackle it first.
- Think before you act.
- Identify the few causes of success in your firm or team.
- Listen to your core customers.
- Make your team 80/20 managers.
- Identify the 20 percent of your work that results in 80 percent of your happiness and effectiveness.
- Progressively reduce your working hours.

Becoming time-rich boosts your health and relationships. It's also the way to reach your full potential. But don't think it'll be easy. In discarding the trivial and focusing on the essential, you will have to reject the habits of a lifetime.

Way Eight: The Simplifying Manager

The best business strategies are always simple, reining the business back to its core customers, deepening relationships with them, and providing only the products that they want. Firms win when they focus on the simplest 20 percent — their most authentic and distinctive core, the most powerful fifth of what they are and what they do. The same goes for managers. The simplest, most authentic, distinctive and powerful 20 percent of what you do should be your exclusive focus. And only one thing should really matter to you at any one time.

How to Simplify Your Work

The essence of simplification is grasping what is and what is not important in a complex picture, then reducing this to something that is recognizable and easily understandable. The Principle states that most things are unimportant. So the challenge is to find the small parts of the picture that are truly crucial and recognizable and then to render the insight memorably in a concise phrase or a product in a form that is intuitive and easy to use. A large part of simplification resides in communication — through the product itself, the brand and associated promotion.

Reframing Reality

The mark of a great leader is someone who simplifies in such a way that his or her listeners grasp *one powerful conclusion and then act on it*. Inevitably, simplification always includes an element of distortion; but the distortions of a great leader are geared to constructive reinterpretation of reality in such a way that the audience knows how to overcome the roadblocks.

Simplification is not just about the big issues in our society and our businesses. It is also about *us.* It involves interpreting and reinterpreting our past, drawing conclusions about the future, de-cluttering our daily lives, and realizing that our minds can act effectively on only a few really simple messages. We need to feed our minds simple messages if we are to act super-effectively.

Way Nine: The Lazy Manager

The Right Sort of Laziness

Contrary to conventional wisdom, managers can be "lazy" and still achieve the status of greatness in their industries. The catch is that this type of laziness must be complemented by high intelligence to truly be an 80/20 strategy. These managers must also possess a host of other virtues, such as thoughtfulness, originality and vision — as well as some less attractive qualities, including at least a pinch of arrogance, narcissism and self-indulgence.

We do not normally associate laziness with determination, but the determination to find a much better solution involving much less effort is the highest form of laziness. It is the very essence of the 80/20 Principle in action. Those

who practice it are *visionary* managers — lazy, thoughtful, inventive and possessing a self-confidence bordering on the most constructive form of arrogance. Their brilliance gives them the confidence to be lazy, and their laziness gives them the freedom to find shortcuts to better results through less effort.

It is easier to make a few really good decisions if you don't waste your time on things that will never be life-changing. Laziness, selectivity and confidence compound each other and are the nearest we can get to a short formula for extraordinary achievement.

Way Ten: The Strategic Manager

The final way to become an 80/20 manager can be demanding. It is, however, often the most valuable and rewarding route. This is the world of the strategic manager. Strategic managers create fantastic value by re-imagining their industry.

By devising fresh ways of doing business, strategic managers provide unique products or services for which customers are happy to pay a premium, or they cut costs without reducing quality, or ideally, they do both. The new way of doing business is highly profitable — it is an 80/20 solution.

The Essential Characteristics of the Strategic Manager

Strategic managers often reach for the stars, but strategic management can be applied to any level of ambition — as long as it yields exceptional results for unexceptional effort. All strategic managers value thought above action. Unlike most of their colleagues, they never let action — or conformity — drive out thought. Then they think very hard about how to do more with less.

Mastering the art of thinking is only the first step in becoming a strategic manager, though, because serious thought inevitably leads to uncertainty; after all, if there wasn't uncertainty, there would be no need to think. Thinking always involves risk — it may force you to commit to something unfamiliar, daunting and possibly even harmful. Acting on an innovative idea is a gamble because you will be staking your reputation, time, energy and the firm's resources without knowing what will happen.

Successful strategic managers also need the extreme ambition to create a better business model, an understanding of how to achieve this, and the determination to make it happen. Once these elements are in place, the rewards for one bright idea can be enormous.

Finale: The 80/20 Manager and the 80/20 Organization

80/20 managers need 80/20 organizations, just as 80/20 organizations need 80/20 managers. 80/20 companies possess proprietary knowledge and earn high returns, mainly from leadership positions in high-growth markets. They are innovators that have reinvented their markets. A corporation that is growing fast and is sustainably profitable is an 80/20 company, even if none of its managers have heard of the Principle.

Like an 80/20 manager, a "super 80/20 company" would use the same highly selective strategies in conducting its business. This company would, among other things, turn their people into 80/20 managers, run 80/20 workshops, develop mentoring programs to reinforce and extend 80/20 learning, build 80/20 project teams, establish weak links to contrasting teams and individuals outside the firm and "twin" with another 80/20 company in a different industry or country to share knowledge and insights.

In these organizations, the best leaders openly encourage their people to take control of their careers and then maintain lifelong, friendly relationships with their former protégés. They appreciate that there is no shortage of talent; there is only a shortage of firms that are prepared to liberate it. Greatness is collective, but its foundation is individual and ever-shifting. Liberating greatness within yourself and then within your colleagues might seem to need a miracle, but it's easy once you know how. The secret to being an 80/20 manager is to realize sky-high aspirations through intelligence and acute observation instead of through toil and trouble. Like angels, we can soar and lift humanity while scarcely flapping our wings. But unless we care deeply about specific results and unless our ambition is boundless, we will never even take off.

RECOMMENDED READING LIST

If you liked *The 80/20 Manager*, you'll also like:

1. ***No More Pointless Meetings by Martin Murphy.*** Murphy reframes the entire concept of collaboration and introduces four "Work Sessions" that replace meetings to get more done, faster than ever before.

2. ***Extreme Productivity by Robert C. Pozen.*** Pozen explains how to determine your highest priorities and match them with how you actually spend your time.

3. ***The Pause Principle by Kevin Cashman.*** Cashman describes the need to pause to grow personal leadership, develop others, and foster a culture of innovation.

THE SUMMARY IN BRIEF

Great leaders know how to build a culture of creativity that churns out high-performing teams. These teams then become the greatest competitive advantage a business can have.

The book ***The Advantage of Other: A Leader's Guide to Building an Equitable, Dynamic, and Productive Workplace*** explores the five pillars that build the foundation of a successful organization. The pages within transform into a personal (and practical) guide for anyone who wants to shape their leadership approach around diversity, equity, and inclusion.

Author Nancy Geenen unfolds a step-by-step journey toward creating a solid culture of inclusivity and building a team that drives your organization toward success. Every chapter of the book overflows with personal anecdotes, recommendations for personal and professional growth, and clear goals and objectives.

IN THIS SUMMARY, YOU WILL LEARN:

- Why people are the greatest competitive advantage in our businesses.
- How, as a leader, you can commit to diversity, equity, and inclusion in the workplace.
- About your people, your presence, your pipeline, your profits, and your partners.
- How to build an equitable, dynamic, and productive workplace.

Introduction

Our employees are the competitive advantage in our businesses. This book is designed to support business leaders who are committed to diversity, equity, and inclusion in the workplace.

Diversity is the representation of many identities and lived experiences. Equity is the access to career opportunities, resources, and tools needed to thrive uniquely in the workplace. Inclusion is the impact on the team member that lets them trust that they are both seen and heard and heard because they are seen.

The best leaders recognize there is a difference between leading and managing. Leading is a way of being accountable to oneself and the team. Managing is a way of holding the team accountable to each other. We have got to create a leadership culture of mattering and belonging in business for both short and long-term sustainability and growth.

Chapter 1: The Power of Story

Before we dive into the broader ideas of diversity, equity, and inclusion at work, I invite you to get curious and approach this book with the wonder of a child. To be childlike is to ask questions and learn new skills, all while being secure in the space of not knowing. The path to leadership has many, many steps, and mastering it requires consistent intention and attention.

We all have a story to tell. More importantly, re-examine the stories that you have always told yourself, and dive deeper into the truths that these stories hold. When we share our stories, we see the similarities and differences among us. From there, we discover how to learn from one another and from one another's stories. Sharing your story is one of the best ways to create and build trust.

Everyone has a very deep need to be seen and heard, to achieve and be accepted, to belong, and to matter. Approach everything with a childlike curiosity. Stay curious throughout your journey. Enjoy being a beginner and enjoy the journey toward mastery, which never ends. To carve a life story worth telling, figure out what your unique ability is, what you love doing, and what comes easily and effortlessly to you.

Chapter 2: Your People

Above everything else, leadership is about giving of yourself. Your time and attention are the most valuable resources your team can have access to. It's your job to make sure your stakeholders, your team, your customers, your suppliers, and even your wider network feel seen and heard.

Recognize that you're a team. While leadership requires some degree of personal work, the simplest thing you can do as a leader is to refocus your attention on the people you work with instead of yourself. Ask yourself, "What do I love about my work?" "What's not working?" "What tools or resources are needed to do more of what's working?" Instead of only telling your stories of leadership and learning, invite others to tell their own stories. Having the vision and the right team isn't enough. A great leader makes their team trust both the greater organizational vision and the people they work with.

To build a valuable team, think like a coach. Consider every member of your team to be an integral part of your business. The first step to building safety among team members is to make sure everything – from the physical working environment to the workplace energy – feels inviting and comfortable. Lean into diversity. The more diverse a team is, the better its performance when measured against the competition. Recognize your biases and set the intention of interrupting them, making the unconscious conscious. Remember, discomfort isn't a bad thing. It's an indicator of growth.

Chapter 3: Your Presence

So much of what empathy is, really, is presence. It's learning to be comfortable enough in the self, in the present moment, to be able to really listen, without judgment or even the desire to fix or solve the problem. Empathy requires a genuine curiosity and interest in other people and their stories. It means listening without involving yourself in the speaker's story. Your presence as a leader, more than anything else, dictates the effectiveness of your team. As the leadership goes, so goes the rest of the company.

The data from the "great resignation" during the COVID-19 pandemic has shown us that more and more people are refusing to put up with a toxic workplace, or an egotistical boss, even if for a hefty paycheck. A leader who holds too tight to the reins, who makes the decisions alone, behind closed doors, will never get full buy-in from the rest of the team. Your confidence should always be tempered with humility. Humble confidence means that the leader is open to sharing challenges as well as triumphs and they are open to advice and recommendations for upgrades.

Recognize your patterns. Try to concentrate on facts and issues. Ask yourself what happened, rather than how you feel about the event or stimulus. Practice presence. When a leader is fully present, they are better equipped for handling those unconscious gestures, facial expressions, and even thoughtless words and actions. Without presence, we are not in control of our actions and what we are communicating likely isn't the information that we want to convey.

Use your time wisely. Prioritize person-to-person interactions or at least, screen to screen, if in-person meetings are not possible. Ask for advice and commit to doing better. Ask everyone on the team for advice on how to do better in the future. Use good listening skills to let your team know they've been heard. Be reliable, keep your word as if your life depended on it. Be accountable and give others permission to hold everyone accountable.

Chapter 4: Your Pipeline

In business, the term "pipeline" typically refers to sales. Leaders should use the same strategies used in sales to nurture and grow their existing talent team. Finding the right people to put in the right seats is a process that starts with identifying a need, defining a function, developing an applicant pool, hiring the candidate, retaining and training the team member, and creating a career path that has positive results for both the company and the team member.

Remember, building a talent pipeline is a process that is relationship based, not transactional. Reexamine your bias about the places from which you can find talent. Building a meaningful relationship with your team is possible only if a leader is comfortable enough to be vulnerable and accessible. Lead the company by example. Create a culture of vulnerability, care, curiosity, and empathy. Create a culture that people will want to be a part of, invest in, and commit to.

Chapter 5: Your Profits

At the end of the day, the business must be profitable to stay open and achieve the vision. Creating a workplace in which people feel seen and heard, is actually an advantage rather than a hindrance to the bottom line.

People are your competitive advantage. The more diverse your group of leaders and management or the individuals who make up your think tank, the faster you're going to grow your revenues. For instance, if you have gender diversity in your leadership, you are likely to experience a whopping 25% increase in profitability over a comparable company that lacks gender equity in its workplace. Every leader must develop financial literacy to succeed in the business world. The business owner must accept responsibility for the numbers and should be well-versed in the financial status of the company, even if the company has an accountant, controller, or chief financial officer

Focus on your company's Gross profit, operating profit, and net profits (also known as bottom line). The leadership must review each of these profit numbers monthly if they are interested in scaling their business. When it comes to a small or mid-size business, cash is king. You must know your cash position every day. Pay close attention to how much money is coming in and how much is going out. Understand the trends on a monthly or annual basis. This information will indicate whether the business is scaling up, adding more people, more products, and more services to the roster. Develop a dashboard that tracks your finances.

Chapter 6: Your Partners

By definition, a partnership is an arrangement where two or more parties agree to cooperate to advance their mutual interests. A partnership is reciprocal. It must be exactly and delicately fair, even if not equal, in terms of resources, energy, money, skills, and open and honest communication.

Really great partners know that being committed to the partnership means that your best day is a day in which your partner has their best day. But what should you look for in a partner? Considering how much risk-taking is involved in business, it's imperative that you find someone you can trust with your money and your well-being. The process of making decisions, even though only one person has the ultimate authority, is the difference maker. Before finalizing whom you want to partner with, take a solid amount of time to discuss the vision, the core values, the mission of the business, and the exit plan.

Through these conversations, you get to know each other. Spend time together in new and different situations. Learn how each handles stress and emotionally charged situations and how they recharge. Check references, both personal and professional. Finally, plan the long-term strategy before signing documents that bind you together. I have found that my most successful partnerships are the ones that are galvanized by an abundance mindset. We show appreciation for challenging one another and encouraging one another to

speak the truth and share our visions.

Conflict in partnerships is absolutely necessary. Healthy, vigorous debate, disagreement, and conflict are to be welcomed. If you can get past the initial discomfort, and really go deep to the place of openness and vulnerability, there is a place of agreement. If not complete agreement, then at least a place of understanding, acknowledgment, and gratitude for one another. This level of trust is important for the creativity and transformation that is necessary to keep building and scaling up your business.

Chapter 7: A Purposeful Implementation

There comes a moment in many leaders' careers where they reach a tipping point that requires an intentional decision. You can dig deeper and do the work or continue to tread lightly and perhaps forgo the dream in making this decision. The choice lies between settling for what's "good enough" and choosing to work toward mastery. Because we are so attached to, and comfortable with the status quo, even a small leap may take a massive amount of bravery and then consistent effort. Choosing change may be scary, but it is the way to move forward.

I'm hopeful that the acceptance that we have fought so hard for – the ideas of mattering and belonging, curiosity and care, being seen and heard – will soon be givens. The new generations in the workplace care deeply about company culture which is demonstrated by the diversity of identities at all levels of leadership.

With equity and inclusion already a part of the system, there still lies the need for creating diversity. Improvement in diversity metrics is the result of systemic inquiry and inclusion processes in every function of a company. Choosing a benchmark, and increasing the diversity of your staff by 25% each year requires a commitment to a strategy supported by sufficient resources.

But metrics are not enough to build a great culture. First, leaders must get comfortable with "otherness" and self-identification. So, before you begin this journey towards diversity, equity, and inclusion, really take some time and ask yourself, "What do I stand for? What work have I already done? What work remains? How am I stepping outside of my comfort zone to do the hard work, both on myself as well as within our company?" Figure out what you stand for, and then take a stand.

Conclusion

Becoming a great leader takes consistent and equally great steps. Find a mentor and a coach who can support and guide you on your personal and professional journey. Join a peer network that offers continuing education such as equity and inclusion, financial, and leadership education. Form an Advisory Board because when you have at least five full-time employees or you have crossed the $3 million mark in revenue, you are going to need a group of subject matter experts who will help you with strategy and growth. Make sure you're always learning and always advancing your knowledge. Finally, stay connected to the most current issues and ideas by reading, listening, and watching thought leaders in the business field.

Nancy Geenen is a serial entrepreneur, and the cofounder and visionary of Flexability, a workplace equity and inclusion firm that has partnered with hundreds of organizations to equip them to build equitable, dynamic, and productive working environments. Prior to that, Nancy spent twenty-five years as a trial attorney, including two years as a prosecutor for the United Nations in Geneva, Switzerland.

What Every Business Must Do to Dominate the Decade

THE AGENDA

THE SUMMARY IN BRIEF

In the fourth quarter of the twentieth century, suppliers, who until then had dominated industrialized economies and set the terms of how business was done, lost their position of dominance to their customers. Customers refused to accept high prices, low quality and dreadful service just to get what they needed. The reason for the shift in power: The servitude of customers — who once stayed with familiar vendors because it was easier — ended when information technology allowed them to comparison shop. At the same time, technology changes dramatically shortened product life cycles, further putting suppliers on the defensive.

The end result is that supplier-dominated economies have been transformed into ones ruled by customers. This is the real "new economy."

The nine agenda items presented in this summary create a map for surviving in today's customer-dominated era.

What You'll Learn In This Summary

- **Make yourself easy to do business with.** Presenting a single face to your customers is just one of six ways to simplify customer interactions.
- **Add more value for your customers.** Your job is to solve problems, not sell products.
- **Obsess about your processes.** Don't focus on individual activities; focus on how those activities fit together.
- **Turn creative work into process work.** Creativity doesn't need chaos; on the contrary, it thrives better in disciplined, coordinated environments.
- **Use measurement for improving, not accounting.** Don't measure to collect data, but rather to collect clues for performance improvement.
- **Loosen up your organizational structure.** Dynamic, respected leaders and motivated teams, not command-and-control hierarchies, are needed.
- **Sell through, not to, your distribution channels.** Too many organizations forget that intermediaries are not their customers. The end user is.
- **Push past your boundaries in pursuit of efficiency. Creative collaboration with outside partners is essential.**
- **Lose your identity in an extended enterprise.** Your company is not an isolated entity, but rather an element in a larger system.

Run Your Business For Your Customers

To succeed, you must become ETDBW, or easy-to-do-business-with. Being ETDBW means that from the customer's standpoint, interacting with you is as inexpensive and effortless as possible. It means you accept orders when and by whatever means your customer wants to use, you make it painless for him to check the order, you send a simple bill, and your customer service representatives actually provide service.

For customers, price is only part of the cost of doing business with you. In some cases, the overhead involved in doing business with you may rival what you charge. If your way of working is designed for your convenience rather than your customers', they will pay the penalty, and in the end so will you. The harder it is to do business with you, the less competitive you become.

Becoming ETDBW requires adopting six practices:

● **Present a single face to your customer.** Many companies present multiple and fragmented faces to their customers. One section doesn't know what the other is doing. To avoid this problem, create an integrated team that deals with customers across all products and functions and has the authority to remove barriers that get in the customer's way.

● **Work in different ways for different classes of customers.** In order to sell to different groups, many companies practice market segmentation. They customize the product and message to each group. But once a customer is captured, the company typically tosses the newcomer into an undifferentiated customer base and does business with him or her the same way it does business with the rest. Resist the temptation to treat customers as if one size fits all. It doesn't.

● **Know what your customers will ask for before they do.** Predict what customers want, and have it ready when they ask. For example, a company customer service line can predict when a customer may need a bilingual operator. Using Caller ID, the company can see if there is a strong likelihood that the caller needs a Spanish-speaking representative, and routes the call to a bilingual operator. And if the caller doesn't need one, no harm is done, since the operator also speaks English.

(continued on page 3)

Managers Transformed Business

Managers responding to the rise of customer power have dramatically changed the way business is done. If Rip Van Winkle had fallen asleep in 1975 and awoke today he would find:

- ✓ **Just-in-time inventory management**
- ✓ **Total quality management and six sigma quality**
- ✓ **Cross-functional teams**
- ✓ **Supply chain integration**
- ✓ **Performance linked compensation**
- ✓ **Economic value added measurements**
- ✓ **Customer-supplier partnerships**

Progressive Insurance Succeeds by Measuring What Matters to Customers

Progressive Insurance, the nation's fourth-largest auto insurer, has adopted customer-focused measures and has benefited enormously. Before the change, it concentrated on internal measures such as adjuster productivity. Of course, that's not what customers cared about. They just wanted to get their claims handled fast. The insurer shifted from "Progressive time to customer time" by measuring the time from accident to adjuster arrival. Soon, adjuster arrival was measured in hours, not days. Customer satisfaction rose, and market share grew.

Run Your Business For Your Customers

(continued from page 2)

● **Make your customers' experience a seamless one.** Customers shouldn't be treated as if they are new when you've been doing business with them for years. You must make sure that every employee who comes in contact with a customer can access relevant information about that customer.

● **Let customers do more for themselves.** One of the best ways to become ETDBW is to let customers do some of the work. Let customers enter and manage their own orders. Customers think it's easier.

● **Measure the things that customers really care about.** Measurements, to be meaningful, must matter to the customer. ■

Give Your Customers What They Really Want

Your customers have no interest in you or your company and only a little more in your products or services. You are merely a bit player in their lives. What your customers care about is themselves and your only excuse for existing is your ability to improve their lives. You must go beyond giving them your products and services; you need to help them solve the problems that motivated them to ask for those products or services in the first place. Give them more value-added (MVA).

All customers have problems that require resolution. You can visualize MVA as a ladder with your product at the bottom and the solution to your customer's problem at the top. The more help you provide your customer to fill that gap, the more value you add to them, which differentiates you from your competitors. You must control as much of the ladder as possible so that the solution is an integrated one.

Trane, a division of American Standard, is a multibillion-dollar manufacturer of heating and cooling equipment. In the past, the company focused on providing the highest quality components, but as the industry matured it became difficult to differentiate on product quality alone. Trane set out to reinvent itself as a total heating and cooling solution. By acting as the general contractor and directly with commercial building owners, the company solves energy problems and recommends solutions. It then installs and services the solution, adding tremendous value to the transaction.

The MVA approach lets you bill customers on value rather than cost. Customers willingly pay for the value you have added. By removing administrative costs and hassle, companies that provide MVA can bill more and make more profit. ■

How GE Adds Value For Home Depot

When Home Depot wanted to sell large appliances to customers, GE responded to the need by doing more than selling Home Depot appliances. It solved a potentially problematic inventory problem for the retailer. Customers want a wide variety of appliance styles and colors to choose from, but keeping a large inventory is expensive in terms of retail floor and warehouse space and finance costs. GE offered to hold the inventory and take over responsibility for delivering the appliances from GE warehouses. Home Depot keeps a few samples on the floor. GE operates a computer kiosk from which customers can order other selections. In effect, GE is relieving Home Depot of some of its most profit-sapping burdens and freeing it to concentrate on selling GE products.

Add More Value For Your Customers

- ✓ Think of yourself as a provider of solutions, rather than of products or services.
- ✓ Distinguish between what you are selling and what your customer is buying.
- ✓ Take a broad view of your customers' underlying problems that go beyond you and your products.
- ✓ See what your customers do with what you give them, and either do it for them or help them with it.
- ✓ Price in terms of value rather than cost.

Put Process First

From the customers' point of view, a company exists only to create value for them. Yet in far too many companies, the actual creation and delivery of customer value is not the responsibility of any particular individual. Instead, the work that creates results for customers is broken into pieces and scattered across departments and units. One person takes the customer call, another gathers the needed information, a third decides what has to be done, a fourth takes action, and no one oversees the whole thing. If your company operates like this, it suffers from a crisis of process.

(continued on page 4)

Put Process First

(continued from page 3)

Process is a technical term with a precise definition: an organized group of related activities that together create a result of value to customers. Note that no single task creates the result. And the process is organized and requires working together. To make it work, all elements must be present in your process. You must design processes that specify exactly what work is to be done, in what order, in what location, and by whom.

Unfortunately, traditional organizations aren't friendly to processes. They are structured around departments, each focused on one task. Each unit speaks its own language and remains aloof from the others. As a result, customers' orders are like travelers passing through a series of rival kingdoms, where border guards give them a hard time before stamping their visas.

How do you make the shift from the old way to the new? It requires paying close attention to process development. Being organized as the definition requires means having concrete, specific designs for processes so that their performance can't be determined by improvisation or luck. Being together means creating an environment in which all process workers are aligned around common goals and see themselves as collaborators rather than adversaries.

The Four Characteristics of Good Process

There are four distinct features that characterize process thinking. First, processes are teleological. That is, they focus on the outcomes of work rather than on the work itself. Everyone in the company understands the why as well as the how of their work. Training and performance measures reinforce the outcome orientation of processes.

Second, processes are customer-focused. Thinking in terms of processes compels a business to see itself and its work from the perspective of the customer rather than from its own.

Third, processes are holistic. Process thinking transcends individual activities. It concentrates instead on how activities fit together to produce the best outcome. Superior value for the customer is achieved when warring departments are replaced with a seamless web of collaborators working together for a unified purpose.

Finally, process thinking is based on the belief that business success flows from well-designed ways of working. A company's success isn't attributed to a visionary CEO, a marketing genius, or a brilliant product developer. Instead, process companies institutionalize success by designing high-performance ways of working. They believe that a company achieves its highest potential by designing processes that mobilize everyone's abilities rather than depending too much on any single individual, no matter how talented.

Creating the Process Owner

In order to work, every process must have a process owner — a manager responsible for ensuring that the entire process keeps flourishing from start to finish, over and over. He or she is in charge of designing the process, building its support, installing it in the organization, and making sure it operates as planned. The manager also designs and implements the measures to assure the process works. The process owner does more than design and measure the process. He or she also supports and enables the people who actually perform it by educating them and serving as a resource.

Process owners must be among the most senior managers in an organization. The position can't be given to a mid-level manager with no clout. He or she must be senior enough to have the authority to implement the process. Some companies are appointing senior executives to be chief process officers, or CPOs. A CPO is responsible for convening and chairing a process council consisting of all the company's process owners and key executives. The council resolves cross-process issues of politics, priorities and resource allocation. ■

The Payoffs of Process Mastery

In a survey of dozens of companies that adopted the process approach, cycle times were reduced by 60 to 90 percent, and on-time delivery with no errors increased by 25 percent. Procurement costs were slashed by 80 percent, and procurement times by 90 percent. Successful launches rose from 30 percent to 50 percent and the time to market for a new product was shortened by 50 to 75 percent. These improvements in process performance paid off in the critical enterprise currencies of customer satisfaction, customer retention and corporate profits.

Create Order Where Chaos Reigns

In many organizations, much work is best compared to Brownian motion, where particles bounce around completely at random. The reason is simple. They still operate the same way they did when they were much smaller and could operate informally.

With growth come problems. The company's old ways of working don't scale up. As more workers are hired, fewer of them know each other, or the customers. The company's employees soon find they know more and more about less and less.

(continued on page 5)

Create Order Where Chaos Reigns

(continued from page 4)

The key to continued success is coordination and discipline. Activities not only must be done, but they must fit together and be done in the right order. The critical work of selling and developing products must be built on discipline and structure — it must move from the ad hoc to the methodical. Making it up as you go is a recipe for disaster. By specifying a precise sequence of steps and pinpointing responsibility for performing them, you introduce composition and order into areas where chaos would otherwise rule. No longer will people need to put energies into figuring out how to work; they can concentrate on the work itself.

Discipline Encourages Creativity

Discipline does not eliminate the need for individuality or creativity. On the contrary, it actually encourages them by providing a framework that allows each person to leverage his or her own activities. Structure ensures that the parts come together as a whole. Structure is liberating. Discipline provides a framework that assures that creative and talent-intensive activities are done by the right people, at the right time, with the right information.

Introducing structure is important for another reason. Companies that do become less dependent (and hostage to) a small group of talented people, who often know all too well that they are close to indispensable. A company dependent on heroes can find itself in desperate straits if they suddenly depart. A disciplined process, however, belongs to the company. If some people go, others can be plugged into the system in their place.

Strong Leadership Is Key

Achieving a disciplined approach requires gaining a new perspective, a new set of attitudes on the part of everyone in the organization — managers and front line workers. People have to accept that they can't be a lone wolf, but must believe in the primacy of teams. It is the group working together that creates results. These are extraordinarily difficult adjustments to make for many people.

How do you make it happen in the face of resistance? The critical ingredient is unswerving executive leadership and constant reinforcement. An occasional memo will not do. A new way of thinking and behaving must be repeated and stressed by the company's leaders, who must make it plain that there is no going back. The cultural shift must also be reinforced by readjusting the compensation system. Compensation can encourage changes in behavior and send a signal of what's important. Even when people get the right results, they must not be rewarded if they succeeded in the wrong way. ■

Measure Like You Mean It

A company's measurement systems typically deliver a blizzard of nearly meaningless data that quantifies practically everything in sight, no matter how unimportant. It often is so voluminous as to be unusable, is delivered too late to be of any use, and languishes in briefing books without being put to any purpose.

Make measuring part of managing, not accounting. Although measurement systems were initially developed to let companies report financial results to shareholders and tax authorities, the systems were inappropriately pressed into service to support management decision-making. Using financial measurements designed for accounting is like trying to manage a baseball game today by using last year's win-loss record to tell you whether to call a hit or bunt.

Today there is relentless pressure from shareholders and customers to improve performance immediately. A company's measurement system must be able to reveal the sources of performance inadequacies. Companies need a new approach to measurement, one that is tuned to the demands of the customer economy. The purpose of measurement is not to know how a business is performing but to let it perform better.

Contemporary measurement systems should provide no data without a purpose; people must know why things are measured and what they are supposed to do about them. Companies will need to develop business models that link overall goals to specific things they can control. Then they must identify the key elements in that model and develop measures for them. Design measures that are objective, timely, easy to calculate and easy to understand. ■

Managers on Useless Measurements

Here are some real comments by managers on their companies' attempts at measuring:

- ✓ **"We use two percent of what we measure. The rest is CYA."**
- ✓ **"We are masters of the micro. We measure paper clip acquisition times."**
- ✓ **"If you want to know my inventory levels on March 2, I'll tell you in mid-April."**
- ✓ **"Business leaders don't concentrate on measurement because they were turned off by accounting in business school."**
- ✓ **"It's hard to do measurement right because our executives don't believe it's important."**

Manage Without Structure

Corporate managers definitely don't play well with others. They are as territorial as lions and wolves, and the more senior they are, the more territorial they become. This behavior isn't genetic; it is induced by the ways in which companies are organized. Executives typically divide their companies into pieces and assign a different manager to each. The problem with this scheme is that it narrows the focus too far. Those managers often ignore everything outside their domain and defend it from all intruders. They reluctantly accept orders from higher-ups but exhibit intense animosity toward other managers who are competing for resources, attention and promotion.

The time has come for managers to worry less about organizational structures and charts and more about marshaling their resources for the benefit of the customer. That an enterprise as a whole can be decomposed into independent units is an outmoded idea. Emerging in its stead is a structure far more subtle and complex, in which no manager has complete independence. Those at the top collaborate for the benefit of the entire company.

New Management and Leadership Skills

This new kind of non-structure needs a new kind of manager with a new set of skills. The traditional managerial role bestowed authority and power on whomever happened to be filling it at the time. No longer. Now management roles are only what the incumbents make of them. If they are forceful representatives for their constituencies as well as effective team players, then both they and the company will succeed. If they are not, they will be relegated to the sidelines.

This new kind of structure is virtually structured and essentially unstructured. It is responsive and flexible and requires very little overhead to make it work effectively. What it does require is a dynamic and strong leader. Structure-less does not mean leaderless. A true leader, not a bureaucrat or a dictator, is an absolute requirement if the enterprise is to harness the power of structural ambiguity. A strong leader provides the cohesion that otherwise would be provided by formal structure.

This kind of business leadership is a new requirement. In the new customer economy, a rigid organization led by a traditional manager will fall apart at the seams. Today's leader must hold the enterprise together, because nothing else will do it for him. ■

End the Tyranny Of the Organizational Chart

✓ Get over the idea of sharply defined business units with autonomous managers.
✓ Redefine managers as representing markets, products or processes, rather than having total control over them.
✓ Make managerial teamwork and cooperation the rule rather than the exception.
✓ Teach managers to put the needs of the enterprise as a whole first.
✓ Employ rewards that emphasize the group over the individual.
✓ Substitute inspirational leadership for formal structure.

Focus on the Final Customer

Do you know who your customers are? In a great many industries, companies simply have no idea. They are shielded from their real customers — the people and companies that make use of their products or services — by their distribution chains or channels — the wholesalers, distributors, retailers, dealers and other intermediaries that come between them. The great majority of products and services reach their final destination only after passing through the hands of one or more intermediaries who buy and resell.

That has to change, simply because each step in the process adds cost, but no value. An air conditioner is no better because it was sold by the manufacturer to the distributor and then to the contractor. In addition, using intermediaries means that goods must be warehoused. Consider the dry groceries industry. Dry groceries are the packaged items in the central isles of most grocery stores. On average, more than 100 days pass from when the product comes off the production line until the consumer buys it. The problem is not slow trucks. The problem is that the foods are moving through lots of hands. More than 40 percent of all food items stop at least twice between the plant and the retail shelf. Each time it must be loaded and unloaded, adding cost but no value.

Using Intermediaries Differently

In the days when customers were weak and powerless, the traditional intermediary system worked. However, customers won't put up with it any longer. Companies must be closer to their final customers in order to hold them, up-sell and cross-sell them, and get the high-margin follow-up sales. They need to be closer so they can serve them quickly and accurately, and to drive out huge costs and inefficiencies.

The answer is not to eliminate intermediaries entirely, but to use them differently. Manufacturers and intermediaries must collaborate to leverage each other's capabilities in the interest of creating a distribution system

(continued on page 7)

Focus on the Final Customer

(continued from page 6)

that maximizes value for the final consumer. You must begin to think of distribution from the customer's point of view.

Remember, the real purpose of a distribution channel is not to get products to final customers, but to solve customers' problems. Consider customers who need cell phone service. To help them sort through the variety of choices of plans, equipment and price, customers need help. They can turn to the sales people who distribute cell phones for that information. If these distribution channels and service providers work together, customers will get what they want and need, and everyone in the chain wins.

The Distribution Community

One furniture manufacturer has turned to the Internet to successfully use intermediaries when necessary, but reaches customers directly for some purchases.

The company has divided its products into furniture and furnishings. Furniture, which customers want to see and touch before buying, and furnishings, such as lamps and other small items that don't need to be touched before selection and are easy to ship, are marketed differently. A Web site lets potential customers see the selection of furniture styles, but directs them to local retailers to try them out. Customers can then order directly or thorough the retailer.

In both cases, the goods are shipped to the retailer for delivery. The retailer remains an intermediary physically, but not financially. He doesn't have to buy and inventory the furniture. The retailer gets a commission for delivery and service. Furnishings are ordered directly from the Web site and then shipped directly to the consumer. But the local retailer still gets a ten percent commission, in exchange for promoting the brand and the Web site.

These new relationships need a new name. They are no longer distribution channels. Rather, there is now a distribution community. Driven by a customer focus, and enabled by new technology, channels have evolved into communities, or groups of companies that work collaboratively to meet the final customer's needs. ■

Duke Power Gets It

One company that understands how to make a company work is Duke Power. At Duke, neither a process owner nor a regional boss has complete autonomy. The former controls the process design while the latter controls the people who carry it out. This requires extraordinary cooperation between the two. In designing the process, the process owner must take into account the regional staff's capabilities. The regional boss must take into account the requirements of the process when hiring people. Neither one can say to the other "Do it my way." If either tries to assert total control or usurp the other's responsibilities, the enterprise fails. Duke does not have a hierarchy with clear lines of authority. Instead, its executives float in a soup of shared accountability. If the process owner and regional boss work well together, both succeed. If they don't, both fail.

Knock Down Your Outer Wall

If you are like many other companies, you have been systematically stripping out all the nonsense activities that degrade business performance. It wasn't easy but now you feel you are lean and mean, flexible and efficient, stripped of fat down to the bone.

Dream on.

Things may in fact be better than they were a decade ago. But in the larger scheme of things, you have just begun. What degrades your performance is no longer how you work internally, but how you work on your boundaries with customers and suppliers. Getting rid of this overhead is the Next Big Thing in improving your operating performance. Now you must destroy the walls between enterprises, especially those that separate you from your suppliers and customers.

Integrating Operations with Suppliers

If integrating operations within your company can produce greater efficiency, so can doing so with your supplier. Take, for example, a common scenario in business. You need to order supplies to use in the manufacturing process. You locate the supplies, prepare an order, send it out, and wait for the supplies to arrive. On the other end, the supplier gets the order, makes sure it is available, prepares an invoice, and ships the order. You then get the shipment, enter the information in your computer, and pay the invoice. Many of the steps in the transactions are redundant. These two processes (order and fulfillment) should be seen as one process.

The real power of the Internet lies in solving this problem, in integrating intercorporate business processes and the information systems that support them. This, in effect, takes a sledgehammer to the walls that separate companies from one another.

There are five guidelines that companies who want to collaborate more closely need to follow. These are:

- **The final customer comes first.** All members of the collaborative must be aligned around meeting the needs of the customer, whom they ultimately work

(continued on page 8)

Knock Down Your Outer Wall

(continued from page 7)

together to serve.

● **The entire process should be designed as a unit.** Any collaborative process needs to be thought through in holistic terms. Each participant can't design and implement its own part in the larger process. It must be done together.

● **No activity should be performed more than once.** Eliminating duplication of activities yields savings.

● **Work should be done by whomever is in the best position to do it.** Do what you do best, and let the others do the same.

● **The entire collaborative should operate one database.** Everyone must share the same version of all information. ■

Extend Your Enterprise

While Henry Ford may have been sold on vertical integration, it doesn't work well today. The realities of scarce capital make it unrealistic to control every aspect of production. It simply isn't possible to finance a totally vertically integrated enterprise anymore. Vertical integration is being replaced with its polar opposite, **virtual integration.**

Instead of doing everything involved in creating a product or service, a virtually integrated business focuses on doing those things it does best. It works in close partnership with other organizations that also focus on what they do best. Companies stop being self-contained units that produce products or services, and become elements in a larger system.

Do More of What You Do Best

Outsourcing is an essential component of virtual integration, as is the notion of core competencies. Core competencies were originally those tasks that a company had to perform superlatively in order to succeed. Companies today are under intense pressure to outsource everything that isn't a core competency — to someone for whom the task or service is a core competency. The marriage of core competence and outsourcing means that companies are doing more of what they do best and less of everything else.

Combine increased customer value-added, inter-enterprise collaboration, and core competence-driven outsourcing, and the result is virtual integration: multiple companies working together to create the results expected from just one. From the inside, everyone can see that there are multiple enterprises at work. From the customer's point of view, everything meshes as though there were only one.

Prize Partnership

Virtual integration will require a radical cultural shift. Instead of the traditional values of haughty pride and suspicion of all outsiders, a company must prize cooperation, trust and partnership. It must eagerly share information and be able to sacrifice short-term gain for the benefit of the larger virtual enterprise of which it is a part. It must recognize that success comes to every participant or none at all. ■

Prepare for a Future You Cannot Predict

You cannot know what challenges will face your company in five years, or even next year. Just look at last year's strategic plan. Is it still relevant? Or are you responding to entirely different challenges than those you envisioned when creating the plan? That doesn't mean you shouldn't plan. It does, however, mean that you must begin to identify problems or opportunities before it is too late.

Do so by building a process to spot changes on the horizon that includes the following steps:

● **Create an early warning system.** Because most organizations regard change as an anomaly, none of a company's sensory systems are designed to watch out for it. Critical change tends to occur far below the sixteenth-floor suites occupied by company executives. These can include a sudden shift in customer preference, or a competitor's new product. You must make change watching a formal and explicit activity within the organization, a process.

● **Develop deep insight into your customers.** Part of the change process must be developing deep insight into your customers. That means identifying their real needs. You must see the world through their eyes and understand them better than they understand themselves.

● **Analyze potential competitors.** New competitors require serious attention. You must continuously scan the horizon looking for others that have the potential to offer competing products and services.

● **Look for the seeds of the future in the present.** There are always early indicators of change. Your job is to find them, and act.

● **Become proficient at responding to change.** There must be a disciplined process in place to respond to change. Waiting too long or moving too fast can both be mistakes.

● **Create a supportive organizational infrastructure.** In order for the processes of change recognition and implementation to succeed, they must take root in a corporate culture and structure that welcomes them. ■

THE SUMMARY IN BRIEF

The arrival of the digital pioneers, such as Amazon's founder and CEO Jeff Bezos, has disrupted corporate leadership models of the past. Amazon's trillion-dollar success is the envy of everyone but achievable by anyone. What has propelled their record streak of growth? Their management system, and it can do the same for you no matter what business you are in or what level.

Soon, all companies will be digital, which means traditional command-and-control management will no longer be relevant. Learning Amazon's system is as simple as six building blocks distilled by *New York Times* best-selling author and global CEO advisor Ram Charan and Julia Yang, in ***The Amazon Management System***.

From high-velocity decision-making to top talent-hiring practices, the insider secrets behind Amazon's success are now within anyone's grasp, block by block. Whether you are an established CEO or a recent college grad, ***The Amazon Management System's*** concise, actionable advice will help your business win in a new digital era that demands nonstop innovation.

IN THIS SUMMARY, YOU WILL LEARN:

- The six building blocks of Amazon's management system.
- Why customer obsession is Amazon's number-one principle.
- How Amazon defines, motivates, and retains the right talent.
- How the company continuously generates groundbreaking inventions.

Introduction

Our 21st century prevailing management systems are still largely inherited from the oldest forms of human organization, such as the military and the church. They were designed for the purpose of command and control in an age when there was no internet, no smartphone, and none of the various forms of digital technology such as big data, algorithms, and AI, and when personal supervision was the only way to keep an eye on employees.

This old management approach has become obsolete in the digital age. Amazon is one of the biggest reasons why.

At the heart of all Amazon's business endeavors is the Amazon management system, a digital engine composed of six building blocks, that has been continuously and relentlessly empowering Amazon for more growth and more exploration into the unlimited sky of the digital age.

It's a Must, Not Optional

Going forward, all companies will be digital. Every company will have a platform of its own and/or be connected to someone else's platform. For founders and business owners, the good news is that most of your legacy peers have not started down this path yet, so if you get a head start on embarking on the digitization journey, you may improve your chances to take the lead.

The choice is yours to make: to die or to digitize and achieve exponential value creation.

For senior executives, in the digital age your job will change radically. Instead of spending most of your time supervising others and attending endless reviews, meetings, and committees, your job will be to study consumers directly (not through filters) and drive continuous innovation for them.

As more companies make the transition to the kinds of Amazon management practices described here, leaders will remove management layers, requiring junior to middle managers to reimagine their jobs and rebuild their competence.

There has never been a better era for new talent—the young and fresh. The more you understand the Amazon management system, the more contributions you can make, and the more successful you will be in your career, whether you are working for a company or starting your own.

The point is not to advocate a blind replication of all and everything in the Amazon management system but to help you understand how it works and pick the valuable ingredients and inspirations for your own digital way.

Let's now learn the six building blocks of Amazon's management system.

Building Block 1: Customer-Obsessed Business Model

The first principle that Amazon founder and CEO Jeff Bezos stated in his famous nine-point management and decision-making approach published in his first Shareholder Letter in 1997 is, "We will continue to focus relentlessly on our customers." Among all 14 Leadership Principles, Customer Obsession ranked number one and has remained at the top ever since.

Why has Bezos been so obsessed with the customers? Customers are the central piece in Amazon's flywheel and in the entire Amazon platform. Why is Amazon able to aggressively and successfully expand into more and more categories? Because they have customers who would like to buy more. Why are third-party sellers attracted to the Amazon platform? One of the most obvious reasons is that there are hundreds of millions of customers, and by leveraging the Amazon platform, they can scale up much faster.

Customers' trust is an earned privilege, not a long-term benefit to be taken for granted. Trust takes years to build, seconds to break, and forever to repair. That's probably why Bezos emphasized, "Our pricing objective is to earn customer trust, not to optimize short-term profit dollars."

Invent for the Customers

As Bezos put it, "One thing I love about customers is that they are divinely discontent. Their expectations are never static—they go up. It's human nature." How do we not just meet but stay ahead of customers' ever-rising expectations? The only way to do this is through continuous innovation and relentless invention. In this way, the divinely discontent customers became the sources of continuous inspiration for Amazon's invention machine.

Unlike traditional companies that primarily use technology for cost reduction, Amazon focuses on using technology to totally transform the existing customer experience and to imagine an experience that does not exist today, and invent on behalf of the customers.

Why is long-term thinking so important for Amazon? The secret is in the very nature of its business model.

In the spirit of this relentless drive to invent, Amazon single-handedly created entirely new markets with huge global potential, such as cloud services (AWS) and smart speakers (Echo). As Bezos pointed out, "No one asked for AWS. No one. Turns out the world was in fact ready and hungry for an offering like AWS but didn't know it. We had a hunch, followed our curiosity, took the necessary financial risks, and began building—reworking, experimenting, and iterating countless times as we proceeded."

Long-Term Thinking

In his first shareholder letter, Bezos said that Amazon "will continue to make investment decisions in light of long-term market leadership considerations rather than short-term profitability considerations or short-term Wall Street reactions."

Why is long-term thinking so important for Amazon? The secret is in the very nature of its business model. Amazon is all about platform and infrastructure. So it is, in essence, a scale business characterized by high fixed costs and relatively low variable costs.

So how to drive the return on such a massive investment? Scale and speed really matter here. According to company shareholder letters, increasing scale "spreads fixed costs across more sales, reducing cost per unit, which makes possible more price reductions."

Once the scale passes a certain threshold, what Bezos calls the "tipping point," it "allows us to launch new ecommerce businesses faster, with a higher quality of customer experience, a lower incremental cost, a higher chance of success, and a faster path to scale and profitability than any other company."

Second is speed. Platform and infrastructure are a technology game. Prior investments and faster movements captivate a larger customer base earlier and accumulate historical data earlier, which translates into significant first-mover advantages in data analytics, algorithm enhancements, and AI-driven solutions. In short, all these elements combined create Amazon's digital core competencies.

Building Block 2: Continuous Bar-Raising Talent Pool

If you ask Bezos what the most important decision is at Amazon, his answer will be and has always been from the very beginning: hiring the right talent.

So what has Amazon done to make sure that they only attract and retain the right talent? In the first place, what is "right" by Amazon's standards? Bezos looks for builders who can make things happen, who can think and behave like owners—the type of people who display a sense of "true ownership."

In his 2018 Shareholder Letter, he wrote, "Builders are people who are curious, explorers. They like to invent. Even when they're experts, they are 'fresh' with a beginner's mind. They see the way we do things as just the way we do things now. A builder's mentality helps us approach big, hard-to-solve opportunities with a humble conviction that success can come through iteration: invent, launch, reinvent, relaunch, start over, rinse, repeat, again and again. They know the path to success is anything but straight."

Amazon is now a burgeoning 750,000-people organization, so how to reinforce such rigor and maintain such a high bar—not only across the globe but also down to each new hire?

The Bar Raisers

Bar raisers are carefully selected individuals who are meticulously trained to be the stewards of Amazon's leadership principles. Their mission is to ensure that the bar is never lowered due to pressing business urgency, to make the final and right hiring decisions, and to strive for continuous raising of the bar. In many ways, they act on behalf of the Amazon leadership team as the final line of defense in recruiting.

Bar raisers have three tasks. The first is to evaluate, using Amazon's Leadership Principles as the yardstick, whether candidates have long-term potential at Amazon and whether they can raise the bar. The second is to conduct the post-interview drilling with each interviewer, as Bezos did before, so that all observations, assessments, considerations,

and doubts can be fully explored and thoroughly examined to arrive at a correct decision. The third is to help hiring managers and other interviewers prepare for interviews, to ensure consistency in the high bar, and most importantly, to provide written feedback.

Given that recruiting the right talent is regarded as the most important decision at Amazon, the company has made huge investment, in terms of teams' time and energy, into getting this right.

Motivate and Retain the Right Talent

Given that Amazon's bar is so high and continuously rising and the short-term cash compensation is not so lucrative, how can Amazon motivate and retain the real builders with true ownership and mental toughness on a long-term basis? The answer lies in two aspects: what they love and what they hate.

What do builders hate most? Bureaucracy. It is slow; it is suffocating; and in many cases it prevents them from making things happen in the way they like. Such an atmosphere is anathema to builders, who love to invent and to try unconventional ways. They have little patience and want to jump in and make things happen. For Bezos, the abhorrence of bureaucracy is personal.

Above all, builders love challenges. The problems that appear to be hard to solve or even impossible for many people represent something entirely different to the real builders. They see these problems as exciting opportunities, the best thrills, and the most fun part of the job.

At Amazon, new hires are pleasantly surprised at how much ownership they can have from the start. When they are assigned to a project team, they will be exposed to and engaged in all functions involved, and make decisions and build products that could potentially impact millions of customers.

Building Block 3: AI-Powered Data and Metrics System

Running Amazon, the gigantic business empire with unprecedented complexity from drastically different businesses, from vastly spanned geographies worldwide and from the massive size and scope of operations, is no doubt a daunting challenge for many.

Without digitization, one could not do that. Bezos' secret lies in Amazon's world-class standard-setting AI-powered data and metrics system, in which everything that matters can be tracked, measured, and analyzed, with insights generated and routine decisions automated.

The Answer Starts With Numbers

Jeff Bezos is a man of numbers. This is his unique way of understanding the world, having fun in life, and running business at Amazon. Bezos has unique standards to define what the robust data and metrics are.

Ultra-detailed. Execution is about knowing and delivering details. Amazon's level of details for data and metrics is magnitudes beyond many people's wildest imagination. If you were asked to pick a location for a new data center, how many factors would you consider? About five, 10, 20, or dozens? Amazon used a checklist of 282 metrics when choosing its first data center in China.

End to end. In most traditional companies, data collection is broken down by silo, by layer, and by actual involvement. Each division or function can see data generated and collected only within its own domain of business operations.

At Amazon, a small team is bestowed with the end-to-end responsibility for one product or one service. How to ensure that this team does a good job? After ensuring the selection of the best people, the next most important crucial enabler is the availability of end-to-end data that is not segregated by silo nor by function. Without such data support, running a business would be as difficult as maneuvering in a pitch-dark mansion.

Real time. In many companies, business reviews are held quarterly or monthly, with a delay of 10 days or more due to the time needed for accounting proceedings. At Amazon, such data is tracked on a real-time basis with no time lag. Relevant people can review the results daily, hourly, or by the second.

Track inputs. This is probably the most unique aspect of Amazon's data and metrics system. When setting goals, most companies focus on revenue growth, margins, and net profits. Amazon believes that to ensure good outputs, one needs to get to the bottom of the issue and seriously track the inputs. Why does Amazon track the time required to load a webpage? Because according to Brad Stone in ***The Everything Store,*** its data analytics shows that "even a minuscule 0.1-second delay in a webpage loading can translate into a 1 percent drop in customer activity."

Trust but verify. At Amazon, each claim needs to be supported by data and metrics. Unfounded promises will not fly.

The AI-Powered Tools

Bezos' personal passion for technology and signature spirit of imagining and inventing have become one of Amazon's underlying characteristics. The applications of this approach are countless and inform virtually all key decisions made by Amazon. How does Amazon pick the location of its next fulfillment center? The answer is Mechanical Sensei, a software system "that simulated all the orders coursing through Amazon's fulfillment centers and predicted where new FCs would most productively be located," according to Stone.

How does Amazon ensure its competitiveness in pricing? Pricing bots. Stone writes that these are "automated programs that crawled the Web, spied on competitors' prices, and then adjusted Amazon's prices accordingly, ensuring that Bezos' adamant demand that the company always match the lowest price anywhere, offline or online, would be met."

How does Amazon drive more consumption from each consumer? Personalized recommendations. And who at Amazon decides which items to recommend to which customers? Actually . . . no one. An algorithm-enabled system fully automates personalized recommendations for each individual consumer.

How does Amazon develop options and decide the fastest and cheapest delivery option for each order? By the early 2000s, an Amazon fulfillment software system could run millions of such decisions every hour. Given Amazon's relentless pursuit of improvement, its highly sophisticated fulfillment software systems have been on a never-ending treadmill of iterations ever since creation.

Building Block 4: Groundbreaking Invention Machine

What makes Amazon an outlier above all others is the sheer power of its identity as an invention machine: one that is able to deliver continuously, and at an ever-accelerating pace, groundbreaking, game-changing, and customer behavior-shaping inventions that create new market spaces and economic opportunities of massive magnitude.

That's probably why *Fortune* described Bezos as "the ultimate disruptor" in 2012, *Fast Company* named Amazon the world's most innovative company in 2017, and *Forbes* put Amazon on its list of World's Most Innovative Companies in 2018.

All great inventions need to start with an idea, a brilliant one, a revolutionary one, or a seemingly impossible one.

So how does Amazon continuously generate new ideas and meticulously pick which ones to pursue?

Seek big ideas continuously. Amazon invented the "idea tool," to tap into employees' creativity and imagination. Anyone who has an idea can submit his or her thoughts without filters of layers of managers or concerns about feasibility from either technical or financial points of view. In addition to the people inside Amazon, Bezos also seeks ideas from those outside.

What makes Amazon an outlier above all others is the sheer power of its identity as an invention machine.

At Amazon, the ideal adventure to create is not aimed at merely 100 or 1000 people. Bezos seeks inventions that speak to billions of customers and millions of enterprises worldwide. Why so big? Because of the risky nature of invention, in which failure and invention are inseparable twins. What could offset the numerous failures along the way? A big win, such as AWS.

The company must invent on behalf of customers, and the idea must be distinctly differentiated. Amazon Go is the perfect example. This venture, as described in Amazon Shareholder Letters, called for a complete re-imagination of a whole new customer experience: walking into a store, picking up what is needed and just walking out, without "annoying and lasting-forever checkout lines" anymore. Many customers describe the experience of shopping at Amazon Go as "magical."

Build the idea patiently. It all starts with the press release, an internal document that looks at what the future would be like with the successful execution of the idea being proposed. Three things play pivotal roles in such releases:

- Who are the customers? How will they use it? What is their new experience? Which existing experience will it replace? What changes will it require them to make? Why will they prefer it? What are the benefits in the

eyes of the customers?

- What are the goals? They need to be bold, specific, and measurable. What drives creativity? It's the challenges. If something gets too easy, people's true creativity will be left underutilized or even untapped.
- What are the hurdles? To convert a big idea—one that is distinctively differentiated, uniquely Amazon, and even seemingly impossible—into reality is never easy. After all, there must be almost insurmountable hurdles that prevent others from trying or even imagining the possibility of success.

Construct the team carefully. Amazon has a well-known approach to drive project development: the two-pizza team, or as Amazon refers to it, 2PT. As Bezos repeatedly pointed out, if you can't feed a team with two pizzas, the team is probably too big.

At Amazon, a project team with a clear mission and specific goals needs to be cross-functional, full-time, and co-located. It's a total immersion experience, with the team constantly working together, hour upon hour, days and nights, and in some cases, months and years.

Why? Creativity comes from people's interactions; inspiration comes from intensive concentration. Just like a start-up, the initial founding team huddles together in a garage, experimenting, iterating, discussing, debating, trying and retrying, again and again.

Pick the right team leader. The right leader may not guarantee success, but the wrong leader will surely guarantee failure. In each of Amazon's major breakthroughs, you will find a strong leader.

At Amazon, the project team is held accountable end to end, meaning their ownership extends all the way from concept, to design, to development, to testing, to launch, and to post-launch operation. Why? Bezos believes in the principle of "eat your own dog food." This is a forcing mechanism of enforcing crystal clear accountability for everyone with nowhere to hide, no one at whom to point the finger.

Building Block 5: High-Velocity and High-Quality Decision-Making

Amazon's decision-making is not only high in both velocity and quality but also high in scale, with a set of clearly articulated principles and a uniquely designed methodology enforced with striking consistency throughout the organization.

How can Amazon upgrade its decision-making and achieve the three seemingly conflicting goals of speed, quality, and scale at the same time?

Bezos has categorized all decisions into two types and designed different kinds of decision-making processes depending on whether they are a Type 1 or Type 2 decision. As noted in a company Shareholder Letter, Type 1 decisions refer to those that "are consequential and irreversible or nearly irreversible—one-way doors . . . . If you walk through and don't like what you see on the other side, you can't get back to where you were before."

Because of the long-term implications, Bezos suggested that Type 1 decisions should go through a heavyweight process to ensure they are of high quality. However, most decisions aren't like that.

Type 2 Decisions: Speed Matters

Type 2 decisions refer to those that "are changeable, reversible—they're two-way doors. If you've made a suboptimal Type 2 decision, you don't have to live with the consequences for that long. You can reopen the door and go back through."

Applying the heavyweight process on Type 2 decisions will lead to slowness, risk aversion, failure to experiment sufficiently, and diminished invention. As CEO, you should identify and delegate the Type 2 decisions, as they "can and should be made quickly by high judgment individuals or small groups."

Don't wait for all the information. In business, Bezos used a 70–90 rule instead. He stated that "most decisions should probably be made with somewhere around 70 percent of the information you wish you had."

Let the metrics owner make the call. At Amazon, each operation has a set of metrics to ensure operational excellence, and each metric has one designated metrics owner. In this way, the metrics owner is the single point of accountability, so no more finger-pointing; the owner has full access to all the relevant data and analytics, so no more being handicapped by partial information; and the owner has clear authorization to take corrective initiatives, with maximum one-level of approval, so no more heavyweight decision-making.

The company also digitizes math-based routine decisions. One typical example: how to manage inventory purchasing. Given the availability of vast amounts of historical data about customer orders, seasonal volatility, replenishment speed of vendors, and all the AI-powered analytics and pre-

Customer obsession and Day 1 thinking are inextricably linked twin drivers of the Amazon management system.

diction tools, this is a typical math-based routine decision that can be largely digitized.

Scale Up Good Decision-Making

Here comes the billion-dollar question: how to scale high-velocity and high-quality decision-making. The first step is to crystallize consistent principles.

In his first Shareholder Letter, Bezos offered an unambiguous manifesto, specific, observable, and verifiable, that enabled shareholders to make informed investment decisions regarding Amazon. It also provided customers with the company's decision catechism, so that they would be more willing to build a trust-based long-term relationship with Amazon.

But most importantly, this transparent and widely shared set of principles is for all current and future Amazon employees: a set of crystal-clear guidelines so that every single one of them can understand the decision-making logic and be able to make the right choice when duty calls.

Specify consistent methodology: narratives. June 9, 2004 witnessed a brilliant innovation in human management practices. It all started with an email from Bezos: No PowerPoint presentations from now on at Amazon's core executive team. From that day on, Amazon embarked on a journey towards what came to be known as "Six-Page Narratives."

Writing six-page narratives forces the author to conduct complete analysis, to distinguish between subtle nuances, to articulate the inner logic and set priorities for various ideas, and take full accountability for specific proposals. There is no wiggle room, no hiding place, and no safe haven. Everyone must put "skin in the game" and is to be held accountable for it.

Enforce a consistent approach in every decision. It is tough to make good decisions and even tougher to crystalize decision-making principles. The toughest part is to walk the talk and consistently apply the stated principles when making every single decision. Julie Weed wrote in the foreword of ***The Amazon Way,*** Amazon's "principles aren't slogans printed on wall posters and coffee mugs. They are lived and breathed every day by Amazonians from the CEO on down."

Building Block 6: Forever-Day-1 Culture

If you read through all the Shareholder Letters that Bezos meticulously wrote over the past 22 years (1997–2018), the phrase "Day 1" appeared an amazing 22 times, with striking consistency. For the past 10 years, every Shareholder Letter has ended with the same line: "As always, I attach a copy of our original 1997 letter. Our approach remains the same, and it's still Day 1."

Why Day 1? At the early stage of any startup, the founder (or the small founding team) runs everything, from design to production, to sales, to delivery, to bookkeeping. If luck is on their side, the business will soon outgrow the capacity of the founding team, and they will need to expand the team and build an organization.

Normally, in the beginning, the organization will still function with speed, nimbleness, and a risk-acceptance mentality, but as the business grows bigger, complexity starts increasing and layers begin creeping in, and the once-nimble startup inevitably falls into the trap of so called "large organizations" characterized by slowness, rigidity, and risk aversion.

Bezos' evocative and sticky model of "Day 1 vs. Day 2" captured his aspiration for Amazon to grow aggressively in scale and scope while preserving the entrepreneurial vitality of a startup and building on the numerous advantages of a large company at the same time. Customer obsession and Day 1 thinking are inextricably linked twin drivers of the Amazon management system. Amazon has to improve continuously in everything it does, in everyone it has, and with accelerating speed and agility.

How to Build a Forever-Day-1 Culture

First, operationalize the culture. Today, Amazon uses a set of 14 Leadership Principles to define its corporate culture: customer obsession; ownership; invent and simplify; are right, a lot; learn and be curious; hire and develop the best;

insist on the highest standards; think big; bias for action; frugality; earn trust; dive deep; have backbone—disagree and commit; deliver results.

For each leadership principle, Amazon specifies the expected behavior. For example, what does "Customer Obsession" really mean? Leaders start with the customer and work backwards. They work vigorously to earn and keep customer trust. Although leaders pay attention to competitors, they obsess over customers. Once you bring these principles down to clear and specific behaviors on the ground, they become operational, and everyone and anyone can start practicing them accordingly.

Create forcing mechanisms. Amazon has created a system of simple but effective forcing mechanisms to ensure that everyone in the organization really lives and breathes the stated values and principles. Let's take Amazon's favorite and perennial number-one principle, Customer Obsession, as an example.

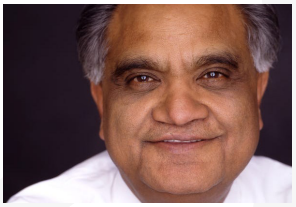
Every week, Bezos asks his executives the same question: What can we do better for the customers? He asks this every week. No exception.

Each year, some managers are required to participate in a two-day training session at a call center. This direct interaction with customers is designed to help them gain a first-hand understanding of customers' frustrations and pain points and also to provide them with the precious humility to recognize that despite its widely applauded success, Amazon still needs to continuously improve.

Given that in the digital age, a seemingly random post can go viral in no time, and if not handled properly in time, the damage from a negative post could be disastrous, Amazon has invested millions to build a system to systematically track customer feedback in real time.

If a service or product provided is discovered to be subpar, instead of waiting for customer complaints posted online or communicated via the call center, Amazon can detect the glitch and take the initiative to refund customers via its automated systems.

The most powerful forcing mechanism has to do with personally modelling the behavior expected from everyone.



Why does the Amazon Management System work so well for Amazon? Because it best fits the personal values, principles, characters, and styles of Jeff Bezos, Amazon's founder and CEO, and his core team; it also best fits the nature of Amazon's platform and infrastructure business.

What works for you? What fits you and your business best? No one has the perfect answer. You will have to experiment, iterate, and invent your own.

Always remember: It is still Day 1.

THE SUMMARY IN BRIEF

Leadership can often seem like an uphill battle—even when you're powered by an idea that's unmistakably good. The problem? Most leaders just don't know how to align their people behind an idea and give it the momentum to get it up and over that hell. But if you were a leader who could get everyone on the same page and moving together, on any project or goal?

Whether you're at the top or bottom of an organization, Patty Beach's ***The Art of Alignment*** is all about helping business leaders move projects, initiatives, strategies, and their overall mission and vision forward. Here you'll find a pragmatic approach to introducing new ideas to a group, getting them to agree on a path forward, and commit to carrying their weight in getting that idea across the finish line. Practical tools include a guide to where alignment and business intersect as well as a full strategy for introducing alignment at your organization through targeted meetings and careful approaches with your people.

IN THIS SUMMARY, YOU WILL LEARN:

- The true power of alignment and why it's so essential (yet undervalued) in business.
- The core principles of alignment, including the iterative co-creation principle, the Shuva principle, and the versatility principle.
- The 4 steps to alignment.
- How to prepare and run alignment meetings.

Alignment and Business

All businesses require alignment because groups of all kinds, including leadership teams, boards, employees, customers, vendors, and investors achieve more when aligned. Alignment isn't just about getting groups to agree. It's required whenever any two people come together to make a plan, whether they're business partners, a boss and direct report, a consultant and client, or two colleagues working together. Imagine how much you could accomplish between all these parties.

Alignment drives growth and scalability in business. To scale and grow, you have to get others to do things, and they, in turn, have to get others to do things, and so on.

Alignment and Leadership

Fostering alignment is the critical skill that separates dreamers from leaders who get things done. To reinforce this idea, it's important to clarify how leadership and alignment are linked.

The most essential component of leadership is vision. Without a vision of a future better than the past, there is no leadership. Instead, you have the status quo— or worse, devolution.

Leadership is the art and science of inspiring committed and aligned action towards a clear vision. Commitment trumps compliance every time.

The Iterative Co-Creation Principle

By consulting as many people as you can to help shape your ideas, you create a brain trust. By including people from different parts of the system, you gain many perspectives on the problem like facets of a prism. When a decision is informed by those it impacts, it is more likely to be sound and well-received.

Another reason to not only consult others but to invite them to co-create with you? Ownership. People don't take down what they build, so including stakeholders in shaping solutions avoids the future destruction of your most recent resolution.

The SHUVA Principle

SHUVA is an acronym that describes a basic need universal to all humans: the need to be Seen, Heard, Understood, Valued, and Appreciated.

When you feel seen, heard, understood, valued, and appreciated, it feels terrific. You can be yourself and express yourself. SHUVA is the path to true alignment because all ideas, including doubts and reservations, are welcome. When you feel SHUVA from a person or group, you're more willing to expand the extra energy required to hash out areas of misalignment. Keep in mind: you don't have to agree with what somebody says to offer them SHUVA.

The Versatility Principle

The Principle of Versatility unleashes the power of masculine and feminine energy by:

- Factoring in facts and feelings into conversations.
- Allowing people to build on each other's ideas.
- Being inclusive and selective about who to engage in the decision-making process.
- Respecting lines of authority while empowering people to reach across them.
- Alternating push and pull energy to move ideas from me to we.

With the Principle of Versatility, you don't end up with forced or fake alignment; you achieve true alignment.

The 4 Steps and 5 Cs of Alignment

Leading divergent thinking is easy; it's getting the group to converge that's hard. Instead of letting the conversation go unstructured, use a standard process to efficiently funnel ideas from divergence to convergence. That process is the 4 Steps of Alignment.

Step 1: Propose

The act of making a proposal shifts the conversation from uncommitted to committed and from divergent to convergent thinking. Just be careful not to go too far. Proposals are not declarations. When it comes to alignment, declarations are deadly because they leave no room for iterative co-creation. They set up challenges and power struggles and are off-putting.

When presenting a proposal, you're laying the groundwork for greater alignment even if the process to get there involves lots of potential roadblocks.

Step 2: Probe

Instead of probing for responses to your proposal in a ran-

dom way, collect feedback using four of the five Cs: Clarifications, Compliments, Concerns, and Changes, in that exact order. First, ask clarifying questions. Next encourage compliments about the proposal. Then you are ready to explore concerns and changes that can resolve the concerns. Finally, test for the last C- commitment.

Here are some tips about the Probe step.

The audience will want to jump ahead. Don't let that happen; instead, hold the line and make sure they follow the Cs in the right order

Give participants a notepad to capture what they are thinking sot hey can hold on to ideas and share them when the right time comes

Make sure someone is transcribing all comments

Step 3: Re-Propose

Your re-proposal should include the ideas that most resonated with the group, not everything that anyone expressed. Lean toward those ideas shared by decision-makers, informed experts, and those responsible for implementing solutions. Giver the preferences of these key stakeholders more weight than those of people the final decision only casually impacts.

If you don't follow this step, you risk having team members waiting until they get to the water cooler to deep-six all your hard work. Training your team to speak up is one of the big benefits of the 4 Steps of Alignment.

Step 4: Close

All too often, we neglect to Close properly. We kick the can down the road, postponing decisions to a later date. This can be a big waste of time and creates a perpetual churn. So, finalize your agreement by declaring a formal close; that doesn't mean the topic can never be reopened, but it does signal an intent to commit and move into action.

You've reached the Close when all parties have reached the desired level of agreement. Resist the temptation to continue debating until everyone is 100 percent satisfied unless you really need that level of agreement.

Defining the Players

One thing that can be hard to determine is who to include on your path to alignment. To help you figure that out, map all stakeholders and consider the best approaches to including them. Before deciding who to include, step back and map out all parties who will be impacted by the change you need alignment around. These are your stakeholders.

Alignment Meeting Logistics

When it comes to planning alignment meetings, it is valuable to follow the Principle of Versatility by balancing masculine and feminine energies. To run a meeting in a versatile way, use this MSF— design tight and hang loose.

For example, plan out an agenda to the minute and bring a timer to reinforce it, but also plan for time to let the conversation roll when needed.

Meeting Roles

If your meeting includes more than six people, it is very helpful to assign roles. Not only does doing so take the load off of you, it provides an opportunity for others to be more engaged and active in the meeting.

The top roles to consider for your meetings are Leader, Facilitator, Scribe, and Timekeeper. IT is customary to give timekeepers a voice or vote depending on whether they are group members or decision-makers.

Issuing the Invitation

Now that you have initial considerations and logistics worked out, you are ready to issue invitations to alignment sessions. A well-worded invitation can help set expectations for participants and get their idea machines up and running before they arrive.

The Opening

A good alignment session starts with a strong opening. Take time when you open a meeting to orient everyone so that they know where the meeting is going and can fully participate.

Follow this process— Clarify the purpose of the meeting, then clarify anything that may have transpired prior to the meeting that is relevant. Then review the agenda and any processes you may use, such as the 4 steps or 5 Cs. Finally, confirm that the participants are ready to start and are in agreement.

Ground Rules for Alignment

Ground rules are recommended for any meeting, but they are particularly useful when you are dealing with critical de-

cisions. The following meeting ground rules, when followed, will go a long way toward creating psychological safety and the best conditions for alignment.

Balance participation

There are no bad ideas

Say what you mean, just don't say it mean

Honor confidentiality

Top-Down Alignment

Alignment in a multilayered organization is always challenging. Conventional wisdom says start at the top, then cascade decisions down to every level. A top-down approach to alignment has many advantages.

Those at the top have the best vantage point to reconcile competing options and make best use of limited resources, have the formal authority to make changes, and hold the power of the purse needed to provide incentives.

Bottom-Up Alignment

When you don't have the power or authority to make a change, you may feel it is not your place to even suggest one. We don't believe in that. If you have an idea that can create a better future, then why hold back, even if you are at the very bottom of an organization? You just need the know-how to step outside the lines and the patience to work iteratively to bring others along. If your idea crosses organizational boundaries, you will need finesse, diplomacy, and change management skills.

Sideways Alignment

Sometimes you need alignment in a system where there is no power differential. Examples include partners in a business, working in a coalition of peers, or working with volunteers where no one is in charge. Every once in a while, I work with teams and organizations that have no hierarchy because they value equity so much that every person has an equal vote. In these cases, alignment principles and practices can keep things moving forward.

Dealing with Disruptors

When someone interferes with progress, it can be tempting to label them as a troublemaker and dismiss them. Labeling is not helpful, as it blames them for being off track and gives you an excuse to do nothing. Rather than thinking of these people as problems, think of them as valuable contributors who are using reactive behaviors to meet their otherwise unmet needs.

Maybe You Are the Trouble

If you feel you are continually facing resistance, guess what? Your problems share a common denominator: you. Start by looking in the mirror. Ask yourself: Am I creating the problem? Whether you are or not, if you change what you are doing, you might discover a breakthrough.

Conclusion

Inclusive leadership takes time, but if you practice the principles in this book, you can get any group of any size to back up good ideas and eliminate bad ones. Big ideas require a lot of preparation, especially when you are working across organizational boundaries. As you think things through, be sure to always be mindful of the whole system and lines of authority.

Understanding the New Currency of Business

THE ATTENTION ECONOMY

THE SUMMARY IN BRIEF

As with any company, an amazing volume of information flows into your offices, within your offices, and out of your offices, to employees, customers and shareholders. What do you and your people focus on first? Second? Over the short and long term? The amount and quality of attention you pay to information can make or break your company. Ask yourself:

✓ **Are you missing key information when making decisions?**

✓ **Do you find yourself without time to reflect on anything but the simplest information transactions (via e-mail or voice mail)?**

✓ **Are you unable to focus when necessary? Do you see this in your employees?**

Accenture consultants Thomas Davenport and John Beck recognize that in today's information-rich business world, the scarcest resource is not talent or technology — it's attention. In this summary, they show how to capture, manage and hold attention, both within your organization and outside it. You will learn:

● **What attention is and isn't.** The authors discuss the six basic units of attention-related "currency," and how companies use different combinations to grab and hold attention successfully.

● **What technology helps focus attention.** The Web's flashy multimedia capabilities has upped the ante for companies hoping to grab customers' attention. The most useful technologies of the future will help people and firms filter and manage information, according to their attention needs.

● **What attention factors affect e-commerce.** "Stickiness" — the ability to get people's attention, keep it there and keep them coming back — is the key to a successful Web site. The authors present the four factors that determine how sticky a site can be.

● **How attention affects leadership.** Leaders must be able to focus their own attention to useful means, as well as focus the attention of their subordinates and customers toward information that benefits both themselves and the leader's business.

The first guidebook on this valuable resource begins on the next page.

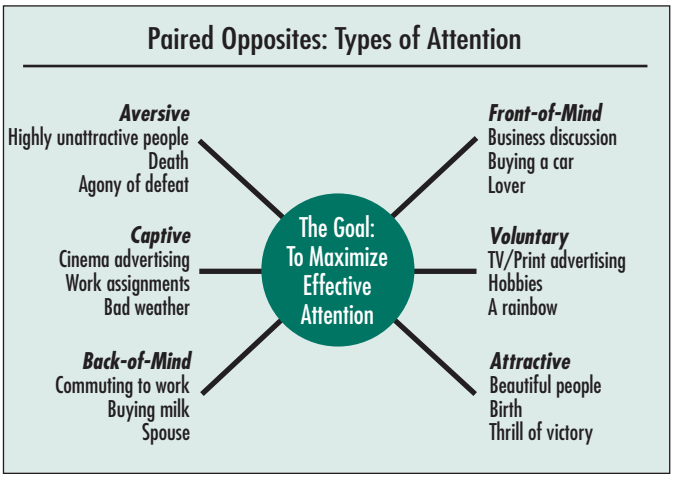
THE ATTENTION ECONOMY

by Thomas H. Davenport and John C. Beck

— THE *COMPLETE* SUMMARY

What Is Attention — And Why Is It Important?

Every business is an engine fueled by attention — the focused mental engagement on a particular item of information. In the Industrial Revolution, manpower drove the economy; in the information age, knowledge was power; in this business era, attention is the rare resource that powers companies. Recognizing that attention is valuable, that where it is directed is important, and that it can be managed like other precious resources is essential in today's economy.

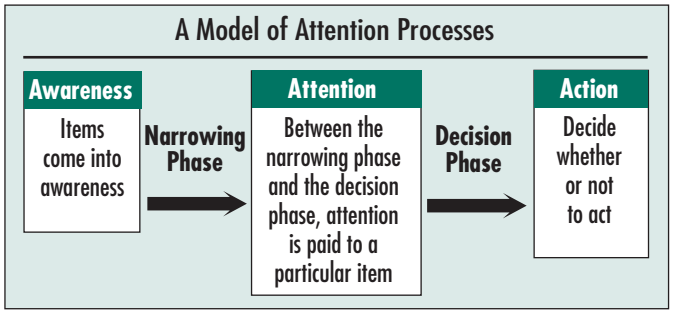


It helps to understand the manner with which information is processed within each of us (see chart below). Items come into our awareness, passing through a relatively unconscious *narrowing* phase, in which we screen out most of the sensory impulses around us. Those items then pass through a *decision* phase in which we decide whether to take action based on the attention-getting information.

Without both phases, there is no attention. Likewise, our definition requires some consideration of action as well. In the end, one may or may not act, but the consideration of action suggests that the matter at hand was given some degree of attention.

Six Units of Attention Currency

The concept of attention in the realm of business is a broad one. While the links between advertising and the attention of customers are fairly obvious, there is also the need for a company's leaders to manage attention on several levels, whether it be directing their own attention toward information, their employees' attention toward profitable activities, or the entire organization's attention toward customer needs.



There are six basic units of currency (see box above, right) that are exchanged in an attention market, each emphasizing a specific facet of focused mental engagement. These types of attention can be paired into three dimensions, with each pair containing two opposing kinds of attention:

● **Captive versus voluntary.** Attention can be driven by curiosity, the desire to learn, or the desire to escape from the demands of an environment — in other words, people pay attention to things they have to pay attention to, as well as to those things they want to pay attention to.

● **Aversive versus attractive.** We pay attention to some things because we wish to avoid negative experiences (aversive attention), whereas we pay attention to other things because we think they may bring us positive experiences (attractive attention). Children ride tires like sleds in Michelin commercials, providing the underlying message that we will jeopardize our children's safety if we buy elsewhere — an example of aversive attention. Likewise, a car with a dubious safety record may be pitched on attractive attention, based on the sleek look of that model.

What Is Attention — And Why Is It Important?

(continued from page 2)

● **Front-of-mind versus back-of-mind.** Front-of-mind is conscious, focused and explicit — the kind of attention you use to write reports or read information. At the same time, your brain is paying back-of-mind attention to dozens of other subjects, things that will never register with you consciously unless something unexpected occurs (for example, breathing).

The ultimate attention-getter draws all six extremes of attention at once. These are experiences that characterize the most intensely rewarding and enjoyable moments of our lives, regardless of whether they come to us or we seek them out or create them. Extreme sports and sky-diving are examples of how to combine all six extremes of attention into a single activity. It seems we love to have our attention totally saturated, to the extent that some of us risk our lives for the experience. ■

Use New Technology To Grab Others' Attention And Protect Your Own

The standard for what's attention-grabbing is always being raised — that which dazzles you today may very well bore you tomorrow. Inserting cute cartoon graphics into your PowerPoint presentations used to elicit chuckles. Now everyone has the same clip art package, the same fonts, the same transitional elements between slides. Many methods and tools for attracting attention have become mere commodities.

To compete in this environment, the attention-conscious manager or employee must engage wholeheartedly in the use of attention-getting technologies — tools such as streaming stored video, high-quality audio, hypertext and high production values. It's important to use the technology to customize information to the specific needs and habits of individuals. Highly tailored information attracts and keeps attention. For example, mass e-mail campaigns annoy just about everyone, whereas a customized message for you and you only gets your attention.

Corio Knows Customization

Corio, a leading application service provider (ASP) that provides access to business information technology applications over the Internet, had developed a product strategy that attempts to minimize the need for the user's attention. The company wants to present an integrated view of all relevant information for a particular type of user, so that everything he or she needs is easily accessible through a Web browser. This is a fine example of an organization building information systems that customize the information they present to each customer — without asking for a lot of the customer's attention in the customization process.

Technology as Filter

Given the barrage of information and the scarcity of attention, perhaps the most popular technologies of the future will be those that preserve, protect and defend your attention. (Ironically, the same technologies used to invade your privacy are the ones that can protect it.)

The goal in employing these technologies is not to eliminate all information, but to filter out messages not wanted at a particular moment. This requires the user to decide on his or her own preferences, then communicate that information to machines by selecting alternatives.

Technology alone will rarely, if ever, be the solution in itself to attention protection. The user must invest some time and attention, and even then, will only be able to protect attention in certain domains (such as e-mail, telephone and TV). ■

Attention Structures: Why We Keep Paying or Lose Attention

What keeps us paying attention once we've started? How can an informational message not lose the attention it has gained?

The following attention structures will help:

● **Make a change.** One way to keep attention over time is to make timely changes — to content, format, tone, involvement level, etc.

● **Tell a story.** We stay in movies and finish novels because we want to find out what happens in a story and to that story's characters. Give your audience a story, and they'll stay with you.

● **Keep it real.** Informational messages that are lifelike and realistic are more likely to keep attention than those that are not.

● **Don't stop.** If you have an audience's attention already, you have a good chance of moving to another topic or location without losing them. If, for example, you're watching a television program, the chances are good that you will watch a commercial broadcast during that program.

● **Alter the flow.** The most successful attention-structuring tools try to hold our attention to a given message, but also make it easy to change the informational context. One big reason that TV, radio and the Web are all successful is that it's very easy to change channels — in essence, altering the flow of the attention stream. ■

E-Commerce and Attention: The 'Stickiness' Factor

Companies that wish to sell their products and services over the Internet will live and die by the attention they receive. Although the connection between attention and e-commerce may be obvious, the potential of attention management in this environment is largely unrealized. Such Internet features as personalization, search capabilities and multimedia content are natural attention-getters, but an organization's ability to execute them is still limited. The systems of measuring attention in e-commerce are likewise flawed.

One of the most critical attention issues in e-commerce is simply how to attract and hold attention. Not everybody can win at the game; gains in attention for some sites mean losses for others. This problem has a name — "stickiness."

A sticky site lures Web surfers, holds them and keeps them coming back for more. And while stickiness does not guarantee success, sites that aren't sticky can't possibly succeed.

The Parameters of Stickiness

Stickiness is measured by three essential parameters: total time spent at a site, number of visits per person, and number of pages viewed per person. Different measures of stickiness are appropriate in different circumstances. For example, an e-commerce site trying to sell goods over the Web might receive high marks for number of visits per person (indicating repeat business), but might want to be cautious about high time-spent marks, which could indicate problems in navigation or appropriate information.

The stickiest sites combine and fully use four tactics: relevance, engagement, community and convenience.

Relevance

The most successful sticky sites remain relevant to customers by addressing the following issues:

● **Content that fulfills a need.** User needs must drive the content of your site. For example, when TWA flight 800 crashed under mysterious circumstances, the airline reconfigured its Web site to give prominence to updates on the investigation. TWA understood people were coming to the site for information, and it provided that information to them.

● **Appropriate scope.** You must find a good balance of breadth and depth in the content you provide, without overwhelming customers. Users of eBay, for example, can find several "hits" on a given item, but not so many that the task of plowing through them becomes too vast an endeavor.

● **Frequent updating.** User needs are not static; things tend to change quickly on the Web. The key to sticky success for financial sites is to provide regular updates, for example on stock prices. The value in such a site comes from providing the latest information on its given topic.

● **More of what customers love.** The stickiest sites are (or claim to be) authoritative — Amazon.com boasts the "earth's biggest selection" of goods, while the 1-JOBS network calls itself the "fastest-growing Internet recruiting service." These sites use time-honored techniques to establish credentials with users.

(continued on page 5)

Insights from the Conversion Principle

Many companies seeking attention on the Web get so caught up in the intricacies and novelty of the medium that they fail to recognize their ultimate goal — to convert attention into cash. Thus, the authors of *The Attention Economy* devised the "Conversion Principle":

"Internet attention is only a starting point; online advertising must engage the viewer and lead to behavior change."

Some interesting insights emerge from this principle:

✓ **Eyeballs are much more valuable when you know to whom they belong.** If you can identify the actual person who has visited your site, you can start pursuing the multitudes of marketing strategies available (relationship marketing, one-to-one marketing, etc.). In order to get people to identify themselves by registering, though, you must offer something in exchange.

✓ **Not all eyeballs are created equal.** The more valuable eyeballs belong to those people who actually make purchases from your site, as well as those with the target demographics sought by the sponsor. Print and TV eyeball seekers have known this for decades; the Web is only just coming around.

✓ **If you can't measure attention, you can't get paid for it.** Through sampling or server-based tools, you can measure whether someone visited a site, whether he or she clicked on anything, and how long he or she stayed. Wouldn't it be useful, though, to know how the visitor felt about the content? Through exciting methods, such as brain-wave monitoring, galvanic skin response, heart rate and other means (which are being used to measure other kinds of attention), we will very likely have that information and more, sooner than later.

E-Commerce and Attention: The 'Stickiness' Factor

(continued from page 4)

Engagement

Sites keep customers engaged by providing the following:

● **Interactivity.** Although the act of clicking links on any Web site is a kind of interactivity, the best sticky sites have taken the concept a step or two further. For example, Atlantic Monthly readers can post their reactions to articles on the site's "Post and Riposte" message board, and revisit the board to see what others have written about the article and their post.

● **Competition.** Gaming sites offer competition as part of their overall experience, and are, as a result, among the stickiest sites on the Web. Many non-gaming sites (like Disney.com and Football365.com) offer interactive competition as well, encouraging people to linger and return.

● **Production values.** Faced with a multitude of competing sites, visitors often discriminate on the basis of what they see. Production values are therefore extremely important to stickiness. British clothing vendor Racing Green, for example, goes to great lengths to make its Web site look and feel like a high-quality catalog.

● **Entertainment.** At the highest level of production quality, technology can blur the lines between commerce and entertainment. You must be careful, however, to make sure your entertaining content feeds back into your overarching business goals for your site.

● **Narrative.** You must find a way to present your messages memorably, whether you develop original content yourself, or get it from users or some other online constituency.

Community

The stickiest sites engender a sense of community with customers by providing the following:

● **Co-creation.** Sites like Schwab's and Fidelity's are built around their customers' substantial investment of their own information, which drives the content of the site. Internet calendars like When.com also depend on this "co-creation" — the factor of stickiness is directly proportional to how much scheduling information the user has provided.

● **Customization.** Customization is a form of co-creation, but usually depends more on filtering and manipulation than on the addition of information by the user. Dell's Premier Pages site, for example, employs customization by letting corporate customers filter out information not relevant to their account.

● **Personalization.** Sites like Amazon.com and Buy.com achieve stickiness by targeting customers individually, through personalized greetings, e-mails that concern purchases and recommendations based on prior purchases.

● **Flattery and recognition.** Amazon also creates stickiness by allowing users to rate customer reviews of products, thus allowing their customers to have a modicum of recognition and flattery in their experience with the site.

Convenience

Sticky sites use the following to make the online experience as convenient as possible for customers:

● **Quick downloads.** Surveys of Internet users suggest that faster access speeds would drive additional usage to the Web, revealing a downside to the use of sound and video that may turn off visitors who tire quickly of waiting for such content to load.

● **Bite-sized chunks of information.** Thanks to its long experience in print, USA Today's Web site is a model of the successful delivery of information in bite-sized chunks. Such presentation is ideal when dealing with the low attention spans of many online users. ■

Leadership: Capturing and Directing Attention

Some seasoned business leaders have long used attention management tools, which constitute a large part of their success; unfortunately, many more leaders do not. While the business section of your nearest bookstore is probably well stocked with books on leadership, not many (if any at all) deal with the relationship between successful leadership and attention. Consider, however, the great business leaders of the century — Ford, Watson, Morita, Welch, Gates — and how they have always managed to capture attention (their own and yours) and use it to their ends.

But even these pillars of attention management would have a tough go in today's increasingly plugged-in world. Now, more than ever, leaders have to find innovative means of capturing and directing attention. As a leader, you need to secure the four elements of attention leadership:

1. Focusing your own attention.
2. Attracting the right kind of attention to yourself.
3. Directing the attention of those who follow you.
4. Maintaining the attention of your customers and clients.

Focusing Your Own Attention

Attention flows downstream, from leaders to workers

(continued on page 6)

Leadership: Capturing and Directing Attention

(continued from page 5)

to clients and customers. Research indicates that leaders who are more self-aware are the most successful at directing the attention of others. Attention leaders must thus be able to focus their own attention — recognizing where their attention is directed and determining whether it is appropriately and effectively aimed.

You can improve your own attention focus (as well as the impact it has on your employees) by doing the following:

- **Go public about where you spend your attention.** By telling others about items in your field of attention, you'll also become more self-aware.
- **Set attention goals for yourself.** Know where you want to spend your future attention.
- **Get feedback from the people around you.** Family, friends and employees may have a better sense of how you spend your attention than you yourself do.

Attracting the Right Kind Of Attention to Yourself

The most successful leaders, like Sony's Nobuyuki Idei (see box at left), have risen through their organizations by knowing how to get the right attention at the right time, and how to avoid inappropriate attention. Whether by instinct or luck, their ability to attract attention to or divert attention from themselves (depending on the situation) is key in their rise and ability to flourish on top.

Directing the Attention of Those Who Follow You

Leaders require followers who pay attention to their beliefs and actions. Without these people, the progression from attention to self to captivating the attention of others gets interrupted. Self-awareness becomes pure vanity. Although old methods of leadership (the "command-and-control" style) are effective at getting the attention of followers, they are increasingly ineffective at maintaining that attention. While most employees will follow their boss' lead, positional authority alone will not keep the attention of employees.

The key to directing attention is to accept that you cannot control anyone's focus. Certainly, you can control many related things — how much time people spend at the office, where they sit, what they talk about, etc. Ultimately, though, people direct their own attention — it is a freedom individuals will always possess.

Attention leaders influence behavior by creating a meaningful context for information. By selecting and contextualizing information — choosing what to focus on and deciding how to focus on what they've chosen — leaders are able to successfully manage attention.

One way of doing this is to eliminate extraneous information by filtering or removing the means by which that excessive data flows. John Browne, CEO of British Petroleum (BP), instructed his information systems managers to delete half of the IT applications in the firm's internal system, after determining that a spate of mergers and acquisitions had limited the company's attention resources. Other leaders limit the kind of e-mail their people send out, noting, for example, that broadcast e-mails typically divert attention from priorities that require more focus.

(continued on page 7)

Sony's CEO Seizes The Attention Advantage

Nobuyuki Idei became the CEO of Sony by staying in the shadows of the company until the time was right to seize the attention advantage. According to staff members, he was "practically invisible," diverting attention away from his nontraditional management style by taking positions away from the company's headquarters. Indeed, Idei lived outside of Japan for much of his career, having created the company's French subsidiary in 1968 and spending a good portion of his career in France and Switzerland. All in all, though, he kept quiet, managing communications channels to accentuate his positive accomplishments and minimize the negatives in his bid to maintain a certain level of attention, while never attracting too much of it.

When he saw his management acumen matched the needs of the company, he came out of "hiding" and captured the attention of board members by taking over the entertainment arms of the firm (Columbia Music and Pictures) and turning them from underachievers to successes. He was the only executive in Sony who did not come strictly from an electronics background, and was thus perfectly positioned to bring the company's electronics and entertainment wings together and make both profitable. He was, above all else, an expert at securing and managing appropriate attention.

As a result of his acumen, Idei was able to jump over 15 more senior members of Sony's executive staff to become CEO. He now openly displays his nontraditional, energetic management style, seizing the attention advantage not just for himself, but also for Sony as a whole.

Leadership: Capturing and Directing Attention

(continued from page 6)

Maintaining the Attention of Their Customers and Clients

Even if you get 100 percent of your employees' attention directed in the right ways 100 percent of the time, your company will still fail if you can't secure and maintain your customers' attention — positioning your organization's products and services in the minds of customers, then maintaining that attention to get repeat business from them. Leaders try to get different types of attention:

- **Michelin's "There's a lot riding on your tires" campaign (with the baby riding in the tire) uses aversive attention.**
- **Pirelli uses attractive attention to sell its tires, making them look sleek, stylish, and high performing.**
- **Coke takes a front-of-mind position on its cola advertising, enticing customers to think "The Real Thing" every time they get thirsty.**

Remember, as an attention leader, you need to manage not only the amount of attention, but also the type of attention your customers give you and, where possible, to your competitors. ■

Strategy: Allocate Attention To One or Two Frameworks

Strategy requires an organization's executives and management to shift their attention away from the specific tasks involved in the business to more abstract and long-term issues. Managers focused on day-to-day concerns must often be convinced to pay more attention to strategy.

When developing strategy, you will have to choose from a multitude of potentially valid alternatives, each of which could take your business in a different direction. Some attention-oriented strategy choices you'll address might include the following:

- **Should we focus our attention on market share or profitability?**
- **Should we focus our attention on growth within our existing business, or on diversification?**
- **How much attention should we focus on traditional competitors, versus new entrants?**
- **On what new technologies should we focus our organization's attention?**
- **Can we ignore the prospect of changes in financial markets during our strategy, or must we focus on that as well?**

Strategy is not just about choosing the right strategic option, but also about what point of view to take on strategy itself — who does the strategy, when it's done, and so forth. Though you can view a strategy from many different perspectives, you cannot pay attention to each and every one of those perspectives. You must allocate your attention to one or two strategy frameworks, temporarily ignoring the others.

Another factor to consider is the dissemination of strategy. The traditional assumption has been a top-down assumption — that strategy is formulated by senior executives and disseminated through other parts of the organization. While this might be valid in some organizations, some argue that senior management is perhaps the least likely to propose revolutionary new ideas, because their attention is fully allocated to existing business. Current perspectives indicate that there be a broader participation in strategy — from secretaries and forklift operators and other employees on the front line. In these cases, managers must cast their attention nets widely if they want to include more nontraditional elements in their strategies.

Once strategy is set, it must be communicated. Communicating strategy across multiple organizational channels is the key to getting attention for that strategy and producing change. You must build awareness, focusing individuals' attention on what is important in the strategic environment, as well as what they must do individually to accomplish this strategy. ■

Jack Welch's Stealth Strategies

When it comes to communicating strategy across the breadth of an organization, few can touch General Electric CEO Jack Welch. Upon taking the mantle of CEO in 1981, he challenged the company's many business units to become Number 1 or Number 2 in their field by 1990, or they would be dissolved.

While this might seem like a simplistic goal in and of itself, it actually incorporated several important goals that fed into Welch's overarching strategy for solving GE's problems. While it was true that a business could be profitable without a Number 1 or Number 2 market share, Welch wanted a stable of champions whose enormous revenues and profit margins would give GE the financial flexibility it needed to dominate its markets. The focus on being Number 1 or Number 2 was a stealthy way of achieving numerous other goals to get GE on top and keep it there.

Structure: Focusing on Certain Aspects of the Business

Organizational structure is a powerful vehicle for focusing attention. Organizational structures focus attention on certain aspects of the business and ignore others. For example, one way to show employees, customers and external observers that a company believes quality is important is to create a quality department. Structure is not the only way to bring attention to a goal, but along with attention, it often pulls other means (performance evaluation, compensation, communications, etc.) toward the purpose of achieving the goal.

When determining on what the structure of your organization should focus its attention, you typically have many possibilities, but one overarching concern — there is only so much attention to go around. Thus, you must choose wisely. Among the options from which you might have to choose are the following:

- **Product-oriented structures.** These are for companies that make multiple products, each with different customers and markets.
- **Geographical structures.** These are for companies that must do business in various ways across its target geographical markets.
- **Functional structures.** These structures focus attention on peoples' technical specialties — marketing, finance, manufacturing, etc. — when business problems are too large and complex to be addressed with a generalist approach. Functional structures are persistent in part because that is how people are educated and trained — students take courses in functions, major in functions, and are then predisposed to devote attention to functions.

Switching the Focus

Even if an organization structure has only one dimension, a manager must take concerted action to draw attention to the new dimension if it is new or different from a prior way of doing business. If you are switching from, for example, product orientation to geographies, there will likely be a considerable transitional effort to undertake.

Let's look at an example: Business processes — the activities by which work is accomplished in an organization — typically cut across other dimensions of structure (such as business units). Some management thinkers suggest that firms adopt **process management** — rather than products, geographical units or functions — as the primary dimension of organizational structure. (Terms such as the "process-centered organization" or the "horizontal organization" refer to structures focused on process management.)

From an attention management point of view, however, this approach is misguided. It is not easy to transfer an entire company's attention to a new dimension of organizational structure, abandoning previous dimensions. Therefore, some alternative but more workable methods for focusing organizational attention on processes might include the following:

- **Tying process management to information systems initiatives (for example, large enterprise systems upgrades or revamps);**
- **Relying on senior executive exhortation;**
- **Evaluating and rewarding employees on the basis of performance.** ■

The Future of Attention-Oriented Policy

Policies in organizations have not, thus far, focused on attention to a significant degree. This will likely change, however, as managers recognize the limits of technology to sufficiently filter out unneeded data and focus attention on important information. Here are some policy initiatives of which we may see more in the coming years:

- Companies may have strict policies for who can send information to employees and who cannot. Wasting another employee's attention will be frowned upon in the most extreme manner; access to corporate e-mail addresses will be strictly limited.
- Executives of companies will probably suggest to employees how much off-hour attention should be devoted to work-related topics.

Firms will establish "information-free zones" or times during which employees will be able to concentrate on their work.

- It may also become common for employers to instruct employees about the amount of attention an employee can devote to non-work-related topics while at work, considering the new emphasis advertisers are placing on reaching prospects through workplace Internet connections.
- Firms will probably also make suggestions to their employees about the amount of attention they should devote to specific work issues or information. This will force management to monitor the allocation of their employees' attention and focus them on productive topics.
- Firms will establish "information-free zones" or times during which employees will be able to concentrate on their work, free of e-mail or phone distractions. Although many people find such isolation difficult to imagine, firms will institute such policies to allow their people to get non-communications-intensive work done. ■

THE SUMMARY IN BRIEF

You've probably learned the hard way that when you're the only one who knows what you know about the business, you can't get other people up and running quickly. Every owner wants the same thing: an efficient workflow that makes sense to everyone in the company. They and you, no doubt want to be able to trust the operation of their business to someone else. All of that knowledge is so much a part of you that you take it for granted--right up until the time the roof falls in because you can't be reached. Having a playbook that includes everything that makes your business your business allows it to exist beyond you.

No matter who ultimately takes on that day-to-day, building a playbook gets you thinking about how to successfully onboard your people so they understand what they need to know and when they need to know it. At the same time, you'll be shaping a culture that values process and efficiency, as well as gaining in all the other ways you'll learn about. ***The Business Playbook*** is a guide for the what, who, how, when, and why of building your company's playbook and making it stick.

IN THIS SUMMARY, YOU WILL LEARN:

- How to document your business in a way that leads to repeatable, effective processes.
- How to create a playbook that will serve as the ultimate guide for future success.
- Create sustainable business practices that will grow alongside your organization.

The Four Elements of a Playbook

Like the periodic table, the elements of a playbook are universal. Unlike the periodic table's 118 elements, a playbook has only four (each starting with the letter "P" for playbook). The first element is your **Profile**. Similar to a profile on social media, the company profile on your playbook is how you introduce what your business is about. It includes your brand, culture, values, mission, vision, and history. The profile section also explains to new hires or potential investors/acquirers why you exist, who you serve, basically how you serve them, and how you differ from other businesses in the same category.

The second element is the **People** who work in the business-a matter of intense curiosity for new hires. They're already looking everyone up on LinkedIn to get a feel for who they'll interact with; they'll appreciate it if you put everything in one place for them. This element helps everyone understand who's who, and who does what in your company.

Third is your company's **Policies** — the operating rules and standards that would typically go into an employee handbook. They include everything from office-access hours, dress code, and vacation time to legal compliance: state and federal regulations, and anti-harassment and safety information. (Start with the policies that apply to everyone.)

The final element is **Process** — the "plays" part of the playbook. It's my favorite element: while Profile, People, and Policies make up the foundation of the building, Processes help you grow into a skyscraper because they scale your business's capacity to produce. They result in more people delivering more products and services to more customers, and doing it consistently. Processes are the step-by-step, start-to-finish sequences of accomplishing a task or meeting a responsibility inside a business.

When, Where, How, and Whether to Start

To help you decide whether your business is ready for a playbook, look closely and objectively at your business and answer these questions:

Is your business mature enough? It might be if you have at least some separation of roles and responsibilities. But it's definitely not mature enough for a playbook if only one person is doing every job.

Do you want a playbook for the right reasons? What's a bigger problem for your business: Is it getting more customers? Or is it being able to consistently and efficiently deliver to the customers you are already getting?

The first— getting more customers — is a revenue problem, and as you saw with our real estate client, a playbook can't solve that. If that's what you're dealing with, spend your time and energy working on marketing and sales. Delivery is an operations problem, which a playbook does solve. Documenting repeatable processes enables you to scale and meet the demand.

Why else do you want a playbook? Maybe you plan to sell the business. Or you want to create a better work-life balance; instead of continuing to allow the business to dominate your life, you want to be able to take a vacation now and then or spend more time with your family. Maybe you aspire to open multiple locations or develop a franchise. Or you might want to pass along the hands-on part of your business to free up your time for your next venture. Keep your answer to "why" in mind for when we talk about how to enlist the help of your team.

Is your team ready and willing to get behind your vision? Regardless of your rationale for building your playbook, if you don't have a good relationship with your people, you'll find it hard or impossible to get them on board. Never start work on a playbook before you're confident that you'll get their help and support— even their excitement.

Your Profile: Defining What Makes Your Business Unique

A number of items belong in the profile of your company— the first section of your playbook. Here they are in their most logical order.

Say Hello

A warm welcome is the best way to begin this section. Although it may sound obvious, give your newcomers a soft landing by starting with a simple hello. Give every new person the same enthusiastic greeting to get them excited about working with you and the process to come.

Share Your Vision and Mission

Your vision is where you expect your company is headed— an imagined end state. It's tied to your passion for the business, who you want to serve, and what kind of impact you want to make on the world. For example, back when only

the biggest companies had computers, Microsoft's vision was "a computer on every desk."

Share Your Core Values

Your values are the traits and principles that you and your team members share. Establish them early before you document your processes. Documented core values make employees confident about taking action. Even before you have specific responses for every scenario you can anticipate, having core values in place will help guide your team's decisions in the right general direction.

Communicate Your Brand

This part of your playbook is your chance to convey the look and feel of your business to your new team members. It's your business's personality, voice, and tone— whether professional and structured, quirky and casual, or something else entirely.

Introduce Your Market/Industry, Customers, and Competitors

When people search for your company online, in what category do they find you? How are you represented in the marketplace? To orient new hires to the space your business belongs in, start this part of the playbook by touching on your category or industry.

Introduce Your Products and Services

Use this part of the playbook to list your company's menu of products or services and their approximate prices.

Introduce Company-Wide Software

Provide a basic intro to only the software tools that apply to everyone, like your email and calendar programs, and chat app, if you use them. New hires will be expected to use these programs early on.

Include a Glossary

Every industry and business has its own jargon. Help new hires get acclimated to it before they find themselves lost or confused in their first meeting.

Introduce How Your Business Works

The final piece of the profile is a start-to-finish look at what actually goes on in your company so that each employee understands their place in the big picture.

Your People: Making the Map for Who's Who and What They Do

People are the most important part of your business. Even though every company's profile is unique, it can be similar in some ways to that of another business. But it's the people who really make the difference. They're who make your business what— and who— it is. It pays to invest in helping everyone feel welcome and get acquainted and in keeping their responsibilities aligned with them.

When you think about the dramatic difference between my two conference experiences, I know there's no question about which experience you want for your new employees. By building a directory, an org chart, friendly bios, and detailed roles and responsibilities, you're creating a sense of belonging for your new team members and setting them up for success.

Your Policies: Writing the Rules of Play

Your policies should never be about eye-roll-worthy layers of red tape. They need to be useful, fair, clear, and never over active. There are dozens of potential policies you may want to consider for your business. That said, there should never be any 'forever' policies. Make it a policy to regularly review your policies. To avoid overwhelming your team, throw away policies that no longer— or never did— make sense. In most businesses, people are doing obsolete policy-based tasks that were established years ago because no one has questioned them since. To avoid this waste of time, regularly review your policies and ask your team to suggest ones to get rid of.

Your Processes: Shifting from "How You Do It" to "How We" Do It"

Answer each of the questions about the responsibility or process to be able to thoroughly and clearly document it.

1. What's the process called? That might sound too obvious, but if the name isn't clear -if it doesn't match what team members expect it to be-no one will be able to find the instructions. Keep names simple and intuitive, like "Replying to Support Tickets," "Extending a Job Offer," or "Sending Out the Weekly Newsletter."

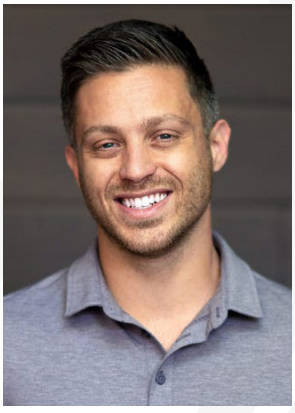
2. Who owns the process? Every process should have just one owner whose job it is to keep it up to date (and post the date it's updated), make sure people are trained in it, answer questions about it, and confirm it's getting done right.

3. What physical or software-based tools are needed to perform this process and where can they be found? Does it require a blank form or company letterhead? Is there a template for, say, a client presentation? Are there required logins and passwords? Or is background information needed, like a client profile including their order history?

4. How often and when is it performed? If you're training on the process for answering phone calls at the reception desk, provide useful context, such as whether the phone rings five times a day or five times an hour. This knowledge will help team members determine how much time to allow for this task and plan their schedules in general.

5. How long does it tend to take? This is especially useful because it communicates how long you expect someone to spend on the process. For creative shops, like web designers, do you allocate two days or two weeks for creating mock designs? To avoid applying unneeded pressure, you might add a range or mention that the process will go faster with practice.

6. How is it measured? Many processes come with important key performance indicators (KPIs) that show how good a job someone is doing. For example, a KPI might measure how quickly team members respond to customer-support tickets or the maximum percentage of tolerable waste in a manufacturing process. Some processes will lend themselves to including in the playbook how they look when they're done well. And for other processes, it might be useful to show a process done right next to how not to do it.



7. Why does it matter to the company that it's done correctly? Understanding this context helps team members buy into learning the process. If they know why the standards matter, they're much more likely to want to uphold them and to work like a human being with a heart, rather than like a robot.

8. Finally, what are the steps? Make them comprehensive and clear. Break up the steps into manageable chunks of content, no more than the approximate length of a half page of paper. This helps keep the content on the screen, readable at a glance, rather than requiring the team member to scroll through endless text. Better yet, whenever possible, incorporate screenshots, videos, or screen recordings. If a picture is worth a thousand words, a video is worth thousands of pictures!

Conclusion

Your small business will stay small if you can't manage to remove yourself from the day-today hands-on running of it. You can scale only if you delegate tasks and operations to your team and trust them to deliver. A playbook that documents your processes, policies, and culture is the best way to get your business out of your brain and into theirs.

Now that you have the tools to collaborate with your team and capture the knowledge and uniqueness that exists in your company, I hope you'll use this book as a roadmap to create a playbook that will do wonders for you, your business, and everyone on your team.

The Human Forces that Fuel or Foil Corporate Transformation and Change

THE CHANGE MONSTER

THE SUMMARY IN BRIEF

Most mergers and acquisitions fail to deliver their promised value. Even many internal restructuring projects often succeed only so far before employees and managers backslide into the old, less productive status quo. Why?

Despite careful management of the operational aspects of corporate change, many managers and executives ignore the human element — how changing a job description or corporate environment makes people feel. Because, ultimately, employees are the backbone of any company, aligning corporate change initiatives with your employees' inner workings — their emotions and reactions — as well as the necessary operational adjustments, can boost the success rate of any restructuring or merger.

In this summary, Boston Consulting Group Senior Vice President Jeanie Daniel Duck introduces a five-stage framework — called the "change curve" — for understanding and managing the human element of the change process.

The change curve consists of the following stages:

I. Stagnation: The organization is either depressed or hyperactive.

II. Preparation: Leaders engage in planning and communication.

III. Implementation: The initiative is expanded to involve more people in multiple layers.

IV. Determination: This is a period in the process that consists of conflicts, clashes, failures and minor successes.

V. Fruition: The results are realized.

With the help of two case studies — an actual case involving the Micro Switch division of Honeywell Systems and a fictional case (based on actual companies) involving the merger of two pharmaceutical companies — Duck leads us through the change process stage by stage.

Any major transformation of your company will awaken the "change monster" — the emotions and fears of those faced with radical change. As a leader, your job is to tame this monster.

This summary will show you how.

The Change Curve — A Map To Find Your Way

"I don't like doing something different, unless I already know how to do it," might sum up how most people feel about change. Any change is stressful. Stress is a stimulus and one that can stimulate in either a positive or negative way. Studies have shown that in workplace situations, stress most commonly occurs:

- **When high demands are placed on employees**
- **When employees' actions are being carefully watched**
- **When employees are concerned about their competence**

In any merger or restructuring, all three of these stressors come into play, producing an even more negative stressful reaction among employees. Leaders of change initiatives and major change programs must address these concerns.

Five Stages

Organizational — as well as individual and personal — change is a process that proceeds over time and has been shown to have distinct observable stages or phases. By identifying and describing these stages, managers can more easily spot the problem areas ahead of time or identify where they are in the overall process.

The "change curve" is a five-stage framework that describes the typical process of change. The five stages of the change curve are **stagnation**, **preparation**, **implementation**, **determination** and **fruition**. Different parts of the organization can be at different locations on the curve, and sometimes you may need to revisit earlier stages. But these are phases that have been seen again and again in numerous companies and cultures. As the company moves further along the change curve, it has been shown, employee morale and confidence rise. ■

Three Essentials Of Change Management

Strategy: A passionate belief in where you're going. Communicating and translating your strategy into action is as important as the strength and depth of your belief in it.

Execution: Good, basic management. This element is even more critical when a company is undergoing a change.

Sensitivity to emotional and behavioral issues: Recognizing and addressing the emotional and behavioral issues involved in change.

This summary focuses on this third essential element of change.

The Dimensions of Change

Some changes can be relatively simple, like installing a new computer system. Generally, there are eight areas addressed in any corporate change initiative:

- ✓ **Strategy**
- ✓ **Business model**
- ✓ **Key processes and IT systems**
- ✓ **Organizational structure**
- ✓ **Roles and responsibilities**
- ✓ **Compensation**
- ✓ **Locations of operation and facilities**
- ✓ **Size and capability of work force**

The more areas that need to be addressed and the more people involved, the more complex a change initiative becomes, and the longer it will take to accomplish.

The author: Jeanie Daniel Duck is senior vice president of The Boston Consulting Group. Her article in the *Harvard Business Review*, "Managing Change: The Art of Balancing," is a bestselling reprint used in executive education programs and business schools. Duck is also an artist with a master's degree in sculpture.

Stage 1: Stagnation

Stagnation, the first stage of the change curve, can be summed up in two words: demoralization and denial. A depressed or demoralized company exhibits the same symptoms as a depressed person: a general slowness, difficulty or inability to make decisions, and lack of motivation or energy.

A company can also exhibit stagnation at the other end of the spectrum by being hyperactive — engaged in frenzied activity but accomplishing very little. This type of atmosphere leaves employees feeling exhausted, abused and very (negatively) stressed.

In some cases, consultants have seen both symptoms exhibited in the same company. In a company experiencing this type of stagnation, there can be many change initiatives in progress, but none that reach fruition. The danger is that management loses credibility and the work force builds up a resistance to any and all change initiatives.

A depressed or demoralized company exhibits the same symptoms as a depressed person: a general slowness, difficulty or inability to make decisions, and lack of motivation or energy.

Stagnation can be caused by poor strategy, lack of leadership, a shift in the market, a lack of new products or services, too few resources (including employees), outdated technology and poor execution. Employees of a stagnating company often express feelings of being safe and secure in their jobs and having faith that their jobs, and the company, will continue forever.

One example of a company in stagnation is Mattel, which comes up with endless spin-offs for its Barbie product line, but has trouble creating anything new. Its acquisition of The Learning Company was an attempt to infuse new ideas and technology into the company, but this move did neither.

Diagnosing Stagnation

Constant vigilance against stagnation is required of all company leaders, most especially in the high-technology and dot-com sectors. Analysis of quantitative data, and external and internal qualitative (or emotional) data is necessary for correctly diagnosing stagnation within a company. You need to talk — and listen — to your customers, suppliers, service providers, distributors and industry experts.

For example, some questions to ask your customers include:

- **Do you like doing business with us? Why or why not?**
- **Do you see our product or service as integral to the health of your business?**
- **Do we provide unique value or are our competitors as attractive as we are?**
- **How has your relationship with us changed over the years?**
- **What one thing could we improve that would make a difference to you?**
- **How would you describe our company to a colleague or friend?**
- **How would you compare us to your ideal?**

Just as important is talking and listening to your employees, whether through structured surveys and focus groups, hallway meetings, presentations or even just spending a few of your lunch hours at the cafeteria. Use as much face-to-face time as possible with both customers and employees.

Overcoming Stagnation

Once you recognize and diagnose stagnation, the next

(continued on page 4)

Micro Switch: First Steps

Make Micro Switch competitive for the 21st century. This was the challenge presented to Ray Alvarez, the new general manager of Honeywell Micro Switch — a company with 5,000 employees spread among 11 factories or offices in the United States, Mexico and Europe. Accomplishing this task would not be easy.

When he came on board, Alvarez found a company using outdated equipment and processes — the antiquated working conditions in the first factory he visited seemed to date from the 19th century. Not surprisingly, workers were demoralized. Willing to accept poor working conditions and little empowerment in exchange for the paycheck, Micro Switch had what Alvarez called "wage earners" (rather than employees) who saw no value in trying to do things differently. The company's work force exhibited no energy or team spirit.

From the start, though, Alvarez was determined to collect soft data — the emotional considerations of the employees — as well as hard financial data. He visited every plant and immediately began forming a change management team. He found that he would need to address all eight areas of change: His company needed a new strategy, a refined business model, revamped processes, adoption of new technologies, entry into new markets, a new management team, new team-based work units, and the reshaping and retraining of its work force.

Pharmaceutical Merger: Denial

A long-standing European pharmaceutical firm, renowned for its research and sense of mission in serving humanity and science, was due to lose its best-selling patent; in addition, one of its drugs far along in the pipeline suddenly lost regulatory approval. While the firm's management was aware of these dangers, its scientists were not. When the announcement of a takeover bid from an American rival came, the company's scientists and researchers were stunned. For them, the acquisition was driven by the greediness of a profit-driven American interloper. The R&D function was in denial because management, by keeping the company's serious problems to itself, had not prepared its scientists and researchers for the possibility of a merger or acquisition.

Stage 1: Stagnation

(continued from page 3)

step is to develop and implement a strategy that will free your company from stagnation and bring it success.

Before you can implement a sound strategy, however, you have to attack the culture of the company — its beliefs, habits and attitudes — that is probably hindering its progress. Many companies have corporate cultures frozen in the past. How much is your corporate culture in sync with today's reality? You can find out by asking questions such as:

- **Where do we stand competitively?**
- **Where do we think we stand competitively?**
- **How does our culture compare to the current reality?**
- **What beliefs and behaviors drive our organization?**
- **What beliefs and behaviors do we need to change in order to compete effectively?**

The managers at Honeywell Micro Switch, for example, continued to think of their company as the leader in the electric switch market for years after most customers viewed electric switches as dinosaurs.

In another example, Merrill Lynch & Co. resisted the "do-it-yourself" investing of online trading until the company finally realized that online trading was the future — and the company had no choice but to become a major player.

To burst free of stagnation, you need to ask yourself: "What outdated beliefs and behaviors are prevalent in our organization that will prevent us from conceiving or executing a winning strategy?" ■

Stage 2: Preparation

During this stage of the change curve, many operational issues are addressed: a new structure for the organization is designed; new employee roles and responsibilities are defined; and management determines which products, services and capabilities will become critical in the future.

As with any preparatory phase, this stage is filled with anxiety about the future ("Will I be laid off after the merger?" "Will I be relocated to New Jersey?"). Expect emotions — yours and your employees' — to be on a roller coaster. Emotional responses seen during this phase include anxiousness, a feeling of being threatened, excitement, betrayal, annoyance and irritation, disbelief and cynicism. Employees become more distracted as changes start to occur, causing productivity to drop.

Three Main Tasks

Leaders of the change effort have three main tasks in the preparation phase:

- Aligning and energizing the management team around the corporate strategy and vision.
- Articulating and detailing the vision and plan so it can be clearly understood and executed by others.
- Generating a healthy dissatisfaction with the status quo and a genuine appreciation for change within the entire work force.

Aligning Top Managers

Leaders of any corporate change movement should begin the preparatory phase by holding one-on-one conversations and group discussions with top management team members. The process involves listening, sharing and refining. The goal is to develop group thinking about the change. This can't happen, however, if the leader isn't open to hearing criticism of his or her ideas.

For example, Ray Alvarez of Micro Switch knew one of his most important tasks at this phase was getting to know each of his three direct reports so that he could determine each person's value to the organization. Each had a different style and relationship with their employees. Alvarez needed to determine the depth of the three managers' knowledge of the industry, their willingness to collaborate with other members of the management team, and, if any of them were let go, their potential reaction to being fired (for example, would they take customers with them?).

It quickly became apparent that he was dealing with a collection of individuals, not a team. They didn't know what to expect or how to collaborate. There was much work to be done before this group was ready to lead a change initiative.

(continued on page 5)

Stage 2: Preparation

(continued from page 4)

Aligning Cultures

Aligning the cultures of your company can be as important as aligning your management team. While differences in national cultures are addressed in multinational mergers, the generational or attitudinal cultures within corporations themselves are often overlooked.

Overall, these differing internal cultures are much harder to bring into alignment than cross-national ones.

The goal is to develop group thinking about the change. This can't happen, however, if the leader isn't open to hearing criticism of his or her ideas.

Plants at different locations, or business units defined by product category or business discipline (i.e., marketing, engineering), can have vastly different approaches to their daily tasks and long-term goals and objectives. The ideal is to create one core set of values that unites and leverages these many subcultures, not to make every department or group a clone of the other.

Are Employees Ready for Change?

Once the company's leadership is unified behind the change initiative, you can broaden your focus from top managers to the entire work force. (In reality, there will be some overlap here: Your entire leadership team may not be aligned before you start focusing on the rest of the organization.)

It's important in this step to quantify and assess how your employees feel about the change. One technique that will help you do this is called the Ready, Willing and Able Assessment (RWA). The RWA survey can be customized to a particular company and yields both quantitative and qualitative data. The quantitative data is helpful for determining the pervasiveness, area and extensiveness of a perception while qualitative data can help you get a better picture of the intensity of feelings toward a particular interpretation.

The RWA focuses on three aspects of change preparedness:

- **Readiness to change.**
- **Willingness to change.**
- **Ability to change.**

An RWA survey can be administered via e-mail, one-on-one discussions or as part of focus groups. The survey needs to create relevant questions for its own employees and its market situation. Respondents are asked to comment on their beliefs about the need for changes in the firm's operations (i.e., due to competitive threats or poor performance); their personal willingness to change (are they confident that the change initiative is the correct plan?); and their own ability to carry out such changes (do they have the skills they will need or do they believe the firm will provide the necessary training?). Questions can be drawn up that invite both quantitative and qualitative answers. The qualitative data (agreeing or disagreeing with a given statement) gives leaders a snapshot of where major issues exist. Asking for input also adds the more human elements and emo-

(continued on page 6

Never Assume Employee Concerns Can Be Addressed Later

When an American company acquired a blue-chip European pharmaceutical firm, it saw the merger as a way to strengthen its lead position in the industry. Another goal was to add new talent and economies of scale to its product development. The European employees, however, felt they had been sold out to a competitor that was purely profit-driven.

To make matters worse, the Executive Integration Team (EIT), formed immediately after the merger was announced, worked in almost total secrecy, fueling the rumor mill at both companies. After two months, the EIT announced a planned reduction in work force at both companies, but offered no details. The result was an even more intensified anxiety level among the 45,000 employees on both sides of the Atlantic.

Ignoring Alienation

Marco Trask was the executive in charge of research and development at a new pharmaceutical group created from the merger.

Trask hesitated about meeting with or addressing the combined research and development staffs of the two companies because he felt he had no hard facts. Nevertheless, he undertook visits to all eight research facilities to introduce himself to the staffs, an interactive company intranet was set up and a bi-monthly employee electronic newsletter was launched. A video was even produced which was circulated to other departments in the companies. Still, it became clear in follow-up surveys that a strong "us versus them" chasm existed between the research departments of both companies. Trask mistakenly believed these feelings would go away once the operational issues were settled.

Stage 2: Preparation

(continued from page 5)

tions.

Just administering the survey is not enough. Employees must know that their input has been taken into consideration. Management's follow-up actions are critical for building credibility. By learning more about employee resistance, managers can better focus their efforts and assess how they can best communicate the change process effort to the organization.

Communicate, Communicate, Communicate

Communication is key in articulating the vision and plan and building an appetite for change in the organization. You don't need a lot of bells and whistles to communicate effectively. The most important criteria for effective communication are a genuine belief that you need to exchange and provide information, and to care about your audience.

Always be on time or early with announcements — even announcements that there is nothing new to announce. Never be late or skip an expected announcement. It's human nature for people to make up their own versions — usually the worst scenario possible — in the absence of any hard facts.

Micro Switch: Using Symbols to Communicate

Ray Alvarez and his Micro Switch management team came up with two symbols to announce its diverse work force, which included employees from scientists to factory workers, the company's perilous state and its need for change. Initially he used a visual image the Midwestern employees could easily see — "storm clouds on the horizon" — to symbolize the competitive threats the company faced in the future. Next, he used the symbol of a "death spiral" the company could fall into if necessary changes weren't made.

But it wasn't just symbols that Alvarez and his team used in their messages. Because of the dire need for change, Alvarez broke some of Micro Switch's "unwritten" rules and decided to share sensitive customer and competitive data with employees. ■

Implementing Change: The 'Build Behavior First' Method

At Honeywell Micro Switch, General Manager Ray Alvarez used the "build behavior first" method. In fact, he refused to tell people how to achieve improved on-time delivery (OTD), one of the change initiative's goals. He set up weekly meetings with his management team to ask them what they had done that week to improve OTD and what they were planning to do the next week. One manager admitted that delivery times did improve — not because he felt they had developed any new "gee whiz" tools or methods, but because there was so much more focus on delivery time. And more important, these managers learned that with this success, they could approach other challenges by being more focused.

A Missing Vision Impedes Implementation

The leaders of the merger between two pharmaceutical companies focused almost exclusively on operational issues. In the research and development function, for example, R&D knew which capabilities would be required in each area, where employees would be located, what their compensation would be and what their new job descriptions were. There was much activity; in focus groups conducted during this phase of the change process, however, it was clear there were strong feelings of mistrust toward the integration team. Most notable: No strategy or vision was being developed for the newly merged entity. Leaders felt this could occur after the organizational issues had been addressed.

Stage 3: Implementation

The point at which preparation becomes implementation is different for each organization and each change. But it can't happen until the employees not only know what their company is trying to be, but what new tasks they will be asked to perform when they show up for work on Monday morning.

Leaders are responsible during Implementation for managing the expectations, energy and experience of the firm. It's not easy to ask a person to change; it usually creates resentment, embarrassment and tension. You need to find the people in your organization who understand (or have the potential to understand) the desired change and allow them to show others how it can work.

Here are some suggestions for getting this phase started:

- **Test and Deploy —** If a new process is being implemented, start it with one product line or within one department first, rather than company-

(continued on page 7)

Stage 3: Implementation

(continued from page 6)

wide. Then you can see how it works and figure out any "bugs" in the system.

- **Build Behavior First —** This approach is recommended for companies in which there is high resistance to change, or where the required change is substantial. Focus on a single objective and ask all employees for input. This technique allows you to empower employees by letting them show you how they can come up with a solution.
- **Use Attraction to Convert —** After testing a new process or method successfully in one department, use this example as a model.
- **Plan Replication —** When the change efforts begin, give managers in each department time to observe, reflect and document what they've learned as the processes evolve. Let them observe best practices with other managers so that the success in one department can be transferred to others.

Building Informal Communication Networks

One danger in any merger or restructuring is the loss of informal communication networks (i.e., when Bill in accounting can no longer call up Sally in purchasing with a quick question because Sally has been relocated). Managers need to identify and hook into these types of networks. They can tell you a lot about how employees are reacting to changes and where any bottlenecks exist. There are three types of informal networks:

1. **Cassandras:** These employees (usually middle managers or line supervisors) are the first to spot impending problems and "sound the alarm."
2. **Networkers:** These employees, usually due to their personality, are keenly attuned to what's happening within a company. They may interact regularly among the different departments or different levels of employees. They can be extremely helpful in identifying which plans are working and which aren't.
3. **Influencers:** These are the employees who can affect the opinions of others. Like thermostats, they can literally "cool down" a department or "heat up" another.

If At First You Don't Succeed…

Avoid the trap of glossing over or ignoring parts of your change plan that fail. Employees know when something has flopped; when management doesn't talk about a failure, they lose credibility. Instead, focus on learning from the failure. ■

Learning Teamwork

Honeywell Micro Switch was able to achieve its Determination phase by ensuring that all of its employees were involved. General Manager Ray Alvarez accomplished this by setting up six teams, dubbed "Building Block Councils." Each had a specific goal, from improving customer satisfaction to employee training, and involved employees at every level. Besides providing stronger focus on core issues, the Building Block Councils helped managers and employees learn to work as a team, to learn the value of explaining the reasons behind the change initiative's goals, and appreciate the importance of things as simple as saying "thank you" to contributors.

Stage 4: Determination

At this point, early successes seem far away, and many employees, even former champions of the change initiative, may begin to have doubts. This period is often punctuated by clashes, conflicts and failures.

Often, service levels drop or production problems arise. This is the time when competitors can come and "cherry pick" the best talent from recently merged companies. By not addressing the underlying emotional and behavioral causes, a company can actually slide back into stagnation.

Therefore, the role of leaders during the Determination phase is critical. It's too easy to simply

(continued on page 8)

Vision is Energizing

It took the resignation of three key researchers and a drop in share price for Marco Trask, who led the R&D function of a newly merged pharmaceutical group, to see the value of developing a vision plan (as well as the means for achieving it) and paying attention to the emotional aspects of an organizational change. One day after a critical article on his management style appeared in the business press, Trask reconvened his integration team. Within two days of continual meetings, Trask and his team announced to the research and development staff that a long-range strategy, vision statement and values statement would be developed within three months. They began to regularly communicate with not only the R&D team, but the entire organization. Once the plan and vision statement were announced — on time — employee cooperation, energy and excitement rose noticeably.

Stage 4: Determination

(continued from page 7)

throw up your hands and say, "They're not doing what we told them to!" As a leader, you must question your own perspectives and assumptions to understand why employees are having difficulty achieving goals.

Don't mistake your own perceptions for reality. The managers of the merger between two pharmaceutical companies believed that all they had to do was concentrate on operational issues; the scientists they were managing, however, were more motivated by ethical issues than profits. Detailed operational edicts were not going to convince these scientists that the change was necessary and should be supported.

Executives and managers involved in leading a change effort need to observe the overall dynamics of an organization and understand the motivations of its key players.

Although many CEOs understand the value of staying in contact with people at every level of the organization, not enough know how to do that effectively. One executive who does routinely asks employees, "What do you have to tell me today?" At first, employees were taken aback, but gradually they felt more comfortable with sharing ideas with him.

Determination from the Top Down

Most disastrous Determination phases can be linked to the withdrawal of the scrutiny and support of executives. It's important to keep an eye on outcomes to be sure what you or your team have designed is actually producing the desired results. This requires you to manage dynamics and align beliefs and behaviors. Don't assume that new operational procedures will automatically lead to necessary changes in attitudes and beliefs.

Often, leaders mistakenly assume that at this stage employees fully support the change. Thus, they announce new structures or processes, without making any concerted effort to get employee buy-in and support. The result is that the change process stalls, and the company slips back into Stagnation. ■

Stage 5: Fruition

No change is easy, and achieving long-sought-after goals is a truly rewarding experience. Once a targeted goal is reached, success can often beget more success. Employees become more confident, and work goes smoother. People may be busy, but they are not engaged in busywork.

This is the time to reward employees for their work, while at the same time communicating that management was capable of designing a change plan that worked. You need to get concrete and tangible with rewards: Give performance bonuses or establish an incentive compensation plan. Put your money where your mouth is.

Inculcate a sense of learning at your company. Let employees internalize their experience of the change process, so they will be able to use these skills, approaches and attitudes in the next change initiative. After all, companies will ultimately need to go through many change processes.

The Fruition stage can, though, lead to a sense of complacency — that can lead again to Stagnation.

To avoid re-entering Stagnation:

- **Don't make today's innovations into tomorrow's sacred cows.**
- **Stay abreast of the external environment.**
- **Keep listening to and communicating with the organization.**
- **Recruit fresh blood.**
- **Leverage your champions.**
- **Build skills of self-observation and correction; teach the change curve.** ■

Learning from the Process

Every change initiative can be a learning experience for managers involved in the process.

At the merged pharmaceutical company, Marco Trask learned first-hand how much commitment is required of executives leading change initiatives. He came to understand the value of recruiting different opinions and perspectives. Within three years of this merger, he was involved in another merger, for which he was named executive vice president for the new entity's R&D department. His first priority was establishing communication, including talking one-on-one with the key researchers and scientists involved.

At Honeywell Micro Switch, the organization as a whole learned the importance of keeping its competitive advantage. Whenever a new competitive threat was spotted, management no longer had to spend as much time explaining to employees the reasons needed for change.

The change at Micro Switch has implications beyond the plant and offices. Because employees felt more secure, they invested more in their homes. Real estate in the town became more valuable, attracting more businesses and homeowners. General Manager Ray Alvarez and his managers became involved in community projects, and local community leaders credited Alvarez with helping to revitalize their area.

Going to Market with Multiple Sales Channels

THE CHANNEL ADVANTAGE

THE SUMMARY IN BRIEF

Today, many leading companies are putting at least as much effort and creativity into *how* they go to market as into *what* they bring to market. Companies have a wide variety of options for connecting products with customers, from sales forces to distributors, from direct mail to the Internet, and everything in between. Each channel has unique strengths as well as weaknesses. For example, sales forces handle complex transactions well, but are expensive. The Internet isn't suitable for sales that require a lot of training or hand-holding, while using distributors can create sales at the expense of direct contact with the customer.

The use of a single channel limits a company's market performance. If you use only a sales force, you may provide great customer service, but you will be at a cost disadvantage to any competitor using another channel. On the other hand, if you use only the Internet, you will be limited to the sale of simple, low-cost products. In short, no single channel does everything well or competitively. Therefore, your challenge is to choose and integrate the right mix of channels to reach the most diverse group of customers and deliver the right product to each at the least cost. The result: a competitive advantage in revenue growth, market reach, customer loyalty and profits.

To build a channel system that will yield world-class performance and a durable competitive advantage, you must:

✓ know which channels you should be using;
✓ know how to build those channels into world-class performers;
✓ and manage them together as an integrated go-to-market system.

This summary will lead you through each of these three steps. You'll learn how to identify the right channels for your company by analyzing customer behavior and product characteristics. You'll learn how to build the different types of channels, from sales forces to the Internet. Finally, you'll learn the importance of effective channel mix and channel integration.

Turn the page to take the first step in building the high-performance, competitive multi-channel system that will set your company apart from its competitors.

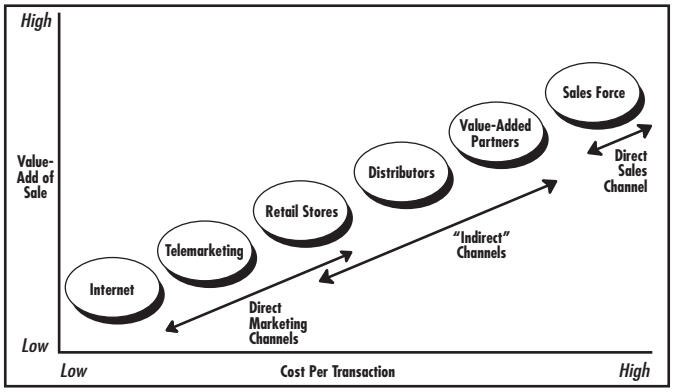
THE CHANNEL ADVANTAGE

by Lawrence G. Friedman and Timothy R. Furey

— THE *COMPLETE* SUMMARY



Choosing the Right Sales Channels

Today, the companies at the top sell products that are not substantially different from those sold by the competition. This is because successful and profitable businesses don't try to compete on the basis of product differentiation. They recognize that a new and improved product no longer yields a long-term advantage. As the rate of change has accelerated, a product advantage today is gone tomorrow.

Instead of differentiating themselves through products, top companies differentiate themselves in the way they reach their customers. Companies are achieving strong revenue and market share growth primarily by making it more attractive for more customers to do more business with them through more convenient sales channels. This is the channel advantage. ■

The Starting Point: Product-Market Focus

Before choosing the best sales channel or channels for your products, you need to take a hard look at your product/market strategy — what products you sell to what markets. Don't add new products (and new channels to distribute those products) without considering whether you aren't better off sticking with your current products and pushing further into your present core market. The truth is that sales growth within existing accounts is usually far easier to achieve than through expensive, risky forays into new products or markets. Remember that it's harder and more expensive to get new customers than to retain established customers. It's also harder to sell new products than established products. The further a company moves away from its core base of existing products and customers, the more difficult it is to achieve high levels of profitable growth.

Sales Channels - connecting products with customers
Source: Oxford Associates, adapted from Dr. Rowland T. Moriarty, Cubex Corp.

Thus, when developing your product/market strategy, start by concentrating on those product-markets characterized by "partially-penetrated" accounts, with low to medium market share.

In other words, customers tend to buy similar products from three to four vendors. Thus, each vendor may have just 25 percent of the total potential sales from that customer — that is, a 25 percent market share.

These low-to-medium market share accounts will yield the greatest profit for the least cost. And don't neglect "dormant" accounts. These customers typically

Channeling at Dell

Dell Computer makes personal computers that are about the same as its competitors' machines. Yet Dell's sales have grown 53 percent annually over the past three years, far faster than its competitors. During the same three years, profits grew 89 percent per year. Why is Dell outperforming the competition? The answer lies in Dell's distribution channels. At a time when other computer manufacturers are struggling with direct sales forces and distributors, Dell markets its computers in ways customers find attractive. Dell customers can configure and order a system over the Internet, or buy from efficient call centers. Together, these channels allow Dell to reach a varied group of customers where they want to be reached.

The authors: Lawrence G. Friedman, co-author of the best-seller *Getting Partnering Right*, is a channel strategy consultant whose clients have included AT&T, Microsoft and Bell Atlantic. Timothy R. Furey is CEO of Oxford Associates, a global go-to-market consulting firm.

Southwest Demonstrates Product-Market Payoff

Southwest Airlines provides an outstanding example of the wisdom of focusing on the right product-markets. For the last 24 years the airline has been the only carrier to turn a consistent profit. Southwest's strategy has been simple: Focus on short-haul intrastate routes, use less congested airports and set prices low enough to fill planes.

The airline has avoided setting up shop in expensive hub-and-spoke airports and focused on serving high-volume city pairs instead. Those pairs are its core market, and it continues to concentrate on growth within the core. Its target customers are price-sensitive local travelers seeking to get from one city to another as quickly and inexpensively as possible. By eliminating in-flight meals and most advance reservations and using smaller airports and standardized aircraft, the airline delivers what the customer base wants. So successful is its strategy that it consistently wins awards for best on-time performance, least complaints and fewest lost bags.

The Starting Point: Product-Market Focus

(continued from page 2)

are easier to sell to than new customers.

You cannot, of course, ignore new products and new customers completely. But you must weigh the cost against the benefits and concentrate your efforts accordingly. Remember that the cost of acquiring a new customer is three to six times that of retaining an existing one. While new customer growth may drive up sales, they paradoxically drive down overall selling profitability.

In sum, make sure that you are not focusing on new customer acquisition at the expense of increasing your market share of current customers — a more profitable use of your resources.

You must be equally careful in planning new product introductions. Relying too much on a growth strategy that pushes selling new products to new customers almost guarantees lower profitability.

In short, your strategy should develop as follows:

- ✓ first, deeper penetration of existing accounts with existing products;
- ✓ reactivation of dormant accounts;
- ✓ selective acquisition of new customers with market-validated products; and, finally,
- ✓ selective introduction of new products for existing customers. ■

Aligning Channels With How Customers Buy

To get customers to buy more, you must meet them where they're ready to do business, whether in a retail store, on the Internet or in their homes through a mail-order catalog. In evaluating new channel options, the acceptance and willingness of customers to use it is more important than any other factor in a channel's favor.

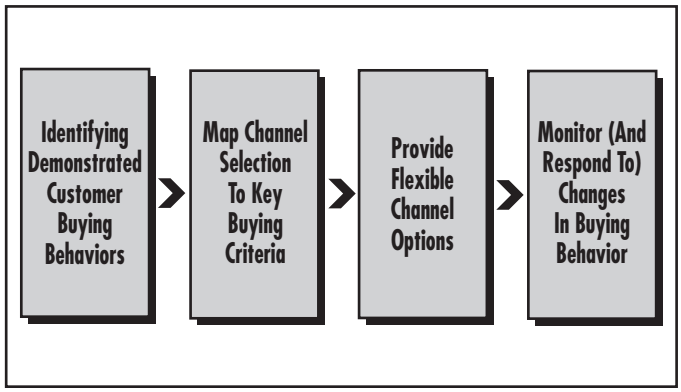
The first step is to identify your customers' channel preferences and buying behaviors.

Customer Surveys

Use a customer survey to acquire the information or data you will need to know about your customer. This data should include:

- key information about the customer including transaction volume and market segment;
- channel usage and preference, correlated with product or service purchased; and
- customer speculation on what channels will be used in the future.

Analyze your survey results to determine which channels are being used and which customers indicate a willingness to use them. From this list, design a flexible mix of channels that meet customer needs — that are, in other words, aligned with proven buying behavior and key buying criteria.



The cutthroat world of the flower business illustrates the channel approach. Customers who value making personal selections and expert advice over price and

(continued on page 4)

Survey Questions

Your channel survey should answer these questions:

- Who are your current customers?
- What criteria do they use to make a purchase?
- When and how do they do business?
- Do they want to buy different products through different channels?
- Do they buy the same product through more than one channel?
- Do you have different customers with different channel preferences?
- Who will your new customers be and will they want different channels?
- What channels do you need to add to meet customer needs?

Aligning customer buying behavior

Aligning Channels With How Customers Buy

(continued from page 3)

speed buy from retail florists. Those who value speed and delivery flexibility may choose a call center florist. Those who value price, speed and delivery flexibility chose an Internet web site.

Of course, the same customer may value different channels for different flower buying occasions. For an anniversary, when customization rather than price is the main consideration, he might choose a local florist. For a less personal business occasion he might choose the convenience of a call center or web site.

Buying Behavior Is Not Static

You will have to continue to monitor and respond to changes in buying behavior. This is particularly true if you use premium (and expensive) channels to close sales. Over time, customers become less willing to pay for premium channels. Be prepared to move into lower-cost channels as time goes on. ■

Amazon Takes Advantage Of New Channel

Amazon.com sells one of the oldest, lowest tech products in the world over an entirely new sales channel, the Internet. Back in 1996, when the Internet was very new, Amazon.com took the concept of bookselling, self-service and technology, and created a virtual bookstore which reached the market capitalization of Borders Group and Barnes & Noble combined within three years. By recognizing that bookbuyers are sophisticated individuals who like self-service and technology, the company took advantage of an entirely new channel to deliver books at significantly lower cost than competitors with physical stores.

How Product Characteristics Affect Channel Selection

Not every product can be delivered through every channel. Some products are simply better suited for one channel over another. You must consider channel touch when matching product to appropriate channel. Channel touch refers to the amount of customer interaction, service and support provided by a channel. For example, a high-touch channel would be a direct sales force because it is capable of touching a customer frequently, intensely and in many different ways. On the other hand, direct mail and the Internet are low-touch channels that offer virtually no interaction with customers.

A highly defined product that is easily recognizable as useful can usually be sold in any channel. For example, a pencil is a highly defined product whose usage and benefits are obvious. It can be sold in any channel, but the most suitable channel is the lowest-touch channel. On the other hand, a mid-definition product like insurance or business software may need a higher-touch channel to explain its benefits. Retail stores or value-added partners may be appropriate sales outlets. Finally, a low-definition offering such as a professional service can't be sold without education and explanation, and needs a high-touch channel such as a sales force. ■

The Economics of Channel Selection

You can't ignore the economics of channel selection. Why, for example, do almost all retail banks severely limit the hours their lobbies are open? "Banker's hours" aren't an accident, but instead reflect an industry wide effort to force customers to use lower cost channels to transact business. The cost per transaction for a do-it-yourself Internet or ATM transaction is far lower than using a teller.

When selecting channels, don't just select the channels that customers want to use. Select the lowest-cost channels customers will use.

In other words, when choosing channels, first identify every possible sales channel available. Next, use the customer survey information to determine which of those channels customers will actually use. Of those channels, determine which of those are a good fit for your product. Finally, identify which of these are likely to perform well economically by determining the channel's profitability.

You can identify the lowest-cost channel through the channel's profitability, which is expressed in terms of its

(continued on page 5)

The Economics of Channel Selection

(continued from page 4)

expense-to-revenue ratio, or E/R. E/R is the average transaction cost divided by the average order size. Say, for example, that you sell home office copiers for $400. If when you sell them through a distributor, the cost per transaction is $40, the E/R is 10%. If the same copier costs $20 to sell through telemarketing, the E/R is 5%. The lower the E/R, the more profitable the channel because the ratio shows that less money is being spent on selling cost for every dollar of revenue.

To determine the cost per transaction needed to calculate the ratio, take the total expense your company incurs to operate the channel and divide it by the total number of transactions.

As a general rule, choose the lowest-cost channel that is accepted by customers and that is a good fit for the product. Using this channel will yield the highest profits. Of course, you also need to make sure the channel you select is capable of producing a target level of sales revenue. Each channel also must be evaluated in terms of its channel capacity. The channel must be able to deliver enough sales to meet targets. ■

Building the Right Sales Channels

Once you have selected the channels that can best deliver high growth and profitability for a product market, you need to develop those channels. Most companies will end up using a combination of a sales force, business partners, telechannels or the Internet. Each channel presents unique challenges and can yield rich rewards. ■

Using the Leveraged Sales Force

The direct sales force is alive and well even in the world of Internet commerce and other technologically driven marketing. They perform a critical function in most organizations. A sales force is still the only channel that can sell complex products and solutions to large key accounts with a high degree of control over the sales process. For companies whose market includes such accounts, a sales force is indispensable.

Because sales forces are an expensive way to make sales, companies are redesigning them to maximize the opportunity for profit. That means that sales forces are no longer expected to chase every account. In a multi-channel system, other channels can often deliver sales at lower cost. By limiting sales force participation to the kinds of complex transactions that require high-end field representatives, companies are leveraging their sales forces to maximum benefit. Their time and energy is spent focusing on the most important market opportunities.

What a Leveraged Sales Force Looks Like

- Large account focus
- Complex, customized product focus
- Fewer accounts per representative, but with higher per account expectations
- Focus on the right call and the right deal
- Use inside sales to leverage time and energy
- Integrate field sales with other channels
- Training in skills to grow large, complex accounts
- Emphasis on partnering with key customers
- Compensation is realigned to reward key account development and discourage low-end selling

Sales forces must be pushed away from chasing every account and into cultivating key accounts. Smaller accounts or products that don't require high-touch selling must be redirected to other channels. The traditional sales training emphasis on aggressively closing sales doesn't work. That approach makes sense if the goal is to sell as much product as possible into as many accounts as possible. But that's not the way a leveraged sales force works. Instead of emphasizing closing any and all sales, salespersons must learn to use problem-solving skills to develop a partnership orientation with customers and the ability to work collaboratively with other channels.

Five Principles

A leveraged sales force is built around five principles. First, you must focus sales activity on large account acquisition. Don't let the force spend too much time with existing customers and small transactions. They need to get out there and acquire new, major accounts. One trick is to stop assigning the sales force to a geographic area. Instead, assign salespeople to a minimum **account size**, **sales complexity** and **growth potentia**l.

To help sales reps focus on the right accounts, be sure to define what you mean by "right." Articulate at least two or three concrete characteristics of the "right" account. You must also reduce the number of accounts per representative.

Second, the sales force must use other channels to offload "low value" selling tasks. Let the sales force be responsible for account planning, customer negotiation

(continued on page 6)

Using the Leveraged Sales Force

(continued from page 5)

and sales closure. Give other tasks like lead generation, proposal writing, order fulfillment and post-sale support to others. For example, lead generation may be better and more economically done by a telemarketing group.

Third, provide extensive technological support to field representatives. Computers and up-to-date business planning software are essential. You must also provide appropriate information to the reps. The focus of that information should be industry news, key account events and business development opportunities.

Fourth, redesign sales force training programs to emphasize large account acquisition and penetration. Teach sales representatives to conduct needs analysis for customers. Reps must stop using aggressive closing techniques and instead learn to develop and court large accounts.

Finally, align performance measurements and compensation with a large account focus.

To refocus attention to larger accounts, you may also need to redesign the compensation structure. You can, for example, discourage retention of small accounts by eliminating commission payment for them. ■

Using Business Partner Channels

A business partner might be a giant multinational company or a housewife selling home baking equipment to her friends. Partners include manufacturer's agents, brokers, wholesalers, retailers, distributors, resellers and value-added dealers. They are intermediaries who sell, support or build a manufacturer's products for its customers in return for a commission or other payment.

Using a business partner is using an indirect channel to reach your customers. When used correctly, business partners can help a company penetrate deeper into dispersed markets and reach more customers, thus growing revenue and market share.

Generally, using a business partner is less expensive than using a sales force. The trade-off, of course, is control and direct contact with the customer. There are seven best practices you should apply to a business partner alliance. These are:

Define the scope of the channel by determining how many partners you need. Some factors to consider are how many partners the market can accommodate. Remember, each partner will have to benefit economically from the partnership. If you sign up too many partners, there may not be enough profit to sustain partner efforts.

Amazon.com Associates

An example of the use of partners to generate leads is Amazon.com's associates program. Through the program, companies or individuals with Internet web sites can set up web sites reviewing or recommending books. Review readers then click through to Amazon.com. The associates' function is strictly to generate leads. In exchange, they receive a portion of any sale resulting from the lead.

Define the partners' role. Will they provide leads, sell or perform a support role after the sale?

Make sure channel policies for your partners are complete, clear and written.

Build a strong base of partners. You must carefully recruit appropriate partners. Create a perfect partner profile and use it to screen candidates.

Build a strong channel support infrastructure, including marketing support, advertising allowances, opportunities for co-branding, opportunities for training and sales promotions.

Measure and manage partner performance. Although partners don't work for you directly, you can still measure their usefulness. Set realistic expectations, and cut loose partners who aren't up to par.

Get good channel feedback. Partners may come up with some of your most promising innovations since they observe firsthand what customers want. ■

Telechannels and Strategic Call Centers

The telechannel, that is, using a telephone-based channel, is a versatile and potent way to do business as well as a low-cost channel. Generally, telechannels are designed to increase revenue growth, reduce selling costs and improve customer satisfaction.

There are five telechannel applications. These are telesales, telecoverage, teleprospecting, customer service, and technical support. Using the telesales application, orders from catalogs or other advertising are closed over the phone. Telesales staff may also do outbound calling.

When the application is telecoverage, the phone team maintains and nurtures key account relationships as support for a field sales force. Duties may include reactivating and reestablishing relationships with dormant buyers. Telecoverage is very cost effective since team members can be anywhere.

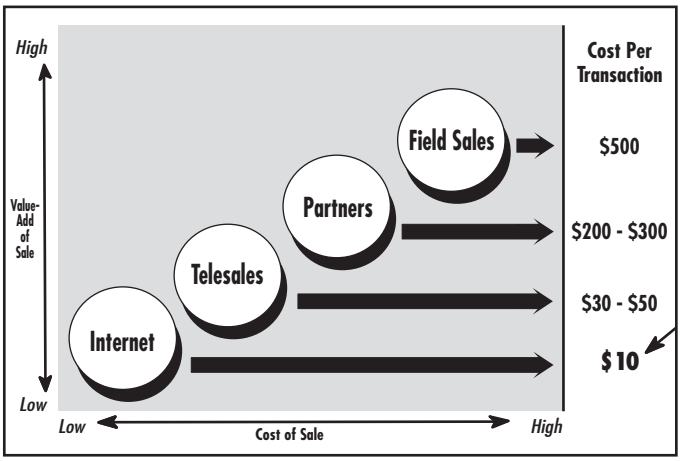
(continued on page 7)

GEICO

GEICO is an insurance company that saw the advantages of a telechannel and used that advantage to sell low cost insurance to thousands. Originally a small insurance company for government employees, the company became a market leader with a campaign proclaiming, "Give us 15 minutes and we could save you hundreds of dollars." GEICO built eight call centers and began selling insurance over the phone rather than the traditional face-to-face way. The company is able to offer low cost insurance because it has lower overhead and because it can check an applicant's driving record online while on the telephone. Poor risks are quickly screened out.

Telechannels and Strategic Call Centers

(continued from page 6)



Teleprospectors generate and qualify new leads for closure by another sales channel. Using telechannels to provide customer service and technical support is also very cost effective.

A company developing a call center to perform telechannel functions would do well to create a strategic plan first. The plan must clearly identify the telechannel business objective. For example, is the goal to retain customers or to cultivate new ones? Will the center close sales, or simply pass prospects on to another channel? Obviously, each telechannel serves a different goal. Be sure to allocate adequate funds for appropriate technology. The plan also must determine how the call center will coordinate with other channels such as the sales force or business partners. The plan also needs to outline how customers will be driven to the telechannels. Customers need to know when they should call their sales rep for support and when they should call the center. They also will need to be told why they should call the center. ■

The Internet as Sales Channel

A few years ago the Internet wasn't a sales channel at all, but a research tool for academics and a communication tool for the Department of Defense. Its original purpose was to ensure that during a nuclear attack the military would be able to continue to communicate. Today the Internet is developing into a low-cost sales channel at a dizzying pace.

As a sales channel, the Internet may be able to provide the lowest cost per transaction of any channel. Typically, an Internet channel costs only a quarter that of other channels. Advantages of using the Internet to go to market are many. The Internet provides expanded market reach by reaching an unlimited number of people at the same cost as reaching a few. It costs no more to reach a million than it does to reach a thousand.

Transaction cost by channel — industrial products: $2,000-$5,000 sale (aggregated from industry data — manufacturing, chemicals, paper, 1996)
Source: Oxford Associates

The real power of the Internet may well turn out to be in business-to-business commerce. Even large accounts can benefit from a combination of self-service, lower prices, 24-hour access, product training and pushbutton connections to another channel like a call center. But the most important factor may well be that buyers like this new channel. It offers them fast, efficient service, as well as the ability to do their own research and purchase on their own schedule.

Doing Business on the Internet

As an e-commerce channel, the Internet can be used in four distinct ways. It can:

- ✓ serve as a customer awareness-building site, providing basic information about your company to stimulate interest in your brand;
- ✓ serve as an open market catalog center, allowing customers to purchase directly online;
- ✓ provide a secure, customized Extranet for key cus-

(continued on page 8)

How Customers Use the Internet

Today, customers use the Internet to accomplish four things. They visit web sites to learn about companies and their capacities. They also want to get detailed information about a company's products or services. They want to buy online, paying electronically. And finally, they seek out a web site for help with a purchase after the sale. Your web site must eventually provide solutions for all these customer needs.

The Internet as Sales Channel

(continued from page 7)

tomers and suppliers where contracts can be reviewed and where orders can be placed, tracked and confirmed; and

✓ serve as a business partner "portal" to broaden exposure.

To take advantage of the Internet, you must start building an e-commerce strategy. Most companies can begin by using the Internet to serve the low-end segment of their markets. The site should be built and deployed in phases. First, put the information technology infrastructure in place. Then design the content, accounting for operating costs for maintenance and updating. Finally, realize that there will be costs associated with driving customers to your web channel just as there are for driving traffic to other channels. That may mean purchasing advertising in traditional media, featuring the www address on all other promotional material, registering with search engines and advertising at other sites. ■

Managing Channels for High Performance

By now, you should be convinced that using one channel to reach your customers is probably not the way to go. But having chosen and developed multiple channels is only the beginning. Now you must learn to mix and integrate the channels you have chosen for maximum impact on profitability. ■

Channel Mix and Channel Integration

The key to success is both channel mix and channel integration. Channel mix refers to a company's coverage of the market with multiple channels. Channel integration is a measure of how well the channels work together. When designing your channel mix, guard against having independent channels chase the same sales.

This is where proper channel integration is important. Channel integration uses different channels to perform different functions within a single sales process. Examples of channel integration include office supplier Staples' use of a direct mail operation to drive customers to a call center as well as stores and Oracle's use of educational seminars to build interest in software solutions.

To achieve successful channel integration, you must assign tasks to different channels, manage channel hand-offs and assign appropriate account ownership across channels. It is crucial that hand-off procedures be in place and that every hand-off be documented. You must also ensure that each channel receiving a hand-off knows what to do next to move the customer from lead to closed sale.

Investing In and Across a Portfolio of Channels

A key task in channel integration is the allocation of your resources to different channels. Suppose, for instance, that you have $30 million to spend on sales and marketing this year. Do you create a new call center, invest in a sales force, seek new partners, experiment with the Internet or buy a few Superbowl ads?

In fact, on what basis do you make the decision? Should you consider:

- the anticipated revenue contribution of each channel;
- the expected cost of each channel;
- funding levels carried over from last year; or
- a gut feeling about where to spend the money?

The bottom line is that as your company expands its channel mix, it must learn to manage those channels collectively as a go-to-market system. Tradeoffs must be made between competing channel needs, and resources put to use in the best places.

Start the process with a top-down approach. The starting point is projected revenue for each market segment. Map these revenue predictions against what coverage each channel can expect, and you get the revenue forecast per channel. Using that, you can calculate the channel E/R. Allocate your resources accordingly. ■

Measuring and Managing Channel Performance

In addition to managing the cost of a multi-channel system, you must also manage its performance. Sound performance management is essential for any company working with several channels. Performance must be measured against expectations. It isn't enough to design a go-to-market system. Once in place, you need to know whether it is performing as promised.

The first step is to define and articulate a set of overall (cross-channel) sales objectives. Next, break down those objectives by channel and let those responsible for meeting those objectives know what they are. Then, develop very specific channel objectives for meeting those goals. For example, translate goals into concrete measures like "increase the average order size" and "make more sales calls." Finally, review the results against the goal and realign as needed to improve channel performance. ■

THE SUMMARY IN BRIEF

Everyone now knows that managers and leaders need to coach their people. You've probably already tried. And failed. Research in 2006 from leadership development firm BlessingWhite suggested that 73 percent of managers had some form of coaching training. However, only 23 percent of people being coached thought that the coaching had a significant impact on their performance or job satisfaction. Ten percent even suggested that the coaching they were getting was having a *negative* effect. The real secret to success here is building new habits, one which ignites curiosity to both the coach and the people it is helping.

In ***The Coaching Habit: Say Less, Ask More & Change the Way You Lead Forever***, Michael Bungay Stanier explores various aspects of coaching and ways people can be more effective in their techniques. What is already known about coaching may not be the best way to go about it due to various reasons covered in this book. The author describes how to break coaching down into Seven Essential Questions to properly motivate people to open up and respond in training sessions.

IN THIS EXECUTIVE BOOK SUMMARY:

- Review why current coaching techniques may not be effective.
- Discover ways to think twice about what is already known about coaching.
- Learn new and more effective ways to coach people through essential questions.
- Explore how to become a better listener and how to respond accordingly.

You Need a Coaching Habit

You're probably not getting very effective coaching; and you're probably not delivering very effective coaching. There are at least three reasons why your first go at developing a coaching habit didn't stick.

The first reason is that the coaching training you got was probably overly theoretical, too complicated, a little boring, and divorced from the reality of your busy work life. Here's reason number two- you likely didn't spend much time figuring out how to translate the new insights into actions so you do things differently. The third reason is that the seemingly simple behavior change of giving a little less advice and asking a few more questions is surprisingly difficult.

But it's not that hard. Coaching is simple. You can coach someone in ten minutes or less. Coaching should be a daily, informal act. There are three vicious circles that plague our workplaces: creating overdependence, getting overwhelmed, and becoming disconnected. At the heart of this book are seven questions that will break you out of these three vicious circles and elevate the way you work.

How to Build a Habit

Before we look at what to change, we need to understand how to change. To build a new habit, you need five essential components: a reason, a trigger, a micro-habit, effective practice, and a plan.

Make a Vow

You need to get clear on the payoff for changing something as familiar and efficient as an old behavior.

Figure Your Trigger

The more specific you can be when defining your trigger moment, the more useful piece of data it is.

Double-S It: Be Short and Specific

You should define your new habit as a micro-habit that needs to take less than sixty seconds to complete.

Practice Deeply

For his book The Talent Code, Dan Coyle researched why certain parts of the world were talent "hot spots" for certain skills. Coyle calls it "Deep Practice", and the three components of Deep Practice are:

- Practicing small chunks of the bigger action.
- Repetition, repetition, and repetition.
- Being mindful and noticing when it goes well.

Plan How to Get Back on Track

Resilient systems build in fail-safes so that when something breaks down, the next step to recover is obvious. Make your habit a resilient system.

Put it Together: The New Habit Formula

There are three parts to the formula. Identifying the trigger, identifying the old habit, and defining the new behavior.

Identifying the Trigger: When This Happens…

Define the trigger. Charles Duhigg says that there are just five types of triggers: location, time, emotional state, other people, and the immediately preceding action.

Identifying the Old Habit: Instead Of…

Articulate the old habit, so you know what you're trying to stop doing.

Defining the New Behavior: I Will…

Define the new behavior, one that will take sixty seconds or less to do.

Question Masterclass Part 1

Ask one question at a time. When questions come hurling at you left and right, there's no time to answer any of them and you're left feeling dazed and confused.

Here's Your New Habit

When this happens: After I've asked a question

Instead of: Adding another question

I will: Ask just one question. (And then be quiet while I wait for the answer.)

1: The Kickstart Question

Breaking the Ice

One of the reasons managers don't coach more often than they do is that they don't know how to start. One of these three situations might be at play: the Small Talk Tango, the Ossified Agenda, or the Default Diagnosis.

The Small Talk Tango

An almost fail-safe way to start a chat that quickly turns into a real conversation is the question, "What's on your mind?"

Small talk might be a useful way to warm up to people, but it's rarely the bridge that leads up to a conversation that matters.

The Ossified Agenda

The agenda may have been perfect a week, a month or a year ago, but now it's putting process in front of what really matters.

The Default Diagnosis

There's no question or conversation about what the issue is. Digging faster or smarter isn't going to help.

The Kickstart Question: "What's on Your Mind?"

An almost fail-safe way to start a chat that quickly turns into a real conversation is the question, "What's on your mind?". Because it's open, it invites people to get to the heart of the matter and share what's most important to them. And yet the question is focused, too.

Coaching for Performance vs. Coaching for Development

Coaching for performance is about addressing and fixing a specific problem or challenge. Coaching for development is about turning the focus from the issue to the person dealing with the issue.

Deepen the Focus with the 3Ps

The 3P model is a framework for choosing what to focus on in a coaching conversation. A challenge might typically be centered on a project, a person or a pattern of behavior.

Projects

A project is the content of the situation,the stuff that's being worked on.

People

When you're talking about people, though, you're not really talking about them. You're talking about a relationship and, specifically, about what your role is in this relationship that might be currently less than ideal.

Patterns

Here you're looking at patterns of behavior and ways of working that you'd like to change.

Question Masterclass Part 2

Cut the intro and ask the question. If you know what question to ask, get to the point and ask it.

Here's Your New Habit

When this happens: When I've got a question to ask…

Instead of: Generally taking forever to get to the point…

I Will: Ask the question. (And then shut up to listen to the answer.)

2: The AWE Question

The AWE Question: "And What Else?"

With seemingly no effort, it creates more–more wisdom, more insights, more self-awareness, more possibilities–out of thin air. There are three reasons it has the impact that it does: more options can lead to better decisions; you rein yourself in; and you buy yourself time.

Channel Your Inner Ron

Remember that the first answer someone gives you is almost never the only answer, and it's rarely the best answer. When you use the "And what else?" you'll get more options and often better options. Better options lead to better decisions. Better decisions lead to greater success.

You Tame the Advice Monster

Even if it's the wrong advice–and it often is–giving it feels more comfortable than the ambiguity of asking a question. There's a place for giving advice, of course. But it's an overused and often ineffective response. Talk less and ask more. "And what else?" breaks the cycle. It's a self-management tool to keep your Advice Monster under restraints.

Buy Yourself Some Time

When you're not entirely sure what's going on, and you need just a moment or two to figure things out, asking "And what else?" buys you a little extra time.

Four Practical Tips for Asking "And What Else?"

- Stay Curious, Stay Genuine
- Ask It One More Time
- Recognize Success
- Move on When It's Time

Going Too Far: The Paradox of Choice

Options are good. The power of "And what else?" is that it's the quickest and easiest way to uncover and create new possibilities. But having lots and lots of options isn't always best, either. The goal isn't to generate a bazillion options. It's to see what ideas that person already has.

Finding the RIght Moment

"And what else?" is such a useful question that you can add it into almost every exchange.

Question Masterclass Part 3

Should you ask rhetorical questions? Stop offering up advice with a question mark attached.

Here's Your New Habit

When this happens: I've got the answer, which I want to suggest…

Instead of: Asking a fake question, which is just advice with a question mark…

I will: Ask one of the Seven Essential Questions

3: The Focus Question

Eureka. Kind Of.

Stop spending so much time and effort solving the wrong problem. When you start jumping in to fix things, things go off the rails in three ways: you work on the wrong problem; you do the work your team should be doing; and the work doesn't get done.

You're Solving the Wrong Problem

You might have come up with a brilliant way to fix the challenge your team is talking about. However, the challenge they're talking about is most likely not the real challenge that needs to be sorted out.

You're Solving the Problem Yourself

Your team has trained you well to do their work for them. Any time there's a problem, rather than trying to figure it out themselves, they now come to you for the answer.

You're Not Solving the Problem

It's not like you don't have your own work to do. And now you've found yourself responsible for solving everyone else's problems, too. You need a way to manage the temptation to jump into fixing that opening challenge. Slow down just a little and you'll get to the heart of the issue.

The Focus Question: What's the Real Challenge Here for You?

Here's how it builds to become such a useful question:

What's the challenge? Curiosity is taking you in the right direction, but phrased like this the question is too vague.

What's the real challenge here? Implied here is that there are a number of challenges to choose from, and you have to find the one that matters most.

What's the real challenge here for you? The "for you" is what pins the person you're talking to. It keeps the question personal.

How the Focus Question Cuts Through the Fog

We call them the Foggy-fiers, and we call the three most common ones the Proliferation of Challenges, Coaching the Ghost, and Abstractions & Generalizations.

Proliferation of Challenges

With every problem listed, you feel a little uptick of anxiety. The only question is where to start: with the first challenge mentioned, or with the one you're most confident about providing the answer. Or you ask the Focus Question: "What's the real challenge here for you?"

Coaching the Ghost

The key thing to know here is that you can coach only the person in front of you. As tempting as it is to talk about a "third point", you need to uncover the challenge for the person to whom you are talking to.

Abstractions & Generalizations

This conversation can feel more like a slightly academic discussion or an executive summary of what's going on. This

Stick to questions starting with "what" and avoid questions starting with"why."

is the time you need to ask the Focus Question: "What's the real challenge here for you?".

Moving from Performance to Development

The simple act of adding "for you" to the end of as many questions as possible is an everyday technique for making conversations more development than performance-oriented.

Three Strategies to Make This Question Work for You

- Trust that you're being useful.
- Remember that there is a place for your advice.
- Remember the Second Question: "What else".

Question Masterclass Part 4

Stick to questions starting with "what" and avoid questions starting with "why."

Here's Your New Habit

When this happens: When I'm tempted to ask them why…

Instead of: Beginning the question with "Why"...

I will: Reframe the question so it starts with "What".

An Irresistible 1-2-3 Combination

The first three questions can combine to become a robust script for your coaching conversation.

4: The Foundation Question

The Foundation Question: "What Do You Want?"

Here's why the question is so difficult to answer:

- We often don't know what we actually want.
- It's often hard to ask for it.
- It's often hard to say it in a way that's clearly heard and understood.
- It's often hard to hear the answer to your request.

Ask a Question. Trade Answers.

There are times when simply asking a question is the thing to do. And there are other times when sharing your answer to that same question can increase impact.

Wait, Come Back!

So how do you influence others' brains and your own so that situations are read as rewarding, not risky? There are four primary drivers that influence how the brain reads any situation.

T is for tribe: The brain is asking, "Are you with me, or are you against me?"

E is for expectation: The brain is figuring out, "Do I know the future or don't I?"

R is for rank: "Are you more important or less important than I am?"

A is for autonomy: "Do I get a say or don't I?"

Your job is to increase the **TERA quotient** whenever you can.

Question Masterclass Part 5

Get comfortable with silence. Silence is often a measure of success.

Here's Your New Habit

When this happens: When I've asked a question and she doesn't have an answer ready within the first two seconds…

Instead of: Filling up the space with another question…

I will: Take a breath, stay open and keep quiet for another three seconds.

5: The Lazy Question

The Lazy Question: How Can I Help?

The power of "How can I help?" is twofold. First, you're forcing your colleague to make a direct and clear request. Second, it stops you from thinking that you know how best to help and leaping into action.

Be Blunt…

The more direct version of "How can I help?" is "What do you want from me?"

…But Be Careful

You can likely guess that how "What do you want from me?" lands will depend in no small part on the tone of voice in which it's asked. A way to soften this question is to use the phrase "Out of curiosity".

Question Masterclass Part 6

Actually listen to the answer.

Here's Your New Habit

When this happens: After I ask a question…

Instead of: Going through the motions of looking like I'm actively listening…

I Will: Actually listen. And when I get distracted (which I will), I'll come back and start listening again.

6: The Strategic Question

More Impact. More Meaning

You know there's some work that you do that you absolutely love? It's not just that the work is making a difference and having an impact; it's that the work means something to you.

The Strategic Question: If You're Saying Yes to This, What Are You Saying No To?

This question is more complex than it sounds, which accounts for its potential. To begin with, you're asking people to be clear and committed to their Yes. But a Yes is nothing without a No that gives it boundaries and form.

What gets us into trouble is how quickly we commit, without fully understanding what we're getting ourselves into or even what we're being asked. The secret to saying No is to shift the focus and learn how to say Yes more slowly.

Question Masterclass Part 7

Acknowledge the answer you get. This isn't about judging people; it's about encouraging them.

Here's Your New Habit

When this happens: The person gives an answer to the question I've asked…

Instead of: Rushing on to the next question…

I will: Acknowledge the reply by saying "Yes, that's good."

7: The Learning Question

How People Learn

As a manager and a leader, you want people to get stuff done. But you want more than that. You want them to learn so that they become more competent, more self-sufficient and more successful.

The Learning Question: "What Was Most Useful for You?"

Your job as a manager and a leader is to help create the space for people to have those learning moments. And to do that, you need a question that drives this double-loop learning. That question is, "What was most useful for you?".

Why "What Was Most Useful for You?" Tops the List

"What was most useful?" helps hit the spot in at least six ways:

- It assumes the conversation was useful.
- It asks people to identify the big thing that was most useful.
- It makes it personal.
- It gives you feedback.
- It's learning, not judgement.
- It reminds people how useful you are to them.

Question Masterclass Part 8

Now that we've covered the Seven Essential Questions, you understand that you're going to have to change the way you have conversations with the people you manage, influence, and engage with.

And yet–a hefty and ever-increasing amount of our lives is spent staring at the screen, tapping away as we exchange emails and IMS and texts and Slack messages. And these Seven Essential Questions work just as well for those communication channels as they do face-to-face.

Use every channel to ask a question. Questions work just as well typed as they do spoken.

Here's Your New Habit

When this happens: When I get an email that triggers the Advice Monster…

Instead of: Writing out a long, thorough answer full of possible solutions…

I will: Decide which one of the seven questions would be most appropriate, and ask that question by email.

Anyone who has been a manager or been managed, coached managers or trained managers to be more coach-like may find that too many conversations between managers and those they're managing feel too much like an ill-fated expedition through a roughly-terrained nature park.

There may be:

- Too much baggage.
- Too much certainty, thinking you know the destination and the path to get there.
- Wandering off the path too quickly.
- Working way too hard to get back on the path.
- And being exhausting at the end, having got a lot less far down the track than you hoped you would.

If that description feels true to you, then you'll be well served to build a coaching habit of your own. The questions presented in this book are the ones that have been found to have the most impact.

If you can make just these Seven Essential Questions part of your management repertoire and everyday conversations, you'll work less hard and have more impact, and your people, your boss, your career, and your life outside work will thank you for it.

The change in behavior that's going to serve you most powerfully is simply this: a little less advice, a little more curiosity. Find your own questions, find your own voice, and above all, build your own coaching habit.

Michael Bungay Stanier has a gift for distilling big, complex ideas into practical, accessible knowledge. His books have sold over a million copies, with The Coaching Habit topping The Wall Street Journal bestseller list. MBS has been featured on the blogs and social media platforms of thought leaders including Seth Godin, Tim Ferriss, and Brené Brown, and has appeared on ABC, BBC, CBC, Ted.com, and innumerable podcasts—as well as the Harvard Business Review, Forbes, Inc., and Fast Company. MBS is the founder of Box of Crayons, a learning and development company, that helps organizations move from advice-driven action to curiosity-led transformation.

Management: Hands-On

The Coaching Manager

Developing Top Talent in Business

by James M. Hunt and Joseph R. Weintraub

THE SUMMARY IN BRIEF

When managers communicate a genuine interest in helping rather than evaluating their employees, they create opportunities for everyone to learn. Managers who try to help employees, as a *routine* part of their management activities, learn and become more productive in the process.

In *The Coaching Manager,* James Hunt and Joseph Weintraub introduce an easy-to-implement developmental coaching model based on their extensive work with thousands of managers, executives and MBA students. The goal is for managers to help employees learn to be more productive on a day-to-day basis. This model encourages employees to take greater responsibility for their learning and development while forging a helping relationship between manager and employee. Such an approach to management lightens the emphasis on evaluation and creates learning opportunities for all involved.

The Coaching Manager includes true stories, tools and action checklists to deepen skills and understanding. The lessons it provides will benefit managers, leaders and entrepreneurs in business and not-for-profit organizations; those in MBA programs; students in leadership, organizational development and human resources management; and participants in executive training programs.

This summary is about how business leaders, often simply referred to as "managers," help their employees learn and develop through coaching.

IN THIS SUMMARY, YOU WILL LEARN:

- How to use real-world strategies to develop the leadership potential of your people.
- Ways to create a coaching-friendly environment within your organization.
- How to create real opportunities for your people to learn.
- How to use a new model of management coaching to become a master coach.

Introduction: The Coaching Manager

Effective coaching managers are successful because they not only give feedback, but they give feedback to people they have *helped make ready for feedback* through the process of reflection. Reflection is the step too often missing in employee development. Reflection allows individual learners to pursue what is important to them, not just what is important to the manager. Reflection allows people to take ownership of their own problems.

Learner ownership of the learning process drives development because it fosters and validates the importance of self-directed learning as an important aspect of successful job performance.

Isaac Stern, the great violinist who died in 2001, captured the power of this concept when he described the outcome of his work with his own mentor: "He taught me to teach myself, which is the greatest thing a teacher can do."

The Transition to Becoming a Coaching Manager

The new coaching manager must be willing to take the small amount of time necessary to be effective at harvesting the opportunities for learning at the individual and organizational level, which are readily available in most firms. The challenge for the manager has as much or more to do with changing his or her mind-set as it does with finding more hours in the day.

There does seem to be one ingredient that is critical to the success of coaching managers: The best all seem to have an interest in helping others. You can't help people learn if you see them as simply a means to an end. Although most organizational mission statements these days say something about respect for the individual, effective coaching really requires that respect. Inherent in this respect is a bit of trust in the notion that most people want to grow. The coaching manager has to be willing to step back and trust that his or her employees share the same overall goals and want to be entrusted with their own learning.

The most effective model for leadership is one that promotes shared effort toward and responsibility for achieving a goal, and builds organizational capability along the way. ●

An Overview of Developmental Coaching

The basic model of developmental coaching includes the following elements:

• **A coaching friendly context**. Coaching interactions need to be "safe." Normally, such interactions should have little or nothing to do with evaluation or performance appraisal.

• **A helpful mind-set**. There are two related components of a coaching mind-set: developing a coaching identity and learning to be helpful rather than evaluative.

• **A "coach-able" learner**. Good coaching requires a motivated coachee who (a) wants to learn, (b) is able to tolerate the process of reflecting on his or her work and (c) therefore can deal with feedback that may be appropriately challenging.

• **Stopping the action and starting the coaching dialogue**. Coaching requires that the manager stop the

action and instigate a dialogue using techniques of inquiry.

• **Knowing what is important**. The coaching manager needs a sense of what good performance looks like in order to know what to look for and what kind of feedback is likely to be helpful.

• **Observing without inferring**. Unfortunately, even with firsthand data, observer bias quickly becomes a problem. The most important point, however, is to acknowledge that such bias exists and is a potential problem for all of us.

• **Providing balanced and helpful feedback**. Ideally, feedback holds up an accurate mirror to coachees, so they can see themselves and take ownership of their actions or results.

• **Collaboratively interpreting what needs to change**. Coaches and coachees must maintain a collaborative dialogue that will encourage coachees to consider the reasons for their behavior.

• **Setting a goal for change and following up**. Change requires that the coachee have an opportunity to practice the desired behaviors; just attending a course, for instance, may not be sufficient. ●

The 'Coaching Mind-Set'

Coaching managers have an overriding attitude of helpfulness when trying to coach others.

Managers who coach want to *help*, as opposed to fix or change others. They like seeing others succeed. They seem to get a kick out of having a chance to admire the good work of others. As one coaching manager said, "I keep track of them in their careers. I hear about their accomplishments. I like to think that in a way, I have contributed to their success."

Coaching managers believe that by helping their employees develop, everybody comes out ahead. By coaching their employees and aiding their development, coaching managers assume that they will build the overall capability of their businesses.

Coaching managers also show less need for control. An emphasis on "results no matter what" can make it hard for managers to coach rather than do. The coaches who do the best jobs are those who are able to tolerate the potential for at least some failure.

In addition, coaching managers believe that most people really do want to learn. Coaching managers are much like gardeners. They plant the flowers (hire the right employees), create a context, provide some support and are there to help out. However, having done that, they don't always expect every effort to bear fruit. Most coaches report that, as they mature, they come to accept that some people don't want to be coached and that they may not be able to make a difference in their development.

Coaching managers also show empathy in their dealings with others. They tend to be able to put themselves in another person's shoes, rather than judging an individual solely on the basis of surface behaviors. ●

The Goals of Coaching

The ultimate goals of coaching are:

- To promote employee development through learning.
- To build organizational capability through sharing learning with others.
- To build better relationships and more effective communications in general in an organization.
- To promote employee retention through the provision of experiences that help employees meet their personal goals for growth.

Seizing the opportunity to create positive, learning-oriented dialogues presents a simple way to meet those goals.

The 'Coach-Able' Learner

What behaviors does the individual demonstrate who is capable of effectively engaging with a coaching manager? Despite the diversity of styles, personalities and cultural backgrounds found in today's work force, it is possible to make some useful generalizations.

First of all, a coachee must be able to reflect on his or her behavior — to step back and examine it from a somewhat objective frame of reference. If you had a particularly troubling meeting with your team and you want to learn something from the event, you need to be able to describe to yourself and to someone else what happened. Furthermore, you need to be able to think about what you did differently this time in contrast to your previous efforts.

Ideally, effective coachees are curious about their performance and the challenges of continuous improvement. The coachee is like a scientist, trying to understand the laws that govern his or her actions and the actions of others, and to exercise some control through that understanding.

Shame

Effective coachees are able to accept that someone else may have more knowledge or be more effective than they are. Feelings of shame make an individual want to keep awareness of his or her mistakes from others, which can make coaching nearly impossible. Effective coachees are able to honestly raise their concerns with their coaching managers, rather than succumb to such inhibitions.

The effective coachee needs to be able to listen. He or she needs to be able to tolerate balanced feedback and consider the meaning of what the coach is trying to say.

Finally, effective coachees are motivated by coaching. Having received feedback, considered its meaning and considered what they might do differently next time, they are anxious to practice. They take full responsibility for change and want to exercise their responsibility so that the learning can continue and they can assess their progress.

Creating a Coaching Friendly Context

In the coaching friendly context, learning is taken for granted to be an important, if not always directly discussed, ingredient of both personal development and business performance. People in a coaching friendly context naturally and informally reflect on their actions, discuss their problems and goals, and ask for feedback and advice.

Here are the values and beliefs that serve as a foundation for such a coaching friendly context:

- **Trust and a large measure of openness are valued.** Trust in the relationship between manager and employee is probably the most important element of a coaching friendly context.
- **Mistakes are tolerated because they are useful for learning.**
- **The organization pays careful attention to hiring the right people.** It is easier to trust people, even to allow them to make mistakes, if you see them as fundamentally in the right job and being able to perform that job to at least a minimal degree.
- **Learning for the long term is important.** Attention to learning, which ultimately validates a manager's efforts to coach, signals to everyone that the group exists for both today and tomorrow.
- **Reward systems encourage managers to spend time coaching.** Closely related to a value on learning are reward systems that create tangible positive outcomes for managers who are effective at employee development.
- **People should feel valued as individuals.** People who feel valued are much more likely to want to learn. They feel that there is a more genuine overlap between the organization's goals and their own personal goals.

Stopping the Action and Starting a Coaching Dialogue

In the coaching friendly context, people seize learning and coaching opportunities both formally and informally whenever they can. Most likely, your work is fast-paced and your business unit is filled with people who incessantly focus on action. They need to get it done, now. Somehow, you have to find a way to stop that action, if only briefly, and engage potential coachees in a useful coaching dialogue.

Maintain a Coaching Mind-Set

The first step to stopping the action and starting the dialogue is maintaining a coaching mind-set. Make sure you are ready to coach, not evaluate or appraise performance.

Next, look for useful coaching opportunities before, after and at natural stopping points during an activity. Ask yourself, "What is the learning potential?"

The next step is assessing the timing. Determine if the employee is able to engage with you now about this issue or topic. Decide if you and the employee can make adequate time for the dialogue. Make sure the employee is in a receptive frame of mind and emotional state. Then, take a minute to establish rapport.

Now is the time to ask reflective questions, listen and probe for understanding. When appropriate, ask follow-up questions. While being empathic, help employees think about their roles, their intent and their actions.

Advice

Help the employee define and take ownership of the real issue, challenge or problem about which he or she needs to learn more. Avoid providing premature or gratuitous feedback. Also, avoid giving advice or jumping in with the solution.

Next, ask the employee what he or she would find useful as a next step, unless you feel that, on the basis of the issue or the potential costs of failure, you need to direct the employee to a next step.

Finally, the employee might find targeted advice use-

ful. However, be wary of giving advice prematurely. Make sure that the employee has done a thorough job of independently thinking it through. The employee must own the solution. ●

Focusing on What Is Important

The notion of the "coaching mirror" can be of enormous value in teaching managers about the somewhat abused concept of feedback. A mirror can send us a powerful message, but it can't change us. Feedback at its best isn't designed to change the recipient of the feedback, it is offered as a tool that recipients can use to help them achieve goals to which they are committed.

The coaching manager can greatly enhance the power of the feedback, and therefore the value of the mirror, in two ways. First, the manager can help the coachee focus on what is truly important. Second, the manager can provide the feedback in a way that makes it as useful as possible.

Competency

Coaching managers can't pay attention to everything, so their focus should begin with what the organization needs for business success. However, it is important to encourage employees to drive the coaching process and their own development. Competency is more than skill. Competencies are skills that are used routinely. We all know people who are extremely good at executing a particular task but hate doing it.

Managers who insist on focusing only on the ability of an employee to deliver should be aware that the mix of great skill and low motivation doesn't yield sustainable superior results. The best coaching managers are able to manage the tension between the organization's needs and the individual's goals. To understand what the employee wants, you must ask, and you must be willing to listen. Although you must focus your coaching efforts on what your organization needs, that goal will be best served by making sure that the people who are trying to fulfill those organizational needs are not only good at doing so, but want to do so as well. ●

Observing What Is Important, Effectively

A tendency to draw inferences can make it difficult for managers to draw an accurate picture of a coachee's job performance.

Effective feedback is possible only when it is based on *accurate observations (or other kinds of performance data)*. If the coaching manager has bad data, the feedback will be flawed and the result will be a lack of learning and even greater defensiveness on the part of the employee.

Coaching managers must gather information about the performance of others and make that information useful.

To get the most from various sources of performance data, always strive for specific examples of work. This is easiest to do when the source of data is your direct observation as the coaching manager. It is the standard against which all other sources of data must be judged.

Always follow up on formal and informal multi-rater feedback assessment activities. Get specific examples from the people involved to reflect the generalizations that are offered by the feedback report.

Beware of Unsolicited Feedback

Be cautious of how you interpret unsolicited feedback provided by others that is delivered by e-mail or by hearsay. Impromptu and unsolicited feedback may be of low quality and may draw heavily on inference. E-mails can be sent impulsively, before the sender has had time to think through whatever is provoking the feedback.

Differentiate feedback from interpretation. You may have good data that accurately describe someone's behavior, but you don't know why they are behaving the way they do. Coaching managers stress the importance of keeping an open mind.

The Coachee's Role

The coachee needs to be an active participant in the coaching process. He or she must keep track of the learning goal, results to date, feedback from others and thoughts about what needs to happen next.

When it comes to learning, the coachee, not the coaching manager, is in the driver's seat. ●

Providing Balanced and Helpful Feedback

Feedback represents a form of communication, or a message. What should the message include?

Feedback content usually includes a description of the *situation* in which you observed the employee; a description of the *behavior* of, or *actions* taken by, the employee you observed; and a description of the *impact* of the behavior or actions of the employee on others or on a relevant business outcome. "Here is what I saw, and here is what I think was the impact of what I saw" is the basic structure of a feedback message. Note what is included and not included in the message.

What *is* included is factual information to the highest degree possible.

What is *not* included is an interpretation. If you describe the impact of a particular action or behavior from your vantage point, you're making very few inferences. After all, an individual's manager is a key stakeholder in the actions of that individual. The impact on you, as manager, does count, and the impact you experience from the actions of an employee may be similar to the impact experienced by others. You can therefore state, "This was the impact on me," with real authority.

The Importance of Goals

Always consider the importance of the employee's goals while delivering feedback. If you *focus on what the employee is trying to accomplish or has told you he or she wants to learn*, you have been given license by the employee to be clear and direct.

Feedback is likely to be most useful when it is offered as part of a systematic approach to coaching. A *systematic approach* means following the steps of creating a coaching friendly context, looking for coaching moments, creating a coaching dialogue, knowing what to look for, providing balanced feedback, collaboratively interpreting the causes for any gap between actual and desired performance and setting some meaningful goals. ●

What Does It All Mean?

Once the coaching manager and the coachee have determined that it is appropriate to search for the root cause or causes for any performance gap, a continuation of the coaching dialogue can help both of them look for those causes. The coaching dialogue encourages the coachee to reflect on the feedback the coaching manager has presented. Provide the feedback, ask the employee for his or her thoughts and wait. See what the employee has to say.

The coaching manager can aid in this process if the coachee is having trouble by using the basic coaching questions: "What were you trying to do?" "What is the impact of what you did?" "What do you need to do differently to have the impact you're hoping for?" Along the way, the coaching manager can encourage the coachee to consider alternatives other than the obvious.

The Importance of 'Getting It Right' When Interpreting Performance

There are times in life when it may be better to do nothing than to do something poorly. This lesson is brought home through a story told by an employee working with a very effective coaching manager. This young engineer was evidently known for his ability to solve enormously complex problems and explain those problems in lay terms to business people. He was about to give the most important presentation of his young life in front of his own CEO and the leaders of several important customers.

When the time came, he stood up and froze. He was absolutely unable to put his thoughts into words or make sense of his own overheads. The CEO was clearly not pleased but said little. In an effort to end the pain, the young engineer's manager stood up and took over. The manager was very upset after the meeting but held her temper in check. The engineer was shocked and fearful. Clearly they needed to talk.

The manager, who basically trusted the engineer, asked him what was going on. The engineer was at a loss. Finally, the manager asked, "Is something wrong? Is anything bothering you?" The engineer, who was loath to talk about his personal life at work, confided that he'd just put his mother in a nursing home. Perhaps he didn't realize, he said, just how much that had shaken his concentration. The manager expressed confidence in his ability to handle situations like this in the future. Although he was quite anxious in light of this incident, his manager assigned him to do another presentation several weeks later. Once again, his anxiety did detract from his performance, but not nearly so badly. He got through it and covered the necessary material. His manager noted the improvement and predicted a slow but sure recovery. Over time, that is exactly what happened.

Criticism

If the manager had criticized the employee after the original incident, she would have been doing so on the basis of an inference that the cause of the problem was a lack of preparation or even a lack of ability to work with senior managers. Working from such an inference would have undermined her ability to accurately understand the source of the problem. In criticizing the employee, she would also have undermined what little confidence he had left. She would not have helped him develop an awareness of the impact of his personal life on his performance and the need to address work and life stress proactively. Ultimately, she might have lost a great engineer.

Most of us can tolerate criticism when it is directed at a real fault, but to be criticized for not being prepared when, in fact, we are struggling with an overwhelming level of stress can generate long-term resentment. Notice how often you rush to interpret the actions of others

before finding out the true cause of their actions. To put it another way, *try to precede every conclusion with an open-ended question.*

Goal Setting and Follow-Up: Making Change Happen

The most effective learning goals are *specific and measurable, time-bound, challenging, few in number, developed in a participatory fashion and aligned with the goals of the business.* Alignment supports all phases of the learning process (unfreezing, change and refreezing) and supports maximum commitment to the goal.

The coaching dialogue question "What are you going to do differently?" is one way of asking an employee to commit to a particular action or goal

Personal Transformation

Personal transformation that addresses a learning goal involves three steps: unfreezing, change and refreezing.

Unfreezing requires developing a readiness for change. For example, the employee knows he or she needs to change and is ready to begin the work of doing so. Critical feedback delivered by a manager has begun to unfreeze the employee.

In the *change* stage, people are more open to learning. Indeed, they have come to accept that the learning is necessary and are ready to drive the learning themselves. They scan their world for helpful information. They may read about the topic at hand and seek out others who can help them.

Refreezing is making the connection between the new behavior, knowledge or skill and the rest of the employee's life. If the change is not consistent with the rest of the employee's life, refreezing may not occur. Changes must also be consistent with the individual's personality, at least to an extent. Likewise, those in the employee's network of relationships must be able to cope with the employee's newly learned skill or new routine. They may need to change their behavior too.

Be ready to support employees along the way. Access to learning resources, including the opportunity to practice, is a critical aspect of the learning process. Remember, employees may need some encouragement, particularly if the goal is a challenging one.

Coaching and Career Development

The following tactics should be helpful to coaching managers while trying to assist their employees with career development:

- In the coaching dialogue, *from time to time, encourage employees to reflect on what they find satisfying about their work.* Ask them how they feel about what they are doing, where they are and where they want to be.
- *Provide balanced feedback whenever possible in your reaction* to the employees' reflection. Your feedback may include your thoughts about employees' strengths and weaknesses in relation to their career interests; or it may include information about opportunities, or the lack of opportunities, that relate to employees' interests.
- *Whenever possible, encourage employees to build relationships with others who work in areas associated with their career interests.* Facilitate networking opportunities if you can.
- *If possible, use "job-sculpting" tactics to reshape the employee's job in line with his or her career interests when possible.* However, always keep the needs of the business in mind while job sculpting.

Listening

Listening may be the most important intervention the coaching manager can offer. Listening to someone talk about his or her career seems easy on the surface, but this is not always the case. After listening, it is important not to jump into helping. *Encourage the coachee to define a goal or a need and a next step.* You may then provide useful feedback on the basis of your understanding of what the business unit or organization can offer.

Developmental Coaching and Performance Problems

At the simplest level, the hallmark of a performance problem is an *ongoing gap* between actual and desired performance, a gap that is not closing and may be worsening. Even the worst performers will be successful on occasion, but for those with performance problems, the gap is there much more often than not. Almost anyone can close a deal sometimes, but organizations need salespeople who can close deals consistently. If someone in a sales role can't sell consistently after he or she has had an opportunity to learn the job, with appropriate support, a performance problem exists.

Addressing Performance Problems

The success of coaching managers rests on their having a helpful attitude, and they need to follow that impulse wherever it takes them. However, they also have their limits, which is a sound insight to keep in mind.

Make sure that the employee with the apparent per-

formance problem clearly understands what is expected of him or her. View coaching as an experiment. If progress is not forthcoming, consider the possibility that coaching may not be working.

Seek input from others who may have knowledge of the employee and the performance problem. You want to be sure that bias and various perception distortions aren't clouding your assessment.

It may be necessary to alter the balance between self-assessment and feedback. Reflection and self-assessment by the coachee are critical to encouraging employee learning and ownership of the issue at hand.

Follow-up is absolutely essential. When unfreezing is necessary, the employee may need frequent feedback and frequent assessments of the impact of their actions.

Make sure that your coaching offers are aligned with other organizational factors, such as job design, compensation and team functioning. ●

Using Coaching to Leverage the Investment in the Classroom

A series of simple but important practices can help the coaching manager and employee get the most out of an investment in formal classroom education.

First, define the learning goal or goals. Will a classroom experience be helpful? It is likely to be helpful when the employee has to learn new skills or concepts, particularly in a short period of time, or the employee is "stuck," and an educational intervention can address the specific problem that is causing this.

The second practice is choosing the right program. Make sure it is aligned with the employee's learning goals. Also, consider whether or not the content of the program is aligned with the needs and culture of the business unit. If it is not, proactively address any barriers that may make transfer of learning more difficult.

Follow Up

Finally, provide coaching follow-up to the employee on completion of the classroom experience. Immediately after the learner returns from the program, set aside a one- to three-hour block of time during which you and the learner review the content of the program. Discuss what the learner thought, saw and/or felt that might be relevant to his or her performance or the organization.

Either at the end of this meeting or within the next day or two, ask the learner to describe one to three personal learning goals that emerged from his or her experience in the executive education program. Help the learner define what effective performance would look like if he or she were successful in attaining the goal.

Support the learner by helping to make sure that he or she has meaningful work related to the learning goals the two of you have identified. ●

Coaching and Organizations

The employee's relationship with his or her manager sets the tone for how the employee feels about the work and the organization.

Employees are much more likely to be loyal to the company through the manager. The stronger the personal connection with the manager, the less of a problem, on balance, retention is likely to be. Note that employees choose to remain in such a relationship not just because the manager is charismatic or fun, but because the employee is getting something invaluable from the relationship: learning and growth.

What Should Organizations Do?

An organization should work to create an open and honest culture in which people can talk freely, without fear of reprisals. Encourage people to take manageable risks. Don't punish innovative failures — reward them. Show interest in new ideas. Stay current as a firm. Make sure all levels of management are paying attention to their industry, community and the larger business world. In other words, show that you value learning in general. It is critical for the firm's leadership to make sure that its compensation practices don't actively discourage coaching and learning.

Coaching is a skill. Most managers will need quality training to get a basic sense of what coaching is and how to do it. Most organizations are capable of providing the basic training for their managers. However, as in most adult learning, on-the-job learning is what counts the most. The learning for coaching managers comes from thinking about the specifics of each case: What can I learn from this effort to help this specific employee? ●

THE SUMMARY IN BRIEF

As a CEO, three of the biggest challenges you will face include making tough decisions in less than clear situations, creating and maintaining a consistent culture, and attracting the right people who fit that culture. These problems often make or break a company, and you must learn how to tackle them in order to create and grow a business that you recognize and can manage effectively. In ***The Core Value Equation: A Framework to Drive Results, Create Limitless Scale and Win the War for Talent,*** Darius Mirshahzadeh explains how creating and implementing core values is the key to tackling all of these problems.

Once you know your core values, you can more easily make decisions that create a consistent culture and attract the right people. All in all, Mirshahzadeh helps business leaders create and grow a business based on core values that lead and inform their decisions every step of the way.

IN THIS SUMMARY, YOU WILL LEARN:

- Why core values matter in business.
- How to create core values for your business.
- How to create and implement an invisible scale.
- How to use core values when making decisions and hiring.

Introduction

By identifying the lack of core values, explaining how to create core values, and offering advice for implementing those values within a growing business, *The Core Value Equation* helps CEOs, business leaders, and entrepreneurs create businesses that reflect a consistent culture with the most desirable and professional talent on their team.

Are You Managing A Monster?

So, you are finally where you want to be—the CEO of a successful business. Your team is rapidly growing, and you are achieving a lot of success for your company. Despite this success, you feel overwhelmed and discouraged by the business you see in front of you. Even though the company is growing, you barely recognize the business in front of you and don't know what's the matter. What gives?

If you feel this way about your business, you very well may be managing a monster. Even if your business is financially successful and seems to be doing well for the community, your business can still be a monster in how it is patched together with conflicting ideas and cultures that don't match. From a CEO's perspective, managing a monster makes your already high-stress job even more stressful.

As the CEO, it is your job to make decisions in uncertain scenarios, create a consistent culture, and set the standards for recruiting successful team members. If your business includes different cultures and ideas that are simply patched together like a business Frankenstein, then it will be much more difficult to do your job. When your company is conflicted on its culture and attitude, you have very little to go off of when making hard decisions or hiring.

There Is A Solution: Core Values

Luckily, there is a solution to business Frankenstein monsters. If you can create a consistent culture with consistent values, you can compare your decisions based on your business's accepted core values and assumptions. You may be wondering, "OK, but how do you create a consistent culture?" The answer is quite simple: core values.

Core values are the beliefs, goals, and assumptions that your business and workers hold to be true for the business. The purpose of the core value is to get everyone on the same page to work together for a single cause. Without these core values, your team members may have different attitudes and goals for work, making your job harder.

Now, it isn't enough to just establish core values. Tons of businesses have core values that mean nothing. To simply claim you have core values but don't do anything to implement them means that your core beliefs are nothing more than words on paper. When your core values are nothing more than words on paper, they do nothing to help you and leave you in the same place as before.

Companies Do Not Have Core Values; People Have Core Values

Instead of letting your core beliefs simply be words on paper, you need to implement your core values so that all of your employees and customers can recite your business' core values by heart. That's right. It isn't enough for you alone to know your core values. Every employee and customer should also know the core values to work together under the same assumptions.

The reason for this is that companies do not have core values; People have core values.

Think about it this way: companies are simply an amalgamation of a group of people. If the people do not have the core values, then the business doesn't have it either. In contrast, the business has the core values of the people within it do. In order to make your job easier, you have to make sure that every member of your team has the same core values so that everyone has the same starting basis and motivation to get the job done.

How To Build Core Values

OK, so it's time to establish your core beliefs, but what if you don't know where to start? How can you create core values that are more than just mere words on the page?

For starters, it is important to incorporate the user and success of the core values into the discovery process. You don't want your core values to be meaningless. Instead, create them, so they actually are indicative of the successful business you want to create. The best way to create a core belief system that is effective is to discover them, not define them.

When you discover your core beliefs, you find out where your beliefs actually lie and figure out what works and what doesn't. Defining your core values, in contrast, is nothing more than creating a wish list that turns into words on paper. Let your senior management team discover the core values they hold so that they can organically trickle throughout the entire business, creating an invisible scale by which everyone is measured.

As you discover your core values, you need to build them in a conducive way to your company. No matter what you find out in the discovery process, it will be meaningless if you don't view your core values as an opportunity for craftsmanship. Only if you build up your core values will you be able to incorporate them into your business in a meaningful and effective way.

Launching Your Core Values

Unfortunately, here is where the real work kicks in. Discovering and building your core values are relatively easy compared to launching them and making them stick. Anyone can create values, but it takes a real disciplined leader to implement them within the company.

The first step for implementation is launching them for the company. During the launching process, you should have the goal of making them stick in mind.

First and foremost, your core value launch should be described to be used in the decision-making process. If the core values are not set up in this way, your company will not know how to utilize the core values to transform the culture properly.

More than this, though, you need to have an effective rollout so that all members of the organization have a clear and distinct understanding of the company's core values. The rollout should include 6 general stages. It begins with prework, which includes group dynamics and working agreements. Then, you should implement exercises so that employees can learn firsthand how the core values work in real life.

Before closing your rollout, you have to end strong. Most people remember the beginning and end of presentations but often forget the middle. Make sure you end strong so that all of the employees understand the core values. Your strong ending should include HR paperwork so that they are obligated to follow the core principles. You should also close with a warm thank you and a core value celebration.

Make Your Core Values Stick

Let's be clear: core values are not static. After your rollout, you have to be intentional and decisive in making your core values stick. As the CEO, it is your job to implement the invisible scale so that the core values permeate the entire company, starting at the top-level management and working its way all the way down. In fact, you should think of your core values as being the oxygen for your organization.

You could also think of core values as the language of the business. With this analogy, think back to your high school days when you learn a foreign language. You didn't start out by reading philosophy books in that language or a 400-page novel. Instead, you started with single words and little practices to help you build your knowledge. You should do the same thing when learning the language of your core values.

Start by incorporating your core values in small ways. This helps you and your employees get the hang of the core values to commit to memory. Once the smaller acts are memorized and understood, you can start incorporating other acts and practices of core value into your system. Eventually, the entire organization will be completely fluent in the language that is the core values.

If you have an effective rollout and then do a step by step integration initiative, your core values can stick. More than that, it creates a firm foundation on which you can continue to build and succeed.

Just like with anything else, you cannot grow and flourish if the foundation is rocky. Create a firm foundation with an effective rollout and implementing the initiative intentionally.

Proving That Your Values Are More Than Fluff

Even if you have a successful rollout and initiation of the core values, you have to continue to prove that your core values are more than fluff. In other words, you have to be able to measure your core values, or else they just become words on paper and fluff for the business. If you can't prove that your values are more than fluff, then all of your work has been meaningless thus far.

In order to prove that your values are more than fluff, you have to be able to make them tangible. If your core values are not tangible, then there's no way to measure them. From the CEO's perspective, an intangible core value means that you can't make changes or fix any problems that may be there. From an employee's perspective, intangible core values mean that they are hard to implement within the business. Only by making values tangible can they be more than fluff or words on paper.

Using Your Core Values

Once your core values become tangible, you and other employees can use them as a measurable scale on which to make decisions. As the CEO, this will make your job immensely easier since you have a firm foundation to make

consistent and well-informed decisions. Even when situations are unclear, and you are unsure what decision you should make, you can use your core values as a foundation for making the decision. This makes it more likely that you will make a decision that is good for the company and not simply based on whim or intuition.

More than making hard decisions, tangible core values can also help you snag team members and win the war for talent. Without clear core values, it can be hard to know what kind of a worker you are looking for. Now that you know your values, however, you can compare every applicant based on the values. See how their life, actions, and mentality interact with the core values of your company.

By selecting applicants based on your core values, you are more likely to snag coworkers and employees that are excited to be there. Not only this, but this will also then enhance your core values more because it ensures that your employees understand and believe in your core values too.

No longer do you have your monster company. Instead, you have a business that works under the same core values. After all, businesses don't have core beliefs; People have core beliefs.

Keep The Ball Rolling

As your business begins to succeed, and your core values become apparent in everyday work life, you must continue to enforce the core beliefs. The second the core beliefs go static in top management is the second that the invisible scale fails to exist.

Keep challenging your company by adding more and more initiatives and exercises to keep the core beliefs fresh and integrated within the workers' minds.

Conclusion

All in all, CEOs must create, establish, and implement core beliefs within their business. When you do this, you will have a firm foundation on which all decisions can be made. Your core beliefs create a foundation for a consistent and lucrative business, from risky business ventures to employee selection.

The Complete Guide to Implementing CRM

THE CUSTOMER DIFFERENTIAL

THE SUMMARY IN BRIEF

One company took 12 months and 12 employees to institute a data warehousing project as part of a corporate-wide customer relationship management (CRM) effort, without any appreciable results. Another company was stymied by the incredible complexities of the processes needed in its CRM effort and had to put the effort on hold almost a year before the right data collection and storage systems were in place. Any company that has begun to implement a CRM plan knows it can be a time-consuming task involving a multitude of business processes and infrastructure dependencies; much broader organizational change than initially thought; and extensive learning of customer-centric and data-driven marketing concepts.

Nevertheless, although it might be easy to dismiss CRM as just another management fad, there are some compelling reasons to take another look at this trend.

First, customers — aided by the technology of the Internet, in particular — have much more power and influence than ever before. Customers today have higher expectations on service, price and delivery.

Second, advances in computer systems are giving companies the ability to collect and analyze specific, up-to-the-minute customer data.

In this summary, you will learn how to transform the five fundamental areas of your company — business focus, organizational structure, business metrics, customer interactions and technology — from a production orientation to a customer-focused orientation.

You will also learn how to:

✓ **Recognize the four stages of CRM.**

✓ **Measure the effectiveness of your CRM program.**

✓ **Calculate the ROI of CRM.**

✓ **Identify barriers to successful CRM implementation.**

The Customer Differential is about differentiating your company by meeting the stringent expectations of today's customers.

Here's how.

Defining Customer Relationship Management

Although the term "customer relationship management" (CRM) is often equated with the old saying, "the customer is always right," it is much broader. True CRM is a revolutionary, enterprise-wide refocusing of how you develop and maintain dialogues with your customers. It requires a careful focus on providing the best value to your customers based on how you communicate with them, how you market to them and what levels of service you can provide—without forgetting the traditional areas of product, price, promotion and distribution.

Most important, CRM is not just a technology solution. While the Internet and other advances in technologies have enabled companies to obtain vast amounts of customer data, these same technologies also have given more power to consumers, who now demand much higher levels of service, greater choice in product features and the lowest prices. Businesses need to know which data are the most important to collect and how to best assimilate and utilize this information while at the same time providing personal "mass customization" to individual customers. This new paradigm calls for a new way of looking at and interacting with customers.

Four Stages of the CRM Process

CRM is a continual process that involves four interlinked stages:

1. **Acquire and Retain.**
2. **Understand and Differentiate.**
3. **Develop and Customize.**
4. **Interact and Deliver.**

As this process evolves, you will be able to add levels of sophistication to your customer strategies. This ongoing, enterprise-wide effort yields unique sustainable competitive advantages that can help increase customer loyalty that will improve your company's bottom line.

Understand and Differentiate

Although business starts with the acquisition of customers, any successful CRM initiative is dependent on a solid understanding of customers. Therefore, the first stage of the continual process that we will examine is how to understand and differentiate customers.

To have a successful relationship with customers, you must understand what services are important to your customers, which products they want to buy and how and when they prefer to interact with you (e-mail, direct mail, telephone, in-person). You can gather this information in the following ways:

- **Perform Customer Profiling.** Gather demographic and geographic information for consumers; for businesses, gather information such as number of employees and company revenues.
- **Segment Customer Groups.** This is a practical place to begin one-to-one marketing. Identify unique groups of customers through similar characteristics relative to the purchase and use of your products. As you continue to narrow segments of customers, you get closer to actual one-to-one marketing.
- **Conduct Primary Research.** You gain insight into your customers' needs and attitudes toward your company's products and services and about your organization as a whole.
- **Rank Each Customer's Value to Your Company.** No customer is created equal. Using the type of information listed here, you can more specifically identify which customers or groups of customers offer the most profitability for your company.

Develop and Customize

In the product-oriented 20th century, manufacturers built products, defined distribution networks and then searched for customers. In the customer-focused 21st century, companies must let the customer drive the choice of product and distribution channel. The most successful organizations are those that base products

Defining Customer Relationship Management

(continued from page 2)

and services and distribution channels on customer needs and wants.

For example, financial services providers now offer ATM and electronic banking, which benefits both the provider and the customer. In the travel industry, wireless-based reservations and electronic ticketing offer customers flexibility.

Interact and Deliver

Companies now have many different customer touchpoints—from retail stores to catalogs to Web sites — and creating a common look and feel and assuring superior service at each site is an essential step in CRM. Most of these touchpoints have been built around the concept of efficiency for the company, not for creating two-way interaction with customers. In fact, although the term "interactive" is usually associated with online initiatives, most Web sites are less interactive than a bricks-and-mortar store staffed by salespeople.

To foster relationships with customers at the various customer touchpoints, companies must make sure:

- that all departments have ready access to relevant customer information; and
- that all employees are trained how to use this information.

Provide them with frameworks (step-by-step scripts, if necessary) for identifying and interacting with individual customers and customer segments.

Acquire and Retain

Learn as much as you can about your most valuable customers, then target prospects who "look like" those valuable customers. The better you understand your customer, the more effective your acquisition efforts; you'll be able to choose the right channels, media, product, offer, timing and message for the target prospect base.

Once you have acquired a new customer, you need to make that person a repeat, loyal customer. By focusing on the following three areas, you can improve your chances of retaining your valuable customers:

- **Continue to provide an ongoing forum for a two-way dialogue.**
- **Consistently meet the customer's definition of value.**
- **Be alert for changes in your customer's needs so you can modify your products or services to meet these evolving needs.** ■

CRM: An Integrated Approach

✓ CRM is not exclusively a marketing initiative. But CRM can involve customer-facing and data-driven marketing and can result in more effective marketing campaigns.

✓ CRM is not exclusively a sales initiative. Sales is just one piece of the CRM puzzle, and a CRM focus can improve sales strategies, account management and SFA efforts.

✓ CRM is not exclusively a service initiative. Rather, service is merely one functional area of a CRM effort.

✓ CRM is not exclusively a technology initiative. While IT and IS are big parts of CRM, it is important to remember that they are simply the tools that allow a company to focus more narrowly on its customers.

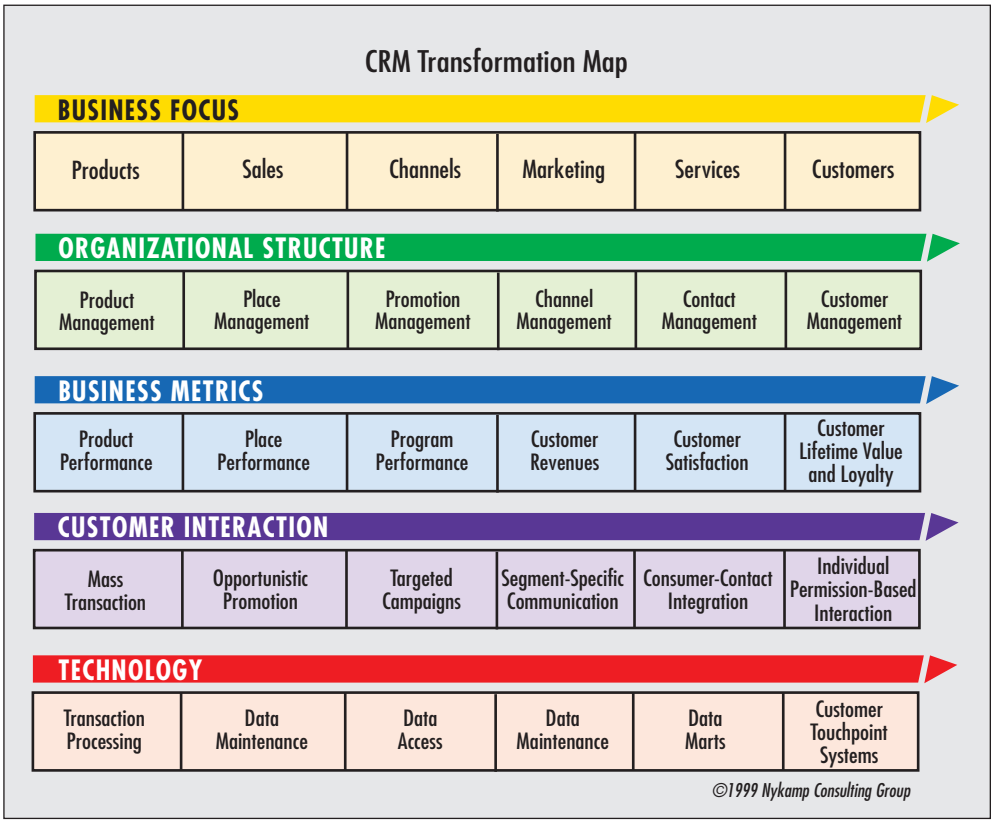
CRM Requires Complete Transformation of the Company

CRM is an enterprise-wide effort, involving nothing less than the transformation of your company from the traditional product/transaction orientation to a customer-focused orientation. Specifically, CRM requires the transformation of your company's business focus, organizational structure, business metrics, customer interactions and technology. The chart on page 4 outlines the stages of transformation in each of these business areas.

Business Focus

Moving from the old "product-focused" business approach requires a radical change that is best accomplished by completely shifting both a company's vision and resources. This shift entails more than just trying to "redirect" customers and customer segments into existing plans and processes or "repackaging" existing products.

What is your company's current focus? Conduct an audit to identify where you can become more customer-focused. Without a true, company-wide focus on anticipating and meeting customer needs, companies can become stuck in intermediate stages, and such half-hearted CRM initiatives usually don't succeed. Even though marketing and service are oriented toward customers, very often these initiatives can become overly tactical and operational. Similarly, with a heavy focus on sales, the emphasis is usually only on customer acquisition, not creating ongoing dialogues with customers.



(continued on page 4)

CRM Requires Complete Transformation Of the Company

(continued from page 3)

Organizational Structure

This area can be one of the most difficult to transform to a customer-facing emphasis, and can be one of the major barriers to successful CRM implementation. Traditionally, companies have organized around products or regions. Transforming the entire structure of an organization requires a complete shift in thinking for managers within all departments, and often entails adding to the existing product line or channel structure, as well as hiring additional employees. Some companies have even created "customer relationship" departments.

Business Metrics

Today, different departments within a company usually measure different sets of metrics. And it is rare to find metrics based on customer-oriented areas. When a CRM transformation is successful, you will have established a way of measuring and tracking customer lifetime value and loyalty. The goal of CRM is therefore to blend traditional metrics (i.e., on product, place) with customer value.

Specifically, you must measure:

1. Product performance: The traditional "build a better mousetrap" ideology.

2. Place performance: Measuring and comparing productivity by regions/territories.

3. Program performance: Marketing efforts are tracked by campaign.

4. Customer revenues: Quantifying the short-term profitability of each customer.

5. Customer satisfaction: A first-stage attempt to measure the quality of customers' experiences with a product or company.

The biggest benefit of these new metrics is that you gain a long-term view of how all of your customer touchpoints factor into overall profitability.

Customer Interaction

The ultimate goal of CRM is to initiate and maintain a back-and-forth dialogue between customers and employees that is individual-based rather than segment-based. This requires a tremendous amount of integration and coordination among employees, departments and information systems. It also requires large investments of time and resources, often on an ongoing basis.

Technology

Rather than creating silos of customer data, the key to successful CRM is using technology to give any employee the right customer information at the right touchpoint at the right time, all the time. But the technology itself is only a tool. ■

The Case for CRM

Results of successful CRM initiatives at organizations in various industries show that:

- ✓ Short-term results often can turn the opposition around quickly.
- ✓ What you learn from these systems tends to strengthen the data, process and functionality of a longer-term solution.
- ✓ Advanced features and functions often are not necessary.

Implementing CRM

Is your company's current organizational structure conducive to optimizing customer relationships? Which employee(s) will take responsibility for the CRM program? Will your CRM project involve hiring any new staff, offering new training, or changes in performance measurement or your compensation structure?

These are critical questions that must be addressed before any CRM initiative is launched. The following checklist is a good guide for assessing your organization's readiness for launching a successful CRM program:

Is senior management tasked with ensuring that the organization understands and is meeting customers' needs? Are they responsible for seeing that the CRM vision and goals are understood?

- **Is management accountable for the P&L of customer performance and responsible for measuring and monitoring customer performance?**
- **Are customer relationship responsibilities clearly defined, assigned, and understood? Are methods for measuring results and providing rewards established?**
- **Are customer-centric performance standards in place at all customer touchpoints?**
- **Are all customer communications viewed as important?**
- **Are policies and procedures critical to managing customer relationships well-documented and consistent across all customer touchpoints?**
- **Are customer-critical functions staffed with well-trained, motivated employees?**
- **Is employee performance measured and rewarded based on meeting customer needs?**
- **Does your company have the necessary sales and marketing expertise and resources?**
- **Does your company have the necessary service and technical resources and expertise?**
- **Have you addressed how you will continue to allow the CRM program to evolve and expand?**

Building the Case for CRM

As budgets for IT equipment (a part of most CRM initiatives) have tightened over the years, it is important to clearly identify the cost benefits and increased effectiveness that CRM offers. Development and implementation of CRM is particularly challenging not only because of the time and money it involves but because you may need to upset deeply entrenched systems and processes and coordinate disparate departments and divisions. The essentials of any CRM business case include:

1. Qualifying your effort. Know the roadblocks you will face and determine which factors will help you or hinder you.

2. Identify the necessary components, and create separate business cases for each one.

3. Project results and improvements in a context that reflects your business setting.

4. Gather case studies and success stories, particularly from your own industry and on companies that operate within similar business models.

5. Create a prototype. It's easier to prove the value of a low-cost option, and it can bolster your longer-term solution.

The CRM Department

Microsoft, American Express, Bell South and Hewlett-Packard have created new departments charged with optimizing customer relationships at all points of interaction. Such CRM departments recruit staff from all customer-facing groups and serve as liaison for CRM implementation in existing functional departments. These firms have found that employees with skills in change management, customer valuation, customer interaction and integrated communications, customer information management and training and performance measurement are essential for their CRM departments.

The Customer Information Management Plan

Another approach to presenting the value of a CRM plan is to develop a Customer Information Management Plan. Typically, this should address: Where and how to efficiently collect customer data, and how to transform these data into meaningful, practical information. You

(continued on page 6)

CRM Hurdles

Lack of Planning is the number one reason CRM initiatives fail. Therefore, be ready to sustain an aggressive effort that spans departmental boundaries and reaches into all functional areas of the firm.

Overdoing Planning also can cause CRM efforts to stagnate. Plan to start small and keep it simple at first.

It Takes Time to reap the results, but it is worth the wait. Don't think of CRM as just a buzzword or "theory of the month." The combination of today's increased customer expectations and rapidly advancing technology, if handled consistently with a CRM focus, can provide you with significant, sustainable competitive differentiation—The Customer Differential.

Implementing CRM

(continued from page 5)

may want to consolidate information into an account or household basis, into monthly transaction summaries, or linked to regional sales territories. You will need to suggest a method to readily distribute customer information throughout your organization.

There are five stages to creating a Customer Information Management Plan:

1. Define where customer data is needed or could be utilized across your organization, and why.

2. Conduct a customer information audit. This is crucial and identifies what data is gathered and how; the quality and quantity of this data; where data is maintained and how frequently it is updated; how this data is maintained and by whom.

3. Using your findings from steps 1 and 2, develop a specification document that will include requirements for data, process, functionality and architecture.

4. Conduct a gap analysis; i.e., find out what information you need that you are not currently collecting.

5. Define a solution that reflects your situation and your prioritized requirements. ■

CRM and Technology

The ideal CRM system includes operational and analytical, online and offline offerings in the following categories:

- **Customer databases**
- **Marketing applications**
- **Data mining applications**
- **Sales force automation (SFA) systems**
- **Customer care applications**
- **Online applications**

Barriers to achieving such an integrated approach include the inability—so far—to blend a speedy operational system with the slower analytical systems. For instance, Online Transaction Processing Systems must use lean customer files for assessing real-time online actions and reactions, while an analytical system such as a reporting tool, needs to sort through huge customer databases to identify trends. Another stumbling block to a total CRM application system is the distinct nature of the sales, customer service and marketing groups within companies. Often, these departments can have independent information processing systems that make it difficult to share data. Finally, the need to integrate established businesses with e-businesses is still a learning curve for most organizations.

Internal Development vs. Outsourcing

In deciding whether to build your CRM technology in house or to outsource, consider the following:

✓ **Solution Scope.** Make sure you know exactly what you want to accomplish — from something as simple as outbound e-mail capability or as sophisticated as multichannel integrated sales. Generally, the broader the scope of your solution, the greater the value in insourcing.

✓ **Core Competencies.** If becoming customer-focused is highly unlikely to be a strength of your IT department, the better it is to outsource this area.

✓ **Time Horizon.** If your goals are shorter-term, outsourcing is recommended, at least for starting a CRM effort.

✓ **IT resources.** If you have no internal technology resources, or your IT department lacks enough experience in managing customer information, outsourcing is recommended.

Dealing with CRM System Vendors

With the volatility in the IT market, there are risks of delays and product and service changes as companies merge. Longer term there may even be dangers of monopolistic pricing. However, the bright side of the continuing M&A activity in the IT sector could mean improved products and services as well as the possibility in the future of "one-stop" shopping as opposed to the many niche players now selling in this market.

Be sure you document the details of both your internal and outsourced services. Your contracts should specify assignment rights, solution specifics and service levels. Ask the important questions, and if a vendor is hesitant to answer forthrightly, find another vendor. And, if a company you have contracted with is merged or acquired with another, this may be an opportunity for you to renegotiate your contract. ■

Changing Your Metrics

Because the traditional business model has been focused on either products or channels, these are the areas where most measures of profits originated. However, none of these metrics capture a comprehensive view of customer behavior. Program performance metrics calculate how many leads were generated in certain promotions, for example, while product-based metrics illustrate the most profitable products, but these two findings alone don't address customer attitudes.

(continued on page 7)

Changing Your Metrics

(continued from page 6)

Customer metrics are difficult to establish, and because customer behavior is dynamic, they also need to be adjusted over time. Even customer satisfaction statistics can often yield only limited information. Some studies, for instance, show that customer dissatisfaction has an inverse correlation with attrition—i.e., that customers who did express a level of dissatisfaction were actually less likely to switch to a competitor. This finding could be because customers willing to participate in a survey in the first place had some loyalty to the brand.

Customer Scorecard

Using a customer scorecard is a good way to begin transforming your company's metrics. This is an iterative process that involves collecting relevant customer data, building on your customer intelligence incrementally, and communicating results across the organization.

To build a customer scorecard, you first need to collect the right customer data by asking the following questions:

1. Who Are Our Customers?

- Unique customer identifier.
- Customer name.
- Name of the customer's organization.
- Department or group in which the customer works.
- Title, role in organization, or other designation.

2. Where Can We Reach Our Customers?

- Home and business addresses, phone number(s), e-mail and fax addresses.

3. What Are Our Customers' Key Characteristics?

- Consumer: Gender, age, household size, estimated income, presence of children, segment classification.
- Business: Industry classification, number of employees, annual revenues, number of locations, role of individual in the purchase process.

4. How Do Customers Prefer to Interact with Us?

- Media preference (mail, e-mail, phone, fax).
- Channel preference (Web, retail store or branch, salesperson, phone).
- Opt-in or opt-out for any media or specific communications.

The Lifetime Value Of Your Customer

One of the key metrics in your customer scorecard will be the estimated lifetime value (LTV) of that customer. LTV estimates the annual profitability over the expected lifetime of a customer, using net present value financial calculations. Some calculations assume statistics of spending, while more complicated models include cross-purchase behavior and changes in spending over time.

Estimated lifetime value will tell you which customers are most valuable to your company — and which customers are just costing you money.

5. What Has Been Our History of Interaction?

- Outbound marketing promotion history.
- Outbound sales contact history.
- Inbound customer-initiated queries.

6. What Has Been Our Customers' Purchase Behavior?

- Purchase dates, number of transactions, items purchased.
- Prices paid.
- Channels utilized.
- Sale vs. nonsale items.
- Returns or exchanges.

7. What is the Customers' Value to Our Organization?

- Revenue to date.
- Profitability to date.
- Estimated lifetime value (see box above)
- Estimated share of wallet. This is the percentage of business a customer is giving you, versus your competitors.
- Estimated probability of: response to specific promotions, specific purchases, attrition, and nonpayment or bad debt.

The next step is to analyze the data that you have collected. Answers to the questions above should allow you, for example, to develop profiles of your customers, to segment the customer base according to different needs and behaviors, and to determine the value of different customer segments.

Once you've collected and analyzed the data, you can create the scorecard, which is basically a snapshot of your customers that can be easily communicated to your organization.

(continued on page 8)

Changing Your Metrics

(continued from page 7)

First, decide on the segments or group of customers you wish to measure. Then choose the metrics you will put on the scorecard. Number of current customers (by segment and tenure), product penetration (percentage of customers that purchased certain product categories) and current profitability are some examples of the metrics that you will want to chart. Another key metric is the customer lifetime value (see box).

Once you decide which metrics are important, set annual goals for each metric — per customer segment — and compare with current performance statistics.

Remember that your customer scorecard needs to tell a story by highlighting trends over time and providing comparisons by customer segment and other relevant criteria. ■

Measuring the ROI of CRM

You've implemented your CRM effort; now you need to show how this initiative has helped increase revenues, decreased costs and improved your firm's competitive differentiation. How do you do this? To begin with, before you make any investment in CRM technology or other resource, scrutinize each CRM business plan by examining its broad-scale quantification of potential return on its investment. By doing this you prioritize each of these initiatives.

It is important to create organization-wide measurements of CRM success as well as establishing metrics for measuring the progress of the CRM effort once it is implemented. Don't just set up the program and forget about it!

Specifically, you will want to measure the progress of the CRM effort in five interrelated areas of your business: internal CRM capabilities, customer interactions, customer dynamics, operational efficiencies and business metrics.

Internal CRM Capabilities

Using best practices, continually monitor your progress with CRM methods to assure that your business focus, organizational structure, technology and customer interaction capabilities are customer-centric. Such ongoing monitoring can help spot over-investment in some areas. Ideally, you want your business focus to be centered on customers, your organizational structure to be tailored to customer management, your metrics to provide information on customer lifetime value and loyalty, your customer interactions to be individual, permission-based dialogues, and your information technology to be able to deliver the right information at the right time across all customer touchpoints.

Customer Interactions

There are potentially hundreds of customer interaction points in an organization. Once you've prioritized the most important interaction points, assess how well you are meeting customer expectations by using a Customer Interaction Scorecard. A typical Customer Interaction Scorecard might track interaction opportunities (for example, "Customer visits our Web site three times daily) according to "past performance," "current performance," "importance to customer relationship" and "improvement priority." For each of these measurements, the interaction opportunity would receive a "3" for high performance, "2" for medium performance and "1" for low performance.

Customer Dynamics Among All Departments

It is essential to link CRM efforts among all departments. Each department needs to study how it can improve customer acquisition, growth and development, retention and reactivation. All CRM initiatives should be linked to these metrics. This can be easier said than done, however, since within many organizations each department has a different way of measuring success. For example, the marketing department may be able to show how its new targeting model has resulted in improved customer response, without mentioning the firm's investment in improving its data collection techniques, implemented by the IT department. Different departments need to be made aware of how their efforts affect other departments and ultimately the company's ability to competitively differentiate itself.

Organizational Structure

Once you have implemented more customer-centric processes in business focus and customer interactions, it is common to see increased operational efficiencies as a result. Some benefits realized by companies using CRM include cost reductions in data collection, maintenance or fulfillment; easier identification of fraud or other problems; and increased integration of other core business processes. ■

Lessons Learned

Here are key lessons learned by companies who have begun implementing enterprise-wide CRM:

1. **CRM initiatives need to be driven by business goals and objectives.**
2. **CRM requires aggressive, ongoing organization and planning.**
3. **Balance planning with action.**
4. **Stick with it!**

THE SUMMARY IN BRIEF

If you are going to succeed in business today, you have no choice but to become customer-centered. Gone are the days when you could compete on price or a unique product alone. Customers can get just about any product they want from a choice of producers at about the same price. Companies who want to distinguish themselves from the competition will have to do so by offering something else. That something else is most likely superior service, delivering exactly what the customer wants when he wants it.

In this summary, you will learn exactly what steps you must take to become customer-centered. You will learn from leaders in the field what they did to change their focus and vision from an *internally* driven idea of what the customer wants to an *outside-in* vision of what the customer wants.

You will see how you can implement an operational strategy that differentiates and competes on service and value to customers rather than merely on products and price. You will begin creating value at touch points to attract and retain customers.

As you learn to listen to your customers, you will see which group can create the greatest profit and be of the greatest value to your company. Then you can tailor your services and products to satisfy the needs of this group by providing value to customers commensurate with their value to you. You will see how you can harvest the information your customers provide to improve your targeting and personalize the services you deliver.

Finally, you will learn how to realign your entire company to meet customer needs and increase profitability. You will harness the power of technology to deliver what your most profitable customers want. Your employees from the top down will see why the changes are being made. You will create an entirely new culture that is customer-focused and able to undergo continuous change.

Customer Value Management

The last two decades have seen companies reinventing themselves over and over. First, they downsized to boost profits. Then they reorganized and reengineered themselves. But through it all, promised profitability didn't soar. What was missing in all these efforts was a focus on the customer. That has to change.

Achieving the Vision

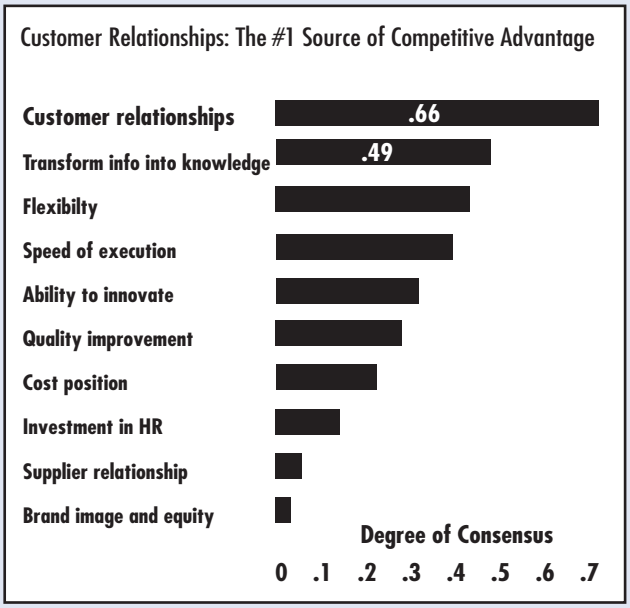
In today's business environment, the world can be characterized by overcapacity, and customers have become kings and queens. The old management philosophy, "If you build it they will come," is being replaced with a new executive order, "Find out what they want and give it to them." But putting the wish to put customers first into action isn't easy. The key is the use of customer value management, or CVM.

Customer value management provides a rational set of techniques, methodologies and strategies to weave the needs and wants of customers into the key process designs and management activities of a company. Customer value management is a way of doing business. Employed correctly, it can help you understand what your customers want and how you can go about aligning your business to deliver that product or service consistently.

Easy to Say; Hard to Do

Implementing a customer-focused vision requires a major shift in most companies' strategic thinking, often including a radical move from product or price to process or service as the basis for competition. Today, one company's products look about the same as another's. What were once exclusive and unique products have become more like commodities. Virtually any product can be bought from several companies for about the same price.

In order to beat the competition, your company must find something other than product features to differentiate you from a dozen other competitors. That something



(continued on page 3)

Stemming Customer Attrition Is Key to Profits

A multi-industry study by the University of Pennsylvania's Wharton School of Business found that companies who managed to reduce their customer attrition by only 5 to 10 percentage points actually increased their profits by an astounding 25 to 75 percent, depending on the industry. When you consider that many American businesses report customer attrition rates approaching 20 percent, the value of becoming more customer centered is obvious. Even if a business doesn't add new customers, keeping the ones it does have can reap rich rewards.

Top Executive Concerns

Global senior executives see customer relationships as most important to their businesses in the new millennium.

Customer Value Management

(continued from page 2)

is customer service and value. The shift requires that you understand what the customer wants and that you align your business processes with the customer's needs. To do that, of course, requires intimate knowledge about your customer. That's where customer value management comes in. Using CVM, you will be able to systematically acquire customer information that is linked to customer behavior. You must get information that tells you what will make the customer buy your product or service.

CVM requires you to take an outside-in customer vision of your company as the ideal provider of goods and services. You start by identifying the target customers and seeing what they really want from your company. This includes identifying:

- **what the customer gets out of interactions with your company,**
- **the minimum value level needed to retain customers,**
- **the optimal value level the customer imagines, and**
- **the customer's vision of the ideal vendor delivering ideal value.** ■

Visioning: Let Customers Set the Goals

The fundamental problem that makes it so hard to become customer-centered is that traditional management principles focus on where you want to be and how to get there. This process, embodied in management by objectives, is a process taught for decades in introductory business courses. It has been programmed into the decision-making DNA of thousands of business school graduates. If you use management by objectives, you decide what objectives you will meet and then set an agenda to get there.

The fundamental problem with management by objectives is that the objectives you set are yours, **not your customer's**. To succeed today, the end goals must be your customer's. That means you must find out what the customer wants. The old management by objectives paradigm must change from an inside-out model of internally defined goals to a radically different, outside-in, customer-defined set of objectives.

Obtaining the Customer Vision

At this point, you may be thinking that it should be obvious that the best way to understand the customer view is to do what thousands of companies have done for years: survey customers. Unfortunately, even that isn't simple. You have to ask the right questions, or you risk collecting a lot of useless information.

Surveys have to ask questions linked to buying behavior to be of any use. An American luxury automaker prided itself with high customer satisfaction marks on surveys, but couldn't understand why those "satisfied" customers were defecting to Lexus and Infiniti. A close look at their surveys revealed that they were asking all the wrong questions. The company learned that its customers appreciated the leather chairs in the waiting room and the clean condition of the shop floors, but learned nothing about what would make the customer buy their

(continued on page 4)

Car Maker Finally Gets It

Becoming customer-centered is a lot harder than it sounds. When a major European automobile manufacturer decided to make customer needs the focus point of its revamped business plan, it was clearly on the right path. But when it came time for the CEO to come up with a new vision statement, his first draft demonstrated exactly how hard it is to move from an inside-out to an outside-in view of business. His draft declared that the company's vision was "Selling a car is the beginning of a lifelong relationship."

The draft had it all wrong. An outside-in view is essential. Only when the CEO changed the vision statement to "*Buying* a car is the beginning of a lifelong relationship" did he get it.

Great Execution, Wrong Vision

Consider the case of a utility company that embraced management by objectives and the related concept of total quality control. Realizing that customers didn't like long power outages during frequent inclement weather, the company embarked on a plan to improve their performance, and, in turn, satisfy customers. The utility reasoned that reducing the duration of power outages would be valuable to customers.

The utility managed to cut the duration of power outages from a few minutes to a few seconds, and congratulated itself for a job well done. When customer surveys revealed declining customer satisfaction, management was perplexed. After all, hadn't they improved their processes and met their goals?

Of course they had. The problem was that they had met **their goal**, not their **customer's goal.** What customers really wanted wasn't shorter outages. They wanted **fewer** outages.

Visioning: Let Customers Set the Goals

(continued from page 3)

brand again. To be effective, surveys must get to what it is that would make the customer buy again. ■

Focus: Listen to the Right Customers

Not every customer is a desirable, high-value customer whose opinions and viewpoint should drive business design and investments. You must identify and focus on a targeted set of customers whose view counts. That customer is the one who receives value from your goods and services, who generates demand and a market for your company.

The Customer View at the Point of Contact

Sometimes the customer is the one at the direct point of interaction with your company's products and services. If that person has an impact on the purchasing decision, his view counts. Take as an example the secretary who makes reservations for business travelers. He or she isn't the ultimate consumer of the goods or service, but does control some of the purchase decision. Should his or her view matter? It may very well. The same goes for others your company directly impacts but who are not end users of the product or service. These "customers" include shipping clerks, purchasing staff and accounts payable clerks.

Customer View from Non-Point-of-Contact Personnel and Influencers

Those who have indirect decision-making power in the decision to make a purchase also count. These include consultants, reviewers and staff expert advisers. When Comerica bank commissioned a CVM study to understand the needs and wants of a targeted market segment — small business owners — they asked customers from where they received information about financial products. Their answers included from manufacturers, service vendors, journalists and publications, software and accountants. But they also revealed that their preference would be to get the information from the bank with whom they already had an ongoing relationship.

In response to the survey, Comerica took two major steps. They made sure every key customer had access to financing information and made sure the customer's other identified sources of information also knew about the bank's financing programs.

Customer View from the Channel or Third Party Value Chain Intermediaries

Another customer whose view must be considered is the channel. Channels are intermediaries for delivering products or services, and can be internal (i.e., call centers) or external (i.e., retailers, agents, dealerships). Many companies are dependent on channels and the relationship those intermediaries have with the end user. Their views must be considered in addition to the views of the ultimate consumer.

Customer View from Internal Customers

Often, companies focus too much on the needs of so-called internal customers at the expense of the paying customer. Programs and processes need to be designed with the paying customer in mind, and you must get internal customers to focus outward rather than inward. Everyone must agree that even internal processes must be designed with the end user in mind.

Targeting the Right Customer

You cannot be all things to all customers. The battle to attract and retain loyal customers will be fought and won on the ability to identify potential profitable current and future markets and then meet their specific needs. You must go beyond analyzing current customers and identify non-customers who are members of desirable market segments.

Technology makes it possible to do just that. Customer transactions and behavior can be analyzed to reveal patterns. By taking a look at the characteristics of a profitable segment and seeing if another customer segment shares characteristics with the profitable group, you can identify potentially high-profit customers within your base.

You may discover that in some cases the cost of meeting a customer group's needs is too high. In that case, you must be willing to "fire" the customer. You cannot be all things to all customers, without regard to how profitable the customer actually is. Sometimes the

(continued on page 5)

Harley-Davidson Turns Around

Harley-Davidson Motorcycles has gone from the edge of bankruptcy to cult-like loyalty and high customer retention by focusing on two customer groups: motorcyclists and dealerships. All its products, processes, services, employee team incentives and measures of satisfaction were linked and aligned with the two groups. Central to Harley-Davidson's success are two customer satisfaction indices: a customer satisfaction index and a dealer satisfaction index. By focusing on both groups, the company has managed to grow a powerful brand that inspires dealer and rider loyalty.

Focus: Listen to the Right Customers

(continued from page 4)

answer to a low-profit segment is to stop recruiting from that group. Sometimes you actually have to "deselect" the segment altogether.

You may also want to vary the level of service provided to different customer groups based on their profitability. One way to do that is to provide a consistent level of service to everyone with a single common support infrastructure but varying the fees for that service based on the profitability of the customer. Another approach is to provide extraordinary service only to the most desirable customers. Low-value customers get only their basic must-have needs met while high-value customers get high-value services to attract, delight and retain them. Airline frequent flyer Bronze, Silver and Gold level services do this. Travelers are grouped based on their value to the business and provided with a commensurate level of service. If low-value flyers want additional services, they have to pay a fee. ■

Scope: Select Highest-Leverage Customer Interactions

Once you have identified those customers whose opinion counts, you are ready to focus on the business activities that directly touch those customers, make them feel important, and let you distinguish yourself from the competition. These interactions become **moments of truth** which can be managed and leveraged to affect customer acquisition, retention, loyalty and growth.

The interaction may be a single process. Take, for example, MasterCard. The company wanted to develop call center standards to improve customer service. They began by identifying cardholder and customer demographics (high, low and moderate income; professional and non-professional; location and member banks.) Next, they determined each customer group's needs and designed the new system to meet those needs.

During the analysis, the company discovered there were far more moments of truth than they had guessed. While the company saw making a call center call as a simple process, customers reported that it was not. The process took a long time and required navigating voice mail systems and providing information several times to several people. What customers wanted was to be able to explain their question or problem once. MasterCard acted on customer needs and developed a system to address those needs. The system was then shared with affiliated banks so every MasterCard customer could benefit from the new design. ■

Getting the Mittens to Granny

Sometimes you must redesign your processes across the entire enterprise or even to an extended enterprise. That is, the entire company may have to be redesigned to meet customer needs, and others in the chain of distribution may have to be included. A perfect example is the interaction between L.L. Bean and Federal Express. L.L. Bean understands that it must manage the entire delivery process beyond the time the customer's order leaves its premises. From the customer's viewpoint, the moment of truth is whether the mittens get to Granny by Christmas. Continued business success for everyone in the value chain depends on the mittens getting where they are supposed to be on time.

L.L. Bean and Federal Express have partnered so that FedEx processes have been integrated into L.L. Bean's processes. When a customer calls L.L. Bean about an order, she is told exactly where her package is and when it will arrive.

Value: Identify Actionable High-Leverage Customer Needs

Your customers' expectations are often set based on their experiences with other businesses. When another industry or company sets its standards high, you will have to respond. The problem is that you don't always know whose standards you must meet. For example, if your customer gets a loaner when he has his Lexus in for service, he probably expects a loaner computer when his laptop is in for repairs. When Sears offers him a specific time for repairs to his dishwasher, he will also expect you to offer a specific time for automobile repairs.

The performance bar is rising relentlessly. Your challenge is two-fold:

- You must understand what your customer values, especially since those values change constantly, and
- You must maintain a balance between what customers value and what you can actually deliver.

You must keep tabs on customers' changing expectations by developing new ways of listening. One approach is to meet customer expectations. The other is to exceed those expectations. The first will effectively manage dissatisfaction, while the second will go much farther. It will let you manage loyalty and attract a

(continued on page 6)

Value: Identify Actionable High-Leverage Customer Needs

(continued from page 5)

greater share of the market through competitive advantage. Which approach you take depends on where you are and where you need to go.

If your strategy is to be the low-cost provider, and you want to compete on the basis of price as a commodity vendor, you may just need to meet minimum expectations. Or you may have so many complaints and such a high rate of attrition that simply meeting minimum expectations will turn things around. On the other hand, if you want to distinguish yourself as a high-service premium provider you will want to exceed expectations. Either way, you need to find out what expectations your customers have. The following techniques will let you do that:

- **Establish customer complaint outlets like 1-800 hot lines, customer reply cards or Internet-based feedback systems.**
- **Interview front-line, customer-facing personnel.**
- **Interview customers who recently defected.**
- **Interview recently lost prospects.**
- **Use customer focus groups.**
- **Use customer satisfaction surveys with blank spaces for write-in comments.**

Once you know what customers want and aren't getting, you can go to work closing the gap. You must align your service promises against your ability to deliver. For example, if you promise zero defects in the hotel rooms you rent, customers will expect you to deliver. That means you must set in place processes that guarantee there will be functioning televisions, clean bathrooms and working air-conditioning before a guest checks in. Providing zero defects is the minimum expectation.

Many companies can't stop at just meeting minimum expectations. Instead, they can strengthen their competitive advantage by providing superior customer value and service. This requires a real understanding of what customers want and what drives their buying behavior. There are three steps to this kind of satisfaction. They are:

- Meet basic needs.
- Exceed basic expectations in ways that make the customer feel good about your company. For example, when a bank teller calls a customer by name, the customer feels good about the bank. Remembering a name isn't enough to bring new customers in nor is its absence enough to drive customers away. But it does drive satisfaction.
- Provide so high or unexpected value that a customer would leave a satisfactory relationship with another company to get it. ■

Finally Hearing the Voice of the Customer

A car rental company held a focus group to determine what improvements it could make for business travelers. The group's facilitator was focusing on a particular moment of truth: when the customer is dropped off at the rental car. The group was asked what would make that moment ideal. One customer replied, "I'd like a light on the side of the bus." When asked why she needed a light, she replied, "Because it's dark out there." After more probing, the real reason emerged. She and the others in the room were worried about their personal safety given that rental lots are often located in high crime areas.

Once the real reason for the request came to light, the group was able to come up with other ways to solve the problem. They suggested that the rental car company bring the car to them instead. The end result was that the company found a way to delight customers by listening to what they had to say.

Prioritization: Make Investment Decisions Based on Buying Behavior

You cannot and should not strive to be world-class at everything. You must learn what is necessary and what isn't. A perfect example is answering the telephone. If your company doesn't answer the phone when customers call, they won't be your customers for very long. But investing millions to answer the phone on the first ring won't help either. It's unlikely new customers will flock to you because you answer on the first rather than the third ring. Being the world leader in this case won't provide a significant incremental customer value or competitive advantage.

On the other hand, providing access to critical information once the phone is answered can give you a competitive advantage. You must decide how important each need is to your customer and if meeting that need will boost your bottom line.

Once you have identified the "voice of the customer," you must translate it into the "voice of the company." After all, the company has other constituents, such as its

(continued on page 7)

Prioritization: Make Investment Decisions Based on Buying Behavior

(continued from page 6)

shareholders, employees, the community and regulatory agencies. The customer's needs must be converted into business decision-making criteria.

Linking Customer Needs with Buying Behavior and Bottom-Line Results

If you want to do more than the minimum required to satisfy customers, you will need to use advanced methods to tie needs to behavior and bottom-line results. You can use focus groups to identify creative, new, added-value interactions that move your company from "meeting customer expectations" to "establishing and fulfilling new value propositions that exceed expectations."

You can also use quantitative surveys to identify actual buying behavior. This serves as a check on whether satisfying the needs you identified actually results in additional buying by those customers.

Prioritization Scenarios

When choosing and applying CVM methods for prioritizing, there are four methods you can use:

- Design a totally new process or service. The most important needs become the top design priorities regardless of how well they were being performed in the old one.
- Design improvements to an existing process or service. In this approach only those important needs that are being poorly performed move to the top of the improvements list.
- If you choose to focus only on the customer's voice, prioritize according to the customer's identification of which needs are most important.
- If you choose to focus on actual buying behavior, choose to focus on those needs that bring bottom-line improvements. ■

High-Tech Call Centers

Today's high-tech call centers demonstrate the power of designing systems from the outside in. These call centers can identify who is calling before the call is answered. By searching internal databases and analyzing the calling history, the center already knows what language to answer in, the caller's buying history and preferences. External databases can also be searched, giving instant access to credit history, risk management data, and fraud protection assessments. In addition, all the gathered data can be analyzed and a prediction made about what the customer is calling about, or what he or she might want to buy. The call can then be routed automatically to a specialist. All this happens seamlessly.

Design: Envision "Ideal" Customer-Defined Business Capabilities

The contenders for high profits and customer loyalty will be the companies that are willing to make fundamental changes in their infrastructure and process capabilities to align themselves with the needs of their customers. Customer value management can be visualized as a pyramid with three layers. The *customer's viewpoint* is at the top, and it is here that CVM begins. Once the customer's vision is identified and business priorities are established, the focus shifts toward the next two levels of the pyramid: the organization's essential *process capabilities* and the required *infrastructures* (including organization structure, business practices, measures/rewards/culture and technology). The capabilities and required infrastructures are designed to support and fulfill the customer's vision.

Let's look at an example of how this is done. Customized service is quickly becoming a universal chorus from customers who are becoming used to personalized treatment from high-service industries. Today, the customer vision is increasingly to have things "my way." For your company, the issue is to identify exactly what that means in terms of new business capabilities and infrastructure investments.

Customers also want businesses to recognize them. That means you need to put processes in place that capture information early on in the relationship. Take a bank loan application as an example. Although a new bank customer will have to supply lots of information up front, an established customer shouldn't have to. If you captured basic information up front and made it available to those who need it, the established customer wouldn't have to repeat information.

Designing the Bottom of the CVM Pyramid

The starting points for CVM are customer desires and company strategy, such as the decision to compete on price or value. Then, you should data mine your company's transactional data to identify high- and low-profit target segments and identify common buying behavior.

With that data in hand, you can conduct primary market research using focus groups and quantitative surveys. This will give you an idea of the relative importance of customer needs, size up where the competition

(continued on page 8)

Design: Envision "Ideal" Customer-Defined Business Capabilities

(continued from page 7)

is, and identify the behavior that drives customers. You can then do on-site benchmarking by visiting other companies in different industries that customers have identified as the best at meeting their needs. You should also do secondary research in journals to see which companies have distinguished themselves. Finally, you and others in your company can brainstorm to come up with the infrastructure and capabilities required to meet the needs identified at the top of the pyramid. ■

Implementation and Maintenance: The Holistic Approach

For a company to become and to remain customer-centered requires a balanced holistic approach. The challenge is to calibrate and align all the major elements of the business so they are mutually supportive, holistically balanced, and aligned and linked with the things that drive customer buying behavior. Once the alignment and balance are attained, however, the reality is that the environment will not remain constant. Changes will take place that must be integrated into the business without upsetting the balance.

Well-articulated business direction and a clear statement of where the company is going are required to help employees understand and support company goals. Employees need a framework for business decision-making. This requires that customer-centeredness must be incorporated into your company's values, vision and mission. It also requires that you change employee incentives, measurements and objectives to align with the customer-centered view. ■

Reaping the Benefits of Being Customer-Centered at IBM

When IBM transformed itself into a customer-centered company, the employees had to be convinced it was necessary; they had to "get it."

Some of the actions taken to assure they would come onboard included educational programs about the changes coming and why they were being made. In addition, the company elevated the customer to the position of final arbiter of whether IBM's performance was satisfactory. Employees were ranked and rated on their individual performance and their team contributions toward customer-focused objectives. Executive compensation, which had been based primarily on business unit performance, was now based on overall business results and customer satisfaction.

The result was that the culture changed and aligned around a new set of values and vision for the company. Together, these efforts assured that the employees "got it."

Sustaining CVM, Always

You're ready. You have arrived at a customer-defined state for your business. Your marketplace has been segmented into groups of customers based on their current and future value and then subsegmented into clusters of customers with common needs and wants. Target market segments have been divided into buying behavior drivers and prioritized based on their relative potential to improve your business. You have redesigned your business capacities and infrastructure to align them with your customer's vision. Your employees are with you. Congratulations!

You must institutionalize becoming customer-centered. You must continually monitor changing customer and market perceptions.

Now, get set to do it again. Because today you are already one day out of sync with your customers. The answer is that you must institutionalize becoming customer-centered. You must continually monitor changing customer and market perceptions.

Remember that the business world today is characterized by an intense but often disorganized desire to become more customer-centered. Virtually every corporation is grappling with how to develop and implement strategies to move closer to their customers. The pressure for a company to become customer-centered will only increase as more and more consumers get used to doing business on the Internet.

As affordable Internet access continues to rise, so will the number of people using the Internet. These consumers will get used to personalized transactions and will have access to new vendors as never before. They will seek out new deals and expect great service. And if these consumers are unhappy with your service or product, they have the power to let the world know.

In light of these realities, you have no choice but to intensify and accelerate your ability to understand customer needs. But if you integrate CVM into your business approach and management, you can be the leader who sets the bar others will have to meet. ■

The Fearless Front Line

The Key to Liberating Leaders to Improve and Grow Their Business

by Ray Attiyah

THE SUMMARY IN BRIEF

Leaders are committed to improving and growing their businesses, but all too often they find themselves mired in operational details and daily issues, leaving no time to pursue bold visions. *The Fearless Front Line* is a call to action for these leaders to set a standard of fearlessness where frontline workers have an "I run this place!" mindset that reflects pride and ownership of their critical role. This, in turn, liberates leadership to focus on the big-picture, bold strategies to improve and grow the business.

Featuring author Ray Attiyah's Run-Improve-Grow (RIG) model — a perpetual model for continuous improvement that stimulates a culture of consistent growth and constant innovation — organizations can master the Run, begin to Improve, and through bold leadership watch themselves Grow.

The Fearless Front Line is designed to help organizations move from a place of slogging through (mediocrity) to a place of joy and engagement (excellence). Attiyah provides readers with critical processes and tools to create responsive, innovative and nimble organizations and inspired, accountable and confident teams. It is a must-read for any manager who is looking for ways to invest in human assets and frontline supervision.

IN THIS SUMMARY, YOU WILL LEARN:

- How to benefit from a proven program to drive perpetual and transformational improvement and growth.
- How to think about improvement and growth by focusing on core processes and supervision.
- How to ask the right questions to move your frontline workers from their current state to world class.
- How to add meaningful value to your business.

Introduction

While managers are stuck in the front line, they're not leading or pursuing activities that propel growth and innovation. The precondition for liberating managers is having a front line that can operate reliably, excellently and independently day in and day out every day of every week of every year. The front line needs to feel powerful, not powerless. It needs to be trusted, encouraged and accountable to itself. It needs to be emboldened.

Run-Improve-Grow can get you and your organization to fearless. Run-Improve-Grow is a perpetual model that approaches improvement as a continuously moving system that stimulates a culture of consistent relevancy, new growth and constant innovation. Run-Improve-Grow is based on fundamental principles that are universally true for every system and collection of people. The principles work for any organization.

PART I — RUN: CREATING A FEARLESS FRONT LINE

Meet the Marathon Manager: Running All the Time

Business is inherently complex, but all too often we make running a business more complex than it needs to be. Too many people involved in too many processes. It only takes one or two moving parts falling out of synchronization to cause systems and processes to become unreliable. Over time, the inherent complexity that comes with running a business seems too difficult to overcome. How do we let that happen?

Our goal is to return business to its simplest state by removing negative complexity. To do that, we first need to look at how we got here in the first place.

The Run

The concept of Run-Improve-Grow can be explained by drawing a triangle and dividing it horizontally into three sections. At the base of the triangle is the Run, or the day-to-day activities necessary to produce your products or deliver your service, which includes securing orders of existing products and services from customers in existing markets and in existing geographies. When the Run can't function reliably and independently of management involvement, it strains resources by pulling managers away from their most value-added functions.

When leaders can't delegate, they're stuck in the Run, so they can't innovate. Without new and innovative ideas, products and services, organizations can't grow. Without innovation and growth, organizations don't have capital to invest in the future, so managers don't attempt growth initiatives. And the cycle continues. So the ability to Improve and to Grow starts with a rock-solid, reliable Run.

Having a solidified Run led by an organization's front line is crucial to Run-Improve-Grow sustainability. Most mid-level and top leaders spend time in the Run out of necessity because they are doing whatever it takes to get product out the door. Without a solidified Run led by the front line, managers get dragged down in the Run, preventing them from working in areas where

they can add the most value to their organization and its customers — in the Improve and Grow functions.

A Run-Centric Culture

A Run-centric culture is actually the opposite of what a business needs to be successful. It is a lack of thought that can foster a Run-centric culture in which too many people who shouldn't be are involved in the Run.

Running around is not the Run. Remember that the Run consists of the day-to-day operations of the organization that sustain the organization's existence. Needless meetings, extra emails and layered processes do not sustain an organization's existence.

When managers enable this Run-centric culture through their involvement in the daily operations, the managers themselves become part of the dysfunctional Run system — they become institutionalized. Institutionalized managers are constantly Running — I like to call them marathon managers. Marathon managers who don't change their frontline systems end up becoming part of the frontline system itself. Work gets done through them.

As marathon managers become firmly embedded in the Run, a vacuum intensifies in the Improve. The company now lacks the right level of focus on the Improve, and that inattention either prevents the Grow or creates chaos and lower profitability when the Grow comes. The Run is, in effect, disconnected from the Grow and, therefore, from long-term organizational relevance. ●

Develop a Fearless Culture: 'I Run This Place'

Before the front line can really start flawlessly executing the Run in accordance with specified performance standards, the organization needs to clean up its processes and clear out the clutter that's clogging up its systems. And that's why the first order of business in a Run-Improve-Grow implementation is identifying and making reactive improvements that simplify the Run.

With so many superfluous systems clouding the view of a defined performance standard, how can leaders identify and prioritize the systems and processes that need simplification? The first step involves going down to the most fundamental level. Ask,

- What is the basic deliverable our customer wants?
- What does our customer do with our deliverable?
- How can we give that customer what he or she wants in the fewest steps possible?

Simplify the Run

Imagine you are a one-person company and you have to do it all — take the orders, buy the materials, make the product or deliver the service, collect payment. You would probably figure out the fewest steps, or the purest process, to get all of that done. That's simplification. Companies with more than one employee find a way over time to add layers to that purest process.

In Run-Improve-Grow, you want to get back to that pure process. So identify those basic elements, and then ask yourself why you're doing anything else — and when you started doing all those extras. This is an opportunity to understand how the organization has evolved. (You need to know how that evolution has occurred because later in the process, you're going to need to justify why you're eliminating steps.)

The organization needs to throw all its clutter on the floor, empty all its metaphorical drawers, cupboards and closets, and really see how much junk it has. Only when you see the entirety of what you're dealing with will you be able to identify the essential elements for making the organization run at peak performance and recognize those superfluous systems, process and practices that are impeding progress and performance.

Why Getting to Fearless Matters

Eliminating the need for marathon managers of any type is critical to your organization's overall success and long-term health. It's the only way to get to fearless. Relationships of trust create positive dividends throughout the organization. In a trusting environment, employees are more likely to bring up ideas or share some other information that could be vitally important to future strategic and operational decision making. That willingness to bring up new ideas reflects courage. ●

Empower the Front Line to Lead: Move Over, Management

Surmounting the impediments to creating a fearless culture in the Run isn't as difficult as you might be thinking. There are three very practical ways to shape the leadership culture you want to pervade the Run:

- Raise the bar of excellence by investing in top performers and removing obstacles that frustrate them.
- Foster quick-win success by removing frustrations and making meaningful changes quickly to bolster team confidence, enthusiasm and trust.
- Implement daily huddles to foster a positive "what went well" environment, communicate your standards

of performance, and create a simple touch point for communicating the status of reactive improvements.

Raise the Bar of Excellence

Recall that leadership is an interpersonal development of trust that inspires a higher standard of performance. So, to foster a fearless front line, leaders need to shift from spending too much time with the wrong people, the organization's worst and neediest employees, to the right people, the organization's top performers. Frontline leaders can rekindle the motivation of disenchanted top performers with a simple shift of attention and simple actions like pursuing their suggestions and publicly giving them credit for their ideas.

One of the most successful methods of raising the bar of excellence is enlisting top performers to share their techniques, processes and best practices with the entire team.

Foster Quick-Win Success

Sometimes, finding an improvement area that galvanizes the team is not so easy. The key to positioning talent with the right skills, strengths and behaviors is identifying a uniform objective toward which everyone can work. A team-building exercise called a *quick win* is one such uniform objective.

Quick wins solve problems rapidly to remove chronic frustrations. They are initiatives intended to spark confidence and trust by tackling obstacles that have become institutionalized. The most successful quick wins are those that resolve the problems people have been managing around on a daily basis.

Implement Daily Huddles

Quick-win projects form the connective tissue between management and leadership. Management involves refining the organization's systems and processes to an efficient perfection. A project that satisfies the quick-win criteria will inherently involve system and process improvement. Yet instead of marathon managers implementing the solutions, the employees themselves do the heavy lifting — that's where leadership and management connect.

Leadership and management also connect in the daily huddle, a forum where leaders can change the type of conversation they have with their employees. Every day at a set time, all members of the frontline team, including the frontline leader, congregate in the same location to openly discuss daily Run topics, daily general Run performance objectives, and reactive improvement suggestions and plans.

Daily huddles produce three outcomes:

- Behavior modeling
- Communication in a common language
- Raised bar of excellence

These three outcomes occur in the process of identifying and executing quick-win projects. Huddles should provide more than enough quick-win opportunities as long as frontline leaders (and top performers) ask the right questions and gather the right data. ●

PART II — IMPROVE: LIBERATING LEADERS TO DO THEIR BEST WORK

Transfer the Winning Momentum: Ignite the Spark

Nothing builds team camaraderie more quickly and effectively than winning momentum.

After a successful quick-win project, a leader's challenge is to keep energy in the system so that employees stay engaged, and the new behaviors become unconscious and establish the new baseline performance standards. Now that you've had this success from the quick win, you have a very narrow window of opportunity to make bold changes. If you wait for complete across-the-board buy-in before capitalizing on the quick win, the energy you've created will dissipate. That's because waiting for everyone to be on board with a change is unrealistic. You might as well not do anything.

But you must.

Changing Gears to Lower RPMs

Once one team, department or division is fired up and energized by a quick win, it's time to quickly transfer that momentum. The goal is to drive transformational change across the operation, and that starts by driving it across the entire front line and continues across departments, functions and the entire organization.

In the Run-Improve-Grow system, what drives that change in vision, attitude and momentum is a spark. At the individual level, the spark is engagement and ownership of a new function. On a team level, it is a quick win. On the frontline level, the spark can come from seeing the impact Run-Improve-Grow practices make.

Mutual Accountability, Ownership and Engagement

In the context of Run-Improve-Grow, genuine sparks are produced from interaction between mutual accountability, ownership and engagement of all frontline employees across all Run functions:

• Accountability: having enough confidence in yourself and others that you are willing to be responsible for flawlessly executing functions where you maximize your value to the organization. Accountability is a function of ownership and engagement. Autonomy is a benefit of accountability.

• Ownership: when an individual performs because it is part of his or her DNA. A person who owns a function takes pride in it and persists despite any obstacles. Commitment is the essence of ownership.

• Engagement: when a person's motivation is aligned to a function's purpose. People feel engaged when their individual purpose is connected to a team's purpose. When a function is more than just "work," a person will be engaged when approaching that function.

When those three behavioral elements bond together, powerful energy is released on the front line.

Upgrade Management Systems: A Liberated Manager Emerges

Even as you enjoy the positive effects of the changes happening around the organization — frontline employees taking complete responsibility of the Run and daily reactive improvement and mid-level leaders fueling proactive improvements to support newer, bolder initiatives — you need to think of the scaffolding that supports and reinforces these new behaviors. That scaffolding is an organization's management systems. This is where most improvement efforts collapse. The management systems and processes used prior to Run-Improve-Grow will be insufficient to support enthusiastic, empowered employees. In fact, using the old scaffolding may cause your organization to revert to its old ways.

A good way to visualize the point is by thinking about dieting. Say you lose 25 pounds by exercising with consistent vigor for several months. You run, swim, bike or hike, but you don't change your eating habits. If you stop exercising because you've met your goal, it won't be long before some or all of those 25 pounds come back, and you are right back where you started. Your system of eating is flawed even as you lose weight, so once your temporary exercise system breaks down, there is no backstop to prevent your old behaviors from destroying your progress.

But let's say that the exercise routines that helped you lose 25 pounds spurred you toward a greater goal, such as a marathon or a triathlon. To support such a rigorous goal, you would have to adhere to strict training and eating routines. You would turn your old, less-organized fitness routines into a new, more complete system tailored to your future goal, right? Doing so would make returning to your old lifestyle impossible, even unattractive, as long as you stay committed to your goal and find new purpose in maintaining a healthy lifestyle and being fit.

The process and rationale for continuously improving management systems in our organizations are very similar. After frontline employees come to own the Run, and marathon managers stop running the operations, management systems need to be tailored to align those new behavioral standards. Because Run-Improve-Grow is a model that creates a process for perpetual improvements, your management systems will need to constantly evolve to meet your new behavioral standards and growth goals.

Setting New Priorities

A key part of adapting management systems is redefining priorities and therefore the questions you ask. What should employees be focusing on now that's different from what they focused on before? Our questions say a lot about our priorities. We ask about topics that we believe are important or confusing. The more questions we ask, the more involved we are, and the more those around us can see our increased involvement.

One of the best ways to establish new priorities is by changing the questions you ask. In the Improve phase, employees need to continue to expand their thinking to come up with and act upon creative ideas and solutions. And the best tool for getting employees to think and act more broadly on a daily basis is the question.

Asking Better Questions

The question "How is everything running today?" is a wonderful question for a marathon manager but not suitable for a Run-Improve-Grow organization. That's because the question is phrased to keep everything and everyone laser focused only on the Run and not what the Run means to the organization.

Let's say that, instead of just getting product out the door, an organization's management team wants its frontline leaders to spend more time listening to their people, soliciting improvements, and then taking the initiative to drive the improvement efforts. In that situation, the question "How's everything running?" has to change. Consider these options to drive the intended frontline behaviors:

• What are the two or three improvements your team put in place this week that came out of last week's huddles?

• Which employees did you recognize for the ideas that they brought up last month, and how did they respond to your recognition?

• What changes have you made to get improvements implemented more quickly?

For organizations that strive to raise the bar of excellence, leaders must be committed to asking questions that spark confidence and influence peak performance behaviors. ●

Fuel Proactive Improvements: A Play-to-Win Culture Emerges

With a reliable Run in place, a front line initiating improvements every day as part of their routine work habits, and redesigned management systems, you might assume you should jump right into your new Grow phase without giving another thought to Improve. But first, you need to build on the more concrete aspects of improvement and cast your view toward more forward-thinking measures.

There are two main reasons that drive people to begin using the Run-Improve-Grow system in general and to focus on making reactive improvements in particular:

• Increased complexity in their operations: They either launched a new offering, landed new customers who have higher and more complex requirements, ventured into a new market and/or surged in volume in a short period of time.

• New leadership has higher expectations: Leaders who have experienced higher standards of excellence and performance and are hired or promoted tend to see more problems than their colleagues who, over the years, have simply adapted to the environment.

Optimized Run-Improve-Grow Systems

Optimized Run-Improve-Grow systems combine proactive improvements with reactive improvements. Reactive improvement makes the Run more reliable and predictable, and that keeps daily work simple. Proactive improvement fuels the new Grow initiatives by enabling the team to offer high standards and bolder promises to current and new customers. Both reactive and proactive improvements are vital to the health and relevance of an organization.

Frontline team members must implement reactive improvements to solve the urgent problems brought on by lack of reliability. Quickly meeting these needs creates relief and buy-in among other departments and develops confidence. Once reactive improvements are part of the front line's DNA, so to speak, management can more confidently pursue bold proactive improvements through a deliberate and purposeful process.

The transition to proactive thinking energizes those who have a vision of excellence and encourages them to think creatively about the entire organization without the constraints of reacting to day-to-day problems — and doing so without compromising long-term success for short-term results. And that's what you need for the Grow. The foundation for a successful Grow phase requires you to fuel proactive improvements.

How Do Proactive Improvements Differ from Reactive Improvements?

Before you commit solidly to proactive improvement (PI), you really need to be able to distinguish reactive from proactive improvements. Reactive improvements help ensure consistent performance of current standards by solving immediate problems that are causing inconsistent Run execution. Rarely do organizations not have some form of a reactive improvement process. Most companies refer to that as "continuous improvement."

The goal for you in the Improve phase is to empower the front line to make reactive improvements as they're needed so that non-frontline leaders and their staff can focus primarily on proactive improvements. ●

PART III — GROW: BLAZING A TRAIL FOR GROWTH

Make (Then Keep) Bold Promises: Confidence in Flawless Execution

Once you've got your Run locked into place (R1) and your management systems focused on the Improve (I1), the next step is to move into Grow mode. But how do you spark your organization to that Grow level? What gets you to G1 to begin with?

The spark is making and keeping bold promises. For example, Mike Neary, a builder of luxury log homes in the Pacific Northwest, embraces a philosophy of always saying yes to customer requests. When Walt Disney was planning to build its Fort Wilderness Lodge in Orlando, the company recruited four contractors who would be given a preliminary trial of 10 percent of the overall project. Time and again during discussions, the Disney architects would ask, "Can you do this? Can you do that?" Mike would reply, "Yes, we can do that." At one point, the architects asked, "Can you bend logs?" Neary said, "Sure," even though his team had never bent logs before.

Bending logs is a pretty bold promise. Some might have said it was impossible to keep. Not Neary. Instead of responding reflexively "we can't do that and here's why," Neary's response is more representative of a culture focusing on what it will take to accomplish the most demanding requests. He and his team invented a warehouse-sized steam cabinet for logs. Logs would steam for days, and when they came out, they were like gigantic spaghetti strands that could be shaped into place. Problem solved. Bent logs shipped to Orlando. Promise fulfilled. Neary went on to win the contract to complete the construction of Disney's Wilderness Lodge. Without having said yes to a demanding request — one that many contractors might have deemed impossible — Neary would not have created his next level of competitive advantage and growth.

To launch your organization up to the level of Grow, you need to make and keep bold promises, just like Neary did. So, what's keeping you from doing just that?

Bold Promises Propel the Grow

Bold promises not only matter to the Grow; they propel it. Making and keeping promises is not necessarily transformational. If you promise the expected, the standard or the conventional and then deliver the expected, the standard and the conventional, your organization will not generate any excitement or energy — either internally or externally. Bold promises, however, allow a company to Grow in new and different ways, to develop new capabilities (bent logs) and to perfect its legacy capabilities. ●

Place (and Win) Bold Bets: Fail Fast, Then Go Big

To survive and thrive in business in today's markets, Run-Improve-Grow organizations need to be able to pivot from their internal culture transformation based on execution to an external transformation based on innovation and relevance. Organizations that don't innovate or scale are quickly lapped by those that do. Even organizations that execute perfectly based on aging standards of performance soon find that perfection of an old metric puts them on the fast track to irrelevance.

Relevance and Survival

Growth requires staying relevant to the market — whatever that market is for your organization. If customers don't see your offerings as relevant, you're bound to wither. It might not happen overnight, but when you're not considered relevant, withering will definitely happen over time. So placing big, sure bets matters to your organization's long-term survival and sustainability as well.

Similarly, placing and winning the biggest, surest bets play a role in your organization's financial strength. You have a more focused and deliberate use of resources. Instead of dribbling resources on every seemingly interesting idea or opportunity that comes your way, you have a process for vetting possibilities and investing in the best, most promising ones. It might seem like an oxymoron to suggest you invest in bold, sure things as a way to increase growth and increase your organization's financial strength. Can a sure thing be bold at the same time? It can. Think about iPhones and iPads, Swiffer and Chipotle. Those might be extreme, but they weren't random gambles on fly-by-night ideas. They were calculated bets by Apple, Procter & Gamble and McDonald's on bold opportunities, and each bet increased the financial strength of its organization.

Organizational Health and Purpose

Placing bets on the biggest and surest opportunities is the essence of relevance. Converting those bets into success is the essence of growth and organizational transformation. By that I mean that beyond boosting metrics related to financial strength and market values, making bold, sure bets matters for the health of the overall organization. Engagement, purpose and the culture all benefit from going after bold possibilities and making them a reality.

Bold bets that become bold road maps to new growth stimulate most everyone in the organization, especially top performers. New opportunities create a new medium through which the excitement and confidence of top performers can continue to expand.

Bolder bets and road maps also give your organization an opportunity to align with your existing suppliers — and potentially new and better suppliers — under a common language with common objectives. In essence, incorporating suppliers into the new road map built around bold bets enables your organization to spread your Run-Improve-Grow experience to your supplier organizations. The benefits to your organization are significant. You have lower costs, increased predictability and new opportunities for collaborating on bold initiatives with partners you trust.

The key ingredient in that engagement is purpose. People engage with others, with ideas and with organizations when they find meaning and purpose in them. ●

Scout (Then Place) Talent: Building Your Grow Team

Attracting talent can be less difficult for world-class organizations because they set the industry standard for innovation and boldness. As a result, people and organizations vie for positions in and partnerships with the company.

Remember, when an organization has a reputation for raising the bar of excellence, more people want to be a part of it. To assemble a talent fleet, you've got to up your game, identify what you need, and scout for specific skills and complementary talents.

Up Your Game

Top performers always want to win, so they join the organizations that provide an opportunity for success. Talented individuals like to know that they are going to be a part of greatness; they look for more than just stability and a paycheck.

Professional sports teams of all kinds know the value of talent. Why doesn't business? Whether an organization needs a few key talents or a partnership or acquisition, scouting is critical.

The level and speed of play propels your organization to talent magnet status. Keep in mind that the depth of your organization's talent fleet determines the power with which it can grow.

Identify What You Need

Not all organizations understand exactly what they need in terms of talent. This is particularly true if an organization's leaders don't have a clear vision of growth. Without this vision, it's difficult to know what skills support a new, bold road map. Not knowing undermines confidence in both any investment in scouting talent and the talent's confidence in their ability to be successful. Managers don't look for the next talented individual because they don't currently have a need for his or her expertise or skills. But how are you to know what you need before you need it? By visualizing what you need to get started and finding people to talk to about what it will take. That means being curious and asking questions.

Anticipating a more comprehensive list of future needs requires the ability to imagine both wild success and significant challenges.

Scout for Skills

Leaders should always be scouting for talent so that when the need for a certain skill arises, they can select bold people with that skill. In the Run-Improve-Grow system, scouting is being aware of, listening to and watching out for talented top performers wherever they are. Those performers may — or may not — actively be seeking new opportunities. An essential part of talent scouting is looking for passive candidates as well as active ones. Your most compelling scouting resource should be your organization's new, bold road map. Share it with people; share it with customers; share it with suppliers. As talented people catch wind of your organization's innovative journey, they'll want to be part of it.

As you share your story, ask your network questions specifically related to scouting:

- Who do you know who has picked the proverbial high-hanging fruit?
- We are seeking to innovate and expand in the following areas: __, __ and __. Who would know talented people who have the passion to explore with us?
- We're always looking for outstanding talent to challenge how we are doing business and going to market. Can you help me identify any top performers who would thrive on this challenge?

Potential top performers with initiative add value to Grow teams. They understand current conditions in the marketplace, proactively engage existing and potential customers with solutions, and trigger demand. Very often, top performers will stand out over the masses because they are confident in their problem-solving abilities and have empathy for others.

Talent is the linchpin for transformational growth. No organization can Grow beyond where it is without involving talented people who can help it achieve ever-higher levels of excellence. Your job as a leader is to be constantly scouting talent both inside and outside the organization. ●

THE SUMMARY IN BRIEF

The traditional culture of "fitting in" and "going along" spells doom in the knowledge economy. Success requires a continuous influx of new ideas, new challenges and critical thought.

The Fearless Organization offers practical guidance for teams and organizations who are serious about success in the modern economy. Author Amy C. Edmondson explores the culture of psychological safety and provides a blueprint for bringing it to life. People must be allowed to voice half-finished thoughts, ask questions from left field and brainstorm out loud. This creates a culture in which a minor flub is no big deal, where actual mistakes are owned and corrected, and where the next left-field idea could be the next big thing. Informative scenario-based explanations provide a clear path forward to constant learning and healthy innovation.

Shed the "yes-men" approach and step into real performance. Fertilize creativity, clarify goals, achieve accountability, redefine leadership and much more. ***The Fearless Organization*** helps you bring about this most critical transformation.

IN THIS SUMMARY, YOU WILL LEARN:

- The connection between psychological safety and high performance.
- To nurture a culture where it's safe to express ideas, ask questions and admit mistakes.
- To use a tool kit that helps to establish psychological safety in teams and organizations.
- Compelling, real-life stories of organizations that got it right — and those that learned the hard way.

PART I: THE POWER OF PSYCHOLOGICAL SAFETY

The Underpinning

The tiny newborn twins seemed healthy enough, but their early arrival at only 27 weeks' gestation meant they were considered "high risk."

Fortunately, the medical team at the busy urban hospital where the babies were delivered included staff from the neonatal intensive care unit: a young neonatal nurse practitioner named Christina Price and a silver-haired neonatologist named Dr. Drake.

As Christina looked at the babies, she was concerned. Her recent training had included administering a medicine that promoted lung development as soon as possible for a high-risk baby. But the neonatologist had not issued an order for the medicine, called a prophylactic surfactant.

Christina stepped forward to remind Dr. Drake about the surfactant and then caught herself. Last week she'd overheard him publicly berate another nurse for questioning one of his orders. She told herself that the twins would probably be fine — after all, the doctor probably had a reason for avoiding the surfactant. Besides, he'd already turned on his heel, off for his morning rounds, white coat billowing.

Like most people, Christina was spontaneously managing her image at work. As noted sociologist Erving Goffman argued in his seminal 1957 book, ***The Presentation of the Self in Everyday Life,*** as humans, we are constantly attempting to influence others' perceptions of us by regulating and controlling information in social interactions. We do this both consciously and subconsciously.

In one study investigating employee experiences with speaking up, 85% of respondents reported at least one occasion when they felt unable to raise a concern with their bosses, even though they believed the issue was important.

The problem with sitting on our hands and staying within the lines rather than speaking up is that although these behaviors keep us personally safe, they can make us underperform and become dissatisfied. They can also put the organization at risk. In the case of Christina and the newborns, no immediate damage was done, but the fear of speaking up can lead to accidents that were in fact avoidable.

Airplanes have crashed, financial institutions have fallen and hospital patients have died unnecessarily because individuals were, for reasons having to do with the climate in which they worked, afraid to speak up. Fortunately, it doesn't have to happen.

Psychological Safety

Most of us have been exposed to, and internalized, the figure of a villainous boss who rules by fear. Worse, many managers still believe in the power of fear to motivate. They assume that people who are afraid (of management or of the consequences of underperforming) will work hard to avoid unpleasant consequences, and good things will happen. But for jobs where learning or collaboration is required for success, fear is not an effective motivator.

Research in neuroscience shows that fear consumes physiologic resources, diverting them from parts of the brain that manage working memory and process new information. This impairs analytic thinking, creative insight and problem solving. This is why it's hard for people to do their best work when they are afraid. As a result, how psychologically safe a person feels strongly shapes the propensity to engage in learning behaviors, such as information sharing, asking for help or experimenting.

Psychological safety is the belief that the work environment is safe for interpersonal risk taking. The concept refers to the experience of feeling able to speak up with relevant ideas, questions or concerns. Psychological safety is present when colleagues trust and respect each other and feel able — even obligated — to be candid.

In psychologically safe environments, people believe that if they make a mistake or ask for help, others will not react badly. Instead, candor is both allowed and expected.

The Paper Trail

In today's organizations, psychological safety is not a "nice to have." It's not an employee perk, like free lunch or game rooms, that you might care about so as to make people happy at work. Psychological safety is ***essential*** to unleashing talent and creating value.

In any company confronting conditions that might be characterized as volatility, uncertainty, complexity and ambiguity (VUCA), psychological safety is directly tied to the bottom line. This is because employee observations, questions, ideas and concerns can provide vital information about what's going on — in the market and in the organization.

Add to that today's growing emphasis on diversity, inclusion

. . . even the extremely smart, high-powered employees at Google needed a psychologically safe work environment to contribute the talents they had to offer.

and belonging at work, and it becomes clear that psychological safety is a vital leadership responsibility. It can make or break an employee's ability to contribute, to grow and learn, and to collaborate.

Over the past 20 years, scholars, consultants and company insiders have published dozens of rigorous studies showing effects of psychological safety in a variety of industry settings. Here are some of the highlights, with groups of studies divided into five categories.

1. An epidemic of silence. Collecting and analyzing data from interviews with employed adults, studies have investigated when and why people feel unable to speak up in the workplace. This work shows, first and foremost, that people often hold back even when they believe that what they have to say could be important for the organization, for the customer or for themselves.

In one early study of workplace silence, the two most frequently mentioned reasons for remaining silent were fear of being viewed or labeled negatively and fear of damaging work relationships. As later research demonstrated more systematically, people at work are not only failing to speak up with potentially threatening or embarrassing content, they are also withholding ideas for improvement.

2. A work environment that supports learning. A growing number of studies find that psychological safety can exist at work and, when it does, that people do in fact speak up, offer ideas, report errors and exhibit a great deal more that can be categorized as "learning behavior." For example, in a study of nurses in four Belgian hospitals, a team of researchers led by Hannes Leroy explored how head nurses encouraged other nurses to report errors, while also enforcing high standards for safety. They found that psychologically safe teams made fewer errors and spoke up about them more often.

3. Why psychological safety matters for performance. With routine, predictable, modular work on the decline, more and more of the tasks that people do require judgment, coping with uncertainty, suggesting new ideas, and coordinating and communicating with others. This means that voice is mission critical. And so, for anything but the most independent or routine work, psychological safety is intimately tied to freeing people up to pursue excellence.

A multi-year study of teams at Google, code-named Project Aristotle, found that psychological safety was the critical factor explaining why some teams outperformed others, as reported in a detailed feature article by Charles Duhigg in the ***New York Times*** Magazine in 2016. They discovered that even the extremely smart, high-powered employees at Google needed a psychologically safe work environment to contribute the talents they had to offer.

4. Psychologically safe employees are engaged employees. A study in a Midwestern insurance company found that psychological safety predicted worker engagement. In turn, psychological safety was fostered by supportive relationships with co-workers. Another study looked at the relationship between employee trust in top management and employee engagement. With survey data from 170 research scientists working in six Irish research centers, the authors showed that trust in top management led to psychological safety, which in turn promoted work engagement.

5. Psychological safety as the extra ingredient. In these studies, psychological safety has been found to help teams overcome the challenges of geographic dispersion, put conflict to good use and leverage diversity. For example, an ambitious study of 14 innovation teams with members dispersed across 18 nations showed that with psychological safety, team members felt less anxious about what others might think of them and were better able to communicate openly.

PART II: PSYCHOLOGICAL SAFETY AT WORK

Avoidable Failure

In May 2015, the Volkswagen Group had every reason to feel proud. It had sold over 10 million vehicles the previous year, thereby laying claim to the title of world's largest auto maker. One of the largest employers in Germany, the com-

pany was credited with helping the country recover from the global financial crisis of 2008.

Ironically, as it would turn out, its Jetta TDI Clean Diesel won the Green Car of the Year at the 2008 Los Angeles Auto Show. A firm with a 78-year history in Germany, made famous by the iconic Beetle of the 1960s, and with a pristine reputation for engineering prowess, Volkswagen's star shone bright enough to be blinding.

As the saying goes, pride cometh before the fall. Merely months later, Volkswagen, the world's largest automotive company, was facing unimaginable scandal. The clean diesel engines that had anchored its impressive U.S. sales were discovered to have been — essentially — a hoax.

In the following years, prosecutors in the United States and Germany would identify more than 40 people, "spread out across at least four cities and working for three VW brands," involved in an elaborate scheme to defraud government regulators. "Dieselgate," as the scandal was dubbed, referred to VW's deceptiveness in complying with the regulations required by the U.S. Environmental Protection Agency to sell automobiles in the United States.

Unreachable Goal, Culture of Fear

How could this have happened? CEO Martin Winterkorn had taken the helm in 2007, and he'd set a goal that was both precise and ambitious: to triple the company's U.S. sales within 10 years, thereby surpassing rivals Toyota and General Motors to become the world's largest automobile maker. The company's so-called clean diesel vehicles, touted for their high performance and excellent fuel economy, were essential to this strategy. There was only one problem: Diesels produced more nitrous oxide than gasoline engines and would not pass the United States environmental regulations.

Somewhere in the millions of lines of software code the engineers wrote for what became the "clean diesel" vehicles, they embedded instructions that would enable the cars to pass the strict U.S. emissions tests. Soon enough, the "defeat device," as the instructions were called, came to light. For the next two years, the U.S. environmental agencies presented their findings; VW denied, covered up and finally confessed.

How could this failure have been avoided? Martin Winterkorn is certainly a good candidate to be cast as the villain. He had a reputation as an arrogant, perfectionistic martinet with an obsessive attention to detail. But Winterkorn's leadership was not born in a vacuum.

The root cause of VW's Dieselgate scandal in 2015 cannot be located in the personality or leadership of any single person or small group. Perhaps one could say the failure was caused by holding fast to an outdated belief about what motivates workers.

Perhaps most stunning about the VW emissions debacle is that it's by no means a singular event. The same script — unreachable target goals, a command-and-control hierarchy that motivates by fear, and people afraid to lose their jobs if they fail — has been repeated again and again.

Volkswagen, and other organizations that have experienced such crises, boasted deep reservoirs of expertise, driven, intelligent leaders and clearly articulated goals. They didn't lack capable employees in any of the relevant fields required for the organization to succeed in its industry. In short, they had talent. What they lacked was the leadership needed to ensure that a climate of psychological safety permeated the workplace, allowing people to speak truth to power inside the company.

Dangerous Silence

More than just business failure is at stake when psychological safety is low. In many workplaces, people see something physically unsafe or wrong and fear reporting it. This reticence unfortunately can lead to widespread frustration, anxiety, depression and even physical harm.

On February 1, 2003, NASA's Space Shuttle Columbia experienced a catastrophic re-entry into the Earth's atmosphere. All seven astronauts perished. Although space travel is obviously risky and fatal accidents seem part of the territory, this particular accident did not come "out of the blue."

Two weeks earlier, a NASA engineer named Rodney Rocha had watched launch-day video footage, a day after what had seemed to be a picture-perfect launch on a sunny Florida morning. But something seemed amiss. Rocha played the tape over and over. He thought a chunk of insulating foam might have fallen off the shuttle's external tank and struck the left wing of the craft.

To resolve the ambiguity, Rocha wanted to get satellite photos of the Shuttle's wing. But this would require NASA higher ups to ask the Department of Defense for help.

Rocha emailed his boss to see if he could get help authorizing a request for satellite images. His boss thought it unnecessary and said so. Working with an ad hoc team of engineers

to assess the damage, he was unable to resolve his concern about possible damage without obtaining images. A week later, when the foam strike possibility was briefly discussed by senior managers in the formal mission management team meeting, Rocha, sitting on the periphery, observed silently.

A formal investigation by experts would later conclude that a large hole in the shuttle wing occurred when a briefcase-sized piece of foam hit the leading edge of the wing, causing the accident. They also identified two, albeit difficult and highly uncertain, rescue options that might have prevented the tragic deaths. Reporting on the investigation, ABC News anchor Charlie Gibson asked Rocha why he hadn't spoken up in the meeting. The engineer replied, "I just couldn't do it. I'm too low down [in the organization]…"

> Having something to say yet feeling literally unable to do so is painfully real for many employees.

The psychological experience of having something to say yet feeling literally unable to do so is painfully real for many employees and very common in organizational hierarchies, like that of NASA in 2003.

Many who analyze events leading up to tragic accidents such as this cannot help pointing out that people should demonstrate a bit more backbone. Courage.

Exhorting people to speak up because it's the right thing to do relies on an ethical argument but is not a strategy for ensuring good outcomes. Insisting on acts of courage puts the onus on individuals without creating the conditions where the expectation is likely to be met. For speaking up to become routine, psychological safety — and expectations about speaking up — must become institutionalized and systematized.

The Fearless Workplace

A growing number of organizations are making the fearless workplace an aspiration. Leaders of these organizations recognize that psychological safety is mission critical when knowledge is a crucial source of value.

When people speak up, ask questions, debate vigorously, and commit themselves to continuous learning and improvement, good things happen. Workplaces where employees know that their input is valued create new possibilities for authentic engagement and stellar performance.

Making Candor Real

If you were over the age of three in 1995, chances are you were aware — or would soon become aware — of a movie called ***Toy Story***, the first computer animated feature film released by a company named Pixar. That year, ***Toy Story*** would become the highest grossing film and Pixar the largest initial public offering. The rest, as they say, is history.

Pixar Animation Studios has since produced 19 feature films, all of which have been commercial and critical triumphs. This is a remarkable statement in an industry where hits are prized but rare, and a series of hits without fail from a single company is all but unheard of.

How do they do it? Through leadership that creates the conditions where both creativity and criticism can flourish. Pixar co-founder Ed Catmull credits the studio's success, in part, to candor.

Catmull encourages candor by looking for ways to institutionalize it in the organization — most notably in what Pixar calls its "Braintrust." A small group that meets every few months or so to assess a movie in process, provide candid feedback to the director and help solve creative problems, the Braintrust was launched in 1999, when Pixar was rushing to save ***Toy Story 2***, which had gone off the rails.

The Braintrust's recipe is fairly simple: A group of directors and storytellers watches an early run of the movie together, eats lunch together and then provides feedback to the director about what they think worked and what did not. But the recipe's key ingredient is candor. And candor, though simple, is never easy.

As Catmull candidly admits, "… early on, all of our movies suck." In other words, it would have been easy to make ***Toy Story*** a movie about the secret life of toys that was sappy and boring. But the creative process, innately iterative, relies on feedback that is truly honest.

Pixar's Braintrust has rules. First, feedback must be constructive — and about the project, not the person. Similarly,

the filmmaker cannot be defensive or take criticism personally and must be ready to hear the truth. Second, the comments are suggestions, not prescriptions. There are no mandates, top-down or otherwise; the director is ultimately the one responsible for the movie and can take or leave solutions offered. Third, candid feedback is not a "gotcha" but must come from a place of empathy.

Braintrusts — groups of people with a shared agenda who offer candid feedback to their peers — are subject to individual personalities and chemistries. In other words, they can easily go off the rails if the process isn't well led. To be effective, managers have to monitor dynamics continually over time. It helps enormously if people respect each other's expertise and trust each other's opinions.

Safe and Sound

Speaking up is easier said than done. There's no switch to flip that will instantaneously turn an organization accustomed to silence and fear into one where people speak candidly. Instead, creating a psychologically safe workplace requires a lot of effort to alter systems, structures and processes. Ultimately, it means that deep-seated, entrenched organizational norms and attitudes must change.

And it begins with what can be called "stage setting." Let's look at how Anglo American, one of the world's largest mines, headquartered in South Africa, prepared for and then institutionalized speaking up.

When Cynthia Carroll was appointed in 2007, with much fanfare, as the first female CEO of an international mining company, she was appalled by the number of worker fatalities occurring in the company — nearly 200 in the five years prior to her arrival.

Realizing that she was "in an unprecedented position to influence change" as both an American/outsider in a foreign country and as a woman where "until very recently women hadn't been allowed to visit underground at mines in South Africa, let alone work there," she immediately used her position to speak up and demand a policy of zero fatalities or serious injuries.

At first, others in the company, especially members of the old guard who saw themselves as upholding tradition, refused to take Carroll seriously. Serious injuries and deaths were considered an inevitable hazard, part of mining's dangerous physical demands.

An Unprecedented Move

Carroll's response to the resistance could not have been more unambiguous. She shut down one of the most problematic and dangerous mines. Even more shocking, Carroll insisted that before the mine could restart, she wanted to find out what the workers were thinking, and she intended to get input from every single worker about how to improve safety. This, she knew, was a direct challenge to Anglo American's strict hierarchical culture and rigid, top-down management style, which had begun with the mine's founding in 1917 and was further strengthened by South Africa's apartheid history.

Here's where things get interesting. Psychological safety had to be created in the mines by finding a culturally appropriate approach. With help from the unions, Anglo American leadership adopted a traditional South African method of conducting village assemblies, called "lekgotla."

Traditionally, in these assemblies, everyone sits in a circle and has a chance to speak without being interrupted or criticized; conversation continues for as long as it takes to reach consensus on whatever issue is at stake. During Anglo American's "lekgotla," senior managers reframed the initial question. Instead of asking workers to give their opinions directly about safety issues, they asked, "What do we need to do to create a work environment of care and respect?" That was when workers started to feel safe enough to speak up about specific concerns.

The dialogue continued until each group had developed a contract stating what specific actions were needed to maximize safety. In a powerful symbolic gesture of shared commitment, workers and Anglo American executives both signed the contract.

PART III: CREATING A FEARLESS ORGANIZATION

Making It Happen

Let's talk about specific ways leaders can build psychological safety in their organizations. The process involves a tool kit with three main strategies: setting the stage, inviting participation and responding productively. With some practice and reflection, this tool kit is available to any leader wishing to create psychological safety.

How to Set the Stage for Psychological Safety

Whenever you are trying to get people on the same page, with common goals and a shared appreciation for what

> Whenever you are trying to get people on the same page, with common goals and a shared appreciation for what they're up against, you're setting the stage for psychological safety.

they're up against, you're setting the stage for psychological safety. The most important skill to master is that of framing the work.

Framing the work includes reframing failure and clarifying the need for voice.

Reframing failure starts with understanding a basic typology of failure types. Failure archetypes include preventable failures (never good news), complex failures (still not good news) and intelligent failures (not fun, but must be considered good news because of the value they bring).

Preventable failures are deviations from recommended procedures that produce bad outcomes. If someone fails to don safety glasses in a factory and suffers an eye injury, this is a preventable failure.

Complex failures occur in familiar contexts when a confluence of factors come together in a way that may never have occurred before; consider the severe flooding of the Wall Street subway station in New York City during Superstorm Sandy in 2012. With vigilance, complex failures can sometimes, but not always, be avoided. Neither preventable nor complex failures are worthy of celebration.

In contrast, intelligent failures, as the term implies, must be celebrated so as to encourage more of them. They are the result of a thoughtful foray into new territory.

Clarifying the need for voice. Framing the work also involves calling attention to other ways, beyond failure's prevalence, in which tasks and environments differ. Three especially important dimensions are uncertainty, interdependence and what's at stake.

Emphasizing uncertainty reminds people that they need to be curious and alert to pick up early indicators of change in, say, customer preferences in a new market, a patient's reaction to a drug, or new technologies on the horizon.

Emphasizing interdependence lets people know that they're responsible for understanding how their tasks interact with other people's tasks.

Finally, clarifying the stakes is important whether the stakes are high or low. Reminding people that human life is on the line — say, in a hospital, a mine or at NASA — helps put interpersonal risk in perspective. People are more likely to speak up — thereby overcoming the inherent asymmetry of voice and silence — if leaders frame its importance.

How to Invite Participation So People Respond

The second essential activity in the leaders' tool kit is inviting participation in a way that people find compelling and genuine. The goal is to lower what is usually a too-high bar for what's considered appropriate participation. The invitation to participate must be crystal clear if people are going to choose to engage rather than to play it safe. Two essential behaviors that signal an invitation is genuine are adopting a mindset of situational humility and engaging in proactive inquiry.

Situational humility. The bottom line is that no one wants to take the interpersonal risk of imposing ideas when the boss appears to think he or she knows everything. A learning mindset, which blends humility and curiosity, mitigates this risk. A learning mindset recognizes that there is always more to learn.

Keep in mind that confidence and humility are not opposites. Confidence in one's abilities and knowledge, when warranted, is far preferable to false modesty. But humility is not modesty, false or otherwise. Humility is the simple recognition that you don't have all the answers, and you certainly don't have a crystal ball.

Proactive inquiry. The second tool for inviting participation is inquiry. Inquiry is purposeful probing to learn more about an issue, situation or person. The foundational skill lies in cultivating genuine interest in others' responses.

Genuine questions convey respect for the other person — a vital aspect of psychological safety. Contrary to what many may believe, asking questions tends to make the leader seem not weak but thoughtful and wise.

How to Respond Productively to Voice –– No Matter Its Quality

To reinforce a climate of psychological safety, it's imperative

that leaders — at all levels — respond productively to the risks people take. Productive responses are characterized by three elements: expressions of appreciation, destigmatizing failure and sanctioning clear violations.

Express appreciation. Imagine if Christina, the NICU nurse discussed at the beginning of this summary, had spoken up to Dr. Drake. Her quiet fear was that he would have berated or belittled her. But what if he had said, "Thank you so much for bringing that up"? Her feeling of psychological safety would have gone up a notch.

This is an example of an appreciative response. It does not matter whether the doctor believes the nurse's suggestion or question is good or bad. Either way, his initial response must be one of appreciation. Then he can educate — that is, give feedback or explain clinical subtleties. But to ensure that staff keeps speaking up so as to keep patients safe from unexpected lapses in attention or judgment, the courage it takes to speak up must receive the mini-reward of thanks.

Destigmatize failure. Leaders who respond to all failures in the same way will not create a healthy environment for learning. When a failure occurs because someone violated a rule or value that matters in the organization, this is very different than when a thoughtful hypothesis in the lab turns out to be wrong.

A productive response to intelligent failure can mean actually celebrating the news. Some years ago, the chief scientific officer at Eli Lilly introduced "failure parties" to honor intelligent, high-quality scientific experiments that failed to achieve the desired results.

Sanction clear violations. Firing can sometimes be an appropriate and productive response — to a blameworthy act. But won't this kill the psychological safety? No. Most people are thoughtful enough to recognize (and appreciate) that when people violate rules or repeatedly take risky shortcuts, they are putting themselves, their colleagues and their organization at risk. In short, psychological safety is reinforced rather than harmed by fair, thoughtful responses to potentially dangerous, harmful or sloppy behavior.

Leadership is a vital force in making it possible for people and organizations to overcome the inherent barriers to voice and engagement. We must be realistic about the fact that "driving fear out" of any organization, as W. Edwards Deming (the father of total quality management who helped transform manufacturing practices around the world) put it, will be a journey.

We don't have a magic wand to make psychological safety happen overnight, but by committing to the aspiration to build it, one conversation at a time, leaders take the first step of a perpetual journey toward building and nurturing organizations that can innovate and thrive in the knowledge economy.

Co-Creating Unique Value With Customers

THE FUTURE OF COMPETITION

THE SUMMARY IN BRIEF

In a world of infinite choice, instant gratification, and unbounded opportunities for innovation, why, ask University of Michigan Business School professors C.K. Prahalad and Venkat Ramaswamy, are companies still unable to satisfy customers or sustain growth and profitability?

The answer lies in the evolving role of the customer — from passive recipient to active co-creator — in the value creation process. No longer do customers receive value through the purchase of products and services alone. Instead, individual customers are interacting with a network of firms and consumer communities in order to satisfy their unique preferences — and the value they obtain comes from the sum total of those personal experiences.

To compete in this developing marketplace, companies must fundamentally alter their value creation infrastructures. They make information and operations transparent and accessible to all collaborators, and transform their interactions with customers from transactions to meaningful dialogues. For their part, customers must be able to understand and assess all the risks, as well as the rewards, of the choices they make.

Exploring the issues that will shape strategy for years to come, the authors reveal what organizations must do to co-create value in the future.

What You'll Learn In This Summary

The consumer and the firm are intimately involved in jointly creating value that is unique to the individual consumer and sustainable to the firm. This summary's purpose is to help your company:

✓ Break out of its old entrenched ways and discover new methods for creating strategic capital.

✓ To recognize the limitations of what it knows — its *zones of comfort* — and identify and occupy new *zones of opportunity*.

✓ To understand how today's industrial system is morphing and evolving and how it will change the way it will compete in the future.

✓ To understand the new value paradigm, in which the firm and the consumer co-create value at points of interaction and can no longer act unilaterally.

The Future of Competition

In 1999 and again in 2000, one of us taught an M.B.A. course called "Emerging Issues in Strategy." Its basic premise was straightforward: The old, established corporations (let's call them "A-type" firms) would not disappear. The new, energetic dot-coms ("B-type" firms) would not necessarily survive. A new class of firms ("C-type") would emerge, signifying a morphing and evolving of both the A-type incumbents and B-type startups.

In the conventional realm of A-type and B-type firms, almost all of the work has centered on the firm. But, what if the individual consumer (whether in an enterprise or a household) were at the center, and not the firm? What if we spoke of "consumer-to-business-to-consumer" (C2B2C) patterns of economic activity?

We challenge the traditional notion of value and its creation, namely that firms create and exchange value with consumers. We believe that, increasingly, the joint efforts of the consumer and the firm — the firm's extended network and consumer communities together — are co-creating value through personalized experiences that are unique to each individual consumer.

The Changing Role of the Consumer

The emerging reality is forcing us to reexamine the traditional system of company-centric value creation that has served us so well over the past hundred years. We now need a new frame of reference for value creation. The answer, we believe, lies in a different premise centered on co-creation of value. It begins with the changing role of the consumer in the industrial system — from isolated to connected, from unaware to informed, from passive to active. The impact of this new consumer role is manifest in many ways:

Information Access: With access to unprecedented amounts of information, knowledgeable consumers can make more informed decisions.

Global View: Consumers can also access information on firms, products, technologies, performance, prices and consumer actions and reactions from around the world.

Networking: "Thematic consumer communities," in which individuals share ideas and feelings without regard for geographic or social barriers, are revolutionizing emerging markets and transforming established ones. The power of consumer communities comes from their independence from the firm. Thus, consumer networking inverts the traditional top-down patterns of marketing communications.

Experimentation: Consumers can also use the Internet to experiment with and develop products, especially digital ones.

Activism: As people learn, they can better discriminate when making choices; as they network, they embolden each other to act and speak out.

What is the net result of the changing role of consumers? Companies can no longer act autonomously, designing products, developing production processes, crafting marketing messages, and controlling sales channels with little or no interference from consumers. The use of interaction as a basis for co-creation is at the crux of our emerging reality.

The Emerging Reality of Value Creation

Let us examine the changing dynamics of interaction between a consumer and the firms that participate in the wellness space. Twenty years ago, doctors thought they knew how to treat me, and since I wasn't a physician myself, I probably agreed. Similarly, most businesses figured they knew how to create customer value — and most customers agreed.

The Future of Competition

(continued from page 2)

Now the health care process is far more complex. I can investigate alternative treatments for my condition and develop an opinion about what might and might not work for me. Ultimately, I can cut my own path through the wellness space, thereby constructing a personal wellness portfolio. As a health care consumer, I can more actively determine the "value bundle" that is appropriate for me, cutting across customary industry boundaries.

Let's move beyond doctors and patients. What if consumers inappropriately use or modify your products and then hold you responsible for any resulting damage? Increasingly, consumers seem to want power without accountability. They want to choose for themselves but not be liable for the consequences of their choices. But no matter how the future unfolds in terms of the roles, rights and responsibilities of companies and consumers, companies *will* have to engage consumers in co-creation of value.

Thus, when we amplify the weak signals reverberating in the wellness space and scrutinize consumer-company interactions, we glimpse the emerging reality of the active involvement of consumers, whether as thematic communities or as informed individuals. This fundamentally challenges two deeply embedded, traditional business assumptions: (1) that any given company or industry can create value unilaterally; and (2) that value resides exclusively in the company's or industry's products and services.

Co-Creation of Value

The new value creation space is a competitive space centered on personalized co-creation experiences developed through purposeful interactions between the consumer and a network of companies and consumer communities. In this space, value lies in the co-creation experience of a specific consumer, at a specific point in time, in a specific location, in the context of a specific event.

In the conventional value creation process, companies and consumers had distinct roles of production and consumption. Products and services contained value, and markets exchanged this value, from the producer to the consumer. Value creation occurred outside the markets. But as we move toward co-creation, this distinction disappears. Increasingly, consumers engage in the processes of both defining and creating value. The co-creation experience of the consumer becomes the basis of value.

In the emerging reality, the patterns of interaction between the consumer and the firm will shape the value creation process, challenging existing ways of doing business and creating value. Simultaneously, they create tremendous new opportunities. The future of competition lies in an altogether new approach to value creation, based on an individual-centered co-creation of value between consumers and companies. To see this future, we must escape the past. ■

The 21st-Century Paradox

Our industrial system is generating more goods and services than at any point in history, delivered through an ever-growing number of channels. Supermarkets, boutiques, online retailers and discount stores proliferate, offering thousands of distinct products and services. The burgeoning complexity of offerings, as well as the associated risks and rewards, confounds and frustrates most time-starved consumers. Product variety has not necessarily resulted in better consumer experiences. For managers, the situation is no better. Thus, the paradox of the 21st-century economy: Consumers have more choices that yield less satisfaction; managers have more strategic options that yield less value.

Escaping the Past

Traditional business thinking starts with the premise that the firm creates value. Employees focus on the quality of the firm's products and processes, potentially enhanced through internal disciplines, such as Six Sigma and Total Quality Management. Innovation involves technology, products and processes. Matching supply and demand has long been the bedrock of the value creation process.

The co-creation experience depends highly on individuals. Each person's uniqueness affects the co-creation process as well as the co-creation experience. A firm cannot create anything of value without the engagement of individuals. Co-creation supplants the exchange process.

A New Frame of Reference For Value Creation

If the new starting premise is that the consumer and the firm co-create value and the co-creation experience is the very basis of value, managers must attend to the quality of co-creation experiences, not just to the quality of the firm's products and processes. Quality depends on the infrastructure for interaction between companies and consumers, oriented around the capacity to create a variety of experiences. Eventually, the roles of the company and the consumer converge toward a unique co-creation experience, or an "experience of one."

(continued on page 4)

A New Frame of Reference For Value Creation

(continued from page 3)

Notice what co-creation is not. It is neither the transfer nor outsourcing of activities to customers nor a marginal customization of products and services. Nor is it a scripting or staging of customer events around the firm's various offerings. The change we are describing is far more fundamental. It involves the co-creation of value through personalized interactions that are meaningful and sensitive to a specific consumer. The co-creation experience, not the offering, is the basis of unique value for each individual. The market begins to resemble a forum organized around individuals and their co-creation experiences rather than around passive pockets of demand for the firm's offerings.

In the emergent economy, competition will center on personalized co-creation experiences, resulting in value that is truly unique to each individual.

DART — The Building Blocks of Co-Creation

The four building blocks of co-creation are dialogue, access, risk assessment, and transparency.

- *Dialogue* encourages not just knowledge sharing but even more important, qualitatively new levels of understanding between companies and consumers. It also allows consumers to interject their views of value into the value creation process.
- *Access* challenges the notion that consumers can experience value only through ownership. By focusing on access to experiences at multiple points of interaction, as opposed to simply ownership of products, companies can broaden their business opportunities.
- *Risk assessment* assumes that if consumers become co-creators of value with companies, then they will demand more information about potential risks of goods and services — but they may also bear more responsibility for dealing with those risks.
- *Transparency* of information is necessary to create trust between institutions and individuals. Companies have traditionally benefited from an information advantage in the marketplace, but that asymmetry between the firm and the consumer is rapidly disappearing.

Creating New Capabilities With DART

Combining the building blocks of transparency, risk assessment, access and dialogue enables companies to better engage customers as collaborators. Transparency facilitates collaborative dialogue with consumers. Constant experimentation, coupled with access and risk assessment on both sides, can lead to new business models and functionalities designed to enable compelling co-creation experiences. Even conventional companies, such as Sony, now engage in collaborative dialogues with consumers, who helped co-develop Sony's PlayStation 2. From Intel to Microsoft to Nokia, companies are enlisting consumers in the shaping of new technologies that range from Web-enabled devices and networking software to cellular phones. Consumers contribute to the debate, both technically and in terms of their expectations and views of value. In doing so, they are co-shaping the future. When companies combine the four building blocks in different ways, they create new and important capabilities.

Beware the Zones of Comfort

Most managers are reluctant to let go of familiar practices and tools — their zones of comfort. The result is an emerging tension between the traditional "company think" and the emerging "consumer think."

Like all humans, business managers are socialized into a dominant logic — that is, they are shaped by the attitudes, behaviors and assumptions they learn in their business environments. Unfortunately, most managers seem to forget that they are also consumers. Their thinking is conditioned by managerial routines, systems, processes, budgets and incentives created under the traditional framework of value creation. They focus on technology road maps, plant scheduling, product quality, cost reduction, cycle time, and efficiency. Unsurprisingly, opportunities for interaction with consumers are approached in a similar fashion.

Simply understanding the framework of co-creation does not suffice in the effort to escape our zones of comfort. We must explicitly recognize how deeply etched ways of thinking limit our ability to shift into co-creation mode.

Most managers implicitly assume that their physical product — the digital camera, for example — is the vessel of value. They rarely consider the aspirations, frustrations and wishes of the heterogeneous group of consumers who experience their product or service. Instead, they focus on the efficiency of production and logistical systems or on advanced technology for its own sake. Misled by company think, they clutter the marketplace with products that are feature rich but experience poor. Meanwhile for the consumer, "technology convergence" can often create "experience divergence."

The disconnect between consumer think and company think is not new. However, as we move toward co-creation, this disconnect becomes more pronounced at *points of interaction*, those intersections where choice is exercised and the consumer interacts with the firm to create an experience.

A New Frame of Reference For Value Creation

(continued from page 4)

Dimensions of Choice

Dialogue, access, risk assessment and transparency — DART — form the foundation for co-creation of value, but these factors alone may not produce compelling experiences in co-creation. We also must pay close attention to the *dimensions of choice* in consumer-company interaction. These condition the co-creation experience. We have identified four such dimensions:

- Consumers want the freedom of choice to interact with the firm through a range of experience gateways. Therefore, the firm must focus on the co-creation experience across *multiple channels*.
- Consumers want to define choices in a manner that reflects their view of value. Therefore, the firm must provide experience-centric *options* that reflect consumer desires.
- Consumers want to interact and transact in their preferred language and style. They want quick, easy, convenient and safe access to experiences. Therefore, in consummating individual choices, the firm must focus on the co-creation experience through *transactions*.
- Consumers want to associate choice with the experiences they are willing to pay for. They want the price of these experiences to be fair. Therefore, the firm must focus on the totality of the *price-experience relationship* in the co-creation.

The Price-Experience Relationship in Co-Creation

The over-arching dimension of choice in co-creation experiences is the price-experience relationship. This is the critical intersection of price and the co-creation experience, where consumers judge economic value.

Witness how Federal Express enhanced the price-experience relationship. Its customers, both shippers and receivers, can log on and check the progress of packages in real time, viewing the same information that FedEx employees have. While this system has reduced the burden on FedEx call centers and trimmed costs, it simultaneously allows for an individual-centric view of interactions. Just knowing a package's whereabouts can reduce customer anxiety. The transparency of the system gives individuals choices otherwise unavailable and thereby enhances the co-creation experience and the totality of the price-experience relationship.

Businesses have typically associated price with cost and often set prices based on the company's cost structure. This traditional methodology is becoming increasingly problematic, because it has little meaning to the consumer. The experience associated with a product or service, and therefore its associated value, varies from one consumer to another. A gadget-loving techie may buy a digital camera just to experiment with new technology. A parent may buy it to capture her child's first steps, a different experience. A small business owner may buy it to record images of inventory for insurance coverage, still another experience. The cost of producing the cameras may be the same, but each camera's value varies from consumer to consumer.

When determining a consumer's "willingness to pay," managers conventionally focus on what they can offer customers in isolation from the experiences they desire. A pricing system that recognizes the existence of experience-based value begins to reflect the nature and quality of heterogeneous consumer experiences. ■

The Call Center Opportunity

The ubiquitous call center is an excellent example of "company think" vs. "consumer think." The company call center represents a unique opportunity for interacting with the consumer. A well-run call center can transform a consumer's experience from negative to positive, not only by solving problems and answering questions but by offering entirely new ways to enjoy the product or service. Yet most firms squander the opportunity by establishing automated call centers, manned by inexperienced, narrowly focused operators whose productivity is measured in terms of calls handled per hour — not the quality of the consumer experience. The managers who develop these systems mean well. They are simply applying the customary management techniques. But most consumer experiences with call centers are unpleasant, irritating — and potentially disastrous.

For Additional Information on how the brokerage industry has been transformed by co-creation across multiple channels, go to: http://my.summary.com

The Experience Environment

We need a generalizable view of the co-creation process that can accommodate large numbers of consumers of varying interests, skill levels, needs and desires. To accomplish this, we need an *experience environment* — a framework that allows the firm to facilitate a variety of co-creation experiences with millions of consumers.

We need to understand that when an experience environment is sufficiently compelling, consumer communities can evolve beyond the firm's control and potentially without the firm's knowledge. Suddenly, whole communities of individuals can directly co-create value.

(continued on page 6)

The Experience Environment

(continued from page 5)

On the positive side, these consumer communities can serve as multipliers for in-house R&D efforts. Managers whose firms have met the preconditions for effective co-creation can use them to augment their creative resource base. On the negative side, enthusiastic, but untrained and unrestrained, consumers can unwittingly ruin other customers' experiences without liability for quality or safety, thereby tainting the company's reputation.

Regardless of a manager's preference, consumer communities will form whenever an experience environment lets them, and they will influence consumer experiences in unpredictable ways. More fundamentally, the role of consumer communities evolves and cannot be predicted *a priori*. As a result, the firm is forced to concentrate on innovating experience environments with consumer communities — environments within which consumers, individually as well as collectively, can co-construct their own experiences. We call this new challenge *experience innovation*.

Experience Personalization

To co-create unique value with customers, we must appreciate what constitutes a *personalized* co-creation experience. The co-creation experience springs from the interaction between a single consumer and an experience environment. Our goal is to create an experience environment that accommodates not just the individual, but *how the individual changes in relation to space, time and events.* Designing an experience environment in which many heterogeneous consumers can enjoy truly personalized co-creation experiences is by no means trivial.

Delta Air Lines, for example, has rolled out information systems that let passengers access information previously available only to gate agents, such as the real-time progress of flights, seating status, and upgrade and standby lists. This transparency can reduce passenger anxiety and gate agent job stress. This example conveys the basic dimensions of an experience and its personalization: events, context, individual involvement and personal meaning.

Events form the basis for experiences. An event is a change of state in space and time that affects one or more individuals. Context is the space and time in which an event occurred. Individual involvement is the form and level of the individual's participation in the event. Personal meaning is the knowledge, insights, enjoyment, satisfaction and excitement that the individual derives from the event. These four dimensions — events, context of events, individual involvement and derivation of personal meaning — put the individual at the heart of a co-creation experience.

Designing Experience Environments

We can develop a broad specification for designing an experience environment. At a minimum, the experience environment must:

✓ Offer opportunities for consumers to co-construct their own experiences on demand, in a specific context of space and time.

✓ Accommodate a heterogeneous group of consumers, from the very sophisticated and active to the very unsophisticated and passive.

✓ Recognize that every consumer (including the active, smart consumer) does not always want to co-create; sometimes he or she just wants to consume.

✓ Facilitate new opportunities afforded by the evolution of emerging technologies.

✓ Accommodate the involvement of consumer communities.

✓ Engage the consumer emotionally and intellectually.

✓ Explicitly recognize both the social and the technical aspects of co-creation experiences.

Migrating to Experience Networks

The following are some of the key points and organizational challenges in building an *experience network* — the infrastructure for effectively co-creating value through personalized experiences:

- The company must facilitate the continuous co-creation of experiences at points of interaction. We must view products, distribution channels, technologies and employees as experience gateways.
- The experience environment should be oriented around the experience space, allowing consumers to initiate experiences on demand.
- Accommodating consumer heterogeneity is crucial. The company must understand its various sources and forms as well as its implications for co-creating unique experiences.
- The experience network should provide consumers with various levels and forms of access, mechanisms for dialogue with the company and other customers, and ways to manage risk.
- The logistics infrastructure should link closely to the experience environment, balancing the customer's desire for access with the company's desire for control. To win the customer's trust, a significant level of transparency in the company's information infrastructure is required.
- Managers need the capacity to react quickly and

(continued on page 7)

The Experience Environment

(continued from page 6)

continuously based on events, along with the capacity to reconfigure resources flexibly and quickly.

● All infrastructures have both a technical and a social side. An effective experience network requires both technical and social enablers of experiences.

The strategic architecture of the experience network is a creative combination of the appropriate technical and social experience enablers, along with selective activation of the competence base to facilitate heterogeneous, individual-centric experiences.

The Market as a Forum

The traditional concept of a market was company-centric. In the emerging concept of a market, the focus is on consumer-company interaction — the roles of the company and the consumer converge. The firm and the consumer are both collaborators and competitors — collaborators in co-creating value and competitors for the extraction of economic value. The market as a whole becomes inseparable from the value creation process.

Co-creation converts the market into a place where dialogue among the consumer, the firm, consumer communities, and networks of firms can take place. We must view the market as a space of potential co-creation experiences in which the constraints and choices of individuals define their willingness to pay for experiences. In short, the market resembles a forum for co-creation experiences.

The Experience Is the Brand

The brand has traditionally been the centerpiece of a firm's communication with customers. Today, the rise of the active consumer has shattered the old company-centric model of brand creation. Advertising has been supplanted as the chief shaper of consumer attitudes by word-of-mouth, which today's Web-linked consumer communities have put on overdrive. Consumers now have access to the information they need to make informed choices, assess value on their own terms, influence the expectations of other consumers, and decide for themselves how they want to transact with the company. As a result, the power of advertising to create or sustain a product or company image is steadily shrinking.

At one time, brands could be created by companies through advertising and other communications. No more. Now, brands evolve through experiences. Consider some of the major survivors of the dot-com decade: Yahoo!, AOL, Amazon and eBay. All are brands that evolved through the personalized experiences of an increasing number of individuals within a social fabric. Individuals legitimized these brands and gave them meaning.

Co-Shaping Expectations

Let's take as an example the movie *Lord of the Rings: The Fellowship of the Ring*. No film in history was released to a larger audience of pre-primed, passionate fans: the tens of millions of readers around the world who had been enthralled by the epic novels of J.R.R. Tolkien. These fans were thrilled by the news that a major film was in the works. They were also ready to denounce the movie en masse if it violated their vision of the fantasy realm of Middle Earth.

Wisely, rather than try to shut down or drown out the vast worldwide network of Tolkien fans, New Line Cinema worked to co-opt them. As Gordon Paddison, senior vice president for worldwide interactive marketing, notes, "It would have been arrogant to say, 'We are *Lord of the Rings*, come to us.'" Instead, Paddison treated the most rabid Tolkien followers as early influencers, whose response could make or break the movie. He reached out to the more than 400 unofficial Tolkien Web sites, giving them insider tips, seeking their feedback on the details of the movie, and offering them access to the production team. With the help of director Peter Jackson, the Web site *www.LordoftheRings.net* was created, including rough sketches of costume designs, handwritten production notes, and other exclusive content. Millions of fans have visited the Web site. Although Tolkien fans still debate the merits of the movie, nearly all appreciate the respect with which the filmmakers have treated the material — and them.

Thus, as companies transition toward the new opportunity space, the co-creation experience and the brand become embedded in each other. In the end, the co-creation experience is the brand. The new focus must be on fostering a consistent quality of co-creation experience. The challenge to managers is one of ensuring a consistent quality of experience across multiple channels, while simultaneously enabling a personalized co-creation experience for each individual. ■

For Additional Information on how to use consumers as a source of competence, go to: http://my.summary.com

The New Theory of Strategic Capital

Managers must build new strategic capital — a new theory of how to compete on experiences and how to build new capabilities consistent with that theory. New strategic capital is about challenging the traditional

(continued on page 8)

The New Theory of Strategic Capital

(continued from page 7)

approach to competition and value creation. It entails new ways to consider and analyze opportunities, access competence, leverage and reconfigure resources, engage the organization, and compete to co-create value based on experiences.

The current capabilities of companies reflect an implicit theory of how to compete, based on the traditional system of value creation. The ideas in this summary collectively embody an emerging theory of the meaning of value and the value creation process.

Bridging the Manager-Consumer Gap

Managing the co-creation of unique value demands a new capability: the ability for managers to relate to consumer interactions with the experience network. Managers must increasingly experience and understand the business as consumers do, and not merely as an abstraction of numbers and charts.

To co-create value effectively, managers must also have the capacity for agility. Agility is the ability to act fast — to improve the cycle time for managerial action. We believe that agility depends above all on the readiness of the line managers to respond quickly to changes on demand. And it is important to recognize that line managers, like consumers, are a heterogeneous lot. No two managers react the same way to similar events. Business agility is largely a function of the capacity of the managerial environment to respond to the needs of heterogeneous line managers.

Rapid Knowledge Creation

To co-create value continually, we must continually co-create new knowledge. To make this happen, we must create knowledge environments that facilitate discovery and action in the new competitive space.

Consider Buckman Laboratories, a $300 million specialty chemicals company based in Memphis, Tennessee, with around 1,300 employees in over 100 countries. Buckman produces more than 1,000 different specialty chemicals in eight factories around the world. Like most multinational corporations (MNC), Buckman operates in many countries, with many businesses — from paper processing and water treatment to personal care, leather and agriculture. Unlike a typical MNC, it is small, enjoying a competitive edge due to its ability to apply the power of all its employees to every customer experience. Central to this capability is its global knowledge-sharing network called K'Netix, which is integral to Buckman's information infrastructure.

An Example of Rapid Knowledge Creation

This story illustrates a typical application of K'Netix. A managing director for Buckman in Singapore — let's call her Mary — must propose a pitch-control program to an Indonesian pulp mill. Pitch is a chemical released from wood that affects paper quality and can cause problems in paper mill operations. Thus, developing an effective pitch-control program is an important and complex aspect of paper mill management.

Mary logs into K'Netix and asks for an update on recent pitch-control approaches around the world. Three hours later, she gets a response from Memphis that refers to a master's thesis by an Indonesian student in the United States on pitch control of tropical hardwoods, and offers some specific suggestions on Buckman chemicals that might be appropriate for this application. About an hour later, a Canadian manager sends a note about his experience in solving the pitch problem in British Columbia. Still later, Mary receives data from Sweden, New Zealand, Spain and France, followed by an offer of technical expertise and scientific advice from the company's central R&D group. In all, Mary receives 11 postings from six countries, forming several conversational threads that enable each participant to learn something new.

The contextual knowledge that was created helps Mary secure a $6 million order from the Indonesian mill.

Lastly, remember that while knowledge creation must be rapid, knowledge environments evolve over time. We must create and nurture mechanisms that enable the emergence of knowledge threads and facilitate the rapid creation of new knowledge. Such mechanisms, or "knowledge catalysts," are critical for integrating the information infrastructure, which is typically designed for managing explicit information (structured and unstructured data), into an effective environment for rapid knowledge creation. ■

Managers As Consumers

Three basic requirements must be met if managers are to share the experiences of consumers and others who play an important role in co-creation:

✓ Managers must get as much real-time event-centric data as possible regarding consumer experiences.

✓ Managers must understand and intervene selectively in individual consumer events even as they manage the overall operation. "How did we do with Hilda Schmidt today?" is just as important as "How did we do around the world this week?"

✓ Managers must be able to respond quickly by mobilizing and reconfiguring resources as needed.

THE SUMMARY IN BRIEF

In ***The Good Fight,*** Liane Davey teaches managers, employees, and people from all backgrounds about the power of positive conflict.The truth is that conflict can actually make our teams, our decisions, our execution, and our results better—as long as it's managed correctly. Avoiding conflict and disagreement can actually devastate our businesses and our relationships, holding us back when positive conflict could be pushing us forward. That said, not all conflict is good conflict. To discover which fights are worth having, it's important to identify the mechanics of what makes conflict productive—and what makes it unproductive.

In order to create an environment where positive conflict can thrive, we can't just rely on our instincts. We need to create, execute, and refine a system for conflict that makes it a clearly defined part of how we work. If we can do that, we'll be rewarded with conflict that builds momentum, trust, and success, rather than tearing them down.

IN THIS SUMMARY, YOU WILL LEARN:

- Why conflict in business can be a good thing, and why avoiding difficult conversations can hold businesses back.
- The mechanics of productive conflict, including how to proactively establish communication and build trust.
- How to systematize conflict, so it becomes a natural part of how you work.
- How to apply productive conflict skills to your most important relationships in work and life.

Introduction

Productive conflict makes businesses more profitable and more innovative. It makes their teams more trusting and helps them enjoy the work they do more than ever. Finally, it makes our lives more rewarding and less stressful.

Avoiding tough discussions and decisions holds businesses back, making teams dysfunctional and causing stress. A gap is created when we avoid contentious issues that need to be resolved. But when you foster productive conflict, you can proactively establish a line of communication and build trust with your colleagues. You just need to learn the techniques to create a srong connection that turns colleagues into adversaries.

In this summary, we'll find practical strategies to short-circuit unproductive or adversarial conflict and start to contribute to a solution, realizing along the way that it's possible to prevent the majority of conflicts and make those you can't prevent more productive and less aversive. Finally, we'll learn how to systematize conflict so that it can become a natural and empowering part of the way we all work.

Conflict Debt

Conflict debt is the sum of all the contentious issues that need to be addressed to be able to move forward but instead remain undiscussed and unresolved. Conflict debt can be as simple as withholding the feedback that would allow your colleague to do a better job and as profound as continually deferring a strategic decision while getting further and further behind the competition.

As with financial debt, conflict debt starts off innocently. An issue comes up that's a little too hot to handle, so you defer it. You promise yourself that you'll revisit it when things are less busy, or when cooler heads prevail. You buy yourself time and space. But days pass, and no spontaneous resolution materializes. Instead, the issue becomes more contentious and the factions more entrenched. Suddenly, you're in conflict debt.

Avoiding interpersonal conflict hampers teamwork. Managers who fail to deal with team members who have insufficient skills or destructive behaviors set up a conflict debt that affects every member of the team.

Conflict Aversion and Avoidance

Conflict aversion is a general unease with the thought of getting into a disagreement. It starts when you're young and can stay with you your whole life. As humans, we're wired to dislike conflict, having evolved to get along with others as a means of staying safe. As children we were encouraged by influential adults to avoid conflict because being disagreeable was considered bad manners. Now, in the workforce, we're encouraged to go along and get along. Those who violate this norm are often given critical feedback and labeled as poor team players.

But in fact, conflict is a natural part of healthy relationships and a critical defense against unhealthy ones. While conflict aversion is normal, it's important that it not turn into conflict avoidance. Disliking conflict will not hurt us, but disavowing it entirely certainly will.

The New Conflict Mindset

Overcoming conflict avoidance requires a new mindset. We need to tune out the naysayers and focus on the positive outcomes that we'll achieve when we work through our conflicts. Although delivering difficult messages might not feel nice in the moment, in the long run, telling someone what they need to hear is often the kindest thing we can do. Rather than remaining a bystander to conflict, weigh in to help those in the thick of the argument solve their problem more objectively.

Don't fear emotion; think of it as a valuable clue that something important is wrong. Calmly and kindly draw out the person to rectify the underlying issues. Disagree with your boss when adding a different view will contribute to a better decision. Speak deliberately and respectfully, and leave a way to backtrack if necessary.

The Conflict Code

In exploring the conflict code, we'll focus on what you can do to prevent the majority of conflicts and make the rest more productive and less aversive. You'll learn how you can proactively establish a line of communication and build trust with your colleagues. Next, you'll see the techniques you can use to create a strong connection that turns adversaries into allies. Finally, you'll get practical strategies for diverting adversarial conflict and constructively developing a solution, through communication, connection, and contribution.

Establish a Line of Communication

Conflicts often arise because we act without a clear understanding of what's expected of us. It's important to establish

a line of communication and to build trust, with your boss, your teammates, and your colleagues in other departments, before there is an issue to address.

To build trust, create a connection that allows your colleagues to understand you as a person. The more predictable they find your behavior, the more they will trust you. Earn credibility even before you have a track record by asking good questions and demonstrating how you will tackle your work. Demonstrate reliability and show your colleagues that you will prioritize their needs. Ooze integrity by being transparent, especially if you are struggling.

Actively strengthen your trust in your colleagues by behaving as though you trust them, even before you really do.

Create a Connection

Making the effort to create a strong connection with a person will allow you to problem-solve as allies rather than fight as adversaries. When a discussion gets heated, the facts and information presented provide excellent clues about what is important to the players. Pay attention to what is (and isn't) said to zero in on what's at stake.

Explore the feelings and emotions the person is signaling with their body language. When emotions are present, it's likely that there are more substantive issues you haven't exposed yet. Use questions and observations to uncover the values and beliefs that underlie their position. It's these values and beliefs that will unlock the solution to the conflict.

Regardless of whether or not you agree with the person, validate what they are saying and ensure they feel heard and understood. Use everything at your disposal to strengthen the connection you have with the other person, including your physical situation, your language and tone, and your body language.

Contribute to a Solution

Once you've established a line of communication and created a strong connection, you are in a good position to contribute to a solution. Use the Two Truths strategy to validate the other person's priorities while adding your own. Assume that both opposing opinions are right in their own way, then work toward a solution that solves for both.

Next, use the Root Cause approach to demonstrate alignment on the problem when you want to offer alternate solutions. Show that you agree on the underlying cause of the problem, even if your proposed solutions differ. Rather than contradicting or criticizing a flawed solution, expose the risks of their plan by showing its potential impact, then redirect the person toward a feasible solution.

Use the Hypothetical technique to overcome resistance by asking the person to imagine the benefits of a plan before solving for the obstacles.

When you have multiple stakeholders with competing interests, use the Common Criteria approach to get everyone aligned on what a good solution would look like. This is a powerful step towards finding common ground on a solution you can all move forward with.

When all else fails, Own the Misunderstanding and use enough clarifying questions to figure out which approach would help resolve the issue.

Codifying Conflict

The Conflict Code—establishing a line of communication, creating a strong connection, and contributing to a solution—definitely works. It just takes a lot of effort. If you had to go through that process for every single conflict in your organization, you'd be exhausted. In the next segment, we'll focus on what you can do to systematize conflict by setting expectations for everyone on your team. Then we'll work through a process to normalize the tensions that, if left unlabeled, can turn into unhealthy conflicts. Finally, we'll talk about how you can create a healthy conflict habit that increases the frequency and decreases the impact of conflict until you hardly notice it at all.

In this section, we'll dive into the processes and tools you can use to get your team out of conflict debt. This is where you'll learn the secrets of how teams systematize conflict so that it takes less toll on the people in your organization or team.

Clarify Expectations

Failing to set clear expectations will lead to subpar work and inefficient rework, which creates frustration and conflict for all involved. You can neutralize conflict by articulating what's expected at different levels of your department and when that value needs to be added. This will help you get value you need from your boss, while heading off unpleasant micromanagement and deep dives.

Your team will have greater focus on your unique value and the activities that are most valuable for your business. Working through this process with your direct reports will allow you to raise the bar, while setting the expectation that you will challenge, critique, and improve your team's work, even when they do a great job.

Normalize Tension

Tensions are a natural part of cross-functional teams, but many people misinterpret tension as contrary to teamwork. Failing to recognize the value of different and opposing perspectives and priorities on a team can set up unproductive conflict.

You can help normalize productive conflict by articulating what's expected of different roles and how those roles will often be in tension with one another. You can use this method to coach team members who are under- or over-contributing and address the imbalance caused by having a mix of multi-incumbent and single-incumbent roles on your team.

Discuss the implications of making trade-offs between team members to reduce the friction caused by win/lose scenarios. Make use of effective goal setting to proactively manage the interdependencies on your team.

The Conflict Habit

The best way to keep conflict productive is to make small, frequent disagreements part of your daily habits. Begin to sprinkle a little conflict to help your teammates develop a taste for it. Invest time up front in clarifying expectations whenever you face a new task, a new project, or a new role. Make dissent more normal by adding tension to even the most routine conversations. Get more skilled at delivering feedback to help your colleagues understand the unintended impact of their behavior. And, when appropriate, use humor and code words to keep difficult discussions light and to avoid triggering defensiveness.

Set clear expectations for how meetings will support productive conflict, and use the start and close of your meetings to reinforce those expectations.

Conclusion

Organizations dole out a steady stream of conflicts, from agonizing strategic trade-offs to petty interpersonal squabbles. You need to work through these issues to keep operations running smoothly. Giving in to conflict aversion and letting issues pile up will lead to conflict debt that stalls your organization, sabotages your team, and stresses you out.

Instead, fight the good fight. Make the effort to establish effective lines of communication and build strong connections with your colleagues. Contribute in creative ways to come to solutions that, if not perfect for everyone, are at least the best choice given your constraints. You deserve to work on a team where productive conflict supports great decisions, strong relationships, and a positive working environment. Now you know fighting the good fight will give you the team you deserve.

THE SUMMARY IN BRIEF

Conventional business wisdom dictates that companies should focus their sites on growth. But growth is no certain thing, say the authors of The Growth Gamble. *Not all companies are built for rapid growth: Their markets are unsteady or extremely competitive, their infrastructure is not sufficiently flexible, or they don't have the quality or quantity of people to lend to the effort. For these companies, a slow or steady growth curve, over years or even decades, is the healthiest option. While this flies in the face of convention, the business landscape is littered with organizations that went belly up because they tried too hard to expand their businesses too far from what they did best, or did so too rapidly to keep themselves solvent. Much of the damage was caused by a lack of rigorous analysis, or the want of a screening tool to help leadership determine what new avenues were right for their companies, and when. With* The Growth Gamble *and its invaluable New Businesses Traffic Lights Toolkit, businesses have what they need to grow smartly and avoid potentially fatal errors.*

What You'll Learn In This Summary

✓ **New business expansion has rules.** Don't stray too far from your core strengths without knowing exactly what you're doing and without knowing, within reason, how your efforts will turn out.

✓ **It's OK to grow slowly.** Do not be seduced by "sexy" business opportunities or driven by inappropriate motivations. For many companies, taking the path of low growth is the smartest option and the one best suited to their business.

✓ **Red means stop; green means go (sometimes).** You cannot be sure a new business opportunity will fit your organization without doing some strategic analysis — the more detailed, the better. The New Businesses Traffic Lights tool distills that strategic thinking in four key areas of consideration — areas you must consider in order to determine whether a new business is right for you.

✓ **Is the profit potential good enough?** Do you know if your potential market is "rare game" or a "dog"? The answer to that question goes a long way toward determining whether your new business is profitable, or a waste of resources.

THE GROWTH GAMBLE

by Andrew Campbell and Robert Park

— THE *COMPLETE* SUMMARY

The Challenge of New Businesses

Microchip maker Intel has made many attempts in the last 10 years to enter new businesses. Some have been successful, but most have not. After initially making its name as a maker of integrated circuits for electronic memory products, by the early 1980s, Intel's main business — in terms of profits and technical commitments — was manufacturing microprocessors. Intel then entered a golden period of about 15 years during which its dominance of the microprocessor market for PCs and servers powered the company's growth and profitability.

During this period, the company made several attempts to enter new businesses, some of which were intended to extend its core microprocessor business into new areas, while others attempted growth outside the core business strategy. The latter businesses included the manufacture of motherboards, LAN adapter cards, fax modems, PCMCIA cards, video conferencing, and supercomputers.

Few Successes

By 1999, few of these businesses had achieved their purpose of extending Intel's reach outside the microchip industry. Part of Intel's problem was positive: Its core business was growing so fast and demanding so much support that initiatives that did not extend the core were viewed with suspicion, resulting in weak follow-through for businesses outside the core.

Intel also had difficulty in managing businesses with a different business model than its microprocessor business. The company's culture, functional structure and managerial rules of thumb were driven by the needs of the core business, with its largely predictable technological progress. Intel struggled with businesses that had different rules that depended on insights about the future.

With new executive leadership, however, Intel pushed to redefine its core business from microprocessors to "Internet building blocks." This change was reinforced by a slowdown in microchip sales in the late 1990s. In 2003, however, Intel announced it was withdrawing from this strategy, writing off $1 billion in the process.

Burger Maker Bites Back

McDonald's likewise found itself in an industry experiencing its share of decline. By the late 1990s, growth potential in the core hamburger business was becoming limited, and McDonald's strong position in the United States was being threatened. Growth opportunities in international markets were also disappearing, and customers were beginning to raise health concerns about beef and fatty foods.

The company responded by reinvesting in existing franchise locations, as well as by making some key acquisitions in an effort to enter new businesses: acquiring a minority stake in the small Chipotle Mexican Grill chain and buying the 143-restaurant chain Donatos Pizza, as well as British coffee chain Aroma Café. These initial forays were followed by a more aggressive buying spree, including:

- The acquisition of the 900-restaurant chain Boston Market.
- An investment in Food.com, the Internet food takeout and delivery service.
- A minority stake in Pret A Manger, the British sandwich chain.

McDonald's also attempted new business concepts, including a sit-down diner with table service, and McCafe, offering gourmet coffee and related products.

McDonald's still retains some of its businesses, but has scaled back its ambitions. Four of its newer acquisi-

The Challenge of New Businesses

(continued from page 2)

tions have been placed into McDonald's Ventures, a subsidiary charged with deciding whether any of these businesses can become significant for McDonald's without distracting from its core.

Companies such as Intel and McDonald's can only find significant new businesses under two circumstances. Either they discover a business that "fits in" with their existing businesses and responds well to the habits and rules of thumb that apply to the core. Or, they go through a crisis that breaks their commitment to the old habits and rules of thumb, and brings in new leadership and new ideas. ■

Beating the Odds

Most companies fail to find new growth businesses when their core businesses mature. Intel and McDonald's illustrate this important new reality: They have not found a significant new business that will enhance their growth prospects. In fact, as many as 99 percent of companies fail to create successful new growth platforms. Less than 10 percent of companies manage to restart growth once it has slowed. Only 3 percent sustain a restart for more than three years. Less than 1 percent do so by creating new growth platforms.

These sobering statistics do not, however, keep companies from trying. There are only a tiny percentage of management teams that settle for sticking to core businesses, and declining gracefully as those businesses mature. The challenge of finding new businesses is a growth gamble. To even take on the challenge is to bet against its odds. There are no easy answers.

Theory Versus Reality: An Opportunity Shortage

Current business theory instructs companies to be more entrepreneurial and to copy approaches used by the venture capital industry in building processes for developing new businesses. According to these theories, the high failure rate of new businesses is due to poor processes and skills.

The reality is quite different. Established companies have entrenched mind-sets and managerial habits, which are normally well tuned to the needs of their existing businesses. When companies delve into new businesses that are compatible with those mind-sets, they achieve success. When they try to do things that do not fit, they fail. The problem is, there are very few opportunities that fit.

A New Approach

There needs to be a new approach to the problem. The shortage of opportunities suggests that a screening tool that helps managers identify opportunities with a reasonable fit is likely to be more useful than a series of process steps for developing new businesses. Trying to make dramatic changes to ensconced managerial mind-sets — such as following venture capital processes — is also unlikely to achieve much. The mind-sets and rules of thumb that have served successful companies in good stead are likely to continue to influence success, and deviating from them will likely end in defeat. ■

Six Rules for New Businesses

The shortage of significant business opportunities that fit is the single biggest challenge for managers seeking new growth. Managers should observe the following six key rules about new businesses:

Rule 1: Continue to invest in the core. Investing in core businesses is the first thing senior management must do. It is imperative that these company leaders have their feet firmly on the ground when they decide in which new businesses to invest. One certain way of killing off a company is to invest unwisely in new opportunities.

Patience is key. Even if a business does not grow quickly over a period of years, it is still most often best to focus on core businesses. Companies should continue to regularly review potential opportunities outside the core, but it might take years for the right opportunities to come along. Trying to force the pace can speed an organization's decline.

Rule 2: Don't be seduced by sexy markets, but recognize rare games. The attention given to growth markets is understandable. To create value, managers should focus on markets in which they have an advantage, instead of markets that are growing. It may, in fact, be easier to create value in less popular areas than in "businesses of the future" that attract every manager hungry for quick growth. Managers should, instead, look for opportunities where their company can bring some special competency or resource to the game.

There are, of course, exceptions to this rule: "dog markets" and "rare games."

Dog markets are those where most competitors currently earn less than their cost of capital or are likely to

(continued on page 4)

BP's 'Biggest Mistake'

British Petroleum's former CEO, Sir Peter Walters, described his company's attempts to enter new businesses as "my biggest mistake." Driven by concerns about the oil industry's future following the 1970s oil shortage, BP entered nutrition, IT, minerals and other businesses either because of the similarity of the skills required or because of their growth potential.

"If we had put even half the effort into our core businesses that we put into new businesses," Walters noted, "we would have come out ahead."

Six Rules for New Businesses

(continued from page 3)

do so in the future. They normally occur because the competition in that market has become too intense. These markets are to be avoided, regardless of whether the company has advantages in them.

Rare games are markets where even average competitors are likely to do well. They usually occur because a new market suddenly opens, creating more demand than supply. Companies that get in early have an advantage, in terms of assets or stronger brands. A company can enter a rare game without an advantage, because it is an easy environment. To be sustainable, however, the company needs to create an advantage during its initial years in the market.

Rule 3: Look for advantage, but don't play the numbers game. There is an argument that companies need dedicated venturing units in order to process large volumes of existing work while managing a large number of investment opportunities, as well. Since one or two successes may take a number of years to emerge, companies require a pipeline of new initiatives.

A Losing Game

This numbers game is a losing game. If the presumption is of many failures and few successes, each new initiative will be expected to fail, and will thus not receive the attention it deserves. The alternative is to be selective — to invest in opportunities only when the company has a significant advantage — when it believes it can serve the market and earn 30 percent better margins than competitors. Sometimes, this may mean no new initiatives; sometimes two or three: At no time should it be 10 or 12 (or, as in one company, 44).

Rule 4: Be humble about your skills when looking for new businesses. When it comes to new businesses, humility is a good thing. One of the reasons the advantage hurdle must be set at 30 percent or greater is because managers are frequently overoptimistic about their skills. Also, competitors have advantages that are difficult to observe. Moreover, there are learning and ramp-up costs inherent to entering any new market. In unfamiliar situations, people make mistakes, managers chief among them: They invest too much in marketing, overdesign products, mismanage suppliers, and more.

The Impact of Learning Costs

It is the learning costs that explain why, for any specific company, there are few opportunities. By understanding the impact of learning costs, managers can discover good prospects for new businesses where much of the learning has already been done, as well as avoid potential disasters where the learning cost is likely to be larger than any of the company's existing advantages.

Keep Your Eyes Open for Saplings

Learning costs are an unknown that upset many plans, but they can also suggest one type of new business idea to look for — "saplings," or operating units that already exist within the company. These units are usually forgotten and/or minimally funded, but they exist for historical reasons or reasons connected to the core business, and can be used to grow new legs for the company. Their special feature is that they tend to have strong managers with insights about how to grow the activity, and most of the learning is already done.

Hewlett-Packard, for example, had a computer processor unit that in the 1970s began selling minicomputers for technical applications. In 1980, after many requests, the unit's management team was allowed to enter the commercial computer application market. HP is, of course, now one of the largest computer manufacturers in the world.

Rule 5: Search for people as much as potential. Large companies get lulled into presuming that somewhere, within their talent pool, managers can be found to lead projects. The challenge, they believe, is to find good projects for them to lead. Within an existing business, there are many managers who understand the products, the markets and the essence of the business model needed to make a profit. In new businesses, all three of these areas of knowledge may be absent.

Often, this leads to projects starting out with the wrong leadership. A company may have a huge advantage in technology or brands or customer relationships, but if it does not have the managers with the talent, experience and will to exploit these advantages, it will create no new value. Any process to search for new business ideas should be complemented by a search for managers with the experience, talent and passion to lead.

Rule 6: Be realistic about ambitions. The successes managers have had using stretch goals to power performance in their existing businesses cloud them from realizing that the same techniques cannot be used to drive the creation of new businesses. Stretch goals work in existing businesses because managers get stuck in ruts and stretch goals unlock their thinking.

In the search for new businesses, managers have no ruts to break out of. Goals should be set only after the opportunities for new businesses have been screened, not before. ■

The Case for Low Growth

When it comes to growth, managers are often driven by inappropriate motivations when they should be more selective rather than more energetic in their approach to

(continued on page 5)

The Case for Low Growth

(continued from page 4)

new businesses. They should assess opportunities to enter new businesses with a tough set of criteria, only investing in those that pass a strategic business screen.

This means, of course, that some companies will, at some points in time, screen out all ideas for new business, relegating themselves to a rate of growth determined by core businesses. If the core market is slow to grow, the company will likewise grow slowly, until a promising and appropriate business opportunity arises.

While most managers believe growth to be an imperative, it can, in many instances, also be a dilemma. In some circumstances, it is acceptable to choose to be a low-growth company.

Arguments for Growth

There are a number of arguments for growth. For one, the value of a company, in terms of market capitalization, is greatly affected by its growth rate. If a decision to impede rapid growth reduces expected future growth rates, the value of the company will decline, sometimes dramatically.

Second, success breeds success. A decision to stop growing may break a company's momentum, allowing managers and employees to lower their sights and encouraging them to be satisfied with less. Also, growing companies attract the best talent because they can provide more interesting career opportunities. Once growth slows, opportunities for advancement decline, and capable younger managers are more likely to leave.

There are also "moral" arguments. The assertion is that, if everyone stopped investing in new businesses, progress itself would slow down. Under this argument, companies have a duty to society to innovate and develop new businesses. While such an argument should not be dismissed out of hand, it is, in essence, an argument based more on hope than on logic; managers cannot be driven by hope rather than by strategic logic.

When Is Low Growth the Right Choice?

Low growth is the right choice for companies under two conditions: 1) when there are few opportunities for the core businesses to grow, and 2) when there are few new businesses that have a good chance of outperforming the average company on the stock market. Companies that follow a low-growth strategy under these circumstances minimize their risks of value destruction and increase their chances of value creation.

When deciding on a company's growth policy, the following principles should guide the choice:

- Companies must exceed market expectations — just growing is not enough. High growth is an expectation treadmill.
- Investments in new businesses need to have a good chance of exceeding average returns to justify management attention.
- If a company cannot find new business projects that are likely to earn more than the cost of capital, surplus funds should be returned to shareholders.
- Low-growth companies can still produce good returns to shareholders.
- As long as there are no tax differences between income and capital gains, shareholders are indifferent between dividends and share buybacks.

Low-Growth Strategies Can Succeed

Despite the logic of the low-growth strategy, many managers remain unconvinced. Growth has been deemed a necessary objective for so long that managers find it hard to accept low growth. Their perception is that low growth will lead to problems that simple financial theory has overlooked. They need proof that it works. Fortunately, examples of low-growth successes do indeed exist. ■

Crown Cork and Seal Uncorks Low-Growth Success

A focused, low-growth strategy benefited Crown Cork and Seal. In the early 20th century, the company was in a dominant position in the market for bottle caps. After a corporate shakeup in the mid-1950s, Crown was being faced down by much larger competitors. The company's management decided to stay focused on bottle caps, where it was still a market leader, and specialist segments of the canning industry, such as cans for motor oils and soft drinks.

In the 1970s and 1980s, soft drink companies began to manufacture their own cans, which led Crown's competitors to invest in new and untested packaging solutions. Crown, on the other hand, kept its focus on bottle caps and cans, helping customers convert from steel to aluminum, and investing in plants close to its customers' canning sites. By the late 1980s, Crown's competitors were investing in growth sectors such as insurance and oil, diversifications that unfortunately produced low returns.

Alone at the Top

By going so far away from their core, these competitors wound up taking huge losses and, eventually, one by one were sold. Crown did eventually get into other packaging opportunities, but only when the company's skills were suited to enter into those areas. By the early 1990s, "new packaging materials" was a maturing market, and Crown stood virtually alone at its summit.

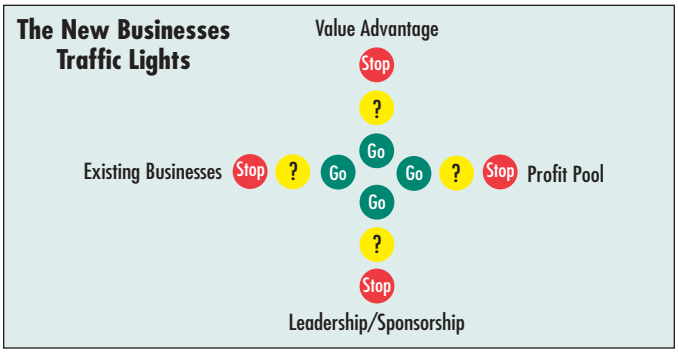
New Businesses Traffic Lights

Managers can and should use the power of basic strategic analysis to help them find business opportunities that fit. The *New Businesses Traffic Lights* is a screening tool to help them do just that. The Traffic Lights are a distillation of strategic thinking. There are four lights: the size of the value advantage, the attractiveness of the profit pool, the quality of the managers running the new ventures and their corporate sponsors, and the likely impact on existing businesses.

What Each Color Implies

Each element is scored as follows:



- **Red.** Red implies a significant disadvantage, or that the market segment has little available profit, or that managers or sponsors are inferior to those of competitors, or that there is a big negative for existing businesses. A red light signals a low probability of success, even if some other lights are green.
- **Green.** Green implies a big advantage, or that the market segment is an easy one in which to make money, or that managers and sponsors are clearly superior to competitors in the market, or that there are big benefits for existing businesses. A green light indicates probable success, as long as no red lights exist and a viable business plan can be drafted.
- **Yellow.** Yellow lights indicate marginal situations. Managers should be asked to reformulate their proposal so that at least one light can be green, or an experimental investment can be made in the hope that one of the yellow judgments might actually be revealed to be green.

Let's take a look at the questions raised by each of the four elements in the Traffic Lights tool, and the insights and implications that accompany them:

Value Advantage

Do we have value advantage? A superior return on capital is usually the result of some area of advantage — success is difficult to achieve without it. To assess whether an organization is likely to have an advantage, consider this value advantage equation:

- Unique value we bring.
- Less percent of value we could trade.

- Less unique value our competitors bring.
- Less cost of learning the new business.
- Equals our value advantage (green if positive, red if negative).

Value advantage discussions should center around the value a company can trade and the cost of learning a new business, if its trade value is low.

Value in trade. Managers do not usually consider the tradability of their unique value when assessing new businesses. The value reason for entering a new business is the extra value that can be created. Hence, managers should deduct from their calculations that part of their unique contribution that can be turned into value without entering a new business. Since many types of unique value, such as brand or patent, can be licensed or "cashed through a joint venture," the value advantage equation is often neutral (yellow) or negative (red).

Cost of learning a new business. Managers do not usually assess the likely costs, at both the operating level and the corporate level, of learning a new business. Because learning costs are hard to quantify, they are often left out of the equation. Fit analysis — one way of identifying likely learning costs — usually focuses on what fits, rather than what does not fit. Since learning costs are rarely less than 10 percent of profits and can be 50 percent or more, at least initially, the value advantage is often neutral (yellow) or negative (red).

Profit Pool Attractiveness

How attractive is the profit pool? Analysis of markets should focus on identifying extremes in profit potential. The profit pool question is about whether a market is a "rare game" (green) — a golden opportunity likely to generate good returns, or a "dog" (red) — a rotten market either too small, uncertain or competitive, leading to low returns. All other situations — markets that are neither rare games nor dogs — are "possibles" (yellow). Five criteria must be assessed to determine the attractiveness of the profit pool:

1. Business model potential for high margins.
2. Industry structure potential for high margins.
3. Opportunity for you to be a leader in the market.
4. Cost of trying, relative to the size of the profit pool.
5. Business model vulnerability.

Strategy analysis demonstrates that in most markets, companies with an advantage will earn above-average returns. Thus, detailed analysis of growth rates and likely margins, while necessary for a financial plan, is often unnecessary for making a strategic decision. Since most markets are neither red nor green, they offer little infor-

(continued on page 7)

For additional information on questions related to the potential of the profit pool, go to: http://my.summary.com

New Businesses Traffic Lights

(continued from page 6)

mation for or against the strategic decision.

Finding Management Talent

Managers often do not give sufficient attention to the issue of who is going to run a new business and, in particular, to whom the new business is going to report. New business projects are frequently launched on the presumption that the operating management team can be recruited at another time. This is a reasonable approach if the activity is familiar and the company has good managers in place who can step up and deliver. For less familiar activities, however, finding the right management talent can be challenging.

The questions for finding management talent that need to be addressed are as follows:

- **Do the leaders of the new business have the passionate commitment, personal insights, entrepreneurial flexibility, execution skills, and influence with the parent company that will enable them to overcome any setbacks and roadblocks, and win in the marketplace?**
- **Does the new business have a sponsor who will provide a compatible home for it in the portfolio, exercise effective oversight, protect it from negative influences, and support it through setbacks?**

Managers, particularly in large companies, believe that their managerial resources are considerable or that good talent can be brought in from outside the company. They also presume that they can learn most new businesses. However, when an objective assessment is made of the quality of the project's managers and sponsors compared to those of current and likely competitors, it is often evident that they are inferior (red) or at least not superior (yellow).

Impact on Existing Businesses

What is the impact on existing businesses? The impact a new business has on existing businesses might be significantly positive as a result of customer or cost synergies (green), significantly negative as a result of conflicts of interest and/or distraction of key managers (red), or somewhere in between (yellow). There are two dimensions to consider:

- How big are the synergies? The synergy criterion is about the benefits for existing businesses. In many cases, there are no positive or negative synergies for existing businesses — the criterion is often neutral.
- What are the distraction risks? Managers often underestimate the loss of performance in the core businesses that occurs when attention shifts to new businesses and some of the most energetic managers are allocated to new business projects.

Indeed, on the latter point, some significant analysis is critical. Distraction risks — the best way of capturing the risk of lower performance in existing businesses — depend on two factors:

- The degree to which the challenges in the existing businesses demand scarce management and financial resources.
- The degree to which the new business will compete for these scarce management or financial resources.

When managers invest in new businesses, they often underestimate both the opportunities for growth in their existing businesses and the threats these businesses face from competition. In order to understand the risks of distraction, managers must first understand in what areas their existing businesses most need attention. Armed with this analysis, it is easier to ascertain whether a particular new business is likely to distract from the attention that the core needs.

Summarizing the Traffic Lights

The Traffic Lights might seem daunting. There are four major judgments that need to be made, each depending on a number of sub-judgments. Frequently, it takes less than an hour to talk through the four Traffic Lights and reach a preliminary conclusion. Parts of such a conclusion may be easy to challenge, but frequently the overall judgment (red, yellow or green) is not in disagreement.

The Traffic Lights are a set of questions that managers need to answer that in aggregate form a strategic business case. They are designed to be used early in the life of a project, and as a sanity check for a financial business plan. They can be used even before much information is available to assess a business' potential.

The Traffic Lights do not focus on execution issues. They will not, for example, assess whether suitable partners can be found or whether a technology will work. They assume any operational issues can be surmounted. The Traffic Lights also do not provide clear go/no-go decisions for every situation. They do, however, screen out a large percentage of new business projects that would subsequently fail, saving managers time and money.

In all, the intention of the Traffic Lights is to pull together the fundamentals of good strategic thinking, in a way that will help managers arrive at better judgments. ■

New Businesses, Right Processes

All companies face the question of what they should do to increase the chances of successfully creating new businesses. One of the primary questions managers have is how to set up the right processes for new business development. The following three guiding rules help accomplish this:

Rule 1: Manage the flow of new business ideas.

(continued on page 8)

New Businesses, Right Processes

(continued from page 7)

Failure to understand the dynamics of the existing businesses leads managers to underestimate their potential or the challenges they face. Without a thorough analysis of existing businesses, managers do not have a sound platform from which to approach the screening of new business projects. Such a strategy review should not only focus on the current business model and current product-market segments, but also on adjacent business models and on new disruptive competitors. Senior management needs this kind of information for developing top-down ideas for new businesses.

Rule 2: Diligently use the New Businesses Traffic Lights. Whether a company invests in new-ideas workshops or limits itself to looking at opportunities that emerge, the Traffic Lights can help ensure that foolish ideas do not get through the screening process. If the Traffic Lights are widely communicated as a tool for assessing the "strategic business case," managers at all levels will feel empowered both to propose ideas that fit and reject ideas that will not pass the Traffic Lights.

Rule 3: Effectively parent each new business initiative. Once a new business idea passes the Traffic Lights, managers need to pay considerable attention to parenting it appropriately. The toughest decision is faced when progress deviates from the original plan in some serious manner. The choice between repositioning the initiative, altering its objectives, increasing the commitment of resources, or pulling the plug often involves agonizing judgments. ■

Positioning and Supporting a New Business

There are four common questions managers face when developing new businesses that are critical to their success. They are:

1. How far should the new business be integrated with or separated from the existing businesses? In most cases, the new venture should be separate from the existing businesses unless the design of the organization suggests otherwise. Among the questions to ask are:

- Does the new business sell to the same market, use the same technology, or draw on a shared source of advantage (marketing advantage)?
- Does the business unit need to draw on the skills of particular managers or teams that cannot be allocated to the new business (people test)?
- Do the cultures and business models of the new businesses integrate well with those of the parent business (specialist cultures)?

Integration is more possible when the answers to those questions are in the affirmative.

2. At what level in the organization should the new business report? Make sure the new venture reports to a level in the organization where it is an important part of the strategy, good sponsorship is available, and there is some objective governance of the venture.

3. What support should be provided to the new business by the layers of management above it? Analyze the potential parent/new business relationship to decide what guidance and support the new venture needs and limit parenting to these elements.

For example, list the major tasks managers in the business unit will need to complete in the next period (six months to a year) and assess whether the management team of the business is likely to do each task well, averagely or poorly. Where scores are lower, more parent involvement will be required.

4. How should corporate managers monitor progress, and when should they pull the plug? Perform a "confidence check" to assess progress and head off crises. Among the things to check are whether your value advantage is large enough and the profit pool is still good enough to justify the project, whether leaders/sponsors of the business are still good enough for the project, and whether the impact on existing businesses still justifies the project.

The Age of Realism

In the age of realism, the strategic business case will have as much status in decision making as the financial business case. This will make optimistic forecasting less necessary and easier to spot.

The age of realism will be a new enlightenment for business, where rational thought has more weight than chief executive ambition, and where managers at many levels will have the tools to challenge weak thinking. Managers, customers and shareholders will all benefit. ■

Real-Life Stories of How People Change Their Organizations

THE HEART OF CHANGE

THE SUMMARY IN BRIEF

If you've ever tried to change anything, you know how hard it is. How do you go about getting your message across to truly change people's behavior?

While most companies believe change happens by making people think differently, that isn't the case. Instead, according to John Kotter and Dan Cohen, change happens when you make people feel *differently.*

You have to appeal more to the heart than the mind.

In this summary, you will learn about a new dynamic — the "see-feel-change" dynamic that fuels action by showing people potent reasons for change that spark their emotions. Built around the eight steps of change first introduced in Kotter's bestseller, Leading Change, The Heart of Change *gives straight advice on successful change — and true stories of companies making change happen.*

What You'll Learn In This Summary

In the following pages, you will learn about:

✓ **The Heart of Change:** Why people succeed and why they fail at large scale-change and how you can use an eight-step path to success.

✓ **The Need for Urgency:** You will see why you must raise feelings of urgency so that people start telling each other "we must do something."

✓ **Building the Guiding Team That Gets the Vision Right:** You need the right group of people with the right vision to start the change process.

✓ **Communicating for Buy-in:** You will send clear messages about change and remove barriers to those changes.

✓ **Creating Early Wins and Not Letting Up:** You will see why creating an early win is important and why you have to keep momentum up.

✓ **Making Change Stick:** You will learn how to change your organization's culture so that change will stick.

The Heart of Change

People change what they do because they are shown a truth that influences their feelings. This is especially so in large-scale organizational change, where you are dealing with new technologies, cultural transformation, globalization and e-business. In an age of turbulence, when you handle this reality well, you win.

To understand why some organizations are leaping into the future more successfully than others, you need first to see the flow of effective large-scale change efforts. Change is an eight step process that few handle well. These steps are:

1. **Create a sense of urgency** so that people start telling each other "Let's go, we need to change things!"
2. **Pull together a guiding team** powerful enough to guide a big change.
3. **Create clear, simple, uplifting visions** and sets of strategies.
4. **Communicate the vision through simple, heart-felt messages** sent through multiple channels so that people begin to buy into the change.
5. **Empower people** by removing obstacles to the vision.
6. **Create short-term wins** that provide momentum.
7. **Maintain momentum** so that wave after wave of change is possible.
8. **Make change stick** by nurturing a new culture. ■

See, Feel, Change

Changing one person is hard enough, but changing 100 or 1000 is an almost Herculean task. Yet organizations are doing just that. Most that do so successfully focus on showing what needs to be changed. Once people respond emotionally to the lesson, their emotional reactions propel them into action. They see, then feel, then change. To help them make the leap, you must:

- ✓ Help people see the need for change with compelling, eye-catching dramatic situations to visualize problems and solutions.
- ✓ Let people feel as they are hit with the reality of their situation and feel the need to act.
- ✓ Let people take their emotionally charged ideas into action.

Increase Urgency

In successful change efforts, the first step is making sure sufficient people act with sufficient urgency — with on-your-toes behavior that looks for opportunities and problems and energizes colleagues, that beams a sense of "let's go." Without urgency, large-scale change won't happen.

Four sets of behaviors often stop change. The first is complacency, driven by false pride or arrogance. The second is immobilization and self-protection, driven by fear or panic. The next is "you-can't-make-me-move" deviance, driven by anger. And the last is a pessimistic attitude, leading to constant hesitation. These behaviors prevent people from taking action. Instead, they hold back or complain as others initiate new action. The result is that a needed change effort is derailed.

The first step is not to create a vision. This is especially true if your organization is in crisis, if alligators are nipping at your feet. If they stand on a burning platform, they have no choice but to take immediate action, to jump away from their comfortable positions. Assembling a team to discuss the organization's new vision won't be very successful, because team members will be worried more about self-preservation than the new vision.

Angry Customer Videotape Spurs Action

How do you change years of ingrained habits and attitudes? You can try facts and figures, but nothing works better than a shock. That's how one company managed to inspire change in a group of craftsmen who had refused to listen to a key customer's needs and continued to do things their way.

The customer had ordered custom-designed equipment, but found he still had to make significant alterations to the equipment. He told management that he had talked to the craftsmen designing the equipment many times, but that they didn't seem to listen. Sure, they would nod their heads, he explained, but they wouldn't take action. The manager asked permission to videotape the customer's complaints. He then showed the craftsmen the tape. Many were genuinely surprised to see the angry customer complain they hadn't listened. Some thought they were right and the customer wrong. But the overwhelming reaction was that something had to be done. The videotape created a sense of urgency that propelled the craftsmen into action.

Increase Urgency

(continued from page 2)

One company brought the need for change to executive attention with a compelling demonstration. The company bought and ordered gloves for its factories through a decentralized process. As a result, the company bought 424 different types of gloves.

To make matters worse, each factory negotiated its own glove purchases. Some factories paid $5 per pair while another paid $17 per pair **for exactly the same glove!**

To spur action, a manager collected one pair of all 424 types of gloves, attached the price, and placed them on the board room conference table. The vice-presidents were shocked by what they saw and immediately took action to change the company's procurement practices.

Here's what works to motivate action:

- Show others the need to change with a compelling object that they can actually see, touch and feel.
- Show people valid and dramatic evidence from outside the organization that demonstrates that change is required.
- Look for cheap and easy ways to reduce complacency and don't underestimate complacency, fear and anger. ■

Build the Guiding Team

The team you put together to guide change needs a sense of urgency. When there is urgency, more people want to lead, even if there is personal risk and few short-term rewards. But urgency isn't enough. Large-scale change does not happen without a powerful guiding force. A fragmented management team cannot do the job, and a hero CEO doesn't work either. There aren't enough hours in the day for even the strongest executive to accomplish change single-handedly. Your challenge is to put together an effective guiding team.

A powerful guiding group has two characteristics. It is made up of the right people, and it demonstrates teamwork. The "right people" are those individuals with appropriate skills, leadership capacity, organizational credibility, and the connections to handle organizational change. The "right people" aren't necessarily part of the existing senior management.

How do you build a team of the right people?

A single individual who feels great urgency usually pulls in the first people. The people selected create a team with:

- Relevant knowledge about what's happening outside the enterprise (essential for creating vision).
- Credibility, connections and stature within the organization (essential for communicating vision).
- Valid information about the internal workings of the enterprise (essential for removing barriers that disempower people from acting on the vision).
- Formal authority and the managerial skills associated with planning, organizing and control (needed to cre-

(continued on page 4)

The New and More Diverse Team

What happens when an organization moves from acquisition mode to one focused on organic growth? Here's how one company created a new and more diverse team to make the transition. The company had just ended an acquisition phase and found there were no remaining competitors small enough to buy. The deal-maker team had been small and like-minded. It was dominated by people with years of combined banking experience, but few of the skills needed to manage organic growth.

The team the CEO put together was incredibly diverse. It consisted of representatives from every major function: finance, human resources, corporate affairs, IT, regional leaders, and asset managers. Together, the team members represented the entire company. As a result, all viewpoints were represented, and decisions about the path to growth were balanced.

Build the Guiding Team

(continued from page 3)

ate short-term wins).

● The leadership skills associated with vision, community, and motivation (required for nearly every aspect of the change process).

As change progresses throughout the entire organization, additional groups are formed at lower levels. These teams help drive action within their units. Together, these groups form a kind of guiding coalition.

Making Meetings Work

Even something as mechanical as how a meeting is run is important when creating a team. How often should you meet and for how long? What will be on the typical agenda? Who will run the sessions? Are nonmembers welcome? Get the format wrong, and frustration grows. Get it right, and the group pulls together into a powerful force.

Poor meeting structure hurts particularly when a group is new. For example, a meeting at which important issues are discussed over and over with no resolution will drive the team crazy. Bad meetings undermine trust, especially with a new group. How do you avoid this? Stick to one topic per meeting. Put someone credible in charge. The person in charge of the unit or department to be changed has to be a central force in the guiding team. For the sake of the credibility of the effort and to avoid the constant threat of the boss pulling the plug on change, this is essential. ■

Get the Vision Right

In successful large-scale change, a well-functioning guiding team answers the questions required to produce a clear sense of direction. What change is necessary? What is our vision for the new organization? What should not be altered? What is the best way to make the vision a reality? What change strategies are unacceptably dangerous? Good answers to these questions position an organization to leap into a better future.

Unfortunately, guiding teams often have neither clear direction nor are they encouraged to embrace sensible missions.

One reason that smart people create no or poor direction for change is that they have been taught that "charting the future" means planning and budgeting. Truth is, when pursuing large-scale change, the best planning exercise is never sufficient. Something very different is essential. In those organizations that have successfully implemented large-scale change, four things have helped direct action in the right direction. These are budgets, plans, strategies and visions. All four are different yet tightly interrelated, and each requires a different development process.

The *budget* is the financial piece of the plan, and is a math exercise in numbers crunching. The *plan* specifies step by step how to implement a strategy and is a logical, linear process. The *strategy* shows how to achieve the vision, and requires accurate and up to date information about customers and competitors. And the *vision* shows an end state where all the plans and strategies will take you. Visioning requires the creativity to see possible futures. Your vision can fit on a page, while your strategy might take up ten pages. Your plans should fit in a notebook, while your budgets probably will require a large notebook and many meetings.

Bold Strategies for Bold Visions

Today's change visions are becoming bolder by necessity. More and more executives believe that their visions must include being an industry leader, being the firm that's first into new markets, or being the low-cost competitor.

Bold visions require bold strategies, and that's where many change initiatives fall apart. People without experience developing bold strategies can't figure out what to do next because it's so different from what they've done before. They sometimes back away from the obvious because it's threatening. Or they convince themselves that small modifications in their current ways of

(continued on page 5)

The Body in the Living Room

The change process needs to move forward quickly or it won't go anywhere at all. If you use a strategy of slow change, chances are organizational inertia will take over, no matter what your original vision.

Consider the advice a real estate agent gave a young professional who had stretched his resources to buy a sixty-five year old house that could best be classified as a "real fixer-upper." She told the buyer that he should immediately make a list of the things he wanted fixed, and get it done in the first six months of ownership. If he didn't, she predicted, it would never get done.

He told her he would take five years of slow improvements and get everything he wanted done, done. She said, 'No you won't, because after six months you get used to it. It seems to fit. You get used to stepping over the dead body in the living room." Five years later, he had to admit she had been right. What hadn't been fixed in the first six months never was. It's the same with "slow and steady" organizational change. What isn't done when the momentum is rising won't get done later.

Get the Vision Right

(continued from page 4)

operating will achieve the vision — eventually. They may even come to believe that the vision is useless because they can't come up with a strategic plan.

The key is to focus on speed. Talking yourself into a very slow change schedule can be disastrous. Nothing may get done! Remember that this is the twenty-first century world. The pace of external change is only going to increase. That means that internal change has to accelerate also.

How do you get the vision part right? Here's what works and what doesn't:

- Articulate a vision that is so clear that it fits on one page and takes less than a minute to share.
- Articulate a vision that's moving — such as a commitment to serve people.
- Create a bold strategy and move ahead quickly.
- Don't assume that logical plans and budgets are enough.
- Don't rely on overly analytical, financially based vision exercises.
- Don't rely on visions that just slash costs. These produce anxiety and depression, but rarely change. ■

Communicate for Buy-In

In successful change efforts, the visions and change strategies can't stay locked in a room with your team. They must be communicated with as many people as possible, who in turn must buy in. The goal: to get as many people as possible acting to make the vision a reality.

When we communicate about a large-scale change, common responses are: "I don't see why we need to change that much," "We'll never be able to pull this off," and "Are you guys serious or is this a joke?" In successful change efforts, the guiding team doesn't argue with this reality. Instead, they find ways to deal with it. They address anxieties, accept anger, and evoke faith in the vision.

Communicating the need for change through a Question-and-Answer session can be effective if done properly. Make sure employees are given a well-prepared presentation about the change effort underway and are encouraged to ask any questions. During the Q&A session, each presenter responds quickly and clearly, with conviction, and without becoming defensive. This demonstrates to everyone that the ideas aren't muddled, that the presenters have faith in the vision, and that those answering the questions think the changes are good.

Nuking the Executive Floor

When one company started talking seriously about its vision of becoming the low-cost producer in its industry, many employees thought the idea was outrageous. After all, the company's executive offices were very grand.

The executive offices had huge rooms, and the joke was that you could play a half-court basketball game in the chairman's office. Almost every executive office had an adjoining conference room and private bath. There was enough polished wood around to build a ship and expensive art on the walls, as well as a private elevator. But discussions got nowhere since redoing the space would cost more than leaving it alone.

When a new CEO took office, he nuked the entire floor. It was gutted, and the expansive offices were replaced by smaller, more contemporary spaces. He sold the art and opened up the elevator. The effect was powerful. The club atmosphere was gone, and the changes would pay for themselves in about two years.

To be effective, the change messages communicated to employees must be simple and heartfelt, not complex and technocratic. Then fear, anger, distrust and pessimism shrink. Feelings of relief and optimism grow. Employees begin to buy into the changes. They waste less time being angry or anxious. They start to take steps to make change happen.

Matching Words and Deeds

People in change-successful enterprises do a much better job than most in eliminating the destructive gap between words and deeds. Deeds speak volumes. When you say one thing and then do another, cynical feelings grow. When you speak of a vision of innovation and then reward people who come up with good ideas or when you talk globalization and then immediately appoint two foreigners to senior management, employees begin to take the message of change seriously.

Matching words and deeds is usually tough, even for a dedicated guiding team. Team members have to help one another. At the end of meetings, for example, they should ask, "Have our actions in the past week been consistent with our change vision?" When the answer is "no," they should ask, " What do we do now and how can we avoid the same mistake in the future?" With a sense of urgency, an emotional commitment to others on the team, and a deep belief in the vision, change leaders will make the personal sacrifices needed to make the message consistent with action. ■

For more information on how one company created a communications portal, go to: http://my.summary.com.

Empower Action

When people begin to understand and act on a change vision, you need to remove barriers in their paths. One example: Take away a pessimistic skipper and give the crew an optimistic boss.

Often the biggest obstacle to change efforts is a boss — an immediate manager or someone higher in the hierarchy. Subordinates see the vision and want to help, but are effectively shut down.

The supervisor's words, actions, or even subtle vibrations say, "This change is stupid." The subordinate, not being a fool, either gives up or spends an inordinate amount of time trying to maneuver around the barrier.

How can you overcome a reluctant boss who has become a barrier to needed change?

Try easing the reluctant boss' attitude through creative approaches. Remember, change can be difficult, especially for someone who has invested psychologically in the status quo. For a fragile and insecure person, change can cause fear, which in turn can lead to the person becoming immobilized. When change does come, the experience can be life changing as the person moves from being stuck in the past to leaping into the future. When seemingly immovable middle-managers feel sufficient urgency, develop sufficient faith in the people leading the change, and see the change vision clearly, they, too, will embrace it.

Removing the "System" Barrier

A second common source of disempowerment is the formal arrangements we often call *the system*. A decade or two ago, this would mostly have been overwhelming bureaucracy — but today the performance evaluation and rewards part of the system is often the stickiest problem.

Evaluations and rewards can disempower when they are at odds with the direction of needed change. "We want you to boldly leap into the future," is the communication, yet the system says, "Boldly leap into the future and you will receive ten cents if you succeed and a hammer on the head if you fail." Conversely, evaluation and rewards can empower people by identifying and compensating behavior that is required by the vision.

When we think of evaluation and rewards, most of us think of money. Few people believe they have all the money they need, and many struggle, even on two incomes. Thus, when there are no economic rewards for transformation, you have a barrier that is very powerful. But the addition of bonuses and raises does not necessarily motivate a change in behavior, nor does it necessarily convince people that if change efforts fail, they won't be punished. Other rewards that strike a cord can include contests and competitions, so long as they aren't cheap manipulations designed to avoid paying for performance. They must be worthwhile.

Removing Other Barriers

After years of stability, incremental change, or failed attempts at change, people can internalize a deep belief that they are not capable of achieving a leap. They may not shout, "I can't do it!" but at some level, they feel it even

(continued on page 7)

Three Don'ts for the Boss Barrier

When confronted with the "Boss Barrier" to change, most companies take one of three approaches. They either:

- ✓ **Ignore the barrier.**
- ✓ **Send the "obstacle" to a short training course.**
- ✓ **Fire, demote or transfer him or her.**

None of these approaches work. Ignoring the problem won't make it go away. A short training course is equally unlikely to work, since the barrier probably will cynically view it as just another part of the misguided change effort underway. And firing, transferring or demoting the culprit is likely to spread fear to others — hardly the atmosphere you are trying to create.

Manufacturing Movies

At one company, senior managers for years came to the factory floor to "inspect things." The plant manager only received instructions about what needed to be fixed. The visits were never positive until one day a division executive announced that there would be no more plant inspections. Instead, he insisted, the company had to empower the work force. At first, the workers agreed they needed to hold meeting to discuss improvements. These quickly deteriorated into "bitching" sessions. They finally decided meetings did no good, and decided to try something entirely different.

Two workers volunteered to be filmed going about their jobs. They started out following how one product was manufactured, capturing on film everything from getting the raw material to taking it off the production line and preparing to ship it.

As people watched the tape, they could see some of the problems. Workers literally walked miles around the plant to finish one piece of equipment. Workers wasted time getting tools out of cabinets one at a time when they could keep them close at hand. The tape let ideas flow freely as the teams rethought options that would make their jobs easier and safer. The film became a very important tool for the work force. It helped spawn good ideas.

Empower Action

(continued from page 6)

when it isn't true. We've all seen this. "No," thinks the 60-year old. "I'll never be able to learn to use the computer." But it's all in his or her head — an irrational and psychological block. Never underestimate the power of the mind to disempower, but don't underestimate the power of clever people to help others see the possibilities either.

Another important barrier to remove is the information barrier. Information is a source of power, and lack of information can disempower. One of the most powerful forms of information is feedback on our own actions. We are often remarkably unaware of how we spend our time, how we interact with others, and how we physically move about. When we do get feedback, it comes from another person, often sounding and feeling subjective, biased, or like a precursor to sanctions. So we end up with information that seems suspect. It need not be that way. ■

For a look at how one company "retooled" a manager to enable change, go to: http://my.summary.com.

Create Short-Term Wins

In successful change efforts, empowered people create short-term wins — victories that nourish faith in the change effort, emotionally reward the hard workers, keep the critics at bay, and build momentum. Without early wins that are visible, timely, unambiguous and meaningful, change efforts invariably run into serious problems.

In successful change efforts, an empowered group of people are very selective in how they spend their time. They focus first on tasks where they can quickly achieve results. These wins:

- **provide feedback to change leaders about the validity of their visions and strategies;**
- **give those working hard to achieve a vision a pat on the back, an emotional lift;**
- **build faith in the effort, attracting those who are not yet actively helping; and**
- **take power away from the cynics.**

Without these achievements, large-scale change rarely happens, and no matter how brilliant the vision and how needed the changes, they never take place.

Focus is Essential

In large organizations, a change effort may require hundreds of projects. When people feel urgency and are empowered to act, they can easily charge ahead on all fronts. With scattered attention, you might find the first win in two years — two years too late! Don't focus on 150 projects (as if you could!) Instead, pick four that are likely to get results.

Not all wins are equal. In general, the more visible the victories, the more they help the change process. If you have been a part of enough successful change efforts, you will understand the power of visible, meaningful and unambiguous wins. If you have not, you can miss the mark. Too often we create wins that we can see, but which others do not, at least not to the same degree.

The order of projects can also make an important difference in large-scale change efforts. You can choose to first target a problem based on a logic that seems rational but does not supply enough wins fast enough to build momentum.

For example, suppose the vision is globalization. One choice that seems rational is to work on the manufacturing piece before the marketing. Make it before you sell it. But building the Frankfurt factory can easily take two years, cost a hundred million dollars, and then another year to assess whether the company can handle its first German manufacturing facility. During this time, wins are hard to find.

A less obvious but better choice is to sell a product,

(continued on page 8)

The Senator Owned A Trucking Company

Here's what happened when a state transportation department implemented a change plan. The agency knew one of the state's senators also ran a trucking company. They approached him to see what the department could do to help companies such as his operate better, thus making the agency's vision of better service to those the agency regulated become a reality. The senator's immediate response was that he was angry the agency made him fill out 15 forms every year, many asking for the same information.

When the change team heard about the problem, they were reluctant to find a solution right away. They had other, bigger plans in mind for transforming the agency, and changing the way trucking companies provide information didn't seem to be urgent. They needed to battle entrenched interests, and redesigning forms didn't seem to be important except that the senator could be in a position to help them later if he saw they were serious about changing. Making truck licensing more efficient could be the early and momentum-building win they were looking for.

A month later, the process had been streamlined from 15 forms into one. The senator was impressed, and the team was enthusiastic about the prospects for real change. A short-term result got the change process in high gear.

Create Short-Term Wins

(continued from page 7)

then build it. Put together a marketing plan for Germany. Implement a plan at minimum cost with a product from Chicago. Achieve a clear success in less than a year. Choose your first success carefully. It must satisfy the basic criteria: visibility, meaningfulness, unambiguity and speed. ■

For a look at how the U.S. Navy underwent change, go to: http://my.summary.com

Don't Let Up

After the first set of short-term wins, a change effort will have direction and momentum. In successful situations, people build on this momentum to make a vision a reality by keeping urgency up and a feeling of false pride down; by eliminating unnecessary, exhausting and demoralizing work; and by not declaring victory prematurely.

The most common problem at this stage in change efforts is sagging urgency. Success becomes an albatross. "We've won," people say, and you have problems reminiscent of those in step 1. It's easy for those driving change to allow organizational urgency to drop, especially when short-term performance rises. Don't become frustrated, and resist the temptation to "beat up" on your people.

Early in a change effort, you generally take on some of the easier problems in order to establish a few wins and create momentum. Picking up every piece of furniture in a house at once and moving it across the street isn't necessary or feasible. There aren't enough movers. In a successful move, the lighter pieces — pictures and side tables — go first. But sooner or later, you are faced with the credenza. For a move to be successful, you can't stop half-way through. You have to persevere.

It's the same with a major organizational change effort. Simple courage and perseverance help. Better still, structure situations so that people can take risks to deal with difficult bureaucratic and political situations without having to put their lives on the line. Structure situations so that people can gain the power to take on the most intractable problem. Power here means more than authority — it means time, resources and access to get the job done.

Not Killing Ourselves

Deep into a transformation, even if urgency remains high, even if people want to take on the big problems, and even if they succeed in generating waves of change, they can still fail because of exhaustion. After all, key people not only have to do the old work to keep things going, but have to handle the additional work to create the future. The answer is really very simple: When you have too much work, jettison some.

Just how do you do that? Start by looking at day-to-day activities, and deciding if a particular task adds value and absolutely needs to be done. Identify and agree on what people can stop doing, and you won't feel so overwhelmed. This needs to be done as early in the change process as possible. Purge your calendar of everything that has no current pressing relevance. Stop the unnecessary Tuesday morning meeting that's been a fixture for five decades. Eliminate the six reports that you don't need. Teleconference instead of hitting the road. Delegate up, down and sideways. ■

For a look at how one company made drastic changes, go to: http://my.summary.com

Make Change Stick

Tradition is a powerful force. Leaps into the future can slide back into the past. Change sticks only if you create a new, supportive and strong organizational culture. A supportive culture provides roots for new ways of working. Making it stick is difficult. If this challenge isn't met at the end of the change process, enormous effort can be wasted.

Change is often held in place solely by a guiding team, a central player in such a team, a compensation system, an organizational structure, initial enthusiasm over the changes created by the changes, or even less. It may not seem that way. You may think you have built a sturdy house, yet not notice that the walls are being held in place by the construction crew. Eventually, the crew leaves, and gravity takes over. The culture isn't there to support the building.

Culture means the behavioral norms and shared values in a group of people. It's a set of common feelings about what is of value and how we should act. In large-scale change efforts, we use the power of culture to help make a transformation stick. It's hard, because creating a new norm means you need to change deeply embedded norms.

Make sure that the cultural changes you have worked so hard to create are passed on to new employees. Be sure new employees are introduced to the culture early on. Create compelling visions that help new employees become part of the company fast. And don't forget the new culture when you hand out promotions. The right promotions make those that truly reflect the new norms more influential, thus strengthening those norms. By putting into power those people who have absorbed the new culture, you create an increasingly stable and solid foundation. ■

The High-Speed Company

Creating Urgency and Growth in a Nanosecond Culture

by Jason Jennings
with Laurence Haughton

THE SUMMARY IN BRIEF

Best-selling author Jason Jennings knows that speed is the ultimate competitive advantage. But in 2015, companies of all sizes still struggle to adapt quickly. They know it's crucial to their future but need help to get everyone implementing speed and urgency at all levels.

Jennings and his researchers have spent years up close and personal with thousands of organizations around the world — figuring out what makes them successful in both the short and long term. *The High-Speed Company* reveals the unique practices of businesses that have proven records of urgency and growth. The key distinction is that they've created extraordinary cultures with a strong purpose, more trust and relentless follow-through. These companies burn less energy, beat the competition and have a lot of fun along the way.

Jennings shows how you can implement the same strategies that have made companies such as CoBank, O'Reilly Auto Parts, Grainger, Henry Schein, Google, and Johnson & Johnson great, including encouraging employees to make the right moves without hesitation, doing more to constantly innovate and bring in new customers, and being transparent about management decisions.

Breathe easier. Handle any hurdle. Get things done faster. That's the way of the high-speed company. Jennings shows you how to build and sustain your own.

IN THIS SUMMARY, YOU WILL LEARN:

- The key traits of high-speed companies — and why they outperform.
- How purpose drives high-speed companies.
- How to address the "immutable law of suckage."
- Why high-speed companies are defined by stewardship.

Introduction

The number one priority for business leaders today is creating organizations that work with a fierce sense of urgency in our crazy-busy world and keep their eye firmly fixed on growth.

In 2014 the consulting firm McKinsey published a report titled "Grow Fast or Die Slow," an analysis of the fates and fortunes of 3,000 software and Internet-services companies. The study concludes that companies that combine urgency and growth (groups growing 60 percent or more a year) deliver five times the returns to shareholders and are eight times more likely to reach $1 billion in revenues.

The report also confirms that companies that don't maintain that culture or take their foot off the pedal have only a one in three chance of ever getting back in the fast lane. Less than one in two companies get back on the growth highway at all after they stall. Most are acquired, downsize or go bankrupt.

High-speed companies breathe easier, burn less energy, are never frantic and get to the destinations they've chosen before the competition. Most have a lot of fun along the way. The key to their cultures of urgency and growth is that their leaders have figured out that speed is the thrill, exhilaration and pride that comes with getting rid of the misguided things that most companies do that end up slowing them down and getting them stuck.

Real cultures of speed and urgency are able to solve problems the first time, keep good customers from defecting, empower the 70 percent of all employees who say they're not engaged, allow people to admit mistakes, encourage people to improvise rather than waiting for direction from the top, reduce resistance to new ideas, get more cooperation and coordination across functions and titles, fill open jobs with people who like being fast, and do all of the preceding simultaneously.

It's not easy to set up a culture ready to execute at this level. It requires stretching your organizational muscles in a way you might not be used to — but it's the only way to set your company up for success today.

Purpose

Nobel Prize winner Milton Friedman declared, "There is one and only one responsibility of business, and that's to make as much money as possible." Business needs to do well, according to Friedman — not do good.

Believing that great leaders must focus on making as much profit as possible, do this any way they're able and leave it to others to do good works creates a major obstacle for any business that wants to become a high-speed company. Companies with a proven record of urgency and growth have torn down that figurative wall between doing well and doing good.

Hundreds of companies of all sizes and across all industries prove the first step to building an organization with a sense of urgency is identifying a purpose that attracts, unites, ignites and fuels people. That purpose needs to address doing good outside the company with the inferred promise that benefits will accrue to those inside the company as well.

A sense of purpose begins with the person in charge, be it the owner, founder, CEO or manager. Purpose might also naturally occur to a very small group of people who are about to start a venture together. Crucially, it's not something formulated by a committee, and it's definitely not the result of a joined-hands kumbaya exercise conducted and voted on at an offsite retreat.

Creating and Cascading Purpose

As the leader of a large company, a small business, an entrepreneurial start-up or a division within a company, you can find your purpose by reflecting on why the company was founded or on a moment when the company did something good or touched a customer in a profound way. Was it something a customer said? Are you remembering a time you swooped in and made a bad situation better? Was it an accomplishment the cynics said was impossible? The leader holds the establishment and protection of purpose in his hand, though the team has to support and execute.

Keep It Brief: You must be able to state your purpose clearly to another person and evoke a strong emotional reaction in only a few words.

Make It Memorable: Way back in 1930, Mike Cullen, an employee of Kroger Foods, wrote a letter to the company's president, Bernard Kroger, proposing a new type of store called a supermarket that would offer low prices on consumables but wouldn't offer delivery or allow customers to charge their groceries to store accounts. He never received an acknowledgment or answer from Kroger, so he took his life savings and moved his family to Long Island, where he opened America's first supermarket. What gave Cullen, his family and his employees the grit they needed to revolutionize the grocery industry? A clear purpose: "to become the world's greatest price wrecker."

It's Great to Be Foolish: What's big enough and important enough to you that you're willing to look (or feel) foolish for persisting and persevering?

Get Your Senior Team on Board: Unless all the senior leaders believe and are seen as believing in the same thing, the company will eventually become filled with discord and subversion and eventually go off the rails or implode.

Hire Only Those Who Believe in the Good You're Trying to Do: James Archer, founder of Multi-Chem, says, "Hire hard and manage easy. When you hire people of integrity who are capable of doing the job, want to be part of what you're trying to do and share your purpose, you don't need a lot of rules. Rules are for the 2 percent of people who need them. We'd just rather weed those people out before hiring them."

Give the People the Why and They'll Give You the How: If you want to build and lead an enterprise with a culture of urgency and growth, the only proper and logical starting point is to begin by making certain that everyone knows and believes the company's purpose, the why. It will change your destiny. Bob Engel, CoBank's CEO, said it best in sharing his insightful observations on purpose: "When people know and buy into the why, they'll figure out the how."

Principles and Values

Guiding principles are rules that leaders use to select the tactics they're going to use. Think of them as the "shalls" and "shall nots" of the company culture that keep everyone true to their stated purpose.

Without guiding principles, companies end up clutching any available tactic in order to try to hit their numbers. Just as you would never build a house without a foundation because it would topple, trying to have a culture of urgency without a set of guiding values will ensure only that the company is in constant turmoil and eventually will careen out of control.

Creating and Cascading Your Guiding Principles

Guiding principles should be simply stated and easy for everyone to understand but based on tremendous underlying wisdom. Each should be broad enough to guide actions at every level, from the shop floor to the C-suite, yet specific enough that people can see where they are accountable. They should be inspirational and memorable enough to make your people proud of this call to action.

Make a Short List: You don't need more than five or six guiding principles. State each guiding principle in as few words as possible, and then hang some flesh on the bones with a brief explanation that provides context.

Buy-in at the Top: One of the best ways of gaining buy-in from the rest of the top leaders is by involving them in the creation and drafting of the guiding principles. Committing your guiding principles to paper shouldn't take long. Chances are good that there are already a number of values you share.

Flow Guiding Principles Through the Company: If you're leading a small company, the best way to move the guiding principles down through the company is in a series of one-on-one or small-group meetings. In a large enterprise, it's better to opt for a gathering of the top leadership and have the top dog present the guiding principles.

Post Them Everywhere: If it's true that calling someone a horse 10 times means they'll start looking for hay, then the same applies to guiding principles. When they're everywhere around people and when they encounter them scores of times throughout their typical workday, it's inevitable they'll eventually sink in.

Celebrate Them: Start every staff meeting by singling out someone who scored a win through the use of your guiding principles. Or feature on the front page of your website the employee of the month who best exemplifies living your values and putting them into action.

Get Rid of the CAVE people: Despite your best efforts to help them out, one of the big challenges occasionally faced by leaders is facing card-carrying members of Citizens Against Virtually Everything. These are the whiners, whingers and complainers who believe that yesterday was better than tomorrow and that the company's best days were in the past. Go ahead and counsel them one more time; try to get them on board. But if you fail, they need to leave. Do it for cause, do it legally and do it quickly.

The Customer

By the time a company recognizes it sucks, it has sucked for a very long time. That's our immutable law of suckage. We call the law of suckage "immutable" because it happens to companies in all industries. All those top executives in organizations currently circling the bowl, and the ones that have already gone down the drain, failed to see that their companies sucked before they started massively hemorrhaging customers and their suckage soured their remaining client relationships.

Topping the list of guiding principles at companies with cultures of urgency and growth is the critical importance of anticipating and then exceeding customers' expectations. Whatever a client expects must be delivered, and when it's not, that has to be noticed and resolved with absolute urgency.

You need to get close to the customers, discover how they live their lives, and learn their hopes, needs, wants, aspirations and dreams. Only then can you have the understanding and the motivation to exceed your customers' expectations and totally satisfy them.

Creating and Cascading 'Customers First'

How do you stay ahead of the immutable law of suckage and stay tuned to your customer in order to keep your company nimble?

Know the Value of Your Customers: In order to think fast and move faster and grow the business, you need to do a checkup from the neck up. Your checkup starts with understanding the immense value of a regular customer. Here's an easy formula for determining the value of a customer: Average value of a transaction x Average number of repeat transactions annually x Years of average (or potential) retention rate = Lifetime value of a customer. Any business can generate sufficient data to determine the annual and lifetime value of a good customer.

Implement a Good Listening Program: No organization will ever become a high-speed company without having an institutionalized program of listening to the marketplace.

Learn to Say You're Sorry and Show You Mean It: If you want to avoid defections and recover from outrage and regret your company created when you failed to deliver what was expected, Bob Engel of CoBank says you've got to learn to say you're sorry for a misstep and show you mean it. Here's his advice:

- Use your "A" team.
- Listen, really listen.
- Don't jump to resolutions.
- Take heavy action.

Ban That Other F Word: Like the little kid who keeps pestering from the backseat with, "Are we there yet?" business has too many people who are always wondering, "Are we finished yet?" No business that hopes to keep thinking fast and moving faster will ever be finished when it comes to completely satisfying its customers. As expectations are met, customers want more. You are never finished combating suckage.

Transparency

According to the 2014 Edelman Trust Barometer, only one in five people believes business leaders tell the truth and make ethical and moral decisions.

Because employees across demographics tend to distrust business and business leaders, they're less likely to quickly adopt new thinking and follow through on new ideas. Only when you find a way to gain people's trust and get more buy-in can speed become your competitive advantage.

Creating and Cascading Transparency

Here are the steps you can take toward greater transparency and destruction of cynicism, things you can do that will make a huge impact by fostering openness among your team.

Connect the Dots: Everyone who works for you should know how their role creates value for the company. They should especially learn the economic value they create and how it can be measured (by you and them).

Stop All the "Closed-Door" Nonsense: In most instances, policies like keeping secrets, operating with a "need to know" mentality and asking people to sign nondisclosure agreements have gone over the top and exist only to confer special status on a few, to let them feel more special than the people they lead. This practice perpetuates the hierarchical BS machine the company has built. Such people's secrets, not their accomplishments, are the only things that allow them to feel important. You can't have transparency when paranoia is an integral part of the culture and everything's hush-hush.

Make Every Directive Clear: Transparency starts with clarity. A great step toward transparency in any organization is to say, "I don't know" when you don't know. Ask your team or fellow leaders for help or feedback. If you need time to formulate clarity of strategy, say so!

Keep It Simple: Physicist Michio Kaku believes that scientists must keep everything simple. He recommends that his peers accept Einstein's directive: "If you can't explain a theory to a child, it is probably worthless." That's good advice for everyone in business too.

Make It Okay to Make Mistakes: Making mistakes isn't a sign of poor leadership — and allowing your team to make, report and learn from mistakes in a united, fast-moving environment is a sign of great leadership. Fast companies gain velocity by making it okay to make mistakes, by being careful to learn from their failures.

End the Spin: Most people have great BS meters and are smart enough to know when they are hearing something authentic and when they are getting snowed. Every time you spin the truth or deceive them, you make them a little more cynical. In our nanosecond culture, you are better off being known as an honest, straight shooter than an evasive, double-talking politician.

Thank People for Their Vigilance: College students are 10 times less likely to cheat when they can see themselves in a mirror. In business, the concept of the mirror is one of the powerful tools for getting things done right faster; 360-degree feedback is a great mirror, as is the offsider (the trusted associate who will tell you your baby is ugly). Best of all is a boss who has a direct line encouraging straight talk about everything.

Systematize Everything

Over the last seven years, spurred by the financial meltdown of 2007 and global recession of 2008, high-speed companies have connected some dots that their slower and less adaptable competitors have not. The most successful companies understand that to make every part of business more reliable, productive and teachable, to quickly and dramatically speed things up and improve results for customers, workers and leadership, they need to systematize everything.

The steps of systematization are standard for any job at any level. High-speed companies start with a clear, specific, and measurable outcome and then examine the actions that currently produce the outcome, consulting data and history and looking for waste (of time or money) or gaps in the outcomes achieved. Then, by asking lots of questions, considering a lot of fresh ideas and consulting its guiding principles, the company aims to map out the best way to get to a desired outcome.

Good systems have four components:

- They offer the best way to achieve a specific outcome.
- They require that everyone receive training.
- They don't allow deviation.
- They offer a baseline for continual improvement.

Creating and Cascading Systematization

Here are four simple steps that guarantee the closest thing to flawless follow-through anybody has ever seen:

1. Involve the Top Dogs. There are three critical reasons why the top man or woman must be part of the systematization efforts: They and they alone negotiate the expectations outside the firm; they have the power to protect the tender green shoots of success; the CEO must also be the CGO — Chief Grit Officer. Grit is the ability to maintain momentum long after the mood has passed.

2. Select Your Fastest People. Eighty-three percent of people will sit on their hands at the introduction of any change in routine. Once you've decided to launch your systematization overhaul, you need to find enough 17 percenters to pitch in and make it work. They're the people who welcome change, show initiative and are the first ones to raise their hands and shout, "Pick me, boss, pick me!"

3. Choose a "Wow" Event. To melt resistance and get people off their hands, you need a powerful success story, one that will make people believe in the power of systematization and get them amped to apply systematization in other parts of the business. It can be small, just not insignificant. The idea is to get people to say, "Wow."

4. Follow Through Quickly. Coolertown is the space in the break room around the watercooler. That's where politicians hold their whispering town halls, explaining to anyone who will listen why things can't change and

won't work out as leadership wants. By nature, these people move slowly and hate speed. So when you actually follow through fast, you can catch them flat-footed. Before they are able to create fear, uncertainty and doom, you've already provided real examples of success and exuberant advocates from your organization's rank and file.

Always Let the Best Idea Win: Search for good ideas relentlessly. Ask, "Who has solved this problem or a problem with similar features?" and bring in outside voices. Adopt an inquiry mode of discovery, asking yourself and your team questions that draw out possibilities rather than shut down people who express unconventional opinions. Ban negativity in your problem-solving discussions. Statements like "I'm fundamentally opposed to that" or "We tried that and it didn't work" or "Let me play devil's advocate" have no place in this world.

Communication

If you believe that one reason high-speed companies are fast is because they do a good job of communicating from the top down, you're not wrong. But if you believe terrific top-down communication is the result of the "I talk and you listen" practiced by executives at most companies, you're mistaken.

The greatest leaders, those committed to building faster organizations, know there's no way to lead anybody anywhere — much less to do so quickly — without knowing where each person wants to go, how soon he wants to get there, what he is willing to invest to get to the destination and his level of commitment to the team.

Creating and Cascading Better Communication

Consider the following suggestions for how to communicate in your company.

Check Yourself: People have really good BS meters. Don't try to fake sincerity. If you can't bring your head and your heart to the discovery conversation, you're better off postponing or getting someone to help.

Timing is Everything: Don't try to have a discovery conversation in an office or cube without privacy. Open doors, constant interruptions, devices ringing and pinging, and people poking in for a quick response to a question aren't conducive to the flow you're trying to achieve.

Be Vulnerable: Most people will at least temporarily suspend any sense of disbelief when you approach them with the following: "Carol, I think I'd be able to be a better leader and help you get to where you want to go if I knew a little more about you and learned where you want to go and what you want to achieve in life. Can we spend some time talking about you?" In this case the two parties have both just made themselves a little vulnerable, the boss by saying she'd like to be a better leader and the employee by agreeing to the conversation.

Repeat What You've Heard: When you hear something that's potentially important, use a small gesture to pause the conversation and say, "I want to make certain I understood what you just said. Did I hear correctly that ____?" When you repeat information, you'll stand a better chance of remembering it.

Tie Their Goal to Yours: When you know what people want to achieve, you're able to (and should) employ every tactic of a great sports coach: Cajole, push, challenge, remind them of the championship they said they wanted to win, and passionately care about their getting to where they said they wanted to go.

What Are They Prepared to Invest? Once you've truly listened and heard about their hopes, dreams and aspirations, there's a final question you need to ask: "What are you willing to do, what are the things you're prepared to do to achieve what you say you want to achieve?" Their answers to questions about what they're prepared to commit and undertake will speak volumes about their character.

Hear Them, Then Lead Them: No matter who you are, you'll inspire more, motivate better, engage your team, and get people to put their hearts into being faster and following through when you ask great questions, learn everyone's story, commit to helping them reach their potential and connect the group's goals to where each individual wishes to end up.

Accountability

We've all seen accountability work miracles. It directs attention, focusing people toward completion of relevant actions and away from irrelevant tasks. It motivates individuals to search for new knowledge as well as to use all their current capabilities. Employees who are accountable to themselves, their teammates, their bosses and the organization for specific, measurable goals learn more new things than those who feel less responsibility for specific outcomes.

And when individual accountability is teamed with timely and relevant feedback from supervisors, especially feedback that shows how individual goals affect the outcomes of others, groups become more cooperative and coordinated, more likely to initiate problem-solving com-

munication to overcome obstacles and achieve the group's goals on time.

Creating and Cascading Accountability

Do these things consistently, and eventually you'll have a cult of clarity and engagement and a high-speed company that outperforms the competition.

Prioritize Fanatically: If you want to be an effective executive, Peter Drucker advised in his famous book of the same name, do "first things first and second things not at all." Time is a leader's most limited resource, and according to Drucker, that means managers have to really prioritize.

Be Obsessive About Clarity: As the leader, it's your role to serve as the destination expert, constantly reminding everyone about the importance of his or her role in reaching the places the business is trying to reach, the good you're going to do, and how you're making the world a better place for your customers and your employees through your company's work.

Negotiate All Expectations: The most successful leaders have learned that they need to manage both up and down, leading both their bosses and their subordinates to be more effective. Often they must turn the vague, general and conflicting goals of their bosses into specific, measurable and agreed targets so they can give their people clear directions. It's a lot of work and requires strong communication skills.

Give Competent Feedback: All year long people need to adjust, tune, get refreshed and put things in their proper perspective. Critiques can't really help if you get them in one big dose with the year-end performance review. It's just common sense. To sustain life, food needs to be consumed daily. The same is true of feedback. Even more important than regularity is that critiques be helpful, useful and knowledgeable.

Prosperity

Companies committed to the financial prosperity of their workforce have five traits in common. They are committed to consistent growth, quick advancement of talented team members, a culture of abundance, a fierce sense of fairness and security for team members.

Consistent Growth: If you fail to grow, you'll fail to create prosperity for your workers. The two are inseparable. Growth, therefore, must always be the top priority in a high-speed company.

Advancement: According to 2014 research reported in *Forbes*, an average of 2.5 million people wave goodbye to their boss each month in the United States. Turnover and employee churn are the enemies of cultures of speed and growth. Vast amounts of time and resources are spent on screening, hiring, training and trying to bring up to speed replacement workers. The best way to make certain that the entire workforce is aware of opportunities for advancement within a company is by practicing what you preach. If you truly have a policy of promoting from within, do it and make each promotion a cause for celebration.

Abundance: Leaders who don't believe there's enough to go around become takers. Eventually they will be surrounded by others who share their negative view of the world. These are not good ingredients for building a fast company.

Fairness: High-speed companies with cultures of urgency and growth are much more egalitarian in nature. There's nothing wrong with CEOs and senior leaders being justly and highly compensated for the economic value they create. What isn't right is when a few folks at the top have looted the coffers, and there's nothing left to compensate everyone else in the organization for the value they've created and provide them with a path to further prosperity as well.

Security: In recent years, knowing you'll even have a job tomorrow has become an important part of prosperity planning for people. Prosperity planning at O'Reilly means quickly promoting and rewarding workers as soon as it's become obvious they've bought into and become part of the culture and have mastered their jobs. Greg Henslee says, "Once people show us, 'Hey, I can do this job,' we say, 'Well, maybe they can do this other job too,' and we promote them and give it a try."

Creating and Cascading Prosperity

Companies that provide the right people challenging work, constant opportunities for advancement, fair compensation that acknowledges the value they've created, a solid benefits package that doesn't favor only a few at the top, stock or shadow stock options and/or a chance of buying in and becoming an owner, and thanks for a job well done will attract and keep the right workers.

What Would You Invest? Now it is your turn to prepare people to do their part in creating prosperity. Here are questions you should ask:

What would you like to be earning in the next 12 months? In 24 months? In five years?

What new responsibilities or professional advancement would you like to achieve in the next two years and in five years?

What do you believe are your top three skills that would qualify you for the kind of promotion you would like?

What do you need from me?

How can I help you?

What you are looking for here is for your direct report to help you construct a road that includes your participation as his leader.

Stewardship

The people who lead the fastest and best-performing companies don't see the world's problems, opportunities, rewards and costs through the lens of what these things mean to them. They understand that true happiness and satisfaction come when we focus on others. They are, at heart, caregivers who see their purpose as being the best stewards of the resources, both tangible and intangible, that have been entrusted to them and making sure that all assets are used efficiently, effectively and profitably.

Stewards share the understanding that their work and their effort are mostly about other people: inspiring them, celebrating them, serving them and genuinely liking them. They also have a humble understanding that their mission is to improve the well-being of five different groups: workers, customers, vendors and suppliers, investors and owners, and society.

A steward's purpose in a high-speed company is to cultivate assets and grow them successfully for the benefit of employees, customers, investors, suppliers and society. Assets are both tangible things like equipment, patents and customers and intangible things like how-to knowledge, brand reputation and great relationships. Stewards look to improve such assets through thoughtful action, sowing the right seeds, adding necessary nutrients to the environment, removing things that inhibit growth, reducing resistance and generally advancing the potential growth of the firm so they can provide a good return on investment for those same five groups.

Creating and Cascading Stewardship

Stewards starve the wolf of negativity, cynicism and bureaucracy. In contrast, they feed the wolf of adaptability and respect.

Adaptability: Jim Ryan, Grainger CEO: "You have to adapt to customers. Anything they buy from us they can go down the street and buy from someone else," he says. "We live and die based on our ability to deliver better and exceed expectations. But expectations are a moving target. The needs of customers change, behavior changes and the competitive environment changes. The challenge is to keep the cornerstones of our culture strong while we flex, adapt and grow."

Respect: Showing respect starts with what you believe is going on inside other people's heads. Do you believe most people are trustworthy? Do they like responsibility, or do they shirk it? Do you think most people prefer to work rather than sit idle? Do they want meaning from their daily work, or is it just about a paycheck for most of them? Do they like to learn, or is that just too hard? Finally, do you believe most people will resist or embrace adapting and bettering themselves? Your beliefs influence how you communicate, what you read between the lines, and the respect or lack of respect that is implied when you communicate freely or cut off any input.

It's time for you to ask yourself two important questions. The answers will reveal not only the real you but also how ready you are to lead a high-speed company that will be able to withstand the tests of the marketplace and of time.

1. Is everything mostly about you or mostly about others?
2. Are you ready to be a good steward in everything you do?

If you decide that you're prepared to be a good steward in all you do and everything you undertake, the only Fast Task you need to do is to pick one time every day to briefly renew the promise you've made to yourself and say, "I will be a good steward in all that I do."

THE SUMMARY IN BRIEF

Organizational leaders need a new approach in this era of relentless innovation, global crises, ferocious competition, and unstoppable disruption. Organizations need to adopt a new approach to change management by recognizing that they function as complex ecosystems rather than machines or social networks. In ***The Hive Mind at Work: Harnessing The Power of Group Intelligence to Create Meaningful and Lasting Change***, a powerful analogy between organizational change and the behavior of a bee colony is explored. The book emphasizes that organizations should be viewed as complex ecosystems rather than machines or social networks. The concept of group intelligence (GQ) is introduced as a more effective model for navigating the complexities of organizational change.

Drawing on the Hive LENS framework — Looking Beyond, Experimenting, Nudging, and Strengthening — the book illustrates how leaders must understand and leverage group dynamics to foster meaningful, long-term change. Key examples from industry leaders highlight how organizations can thrive by viewing themselves as interconnected systems where every part plays a unique role in the transformation process.

IN THIS EXECUTIVE BOOK SUMMARY:

- Recognize organizations as ecosystems requiring group intelligence (GQ) for successful change.
- Apply the Hive LENS model to drive meaningful, lasting transformation.
- Understand and leverage group dynamics to foster long-term shifts.
- Cultivate a balanced environment for adaptation and continuous progress.

EXPLORING THE HIVE'S WISDOM

Organization's change failures usually stem from two conventional ways of thinking about transformation:

1. Organizations function like machines, where managers can "fix" problems with an engineer's mindset (intelligence quotient or IQ).
2. People form social networks wherein individual influencers can make change happen by developing effective interpersonal relationships (emotional quotient or EQ).

This book introduces a third option: organizations are complex ecosystems that require a Hive Mind or group intelligence (otherwise known as group intelligence quotient or GQ) to get optimal results.

Major organizational change is complicated. It often requires groups of people to change: frontline employees, managers, executives, customers, potential customers, suppliers, investors, community members, and government bodies.

Organizations as machines: This traditional mindset views change through a mechanistic lens, treating organizations like machines that can be adjusted with technical precision.

Organizations as social networks:This emphasizes the importance of relationships and emotional intelligence (EQ) in driving change. Here, individuals are seen as nodes in a web of relationships, and change is driven by understanding and influencing those connections.

Organizations as ecosystems: A third option recognizes that organizations are more than machines or networks — they are living, adaptive ecosystems. This perspective focuses on understanding how all parts of the organization interact within their environment.

Leaders must develop group intelligence (GQ), focusing less on individual behavior and more on how the collective operates. Change is complex and requires time, patience, and an understanding of group dynamics. Leaders must learn to embrace the interconnected nature of organizations to drive lasting change.

Embracing this ecosystem approach, leaders can shift away from the rigid control of the machine metaphor or the hyperfocus on individual behavior from the social network view, instead fostering environments where the collective intelligence of the group can thrive.

CREATING A COMPELLING CASE FOR CHANGE

Bees instinctively understand the need for preparation when facing change. When the hive becomes overcrowded, the queen, along with half the colony, sets out to establish a new home. Worker bees carefully plan for this transition, constructing cells for new queens, and preparing the old queen for her journey by ensuring she is lighter and ready for travel. This meticulous process ensures the hive's survival and success.

In contrast, corporate leaders often fail to lay the necessary groundwork for change, leading to costly failures. A striking example is Apple's botched 2012 launch of Apple Maps. In its haste to compete with Google Maps, Apple rushed into a highly complex market without thoroughly considering the nuances. The lack of preparation tarnished Apple's reputation, demonstrating that reacting impulsively to a competitive threat can do more harm than good.

To create a compelling case for change, leaders must resist the temptation to react hastily, especially under pressure. Thoughtful planning, understanding the intricacies of group dynamics, and anticipating challenges are essential. Without a well-crafted vision, organizations risk making impulsive decisions that lead to inefficiency, financial losses, and damaged reputations. Leaders must take the time to envision a better future, build a solid case for change, and guide their teams toward success with clear, deliberate actions.

TESTING NEW FLIGHT PATTERNS

In the late afternoon light, as a swarm of bees leaves their overcrowded hive, they settle temporarily on a nearby branch. Time is of the essence — they must find a new home quickly or risk disaster. The bees don't rush into a decision but rather collect information from many sources, weighing the best options before selecting their new home. This thoughtful, experimental approach to change is crucial for survival.

Amazon founder Jeff Bezos embraces this same mindset. Despite the failure of the Fire Phone in 2014, Bezos saw it as a learning experience, leading his team to ultimately create the successful Echo. By encouraging experimentation, Bezos allowed Amazon to continuously adapt and thrive.

Too often, leaders attempt change using a rigid, step-by-step approach that ignores the complexities and unpredictabilities of real-world environments. Organizations must experiment with new flight patterns before committing to

For change to resonate across and entire organization, leaders must also generatate excitement and communicate effectively.

major changes. This requires shifting from a traditional Production Operating Model, focused on daily tasks, to a Change Operating Model, where every team member takes on a role aligned with the larger transformation effort.

Successful companies like Amazon, Apple, and Microsoft have all embraced this experimental, adaptive approach. By redesigning roles and fostering innovation, they've led their industries, proving that meaningful and lasting change is achieved through careful planning, experimentation, and continuous measurement.

MAKING THE CRITICAL CHANGE DECISIONS

When a colony becomes too crowded, the bees instinctively know it's time to split and find a new home. Through a collective process of gathering and evaluating information, the hive makes the best decision for its future home, ensuring survival and success.

David Novak, former head of marketing at Pepsi, learned a valuable lesson about the importance of collective wisdom after the failure of Crystal Pepsi. Despite warnings from others within the company that the product wasn't up to par, Novak pushed ahead, believing he knew best. The result? One of the most memorable marketing flops of the 20th century.

Successful organizations rely on the collective intelligence of their teams. James Dyson, for example, didn't single-handedly develop the Dyson Supersonic hair dryer. Instead, he activated a Hive Mind of over 100 engineers and experts who worked together, eventually leading to an award-winning product. This concept of "emergence" emphasizes that change doesn't come from one individual; it comes from the interaction of all parts of the organization working together.

The key to meaningful change lies in empowering those closest to the work to become creative problem-solvers. Organizations that resist bureaucracy and allow their employees to act independently can streamline operations and achieve record-breaking success.

For change to resonate across an entire organization, leaders must also generate excitement and communicate effectively. Leaders must similarly craft messages that are clear, concise, and compelling to ensure that the Hive Mind remains aligned with the vision for change.

Ultimately, leaders who embrace the collective intelligence of their teams, eliminate bureaucratic obstacles, and communicate effectively will foster an environment where change emerges naturally, leading to lasting success.

EMERGING HIVE-WIDE LEADERSHIP

During a hive's transition to a new home, each bee plays a vital role. Similarly, human organizations need every member to step into their change leadership roles when navigating transformations. This was a hard lesson learned by Jamal Jackson, the newly appointed CEO of AAADoorShop, who was tasked with making the company more competitive.

Jackson initially believed that as CEO, he could bring about the change single-handedly. However, he quickly realized that even the most charismatic leaders can't enact meaningful change alone — they need the support and leadership of the entire organization.

The key to successful change lies in understanding the four critical leadership roles: Delivery Leader, Performance Coach, Business Strategist, and Change Leader. Leaders must fluidly transition between these roles as needed, depending on the situation.

Leaders must avoid three common mistakes: carrying change passengers (people disengaged from the process), playing the Puppet Master (micromanaging), and failing to live by their organization's values. Leaders like Jackson who can overcome these pitfalls, empower their teams, and lead by example can drive meaningful, lasting change.

NUDGING THE HIVE FORWARD

After surviving a perilous night on the exposed branch, the bees know they have limited time to reach their new home.

Their urgency is clear, but instead of chaos, they nudge one another with gentle headbutts and high-pitched beeps, signaling it's time to move.

Similarly, change within human organizations often requires a gentle nudge rather than force.

Many leaders mistakenly believe that pressure and urgency are the keys to successful change. Some even use the "burning platform" approach, setting a fire under their teams, hoping fear will spur action. But this tactic is counterproductive. When leaders push too hard, it often ignites resistance rather than progress.

Take the case of Juliette Garnier, CEO of Metro City Hospital, who faced backlash after aggressively imposing a 10% budget cut on already strained departments. The result? Silent resentment followed by a planned nurses' strike. It wasn't until she softened her approach — asking for collaborative solutions — that her team came together and proposed a savings plan that improved efficiency without sacrificing patient care.

Leaders must also be prepared for objections and resistance, as was the case with Toys "R" Us, whose leadership resisted change and ultimately failed. Management blocked employee suggestions, clinging to outdated strategies until the company was forced into bankruptcy.

Had they nudged their business model forward in response to shifting customer behaviors, their story might have ended differently.

It's not just external forces but also internal assumptions that can block progress. When Clancy Builders resisted adopting new technology, their general manager, Aisha Sultan, didn't push back; instead, she nudged her team forward by piloting the new system on a small project. Once the benefits were clear, the entire company eagerly adopted the change.

In complex ecosystems, where every change can trigger a ripple effect, nudging is more effective than pushing. It's about understanding the interconnectedness of the system and guiding it forward with subtlety and care. Leaders who adopt this approach will find themselves guiding their organizations to meaningful and lasting change without the backlash that comes from pushing too hard.

REACHING CRITICAL MASS

As the sun rises and the bees swarm toward their new home, they embody a crucial phase in any change process: reaching critical mass. Much like a bee colony uniting to occupy a new space, successful leaders help their teams hit a tipping point where change takes root and spreads throughout the organization.

This tipping point, where small shifts lead to widespread transformation, is vital for momentum. Leaders need to nurture this moment carefully, ensuring that the energy and excitement don't fade into cynicism or inertia.

The same principle applies in the business world, where harnessing group intelligence can yield dramatic results. Take Nik Robinson.

With his company Good Citizens, he didn't just create sunglasses from recycled plastic bottles; he created a viral change movement that captured people's imaginations. His persistence paid off when his sustainable sunglasses were displayed alongside luxury brands at Selfridges.

Symbols, too, play a critical role. They help translate abstract concepts into something tangible and memorable. At Lego, the "war room" symbolized the company's fight for survival, rallying employees to work together and turn the company around.

Rituals further cement these changes. Just as Amazon's "6-pager" practice transformed how employees communicated new ideas, rituals help groups internalize and repeat behaviors until they become second nature. These daily habits, honed through repetition, build the confidence needed to sustain transformation.

In the end, reaching critical mass in any change initiative requires thoughtful leadership. Leaders must deploy stories, symbols, and rituals to guide the swarm, helping the group coalesce into a powerful, unified force for change.

Only then can they nudge the organization toward its tipping point, where momentum takes over, and lasting transformation becomes inevitable.

ALIGNING TECHNOLOGY AND PROCESSES

As the bees reach their new home, they instinctively know that constructing the right infrastructure is critical to their survival. In the same way, organizations embarking on transformation must ensure they have the proper systems, processes, and tools in place to support and sustain the change.

Even when new systems are introduced, people can slip back into familiar routines, derailing progress.

Chipotle's journey from crisis to recovery is a prime example of how essential it is to strengthen internal structures. After foodborne illnesses struck hundreds of customers, the company turned to food safety expert Mansour Samadpour. His efforts mirrored the bees' precise construction of their hive, as he implemented new safety protocols, centralized food preparation, and enforced wellness checks.

Clear processes and procedures are vital to the health of any organization. They act as the foundation that supports change. Toyota's renowned Toyota Production System (TPS), with its emphasis on jidoka (automation with human oversight) and just-in-time production, exemplifies the power of well-designed processes to drive a company forward. Through its meticulous adherence to these practices, Toyota grew from a small operation to a global powerhouse.

In the digital age, embracing technology can be the catalyst that accelerates transformation.

However, having the right tools is just as crucial as adopting new technologies. When Southwest Airlines faced a massive operational meltdown during the 2022 holiday season, it became clear that outdated systems hindered their ability to respond to crises.

Tracking progress is another key aspect of ensuring success. Organizations must use data and metrics to monitor their transformation. Hershey CEO Michele Buck exemplified this by setting measurable goals for diversity and inclusion within the company. By tying progress to executive performance, she ensured accountability and maintained focus on the company's goals.

By designing clear processes, embracing technology, using the right tools, and measuring progress, leaders can guide their organizations toward lasting success.

MAKING THE CHANGE STICK

Just as the bees tirelessly forage for nectar in preparation for winter, ensuring their hive's long-term survival, so must organizations press forward to make lasting change. Satya Nadella's leadership of Microsoft is a prime example of this relentless pursuit of innovation.

Taking over in 2014, Nadella transformed Microsoft from a company stuck in old patterns into a $1 trillion tech giant by consistently reinforcing a new path focused on collaboration and reinvention. Despite reaching such heights, Nadella warned his employees that resting on past successes would lead to decline, emphasizing that they needed to keep moving forward.

Old habits are tough to break. Even when new systems are introduced, people can slip back into familiar routines, derailing progress. This was evident at ANZ bank, where, despite years of improvement in customer satisfaction and profitability, old self-serving behaviors resurfaced, causing a setback.

Leaders need to be vigilant against these old patterns and maintain a focus on group behavior, knowing that the group's ecosystem is interconnected and dynamic. By understanding the complexity of group dynamics and adopting new approaches, change leaders can prevent reversion to outdated ways.

Siobhan McHale has worked across four continents, helping thousands of leaders to create more agile and productive workplaces. She also has been on the "inside" as the executive in charge of culture change in a series of large, multinational organizations. One of these inside jobs was a radical seven-year change initiative at Australia and New Zealand Banking Group Limited (ANZ) Bank that transformed it from the lowest-performing bank in the country into one of the highest-performing and most admired banks in the world. Professor John Kotter used her work with ANZ as a Harvard Business School case study.

THE SUMMARY IN BRIEF

In his classic book, ***The Five Dysfunctions of a Team***, Patrick Lencioni laid out a groundbreaking approach for tackling the perilous group behaviors that destroy teamwork. Here he turns his focus to the individual, revealing the three indispensable virtues of an ideal team player.

In ***The Ideal Team Player***, Lencioni tells the story of Jeff Shanley, a leader desperate to save his uncle's company by restoring its cultural commitment to teamwork. Jeff must crack the code on the virtues that real team players possess, and then build a culture of hiring and development around those virtues.

Beyond the fable, Lencioni presents a practical framework and actionable tools for identifying, hiring and developing ideal team players. Whether you're a leader trying to create a culture around teamwork, a staffing professional looking to hire real team players or a team player wanting to improve yourself, this book will prove to be as useful as it is compelling.

IN THIS SUMMARY, YOU WILL LEARN:

- An entertaining story of how leaders discover and embrace the three virtues of the ideal team player.
- The distinct, surprising features of the three virtues and how to recognize those features.
- How people behave when they possess only one or two of the virtues.
- Principles and tips for hiring, assessing and developing people according to the three virtues.
- Tips for embedding the virtues in your organization.

THE FABLE

The Situation

After 20 years, Jeff Shanley had experienced more than his fair share of the Silicon Valley. The hours. The traffic. The pretentiousness. It was time to make a change. Where he would go and what he would do next was a mystery to him. He certainly didn't expect the answer to come via a phone call from his uncle Bob.

Robert Shanley had been the most prominent and diversified building contractor in the Napa Valley for three decades. Unfortunately for Bob, none of his kids was interested in taking over the family business. And that's why Bob called his nephew to see if he knew anyone who might be interested in running the company in a couple of years when Bob retired.

Bob thought so much of Jeff that he had absolutely no expectation that his ambitious nephew in the exciting world of high tech would ever be interested in working in construction. Which is why he was so stunned when Jeff asked, "Would you consider hiring someone without industry experience? Someone like me?"

Within the month, Jeff and Maurine Shanley had sold their tiny home in San Mateo and moved their two children and one dog to the northern end of Napa — the town, not the valley.

After eight weeks of observation and learning, Jeff came to the conclusion that the move to Napa was the right one and that the stress of his previous life in the Silicon Valley was over.

He was wrong.

Diagnosis

Sitting down for lunch at an upscale BBQ restaurant near the Napa River, Bob got right to the point. "Here's the deal. I am ridiculously happy that I hired you. You've already been a blessing to me and the company."

Jeff felt as gratified by this feedback as any he had heard in his career, probably because it came from a family member. But he could tell his uncle had more to say.

"In fact, I'm not going to wait a year to put you in charge. We're going to do it right away."

Caught completely off guard by the announcement, Jeff pushed back. "Whoa. I don't think we should get ahead of —"

Smiling, Bob waved his hand and interrupted. "Don't start telling me you're not ready, because I already know that."

He paused and struggled to get out the next sentence.

"Jeff, my doctor says I have a serious heart condition. The kind you don't recover from. I don't understand half the words the doctor uses. Something about ischemia and angina. All I know is that he says I need surgery and that my life needs to change. Immediately. If surgery goes well and I do what the doctor tells me, I should be fine. But it's going to be hard for me. Which is why I have to step away from the business. Honestly, Jeff, I don't know what we'd do if we hadn't hired you."

Jeff nodded, glad for the confidence but not loving the context of it all. That context was about to get much worse.

Jeff decided to dive into the details. "Well, I hate to do this, but I think it's time we talked about the balance sheet and the longer-term financials of the company."

Bob looked Jeff in the eye with a bizarre mix of excitement and worry.

"Jeff, we just landed two great projects. It's very exciting. The Queen of the Valley Hospital project, which I mentioned to you a few weeks ago, came through on Monday. And I signed the papers yesterday morning for the new hotel project in St. Helena."

He paused and seemed to force a big smile. "We're going to build both of them."

Jeff was confused. "That's good news, right?"

"It's fantastic news," Bob answered, in a tone that was something less than fantastic.

"When was the last time we had two projects like that on the books at the same time?" Jeff was more than a little curious to know.

Bob hesitated, looking down at his glass of water for a moment and back up at Jeff.

"That's the thing. We've never had two major projects like this at the same time." He paused. "In fact, both of these are as big as anything we've ever done."

First Meeting

Sitting down at a big table in the back of Maria's Mexican Restaurant a few blocks from the office, Jeff and his new di-

rect reports, Clare Massick, head of administration and HR, and Bobby Brady, head of all field operations, moved aside their plates and silverware to make room for paperwork.

"Okay, let's just identify the biggest levers that we're going to need to pull to make this work."

Clare explained. "We need 60 more people to staff the project. To do that we'll have to hire at least 80."

"Why?"

"We'll lose at least 20 of them along the way."

Jeff was shocked. "That's 33 percent turnover."

The Hammer

"Okay, I'm going to get pretty direct here, if that's alright." Jeff was trying hard to be polite.

Bobby and Clare looked at each other with a little concern on their faces, and then they nodded.

"You guys don't seem to know what you mean when you talk about team players. And so you can't possibly know who needs to change, who should stay and who should go."

"We didn't say —" Clare wanted to explain, but Jeff wouldn't let her.

"Oh wait. I forgot." Jeff was being sarcastic, but not rude. "You do have one clear definition. A person can't be a jackass."

They laughed, but in a guilty sort of way. After a moment, Bobby said something surprising.

"Actually, that's probably about right. Call them jerks or SOBs. Whatever the case, that's how I think about it."

Jeff smiled. "Let's stick with jackasses for right now. So, how do you know if a person is a jackass? And how do you avoid hiring them?"

Clare answered first. "I guess you know one after you've worked with one for a while."

Jeff shook his head. "Yeah, but by then it's too late. And you know what happens when you keep a jackass longer than you should?" They didn't respond, so he answered the question for them. "The non-jackasses start to leave."

Clare seemed to have a revelation.

"You know, we always just relied on Bob for knowing who fit and who didn't. He had a way with sizing people up. But even he couldn't get everyone right. And he couldn't interview and decide on every candidate at every level. I guess it just broke down."

Jeff seemed suddenly energized. "Well, I think it's time we figured this out. We have to stop hiring people who aren't team players. And we have to find out how many non–team players are still working here, and then get them to change or move them out."

He paused and looked at his notes. "Because if we can't do that, I don't see how we're going to build a hotel and new wing on a hospital in the next 18 months." He paused, and took a breath. "And as much as I hate to say it, if we can't do that, then I really don't know how we're going to keep VB in business."

Discovery

Jeff asked Clare to put together a list of all the former employees that VB had let go over the past few years and any current ones whom she had doubts about.

When Bobby and Clare arrived at his office the next afternoon, Jeff had written 23 names from Clare's list on the whiteboard.

"Let's go through these names one by one, trying to figure out any common denominators that might help us figure out what red flags we should be looking for."

As always, Bobby joked. "You mean jackass indicators?"

Clare countered. "Hey, remember that some of these employees still work here. We might want to be a little more careful about how we refer to them."

Jeff reinforced her point. "She's right. We need to remember that these aren't bad people. They just might not be right for a culture built around teamwork."

"Okay. So far, after all of our conversations and the analysis of the 23 people, it seems to me that there are two qualities, maybe three."

Jeff took his pen and wrote three phrases on the paper placemat so that everyone could see them: ego, hard work and people.

Clare frowned. "Don't use the word ego. Find a positive word."

"Oh, right." He scratched out ego and wrote unpretentious in its place.

The three teammates sat looking at the words Jeff had written.

"Again, this seems too simple," Jeff apologized.

Clare jumped in. "No, I think we may be on to something here, even if it's obvious. Let's go back to our list of difficult people and see if it explains their issues.

Implementation

Bobby kept the conversation going at their next meeting. "I've got another employee for us to analyze: Tommy Burleson."

Clare winced. "Oh, I'd almost forgotten about him."

"Was he a jackass?" Jeff asked.

Clare looked at Bobby. "What do you think?"

He thought about it. "I don't know. He wasn't a jerk, that's for sure. Which is probably why we kept him here for two years before we asked him to leave. But he certainly wasn't a good guy to have on your team."

"Why not?" Jeff asked.

"Tommy was one of the most frustrating people I've ever had to deal with," Clare announced. "The guy was funny. Charming. Bright. But as wonderful a guy as he was, we just couldn't get him to step up."

"You mean he wasn't hardworking? He was lazy?"

Bobby smiled and winced at the same time. "That's what was so hard about Tommy. You wouldn't say he was your classic lazy person. He would do what you asked him to do."

Clare finished, "And nothing else."

Bobby agreed. "He'd do just enough to stay out of trouble, but he'd never really tackle a project or a problem with a sense of urgency. Or passion."

"So he was lacking passion?" Jeff prodded, seeking closure around the right word.

Clare tried to capture it. "He just wasn't hungry."

Jeff wrote something in his notebook and then asked Clare, "What do you mean by that?"

"I mean, he wasn't the kind of guy who had a sense of personal motivation or a desire to do something big. Maybe it's because he came from a pretty comfortable background and just didn't have anything to prove. Or to accomplish. I don't know."

Bobby added, "He's the kind of guy who would be the best next-door neighbor in the world but not someone you'd want to depend on. Or go into business with."

Jeff was nodding and looking at his notebook. "Hungry. I like that."

"So do I," said Clare. "That's better than hardworking."

Jeff went to the whiteboard and wrote hungry.

"Okay," he announced, "I think that's the right word. We need to hire people who are hungry. They go beyond what is required. Passionate about the work they're doing. Hungry."

They all nodded, and Jeff continued. "And then there was the other concept we talked about."

Clare nodded."People. It had to do with being smart about people."

Jeff wrote smart on the board.

"That doesn't sound right," Bobby objected. "It sounds like you mean intelligent."

"I think that's why I like it," Clare said. "It's not your typical 'nice guy' description. It's like emotional intelligence but simpler. It just means a person has to know how to act and what to say and what not to say. People smart. Which is a lot more than being nice."

"And I think calling it smart will make people think about it in a different way," Jeff agreed. "They won't write it off as something soft or easy."

Bobby wasn't sold. "But you can't be a jackass if you're smart about people. This sounds like it should be the only thing that matters."

Jeff thought about it and pushed back. "I disagree. A smart person could be a jackass. In fact, that would be the worst kind of jackass."

"Explain that," Clare asked.

"Well, you could be really good about knowing what to say and how to say it and how to charm everyone you deal with," Jeff said. "But if deep down inside you were doing it for yourself, for your own ambitions, that would make you a duplicitous jackass."

"Use words I can spell, smart man," Bobby joked.

Jeff smiled. "Two-faced. Deceitful. Dishonest."

A light seemed to go on above Clare's head. "Maybe that's where the next idea comes into play."

"What idea?" Bobby asked.

Clare looked at the placemat. "Well, the word you wrote here was unpretentious."

Jeff nodded. "Right. That came from our discussion about Bob. People at VB don't fit in if they're pretentious."

"I think pretentiousness isn't the right concept." Surprisingly, it was Bobby who was pushing on this one. "Or maybe I'm wrong. I mean, pretentious people are definitely jackasses, but there's more to it than that. What makes someone stand out here, in a bad way, is when they're . . . arrogant."

He seemed confident that was the right word. "What's the opposite of arrogance?"

"Humility," Clare responded enthusiastically. "Jackasses aren't humble."

"That's it," Bobby said. "And that's Bob for sure."

Jeff drew three circles on the board, creating a Venn diagram of sorts. He then wrote the words humble, hungry and smart next to the circles.

For the next hour, they chose employee after employee, some who were difficult, others who were all-stars and others who fell somewhere in between. They evaluated them against the three new words, placing them in the circles where they belonged.

Every all-star easily met a pretty high standard for being humble, hungry and smart, and they were placed in the middle segment. Some barely failed to meet the standard in just one area and were close to the middle of the chart, while others struggled with more than one of the qualities and were further out from the middle.

Jeff insisted that the leadership team be evaluated the same way, and though each person made it into the middle segment, what was interesting is that they landed in different locations.

But Jeff was still uncertain. "It still sounds too simple to me." He kept looking at the three words. "And yet, I don't see anything missing. I guess it's just the combination of the three."

"That's it," Clare announced, walking to the whiteboard and circling the middle segment in bright red. "The magic here is just that if even one of the qualities is missing in a big way, you've got yourself a jackass."

They decided they should start using the model right away in the hiring process, which Bobby suggested they call the "no jackass test."

Indicators

Less than 30 days after everyone committing fully to the new hiring model, everything at VB had changed completely. All open positions had been hired with ideal team players, and the projects were both way ahead of schedule. And every single employee who lacked humility, hunger and smarts had chosen to leave the company on their own, with no animosity.

About a year later, the biggest change that the humble, hungry and smart model had made could be seen most starkly in human resources — not the department but the function. Though Clare and her small staff were certainly involved in maintaining the culture, Jeff had made it clear that his leadership team, and their direct reports, were responsible for ensuring that VB stayed humble, hungry and smart.

He also constantly reminded them that there was nothing theoretical or touchy-feely about it. From interviews and orientation to performance reviews and compensation decisions, "the three virtues," as they came to be known, were to be regular topics of conversation.

From a practical standpoint, there were a few indicators that VB's business had changed as a result of the clarity around teamwork. First, recruiting had shifted largely away from headhunters and outside agencies as more and more employees, from contractors to foremen, sought out jobs at VB through friends and references.

Second, morale at the company was undeniably higher, and turnover had dropped markedly. But Jeff was adamant that it shouldn't go away completely: "If no one is leaving or being asked to leave, then we're probably not truly living these values."

Finally, and most importantly from the standpoint of proof that the model worked, client satisfaction at the hospital and the hotel were better than Jeff and his team could have expected. Though fires had to be fought and unexpected challenges surfaced at inopportune times, the way the company rallied and addressed those issues no longer inspired panic and heroism. A new confidence,

even in the messiest situations, permeated the offices and worksites of Valley Builders.

THE MODEL

When team members possess significant humility, hunger and people smarts — they'll be more likely to be vulnerable and build trust, engage in productive but uncomfortable conflict with team members, commit to group decisions even if they initially disagree, hold their peers accountable when they see performance gaps that can be addressed, and put the results of the team ahead of their own needs.

Only humble, hungry and smart people can do those things without a great deal of coaching. Those who don't have all three virtues are going to require significantly more time, attention and patience from their managers.

The Categories

Let's take a look at the various categories of people, starting with those who have none of the required qualities and moving to the ideal team players who have all three.

Those who lack all three qualities, who are markedly deficient in humility, hunger and people smarts, have little chance of being valuable team members. It would take great effort over a long period of time for them to develop the capacity for all three, let alone two or even one. Fortunately for managers, these people are very easy to identify and rarely slip through interviews and make it onto teams.

For those who lack two of the three in a big way, it's also going to be an uphill battle — not impossible, but not easy.

Humble only: the Pawn. People who are only humble but not at all hungry or smart are the "pawns" on a team. They are pleasant, kind-hearted, unassuming people who just don't feel a great need to get things done and don't have the ability to build effective relationships with colleagues. They often get left out of conversations and activities and have little impact on the performance of a team. Pawns don't make waves, so they can survive for quite a long time on teams that value harmony and don't demand performance.

Hungry only: the Bulldozer. People who are hungry but not at all humble or smart can be thought of as "bulldozers." These people will be determined to get things done, but with a focus on their own interests and with no understanding or concern for how their actions impact others. Bulldozers are quick destroyers of teams. Fortunately, unlike pawns, they stand out and can be easily identified and removed by leaders who truly value teamwork. However, in organizations that place a premium on production alone, bulldozers can thrive and go uncorrected for long periods of time.

Smart only: the Charmer. People who are smart but sorely lacking in humility and hunger are "charmers." They can be entertaining and even likeable for a while but have little interest in the long-term well-being of the team or their colleagues. Their social skills can sometimes help them survive longer than bulldozers or pawns, but because their contributions to the team are negligible, they often wear out their welcome quickly.

Team members who lack only one of the three traits have a little higher likelihood of overcoming their challenges and becoming ideal team players. Still, lacking even one in a serious way can impede the teambuilding process.

Humble and hungry but not smart: the Accidental Mess-Maker. People who are humble and hungry but decidedly not smart are the "accidental mess-makers." They genuinely want to serve the team and are not interested in getting a disproportionate amount of attention and credit. However, their lack of understanding of how their words and actions are received by others will lead them to inadvertently create interpersonal problems on the team. While colleagues will respect their work ethic and sincere desire to be helpful, those colleagues can get tired of having to clean up the emotional and interpersonal problems that accidental mess-makers so often leave behind.

Hungry and smart but not humble: the Skillful Politician. People who are hungry and smart but lack humility are the "skillful politicians." These people are cleverly ambitious and willing to work extremely hard, but only in as much as it will benefit them personally. Unfortunately, because they are so smart, skillful politicians are very adept at portraying themselves as being humble, making it hard for leaders to identify them and address their destructive behaviors. By the time the leader sees what's going on, the politician may have already created a trail of destruction among their more humble colleagues who have been manipulated, discouraged and scarred. Most of us have worked with plenty of skillful politicians, as they tend to rise in the ranks of companies where leaders reward individual performance over teamwork.

Managers will need to be "smart" about how to use the terms with their employees. And remember, the real purpose of identifying these types is not to pigeonhole people

but to better understand what constitutes ideal team players so we can recognize or develop them on our teams.

Humble, hungry, smart: the Ideal Team Player. Ideal team players possess adequate measures of humility, hunger and people smarts. They have little ego when it comes to needing attention or credit for their contributions, and they are comfortable sharing their accolades or even occasionally missing out on them. Ideal team players work with a sense of energy, passion and personal responsibility, taking on whatever they possibly can for the good of the team. Finally, they say and do the right things to help teammates feel appreciated, understood and included, even when difficult situations arise that require tough love. Most of us can recall having managed or worked with ideal team players in our careers, as they are quite appealing and memorable.

Now that we understand each of the three virtues and how they fit together, we can look at how the model can be applied.

Application

There are four primary applications of the ideal team player model within an organization: (1) hiring, (2) assessing current employees, (3) developing employees who are lacking in one or more of the virtues and (4) embedding the model into an organization's culture.

Hiring

Though it would be nice to have a perfectly reliable, diagnostic tool for accurately identifying and selecting people who are humble, hungry and smart, no such tool currently exists. However, by doing thorough interviewing and selective reference checking, a manager can hire people with a high degree of confidence that they'll be ideal team players. The key is sticking to a few concepts, all of which may seem obvious but are too often overlooked.

Don't be generic. Too many interviews leave interviewers with extremely general assessments of candidates. "She seems like a nice person. I like her." That would be fine if you were looking for someone to mow your lawn once a week. If you're looking for a team player who is humble, hungry and smart, being specific about targeted behaviors and attributes is critical.

Debrief each interview as a team. Interviewers should debrief quickly after each interview, specifically around observations related to humility, hunger and people smarts. For instance, if the first two interviewers agree that the candidate is hungry and smart, the third can focus on humility, taking more time and probing more directly for the unknown piece.

Make interviews nontraditional. Interviews should incorporate interaction with diverse groups of people in everyday situations, and they should be longer than 45 minutes. Get out of the office with a candidate and see him deal with people in an unstructured environment. Running an errand at the grocery store or the mall is not a bad idea. Spending time in a car and seeing how he behaves when he's not answering a question helps to understand him better. Whatever you're doing with that candidate, look specifically for signs that he is humble, hungry and smart.

Ask what others would say. Instead of asking candidates to self-assess a given behavior or characteristic related to humility, hunger or people smarts, ask them what others would say about them. There is just something about having to answer on behalf of another person that makes a candidate more honest.

Ask candidates to do some real work. The point is not to get free work but rather to see how people perform in real-world situations so you can discern whether they are humble, hungry and smart.

Don't ignore hunches. If you have a doubt about a person's humility, hunger or smarts, don't ignore it. Keep probing. More often than not, there is something causing that doubt.

Assessing Current Employees

How exactly should a leader go about evaluating people for humility, hunger and smarts? There is no easy, quantitative diagnostic, but there are reliable, qualitative approaches that can work very well.

There are a number of questions managers can ask themselves about a given employee to determine whether he or she is humble, hungry or smart.

Humble. Does he genuinely compliment or praise teammates without hesitation? Does she easily admit when she makes a mistake? Is he willing to take on lower-level work for the good of the team? Does she gladly share credit for team accomplishments? Does he readily acknowledge his weaknesses? Does she offer and receive apologies graciously?

Hungry. Does he do more than what is required in his own job? Does she have passion for the "mission" of the team? Does he feel a sense of personal responsibility for the

overall success of the team? Is she willing to contribute to and think about work outside of office hours? Is he willing and eager to take on tedious and challenging tasks whenever necessary? Does she look for opportunities to contribute outside of her area of responsibility?

Smart. Does he seem to know what teammates are feeling during meetings and interactions? Does she show empathy to others on the team? Does he demonstrate an interest in the lives of teammates? Is she an attentive listener? Is he aware of how his words and actions impact others on the team? Is she good at adjusting her behavior and style to fit the nature of a conversation or relationship?

Developing Employees

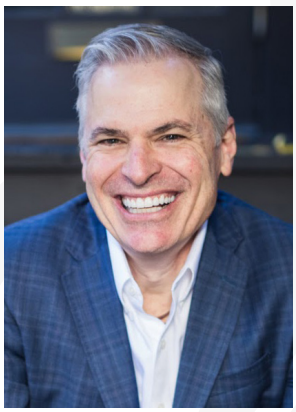
Once a leader (or employee) has established a clear sense of his employees' (or his own) relative strengths and weaknesses related to the three virtues, the process of improvement can begin. The most important part of the development process, and the part that is so often missing, is the leader's commitment to constantly "reminding" an employee if she is not yet doing what is needed. Without this, improvement will not occur.

Humility. The source of a lack of humility is always related in some way to insecurity, and for most people, insecurity is rooted in childhood and family issues that go way back beyond their first day on the job or the team. Without getting too deep into psychological analysis or therapy, a manager or coach can experience significant relief simply by identifying the general cause of insecurity.

People who lack humility need behavioral training in an exposure therapy kind of way. Don't be put off by the clinical sound of this. Employees can make progress simply by acting like they are humble. By intentionally forcing themselves to compliment others, admit their mistakes and weaknesses and take an interest in colleagues, employees can begin to experience the liberation of humility. This happens because they suddenly realize that focusing on others does not detract from their own happiness but rather adds to it. After all, humility is the most attractive and central of all virtues. But the best way of all is to have teammates coach the employee, providing encouragement and immediate feedback when the desired virtues are demonstrated or lacking.

Hunger. All too often, employees struggle to become hungry because they don't understand the connection between what they do and the impact it has on others. When a slightly non-hungry employee hears his colleagues describe their motivation and connection to the mission, he may get "infected" by his teammates' passion. Set clear behavioral expectations for employees, and then hold them accountable. When a non-hungry employee starts to exhibit signs of hunger, praise her publicly and have teammates do the same.

Smarts. Employees who lack people smarts have no desire to create interpersonal problems with their teammates. They just don't understand the nuances of interpersonal situations, and they don't seem to realize how their words and actions impact others. A person who has trouble being smart with people can be likened to a pet. Like a puppy being trained, he needs to be quickly and lovingly rapped on the nose with a newspaper whenever he does something non-smart. So, in the middle of a meeting, stop and say, "Hey, Bob, this is the part of the meeting where you should thank her for what she did." If this sounds rudimentary or even juvenile, that's okay. It won't be once you establish the real nature of the help your employee needs. And if he is sincerely interested in getting better, he'll thank you for it.



Embedding the Model into an Organization's Culture

Teamwork is not a virtue but rather a choice. For those organizations that are sincere about humility, hunger and smarts, here are a few simple ideas for embedding those virtues into your culture.

- Be explicit and bold. Leaders who believe teamwork is important and expect their people to be humble, hungry and smart should come right out and say so. They should tell everyone. Employees. Vendors. Partners. Customers. It's not marketing but rather expectation-setting.
- Catch and revere. Leaders should be constantly on the lookout for any displays of the virtues. And when they see those displays, they should hold them up as examples for everyone to see. Great team leaders will acknowledge an act of humility, hunger or people smarts not because they want to be seen as sophisticated or clever managers but because they want everyone to know exactly what kinds of behavior they expect and appreciate.
- Detect and address. Whenever you see a behavior that violates one of the values, take the time to let the violator know that his behavior is out of line. And don't just do it in egregious situations. Often, the smaller offenses are the ones that are harder for employees to see and the ones they learn from the most. Of course,

doing this well requires tact and good judgment. The key is that leaders and, eventually, teammates don't squander opportunities for constructive learning.

Great cultures tend to be appropriately intolerant of certain behaviors, and great teams should be quick and tactful in addressing any lack of humility, hunger and people smarts.

Patrick Lencioni is founder and president of The Table Group, a firm dedicated to helping leaders improve their organizations' health since 1997. Lencioni is the author of 10 business books, with nearly 5 million copies sold worldwide. His work has appeared in the *Wall Street Journal, Harvard Business Review, Fortune, Bloomberg Businessweek* and *USA Today*, among other publications.

The Learned Disciplines of Management

How to Make the Right Things Happen

by Jim Burkett

THE SUMMARY IN BRIEF

Jim Burkett knows something about making the right things happen. He has turned around 28 underperforming and troubled companies, from Fortune 500 companies to smaller public and private companies, throughout the United States, Canada and Europe. In *The Learned Disciplines of Management*, Burkett shares his accumulated insights and distills his management experience to give you a practical guide filled with scores of specific, real-life examples that show managers at all levels how to manage more effectively.

Burkett presents a coherent framework of individual disciplines that form a powerful, self-reinforcing management system for making the right things happen. They include planning, organizing, measuring performance, executing, following up, real-time reporting and problem solving. Each discipline is impactful, and all are indispensable. Their practice is the best way to understand what effective management does.

Ignore, misuse or neglect the learned disciplines of management, and you will not manage effectively. Fortunately, every one of the disciplines can be learned, and their practice will make you a more effective manager. *The Learned Disciplines of Management* is a definitive guide on management practice and is essential reading for anyone working to make the right things happen.

IN THIS SUMMARY, YOU WILL LEARN:

- The tools that will allow you to make the right things happen.
- Why the learned disciplines of management are not practiced effectively.
- How to enhance your management effectiveness.
- Why planning is a twofold discipline based on the right aims and the correct means.

THE COMPLETE SUMMARY: **THE LEARNED DISCIPLINES OF MANAGEMENT**

by Jim Burkett

The author: Jim Burkett is a turnaround specialist and president of Corporate Turnaround Consulting, Inc. During the past 35 years, he has turned around 28 underperforming and troubled companies, using his hands-on experience to transform management effectiveness through practicing the learned disciplines of management.

Introduction

A manager's ability to make the right things happen is not an innate skill — no one is born a manager. Although management does require certain aptitudes, it also requires learning certain disciplines. The management disciplines function as tools that extend a manager's skill, allowing the manager to accomplish more than would have been possible without these tools.

Your tool kit may hold management techniques passed on by your predecessor or management methods given to you by your boss. But are they the right tools? Are they tools that make you effective — tools that allow you to make the right things happen? In other words, does your tool kit hold the seven learned disciplines of management? Your tool kit must include the following tools:

- **Planning:** Determines the right aims and the necessary means to achieve them.
- **Organizing:** Orders how activities are performed so as to maximize results and optimize resources.
- **Measuring performance:** Measures how well activities are performed, recognizing what gets measured, gets managed and gets done.
- **Executing:** Executes essential activities, ensuring that they are satisfactorily performed and completed.
- **Following up:** Ascertains and reinforces excellent performance outcomes through actionable feedback, activity alignment and employee accountability.
- **Real-time reporting:** Circulates real-time performance information throughout the organization to facilitate making the right things happen.
- **Problem solving:** Uses actionable feedback to identify, understand and solve problems.

These principles have been practiced, tested, refined and validated. Their skillful practice is the secret to your management effectiveness and success.

Planning

The first learned discipline of management is planning. Effective planning must answer two vital questions: What are the organization's aims, and what are the means for achieving them? A plan is a tool much like a construction blueprint. A blueprint depicts the project's aims and specifies the best means to obtain them. These elements make a plan executable; guiding, informing and directing management to a successful outcome.

Financially troubled companies often arrive at the wrong planned aims. This happens as management struggles to survive. When their plan fails, they try another. As they enact these changes in plans, compromises are made, and each plan becomes weaker, demanding less than the one before it. This process further deteriorates management effectiveness and the organization's performance, further imperiling the company's future.

The Right Aims

Effective planning requires management to establish the organization's right aims. This is management's only recourse, for until an organization is mobilized toward the right aims, its efforts are misdirected and its resources squandered.

Not only must the plan's aims be the right ones, but they also must be specific and measurable. Specificity requires that management rigorously arrive at the aim's precise details. Lack of specifics is one reason an organi-

zation does not make progress in achieving its aims. Vague aims render a plan immeasurable, thus making it impracticable to manage. Measurability promotes manageability and is a critical consideration in arriving at a plan's aims (and means).

An effective plan lays the foundation for management success as it rightly establishes the organization's aims and correctly determines the means for achieving them, rendering both specific and measurable.

Organizing

The second learned discipline is organizing. Through its practice, the crucial connection between an organization's aims and the resources necessary to achieve them is reinforced.

Organizing does this in two ways. First, it makes certain that the required resources are available so that essential activities can be performed successfully. Second, activities are organized to ensure they use resources efficiently and effectively. When these two organizing aspects are carried out, the result is resources and results being maximized, which contributes to management making the right things happen.

Organizing is a time-consuming, deliberate and exacting process. Its jumping-off point is to recognize all the activities that must be performed to achieve the organization's aims. Once identified, these activities must be thoroughly understood. It is only after the activities have been identified and understood that management can evaluate whether the activities maximize resources and results. If it is determined that they do not, management acts to optimally organize them.

Carrying out these dictates can seem overwhelming at first. Fortunately, this process is best approached little by little, making it manageable.

Recognize the Activities

An organization's goals are achieved through its established means. These means, made up of various activities, must be performed successfully. Therefore, it is incumbent that management not only recognize what these activities are but break the activities down to identify the various steps, processes, procedures and resources that are required to successfully complete the activities.

Before the activities can be thoroughly understood and evaluated, they first must be recognized.

For example, if the organization's aim is to grow sales by 10 percent, then performing more sales calls would be a recognized activity. If the organization's aim is to eliminate trade receivables over 60 days, then making phone calls on delinquent accounts would be a recognized activity. Each activity has various components that must be identified. Performing more sales calls entails selecting prospective customers, setting and carrying out sales call appointments, making sales proposals, processing customer orders, and determining if a salesperson has additional time available to perform these steps.

Often, recognizing the organization's activities is a straightforward process, but some situations make the process challenging. It's difficult to recognize an activity that is not being done but should be. Because an activity is not being done, it cannot be observed, thus making it difficult to recognize. Fortunately, the activity not being done produces consequences that can be observed, making recognizing the activity possible.

Evaluating Organization

Once all activities have been recognized and their various processes identified and thoroughly understood, you evaluate whether they are optimally organized. Evaluating how well an activity is organized guarantees that resources are ordered and coordinated so that the activity can be successfully performed, and ensures that employed resources are used effectively and efficiently.

In evaluating how well an activity is organized, it is helpful to simply ask *why* an activity is organized and performed the way it is. For instance, *why* isn't the activity done smarter, faster, better and cheaper? Asking "why" not only aids management in evaluating how an activity is organized and performed but also how it *should* be organized and performed.

An activity that is optimally organized maximizes results and resources. Conversely, a poorly organized activity diminishes results and resources. Thus, a poorly organized activity uses more resources while producing fewer results, whereas a well-organized activity uses fewer resources while producing more results. We see this in how cars are evaluated. A car that goes 40 miles on a gallon of gasoline is said to get good gas mileage (maximizes resources), whereas a car that goes seven miles on a gallon of gasoline is said to get poor gas mileage (minimizes resources).

Maximizing Resources

Maximizing resources (people, equipment, materials, supplies, etc.) is what effective management does. Thus, individual activities (and the interaction between integrated activities) are analyzed and evaluated to determine how effectively and efficiently they use resources.

The discipline of organizing focuses on both the effective and efficient use of resources. For it is possible to use resources efficiently but to fail to effectively accomplish the activity's intended results. It is also possible for an activity to effectively accomplish its intended results but to do so inefficiently, wasting resources in the process.

Management measures, analyzes and evaluates how well each activity is organized using these two measures: effectiveness and efficiency. If an activity does not maximize results or resources, it gets reorganized. Keep in mind that during the process of organizing, it is crucial to favor the most valuable resources.

Effective organizing results in maximizing the resources an activity employs and the results it produces. When activities are thus optimally organized, they help achieve an organization's aims.

Measuring Performance

Measuring performance is essential to management making the right things happen. Its practice allows management to evaluate how activities *should* be organized and performed and to gauge how activities *are* organized and performed.

Measuring performance gives managers clear, immediate and objective feedback, indicating how effectively and efficiently an activity was performed. With this performance information, management recognizes when an activity is performed poorly so that the appropriate action can be taken to address the situation.

Here are three ways to measure performance:

1. **Time-based performance measures** establish the time (usually in minutes) it ideally takes to complete a given activity. For example, a time-based performance measure indicates the number of minutes it takes an employee to process a customer's order or the number of minutes it takes an employee to assemble a product.
2. **Outcome-based performance measures** establish the number of outcomes an activity ideally produces. This is often stated within a time context. For example, an outcome-based performance measure indicates the number of units (outcomes) a machine produces in an hour or the number of sales calls (outcomes) a salesperson performs in a day.
3. **Relational-based performance measures** show how two or more performance measures ideally relate, depicted as a ratio, quotient or some other relative, comparative amount. For example, the number of defective units produced in relation to the total number of units produced gives us a quality performance ratio. The number of minutes it actually took to complete an activity compared to the number of minutes it should have taken gives us an efficiency performance ratio.

Why Measuring Performance is Not Practiced

Given performance measurement's inestimable benefits, you would think its practice was universal. But sadly that is not the case.

Perhaps the chief reason measuring performance is not practiced is because its distinct qualities go unrecognized and unappreciated. As a result, other methods such as accounting information, simple activity tallies, and industrial time and motion studies are commonly substituted. These are inadequate substitutes at best. Unlike these methods, measuring performance is designed to assess an activity's unique performance characteristics. This results in measured performance feedback that is clear, immediate and objective.

Another reason why measuring performance is not practiced is its perceived difficulty. The perceived difficulty of measuring performance is often not in deriving performance measures themselves. Rather, the perceived difficulty lies in overcoming the negative connotations that surround practicing measuring performance. Some common negative perceptions include

- Measuring performance treats people as cogs in a machine. It is a dehumanizing, callous practice.
- Management uses measuring performance as a heavy-handed method to extract more work from already overworked employees.
- Management measures performance because they mistrust their employees' motivation and intentions.
- It is not possible to accurately measure how well activities are performed.
- Measuring performance is a rigid and unrealistic management approach.
- Measuring performance against an ideal creates an unrealistic expectation.

Measuring performance is relentless; it constantly, quantifiably and qualitatively measures how activities are performed. It exposes individual performance, stripping away pretense, incompetence and complacency. It is no surprise that measuring performance can be threatening, as poorly performing employees and managers have no place to run or hide.

How to Measure Performance

The first step is to establish an ideal performance measure for every activity. Deriving an ideal performance measure is a simple process. It entails measuring an activity that is performed ideally (that is, using the best practices

while not encountering any problems). This activity is measured (using time, outcome and relational measures) to derive an ideal performance measure. Ideal performance measures are the essential building blocks that management uses to gauge how effectively and efficiently an activity is performed.

As a general rule, the more timed observations the better. Not only does gathering more timed observations make the sample more accurate, but it also provides valuable insight into how the activity is and should be performed.

Sometimes taking accurate performance measurements is not possible. This is especially challenging when employees know their performance is being measured and are uncomfortable with or opposed to the practice. In these cases, it's necessary to ask for the department manager's help. This may require having the manager him or herself or a more willing and capable employee perform the activity so that accurate performance measures can be obtained.

Deriving performance measures is a process. The process obviously entails trying to get them right the first time. But another part of the process is to actually use the measures and, in doing so, validate them (or not). For credibility's sake, it is important to try and make them as accurate as possible. But when this does not happen, realize they are easy to correct later on in the process.

Once performance measures are in place, it is a good idea to make someone responsible for administering them. Existing measurements need to be maintained, validated and, if necessary, corrected. Also, activities change, requiring new measures to be derived. Administering performance measures is an ongoing effort.

Executing

Executing is management personified. Executing involves managers taking concrete action to make an organization's abstract aims a reality. Execution's concrete actions include making sure all the essential activities are satisfactorily performed and completed, engaging employees to ideally perform their assigned activities, and empowering employees to overcome the problems they encounter. The tangible results of effective executing are management making the right things happen.

Executing is not only an imperative management discipline; it is also a pivotal one. Planning, organizing and measuring performance lay the foundation for its practice. Executing in turn facilitates the practice of follow up, real-time reporting and problem solving.

Executing is simple in concept and demanding in practice. Conceptually, it entails carrying out all the activities that achieve the organization's aims. Its practice demands that the performance of these activities is not haphazard, but is methodically assigned to those responsible for performing them.

Consequently, executing is a meticulous nuts-and-bolts discipline. It achieves the organizations' aims by linking the desired outcomes to the activities that produce them. This makes executing certain, expectant and compelling. Executing is certain because it identifies and assigns specific activities to be completed. Executing is expectant because it expects all the activities to be performed perfectly. Executing is compelling because it holds accountable those who are responsible for performing the activities, insisting on excellent performance.

For some organizations, executing is not done because other inadequate means are used in its place. For example, management commonly uses communication as a means to execute its aims. In these organizations, managers believe that if they emphasize the organization's vision, mission and values, these oft-repeated qualities will work their way into how activities are performed. Still other organizations depend on an incomplete set of management disciplines, hoping these will enable managers to carry out the organization's aims.

There is no substitute for effective executing, which entails developing a checklist to identify and help carry out essential activities, properly assigning activities to the employees responsible for performing them, engaging employees to perform the assigned activities ideally, and empowering employees to deal with the problems that hinder their performance.

Developing a Checklist

Performing essential activities cannot be left to chance. Therefore, it is incumbent on management to guarantee that all essential activities will be satisfactorily performed and completed. To ensure that this is done, management develops a checklist.

Checklists are basic tools used to identify and help carry out activities. They run the gamut from simple checklists used for cooking (recipes) to complex checklists used to operate nuclear power plants (nuclear reactor checklists).

The checklist's purpose is to make certain that all essential activities will be carried out to insure that their execution is not random. Consequently, a checklist is used to choreograph performance. It links identified activities into being assigned and performed. For those performing the activities, a checklist informs, directs, reminds and records their efforts. For those managing the activities, a checklist records how

the assigned activities have been performed, facilitating following up, real-time reporting and problem solving.

The developed checklist is used to facilitate the second aspect of executing: formally assigning specific activities to particular employees to perform. This is a crucial step, for when managers are unable or unwilling to make formal, specific work assignments to individual employees, the activity's performance outcome is uncertain and unpredictable. This is not effective executing but wishful thinking.

Instead, effective executing requires management to formally assign activities — that is, asking a particular employee to perform specific activities using a checklist that serves as an official record that the activities have been assigned and received.

Engaging and Empowering Employees

The third aspect of effective executing is management engaging employees to perform their activities ideally. Engagement recognizes the critical importance of communicating to employees how they are to perform their assigned activities. Through measuring performance, management has quantitatively and qualitatively established how each activity can be ideally performed. Now it is the manager's role to engage each employee to "try to get there."

Obtaining ideal performance is not always easy or possible. Nevertheless, it is a manager's role to engage employees to make the effort, that is, to strive to perform their assigned activities ideally — perfectly.

Engaging employees has a galvanizing effect on performance. However, to sustain this effort requires that managers empower their employees because they will inevitably encounter problems when attempting to ideally perform their assigned activities. When problems are encountered, it will be necessary for the employee to take the initiative to address the problems so that hoped-for performance outcomes can be achieved.

Empowerment recognizes employees' intimate knowledge of the activities they perform. This gives them a unique opportunity to aptly respond to problems, one not afforded to management. Empowering employees to take appropriate action assumes many forms. It may mean solving the problem, moderating the problem, or involving others better suited to solve the problem.

Empowerment invites employees to take the initiative. It asks them to participate in addressing the problems that compromise their performance. This invitation implies treating employees as valued colleagues. It signifies management and employees working together to improve performance. As a result, empowered employees tackle problems, whereas apathetic employees accept them.

Following Up

Many managers stop at executing and consider their job finished. They assume the assigned activities will be satisfactorily performed and completed. This is not management but make-believe. Activities are not always satisfactorily carried out, nor are they properly completed. Consequently, management must effectively follow up on the assigned activities to ensure that the expected performance outcomes have been achieved.

As managers follow up, it produces four indispensable benefits. It creates actionable feedback; it aligns activities to produce expected results; it instills employee cooperation and fosters accountability; and it reinforces making the right things happen.

Create Actionable Feedback

Management follows up on assigned activities to ascertain how well the activities have been performed and to take action when performance is unsatisfactory. To rightly assess performance requires the manager to generate and collect actionable feedback (actionable feedback can also come from secondary sources such as reports and records). Actionable feedback is performance information that is accurate, reliable and timely; it is information that allows management to quantitatively and qualitatively assess performance and take the appropriate action to make the right things happen.

Not only does management thrive on actionable feedback, but employees do too. Employees crave real feedback — not the superficial, patronizing kind that passes for most interactions between manager and employee, but feedback that is reliable, accurate and timely.

This feedback is gathered in the immediacy of the moment when the work is being performed — not, as so often happens, when an employee's performance is evaluated every six to 12 months using the despised employee performance review.

Feedback is meaningful and fair when it is gathered throughout the workday, where it is immediately understood and instantly applied to the activities being performed. This timeliness enables the manager to approve good performance and correct bad performance. Correcting bad performance happens right away when problems are identified. Consequently, performance is enhanced when problems are not allowed to persist, worsen and spread but are decisively addressed in the immediacy of the moment.

Following up may reveal that the reason the expected results were not obtained is because the assigned activity was never completed. Or that it was not performed proficiently. Or that the assigned activity even when skillfully

performed did not achieve the expected outcome, thus wasting resources. In these situations, following up gives management the chance to appropriately align activities to produce the expected performance outcomes.

Instill Cooperation and Foster Accountability

Following up instills and fosters employee and management cooperation and accountability. Employee cooperation is encouraged when manager and employee interact with each other when management frequently reviews and discusses how an employee performed. Management is a people-oriented profession requiring managers to work with and through people to make the right things happen. Following up establishes a platform where management can consistently interact with their employees, constructively supporting and encouraging the activities they carry out.

Practicalities of Following Up

In practice, follow up should flow like this:

- Generate and collect actionable feedback. Continue using the employee's activity checklist to calculate the employee's actual performance.
- When ideal performance has been achieved, the employee's performance is commended.
- When ideal performance has not been achieved, it prompts a conversation between employee and manager. This discussion generates more actionable feedback.
- Follow up should be done in two- to three-hour periods (when activities take longer to complete, this can be extended to four- or five-hour periods).
- Follow up sessions are intentionally brief, lasting no more than a few minutes.
- When communicating performance results, it is important to encourage employee cooperation.
- Reassure employees that the purpose of the session is not to manipulate, criticize and callously control an employee's performance but to constructively identify and address the problems that affect an employee's performance.

Real-Time Reporting

There is nothing like the sheer power of real-time reported feedback to scrub away layers of ignorance, inaction, incompetence, confusion, concealment and contradiction. Effective managers harness this power. Successful managers avoid relying on appearances. Instead, they use real-time reported performance information to discern reality, enabling them to take action on the things that are.

Authentic real-time reporting emerges through management follow-up. During follow-up, management generates and gathers actionable feedback that depicts how activities were performed. This reported feedback is real and timely. Its timeliness arises from being gathered in the moment when the activity is being performed and then promptly shared with employees and management. It is not reconstructed information put together after the fact. It is not historic information collected long after the activities have happened. It is not projected information, forecasting what might happen. Instead, real-time performance information is a few minutes to a few hours old.

There is an important distinction here: Real-time reporting is not accounting information. Accounting information was never intended to be used to manage performance. Accounting was originally practiced for financial planning and later for tax compliance. Accounting measures profits and losses, various costs, inventory turns, return on investment and so on. Although these are important financial determinants, they are inadequate for managing performance.

In addition, accounting information is historic information. It is a look back in time, usually the previous month's financial results. This monthly look back is fine for financial planning but ruinous for managing performance.

Six Features of Real-Time Reporting

Real-time reporting distributes performance information: This happens when management takes the collected performance information and effectively conveys it to those who can use it to make the right things happen.

Real-time reporting structures follow-up meetings: In these meetings, performance information is shared with the appropriate party through a daily performance summary and a weekly performance summary.

Real-time reporting perpetuates ideal performance: Real-time reporting makes ideal performance outcomes the organization's constant and inescapable focus. This focus impacts how activities are carried out as individuals and managers are given real-time performance information assessing whether they have achieved ideal performance. Over time, this focus eventually makes ideal performance routine.

Real-time reporting links the practice of the learned disciplines of management: These linkages safeguard the constant and consistent practice of the learned disciplines and result in management making the right things happen.

Real-time reporting identifies best practices: The ability to achieve ideal performance often indicates the

absence of problems, but it can also indicate the use of best practices. Best practices produce the best performance outcomes. Once these are identified, the best practices can be replicated and broadly implemented to ideally carry out the assigned activities.

Real-time reporting facilitates problem solving: Reported real-time performance information is evaluated to confirm whether a problem has been solved. Real-time reporting also provides feedback to determine if a solution may have caused other problems.

Problem Solving

Solving problems is not easy. The inherent underlying challenges in effective problem solving are first recognizing when problems occur and then identifying what they are.

This difficulty in recognizing and identifying problems is likened to a primordial swamp. Beneath a swamp's murky waters lie hidden obstacles and dangers. It is a haven for parasites and predators who exploit being unseen and unhindered.

To solve problems, management must first recognize and identify them. To do this, management must drain the swamp. The systematic practice of the learned disciplines of management drains the swamp. It gives management the capability to solve problems, enabling management to make the right things happen. After all, solving problems is what effective management does, enhancing their effectiveness and ensuring their success. Effective problem solving incorporates five essential practices:

- Recognize, identify and understand the problem.
- Determine if the problem is worth solving.
- Determine which problem solution to implement.
- Take action to solve the problem.
- Monitor if the problem has been solved.

Continually asking why a problem occurred results in a manager obtaining a deeper understanding of the problem. Once this is obtained, management is ready to determine if the problem is worth solving.

Not all problems are worth solving. This may sound strange, but ironically, there are solutions to problems that cost more than the problem itself. There are solutions that are more troublesome than the problem itself. Management must weigh if the problem's cost and consequences are compelling enough for management to try and find a solution.

If the problem is worth solving, then management must work to arrive at a solution worth implementing. Often, more than one solution is found. Each solution's costs and benefits are scrutinized to decide which solution most compellingly solves the problem, thus triggering management action to implement it.

Take Action to Solve the Problem

Taking action has six salient phases: it specifically identifies what actions are to be taken; it measures the actions; the actions are translated into executable steps; the steps are assigned to be implemented; those assigned have a specific deadline to complete them; and the deadlines are followed up on to confirm they are completed when due.

Confirming that the problem has been solved also requires monitoring to ensure that the right action was taken. Sometimes there are unintended consequences. Sometimes the solution unexpectedly costs more than anticipated. Sometimes the "solution" does not work. Through constant monitoring, these possible outcomes are recognized and acted on.

Problem solving is the learned disciplines of management's apex. Its practice complements them by eliminating the wrong things from happening. It completes them by making the right things happen. As it does so, it fulfills management's aims and ensures their success.

When practiced both individually and collectively, the seven learned disciplines of management form a coherent management system that effectively transforms a company's management team that is struggling to make the right things happen.

THE SUMMARY IN BRIEF

For decades, leaders have been encouraged to run their organizations like lean, agile startups. They often place their bets on trends like digital transformation or design thinking. This is well-intended, but in isolation these trends are not enough.

There's another, better way to drive durable, effective change in your organization, and it's been proven by global IT and business consulting leader Infosys. ***The Live Enterprise's*** operating model provides a clear path to transform large complex businesses into agile, digital ecosystems that evolve with changing market needs and scale to any size.

In ***The Live Enterprise***, you'll learn how to apply the benefits of the startup operating model—and go much further. This essential guide can help you create groundbreaking structures, response capacities, value chains, and more. It can help transform your organization into a constantly learning, ever-evolving industry leader.

IN THIS SUMMARY, YOU WILL LEARN:

- To create an organizational structure that drives collaboration, innovation, strategic alignment, and new culture across distributed, interconnected teams.
- To respond quickly yet thoughtfully to opportunities to create valuable new employee and customer experiences.
- To automate routine decisions with maximum human intuition and minimum human intervention.

The Live Enterprise Model

The promise and peril of the digital future has been forecast for years, from turn-of-the-century dotcom boom and bust, through the rise of mobile applications and social media, and more recently through Industry 4.0.

What's changed is that exponential technologies like the cloud, mobile, AI, open source, and Internet of Things have matured and converged. We are seeing the results of this converged life-cycle maturity at the same time that stakeholder capitalism has come of age: The next generation of customers and employees is more than simply aware of sustainability and equality—they demand action from enterprises.

Globalism has spurred the rise of the corporate city-state, where large enterprises have additional societal responsibilities in addition to, or perhaps even because of, their role as generators of financial returns. And of course, the COVID-19 pandemic was the match that lit the tinderbox and dramatically accelerated change.

Multinational information technology company Infosys developed the Live Enterprise model after they found that the traditional operating model framework does not meet the requirements of a modern, large, complex organization.

To seek nonlinear change, they dismantled old operating models rather than supplementing them. They started with six strategic objectives: agility of a startup; responsive to customer needs; networked and connected ecosystem; velocity of ideas and innovations; competitive advantage through platforms; and extreme automation in everything they do.

These objectives work in concert to accomplish four outcomes:

- **Quantum organization.** Agile organizational structure that drives collaboration, innovation, strategic alignment and new culture across distributed interconnected teams.
- **Perceptive experiences**. Respond quickly, yet thoughtfully and scientifically, to opportunities to create valuable new employee and customer experiences.
- **Responsive value chains**. Repurpose, reimagine, and reengineer the value chain to see what is not there, can be improved, or can be eliminated.
- **Intuitive decisions**. Automate systems and activate intelligence so that routine decisions and responses can be acted upon with maximum human intuition and minimum human intervention, so that humans can focus on higher-order analysis and decisions not suited for machines.

These outcomes are made possible through four ingredients:

- **Hybrid talent;**
- **Design to evolve;**
- **Digital runway;**
- **Micro is the new mega.**

Taken together, the eight elements—the four outcomes and four ingredients—can be seen as the leverage points in the enterprise operating model. These eight themes offer guidance on how to change perspective and view the enterprise as a living organism, enabled by technology.

Given the pressures leaders face to survive, they need new models to address the challenges. Let's now explore each of the eight Live Enterprise model themes.

Quantum Organization

Uncertainty about the future is a particularly unnerving aspect of the new normal. To mitigate, the entire enterprise needs to move quickly together and evolve.

Large enterprise responses to the pandemic demonstrated that companies can be lifelike, responsive, evolving entities at enterprise scale—and any company, however large and complex, can transform to be adaptive and resilient. In fact, they may have no alternative in order to survive.

A quantum organization is not linear like traditional models but drives nonlinearity by enabling multiple organizational initiatives at any given point in time. These initiatives run in parallel and at scale to drive results that show up in operations, not just project readouts.

Shared digital infrastructure enables ideas to become teams and experiments to become offerings, following an organic, market-driven drumbeat.

Amazon is arguably the best-known example of a quantum organization. In the words of noted tech analyst Benedict Evans, "Amazon is a machine to make a machine—it is a machine to make more Amazon."

In other words, the business model itself creates more effective businesses.

In the Live Enterprise model, perceptive experiences are delivered by blending the capabilities of heart, brain, and machine together in an integrated way.

The key characteristics of the quantum organization are as follows:

User at the heart of all initiatives. Fundamental questions are asked at the beginning of each project. "Why are we doing this, and how will this help the user (who could be a customer, employee, or partner)?"

Hyper-productive collaborative teams. This connects the silos that exist in any organization, guided by value stream and user journey. This requires formation of agile cross-functional teams that take an end-to-end view of the value stream, business metrics, KPIs, and user experience.

Rapid experimentation and innovation. Instead of long delivery times and quest for perfection, teams rapidly experiment with new ideas and roll them out to users quickly. They introduce new features every few weeks with rapid releases and then mature and scale over a period of time.

Shared digital infrastructure. Shared digital infrastructure connects humans, data, and things across the ecosystem and makes this available to the team to build contextual and intelligent products for its users. It also jump-starts the entire product to be delivered in weeks, rather than months or years.

Micro-change management. In a quantum organization with high innovation velocity and frequent feature release, adoption must also occur rapidly. This change is fundamentally different than the traditional new product or program rollout, where a single large campaign is expected to drive change.

Instead, a frequent series of small interventions is needed to drive adoption, and this is called micro-change management.

This agile approach to change is both simple and profound, accommodating pace of change and accepting the inherent uncertainty of future requirements.

Perceptive Experience

Compared to just a decade ago, today's corporate experience landscape is radically different, with COVID-19 pressing the button on even faster, more fundamental changes. The field of experience design has been reshaped by the tremendous success of design thinking, enabling the creation of products and services that better serve both customer expectations and employee needs.

However, to continue to meet these rising requirements, a new approach is needed. In the Live Enterprise model, perceptive experiences are delivered by blending the capabilities of heart, brain, and machine together in an integrated way. Every user is a unique cosmos, with emotion, ambitions, and potential. At the core, there is an inherent human nature, surrounded by the wider environment and the context in which they operate.

To significantly enhance user experience, we need to understand their emotional state and contextualize the experience to make it personalized and useful for their needs. The enterprise digital brain constantly senses the signals emitted by users as part of their experiential actions and events to anticipate their needs and recommend actions that optimize their productivity.

Design thinking needs to be complemented by a new model to maintain current momentum and to meet growing stakeholder expectations and company responsibilities. The required changes can be understood in terms of three macro-level challenges, each of which will affect all organizations in the decade ahead: change is the only constant, evolving expectations, and a growing appetite for evidence.

The New Paradigm

Computational design addresses these macro-level design challenges. This represents a pivotal change in the way products and services are designed, and the approach is based on three principles: design adaptable, design inclusive, and design measurable. When adopted together, these principles provide designers and businesses an approach to address the challenges.

Design adaptable. The current view that change is a risk to be mitigated gives way to a new paradigm that sees change as an opportunity to embrace. Design solutions need to be adaptable so organizations react to change in a

fast, frictionless, and cost-effective way.

Design inclusive. The current belief that sees a single-best design solution yields to a new paradigm that sees design manifest itself in a thousand variants, customized to the user on the basis of a deep understanding of who they are.

Design measurable. The current view that sees measurement as an activity undertaken after release gives way to a new approach that sees measurement as core to design, built into its DNA from inception.

Experience is the new frontier of value creation, a frontier that continually expands. In this landscape, organizations create value by adopting principles of computational design—adaptive, inclusive, measurable—and deliver experiences that meet growing customer and employee expectations and lead to better business outcomes.

Organizations that embrace this new reality will receive an abundance of valuable data points for customers, employees, and users overall.

Responsive Value Chains

By 1926, Yellowstone's last wolf pack had been hunted to elimination, relieving pressure on the elk population, the wolf's main prey. This caused the elk to stay sedentary and overgraze on willow trees, which beavers needed to survive the winter.

On January 12, 1995, eight lupus (gray) wolves were reintroduced to Yellowstone, with an additional 23 reintroduced by the end of the following year, and they galvanized the park's ecosystem. The sole beaver colony in 1995 grew to nine by 2020, thanks to predatory wolves keeping elk on the move, halting the overgrazing and granting beavers an abundant source of food.

It didn't end there. More beavers meant more dams and ponds, meaning a recharged water table in streams, and shaded water for fish. Elk populations avoided the cycle of boom and bust, with more willow creating homes for songbirds. Eagles, ravens, coyotes, and bears benefited, too, free to scavenge the elk carcasses in winter helpfully left by wolves.

In Yellowstone, the gray wolf acts as a "keystone" species, critical to health of the wider ecosystem. Much like the Yellowstone lupus, responsive value chains are the keystone species that provide stability directly and through their beneficial secondary and tertiary impacts. The value chain across the enterprise ecosystem depends upon change and stability, reimagining and resilience.

Sentience is a state of awareness with perception. To deliver the outcomes of the Live Enterprise model, the architectural layers should have a state of awareness that provides them the ability to sense, process, and respond to changes in state. In the traditional systems, only the user state is maintained and managed and only for a specific interaction channel; however, to be sentient, state awareness at multiple levels is required.

The Five Sentient Principles

Live Enterprise process analysis and reimagining is accomplished through five sentient principles.

- **Proximity to source**. Users should be provided with all the information and insights required for them to make a decision, at the interaction point where a decision needs to be made.
- **Zero latency**. Zero latency identifies how a company arrives at straight through processing across the value chain with the minimal number of steps and approvals required to complete the interaction. Put simply, zero latency is response following input, without delay.
- **Instant simulation**. Instant simulation provides the ability to not only conduct traditional what-if analysis but also explore alternatives and simulate to make the correct decision. It requires running simulations, practicing the process and predicting potential futures. Users evaluate alternatives at the point of decision making.
- **Micro-feedback**. Micro-feedback is user feedback gathered in the work flow. At the end of each user interaction, ask a simple question to understand their overall experience for this interaction.
- **Guided practice**. Guided practice provides a well-defined user pathway to complete a specific task or activity. The best practices get codified into the interaction flow itself. This is essential to develop new routines and drive behavior change.

Intuitive Decisions

It takes 302 neurons to keep a worm's nervous system ticking, while the capuchin monkey has around 3.7 billion neurons. For us humans, the magic number is 100 billion neurons—about the same number of stars in the Milky Way.

Those 100 billion neurons spark more than 100 trillion connections, called a "neuron forest" by the experts, where information runs at up to 250 miles an hour inside our skulls.

Thanks to those 100 billion neurons, the human mind is wired to see patterns, an essential aspect of intelligence. The mind processes information in conjunction with insights from past experiences to create intuition, and intuition guides much of our decisions.

Maximum Intuition, Minimum Intervention

Leading organizations are developing a similar intuition to drive decisions swiftly and accurately, and to act with resilience in the face of disruption. Sentience enabled by AI and automation are fundamental to this capability so that decisions and responses to data-led insights are acted upon with maximum human intuition and minimum human intervention.

This manifests in an ecosystem of tools that captures and maps complex and vast process environments. Businesses rely on historical and live data, both qualitative and quantitative, to learn from and then guide the formation of patterns that automatically detect, classify, and resolve problems.

These patterns also help companies see opportunities to improve the things they already do. Organizations use process and mining tools to digitize existing manual and semiautomated processes, and also capture variants and flow. Robotic process automation and similar tools have created digital workers, worker bots, and micro-bots that automate, optimize, and take on much of the deterministic decision load.

AI and related tools of machine learning (ML), deep learning (DL), and natural language understanding (NLU) allow businesses to automate routine and deterministic decisions, while at the same time provide instant simulation capabilities for users to experiment and test. Then users can make more complex decisions about what and how to adapt, like in response to disruption that emanates after a crisis situation.

Knowledge Graphs and Digital Brains

The knowledge graph links all data-spanning employees, customers, partners, networks, and devices, plus the interactions in between. An AI-driven core connects these islands of information in real time, allowing enterprises to make data-driven decisions, plus sense, process, and adapt to changing business stimuli.

The digital brain uses machine learning and deep learning as a nexus for continuous, automated learning from data across business units and product lines. The digital brain processes this input to determine if any action is required and, if so, aids users through nudging and guided feedback. It then monitors the responses to learn and evolve from them, providing the enterprise with higher cognition.

The knowledge graph and digital brain continuously curate organizational knowledge to create perceptive experiences and make intuitive decisions. They capture and analyze enterprise data using automated reasoning to orchestrate intelligent responses to emerging events.

> Hybrid, modular, or quick-assembly talent is the future of the workforce.

Hybrid Talent

Hybrid, modular, or quick-assembly talent is the future of the workforce. Beyond an individual "full-stack" worker with both STEM skills and empathetic creativity, hybrid talent is also defined as a seamless mix of humans, machines, and the gig economy to bring the right talent at the right time for the task at hand.

The hybrid talent model is built on three pillars:

- Promote micro-change routines, which over time build a culture of lifelong learning, and emphasize micro-feedback, helping people improve through small changes on a continuous basis.
- Adopt an open, collaborative, and multi-experience learning mindset across multigenerational learners, as they seek guided practice and experiences with tech trends such as edge computing, hyper-automation, and practical blockchain.
- Elevate corporate trainers to learning champions, viewing their roles differently to simulate learner behaviors and learning patterns, enabling them to provide learning with minimal latency and instant simulation.

Establishing a Talent Model

Lifelong learning is the North Star for organizational talent development. These forces are disrupting and changing the talent needs of every industry, with the frequent introduction of emerging technologies, new delivery models, changing talent demographics, and geopolitical challenges.

As a result, the core principles in establishing a talent model are as follows:

Motivate employees to learn. Ensure learners are able to access resources anytime, anywhere, and on any device—taking complete control of how they manage their individual learning journeys.

Leverage the manager-employee relationship. For learning efforts to be effective, an active role for managers should be created to help support and guide their teams in their learning journeys.

Anywhere, just-in-time learning. Trends indicate that employees prefer to learn on the go, at their convenience, and just in time.

Learning experience. Most employees are used to digital experiences on platforms like YouTube, Netflix, Amazon Prime shopping, and learning platforms like Udacity. Digital learning solutions must be designed to provide similar experiences and feel.

Future ready, while excellent today. Learning programs and courses must be forward-looking to excite digital native learners with fresh content and exciting formats, yet also designed to meet the needs of those who are less tech-savvy and need to learn mature, well-established capabilities.

Design to Evolve

While enterprises continue to leverage technology to improve productivity, the most successful businesses also transform to improve customer experience and employee engagement. Many companies deal with the duality of accelerating digital initiatives while maintaining operations stability in their new normal. The enterprises that survive will be those that navigate this duality and become resilient.

Business resilience means the ability to respond to market changes and uncertainty, without stepping off the treadmill of continually rising expectations.

For Infosys, this duality required defining and developing an evolutionary architectural approach using Live Enterprise principles with the goal to make the existing IT landscape robust and resilient, abstract complexity, and establish a foundation to build new capabilities.

The reference architecture for a Live Enterprise augments an existing IT landscape and creates new services around it, and in the process transforms it into a Live Enterprise model. The model includes five elements:

Enterprise IT systems. These are the systems that run older, mission-critical applications and tend to be part of systems of record. A big bang modernization approach is not recommended, given the risk and complexity involved. Instead, consider an evolutionary approach to modernize core systems to simplify and reduce technical debt, improve efficiency through automation, optimize run cost, and make them resilient.

Interact layer—driving connections and collaboration. In the Live Enterprise, all users cooperate rapidly to visual and system cues across a range of channels. A Live Enterprise is connected, and this connectedness drives interactions and collaboration between humans, things, and data.

Process and serve layer—orchestrating and powering interactions. The process and serve layer acts as the glue that connects and powers the user experience by enabling and orchestrating the application programming interfaces (APIs) provided by the intelligence layer, core systems of record, and the digital runway.

As organizations start reimagining the experience, it also requires the underlying processes to be reimagined, reconfigured, and orchestrated to enable anytime, anywhere perceptive experiences.

To provide this flexibility, it is important to unbundle the entire business process, features, and functionality into a set of services that can be developed by independent teams to provide discrete functionality and can be stitched together in different combinations over time to enable the continuous evolution of experience and features.

Intelligence layer—driving sentience. Data is the next degree of connectedness. For a Live Enterprise, connected real-time data is required to be able to sense, process, and respond to evolving events, situations, and user needs. Once an organization connects humans, data, and things, it can then observe the data streaming from each of these inputs.

The digital runway requires a significant cultureshift in corporate mindset.

Once organizations start observing, then they can also sense, process, and respond—gaining sentience. If sufficient signals are in place, they can be acted upon.

Digital runway—shared digital infrastructure for the company. In the Live Enterprise model, getting the architecture right is critical, and it starts by developing a shared digital infrastructure for the company, determining which platforms, features, and functions can be developed in the future. The shared digital infrastructure for the company is called a "digital runway" that helps increase the velocity of developing new ideas and innovations and taking them to the market in a shorter span of time.

All five layers of Enterprise IT systems, intelligence, process and serve, interact, and digital runway layers consume the services provided by the digital runway.

Digital Runway

In large global organizations, very good ideas and innovation tend to happen on a regular basis but in isolated pockets. It is straightforward to rapidly experiment, innovate, and develop point solutions.

However, it becomes a significant challenge when one has to unbundle them into shared digital infrastructure services and then scale, productize, and roll it out across the global organizational footprint. Few companies are able to do this successfully so that global users can use these unbundled services to rebundle and solve problems specific to their customers, lines of business, and geographies.

Amazon has developed digital platforms for their company using their famous two pizza team size rule, and innovates at a rapid pace to develop newer platforms, features, and functionality. The digital platform provides the tools that can be used by hundreds of independent and globally distributed teams to rapidly experiment and roll out successful ideas to their entire customer base.

The digital runway provides the tools to scale ideas and innovations, and also provides the ability for teams to independently use these tools to solve their customer problems in their context and part of the business.

Through digital runways, curating and organizing knowledge, platforms and services, processes and playbooks, data and AI services, and other resources come together in a cohesive manner and in a scalable model that drives the velocity of new ideas and innovations.

This also enables ideas that have worked well in one area of business or platform to be quickly scaled to the rest of the organization, as they are based on the same digital infrastructure.

The digital runway has five categories: knowledge, platform services, process, data and AI, and resources.

An architecture-first and platform mindset should be applied to ensure the platforms are designed for evolvability rather than features and functions. An architecture fitness function should be defined to continuously measure platform quality, plus include playbooks to define and codify guided practices.

The digital runway requires a significant culture shift in corporate mindset. To deliver a change in culture and drive the business, there should be a persistent focus on the consumption, coverage, adoption, business impact, and usage of shared infrastructure.

Micro Is the New Mega

Micro-change management is how the Live Enterprise model operates. The vision and aspirations are big, but the organization thinks "micro." Agile teams work on micro-problems, and they pivot to address user needs and develop a minimum viable product (MVP).

These micro-problems are addressed by small, hyper-productive teams working on micro-releases to rapidly experiment and take concepts to market in weeks.

Micro is the new mega, with agile predisposed to small teams working on rapid learning and decision cycles. Agile evolu-

tion is broken down into incremental micro-projects pulled together with a micro-front end and micro-service architecture, to create an environment of frequent micro-gains.

In effect, micro-change management ultimately helps organizations evolve enterprise agile.

Frameworking Change, Impact, and Scale

For the Live Enterprise model to be successful within an organization, the employees and teams working to define and execute the vision and strategy should believe in it and implement it effectively. One of the objectives is also to bring about cultural change, so that during transformation to a Live Enterprise, this changes employee routines and eventually their behavior.

Consider this simple framework to drive micro-change across the organization:

Micro-changes: Break down strategic initiatives into multiple micro-change programs, with each having a well-defined objective and outcome. Ask why a change is required, whether incremental or exponential, what value it will deliver, and what change in behavior is needed. These micro-change programs will lead to a sigma of micro change programs to accomplish the mega vision.

Routine + 1. Each micro-change management program should drive a small change in a routine. Periodically augment with similar adjacent changes (Routine + 1). Eventually create a new routine and achieve behavior shift with minimal resistance.

Behavioral approach to change management. Behavioral approach is a combination of cues, hints, and suggestions. Positively nudge the impacted stakeholders, and supplement with rewards and incentives which create excitement and improve outcomes.

Continuously measure, learn, and evolve. As micro-change programs are rolled out, continuously measure to ensure they accomplish desired outcomes. If not, analyze data, rethink, and improve through iteration.

Each new micro-change initiative within the organization follows this four-step process.

While technology and market forces are disruptive, leaders have a choice in how they approach the future. The Live Enterprise model offers a science-based yet uplifting mindset to create an enduring, prosperous company.

It also provides a blueprint for individuals, governments, and society to evolve purposefully while addressing the structural problems and opportunities that will define the future of business and, ultimately, life itself.

THE SUMMARY IN BRIEF

Despite having an impressive business education, including an MBA from Stanford's elite business school and experience working at McKinsey & Company, author David Dodson learned the hard way that no one taught him the basic skills necessary to lead an organization. When he started his first company he learned on the job, slowly and expensively. He made horrendous hiring mistakes, wasted cash, misused his team's time and lost great employees and valuable customers. Those missteps are the inspiration for ***The Manager's Handbook: Five Simple Steps to Build a Team, Stay Focused, Make Better Decisions, and Crush Your Competition***.

Dodson knew those early experiences were not unique. There had to be a better way to prepare people for leadership. After three years of study and observation he discovered the answer to a nagging question: Why are some people better than others at getting things done? Personality attributes vary, but a command of skills is universal. Exceptional managers share five common skill characteristics that can be learned and applied by anyone–including you. ***The Manager's Handbook*** will show you how to use them.

IN THIS SUMMARY, YOU WILL LEARN:

- How to commit to building a team.
- The impact of being a fanatical custodian of time.
- The value in seeking and taking advice.
- How to set and adhere to priorities.

Part I: Commitment to Building a Team

Hire for Outcomes

Inventing the next big thing won't make a lick of difference if you don't have the right team in place to pull it off. But most managers are really bad at hiring. Instead of hiring for outcomes–or put more bluntly, hiring "to get things done"–most of us hire the person who we click with and willingly accept a 50/50 shot at having gotten it right.

Better hiring begins with committing to a standardized approach across your organization. The conventional objection to standardization is that it takes away the hiring manager's flexibility. But a process for hiring for outcomes doesn't impact anyone's role in exercising their judgment in making a final decision; it increases the quality of the data collected in order to improve the eventual decision. Hiring for outcomes works. You do this by creating a hiring scorecard.

Begin with a list of desired outcomes and then answer the question, "How will I know?" This becomes your hiring action plan, allowing you to target the data you need to collect. To finish, identify the right attributes, or qualities, characteristics, and traits of a person, that are the reason someone is likely to achieve the outcome.

Conduct team interviews to allow for a faster process that also gathers data from a group, not just the most senior person. Then apply a systemic interview process that:

- Relies on team interviews, not one-on-ones
- Deepens and narrows responses by asking: What? How? Can you tell me more?
- Gives time for team to caucus during the interview to identify areas that need clarification
- Reviews the candidate's fit, focusing on data, not likability

Once you find the right candidate to hire, give them a 100-day window to get comfortable asking questions, make friends and connections, learn workplace norms, or get trained in their areas of expertise. This strong onboarding process drastically reduces turnover.

Instant Performance Feedback

Feedback is most effectual–positive and negative–when it is delivered as close to the time of the underlying event as possible. Don't save your thoughts for a semi-annual event. If it's feedback worth giving, it's worth delivering right away. The best managers are always on the lookout for coachable moments.

Kim Scott, the author of ***Radical Candor: How to Get What You Want by Saying What You Mean*** developed a framework to measure a person's willingness to challenge directly and care personally. Scott observed that most people either resist providing ongoing, high-quality coaching out of a misperception that kindness requires being indirect, or they let bad news go unaddressed. This leaves the person in need of feedback unscathed and feeling better about themselves, but it fails the team.

A common form this takes is the feedback sandwich, when we first deliver a gratuitous compliment only to earn permission to say what we really want to say. We then offer the important feedback, then complete the sandwich by tossing in some reassuring words that only serve to reduce the impact of our feedback. This doesn't affect change.

Scott incorporates two principles to delivering quality feedback: showing care but being direct. You can accomplish this with Radical Candor and when done right, it's highly effective and should be given for both positive and negative feedback.

When modeling it, call it by its name. It may sound something like this. "I'd like to offer you some feedback in the form of Radical Candor. You're consistently arriving late for meetings, and the reason this is an issue is because…"

When you begin to implement this, start by soliciting it for yourself, helping those who give it the chance to rephrase as you model how to deliver feedback in this way. For the first three months of implementing it team-wide, aim for twice as many instances of positive feedback over negative feedback, but never confuse it with serving a feedback sandwich.

Coaching Underperformance

Many underperformers can be coached to success but few managers and companies know how to do so. If a team member is underperforming in a way that is unsustainable and, if not addressed, calls to question whether they belong with the organization, you should apply the following four-step process.

First, note on your organization chart which team members you would rank as A, B, or C with an A rating to indicate the person who has a 90% chance of achieving top 10% results. The B rating reflects those with the potential to

Not only is it okay to say "no," to be a high-performing leader, you must learn to do so.

become A. C represents those who are frequently failing to meet expectations or struggling in areas that are material to their success.

Second, imagine those who were marked B or C coming into your office and resigning for a great opportunity. You've now eliminated the uncomfortable step of having to fire them. With this, consider whether in your gut you would feel relieved, neutral, or devastated?

Third, beginning with the word, "In three years…," sketch out what you expect your organization chart to look like. Include names and titles. As you imagine your star team, can you picture this person with you then, or are they just filling a current need?

Fourth and last, ask yourself: "If I were filling a vacancy, would this person be hired for that position for 125% of their current salary?"

These four questions take about half an hour, twice a year. When done methodically, you'll identify the people you need to focus on retaining and developing, and those who have more fundamental concerns that may not be coachable.

Part II: Fanatical Custodian of Time

Activity is Not Progress

To manage a team and maintain your own priorities you have to be an especially careful custodian of your most precious and finite resource: your time. People that get things done protect their time. Managers can create more quantity of time, about two hours each day, by applying specific techniques.

Let's start with meetings. 30 and 60 minutes are the default times for nearly every meeting in the world. Managers spend a whopping 72% of their work hours in meetings. If you reduce those meetings to 20 and 40 minutes, you can add significant time back to your day. And there is a bonus. When a meeting is scheduled for 20 minutes instead of 30, people assume there is a reason. They show up on time and get right down to business.

Task management is crucial to protecting your time. The average amount of time a manager spends on a task is just over three minutes and they engage in about a dozen working spheres in a single day, switching every ten minutes from one task to the next. This practice is described as *task switching* and we know it is an inefficient way to complete work.

Chipping away at a single task over multiple times throughout the day requires more minutes than doing it all at once. But the cost is even higher than wasting the quantity of time you have. When you focus on a single task, your concentration and energy moves at an accelerated pace.

Saying "no" is another way to protect your time. High-performing leaders don't feel the requirement to read every article someone sends them, reply to every message they receive, or take meetings with someone just because a colleague asks if they will. Not only is it okay to say "no," to be a high-performing leader you must learn to do so.

Create quality by intentionally planning for times of *deep work* and shallow work. *Shallow work* can be done at almost any time and in almost any environment. Deep work is where creativity and innovation takes place and it requires uninterrupted periods of concentration.

Once you become a fanatical custodian of your own time, instill these same habits and practice among your entire team. Imagine the power you create when your whole team has extra time in their day as they carve back time in meetings, or when the whole team–not just you–creates uninterrupted periods of quality time for high-value work.

And because you are making these adjustments as a team, no one is put off when their email is not answered within seconds, when the meeting is scheduled for only 20 minutes, or if you politely decline when they ask, "Got a minute?"

Delegating

Many emerging leaders, as they face a growing to-do list, resort to working harder and longer hours as a way to scale. But managing is different than doing. There is only one solution if you want to build a lasting organization–you must learn the craft of delegation.

When you decide to delegate, use SCS, which stands for *specific*, *co-create*, and *support*. SCS is a mindset that captures three parallel elements of skillful delegation.

- Specific: Don't trade hours in the future to save minutes in the present. Give specific direction on the work product to save the back and forth that will result if you don't.
- Co-Create: If the result is not something ideal, offer suggestions for improvement without micromanaging. Ask questions that you may know the answers to in an effort to have them come up with solutions. This develops the skills they need to be successful next time around.
- Support: Have regular checkpoints to find out whether they are struggling, discover if your plan was unclear, or identify if they need additional guidance or resources.

Initially, delegation will not come naturally. In learning to delegate well, you will understand the need to let go of the old habits of simply doing everything yourself, you'll resist the pull to doing what once made you successful, and transition to a scalable form of leadership.

Part III: Willingness to Seek and Take Advice

Five Questions

There is significant know-how and wisdom within your sphere, but what you hear from them has likely been sifted through a filter, generating positions that conform to your existing views. To break away from these natural biases, you'll need to employ a structure to fact finding, asking a set of five questions to your team, then your customers and clients, suppliers and vendors, and finally, your competition.

Begin by making it clear to the person you're talking with your goal and intention. Tell them that you need to make a decision on the direction of the organization and need their input to make a wise one. Then, with pen and paper in hand ask them these five questions to each respective group.

Your Team

- What is going well?
- What are we working on that is a waste of time?
- What do our customers care the most about?
- What are we better at than all our competitors?
- If you were me, what would you be working on?

Customers and Clients

- Why do you buy from us?
- Do you buy exclusively from us or from others…and why?
- What are examples of things our competitors do better than us?
- What would we need to do to earn more of your business?
- What feature, service, or product do you wish we offered?

Suppliers and Vendors

- Where do you see the market expanding and contracting?
- What do you think our customers value most?
- What innovations or technological changes do you see happening?
- Among our competitors, who is the best and why?
- What are examples of things that we do better than our competition?

Former Employees of the Competition

- When you were there, what do you think they did well?
- What were their big challenges?
- Which competitors do they fear the most, and why?
- Why do people like to work there?
- When they lose people, what are the reasons?

Management is more than just walking around and casually interacting for show. Be intentional and purposeful as you seek information, using the structure provided by the five questions.

Executive Coaching

Coaches teach you to fish. Their mission is to help you build leadership skills, not create codependency. A coach participates in your development by creating frameworks for solving business problems, not by handing you the answer.

A coach creates a safe space in which you can wander and wonder as you explore new opportunities, expand your

Management is more than just walking around and casually interacting for show.

possibilities, and examine how you feel about your personal and professional circumstances.

To find the right coach, begin by creating a list of potential coaches. Search engines will lead you to a large list of candidates, but the preferred method is to tap into your network by asking other managers, as well as lawyers, accountants, and active investors, for their recommendations.

Next, check the coach's formal training. Coaching is a skill, not an accumulation of life experiences. There are credentialed programs, certifications, and accreditation for coaches as well as continuing education programs at major universities.

Meet with two or three coaches before deciding to get a sense of the range of options, styles and experiences available to you. In these conversations, you'll want to ask them how often they would expect to meet with you and for how long, how they handle emergency sessions, and whether they are available for unexpected situations.

Keep in mind that a coach is an investment, not an expense. Before taking a cheaper option, evaluate the price difference against the benefit of making a series of improved leadership decisions over time.

The days when people viewed coaching as a way to save a flailing executive are over. Think of a coach the way a star athlete does–as an essential component to reaching your full potential.

Part IV: Setting and Adhering to Priorities

Key Performance Indicators (KPIs)

Many of us begin our professional lives measured mostly by how well we collect and present historical data. But historical financial statements seldom drive operational decisions. It is far more effective to rely on KPIs that are material, actionable, and measurable.

To unleash the potential of a KPI, it needs to be understood and used by your frontline workers. Too often KPIs are saved for the boardroom and senior leadership team. But those are not the people making daily decisions that impact your operations. Your frontline team is your primary audience of a KPI. To take advantage of this, you need to apply a fidelity to *duplication*, *simplicity*, *frequency*, and *format*.

Duplication: When it comes to communicating KPIs to your team, less is more. Begin by eliminating overlapping KPIs. Understand that KPIs are not about precisely measuring all aspects of your operation, but tools to guide forward-facing management decisions.

Simplicity: Today, our ability to collect and process data is so potent that we can create complex KPIs that your frontline organization could never understand. Sacrifice some precision and use a KPI everyone can understand.

Frequency: The frequency with which you communicate a KPI should be based on the speed at which your organization can act on the information, not how often you can collect the data.

Format: Elaborate formatting comes at a cost. Impressive charts and elaborate PowerPoint presentations add nothing to the underlying content of a KPI. Keep the format simple.

The genius of a KPI is the ability to get the entire organization to rally around a single goal. Managers should harness this power by getting straightforward facts they can share with their team to make decisions that impact future results.

The Operating Plan

Prioritizing is not saying "no" to *unattractive* ideas. Prioritization is a willingness to also say "no" to *attractive* ideas. The pace at which you come up with good ideas will always outrun your organization's ability to implement them.

Because of this tension between ambition and realism, prioritization requires a process– discarding so many great ideas seldom happens on its own, and a process of institutional prioritization begins with the annual *operating plan*.

Begin by creating a baseline budget, which represents what the team believes will occur without implementing any new

initiatives. Put another way, it's how the company will perform if everyone just keeps doing what they're currently doing.

The next step is for your leadership team to brainstorm ideas for the following year. Be sure to stretch the team's creative energy, broadening the process beyond the most outspoken, or senior, members by making sure to solicit everyone's views.

Develop a set of potential initiatives for the following year, eliminating those with limited promise. Focus on developing what remains by fleshing out enough tactical detail to get a sense of the effort involved in the approximate cost.

Now, cross almost everything off the list. A company that takes on too many initiatives and needs to subtract will almost always first push the organization too hard in an effort to succeed, wearing down the team, lowering morale, and diffusing focus before finally acknowledging defeat. In contrast if you find yourself ahead of schedule and have the opportunity to add, you can do so with virtually no cost to the organization while likely lifting morale along the way.

Alignment Through Compensations

A company's performance is the result of a skilled and motivated team working in harmony. People are complex. They are influenced most by how they are regarded, whether they find the work interesting, their attitude toward their company and their boss, and being on a winning team. While some households don't have the luxury of taking a lower wage, the data show that most people will trade some compensation for the job they prefer.

There are three principal types of compensation: b*ase compensation*, *benefits*, and *variable compensation*. Properly designed, variable compensation is a powerful tool in your efforts to get your team to set and adhere to priorities.

Before considering any variable compensation, you need to first provide enough base compensation and benefits to satisfy your team's requirements for security. Creating economic stress and anxiety in the hope that you'll motivate people to work harder almost never increases performance.

Variable compensation provides clear direction on where you want folks to focus their efforts. It should be tied directly to your KPIs and operating plan and be used as a means to focus and reward the team's ability to hit those targets.

As you make the team aware of your operating plan and KPIs, reinforce your priorities by aligning your variable compensation plan to those targets. The best variable compensation plans have between one and four measurements, all consistent with the operating plan and each material to the final payout.

Use variable compensation to communicate your priorities, center your team's attention, actively measure results, and provide regular feedback and coaching opportunities. Use economic gains from bonus plans not to drive behavior, but as a way to align your team around common objectives and to reward success.

Part V: An Obsession with Quality

Quality Drives Profits

Quality impacts profit more than any single operational area of a company. Quality positively impacts sales, pricing, and expenses. Once someone experiences your product or service, all the sales and marketing prowess won't get them to buy from you again if you disappoint them.

But too often managers try to drive sales by cranking up their sales force, unaware that increasing and maintaining quality is an easier, faster, and cheaper way. A great sales engine can't sell a mediocre product. Fantastic salespeople may help get you in the door or make an initial sale, but no amount of marketing or selling can cast off the anchor of an unexceptional product or service.

The exciting aspect of quality is that it sets up an interesting "virtuous cycle" with your sales and marketing organization. Great salespeople gravitate to the company selling the best quality products or services. Which means companies selling quality goods end up with the best sales and marketing people creating a further acceleration in sales growth.

A Vow to Wow

Meeting the basic quality requirements of a customer is not enough to build loyalty. Winning requires carefully identifying a customer segment that has unique definitions of quality and then meeting those needs with a *vow to wow*.

The mistake many leaders make is believing that quality is a "mindset" or that it can be achieved through a slogan like "Quality is King!" Your customers don't care what you say in your commercials; the only thing that matters to them is whether you have met their definition of quality. The only way to achieve that high quality over an extended period of time–consistently throughout your company–is to have quality built into your processes.

Another common mistake is to chase every customer, and in doing so you impress no one. Wowing your target customer necessarily means that there will be those who love what you have to offer, and those who prefer to go elsewhere. If you chase every customer, you'll become operationally overwhelmed, and in the end, be mediocre at everything. Build an enduring company by finding a corner of the market that defines quality differently, and then satisfy your customers with a *vow to wow*.

Great leaders have the potential to do great things–and this world needs some of that right now. In doing so you'll have a positive impact on people's lives, maybe even more than that. Get your shot at being great by mastering these five skills.

David Dodson is on Stanford University's Graduate School of Business faculty, where he guides students in tactical execution. He teaches one of the most sought-after courses at Stanford, and in 2023 The Economist listed his course as one of the three "hottest" courses at Stanford. He recently received the MSx Teaching Excellence Award and is a six-time speaker in the graduation Last Lecture series. He also holds an economics and business degree from Stanford University.

Why Companies Never Try to Be The Best at Everything

THE MYTH OF EXCELLENCE

THE SUMMARY IN BRIEF

If your company tries to succeed at everything, it will wind up succeeding at nothing — so state Fred Crawford and Ryan Mathews in *The Myth of Excellence*. Backed by a bevy of consumer research, the two make the case for organizations to channel their energies toward a specific set of goals in order to reach their target audience with greater efficiency and success.

In the course of its transactions, a company can engage its customers in any one of five attributes: Price, Service, Access, Product or Experience. The authors discuss each one in detail, in conjunction with their Conceptual Model of Consumer Relevancy — a three-level hierarchy that dictates the length, breadth and depth of a customer-company business relationship in the following terms:

Acceptance. At bare minimum, a business wants its customers to accept their products or services as par for their market and make routine transactions with them. While this is an acceptable level of doing business, there is little effort on either side to maintain a sense of loyalty.

Preference. When a company deepens the level of respect, access and quality in a customer relationship, customers tend to grow to prefer that company over others. This is accomplished because the company has differentiated itself from competitors that achieve mere acceptance in the market.

Seeking. When a consumer not only prefers a company, but seeks out its products and services above all others, the company has achieved the ideal state of relationship with its customer.

Companies cannot, however, successfully achieve the third (seeking) status for each of the five transactional attributes — no organization possesses sufficient resources to succeed. You must determine the attributes your customers prefer best, and gear your efforts toward achieving the appropriate Relevancy level for each attribute — for example, the *seeking* level for attributes that are most important and acceptance for less important attributes.

The Myth of Excellence shows you how.

Align Commerce with Values

Many companies and pundits alike work under the assumption that consumers are chiefly concerned with purchasing the very best goods at the lowest possible price, and receiving plenty of value-added services, to boot. In truth, consumers are looking for values, not just value. They want recognition as human beings, not just a 30 percent discount.

Indeed, there are three key societal changes — all occurring at once — that drive consumers to crave something different, a change in the relative weighting we assign to the context of a transaction. Those factors are:

● **Societal devolution.** Traditional institutions have become less able to adequately reflect fundamental human values. As individuals, we unconsciously seek out reinforcement and ratification of our personal values, rewarding commercial institutions that are smart enough to build those values into their offerings.

● **Increased inability to keep pace with daily life.** We work too much; we're stressed out; depression is becoming more prevalent than heart disease. It is clear that expectations are rising, yet we are falling further behind.

● **Proliferation of increasingly intrusive information and communication technologies.** We are hit from all sides with information and commercial imagery, on television, the Internet and other means, which has left us better informed, but less aware.

Kmart's High Fashion Faux Pas

Sometimes, companies try desperately to excel in an area that consumers don't want. Several years ago, Kmart made a famously misguided attempt to make its line of clothing more upscale. As part of that campaign, the retailer began offering higher-priced Gitano designer jeans, a move that flopped because consumers didn't believe designer clothes could be sold at Kmart prices. Gitano, too, felt the full force of the miscalculation — damaging its standing with upscale customers who didn't believe any brand sold at Kmart could carry high-fashion cachet.

It was a case in which customers believed that *low cost* plus *high fashion* equaled *low quality*. Whether the jeans were a good value never entered into the equation.

Aligning the Commercial Context

As a result of the convergence of these factors, consumers want the commercial context to be aligned with human values. This alignment is *Consumer Relevancy,* which is based on three foundations:

● **Human values are the contemporary currency of commerce.** Businesses that address human needs that are typically ignored elsewhere are well positioned to take shares from competitors.

● **Human values determine commercial value.** While inferior quality in products will not be tolerated by consumers, product quality alone is not enough. Companies that address human values will have greater opportunities for differentiation, branding and building loyalty.

● **Values are more important than value to consumers.** Today, differentiation is found in the manner in which a product or service is rendered, through the lens of human values.

Focusing on Attributes

With these things in mind (and with research gleaned from a survey of 5,000 consumers), the authors came to the conclusion that every business transaction — from the simplest sale of goods to the most complex service offering — can be broken down into five attributes

1. Price
2. Service
3. Access
4. Experience
5. Product

While many companies attempt to excel at all five, none (not even retail giant Wal-Mart) are capable of being great at everything, yet this myth of excellence

Align Commerce with Values

(continued from page 2)

pervades the culture. Even if a given company could excel in all five areas, it would have trouble communicating a clear value proposition to consumers.

Companies must instead select an attribute that defines their primary field of competition (the one in which they want to dominate), homing in on the one that their target consumers value the most.

Finding out what attributes and values you ought to embody is relatively easy — you must talk to your customers in their language and be open to what they tell you. Once you've got the message, it must form the cornerstone of everything you do that touches the customer — no exceptions, no short-term deviations, no panic if sales dip in a quarter. Those values must permeate your culture, as well as your product offerings — a fact that is easier said than done in these competitive times. ■

A Conceptual Model For Consumer Relevancy

From the seller's perspective, the relationships between consumers and businesses haven't changed all that much from the days of the 19th century country store. Whereas the country store owner got to know his customers through countless interactions (enabling him to anticipate and meet their needs), today's businesses have technology on their side, to track purchases and deliver goods specifically tailored to the needs of consumers.

The Five Transaction Attributes

If things haven't changed that much, why do customers seem so upset? Part of the answer is that while the essential transactional infrastructure (the five basic attributes of commerce) appears the same over time, the specific meaning of those attributes has been radically transformed. This has affected those attributes in the following ways:

- **Price.** Consumers — regardless of income level, geographic location and/or education — are less concerned with getting the lowest price than they are with getting a fair and honest price. They want a price that is consistent and that doesn't appear to have been artificially increased or decreased at the expense of other things they want to buy. Business brags about cheap, but people value honest.
- **Service.** Time after time, companies fall over themselves to provide "value-added" services for consumers in one area, while failing to provide even basic service in others. All those special services mean little if a company cannot successfully serve customers' basic, everyday requests.
- **Access.** Today, consumers care more about navigation (physical and psychological) than mere geographic location. Getting to a business is far less important than getting what they want once they've arrived.
- **Product.** Just because businesses believe their products are the best doesn't necessarily mean you're dominating your customers' consciousness. A vast majority of consumers indicate that a consistently good product is more desirable than a single best offering. In other words, "good enough" is good enough for most consumers.
- **Experience.** Intimacy matters. Consumers want respect, to be treated like a human being (not a human purchase order), and to be offered unique products or services, a demand that stands in stark contrast to the stereotypical used car salesman trying to trick people into buying more car than they need.

The Four Relationship Levels

There is another dimension to the consumer/seller relationship — a hierarchy of interaction that dictates four potential levels at which the two parties meet and transact business. Where a company falls in this hierarchy depends on how well it listens to consumers, truly understands what they are looking for, and satisfies their needs. The levels in this Conceptual Model are as follows:

- **Consumer Underworld.** There exists a deep distrust on the part of consumers as a result of real or perceived disrespect or lack of accommodation at the hands of the company in question. No company wants to be at this "negative" level.
- **Level I: Consumer accepts the company.** This is the threshold at which a company represents par for a particular market or business — honest pricing, credible products, accommodating service, easy access and respect for customers. In a Level I relationship, consumers are willing to make routine transactions with the company, but there is little sense of loyalty either way.
- **Level II: Consumer prefers the company.** At this level, consumers actually prefer one store or brand over another. This typically takes place when the company makes access to its facilities, product, Web site, etc., convenient; shows respect at a personal level; clearly presents consistent prices; offers reliable, good quality products; and is able to educate consumers on the use of a product or service. To hit Level II, you must find ways to differentiate yourself from competitors, building a degree of trust sufficient to cause consumers to prefer doing business with them.
- **Level III: Consumer seeks the company.** This is the ideal state of interaction, in which the consumer not

(continued on page 4)

A Conceptual Model for Consumer Relevancy

(continued from page 3)

only prefers one company over others, but actively seeks out the company of choice. These companies find ways to dominate their markets, to separate themselves from the pack, to move consumers into lifestyle relationships, in which the company becomes the source that customers appoint to make all the right decisions.

Customer Relevancy

How do these levels interact with and add clarity to the five customer-centric categories to create a consumer-relevant company? Truly consumer-relevant companies do not attempt to dominate in every one of the five categories; they overcome the constant temptation to strive for universal excellence (or Level III standing), instead deciding upon which attribute they want to compete.

In addition to choosing a primary attribute, highly consumer-relevant companies select a second (Level II) attribute that serves as a strong complement and further differentiates them from competitors. Finally, those companies must not fall below par (Level I) in any of the other categories; many companies overlook this critically important point.

Thus, for example, a company might strive for Level III on product, Level II on service and Level I on price, access and experience. ■

Price Can Be a Major Attribute — But Not the Only One

Dominating on price doesn't necessarily mean having the absolute lowest cost — it means consistently offering customers fair and honest pricing. Indeed, while most consumer businesses appear happy to compete ferociously on the basis of cost of goods or services — under the contention that their customers really want the lowest prices available — in most circumstances they're just flat wrong.

Absolute lowest price may continue to be important to some segment of the population, but it will be just one factor in the purchase-decision process for the vast majority of consumers. In many cases, price will actually be a less significant factor than it has been, because most consumers find themselves more rushed and time-starved than ever before.

While many current (and deceased) Internet businesses treat lowest price as their key factor, the typical consumer business in the non-virtual world must recognize the multidimensional aspects of price, that, in fact, it takes more than simply offering low prices to attract consumers.

On the surface, Dollar General Corp. (the Nashville-based retailer catering to low- and fixed-income consumers) is clearly a consumer business that aims to dominate on price. Get below that shell, however, and you see that price is only its primary (Level III) attribute; it also focuses on access (as its Level II attribute) to differentiate its stores from other general goods outlets, such as Wal-Mart. And it operates at par in terms of service and experience.

Dollar General's Level III Attribute: Price

Dollar General is able to excel at price in part because its strategy is rooted in several crucial factors, including the following:

- **Cash and carry.** The chain does not accept credit cards, eliminating the two- to six-percent fees charged by credit card companies, as well as expensive credit card verification systems.
- **No advertising.** You will never see a Dollar General sales circular in your local paper, unless a new store is opening in your area. The company also avoids all radio and TV advertisements, as well.
- **Mixing of brands.** Dollar General offers a mix of brands that enables the company to provide consistently good quality at as low a price as possible. Approximately 10 to 15 percent of its items are well-known national brands; an equal portion consists of the chain's own DG Signature label products. The remainder of the products offered consist of various labels exclusive to Dollar General that meet the company's high standards of quality.
- **Simple, no glitz stores.** The company's store units are decidedly unglamorous, but that suits management and customers alike just fine.
- **Quality labor force.** The company taps its own customer base and leverages its stores locales to find the best employees it can, at reasonable wages.

Dollar General's Level II Attribute: Access

Dollar General can differentiate itself from competitors on the factor of access by maintaining the following attributes:

- **Small footprint.** At about 7,000 square feet, the typical Dollar General store is smaller than its competition's outlets.
- **Eye-level focus.** In every Dollar General store, nothing — fixtures, signs, merchandise, etc. — is above eye level. Customers standing in the store entrance have an unobstructed view of the entire store without having to wander around.
- **Streamlined checkout.** Dollar General keeps checkout lines moving by employing price scanners and removing impulse buy items (gum, candy, etc.) from its front-end area.

(continued on page 5)

Price Can Be a Major Attribute — But Not the Only One

(continued from page 4)

● **Limited choices.** The company keeps a tight reign on its inventory, limiting itself to just 4500 stock keeping units, or SKUs (Wal-Mart, by contrast, offers more than eight times that many), keeping stock from crowding the stores and inconveniencing customers who don't want to wade through too many choices.

● **Convenient location.** Although access is typically defined as internal navigation, a nice store means little if customers can't get to it. Dollar General tries to locate its units in the heart of small towns or on major public transit lines in larger cities. ■

Service with a Smile?

Service is all about people — the element of human-to-human interaction is what most clearly defines the service attribute in a business. Unlike product or price, service is a living, breathing dynamic, experienced by individuals in a very personal way. Since employees are the touch points between a company and its customers, the mechanisms companies use to motivate their employees are a critical part of how their customers experience service.

Historically, companies have considered service to be something they offered to consumers; however, as attitudes toward service have shifted, that viewpoint has changed. Now, consumers regard service as something a business embodies. They differentiate among various kinds of service a company can offer — before, during and after transactions. They recognize the close relationship between service and experience; it's not so much what you offer, but how you offer it that makes the difference in a service situation.

Businesses that want to compete on service as their primary attribute, or even those that wish to simply bring their service component up to industry standards, must listen carefully to the voice of the consumer.

Levels of Service

The hierarchy of interaction would work as follows:

● **Level I.** The first level for service is *accommodation* — meeting the fundamental expectations of the consumer. To be accommodated, customers must feel as if they are respected and treated fairly by the company's personnel, and that employees take seriously any dissatisfaction they might have with a purchase. Companies must focus on hiring and training salespeople and customer service representatives who are committed to serving customers first and foremost.

Superquinn Keeps Customers Coming Back

Superquinn isn't just an Irish supermarket chain; in the words of one employee, it's a cult. Every employee, most of the customers, and the company's management are all dedicated to the chain's primary competitive attribute — service. Here's how they do it:

✓ **They do the simple things right.** Superquinn never forgets to do the little things to make customers happy. All its stores have a greeter posted at the store entrance, not only to make a good first impression, but also to help customers get situated in the store so they can go about their business. Store managers, also, are a constant presence on the floor; they can often be seen doing their paperwork at empty registers, on shelves, etc. — all in the name of remaining accessible to customers.

✓ **They go the extra mile.** While many retailers hide their complaint department, Superquinn places its service counter right at the entrance of the store, powerfully communicating the value the chain puts in addressing its customers' comments and complaints. The company will also stock special items for specific customers, even if only a competitor carries that item.

✓ **They exceed customer expectations.** While there are many points of difference between Superquinn and its competitors, some programs are clearly light years ahead of anything most other retailers will do for their customers. One such program is the company's child-care service — each store is equipped with a supervised playhouse area where customers can leave their children to play, free of charge. Another program is the SuperClub customer loyalty program, which enables customers to accumulate points good toward the purchase of merchandise at Superquinn's partner companies.

● **Level II.** At the second level, consumers want *education* — information about products and services. They want their questions answered by employees who are well trained, knowledgeable and friendly.

● **Level III.** Businesses aiming to excel at the service attribute must offer the consumer individualized *customization* of the product or service. This customization can be a tricky proposition, however; if you make a mistake, it can have a terribly negative effect on your standing with customers. A good example of customization gone wrong might be a direct mail campaign, seemingly customized with your name and address, but with one or both misspelled. ■

Access: Physical and Psychological

For decades, companies have defined access by the age-old real estate adage of "location, location, location." However, a new definition of access is starting to win over today's consumers, a definition that has less to do with physical location and everything to do with *psychological* access — specifically, the perception of being able to easily and successfully navigate the physical area of a business and find what you're looking for. Dollar General, while dominating on price, has also successfully captured this notion of access, with the uniform, easily navigated layout of each and every one of its stores.

The lesson to be learned for a consumer business is the fact that there is a pot of gold awaiting the retailer or service provider that can create a sense of connectivity and community — that is, psychological access — as a means of differentiation. They must recognize that their customers likely rush through their lives, accompanied by more acquaintances than friends; these customers need a sense of connection and of community affiliation, and, very often, find neither.

This non-physical access — or, for lack of a better term, "higher" access — is key to successfully dominating or differentiating your business on the attribute of access. The Conceptual Model for access, then, would look something like the following:

- **Level I.** At this basic threshold of competing on access, consumers are saying, "Make it *easy* for me to find what I need, and to get in and out of your store or location in a hurry."
- **Level II.** At this level of consumer preference, consumers are telling businesses to make the experience *convenient* for them.
- **Level III.** At the level in which consumers actively seek a company, they define access not only in terms of ease and convenience, but also in terms of whether that business provides *solutions* to their lifestyle problems, or offers that psychological sense of *connectivity* and community.

If your organization wants to excel at access, ask yourself some key questions:

- Are you offering your customers a real solution to their needs (for example, arranging extra shipments or "shopping" the competition for last-minute purchases)?
- How convenient is it to do business with you? Do you, for example, use available technology wisely, in order to enhance your customers' ability to engage your business?
- How easy is it for your customers to get the goods or services they're looking for?
- If you have a Web site, do you respond to customer communications in real time, or only once a day?
- Are you willing to go to the customer if need be, or do you insist they come to you? ■

Running Circles Around Access

Circles, a Boston-based personal services company that offers a virtual concierge service, helps its customers find just about anything they want (from restaurants to cars to virtually any kind of shopping), offering access, literally, to a world of products and services. Through offering such a wide array of solutions to customer needs, Circles shows businesses how they, too, can excel at the attribute of access:

- ✓ **Take care of your customers' customers.** You can't access Circles if you're an individual customer, but you can if you're a customer of one of Circles' client companies, including Razorfish, Cap Gemini Ernst & Young, Hyperion and nearly 75 other corporations. These companies know that, in competitive job markets, offering perks to employees, such as contracting with a personal services company, is an effective way to build employee loyalty. The exclusivity of Circles' access also makes its services more valuable.
- ✓ **Help others achieve balance.** By helping customers take care of little things (hiring a dog walker, getting tickets to an event, etc.), Circles enables those customers to find time for other pursuits outside those associated with work or day-to-day chores.
- ✓ **Hire and train properly.** Providing access excellence is impossible without the right people. Circles has 250 professionals in its employ, including 150 highly trained personal assistants.

Product Bandwidth: Why 'Good' Is Good Enough

As with most of the attributes, product has a multitude of dimensions; chief among them are quality, breadth and depth. Companies that choose to compete on the basis of product must determine the most appropriate mix of these three elements.

At a basic level, a company must set the quality bar for its products, selecting a product "quality range" that strikes an appropriate balance of "good, better or best,"

(continued on page 7)

Product Bandwidth: Why 'Good' Is Good Enough

(continued from page 6)

depending on the needs of the consumer audience it is targeting. These companies will find themselves answering several important questions immediately:

- **Will we offer the most innovative products made to exacting specifications (which are, consequently, very expensive)?**
- **Will we go for items that are of lower quality but are more affordable to a larger pool of consumers?**
- **Will we strike a balance, somewhere between high and lower quality?**

Research points to a certain emotional-commitment range associated with product quality — a range that runs from disposability on one end to attachment on the other. Of course, this attachment depends largely on the individual; consumers who have an emotional attachment to a particular product tend to spend time researching and shopping for that product, before actually making a purchase.

Breadth and Depth

Breadth and depth are also key aspects of the product attribute. Companies choosing to compete on product must decide whether they intend to have the deepest selection of products in their category of choice (such as Toys R Us or Staples) or the broadest assortment of items for their market (like Target or The Home Depot). Ultimately, however, the growth of online business will make product depth an increasingly difficult strategy on which to dominate in the brick-and-mortar world; this will likely lead to product depth increasing as a virtual business strategy, as it becomes the key differentiating factor for many businesses.

The Three Levels of Product

When applying the Conceptual Model to "product," it is necessary to recognize the first demand consumers will make of a business' product — *credibility*. In order to get to Level I, companies must offer a product that meets basic expectations and a minimum threshold of utility. A cheap wrench, for example, must still be able to loosen a rusted nut.

To get to Level II, businesses must guarantee the *reliability* of their products — consistently good merchandise and a low out-of-stock condition. Consumers will prefer your business if your products do what they purport to do, whether you're FedEx delivering overnight, or Maytag keeping its repairmen bored by making washers that don't break down. The perception of reliability is a principal result of successful branding and the expectation that such brands will always perform consistently.

Businesses that achieve Level III provide not only credibility and reliability, but also *inspiration*. They carry products that are unique, unusual or difficult to find — items that inspire the consumer to aspire to a higher level of lifestyle. Companies like Tiffany or Rolex provide this level of inspiration. That inspiration also extends to businesses that are not on the higher-end of the scale — companies like The Home Depot or Ikea, which attract repeat customers with their range of products or stylish designs. Clearly, these businesses understand their customers' product quality and price thresholds, but they also paint the picture of an inspiring lifestyle, in which their products play a starring role. ■

(continued on page 8)

Record Time: Becoming the Product

Record Time, a Detroit-based independent music store, has lasted more than 20 years in a progressive, competitive market by excelling at the primary attribute of product — offering customers the music they want, when they want it, regardless of whether they desire a Top Ten hit or the most obscure record by a niche artist. In order to outlast major competitors (such as Best Buy, Borders, Media Play and the like), the store's owner, Mike Himes, keenly observes several key guidelines:

- ✓ **Give the people what they want.** Record Time inspires customers by offering them recordings by cutting-edge artists that they can't find anywhere else.
- ✓ **Hire knowledge.** Himes hires only salespeople who are themselves deeply involved with music, either as artists, DJs, or just devoted fans.
- ✓ **Know your limits.** Hip-hop and alternative music are Record Time's bread and butter; as a result, the store stocks a lot of artists in those genres, and very little in other genres (like country or classical) that are unpopular with the store's target market of 15-to-30-year-olds.
- ✓ **Provide a community experience.** Record Time has a separate "Dance Room," where customers can listen to product and hang out with other aficionados.
- ✓ **Encourage local talent.** Himes regularly features live, in-store performances by local artists. He has also sponsored certain artists by distributing their music himself, with minimal (if any) record company support.

The Experience Factor

Experience may be the most difficult attribute at which to excel, in part because it is possibly the most misunderstood.

Many businesses often make the mistake of equating experience with entertainment — and entertainment alone — rather than seeing the latter as an augmentation to an already solid offer and a contributor to the consumer's experience. The allure of entertainment — of style over substantive experience or a value proposition — wears off after a while. Think of all the themed restaurants that once seemed so prevalent and experience-oriented, but which actually substituted glitz for value. Has anyone eaten at a Fashion Café lately?

Two Kinds of Experience

In much the same way that there are two kinds of access — physical and psychological — there are also two types of experience: the external, or entertainment, experience; and the internal experience, which is tied to the feeling a consumer has about doing business with a company. The distinction between the two has largely to do with how the business in question engages the customer, and the associated experience that transpires as a result of that engagement — how the customer feels; whether he or she is treated with respect; whether he or she feels valued; etc.

The Three Levels of Experience

To compete on experience successfully, businesses must consider the implications for experience, as denoted in the Conceptual Model:

- At Level I, consumers simply want to be treated as human beings. They demand respect, or they will shop your competition for the products and services they need.
- At Level II, the relationship between consumer and business deepens to include care. In addition to the attitudes of employees, care also encompasses environmental factors — signage, music, employee dress, etc. — that constitute the business' image. After all, if a company doesn't care about the image it relays to its customers, how can it purport to care about the customers themselves?
- Level III is the customer-affirming experience, in which the consumer feels a close bond with the company — a degree of intimacy, interaction and trust that leads to a long-term relationship. The consumer believes the company has his or her best interests at heart, respects him or her, and cares more about his or her needs than simply making a sale. ■

The Campbell Bewley Experience

If you speak of coffee or tea in Dublin, chances are you're speaking of (or inside) a Bewley's coffeehouse — such is the standing of the company in Ireland and modern Irish culture. From the stately appearance and decor of each of the company's 30 cafes to the professionalism and friendliness of each outlet's staff, Bewley (and its parent company, Campbell Bewley Group) offers an experience that is unique among coffee shops anywhere in the world — an atmosphere and product that has become synonymous with Dublin itself.

How does Bewley do it?

- ✓ **By attending to details.** The physical structure of each Bewley cafe is a paragon of consistency and warmth — high ceilings, mahogany walls, stained glass windows, an open fire and red upholstery are as much a part of the Bewley's experience as coffee and tea.
- ✓ **By doing staffing their way.** Bewley's operates without a wait staff, which management feels encourages customers to relax and hang out, without feeling rushed by someone asking them if they need anything. The people the company does employ must complete a series of training seminars and gain a certain amount of experience on the floor to move up the positional hierarchy (from trainee to shift leader). That hierarchy is visually represented by colored nametags that both alert customers to the capabilities and authority of a given worker, and give those workers something to which they can strive in their time as Bewley employees.
- ✓ **By communicating to customers.** Customers are treated to an array of hints (both subtle and overstated) of what they can expect at a Bewley's cafe — friendly staff, clean tables, etc. Customers are also alerted a week in advance to any changes that might be taking place — a particularly important communiqué for regular customers.
- ✓ **By doing what customers tell them to do.** Bewley's management believes that the only way to keep giving people what they want is to listen to customers and do what they say. The company solicits input — both positive and negative — via comment cards at every location. The feedback from those comment cards is taken seriously and acted upon immediately; employees who receive praise are rewarded immediately, and managers are evaluated on their outlet's feedback monthly.

THE SUMMARY IN BRIEF

What people expect from work today goes beyond just having to build a nine-to-five persona to fund their lives. The current corporate world journeys through overwhelming market upheavals as we speak. So, why are organizations still clinging to obsolete workplace practices?

The New Work Exchange: Embracing the Future by Putting Employees First introduces the philosophy of the New Work Exchange to redefine the way we work today. It takes us on a historical journey of work and tells us why corporate practices of the past century don't belong in modern workplaces.

By unpacking insightful real-life examples, author Scott Cawood helps us re-evaluate our alignment with our workers and workplaces. He urges organizations to put people first and unlocks valuable strategies to help organizations keep pace with consumer demands.

IN THIS SUMMARY, YOU WILL LEARN:

- The fundamental tenants of the New Work Exchange.
- Why many aspects of work have become obsolete.
- How to lead people instead of workers.
- How to make work and workplaces better.

Introduction: The State of Work

Work is one of the most important aspects of our lives – not just because it allows us to pay the bills or go on vacation but also because it helps us find identity and meaning.

In its State of the Global Workplace: 2022 Report, Gallup reported that 60 percent of people feel "detached at work" and 10 percent of the world's workforce is "miserable" at work. If emerging data hints at unprecedented levels of detachment and dissatisfaction with work, it begs us to pause and analyze important questions like: "Where did we go wrong?" and "Can we make work better?"

The pages in this book signal our need to redefine work and workplaces as part of the next industrial age. A New Work Exchange is emerging between employers and employees right in front of us. These new paradigms have the power to influence our sense of purpose when it comes to work.

The first chapter of the book helps us redefine work and explore the fundamental tenets of the New Work Exchange. In the second chapter, we examine how we got to our current state. The third chapter discusses why so many aspects of the work we've known have become obsolete. In chapter four, we understand how to lead people instead of workers. Chapter five covers inviting people within organizations to serve as real stakeholders. Finally, in chapter six, we assess how to set a new pace within the workplace.

Chapter 1: Working for Way More Than the Weekend

While work is the way we all earn our livings, it can also be a measure of our influence on the world. For most of the past century, work has mostly been an exchange in which an employer would essentially say, "Give me forty years of your life, and if you work hard, you'll get a paycheck to fund your life." However, the past few years have shown that work isn't just about monetary compensation or the physical workplace. Instead, it's about the value alignment between employer and employee.

Ultimately, organizations are trying to find people who care about their work and people are trying to find organizations that care about them and support what's important to them. Positively redefining your work and workplace demands forging an alignment between your organization and its people. Understand that work can be different and better. Don't be averse to disruption. Instead, acknowledge how change can make things better. Divorce yourself from outdated systems of work and transform work into something more meaningful for the people within your organization.

Acknowledge that people are the core of your business. Create a work culture where people become your business. When we see people as our business, it allows us to shift the conversation and focus on what it takes for people to do their best work. Create a healthy culture that sets people up for success. Culture is about how things get done in an organization. It manifests as policies, processes, mindsets, interactions, and decisions.

Chapter 2: Looking Back and Moving Forward

Starting a journey toward the New Work Exchange requires that we shift our perspective on what work is. But before we move forward, we must take a tour of some historical structures of work. This will help us understand how we got here in the first place so we can move forward deliberately and mindfully.

The Industrial Revolution came with manufacturing environments like factories, which provided an employment outlet that was revolutionary for millions. Railroads brought another hiring boom and brought along the corporate hierarchy that we're all familiar with today.

In the 1940s and '50s, DuPont developed and deployed task forces it sent out to various locations to solve specific problems. Task forces developed a reputation for agile and innovative work solutions. A man named Wilbur "Bill" Gore worked on a DuPont task force from 1945 until 1957, which informed his ideas about how organizations should be structured. He then went on to form his own company, W.L. Gore & Associates, and it has long been known as one of the best organizations to work for.

His company essentially said no to most of the traditional management practices seen at any other company. Gore based his company structure on the most collaborative, equitable model of task force work he'd experienced. He believed the traditional corporate hierarchy constrained people rather than generating momentum and ownership. Instead of having a "job," employees had "commitment areas." The company had four simple principles that guided all behaviors: Freedom, Commitment, Fairness, and Waterline. The last principle was Gore's way of saying that everyone was in the same boat together and should

do their own part to contribute to the company's success. This emphasized a sense of ownership, responsibility, and camaraderie within the company that endures after more than half a century.

Today, the remote work revolution creates new opportunities for those with location-based work requirements or who need specific accommodations at work. With more organizations open to flexible work times and locations, geographic limitations that businesses have formerly instituted are toppling quickly, which allows organizations to find the best talent available.

Work always has and will move in a forward direction and the only questions that matter at this point are: Are you moving with it or not? Are you on board or on the sidelines as the New Work Exchange is developed without you?

Chapter 3: Walking Away from Obsolete Practices

What we've begun to unravel is that the new practices, structures, mindsets, and methodologies we need at work come with some hard truths: work doesn't really suck. Neither does Monday. What does? All the baggage we have about work!

Tough business is bad business. Title-centric cultures signal how important some people are and create a robust sense of unimportance for many others. Operating and reinforcing a title-centric culture means we often end up hiring the role, not the person, causing massive business implications where a team ends up underperforming.

An adaptability paradox exists in most companies. It is the tendency to default to a comfortable practice, even when we know the practice isn't in our best interest. The adaptability paradox emerges when we most need to learn and change, but we stick with what we know, often in a way that stifles learning and innovation. To develop new things, organizations, and their people must fight the instinct to repeat the past. Awareness is the first step to change. To bring work into a new age, we must first admit that the paradox affects us all.

Organizations must give folks greater influence and control over their day-to-day lives. People don't like "gray spaces" of uncertainty. We thrive when there's certainty and clarity. Decentralization is another way of saying "Stop micromanaging everything." When we decentralize, control shifts and rebalances. People have more work options than ever before. With those options, they want more involvement in how, where, when, and why they work. To support ongoing cultural shifts, we must identify and change what's obsolete.

Chapter 4: Putting People First

The New Work Exchange is, in almost every way, about people. By incorporating human beings into our organizations instead of focusing on employees, we're more attuned to the changes taking place at every level of work. It also creates trust, which leads to more transparency in what's working and not working for people – and that's always great for business and people.

Personalizing relationships and avoiding a transactional approach as part of work is what people need, want, and are asking for, even though many common and current tactics are actually, "transactional, commonplace, and impersonal."

Contemplate the employee experience at your organization, then think about your experience at work. How do you impact people's work experiences through actions, policies, workstyles, and habits? What's required for your business to become people-centric? We can keep managing projects, timelines, and processes, but let's make the shift to leading with people first.

The New Work Exchange requires a fair, comprehensive, and thoughtful strategy for Total Rewards and we can reward people only if we're focused on people, not workers. Start by visualizing the ideal experience. Experiment with flipping the norms on traditional methods of decision-making, protocol, or processes. Develop new programs. Rethink your programs for compensation, benefits, and well-being. Get to the root of equity, belonging, diversity, and inclusion within your company by establishing committees and sponsoring a consultant to help with organizational DEI audits and suggest a formal pay equity assessment.

Intentionally design recruiting and onboarding processes aimed at preparing new people for what they need to know as they contemplate joining your team. Develop flexibility to bring the best from your people. Finally, build recognition and appreciation and cultivate a culture of growth.

Chapter 5: Fostering Stakeholders

When people are engaged, inspired, committed, and productive at work, they tend to feel included and valued. There's an understanding that they matter, their work mat-

ters, and their work influences outcomes.

The New Work Exchange tells us that everything within organizations, including results and outcomes, is elevated when we see our team members as people and then understand their roles as our most important stakeholders.

Stakeholders are anyone with an interest in an organization's success – specifically defining "success" as more than stock performance or return on investment. If a person is an active steward of an organization's mission, goals, outlook, brand, process, people, or vision, then that person is a stakeholder. That can include employees, customers, vendors, and government institutions. There are two types of stakeholders: internal and external.

Internal stakeholders are people working inside a business, such as the owners and employees, because they're directly impacted by what's happening, whereas external stakeholders have an interest in the success of the business and are not directly impacted by the work itself. These could include customers, shareholders, suppliers, vendors, government institutions, and the media.

The important question to ask here is, "How can we engage all stakeholders to have the maximum possible impact on our business?"

Remember, when financial capital is made ultimate, shareholders are placed above everyone else. Human capital, on the other hand, consists of the collective skills, expertise, capabilities, health, and practical know-how within and among the people who work within an organization. Tapping into human capital is about investing time and resources into the best areas to propel growth in people.

Chapter 6: Finding Our Pace in a Much Faster World

The world is faster than ever. So work is too. But have we found our pace yet? Probably not and here's why: the New Work Exchange will only accelerate the flow of work, and there's a lot of extraneous change impacting us already. We work through things, we fall backward onto old behaviors, we learn from them, and then after developing some new muscle memory from new patterns, we're propelled forward.

One of the most obvious factors disrupting traditional ideas of work has been the advent of faster communication, enabled through technology and higher information bandwidth. The culture, logistics, and fundamental ideas of leadership have been shifted in ways that have left many organizations and people struggling to catch their breath. The final step in the new era of work is finding the right pace in a world where everything is needed now and everyone is required to work faster. The way we communicate within an organization is directly linked to the speed with which we execute things.

Apply the 100/100 rule to make communication more effective. This rule suggests that you are 100 percent responsible for making sure you understand what someone is saying. And when you talk, you're also 100 percent responsible for making sure you understand what you're saying to someone.

Put people over platforms and processes. Decisions that must travel up and down the corporate ladder at a snail's pace are relics of a bygone era. We have to go directly to the person with the answer to the question so things can move quickly.

If someone were to be first in reaching the New Work Exchange, wouldn't you prefer it to be you? In a world where start-ups pop up at intense rates, being first will always remain coveted. Therefore, it's imperative to leverage our abilities to create, make, and sell at warp speed.

Conclusion: Exchanging Old for New

Everything we've discussed so far leads to a series of "What if?" questions. Such potential and opportunity with all those questions! What happens when we start implementing the answers to our questions and make changes? What if we start leading people instead of employees? What if we create policies and processes that set people up for unparalleled levels of success? What if the people within our businesses and organizations become our primary stakeholders? When we're asking these questions, what we're really asking becomes crystal clear: "What if we can make work better?" I believe we can.

Scott Cawood has spent his entire career working to answer a very specific question: How can we make work—and workplaces—better? A self-described "work nerd," Cawood's passion for the workplace and how it functions (or not) inspired him to earn degrees in organizational communication, labor and industrial relations, education, and a doctorate degree in organization and work-based learning. Unsurprisingly, he's forged these disciplines into a singular passion for organizations dedicated to great work. An in-demand speaker and presenter, *The New Work Exchange* is his second book.

FILE: STRATEGIC MANAGEMENT

By Kenichi Ohmae

Challenges and Opportunities In Our Borderless World

THE NEXT GLOBAL STAGE

THE SUMMARY IN BRIEF

A radically new world is taking shape from the ashes of yesterday's nation-based economic world. To succeed, you must act on the global stage, leveraging radically new drivers of economic power and growth. In this summary, legendary business strategist Kenichi Ohmae synthesizes today's emerging trends into the first coherent view of tomorrow's *global economy — and its implications for politics, business and personal success.*

Ohmae shows why yesterday's economic theories are collapsing, and explores the dynamics of the new region-state: tomorrow's most potent economic institution. He also shows how China is rapidly becoming the exemplar of this new economic paradigm.

This summary offers a practical blueprint for businesses, governments and individuals who seek ways to thrive in this new environment. It concludes with a detailed look at strategy in an era when it is tougher than ever to define competitors, customers and even companies themselves.

What You'll Learn In This Summary

✓ **What is the "cybercontinent"?** It is everywhere and nowhere. It is populated by the 800 million individuals who live almost everywhere in the physical world and are electronically interconnected.

✓ **How has the global economy changed the rules of competition?** Prosperity no longer depends exclusively on material wealth. And size is no longer important — companies no longer need a large domestic market in order to be successful.

✓ **Why are "platforms" so important?** They enable the exceedingly rapid exchange of goods and information, e.g., such phenomena as diverse as ATM cards, global positioning satellites and the English language.

✓ **What are the new roles of government in the global economy?** Central governments must make it easier for businesses and investments to come to their countries. The best way: Don't impede entrepreneurial region-states.

THE NEXT GLOBAL STAGE

by Kenichi Ohmae

— THE *COMPLETE* SUMMARY

PART I: THE STAGE

What Is the Global Economy?

For many, Ireland summons up visions of green, mist-covered fields and valleys. But outside the tourism industry, pleasant scenery does not produce wealth.

When Ireland became independent as a nation in 1922, it was overwhelmingly rural. From the 1960s onward, attempts were made to attract manufacturing industry from abroad. The Industrial Development Authority, a government agency, constructed industrial infrastructure and facilities, while the government offered generous tax breaks for foreign direct investments. These moves were only partly successful.

Location, Location, Location

In the 1970s and early 1980s, physical geography still played a big role in the international economy, and Ireland's location on the far western periphery of Europe meant that it was just too far away from potential markets.

In the late 1980s, emigration from Ireland increased, but those highly educated emigrants often returned after gaining experience and contacts outside the country. A new self-confidence began to take hold. The fact that the country had missed out on industrialization was increasingly seen as a blessing. It meant that the country's economy could take advantage of new trends beyond its borders in the *global* economy. Ireland could begin from scratch. In the late 1980s, developments in cybertechnology made it clear that jobs and prosperity could come at the end of a telephone line.

In 1992, the vision of Ireland as the "e-hub of Europe" emerged. Ireland is lucky: It is a nation-state that is the same size as a *region-state*. It is therefore capable of tapping into the dynamism of such a region-state. One of the keys to the success of a region-state is being able to brand itself successfully (such as an "e-hub") and to offer something different that sets it apart from the competition.

Innate Characteristics of the Global Economy

The global economy has four innate characteristics:

1. Borderless. National borders are far less constrictive than they once were. In terms of the four key factors of business life — communications, capital, corporations and consumers — the world has attained the position of being effectively without borders.

2. Invisible. The potency and prevalence of the global economy is not totally visible to the naked eye. The actions that it performs often take place not on the streets or in the debating chambers of national parliaments, but on computer terminals. Plus, cash transfers occur with a credit card.

3. Cyber-Connected. The global economy would not be possible without cybertechnology allowing large amounts of data to be transferred incredibly quickly. The Internet is only the most public part of this. Everything and everyone connects.

4. Measured in Multiples. Money is no longer seen only as a unit of value in the short term. Multiples are signs given to management by shareholders to shoot at the business opportunities on the horizon. Multiples are fictitious, in that they often do not reflect corporate value, but they express an expectation. ■

Opening Night

The pivotal year in the evolution of the global economy was 1985: Mikhail Gorbachev became general secretary of the Communist Party, and the finance ministers of the major economic powers created the Plaza Accord, which would allow the dollar to fall in value and thus reduce the overall U.S. debt. Also, Congress passed the Gramm-Rudman Act and made the U.S. budget deficit

(continued on page 3)

The author: Kenichi Ohmae is one of the world's leading business and corporate strategists. He has written more than 100 books, including *The Borderless World*, *The End of the Nation State* and *The Invisible Continent*.

Opening Night

(continued from page 2)

less of a bogeyman (even though it didn't go away, as the Act intended).

Also in 1985, Microsoft launched its new operating system: Windows. A user-friendly operating system was a very significant innovation. It allowed different types of applications to be run on the same machine, and it enabled many nontechnical people to use computers.

Changes in China

Meanwhile, China was seeking to compress 200 years of post-Industrial Revolution development into a couple of decades. At the root of the changes was a series of reforms that created stand-alone companies out of state-owned enterprises. The changes were monumental. Capitalism has come to China — but in the most brutal, inhumane and unsentimental form imaginable. Workers are exploited beyond anything imaginable in the West, and capitalists do anything they want.

The technological background for all of this is the cybercontinent — greater than any country on Earth. For the first time in human history, the world changes its habits in a matter of days rather than years. By the end of 2003, 800 million people were connected to the Internet. They're ready to read, listen to or watch anything available in cyberspace. ■

The End of Economics

Traditionally, economics was concerned with relationships between demand and supply — and supply and employment.

But the world has changed dramatically. An "economy" is not confined by national boundaries, nor is the world an assembly of autonomous nation-states, as economists assume. The significant players are independent units, both nations and regions. Some regions have a population of millions; others, such as the European Union (EU), have hundreds of millions.

The global economy powerfully affects national economies: In a borderless world, excess money supply from the central bank can slip out of the country if there are no attractive opportunities within. Thus, governments are constantly disciplined by their own citizens and by the investors in the rest of the world.

There is no model that describes the way the cyber-economy grows as goods, services and financial instruments are exchanged across borders in ways that are not understood by economists, let alone governments.

The whole system is suffused with funny money: bonds, Treasury bills and other instruments that don't represent cash or assets — but liabilities. The effectiveness of any government's fiscal policy is thus at the mercy of not only domestic businesses and consumers, but also of governments, companies and consumers in the rest of the world. In the last few years, derivatives and multiples (assessed values) have added to the amount and kinds of funny money in circulation.

Derivatives and multiples defy traditional business thinking and seem to rely on nonstatistical elements, which are often nonrational or even irrational, such as euphoria. Yet economic education still revolves around the old paradigms.

A New Economic Paradigm

The characteristics of the New Economic Paradigm are:

- **Prosperity doesn't depend exclusively on material wealth, such as natural resources.** You don't have to be rich to get richer. Countries such as Ireland and Finland can be poor in traditional resources, yet still prosper.
- **The world has an excess of capital.** Many areas are cash-rich and are searching constantly for investment opportunities. But regions must show themselves to be worthy of consideration. Money isn't necessary for prosperity — but investment is.
- **Size no longer matters.** Companies are no longer required to develop a substantial domestic market. Nokia is highly successful but has only a tiny domestic market in Finland. In fact, a large domestic market is no longer a competitive advantage. ■

PART II: STAGE DIRECTIONS

Playmakers

The geographical and economic unit of the global economy is the region. In a world of near-instant communications and a completely interconnected economy, the nation-state is increasingly irrelevant.

Some regions are parts of the old nation-states; others spill over existing borders. A region-state is not a political unit, but an economic one. Some, such as Singapore, are also political units. Or they can be smaller — the greater Tokyo area has a GNP that is in the world's top three.

A region-state is a unit for creating a positive wealth-cycle. The more new immigrants — and the more varied their backgrounds and skills — the more varied the region becomes over time. Manufacturing is followed by services, financial institutions and other businesses.

Playmakers

(continued from page 3)

Finding Your Bearings on the Global Stage

A positive cycle thus occurs, and the region becomes a totality with a deeper, wider economic and business base. Industries and service providers — from car dealerships to hospitals — are quickly attracted to a prosperous region, and move there to support some of the industries already spearheading industrial acceleration.

Region-states have been most successfully established in China, where in the 1980s, the government opened up a number of special economic zones to attract foreign direct investment. In GDP per capita, some of these region-states are among the top 15 economic units in the world.

Within the region-states, there can be smaller industrial clusters, as in northern Italy, where the town of Modena has a cluster of producers of fast sports cars, Parma has famous cheese producers, and nearby Carpi has knitwear manufacturers. Table 1 (on the right) provides examples of globally active and prosperous region-states.

Flexibility

The aspiring region or micro-region must be flexible — willing not to be imprisoned by the paradigms of the past and, if necessary, to reinvent itself to meet the requirements of the global economy. Thus, Italy is a tapestry of small townships, each of which has been able to thrive by producing pricey items for which there is an inelastic demand.

Also, if regions are to attain their potential, they must devolve decision-making, especially in economic and trade policy. National leaders are not intellectually equipped or politically motivated to embrace the global economy.

There is bound to be tension when an area becomes successful while remaining part of a nation-state built on the 19th-century model, just as the traditional, physical stock exchange is becoming less relevant in today's borderless world. Thus, emerging regions must often renegotiate their relationship with the center of power.

Even well-advantaged regions are not guaranteed success. Interference by the central government can undermine a region's prospects. A region can undermine its own success by not being flexible — or by trying to do too many things but specializing in nothing.

Good Marketing

Regions also need good marketing. They must learn from other successful regions but never slavishly copy them. They must be aware of local differences and of what makes their region uniquely attractive.

Most important is the will to succeed. Unless this becomes part of the fabric of the region's identity, participation in the global economy will remain mere rhetoric.

Globally Active and Prosperous Megaregions, Region-States and Microregions

Breadth of Industrial Spectrum	Functional Specialist	Multiple but Sporadic	Full Range or Controlling
Broad	Shandong	Pearl River Delta Greater Shanghai	Tokyo Metropolitan Area
Sector Specific	Irish CRM Dutch BPO	Singapore Indian BPO (Bangalore/ Hyderabad)	Silicon Valley Greater Boston Medicon Valley
Niche	Italian Towns	Chinese CRM (Dalian)	Austin

Table 1 — Business System Leading to End Users/Customers

The world must start thinking not only smaller (in terms of regions) — but also bigger in terms of the global totality and amalgams of effective and progressive regions. Large economic groupings such as the EU and the countries of ASEAN can play a vital role on the new global stage.

Some complain that globalization is an attempt to impose a particular form of commercial activity on the whole world at the expense of the varied tapestry of cultural differences. Others say that it is equivalent to Americanization.

Both groups are wrong. Globalization realizes and affirms our interdependence as human beings and societies. It exposes the fallacy of self-sufficiency, whether economic or cultural. It is a process of global optimization and the best mechanism to help less-developed nations to grow without artificial subsidies from the rich — but with the legitimate filter of markets.

Globalization is nothing but the liberalization of the individual, consumers, corporations and regions from the legacy of the nation-state in which they belong. ■

Platforms for Progress

Though we like to think of human development as gradual, made up of small and manageable incremental improvements, the reality is that sudden bursts of energy, often unleashed by or in tandem with technological breakthroughs, have moved us forward. They are groundbreaking when they happen, but then they are added to the aggregate of human progress and become part of our everyday life.

"Platforms" are ways to enable organizations or indi-

Platforms for Progress

(continued from page 4)

viduals to communicate with each other to get things done more quickly or more efficiently.

Platforms are: (a) open and communal — the technology that powers them is accessible to a wide range of users, and anyone with the appropriate license can participate; (b) two-way and interactive; and (c) adaptable and easy to use.

Information technology has been the platform for the global economy in two ways: first, its impact on the world's money markets; second, the extent to which, through the Internet, it redefines the very concept of the market and the types of relationships that businesses must be prepared to develop.

Recent Breakthroughs

The recent breakthroughs in data-transfer — in the materials through which data must pass, and in the formats in which large amounts of data can be efficiently stored — have totally transformed our world. They have made many products cheaper and given millions of people access to information that was once beyond their reach.

A language can also be a platform, just as English has become the language of the global economy and the standard in cyberspace for the storage of information and two-way communication. The prominence of English in Ireland and India is a major factor in the success of these two countries as electronic hubs for the rest of the world.

Nevertheless, native English speakers should realize that if they do not learn a second language, they might be disadvantaged in their long-term ability to participate in the global marketplace.

Here are other crucial platforms on the global stage:

- **The U.S. dollar.** It is the natural medium of payment for the substantial part of world trade that centers on the United States, as well as a considerable number of other trading partners.
