- **Brands.** A borderless world has opened up vast new possibilities for branding. The same brands are almost everywhere. They gain loyalty with the promise of consistently offering certain features. Most major brands are American.
- **A global business culture and language.** Business executives throughout the world communicate in English. They use the same terminology and have the same motivations and professional interests. They read the same magazines and very likely attended the same business schools — or ones that offer a very similar range of teaching materials, lecturing styles and placement opportunities. The new jargon of business — CRM, EBITA, BPO — is understood internationally.
- **The ATM.** The dispensation of money is now almost completely detached from the physical bank.
- **Credit cards and smart cards.** Programmable cards can now be used for a wide range of purposes — acquiring services, accumulating shopping points and much more.
- **The global positioning satellite.** This technology now has a rapidly expanding array of uses, such as providing information to travelers on foot, tracking stolen cars and analyzing traffic patterns from the sky. ■

Breaking the Chains

We live in a small and intimate global community where all sorts of information, even rumors, can disseminate in a matter of seconds. It is a global village with a population of 800 million people who could be treated as a single race or tribe. They include the enlightened and curious in the developing and underdeveloped countries. These "cyberites" follow three rules of behavior:

- **Cyberites who have used the Internet for five years or more tend to think and act similarly.** The longer their online experience, the more they take advantage of the Internet's various resources, engage in international trade, become more global in outlook, and gain the confidence that they can live well under the liberated regime of a truly global environment.
- **The number of years it takes to become a true cyberite is (age minus 10) divided by 10.** It takes longer to unlearn 20th-century assumptions, depending on how long you were exposed to them.
- **Cyberites are proactive consumers.** That is why TV and print advertising is so ineffective. Eight hundred million people now actively seek what they want through their favorite search engines. Marketers must make sure that their advertising is search engine-triggered, so that it tracks with the growing Internet sophistication of their customers.

The Logistics Revolution

The final part of the revolution is taking place in logistics.

Even though there is still a physical supply chain — and warehouses and inventory are still important — distribution centers are decisive. Once again, technology has triggered the revolution. The relationship between the product provider (who might also be the producer) and the end consumer has been simplified, even collapsed, by e-commerce.

Dell and Gateway exemplify an entirely new business entity — the virtual company — that assembles products not in a single factory, but in a large number of places, and ships them from distribution centers, warehouses and FedEx facilities.

And companies such as FedEx are getting into the strategic logistics business and using their databases to

(continued on page 6)

Out and About

Cross-border business process outsourcing (BPO) is another platform that helps people and businesses communicate, and it is shaping the global stage in a major way. It's about optimization. Activities once done in a high-cost environment are moved to where the labor costs are lower, with no loss in quality. It has been going on for decades, and it is controversial because of the loss of jobs at home. Almost every area of the world has some type of BPO activity.

There is nothing inevitable about BPO. It suits some sectors better than others. For some, it can be very successful; for those poorly prepared, it can spell disaster.

BPO would be unthinkable without present-day telecommunications technology. The two countries that have been most successful in the outsourcing of electronic services — India and Ireland — have made radical improvements in their telecommunications infrastructures.

BPO is happening in other areas, such as clinical drug trials (patents come from various countries at lower costs) and compiling research materials.

Home Offices

Many BPO providers work from their own homes or in a small office environment. This is the most important difference between the Manufacturing Age and the Cyber Age. The reality of BPO is that it is not about sweatshops and exploited labor. BPO brings prosperity and hope to countless millions of people.

Patriotic sentiment and a desire to protect domestic jobs doesn't do much for a company's bottom line. Outsourcing decisions are never based only on lower labor costs — in Ireland, labor costs don't even enter the discussion. Processes are outsourced to environments that can provide the same level of service and expertise — but at a lower price. BPO makes economic sense, despite what its critics say. Also, technology has ensured that it is irreversible.

BPO is a way for companies to seek more competitive ways to grow on the global stage.

Breaking the Chains

(continued from page 5)

become a vital link in other companies' supply chains.

A micro tag (only 0.5 mm square) can be buried in books, clothes and anything that is not going to be eaten. Soon, most items will have these tags built into them, representing the products' ID card, with a radio frequency capability that can be detected remotely.

The result will be a revolution in physical distribution and merchandising. We will no longer have to check out each individual item, so shopping will become quicker and less stressful. Inventory control will also benefit: Companies will know exactly how much of each product they are selling, as soon as it is sold. And because the micro tag contains details about the person to whom the item is being sold, it could have a major impact on theft and shoplifting.

Homogenous Chains

On the global stage, much of the logistics process has been containerized and standardized into homogenous chains, as foods of all types are transmitted worldwide through special equipment (to maintain a consistent environment) and seamless, electronically guided logistics platforms. The result has been a fundamental change to lifestyles.

In time, postal services, which, until recently, haven't given much thought to logistics, will realize that they are fundamentally in the logistics business, and, despite the challenge from e-mail, need to avail themselves of the latest developments.

The question is: Are we brave enough to apply the new technology? Strenuous opposition to worldwide, supranational markets comes from many places, including local farmers. Perhaps over time, people will adopt the attitude that a particular product need not come from a particular nation (as, for example, with the Japanese attitude about rice) because there are such enormous economic benefits to be realized from the logistics revolution. ■

PART III: THE SCRIPT

Reinventing Government

Governments don't create wealth, except through taxation. Thus, a key priority for politicians is to look into the economic development of their countries and regions. Is bureaucracy preventing local governments and regions from taking initiatives? Is the central government hindering them? Is there a clear chain of command and consistent messages? Are special interest groups or political lobbies blocking the regions' initiatives?

Too many governments still see themselves as distributors of wealth. They see their role as protecting domestic companies, their own population and certain regions considered vulnerable or disadvantaged. Local industries, protected by taxpayers' money, don't think globally. And governments have not been successful in tempting cyberites, who have the power to send their money anywhere.

Governments of the future, if they want to remain vibrant and relevant, must figure out how to facilitate economic development, introduce more discipline in their public services, and simplify their tax code to increase compliance.

The best government is small government. And the best it

(continued on page 7)

Reinventing Government

(continued from page 6)

can do for its people is to invite capital by welcoming corporations, that will bring in jobs and take over weak companies, so that the government won't have to use taxpayers' money to subsidize them. The smaller the government is, and the more open it is to wealth and investment from outside, the greater the payback will be for the region-state.

Today, the most important success factor is not a well-established domestic industry or home markets, but an educated and motivated work force — on the factory floor, in the computer room and in the agencies that provide national services. Also, a region must have good infrastructure, in both technology and logistics.

Challenges and Vision

As governments change their focus, they face several challenges: In a borderless world, they must not overemphasize the national interest. They must also realize that wealth creation is increasingly leveraged. Governments must come up with and deliver an economic vision that attracts many global investors, resulting in high multiples.

A viable vision must adhere to the already-known fundamentals of the global stage. The vision must:

- **Empower individuals.** The wealth of a nation, region or company is more dependent than ever on the number of talented individuals it can produce.
- **Invite capital from the rest of the world, and minimize obstacles to investment.**
- **Maintain an even keel.** Government must ensure that individuals can grow and prosper, and that regions can interact with the rest of the world.
- **Welcome new technology,** as Ireland did in the early 1990s by providing all primary schools with personal computers.
- **Diminish hindrances to the inflow and outflow of capital.**
- **Eliminate obstacles to companies that want to attract the best people to work for them, at any level and from any geographical area.**
- **Specialize.** The government must decide what industry or range of industries it wants to attract. ■

The Futures Market

On the global stage, change is necessary and inevitable at three fundamental levels: technological, personal and organizational.

- **Technological.** Technological progress can speedily reshape, even destroy, entire industries. Technology means that industrial death is increasingly a fact of business life.

It has never been uncommon to see whole sections of industry wiped out by technological progress. We need only think of the impact that the automobile had not only on the carriage industry, but also on saddle makers and the providers of feed and stables for horses. Each new technological wave usually has its victims: those who were unable to change in time.

Time has now been compressed. In the past, there was usually some time lag between the discovery of a new process or processes, and their complete victory over their predecessors. In the world of the interconnected global economy, such time lags are very rare.

Capitalizing on New Opportunities

- **Personal.** No matter where they are, individuals will have to adapt to the new reality in which one seldom has a job for life and cannot look forward to the certainty of an incrementally improving lifestyle and a post-retirement soft landing, in which all or most of his or her needs are provided for.

Instead, people will have to take more responsibility for themselves and take advantage of the vast quantity of new information that is now available — and the opportunities for personal development.

Success in the global economy will also depend on good leadership — of a region-state, a microstate or a company. The best leaders in the new economy, such as Singapore's Lee Kuan-Yew, have the courage to look into the future and to act according to time intervals longer than the present accounting period or the next elections.

- **Organizational.** The answer to uncertainty is more information. Leaders in the global economy must be well informed about the world around them. They must fully understand and have an instinctive sympathy for and familiarity with the global economy.

The changing structure of organizations requires leaders to be flexible and intuitive, without preconceived attitudes about their role.

E-Everything at GE

An old-line company really can morph itself into a global competitor. General Electric has done an amazing job. It has never become complacent. It has been a leader in outsourcing its support base.

GE was fortunate to have Jack Welch, a true visionary, who once told the company to put the letter "e" in front of all internally used verbs, such as "e-design," "e-sell" and "e-distribute." The idea was to get the entire company to think electronically. And it worked.

Players in the new economy must learn to doubt and even discard the business models of the past. That is why business schools should question the case-study method: Companies rise and fall more quickly than ever before, and students need to learn the dynamics of steering a company — as opposed to balancing static power.

(continued on page 8)

The Futures Market

(continued from page 7)

The successful company must be something quite new, owing little to the precedents of the past. Whatever business structure you adopt, customers must know that they are in control. As far as possible, their involvement must be sought and their whims catered to. And instead of the usual sources of information, such as market surveys and statistics, leaders need to develop a feel for what is happening with the 800 million cyberites who are the key drivers of the global economy.

Companies must also divorce themselves from a physical focus on the home office or the country. They must totally embrace the borderlessness of the new economy.

And companies should abandon the old divisions of the business world into industrial sectors, because the global economy can bring a company into areas where it does not expect to be.

Four Areas for Innovation

Companies must also commit themselves to innovation as never before in these four areas:

- **Business systems.** Companies must ally themselves with the best and cheapest providers of products and services across the entire spectrum of corporate functions. Companies must also learn to make their organizations scalable, so that there's less stress in growing fast.
- **Products and services.** The need for innovation is obvious, but the challenge is formidable: What we once thought were technological islands, such as mobile phones and PCs, are all converging to form huge "continents." The marketing and technological "territory" in which a company operates is constantly changing.
- **Customer interface.** Innovation in customer interface is a prerequisite for most companies, because the traditional advertising media are not only cost-ineffective but also inadequate for keeping customers interested.
- **Employees, managers and staff.** Power is shifting from those who make rules to those who break or rewrite them. Thus, corporations need to find ways to recruit dropouts, retirees, very young people and even petty criminals (as in the case of hackers who have been turned into computer security experts). Companies must also find untraditional ways to reward innovation.

Also, companies must learn not to take their traditional identity too seriously. The fact that something has never been tried should not be an obstacle to its future adoption.

Finally, the traditional hierarchy — the pyramid structure of almost all organizations — has to be discarded. The traditional top-down method of leadership is wasteful and ineffective because a company's need to innovate continues to conflict with shared assumptions about loyalty and unquestioning obedience. This situation must change. ■

The Next Stage

Some economic units have the potential to adapt successfully to the new realities. Here are the regions that currently have some of the ingredients to attain the level of a prosperous region-state:

Hainan Island, China. The People's Republic of China has shown the world how region-states can prosper. The province of Hainan Island, with 8 million people, is far away from the capital's interference and has an outward-looking government. It has established air routes to Southeast Asia and to Europe. Still, it has not taken off as quickly as other burgeoning Chinese regions.

Petropavlosk-Kamchatsily, Russia. The climate of this remote region is really no more severe than that of Kalamazoo, Mich. It would be a wonderful location for e-professionals of all kinds who don't mind the isolation, given that technology enables many more people to work from anywhere in the world.

Vancouver and British Columbia. British Columbia is geographically the closest Canadian province to Asia, so the Vancouver area is increasingly attractive to Asian tourism and business. It is also a geographical and commercial extension of Northwest Washington State. On its doorstep are the homes of Microsoft, Starbucks and Amazon. Despite high taxes and onerous regulations, there is a new desire on the part of the provincial government to open up to the rest of the world.

Regions With Potential

Other regions with similar potential include Estonia; the Baltic Corner; Ho Chi Minh City, Vietnam; Khabarovsk, Maritime (Primorye) Province and Sakhalin Island, Russia; São Paulo, Brazil; and Kyushu, Japan. From the investor's point of view, the list of attractive regions is getting longer.

You now have some feel for the new global economy, the coming shape of the geopolitical maps of the future, the key levers corporations can pull, and the dynamic business domains we can tap. Now it is your turn to climb up onto the global stage and perform. ■

The PRIMES

How Any Group Can Solve Any Problem

by Chris J. McGoff

THE SUMMARY IN BRIEF

The PRIMES correctly names universal patterns of group behavior. They are an inextricable part of the human experience. PRIMES show up every time people join up in groups to solve problems, drive change and transform systems. Master the PRIMES and you can master leading groups. Master leading groups, and you can tackle the toughest problems you face.

We as a people do not have a good track record of forming groups and solving problems when stakeholder complexity is high. Most of these efforts fail outright. The rest usually go significantly over budget and finish late. Of the few projects that get completed, only one out of two meets minimal expectations.

The good news is that outfitted with the PRIMES, you will beat these odds. You will recognize and decode the human behaviors that often appear on the surface as pure craziness when groups take on big problems.

The PRIMES are universal and unavoidable patterns of group behavior that emerge whenever people attempt to transform systems or collaborate to solve complex problems. Every leader has seen their effect, but few can recognize, anticipate and manage them. Unacknowledged, the PRIMES can put any leadership agenda at risk. An essential guide for 21st-century change agents, *The PRIMES* unveils universal secrets for how to step up to major challenges, create a brighter future and produce extraordinary results.

IN THIS SUMMARY, YOU WILL LEARN:

- How to lead groups in uncertain times.
- How to enroll others to their highest level of commitment.
- Why it is critical to maintain shared perspective amid diversity.
- The method to harness the universal patterns of outstanding group performance.
- How to overcome universal patterns of group failure.

PART ONE: UNIVERSAL PATTERNS OF LEADING IN UNCERTAIN TIMES

How do some people, organizations and coalitions thrive in uncertain times? What enables them to appear so certain and take decisive action amid ambiguity about the future?

Yogi Berra was right when he said, "The future ain't what it used to be." Not much else is certain these days. Steady state now is changing at the speed of the environment. This frightens, overwhelms and immobilizes some people. For others, this global reset is a thrill ride, and they want a front seat. If this sounds like you, the PRIMES will get you outfitted to "make your dent in the universe." ●

Being Clear on What's Really Important

How did you decide how you spent your time yesterday?

LEADING

The LEADING PRIME defines the act of leading as setting direction, allocating resources and inspiring action. Any time you are not doing these three things, you are not leading.

Take a moment to highlight the times over the last five days when you were setting direction, aligning resources and inspiring action. If you own a law firm, when you were practicing law, you were operating your business. If you are cutting hair in the salon you own, you are operating your business. When you spend time doing what the business does, you are not leading. Even when you spend your time making your business more efficient, you are managing, not leading your business.

The question is, "Are the right people (including you) spending the right amount of time leading versus managing and operating?"

CHANGE VERSUS TRANSFORMATION

Are you fixing or creating? Does solving your problem require CHANGE or TRANSFORMATION? CHANGE is the right path when a problem is relatively simple and the current system needs only a tune-up. TRANSFORMATION is the right path when problems are "wicked" and a completely new system is required.

CHANGE requires you to become familiar with the current situation and to work to make things better, faster, cheaper or some other "-er" word. When we choose change, our future is really a reconditioned or improved version of the past.

TRANSFORMATION involves a break with the past that is traumatic but potentially freeing. TRANSFORMATION doesn't describe our future by referencing the past (better, faster or cheaper); it births a future that is entirely new.

Ask your group or organizations, "What determines what they're doing right now?" Is it about making a better, faster, cheaper past or committing to fulfill a declaration and create a future? It's one or the other, but never both. Ignore this distinction at your peril. ●

Being Intentional and Going First

What are you committed to make happen and by when? What does "committed" mean? What does your commitment mean to others?

INTEGRITY

Leave all other connotations of INTEGRITY aside for a moment. In the context of the PRIMES, INTEGRITY

means, "I say what I am going to do, and I do what I say … every time." INTEGRITY is not based on values or morals. It is based on honoring and keeping your word. When people choose to operate in INTEGRITY, their words about the future cause the future. People trust them. They reach a level of performance that otherwise would be unattainable.

At the outset of any project, I ask the people involved to live in INTEGRITY for the duration of the project. The rule is that there are no small or big promises; there are only promises. And all promises will be kept.

DECLARATION

Are you willing to live unreasonably? A DECLARATION is a statement of "what" will be achieved by "when." President Kennedy's DECLARATION was an American to the moon and back by the end of the decade. Mahatma Gandhi's was a free India before his death. Babe Ruth's was the next pitch over the wall. These leaders pointed, then hit. Athletes today swing away. When they happen to hit one over the wall, they stand and point. That is not declarative leadership. The order matters. ●

Enrolling Others

While all teams are groups, not all groups are teams. Teams are groups in which the feeling is one-for-all-and-all-for-one. Teams have someone to whom they all report and who can tell them what to do. Teams are a luxury. But many groups you will be leading and of which you're a member are more like coalitions. The problems you'll solve and the change you'll drive will increasingly require that strangers, competitors, cautious allies and suspicious stakeholders participate and commit. Those who master leading these heterogeneous coalitions will never be without a purpose — or paycheck.

POWER

Any group's power is a function of the degree to which its members are willing to operate from a shared perspective, the degree to which they will commit to a shared intent and the level of coordination of their actions. A weakness in any part of the triangle erodes the power.

Power is one of three ways to get something accomplished, along with authority and force. The source of the energy is what distinguishes each of the three.

1. Force. Force gets members of the group to do something because they are intimidated by your sheer strength.

2. Authority. Authority requires that you compel someone to do something because you have been empowered by a larger community to enforce its will.

3. Power. Power is energy that is generated from within the group by the group itself when members freely choose to work collectively toward a common outcome.

The POWER PRIME reveals the components required to generate unprecedented levels of power. Leaders must set their sights on mastering the skill of generating power in groups as opposed to teams. Teams are only one kind of group, and their future is limited. Globalization, interconnectedness and systems thinking are producing an entirely new level of problems and possibilities that no single organization or authority can get its arms around. The highest skill to master is the ability to generate power in groups composed of strangers, competitors, cautious allies and suspicious stakeholders. This is the world in which we live. ●

PART TWO: UNIVERSAL PATTERNS OF POWERFUL ALLIANCES

Gaining Shared Perspective

Shared perspective enriches and sharpens the conversation and is the first step in generating and accessing the group's full power.

BLIND MEN AND THE ELEPHANT

Countless people have heard the tale of the blind man who holds the elephant's trunk and has every reason to identify it as a snake. The same may be said for the blind man who stands next to the elephant's leg and perceives it to be a tree. The two men arrive at different conclusions because they have different information. Once members of a team observe this dynamic and recognize that they each hold only a part of the elephant, they often resolve their differences quickly.

A few years ago, I witnessed firsthand the awesome power of "seeing the elephant." The question at hand was, "Why were the responses to Hurricane Katrina and the Haitian earthquake such dismal failures?"

We began by interviewing many of the stakeholders and asking simple questions. While the answers to the questions were all over the map, we unearthed a single key insight: that the collective group lacked a shared picture of the overall response. In other words, even the word "response" had different meanings depending on which organization you asked.

Our solution was to gather everybody together and "draw a picture of the elephant." Once we had a shared,

explicit representation of the "response," we were able to agree on the root causes of the problem and ways to make things go more smoothly going forward. This wouldn't have been possible if we hadn't taken the time to gain a common picture of the entire system.

You don't have to be an artist to draw the "elephant," and the pictures do not need to be pretty. Simply get to a white board or grab a sheet of paper, and draw a picture that answers the question, "How does this system work?" Do not be surprised if you end up with two to four different pictures. And always remember that the most important part of this process is the conversation you have during it. The picture, the "elephant," represents an explicit and shared model of how the system works. And there is a rule when building models: All models are wrong. Some are useful. A useful model is one that positions people at a common vantage point that allows them to discuss what they see — and how to affect it. ●

Establishing Shared Intent

How do you lead the group to be intentional?

CORE PRIME

The CORE PRIME distinguishes five essential agreements that generate creative tension and establish deep and sustainable shared intent:

1. As Is. Stakeholders must see their current situation — the whole thing — as it really is as opposed to how they want it to be.

2. Environment. They must agree on what's happening around them — which they're unable to affect but that will affect them.

3. Stake. They must agree on what's at stake if they stay where they are and don't change.

4. To Be. They must agree on a vision of the future with which they have fallen in love.

5. Strategy. Finally, they must agree on how to break out of the "As Is" and chart a course toward the "To Be." ●

Taking Coordinated Action

How do you get the group to do everything persistently about a few critical things versus doing a few things about everything?

COHESION

COHESION may be one of the most critical elements to manage as a group charges against its challenges. It is present when everyone gives the same answers to the following three questions:

1. Where are we starting?
2. Where are we going?
3. What do we have to do to get there?

COHESION among group members is an unnatural state that requires constant energy to maintain. Without the group's investment in it, individuals tend to have slightly — or significantly — different views of their current situation, the urgency to change and where they are headed. While this is natural, these differences — when unchecked — fragment the group's focus, dissipate its energy and create an environment ripe for conflict. The COHESION PRIME reminds us that people work on different activities for different reasons and at different intensities. So expect fragmentation, but invest to establish and maintain COHESION.

REDPOINT

The REDPOINT PRIME can be summed up in one word: focus. It reveals the fastest, least risky path from our "As Is" to our "To Be." At its core, REDPOINT embodies a simple concept: Rather than do a few things about everything, the most powerful leaders and teams do everything about the fewest, most important things. They willingly live with complete Integrity to realize their declared "To Be" on time. ●

PART THREE: UNIVERSAL PATTERNS OF OUTSTANDING GROUP PERFORMANCE

Making Decisions

In the context of PRIMES, decisions are "irrevocable allocation of resources." The group may have used brainstorming to generate ideas and get to "the end of what it knows" to get to this point. Members of the group might have taken the next step and formed various recommendations. However, the only way to cash in on the energy invested thus far is for someone to make a decision.

The truth is that a single individual makes a decision in a single moment. Contrary to some popular notions of leadership, groups do not make decisions.

CONSENSUS

The most challenging environments in which to pursue transformation and problem solving are institutes of higher learning and multilateral organizations like the World Bank, the International Finance Corporation and the United Nations. They're stuffed full with brilliant

people. Yet as Peter Keen, a gifted colleague at the World Bank, once remarked, "Intelligence is like having four-wheel drive: you usually end up stuck like everyone else, just in a more remote location."

When I sat with my colleague Michael Doyle one afternoon and lamented my inability to secure a critical decision at the World Bank, he asked gently, "What are you trying to do?" I replied, "I'm just trying to get everyone to agree!" Michael looked at me penetratingly and said, "Why would you ever try to do that?"

My job and your job is to get the group to adopt the working definition of CONSENSUS embodied in this PRIME, then make sure that everyone answers "yes" to the following three questions:

1. Process Satisfaction. Was the process we used explicit, rational and fair?

2. Personal Treatment. Were you personally treated well? Did you have ample opportunity to be heard, to make your opinions known and to consider others' opinions?

3. Outcome Satisfaction. Can you live with the outcome and commit to supporting the decisions of the group? (Notice the words *live with* as opposed to *agree with*. This is a critical distinction.)

Michael's point was that if people are satisfied with the first two elements, they typically agree to the third. ●

Building an Intentional Culture

When culture fails to drive behaviors that are essential to the success of the group or organization, authorities develop, implement and enforce rules, policies and laws. Excessive rules, policies and laws represent a failure of culture.

CULTURE

CULTURE represents the difference between the behaviors that groups tolerate — and encourage — and those that they do not tolerate.

Some groups make their culture explicit by writing it down. Stating the culture explicitly makes it easy for all, especially new members, to know where this line is. Explicit statements of culture also make it easier to reinforce and enforce the culture — especially for those lower in rank. This articulation is important because unlike with rules and policies, adherence to culture must be the responsibility of every member of the group regardless of placement in the hierarchy.

Rules and policies pale in comparison with CULTURE when it comes to determining behavior within any group. When a group steps up to state its culture on a piece of paper, its words create a place from which to stand and operate. These are some of the most senior conversations on the planet.

CONGRUENCE

By stating your intended CULTURE, you run the risk of behaving in a way that is not congruent with what you've stated.

This risk is mitigated through the CONGRUENCE PRIME, which reveals the constant tension between what is "stated" and what is "experienced."

A simple and fast way to determine how much CONGRUENCE your group is experiencing is to ask everyone to draw two circles, one labeled "stated" and another labeled "experienced," and ask them to overlap the circles to the degree they feel the stated culture is in fact the culture they are experiencing. Display all the papers, and discuss what you see. Ask for specific stories about when the "stated" and "experienced overlap" and when they do not.

The energy that pushes these circles together is FEEDBACK. This occurs when someone says to someone else, "Hey, I want to acknowledge you for acting in congruence with our stated culture" (positive reinforcement), or, "Hey, I don't think that what you are doing is congruent with our culture" (negative reinforcement). The capacity and willingness of group members to give feedback to each other is essential to actually experiencing the culture that is stated. ●

Social Contracting and Accountability Within the Group

How do peers give each other commands?

TRUST

Everyone discusses how critical it is for high-performance groups to establish trust. But what exactly is it? How do we generate — and destroy — TRUST? And if we do destroy it, can TRUST be regenerated?

To TRUST is to believe that a person keeps his or her word. That's it. Some people, upon first meeting, assume they can TRUST you. They start out relationships with a full TRUST bucket, while others start out with an empty bucket and need evidence to fill it. Frankly, this is a distinction without difference. It really does not matter how people choose to start out in relation to their TRUST in you because you have the power to generate TRUST. The key is to give your word and keep it

— over and over again. Doing this will fill any trust bucket and/or keep it full.

Being trusted is the result of living in INTEGRITY with everyone you encounter. Every time someone makes a REQUEST of you, something is going to happen to the TRUST bucket.

This is why there are no small requests. Giving your word is giving your word regardless of the magnitude of the REQUEST. INTEGRITY is binary. You either keep your word, or do not keep your word; size does not matter. ●

Saying and Not Saying; Listening and Not Listening

GOSSIP

In this context, GOSSIP is defined as when two (or more) people talk about a third person … in a manner that leaves the third person diminished in his or her eyes with no one doing the talking committed to helping the third person directly.

GOSSIP is pure, negative energy that destroys possibility and is the most harmful behavior any group can choose to tolerate.

However, GOSSIP is tolerated in most organizations. Attempts to eliminate it often prove ineffective because the efforts are focused on eliminating the "saying" of GOSSIP. The problem with this approach is that many people fail in the moment to recognize that they are spreading GOSSIP.

If you want to build a GOSSIP-free culture, you must instead focus on eliminating the "listening" to GOSSIP — because GOSSIP stops when no one listens. It's as simple as this: When anyone begins to complain or talk badly about another person, no matter the reason, ask, "Before you go on, will either of us approach him directly about this?" If the answer is "no," stop listening. Elimination of GOSSIP creates the possibility of sustaining a CULTURE in which group members actively invest in the development of all other members. ●

PART FOUR: UNIVERSAL PATTERNS OF GROUP FAILURE

Overcoming Resistance

While most people resist change, the patterns of this resistance are fairly predictable. By understanding these patterns, you can channel a significant portion of the energy spent resisting the change into energy that instead drives it. And you can learn alternately to recognize and ignore sources of insignificant resistance.

High-performing groups have learned to distinguish which people resisting the change matter and which ones do not. They spend the maximum amount of time working with the first group and virtually ignore the latter group. This skill is teachable.

You must embrace resistance while not allowing it to defeat you.

Laggards

Three percent of your people are "visionaries" who will jump at anything. Early Adopters are willing to take a risk if basic questions are answered satisfactorily. The Early Majority relies on Early Adopters for direction, while the Late Majority moves because it doesn't want to be left behind. LAGGARDS, however, never come along; they destroy possibility by constantly asking questions, ignoring answers and declaring why things won't work.

Leaders must identify the traits of individuals in a group; they have to ignore the LAGGARDS and invest their time and energy in the Early Adopters.

When presented with a new idea or change, Early Adopters ask important questions: "What does this new possibility mean? How is it going to affect our existing market share? What are we going to do with our existing products?" They ask good questions, need good answers and listen; they want to be convinced. When Early Adopters' questions are answered satisfactorily, they say, "Okay, we don't have it all worked out yet, but we have enough information to move. I am in."

LAGGARDS rarely enroll fully in a universe-denting effort. They drag their feet and often need to be carried. They love getting attention; it fuels their resistance. ●

Managing Intractable Dilemmas

How do you end a never-ending argument?

RIGHT VERSUS RIGHT

When conversations deteriorate into disagreements that disintegrate into arguments, the great misperception is that one position must be right, and others must be wrong. While right versus wrong issues certainly create opportunities for disagreement, it can be as debilitating and destructive as gossip to mistake a RIGHT VERSUS RIGHT issue for a right versus wrong dilemma. It is imperative to recognize immediately the collision of two

"rights"; this recognition enables a leader to intervene, honor all the "rights" and reorient the group toward the defined "To Be."

You will recognize RIGHT VERSUS RIGHT dilemmas everywhere. What happens when the needs of the group are in conflict with the needs of a specific individual? These issues confront us throughout the human experience.

RESOLUTION PRINCIPLES

You'll likely encounter one or more dilemmas on the path to your declared outcome. The RESOLUTION PRINCIPLES PRIME can help you find the highest "right" when faced with the toughest choices.

There are only three ways to make the best choice when faced with such a RIGHT VERSUS RIGHT dilemma:

1. End-based. Select the option that generates the most good for the most people.

2. Rule-based. Choose as if you're creating a universal standard.

3. Care-based. Choose as if you were the one most affected by your decision. ●

Avoid Tripping Hazards

Tripping hazards are easier to avoid when you know where they are. When it comes to working in groups, can you see them coming?

PROCESS-CONTENT

You can run the process. You can contribute to content. Pick one.

If you work with a group that has more than seven participants, someone has to facilitate the process. And whoever takes responsibility for facilitating the process must surrender his or her right to offer content. Unfortunately, people constantly violate this PRIME.

I regularly see senior leaders running meetings. They facilitate the process while offering content and assigning value to what is being said. This is completely inappropriate; it does not prompt the best ideas to come forward with the best buy-in from stakeholders.

The reason for this is simple: If you are running the process and have a stake in the outcome, you will manipulate the process to get your outcome. When the stakes are high and many stakeholders are involved, process and content must be separated. Someone must be held responsible for designing a well-thought-out process design and make that design explicit and fair. ●

Refusing to Hide Out

We all live our lives trying to avoid embarrassment. Can you recognize when you and your group are hiding out and playing safe?

VICTIM-LEADER

Groups are moving toward being LEADERS or VICTIMS at any single point in time. They talk either about things they can do or about what's being done to them. Once it can distinguish this PRIME, a group becomes directly responsible for tolerating victimhood. This awareness makes what once was easy — hiding out and blaming others — suddenly unpleasant and intolerable.

To take responsibility at all times — to be the causes — may feel like a huge burden. VICTIM-LEADER, therefore is one of the few PRIMES best introduced in explicit fashion sparingly. This PRIME is valuable even when you keep it to yourself. So even if you don't speak of it, pay close attention to which way the group is headed. Guide group members to talk about things they can control. That's where their power is stored.

COURT-LOCKER ROOM

Planning is a near-death experience. We step out of living (COURT), and we step into talking about living (LOCKER ROOM). At best, planning helps us become organized and take action. In the business environment, it more often serves as giving us something to do so we do not have to actually do anything.

This PRIME began to reveal itself when we were asked to support an 18-month transformation effort in Washington, D.C. Regular meetings were scheduled for leadership to participate. Near the end of our first planning meeting, with only 30 minutes to go, we asked, "Is there anything obvious that we could take on now to get this transformation started?" People were flustered. They said, "We are only on the first day of this planning process. It is too early to take an action." We asked them, "How long have each of you lived and worked in D.C.?" Collectively, the number was over 500 years. And so we replied, "We have 500 years of experience and dozens of recent studies. When you close your eyes and imagine D.C., isn't there anything obvious, no matter how much longer we study it, that we simply must do now? Because it either must be part of our vision for the city or must not be part of the city we imagine."

After just a few moments, the city administrator made a suggestion to close D.C. General, the only public hospital in town. As he explained, "The building is old and loaded with asbestos. We have studied this for years. We

know the costs to bring it up to code are simply not worth it."

We encouraged the leadership team to think of the transformation of D.C. like a basketball game. We will develop an overall game plan. Then we will get onto the court and act. While on the court, depending on what is showing up, we will call some plays and adjust our plan. We leave the court, go to the locker room, do some planning and then get back onto the court. ●

PART FIVE: UNIVERSAL PATTERNS OF THRIVING IN AMBIGUITY

Avoiding Bright and Shiny Objects and Squirrels

How do you manage distractions? We as people are chronically interrupted. This problem is going to get much worse as our appliances, vehicles and even food products vie for our attention.

A CLEARING

A CLEARING is a void where nothing exists. You can create CLEARINGS in your schedule or physical CLEARINGS in your office, home or hotel conference center. And you can create CLEARINGS in your mind as they are spaces where possibilities can exist. In the context of the PRIMES, we remove all facts, thoughts, technology, people, meetings, distractions, interruptions, biases and legacies. In short, you push aside everything. In this space of nothing, you place your DECLARED OUTCOME. You guard the CLEARING. You let into the CLEARING only what is essential to achieving your DECLARED OUTCOME.

So, create CLEARINGS for your group. Push the noise back. Make an opening where nothing exists except what is essential to your outcome. Here are some tips:

• Keep your group as small as absolutely possible, and try to encourage each person to bring something essential and unique to it.

• Minimize the amount of data you consider.

• Get off the grid when you need to do critical thinking. Disconnect from text messages and email as much as you can, and manage your connectivity.

The CLEARING PRIME is not about making major life changes. It simply requests that we focus on the task at hand while we're performing it. ●

Taking Great Care of Yourself

Can you give up coming from "something is wrong"?

Be

The BE PRIME reveals a simple way to give yourself the freedom to BE how you want to BE, independent from everything that is going on around you.

I discovered the BE PRIME while working with a group from the Women Presidents' Organization (WPO). This particular meeting took place at the height of the global financial meltdown in 2010. The challenges were beginning to take their toll.

One of the participants helped us realize a critical element to controlling our "way of being" and not letting our circumstances control it — and this was to "notice" our way of being. She and the others eventually stripped the essence of "controlling your way of being regardless of your circumstances" down to four steps:

1. Be. Acknowledge that at any point in time, you are being some way.

2. Notice. Regularly pause what you are doing, and notice how you are being.

3. Choose. In that moment of noticing, choose any way of being.

4. Be. Instantly become that chosen way of being.

The BE PRIME is not about one way of being over another. It simply reveals how you can be any way you want to be regardless of what is happening around you. That is it. Be any way you choose to be. Just be it because you choose to be it — not because the situation caused you. When outfitted with the BE PRIME, you and you alone are forever the source of how you are being and how you are showing up to others.

Now What?

Now what? That is easy. Outfit yourself with a few of the PRIMES, run out onto the court of life, and make your dent! ●

Master the Art of Business

Josh Kaufman is the founder of an organization called The Personal MBA, through which he helps teach the principles of business without students needing to go through the formal process of earning an MBA from an accredited university. He was born in 1983 and he graduated from Yale University. His work has been featured on many reputable online publications, such as Inc. Magazine, Forbes, Entrepreneur, Fast Company and others. He is also a nationally certified coach for pre-business students with the National Institute of Certified Coaches. Kaufman has long been down on the idea of MBA programs, which he takes down in no uncertain terms in the book's marketing materials:

"The consensus is clear: MBA programs are a waste of time and money. Even the elite schools offer outdated assembly-line education about profit-and-loss statements and PowerPoint presentations. After two years poring over sanitized case studies, students are shuffled off into middle management to find out how business really works."

Where you stand on this admittedly strong opinion will probably say a lot about whether you consider yourself a fan of Kaufman's message and work. But in general, Kaufman's book ***The Personal MBA*** is a fantastic read for anyone who would like to learn the basics of business. He does an excellent job when it comes to breaking down each topic into smaller pieces, so that readers are able to understand everything without falling asleep in the process. He also offers several examples to support his arguments which makes this work even more compelling and engaging at the same time. Moreover, he provides connections to various resources where readers can find additional information about topics discussed in detail within these pages. All of this combines with Kaufman's witty sense of humor and makes reading his content entertaining and, somehow, even fun.

As Josh says, "True leaders aren't made by business schools—they make themselves, seeking out the knowledge, skills, and experiences they need to succeed." If he's right, he's written a book that serves as an effective place to start with that search for knowledge.

The Art and Science of Value Creation

Kaufman breaks the book into 9 essential segments, and the first focuses on value creation. The most essential element of this section is his breakdown of what exactly a business is, which can be identified as five simple pieces. According to Kaufman, a business is a repeatable process that:

Creates and delivers something of value…

That other people want or need…

At a price they're willing to pay…

In a way that satisfies that customer's needs and expectations…

So that the business brings in enough profit to make it worthwhile for the owners to continue operation. Notably, that begins with value creation— discovering what people want or need, then making it. Kaufman goes on to explore the process involved with creating value, from ideation to executing on those ideas in a way that leads to actual demand for your products. All along the way, he keeps his tone light but informative enough to feel like a great business course— which seems to be Kaufman's goal, given the book's title.

Marketing for the Future

Next, Kaufman dives into the concept of marketing with his signature no-BS approach that stresses that offering value simply isn't enough. As he puts it in the section's introduction, "If no one knows or cares about what you have to offer, it doesn't matter how much value you create. Without marketing, no business can survive— people who don't know you exist can't purchase what you have to offer, and people who aren't interested in what you have to offer won't become paying customers.

What makes Kaufman's writing on marketing so effective is that he perfectly balances the bird's-eye-view importance of marketing efforts with the technical details that are required to execute it. He leaves no stone unturned, covering everything from attention and receptivity to qualification of leads and point of market entry— and even advanced marketing tactics like controlling a narrative and managing controversy. It's a master-class on marketing that truly ought to be taught in every real-world MBA program nationwide.

Sales, Sales, Sales

The eternal battle for prominence between marketing and sales rages on, but Kaufman isn't particularly interested in crowning a winner in The Personal MBA. From his perspective, both marketing and sales have interrelated roles to play— and can make or break a business.

"The best businesses in the world earn the trust of their prospects and help them understand why the offer is worth paying for," he writes. "No one wants to make a bad decision or be taken advantage of, so sales mostly consists of helping the prospect understand what's important and convincing them you're capable of actually delivering on what you promise."

While this is one of the more technical sections of The Personal MBA, this complexity comes out of necessity. Kaufman is not afraid to shy away from the technical yet vitally important elements of sales for successful businesses, including the pricing uncertainty principle, price transition shock, value-based selling, education-based selling, and other advanced concepts— some of which are missed in the average MBA class.

Value Delivery Made Simple (Well, Simpler)

Creating value is one thing. How do you bring that value to customers effectively? Kaufman covers this concept at length in one of the book's most compelling sections. This is a particularly remarkable feat considering that many of the concepts involved with value delivery— order processing, inventory management, delivery/fulfillment troubleshooting, and customer support— are generally considered among the driest business concepts. They don't grab attention or get anyone particularly excited about entrepreneurship like innovation and disruption do.

One of the primary focuses of this section is scale. After all, Kaufman compellingly explains, logistical issues are simple on a small scale. If I have to deliver a loaf of bread to my neighbor across the street once a week, my value delivery process is relatively straightforward. But if I had to deliver 10,000 loafs of bread to 10,000 different people, spread across the country, every day, suddenly more advanced processes would need to be in place. Kaufman effectively highlights the methods that will help businesses prepare for that level of scale before they need it, not after.

Mastering Finance

As much as the mechanics of value delivery can lead to glazed-over eyes and disinterest, nothing puts people to sleep quite like discussions of finance. But Kaufman has a unique talent for making financial concepts simple to understand, and placing finance firmly in the larger context of meeting your business goals.

"Finance is the art and science of watching the money lowing into and out of a business, then deciding how to allocate it and determining whether or not what you're doing is producing the results you want," he says, before continuing: "Accounting is the process of ensuring the data you use to make financial decisions is as complete and accurate as possible. It's really not any more complicated than that." The way Kaufman speaks so effectively and concisely on finance and accounting, you're likely to believe him.

The Human Mind

In Kaufman's own words, "Understanding how we take in information, how we make decisions, and how we decide what to do or what not to do is critically important if you want to create and sustain a successful business venture." Once you have a clear pic-

> Once you have a clear picture of how the human mind works, it's easy to find better ways to get things done and work more effectively with others."

ture of how the human mind works, it's easy to find better ways to get things done and work more effectively with others.

Concepts covered here include conservation of energy, conflict resolution, pattern matching, intrinsic and extrinsic motivations, and how inhibition can be both an enemy and an ally when trying to motivate yourself and others to escape their comfort zone and deliver great work— or purchase your product despite their reservations. Meanwhile, Kaufman covers business 101 basics such as scarcity, absence blindness, loss aversion, and novelty to explain why people do what they do and buy what they buy— or don't buy what they don't buy.

Working with Yourself

In these sections, Kaufman turns his psychological focus towards two distinct but equally important areas— your relationship with yourself, and your relationship with others.

First, he begins by highlighting that the most effective and successful entrepreneurs and business people are those who know how to 'work with themselves.' "In today's busy business environment," he writes, "it's easy to get stressed about everything that needs to be done. Learning how to work effectively and efficiently can be the difference between a fulfilling career and a draining one."

A quick glance at the chapter titles in this section might have you thinking you're ready a philosophy book— Akrasia, Monoidealism, States of Being, Self-Elicitation, to name a few— but each one is effectively tied back to the principles of business and justifies its presence in this book. Kaufman believably draws a line directly from enhanced understanding of human nature to increased business success, in any industry or market.

Working with Others

At this point, Kaufman acknowledges the inherent truth of running a business— it's not just you. No matter how small or humble your company's origins, any goal you may have of future growth will require you to work with others.

"Working with other people is an ever-present part of business and life: you can't escape it, even if you want to. Customers, employees, contractors, and partners are all individuals with their own unique motivations and desires. If you want to do well in this world, it pays to understand how to get things done with and through other people."

It's here that Kaufman's book outshines its traditional education counterparts. He recognizes that a business is more than just strategies and finances, profit margins and marketing schemes. It's the interaction of people, sometimes on a small scale and sometimes on a massive scale. This understanding makes the book, and this section in particular, both engaging and highly actionable. It's packed with insights, from communication overhead and employee safety to the dangers of apathy, improper planning, and imbalance of power.

Understanding, Analyzing, and Improving Systems

At its core, a business is a system. Its people, its policies, its products, its customers, and everything in-between all create a complex moving organism of sorts. But that system also operates within other systems— the market, the industry, the society, the planet. Meanwhile, smaller systems operate inside of the business— the teams, departments, and employee relationships that must be navigated daily.

Understanding, analyzing, and successfully improving those systems is the central focus of the book's final third. And while it's decidedly more complex in its subject matter than much of the book, its value isn't lost as a result. Kaufman manages to reveal key insights based on economic and even philosophical concepts— Gall's Law, for example— to help readers become more effective business leaders through their understanding of complex (and simple) systems. Here is where Kaufman ties it all together, helping businesses build resilience, stress test their processes, establish standard operating procedures that are built to be changed, and ensuring a healthy experimental mindset no matter how big or established your business may become.

Conclusion

Josh Kaufman has created a great resource for anyone who is looking to learn more about business and get the real-world experience he provides without having to spend years working in the real-world themselves. ***The Personal MBA*** provides all the information you need to know in order to start your own business or improve an existing one, without going deep into debt or spending years of your life pursuing an MBA at one of the outdated programs still being offered throughout the country. This book does not offer any quick fixes and instead teaches people how to think like successful entrepreneurs, and for that alone Kaufman should be respected as a profoundly talented mind on the art of teaching business for the real world.

THE SUMMARY IN BRIEF

Whatever is holding you back from the team you've always wanted, the company you've always wanted, and the results you've always wanted, this book will solve those problems and make your dreams a reality through a treasure trove of practical and essential advice.

Written as an easy-to-use actionable guide for entrepreneurs, managers, executives, board members, founders, sales professionals, and other leaders looking to improve their leadership skills, new lessons are introduced that will challenge your thinking and help you make a positive impact on others throughout the course of a year.

The Power of Going All-In: Secrets for Success in Business, Leadership, and Life by Brandon Bornancin consists of leadership secrets and strategies and is ultimately designed to motivate you to keep going when the path seems difficult. The managers and leaders who go all-in never give up. They know there is always a way. There is always a solution. You just have to find it.

IN THIS SUMMARY, YOU WILL LEARN:

- The principles for going all-in that provide the groundwork to build a strong team built for maximum success.
- The strategies for building high-performing teams that cover the best tactics for harnessing tenacity in the face of failure.
- The keys to unlocking your team's potential and building trust.
- The secrets to developing the next generation of leaders.

What Does it Mean to Go All In?

"Going all-in" or "all-in leadership" is all at once a mindset and a way of life. It's an unwavering commitment to excellence and a relentless pursuit of growth.

The power of going all-in pushes against leadership norms like micromanaging and turning your team into mindless robots. Instead, going all-in empowers companies to become the unstoppable leaders of tomorrow.

Anyone going all-in refuses to settle for anything average or ordinary and instead strives to help their team achieve the extraordinary.

Going all-in is about channeling your time, energy, and resources into a purpose bigger than yourself and helping your employees take their careers to the next level.

Going all-in encompasses the following core characteristics:

- Massive goals: All-in leaders never settle for average, and they aren't afraid to set massive, ambitious goals for themselves, their team, and their business. They're always ready to put in the effort to make their dreams a reality and take their company to new heights.
- Positivity: No matter the obstacle, people who are all-in take a glass-half-full approach to everything in life and stay positive at all costs. This positivity makes the biggest challenges seem minor, and it turns every setback into an opportunity for growth. The relentless positivity of all-in leaders is the momentum that pushes their team forward.
- Coachability: Regardless of how much experience an all-in leader has, they never get a big ego or think they're too good to learn anymore. Instead, leveraging the power of going all-in is all about staying humble, coachable, hungry to learn, and eager to improve.
- Strong work ethic: All-in leaders aren't afraid to get their hands dirty and put in good old-fashioned hard work. Hustle beats talent when talent doesn't hustle, and an all-in leader is always the first to show up at the office and the last to leave because they understand that hard work is the magic behind the greatest successes.
- Whatever it takes: When there's a goal, all-in leaders are willing to do whatever it takes to make it happen. Whether they have to put in extra hours, invest more money, or get down in the trenches with their employees, all-in leaders give everything they've got to make the impossible possible.
- No excuses: All-in leaders have zero tolerance for excuses for themselves or their teammates because excuses are distractions that get in the way of improvement.
- Extreme ownership: When the team wins, all-in leaders give all the credit. And when things don't go as planned, they take full ownership of the mistakes and 100% of the blame.
- Unshakable commitment: All-in leaders possess an unbreakable commitment to their vision. They are fully invested in their pursuits and willing to go above and beyond to make their goals happen.
- Fearless resilience: Going all-in means embracing failure as a stepping stone to success. All-in leaders bounce back from set- backs, learn from their mistakes, and use adversity as fuel to propel themselves forward.
- Limitless passion: All-in leaders understand that passion is a powerful catalyst for extraordinary achievements. Their enthusiasm is infectious, and they're great at fostering a collective sense of purpose.
- Courageous vision: Top leaders have a bold vision for the future of their team. They have the skills to not only articulate this vision clearly but motivate others to join them on their journey.
- Continuous growth mindset: All-in leaders are lifelong learners. They actively seek opportunities for personal and professional development. Never content, they embrace constructive feedback, seek out mentors, and always strive to expand their knowledge and skill sets.

When all-in leadership takes root, the impact is profound! Organizations experience exponential growth, innovation, and a culture of excellence. All-in leaders create an environment where individuals are encouraged to think bigger, reach new heights, and challenge the status quo.

The All-In Roadmap

The year-long program outlined in this book is a roadmap for becoming a transformational leader. Each month focuses on a key aspect of leadership, providing actionable strategies to build a strong team, foster a high-performance culture, and empower individuals to achieve their full potential. The program emphasizes effective communication, transparency, continuous learning, building trust, and servant leadership, while equipping you with the tools to navigate challenges, embrace change, and make data-driven decisions. Ultimately, by following these principles and

Ultimately, your success is a team effort, so ditch the blame game and focus on collective achievement.

investing in your team's development, you can become a leader who inspires, motivates, and drives results.

Month 1: Mission, Vision, and Accountability

The first month should be spent focused on building yourself as a leader and fostering a strong team identity. Invest in your own development and implement strategies to propel your team's success. Clearly define your vision and translate it into actionable plans. Remember, your role is to empower and serve your employees. Effective leaders inspire loyalty and growth, turning good employees into excellent ones.

Create a supportive and collaborative environment where open communication is key. Celebrate even small wins and cultivate a sense of gratitude within the team. Embrace change and adaptability, constantly striving to improve.

Remember, leadership is a privilege, and your dedication will ignite a fire of passion and growth within your team. Empower your team members to become future leaders by setting achievable goals and fostering their development. Ultimately, your success is a team effort, so ditch the blame game and focus on collective achievement.

Month 2: Building the Foundation for Great Hiring and Onboarding

The second month is dedicated to building a strong foundation through strategic hiring and onboarding. Focus on recruiting top talent with a "future-proof" mindset. Utilize behavior-based interviews and prioritize candidates with initiative, intelligence, integrity, and a growth mindset. Invest in those with unique skills and the potential to elevate the team.

Develop a clear onboarding process that allows new hires to quickly showcase their talents and integrate into the company culture. Provide opportunities for mentorship, regular check-ins, and access to training and technology. By creating a supportive and growth-oriented environment, you'll empower new team members to succeed and contribute significantly.

Remember, building a high-performing team is an ongoing process, so embrace continuous learning and celebrate both individual and collective achievements.

Month 3: Developing a High Performance Culture

The third month dives into cultivating a high-performance culture. Foster open communication by actively listening to your team's needs and fostering a positive, challenging, and collaborative environment. Unleash their creativity and empower them to excel by providing extensive resources and eliminating roadblocks. Celebrate both individual and collective achievements, while fostering a sense of shared purpose.

Remember, progress trumps perfection. Embrace continuous learning by providing training, mentorship, and opportunities to learn from each other. Become a servant leader, obsessed with maximizing your team's potential. Empower them with ownership and autonomy, while offering constant support and celebrating their success. Prioritize continuous improvement by gathering feedback, eliminating inefficiencies, and fostering a culture of innovation.

Month 4: KPIs, Goal Setting, and Decision-Making

The fourth month emphasizes data-driven decision making and goal achievement. Fuel your strategic thinking by reflecting on your purpose and continuously learning. Empower your team to become independent thinkers and problem solvers, fostering a culture of integrity and risk-taking. Establish clear KPIs and collaboratively set ambitious, measurable goals at various timeframes.

Embrace regular communication through weekly updates and encourage team input when making decisions. Prioritize and focus on completing one task at a time to achieve excellence.

Cultivate a fun and results-oriented environment where data guides decisions and continuous improvement is cel-

ebrated. Empower your team to be vocal problem-solvers, trusting their ability to make impactful contributions. Remember, speed and collaboration are key to success. Learn from high performers and constantly seek new knowledge to propel your team to new heights.

Month 5: Prioritizing Tasks, Diagnosing Issues, And Taking Action

Month five focuses on streamlining your team's operations. Embrace a decisive "hell yes" or "hell no" approach to prioritize tasks aligned with company goals. Plan effectively, cleaning up your sales pipeline regularly, and prioritize direction over speed. Empower your team by fostering a meritocracy and equipping them with the necessary skills.

Break down complex goals into manageable steps and prioritize high-probability deals. Prepare game plans, provide ongoing coaching, and hold efficient team meetings. Ask insightful questions, promote rapid learning, and encourage a "learn fast, fail fast" mentality. Invest in training and empower your team members to take ownership.

Focus on high-impact activities, securing the resources needed to achieve ambitious goals. Give your team a head start by anticipating their needs and aggressively cut project timelines. Prioritize working on the right tasks and help your team find a balance between supporting others and achieving their own goals. Cultivate a sense of urgency within your team, value fresh perspectives from new hires, and instill the importance of hard work. This month is about maximizing efficiency, clarity, and results.

Month 6: Thriving In Adversity With Resilience, Discipline, And A Growth Mindset

The sixth month emphasizes navigating challenges and building resilience. Cultivate a persistently positive attitude and instill a "whatever it takes" work ethic within your team. Emphasize the power of consistent effort and daily improvement, highlighting that growth thrives on overcoming obstacles. Challenge the notion that grit equates solely to winning, and instead, focus on the "show, do, be" model: leading by example.

Empower your team to believe in themselves and overcome self-doubt. Normalize the learning curve and celebrate teamwork. Teach your team to compete with their past selves, fostering a growth mindset. Embrace calculated risks and encourage proactive problem-solving as the team evolves. Promote a culture of continuous learning by encouraging curiosity and open communication. Help your team see challenges as manageable obstacles and empower them to take calculated risks.

Foster a coachable environment where constructive feedback is seen as an opportunity for growth. Embrace vulnerability and encourage honest in-person feedback. Instill a "never say die" attitude and promote collaborative problem-solving through dividing large tasks.

Reframe mistakes as learning experiences, focusing on solutions over dwelling on problems. Prioritize action and accountability, asking "what needs to be done today?" Acknowledge that success requires discomfort and teach your team to enjoy the journey while striving for their goals. Ultimately, promote a focus on hard work over luck and celebrate the joy of the process along with achieving desired outcomes.

Month 7: The Art Of Communication, Transparency, And Active Listening

Month seven dives deep into effective communication and building trust. Practice active listening and prioritize clear, purposeful communication built on trust. Strive to understand your team's perspectives and become obsessed with their success. Maintain transparency by sharing key decisions, wins, and losses that impact the company mission. Celebrate your team's achievements and avoid a "one-up" mentality.

Foster open communication by asking insightful questions and encouraging honest feedback. Recognize and address burnout, and empower your team to seek solutions, not dwell on problems. Hold high expectations and provide constructive criticism through Performance Improvement Plans to help underperformers. Address negativity swiftly and don't hesitate to have difficult conversations.

Remember, fostering a positive and supportive environment is key to success. Be open to feedback and acknowledge that challenges can be opportunities for growth. Embrace change and empower your team to overcome resistance as you navigate the path to success.

Month 8: Empowerment, Trust, And Autonomy

Month eight emphasizes empowering your team for peak

Recognize and reward hard work, understanding that dedication goes beyond a traditional workweek.

performance. Acknowledge everyone's learning curve and encourage continuous development. Create a sense of purpose that transcends individual tasks by outlining a bigger vision.

Equip your team with the tools and framework of SWATR: Set, Work, Track, Achieve, Repeat, to crush their goals. Foster a culture of open communication where asking for help and feedback is encouraged. Recognize and celebrate achievements, promoting a positive and motivating environment. Leverage data to learn from experiences and foster an environment where failure is seen as a stepping stone to growth.

Empower your team to overcome obstacles and champion autonomy, allowing for independent creativity and innovation. Recognize and reward hard work, understanding that dedication goes beyond a traditional workweek. Embrace a servant leadership style, prioritizing your team's success over your own.

Embrace continuous learning, creating a circular teaching environment where knowledge flows reciprocally. Maintain a positive attitude and focus on potential for improvement, fostering an optimistic and growth-oriented environment. Stay open to new ideas and embrace discomfort as a sign of learning and progress. Recognize that stagnation is regression, and celebrate your team's ongoing evolution.

Month 9: Leading Through Change, Uncertainty, And Tough Times

Month nine tackles navigating change and adversity. Reframe challenges as opportunities for learning and growth. Embrace discomfort as a catalyst for improvement and empower your team to do the same. Differentiate between high-performing team members and those requiring additional coaching. Address mediocrity head-on, reminding them that results reflect effort. Foster a positive mindset and encourage your team to stay focused amidst challenges. Actively listen to unspoken concerns and identify areas for improvement. Step outside your comfort zone and encourage calculated risks.

Maintain a zero-tolerance policy for negativity and micromanagement. Promote respectful disagreement within a collaborative environment. Recognize that tough times build resilience. When considering significant changes, conduct a thorough analysis considering timing, alignment with company goals, team and company betterment, resource availability, implementation plan, expert consultation, testing feasibility, and potential for negative impact.

Make critical decisions when at your peak and value your team's ideas as potential game-changers. Lead from the frontlines alongside your team. Embrace a "never stop learning" attitude and actively seek feedback.

Lead with empathy during challenges and take full ownership, even during difficult times. Redefine failure as a missed opportunity to try, not an endpoint. Empower your team to overcome roadblocks and instill a sense of confidence in their capabilities. Maintain an unwavering sense of optimism to navigate challenges and propel your team forward.

Month 10: The Human Element, Emotional Intelligence, And Soft Skills

The tenth month focuses on mastering the human element of leadership. Distinguish yourself from an authoritative "boss" by prioritizing your team's happiness and performance. Embrace authenticity and self-awareness as cornerstones of effective communication. Utilize open-ended questions to foster dialogue and move beyond the status quo. Learn your team's communication styles for optimal understanding.

Focus on collaborative problem solving and demonstrate compassion through action. Embrace a learning mindset and acknowledge that intuition, coupled with data, fuels informed decisions. Empower your team by unlocking their talents and fostering mental health resilience. Recognize your team's options and actively promote a healthy work-life balance.

Remember, your leadership style is a deciding factor in employee retention. Treat your team with respect, fostering a sense of family, and leverage shared experiences to build strong relationships. Advocate for your team and champion

their success, especially during challenges. Develop empathy by considering different perspectives and communicate with honesty without resorting to harshness.

Embrace your unique leadership style and be fully engaged during interactions. Emotional intelligence is paramount - aim for high EQ interactions that build trust and make your team feel valued. Always recognize and celebrate their achievements, big and small, to foster a culture of motivation and appreciation.

Month 11: Leading Diverse Teams And Fostering Continuous Learning

Foster a team that thrives on differences. Mentor everyone to reach their full potential, regardless of personal preferences. Recognize that true leadership is about empowering others, not micromanaging. Maintain a stellar reputation and share your vision as a leader. Go the extra mile for your team and prioritize their needs.

Personalize your approach to one-on-one interactions. Cultivate team spirit and invest in their success. Conquer self-doubt and inspire your team to push beyond limitations. Embrace an "abundance mindset," believing in your team's potential and the power of collaboration. Build a supportive network of leaders for mutual growth.

Never stop learning. Challenge the status quo and seek continuous improvement. Manage your time effectively and avoid entitlement. Promote a culture of accountability and ownership. Create a safe space for innovation and calculated risks. Focus on actions, not just words. Earn your team's respect and lead by example. Encourage self-development and invest in your own growth to become the leader you admire.

Month 12: Developing Future Leaders, Coaching, And Succession Planning

Month twelve focuses on cultivating future leaders and building a strong succession plan. View every team member as a potential diamond in the rough, and empower them to invest in their own development. Lead with a clear purpose that transcends personal gain, and coach your managers to follow suit.

Break free from micromanagement and identify future leaders by seeking strong leadership abilities, a consistent track record of performance, and a deep understanding of your company culture. Become obsessed with becoming a world-class coach, facilitating sessions that empower your team. Nurture your top talent to prevent them from seeking opportunities elsewhere. Utilize data to prioritize coaching needs and dedicate time to this crucial investment.

Equip your team with the skills to act as CEOs of their own work spheres. Uncover their intrinsic motivators and inspire a passion for their work. Provide immediate feedback and leverage monthly reviews as opportunities for reflection and strategic planning. Conduct annual reviews that fuel growth, focusing on high-potential individuals. Develop clear promotional paths for each position and teach your team how to take initiative to propel themselves forward.

Encourage team members to "act the part" before formally receiving a promotion. Be proactive with promotions, recognizing people's readiness for advancement. Offer genuine compliments and personally congratulate team members on promotions. Embrace a culture of continuous learning by asking "what did you learn today?" Find a progress partner to hold you accountable for your own growth.

Remember, leadership is a journey, not a destination. Empower your team to take ownership of their success, and instill a belief in achieving their goals through positive affirmations.

The goal of The Power of Going All-In is to provide everything needed to become the best leader possible, both professionally and personally. A number of strategies are shared in this book, from servant leadership to radical transparency, and these secrets not only help maximize potential but help ensure that a team's performance skyrockets!

So, what's next for you on your all-in leadership journey? The greatest leaders always put in the hard work, rain or shine, because all-in leadership requires nothing less than 100% effort day in and day out.

Putting Models to Work
Pages 7, 8

THE SUMMARY IN BRIEF

To change your world, you first have to change your own thinking. The ability to see the world differently can create significant opportunities, as companies such as Southwest Airlines, FedEx, Charles Schwab and others have demonstrated. But even successful models can ultimately become a prison if they limit your ability to make sense of a changing world, in the way that major airlines failed to fully recognize the threat of upstarts such as Ryanair or that music companies failed to see the opportunities and threats of music file sharing. From driving organizational growth to improving personal health and fitness to fighting international terrorism, your mental models shape your responses in every area of your life. The Power of Impossible Thinking *provides a systematic process to help you understand the importance of mental models, assess whether your models are relevant, what kinds of models are needed, and how to act upon these models more effectively. This approach is applicable to diverse issues in personal life such as dieting or dating, business decisions such as outsourcing or growth, and societal issues such as battling terrorism or treating diseases.*

What You'll Learn In This Summary

✓ **How to change the way you think.** Changing your mental models can open new opportunities and offer a lever for transforming your organization or your life.

✓ **How to keep your mental models relevant.** You need to know when to shift models, create a portfolio of models (both old and new) rather than leading one-way revolutions, and discover new models.

✓ **How to transform your world.** To transform the world, you need to overcome the inhibitors to change.

✓ **How to act quickly and effectively.** Mental models need to be acted upon. They can be accessed quickly through the effective use of informed intuition.

Mental Models Shape Your World

It's almost midnight.

You are walking down a dark city street toward your car parked several blocks away, when you hear footsteps behind you. You don't turn around, but you quicken your pace. You remember a news story from a few weeks ago about a robbery at knife point in the neighborhood. Your pace quickens. But the footsteps behind you are also moving very quickly.

The person is catching up to you.

At the end of the block, under the street lamp, the steps are immediately behind you. You turn suddenly. You recognize the familiar face of one of your colleagues, heading to the same parking lot. With a sigh of relief, you say hello, and you and he continue on your way together.

Recognition

What just happened?

The reality of the situation didn't change at all, but the instant you recognized the face of your colleague, the world in your mind was transformed. The image of the pursuing attacker was transformed into that of a friend. How could so little have changed in the situation, yet so much have changed in the way you viewed it?

First of all, you had created a complete picture of what was happening based on a tiny bit of information — the sound of footsteps behind you at night. From this mere suggestion, you drew upon memories of news stories of crimes, together with your personal fears and experiences, to conjure up an image of a potential attacker. You changed your actions based on this assessment of the situation, walking faster to escape an assailant. This could be a great survival instinct, but in this case, you were fleeing an assailant who did not exist.

A Little More Information

Then, just as quickly, in the flash of the street lamp, you gained a little more information — and the entire picture shifted. In a split second, you recognized the face of a colleague — again based on the vaguest hints. You didn't take time to stare or think deeply about it. There might have been other possibilities in the situation. Could the person have been an assailant wearing a mask to look like your colleague? Could your colleague be an assailant? These possibilities were so remote that you didn't consider them, and by the time you thought through them, you might be dead. You saw the face, and the footsteps quickly switched categories from "foe" to "friend." Only a small part of this drama happened on the sidewalk. Most of it was created within your own mind.

Transformation Initiatives

Working on transformation initiatives with leaders of major global corporations, we have recognized a simple lesson with profound implications: To change your world, you first have to change your own thinking.

Neuroscience research shows that your mind discards the majority of the sensory stimuli you receive. Studies by neuroscience pioneer Walter Freeman, for example, have shown that the neural activity from sensory stimuli disappears in the brain's cortex. It disappears. We use these stimuli to evoke an internal model that we then accept as reality. There are obvious advantages to not having to process every bit of sensory data that floods over us, but there are also obvious disadvantages to ignoring a good part of the world. We are, in effect, seeing magic tricks every day but accepting them as reality. What you see is what you think.

Mental Models Shape Your World

(continued from page 2)

But surely, you might believe, the human mind is not so malleable.

Are you saying we all have lost touch with reality?

We know what we see, right?

Bugs Bunny in Disneyland

Well, why don't we ask the folks who saw Bugs Bunny in Disneyland?

The "wascally wabbit" from Warner Brothers would be turned into stew if he actually showed up to cavort with Mickey Mouse and Donald Duck in the theme park of rival entertainment company Disney. Yet when test subjects were shown mocked-up images of Bugs Bunny shaking hands with tourists in Disneyland, some 40 percent subsequently recalled a personal experience of meeting Bugs Bunny in Disneyland.

They "remembered" a meeting that was, in fact, impossible. It turns out that many of us are not much more astute at avoiding the rabbit's tricks than his befuddled archrival Elmer Fudd. How often in your daily life do you find yourself shaking hands with Bugs Bunny in Disneyland?

An 800-Pound Gorilla

OK, you might answer, so we might be fooled by some sleight of hand in a theme park, but we certainly won't miss the signals that are truly important in our environment.

How about overlooking a gorilla?

Researchers asked subjects to count the number of times ballplayers with white shirts pitched a ball back and forth in a video. Most subjects did a good job at the task. They counted the 14 passes between the players with white shirts, but they failed the real test. They were so thoroughly engaged in watching white shirts that they failed to notice a black gorilla that wandered across the scene. The gorilla even paused in the middle to beat his chest. It was right there in the middle of the action. But they had their noses so buried in their work that they didn't even see the gorilla. Has this ever happened to you?

What gorillas are moving through your field of vision while you are so hard at work that you fail to see them? Will some of these 800-pound gorillas ultimately disrupt your game?

See the Impossible

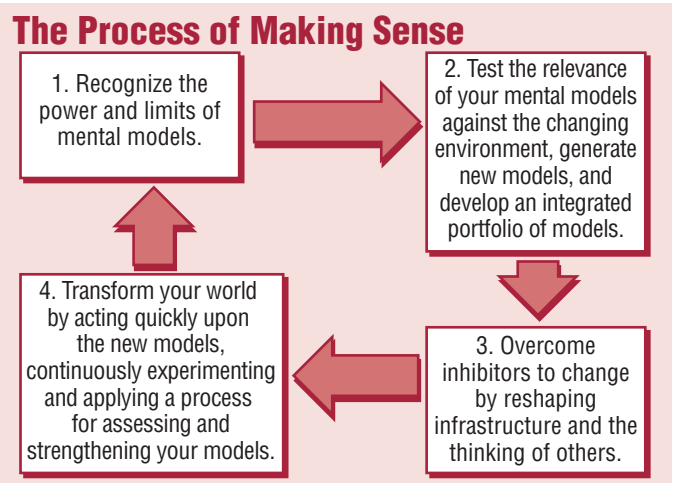
What you see is what you think.

Just as we can believe we see the "impossible" — such as Bugs Bunny in Disneyland — or fail to see a gorilla striding across our field of vision, our mental models shape the opportunities and threats that we can see in our lives. ■

A Process for Impossible Thinking

Mental models shape every aspect of our lives. Are you stuck in your career? Is your organization stalled in its growth? A mental model may be holding you back. A new model might open opportunities for progress. Are you lagging behind your competitors in innovation? It may be that your models are constraining your creativity. Are you overwhelmed by information?

Perhaps the models you are using are not up to the challenge of making sense in our information-rich world. In your personal life, are you trying unsuccessfully to lose weight, increase exercise or improve your health? The mental models you use to understand these activities will have a dramatic impact on the outcomes you achieve and the quality of your life. Are your personal relationships strained? Your mental models, and those of others, could be at the root. And if you want to change society or the broader world, you need to begin by looking at the mental models that shape your world and challenging them.



The Process of Making Sense

Our mental models play an important role in limiting or expanding our opportunities. There is a four-step process for assessing and changing these models, and then using this shift in mind-set to transform the world (see the chart below). These steps are:

1. Recognize the power and limits of mental models. To take advantage of mental models, you have to know how they shape your possibilities. How do they limit your ability to see opportunities and threats?

2. Test the relevance of your mental models against the changing environment, generate new models, and develop an integrated portfolio of models. As the world changes, do your models still fit? If so, how do you find new models and put together a portfolio of

(continued on page 4)

A Process for Impossible Thinking

(continued from page 3)

models to meet future challenges?

3. Overcome inhibitors to change by reshaping infrastructure and the thinking of others. Your entire world is organized around your current models, and people around you may be much slower to change. To introduce a new order, you need to change the structures of the old world and the thinking of others.

4. Transform your world by acting quickly upon the new models, continuously experimenting and applying a process for continuing to assess and strengthen your models. You need to continuously examine your models to keep them fresh and relevant, and apply your insights quickly and effectively, using informed intuition.

Knowing how this process works will help you challenge the way you view the world and the way you act. This idea may seem quite simple and self-evident, and it is. But if you truly consider the implications, it is a powerful idea. This transformation of thinking is where all the transformations of our personal lives, our organizations and our society begin. That's the power of impossible thinking. ■

For Additional Information on making sense from nonsense, go to: http://my.summary.com

Step 1: Recognize the Power And Limits of Mental Models

To transform yourself, your organization and society, you need to understand and change your mental models. How do you do this?

Understand how models shape your world. Recognize that the world you see is only partially determined by the information flowing in through your senses. Understand the importance of models and recognize the ways they shape your understanding of the world. Half the battle is to explicitly understand your own mental models and to recognize how they shape your thinking.

Until 1954, running the four-minute mile was something considered beyond comprehension and so beyond human achievement. Then, Roger Bannister broke this barrier that year on an Oxford track. Within three years, 16 other runners had also shattered this record. Was there some breakthrough in human evolution? No. The equipment was the same. What changed were the mind-sets of the runners about what was possible. What are the four-minute miles in your own life that are limiting your own thinking? In business, for example, there have been many shifts in thinking in recent years. Inventory was seen as an asset, but with just-in-time manufacturing, it has become a liability. People were seen as an expense, but now are seen as an asset in an age of knowledge workers. What are the models in your own life that are now out of sync with the times?

Levers for Transforming

Recognize how models limit or expand your scope of actions. Like the model of a "flat earth" held by early mariners, your mental models limit your vision and your course of action. Changing your mental models can open new opportunities and offer a lever for transforming your organization or your life.

Southwest Airlines built a thriving model by creating a no-frills, point-to-point service to challenge the prevailing hub-and-spoke model. Palm's Pilot overcame the technological limitations that doomed most previous generations of personal digital assistants (PDAs) by recognizing that users could be taught a simplified language easier than teaching a machine to read diverse handwriting styles.

On the other hand, the music industry found itself trapped in outdated models, protecting its old model of safeguarding intellectual property and selling songs on CDs. Apple's iTunes changed the mind-set, offering downloads of individual 99-cent tunes that could be burned or copied onto listening devices. New models are not always accepted, as was shown with Segway's scooter, a revolutionary way to travel, that had slower-than-expected adoption and ran into opposition from local authorities. ■

Step 2: Keep Your Mental Models Relevant

Are your models still relevant? Are you, like old generals, still fighting the "last war"? In a changing world, you need to make sure you have the right mental models for the current environment. How do you do this?

Know when to shift horses. You need to navigate through twin perils, either failing to recognize an important new model or else leaping to a new model too soon and too enthusiastically. You need to be able to gauge when to make the leap and then perform experiments to gradually ease your way into a new model.

U.K.-based GEC transformed itself from a stodgy but very profitable company with businesses in power, defense and electronics, into a high-tech firm renamed Marconi, which was designed to grab onto the rapidly rising star of telecommunications. But the telecom revolution in Europe fizzled and the company lost virtually all its value. To know when to shift horses, we need to

(continued on page 5)

Step 2: Keep Your Mental Models Relevant

(continued from page 4)

pay attention to "just noticeable differences," avoid cognitive lock, and create an early warning system. We also need to be alert to being swept up in passing fads. Finally, by using experimentation, we can avoid making a "leap in the dark."

Two-Way Paradigm Shifts

Recognize that paradigm shifts are a two-way street. When new models emerge, old ones are not always toppled like statues of the old order. This is why you still have fountain pens, writing paper and a telephone next to your computer. The shifts that appear to be one-way streets to a new world order can turn out to be two-way streets. By developing a portfolio of models, you can select those that work best for a given situation. For example, in Afghanistan, the high-tech and mechanized U.S. military turned to soldiers on horseback to guide its missiles.

By creating portfolios of models, you can draw upon the best model for a specific situation. For example, you might use a fountain pen for a personal note but e-mail when speed and efficiency are more important than personal connection. We need to avoid seeing the arrival of a new model as an irrevocable revolution that blinds us to the value of the old model. By creating a toolbox of models, we can better address the specific challenges we face.

A New Way of Seeing

Find new models by seeing a new way of seeing. When open-source pioneer Richard Stallman spoke to IBM researchers in the 1990s, he seemed like he dropped in from another planet. But by listening to this outrageous idea, IBM was able to find a way to create a powerful new business model around open-source software (using free open-source programs as the basic platform on which to construct more advanced software and services). While the idea of giving away open-source software seemed crazy when it was first proposed to IBM researchers, it became the core of IBM's strategy in supporting Linux.

To adopt new mental models, you need to be able to see them in the first place. This is more difficult than it appears, because your current models limit your ability to see new ways of seeing. These new ways of seeing can come from listening to radicals such as Stallman and really considering the value of their ideas. New models can also come from journeys of discovery such as Darwin's voyage on The Beagle that led to his theory of evolution. These new ways of seeing can be encouraged by looking across disciplines, questioning routines, and recognizing barriers. We also can practice for the unexpected, as pilots do when they train in flight simulators at "flying upside down." Destroying the old model and creating a new one from scratch (idealized design), taking a devil's advocate position, and envi-

(continued on page 6)

Zooming In and Zooming Out

The process of *zooming in* involves focusing on the details of the situation. Several approaches facilitate this process of focusing on detail without being completely overwhelmed by it. These include:

- **Engage in Rigorous Analysis.** Mark Twain tells the story of a cat who sits on a hot stove and wisely learns not to sit on a hot stove again. But the cat also avoids the cold stove as well. Be careful not to overreact to small pieces of information that might alarm you. Engage in rigorous analysis to explore the risks and rewards of different approaches. Pay particular attention to the outliers and inconsistencies.
- **Categorizing and Prioritizing.** Having a framework for new information makes it easier to focus on details without becoming overwhelmed. Categorize according to similarity, common fate (whether the items move together), continuation, and surroundedness (whether items can be seen as a closed form and whether they stand out together against a background).
- **Avoid Being Paralyzed by Too Broad a Context.** Watch out for too broad a focus that overwhelms you and leads to inaction.

The process of *zooming out* lets you look at the bigger picture. To approach this process, you must:

- **Recognize the Limits of Your Field of Vision.** Look for disconfirming evidence. Step back and consciously enlarge your field of vision.
- **Avoid Cognitive Fixation.** A pair of young lovers staring into one another's eyes across a romantic dinner, for example, will be in grave danger in their self-absorption if they fail to notice that the building is on fire. Pull back and take a larger view, or something might suddenly enter your field of vision that you wish you had recognized earlier.
- **Appreciate the Context.** What is the context of the current decision you are making? What assumptions have you made about the context, and how do these need to be changed?
- **Step Out of the Stream.** It is impossible to swim forever without taking a rest. Step out of the information stream periodically and create space for reflection.
- **Use Multiple Approaches.** Develop multiple sources of information and use different analytical methods to validate your information.
- **Collaborate With Others.** Through collaboration technology, individuals can now contemplate making sense of specific things and sharing this with others.

Step 2: Keep Your Mental Models Relevant

(continued from page 5)

sioning multiple futures through scenarios are also ways to see a new way of seeing.

Zoom In and Out

Zoom in and out to make sense from complexity. In an information-rich environment, it is easy to be overwhelmed by complexity. By cultivating a habit of zooming in and out, focusing on details, and then pulling back to see the big picture, you can make better sense of what is going on. You can focus on both the content and the context.

A model from computer programming has demonstrated the power of keeping an eye on both the detailed content and the broader context. In Extreme Programming (XP), teams of programmers work on a project that would typically have been assigned to one person. One programmer is zoomed in working on the details, while the other, a navigator, is zoomed out, making sure the program addresses the user's true needs. Although this seems inefficient, it produces better software more quickly.

An Experimental Approach

Engage in experiments. By taking an experimental approach to life, you can efficiently and continuously learn and develop new models to make sense of the world. Treating your models as hypotheses rather than reality can help you test their strengths and weaknesses and find the best models for your situation. These experiments can be planned experiments, natural experiments that occur in the course of life, and adaptive experiments where each experiment creates the hypothesis for the next one.

Among the ways we can engage in experimentation are the design of adaptive experiments, the conduct of post-mortems, simulations, and the study of natural experiments. For example, the U.S. Army created an online video game that sent players out on virtual missions, which was originally designed as a recruiting tool. But after players had made 100 million sorties, the Army realized that the system could offer insights on military strategies by testing creative approaches and offering direct feedback on which ones were successful. It became a kind of large-scale natural experiment that would not have been possible out in the field where real lives were at stake. ■

Starbucks: Finding Venti Growth In a Demitasse Market

When Howard Schultz joined Starbucks in 1981, the market for coffee was in decline. It was a commodity industry with fierce price competition. The local economy in Seattle was suffering from job cuts at Boeing, the city's largest employer. It seemed like the worst possible place and time to start an upscale coffee business. But Schultz saw something different: the opportunity to create a chain of European-style cafes in the United States. It was such a radical idea that his own partners in the business didn't embrace the idea, so he left to start his own business, then acquired Starbucks and its name.

Schultz created a phenomenally successful company, with more than 7,500 stores around the world and more than $4.4 billion in profit. In the process, he created an infrastructure to support this business, including rethinking store designs, offering extensive training and benefits to employees, and creating a global supply of coffee and even a new language (teaching customers to say "tall," "grande" and "venti"). Along the way, the company challenged many of its key assumptions about the business. They changed their original policy of not selling drinks with milk, created the very successful frappuccino, and set aside a firm policy of not franchising to open the way to global growth. They also added related merchandise and wireless Internet service.

As Schultz writes in his autobiography, *Pour Your Heart Into It*, success in life is "seeing what other people don't see, and pursuing that vision no matter who tells you not to."

Step 3: Overcome Inhibitors to Change

Your own mind is not the only one that matters. In the process of managing and developing a relevant mental-models portfolio, you will inevitably encounter obstacles to actually changing them. How do you overcome them to implement a new model?

Dismantle the old order. Like the smoker who has developed breaks and routines around the habit, or the missile silos of the Cold War, changing a mental model also requires dismantling the habits and infrastructure of investments that support it. These aspects of the old order need to be recognized and dismantled to make way for the new.

You can apply a variety of strategies to accomplish this, including using dashboards to change metrics and make the information transparent, aligning incentives and, when possible, beating "swords into plowshares" by transforming the infrastructure of the old order into a new one.

(continued on page 7)

Step 3: Overcome Inhibitors to Change

(continued from page 6)

Small Victories

Hard analysis and measurement, and small victories, can often drive this process of change. For example, in the crusade by Mayor Rudolph Giuliani and Police Commissioner William Bratton against New York City crime, they changed measurement and reporting, creating a dashboard to track key metrics in real time and holding people accountable for results. Metrics were reviewed in a weekly forum to share information and experiences. They also created a zero-tolerance policy for petty crimes that had been overlooked, and focused on prevention, which changed public attitudes toward crime and built momentum for other changes. The crime rate in the city fell six times faster than the national average from 1993 to 1994.

Common Ground

Find common ground to bridge adaptive disconnects. The people around you don't change their mental models at the same rate as you. We can see adaptive disconnects between the developed and developing world, or between finance and marketing in organizations. You need to recognize these gaps and use strategies such as interpreters to bridge these adaptive disconnects.

Among the ways to avoid disconnects in your own thinking are keeping an open mind by compartmentalizing, drawing on a portfolio of models, paying attention to what other people are saying about you, and avoiding rigid positions or fundamentalism. Among the ways to bridge the gaps with others who have different mental models are creating a dialogue, focusing on utility to move away from dogma, changing the culture, and precipitating a crisis to galvanize the group to action. Companies can also look for "boundary spanners" who understand both models and can create a link between the groups. ■

Step 4: Transform Your World

How can you quickly and effectively exploit your new mental models to transform your world?

Develop and refine your intuition. Intuition based on deep expertise and applied judiciously can be a powerful way of recognizing and accessing a new mental model. You often cannot analyze your way into a new mental model. New insights and transformation in thinking come from what Einstein described as "a feeling in your fingers." Intuition is a powerful and efficient way to access and apply your mental models, or discover new ones. You do need to ensure that your intuition is refined to reflect the current reality and recognize that it may make it harder to communicate your insights to others.

Oprah: Rethinking The Talk Show

When Oprah Winfrey went up against reigning talk show host Phil Donahue in the mid 1980s, she completely changed the formula. Instead of Donahue's detached style of a reporter, Oprah met the audience as friends, sharing her own personal life experiences. Through the power of her personality, she made the medium more intimate, launching a nearly two-decade reign as the Queen of Talk. She transformed thinking in her industry and the lives of some 23 million viewers in more than 100 countries.

She went on to challenge thinking in book publishing and literary fiction, filmmaking and philanthropy. As she said during one of her live road shows, "If you're open to the possibilities, your life gets grander, bigger, bolder!" How can you use your own life experiences to shake up the models in your industry or transform your life?

Test Intuition

While intuition can quickly access and apply models, we need to continue to test our intuition to make sure it is relevant. Intuition should be based on experience and expertise. We also need to be aware that decisions made based on "gut" may be much more difficult to communicate to others, which can slow the process of change.

Transform your actions. To be effective in recognizing and transforming your mental models, you need practice in applying new models to business, personal and societal decisions. Every decision you encounter — your own and those of others — offers an opportunity to identify models and explore ways to apply new ones. Through practice in considering and applying mental models, you can develop facility in recognizing and transforming your models, thinking and actions.

Impossible thinkers in diverse areas, such as Howard Schultz (see box on previous page), Oprah Winfrey (see box above) and Andy Grove (see box on next page), have transformed thinking in their industries and created powerful new opportunities. What untapped opportunities are right in front of you that you cannot see because of the limits of your own mental models? How could you transform these models? ■

Putting Models to Work

As an example of how to apply these insights in your own life, consider the mental models that shape your approach to health and wellness. There are Eastern models, such as acupuncture or herbal medicine, and

(continued on page 8)

Putting Models to Work

(continued from page 7)

Western ones, such as pharmaceuticals and surgery. There is a focus on treatment versus a focus on prevention and wellness. And there is a constant flow of information about different strategies for diet and health. The mental models we choose could have a direct impact on our health. How can we improve our capacity for "healthy thinking"?

We need to actively seek out and explore new models and create a portfolio of approaches to health, combining diet, exercise and vitamins, along with medical and surgical treatments if necessary. Within Western medicine itself, we need to draw upon insights from different specialties, as the Mayo Clinic does in assembling interdisciplinary teams of physicians to assess patients. We need to sift through the complexity of the constantly changing fads and studies about various foods (such as reports that French fries were carcinogenic).

By zooming in and out we can appreciate the true implications of various studies and put them in their proper context. We also need to understand our own models that shape our thinking, from our upbringing, education and experience, and conduct our own experiments to see what works in our own lives. Finally, we need to recognize the structures and habits that reinforce our old models and work to change eating and exercise patterns. Many diets address this challenge by creating social systems and mentors to support new behaviors.

Making Sense in Business

The models you adopt shape how you approach decisions not only about personal life, but also about business as well. For example, what can we learn about mental models from the dot-com bubble and its aftermath? Here are a few lessons:

- **Understand your models.** Carefully and rigorously examine the strengths and weaknesses of either the old or new models.
- **Know when to switch horses.** Don't get swept away by fads. With all the media hype about the Internet and all the investment dollars flowing in, it was hard to think rationally. Look at the potential risks and rewards of sticking with your current mental models or changing them to embrace new technologies and opportunities.
- **Recognize that paradigm shifts are a two-way street.** Look at the value of the old mental models in the new e-business world.
- **See a new way of seeing.** Look at the emerging opportunities in the online world and explore how you can tap into these developments and use them to rethink your business models and underlying mental models.
- **Sift sense from streams of complexity.** Explore the new areas of technology development and application on the horizon, and how you can discover them and recognize their potential to change mental and business models.
- **Engage in experiments.** Learn from post-mortems of natural experiments of your company and other firms in using the Internet. What new experiments can you design?
- **Bridge adaptive disconnects.** How can you bring technology leaders and business leaders together to understand the business implications of new technologies?
- **Consider the infrastructure.** Examine the investments, structures and processes of your current business to find out what makes it hard for you to embrace new technologies and new mental models.
- **Trust your intuition — but gain the experience to change it.** What does your intuition tell you about how you should use the Internet and other technologies? Decide whether you can trust your current intuition and how you can refine your intuition through new experiences.

What are the models that shape your thinking and actions in other areas of your personal life, professional life, or in addressing broader societal issues? How can you challenge these models? The world is more flexible than you might think. If you are able to change your thinking, you might find opportunities to think — and do — the impossible. ■

Intel: Discovering a New World Of Computing

Intel's Andy Grove reinvented the company several times throughout its history. He recognized what he called "strategic inflection points," where a new strategy and mental model was needed. During the 1980s, Intel made the courageous decision to abandon its core business of semiconductor dynamic memory to international rivals. The company shifted its focus to personal computer chips. Although Grove was trained as an engineer, the company used the marketing innovation of "Intel Inside" branding to recognize the value of chips hidden inside the PC. These strategies helped Intel dominate the world's microcomputer industry with a market share exceeding 90 percent.

Grove has likened strategic inflections to "a mental map of the New World," where the territory may be unknown but the need for a shift in thinking and action is recognized. He argues that these inflection points can be found in businesses outside of high technology and even in one's career, where one sees the need to change horses. Are you recognizing the strategic inflection points that require a shift in your own thinking?

The Power of LEO

The Revolutionary Process for Achieving Extraordinary Results

by Subir Chowdhury

THE SUMMARY IN BRIEF

Hailed as "the Quality Prophet" by *BusinessWeek*, Subir Chowdhury is the long-established global authority on the critical importance of quality and how to achieve it with Design for Six Sigma (DFSS). Now, he takes it to the next level by showing you how to build quality into the DNA of your entire organization.

In his best-selling book *The Ice Cream Maker*, Chowdhury introduced his next-generation management system — LEO. In *The Power of LEO*, he describes how continuous focus on quality improvement can revolutionize any process — from manufacturing operations to managerial decision making. The secret is to stop delegating the responsibility of quality to specific teams or departments and permanently lodge it within the core of an organization's culture.

Chowdhury's profoundly simple, yet extraordinarily effective, management system is based on three basic principles: Listen, Enrich and Optimize.

Quality methodologies like Six Sigma and Lean can be highly effective but are used narrowly and by limited personnel within an organization. LEO is the encompassing strategy that can be easily embraced by everyone within an organization, resulting in measurable improvements in your operations, products and bottom line.

IN THIS SUMMARY, YOU WILL LEARN:

- How to seek input from all stakeholders within your organization, from suppliers to employees to customers.
- How to create new ideas for improvement and solutions for problems using simple techniques.
- How to select the best improvement idea or solution, subject it to testing in the real world and correct all shortcomings.
- How to make quality a way of life.

THE COMPLETE SUMMARY: **THE POWER OF LEO**

by Subir Chowdhury

The author: Subir Chowdhury is the author of 13 books, including the international best-sellers *The Power of Six Sigma* and *The Ice Cream Maker*. As chairman and CEO of ASI Consulting Group (www.asiusa.com), he advises CEOs and senior leaders of Fortune 100 companies and in private and public sectors all over the world, helping them make "quality" a part of their business culture. In 2009, the U.S. Department of Homeland Security presented him with the Outstanding American by Choice Award.

Introducing LEO

In 2003, the chief executive of a large East Coast hospital invited me to meet with him and his leadership team. "We have a problem," he began. The organization had gone through weeks of training in Six Sigma with the goal of trimming waste and boosting efficiency. But six months later, the results were meager. He wanted to know if I could help.

In the course of our talk, I asked each of the six executives what I thought was a simple question: "You learned a lot of tool sets during your training, so tell me what percentage of them you've been able to apply in your work." The answers shook me. "Fifty percent," said the chief medical officer. "Thirty percent," said the chief financial officer. All six of them had the same basic response: a huge chunk of the Six Sigma tools they had spent so much time learning was simply inappropriate to their needs.

It's ironic in a way. At a time in history when we have an abundance of impressive management tools to help us seriously ratchet up performance, most of us have made only marginal gains. Lean manufacturing, reengineering, Total Quality Management, Six Sigma: on and on the list goes. A handful of inspired leaders — Jack Welch of General Electric comes to mind — have made the most of these tools. But many companies have invested huge amounts of time, energy and cash in them without significantly improving the quality of their operations.

After the meeting with the hospital leaders, I called my own team together. Now I was the one saying, "We have a problem." Like the rest of the management community, we had been automatically introducing the whole gamut of Six Sigma and other management tools into companies without having an in-depth understanding of the companies' goals, their cultures or their core strengths and weaknesses. "We have to change," I said. "We have to start tailoring the tools to fit each company's circumstances." No more cookie-cutter presentations for us.

Listen, Enrich and Optimize

That was when we began to develop the management approach that we now call LEO, for Listen, Enrich and Optimize, and we have spent all the years since then putting it to the test in one organization after another. It has passed with flying colors because LEO is not simply another management tool; rather, it is an overall methodology that makes it possible to apply management tools to maximum advantage. In other words, LEO represents a new mindset, a transformational way to think about the decisions that managers on every level make and the actions that they take. It is a system devised to help companies dramatically improve their performance, to make quality part of their corporate DNA. When I go to visit a company today, I explain the LEO strategy. I assure the leaders that whatever suggestions we make and whatever management tools we employ will be geared precisely to their company's special needs and particular makeup. If they follow the LEO methodology, they will achieve a major, measurable increase in the quality of their operations, their products and their bottom line.

Here are the basic elements of the LEO strategy:

- **LISTEN: Observe and Understand.** To obtain a deep comprehension of the issue at hand, put

aside past assumptions and interact directly with all relevant parties — specifically including customers, suppliers and employees. Add to your findings whatever relevant data can be uncovered.

- **ENRICH: Explore and Discover.** Based upon the information you have gathered, reach out to all relevant parties for ideas and possible solutions. The wider you cast your net, the more likely it is that you will move beyond the usual suspects to discover new and better answers.
- **OPTIMIZE: Improve and Perfect.** Examine the solutions you have found and select the best. Subject it to every kind of challenge it might conceivably encounter, and correct any and all possible shortcomings.

By rigorously and consistently using one or all of the LEO guidelines, we have seen companies achieve higher levels of performance, thereby measurably enhancing their products, services and finances. That's because LEO can find answers to the questions that plague managers everywhere: Why are my sales dropping off? How do I reduce high turnover? How can I match my competitor's price? Why is my new product pipeline empty? In the final analysis, though, the answers to these questions boil down to one word: quality.

The unending pursuit of quality, of perfection, is the single most important action any individual or organization can take to resolve problems and achieve goals.

The Four Cornerstones

For organizations that make a major commitment to LEO, their success will be determined in large measure by the level of their commitment to four basic principles. We call them cornerstones because the more closely you abide by them, the more your total LEO experience will align with your expectations.

The attitudes expressed in the four cornerstones are not arbitrary; they are carefully considered and essential elements of the LEO approach. Once they are embedded in any organization's culture, its quality will soar.

1. Quality Is My Responsibility. The pursuit of quality must be a personal responsibility, reflected in every aspect of your work.

2. All the People, All the Time. There is no way a company can attain quality without the dedication of the whole universe of its stakeholders — every supplier and distributor as well as every manager and front-line worker. The quality mission belongs to all the people, all the time.

3. An I-Can-Do-It Mindset. In a LEO deployment, management needs to build up employees' confidence in themselves and their readiness to take part in the quality transformation.

4. No One Size Fits All. A LEO deployment recognizes the absolute necessity of tailoring solutions to the specific needs of the particular company. ●

LEO at Work

All across the world, it seems, nature is on a rampage. Earthquakes, tsunamis and tornadoes have been creating havoc. When the rubble is cleared away, many residents are determined to return and rebuild. We have worked with a foundation that helps make that happen.

When we first volunteered to help this foundation in May 2009, we explained that we would be using our LEO system and asked to take on the organization's most difficult management problem. The most pressing need, we were told, was to find ways to improve the way the foundation gathered data on all of its activities.

I remember arriving at the foundation's headquarters that August. On a tour of the most hard-hit area, I was shown hundreds of concrete slabs — all that remained of the old homes. I also saw the dozen or so new homes that the foundation had put up — a disappointing number, since it was so far short of its goal of 250. We were determined to help speed up the pace.

Listen

In so many companies, the leaders dedicate themselves to collecting data associated with a problem without asking "why" and "how" questions about the process behind that data. Then they deploy one or another time-consuming, costly management tool in an effort to solve the problem.

In the course of our study of the foundation's "acquired lots" process in the rebuilding, we uncovered the bottleneck. The problem was centered in two subprocesses: "Identify potential lots for purchase within the target area" and "find out whether a purchase is in fact feasible." The processes were fairly complex.

Ownership had to be determined and the owners found — no small matter given the exodus following the disaster. The zoning stats had to be checked, along with any mortgages, taxes due or other liens on the property. Owners had to be interviewed to find out whether they wanted to live on the lot with a new home, wanted to sell the property to the foundation or simply had no interest in the whole project.

Enrich

With full knowledge of the situation on the ground, we had the basis for developing a solution. We made a list of all the tasks in the "acquire lots" process. Then we sat down with the CEO and three of his aides and gradually, over hours, tried to put all of those tasks into a logical, step-by-step sequence. There was debate within the room, occasionally heated, over many items, but when the working session was over, all parties were pleased with the result.

Optimize

Once the various elements of the solution had been identified, they were subjected to a rigorous examination to make sure the process would continue to function under unexpected but not impossible circumstances — a power failure, for example. The goal, after all, was not just to put out a fire but also to prevent it from happening again.

In designing LEO, we selected three general areas of corporate activity where potential quality resides and where the Listen, Enrich and Optimize functions could be most effectively applied. The three areas are *Fire*, *Flow* and *Future*. *Fire* refers to a specific, often sudden problem in any area of the organization. *Flow* speaks to the operations side of the company. And *Future* covers new products and services. ●

Putting Out Fires

In a chocolate and jelly bean plant we were called to tour, chocolate makes up 75 percent of the production, but in terms of profit margins, the two are equal. In fact, the market for the company's jelly beans has so outstripped the plant's capacity that 12 percent of total production, worth $5 million, has had to be outsourced.

The Listen phase started with a survey of the chocolate and jelly bean operations to sort out problems and identify the most costly fire. After looking over the data and talking with management, we focused on the jelly bean operation. Not that fires were lacking on the chocolate side, but they paled in comparison to the opportunities in jelly beans.

From conversations with management and front-line people, we learned about three main problem areas in jelly bean production:

1. **Too much waste scrap**
2. **Insufficient output**
3. **Overweight packages**

When we compared the financial data for the three areas, our optimum target became obvious. Trimming the weight of the packages could save $1 million a year, while solving the other two issues could yield a total of only $400,000.

What we found in the overweight bags was an inordinate number of underweight beans. Because of those lightweights, the machine was tossing an extra bucketful of beans into a substantial number of bags, pushing their weight as high as 5 ounces.

We could now redefine our immediate goal. It became, "Reduce/eliminate the production of underweight jelly beans." We had moved from "overweight packaging" to "underweight product." With that accomplished, we were ready to initiate the Enrich phase of LEO.

Finding a Fire's Flash Point

Our next move was to study the dispensing of cornstarch. That's where we hit pay dirt.

When we studied the dumping process, we saw that the cornstarch fell only about 18 inches before hitting the tray. But the flow of the starch was disrupted by a crossbeam that was part of the mogul's structural support. Across the top of the beam was a thick deposit of starch, something like the buildup of snow on a picket fence. The location of the beam matched the area of the trays where the underweight bean centers were found.

We concluded that the crossbeam reduced the amount of cornstarch laid down in those areas, preventing the formation of normal molds and thus of full-weight bean centers.

Fire Prevention

Moving from the Enrich phase of LEO, we proposed steps that would both put out the fire and prevent its recurrence.

Once the crossbeam was replaced by four new supports in the corners of the mogul, at a cost of $25,000, we tested the new arrangement. This time, the patterns of variation seen during the days of the crossbeam were absent. Once these changes were put in place, the benefits to the company proved to be far greater than the expected $1 million in savings. When the glob problem vanished, there was no longer any need to shut down the plant each year for cleaning, and there were no more empty trays being sent through the system by the operator-inspector. All told, the LEO deployment increased the productive capacity of the plant by a substantial 15 percent, which made it possible for the company to stop outsourcing the $5 million of production and bring it back in-house. ●

Fixing the Flow

Imagine what it would be like if you went to work one morning, sat down at your desk and everything went perfectly — no complaints, no recalls, no slip-ups, not a single problem. You would probably be bored out of your skull, but not to worry: No organization — and no process within that organization — is ever going to run perfectly.

I remember overhearing a woman and her friend talking about their children's grades at school. "I don't expect Jimmy to get 100 in every class," the woman was saying. Her friend nodded approvingly. Then the woman continued, "As long as he gets 95."

She didn't expect perfection, but she did expect that her son would never stop striving for it. And that's not so far from the underlying principle of the LEO approach. It assumes that every process could — and should — run more and more smoothly. Continuous quality improvement is the goal.

There are three basic conditions that help to explain why processes tend to run amok:

- **Unreasonable work.** You're told to complete 700 assemblies this shift when four people — a fifth of your crew — are missing and your normal production goal, fully staffed, is 650 assemblies. Or you're told you have to make the company's services best in class, but the company doesn't even measure service quality. Or you're told that you have to greet every person coming into the store as if he or she were your best friend, this toward the end of a double shift that you're working because a colleague caught the flu.
- **Uneven work.** You have eight meetings on Monday, two on Tuesday, none on Wednesday, six on Thursday and seven on Friday — and that's just this week. There's no way you can schedule your work and get it done in eight hours when your schedule is constantly being messed around with. So you work 12 hours and the next day you begin to fade in the afternoon.
- **Unnecessary work.** You spend hours of every day looking for lost files on your computer system ... or waiting until somebody else finishes using the printer ... or waiting for a meeting to start ... or redoing a chart that you've already redone twice. The sign of unnecessary work: Everyone's always busy, but everyone's falling behind.

LEO helps companies find ways to treat these conditions on a continuing, sustainable basis. The object is not to achieve perfection, but to keep moving toward it.

What Engineers Don't Know

During LEO Future projects, companies develop new products or services, or improve existing ones. The Listen, Enrich and Optimize stages are all pursued, with greater or lesser emphasis on one or another, depending upon the project and the organization. Though the ultimate goal of Fire and Flow projects is to provide value to the customer, they are concerned with the processes that deliver existing products. Future projects require a different, more foward-looking mindset and a direct, structured connection with those external stakeholders called "customers."

Commanding the Future

On a sun-filled September weekend, a dozen product development engineers set out on an unlikely mission. They were to spend the two days interviewing and riding around with local car owners at a shopping center in Oakbrook, Ill., a suburb of Chicago. Over the next month, two more groups of engineers from the same organization undertook a similar assignment in San Diego, Calif. and Birmingham, Ala. Their company was in the early stages of planning for a new midsize, five-passenger sedan, and the engineers had been assigned to find out what potential customers actually thought about and how they experienced their cars.

All weekend long, two-person teams in Oakbrook interviewed and drove with the car owners. They made copious notes about every detail of the encounters — not just what was said, but how the owners interacted with their cars. When an owner frowned as he stopped at a red light, an explanation was sought. "It's a small thing," the owner said, "but I just had my brakes serviced, and I still get that squeal when I come to a full stop." The complaint was carefully noted.

Gaining a Firsthand Understanding

This assignment was not something that the engineers had done before. In fact, that was the point of the exercise. It addressed a serious, seldom-asked question: How can engineers design a new product that truly speaks to the needs and wants of customers without a firsthand understanding of those needs and wants? The question had not been considered through all the earlier generations of the company's vehicles.

The shopping-center encounters signaled the start of the Listen phase of the LEO Future deployment. After gathering the information, the company proceeded, over the next 18 months, to apply the LEO philosophy and

tools to the development of a new passenger car that has since won major critical acclaim. ●

Listening Hard

Listening in LEO is not a rigid, step-by-step technique for finding out what customers want or need. In fact, there is no strict methodology that can possibly be successfully applied to the infinite variations of a customer's experience and desires. Each organization is unique in terms of its products and processes, and the way it interacts with and is perceived by its customers.

Listen is, like every aspect of LEO, eclectic — tailored to the particular company and its particular customers. And those customers may not be the folks who are buying the company's products. They may be internal customers — the people working in the call center who are making an unusual number of errors, or suppliers — the people who no longer answer your calls because they lose money trying to cope with your unreliable requests for bids.

Fire, Flow or Future

In a LEO deployment, you may be listening in order to find a new service for existing customers ... or to improve a current product ... or to reduce the amount of scrap and rework in your plant ... or to deal with any of a dozen concerns that come under the heading of Fire, Flow or Future.

Companies typically rely on marketers and customer service people to find out what customers want and don't want. The marketers conduct surveys and focus groups. They connect with customers and potential customers on company websites, on Facebook and via Twitter. The customer service department records customers' comments and complaints as expressed in e-mails and phone calls. There is no question, the information gathered in this way is vitally important and should be part of any company's product planning.

Meanwhile, line managers are constantly monitoring their areas, whether they're in Production or Accounting, and they provide company leaders with essential information about these operations.

But when serious problems arise in the sales or operations areas, or when a new or improved product is required, these sources of information are not enough. Management needs a better comprehension of the situation, one that is both broader and more intimate — broader because the particular situation must be understood in the context of the organization as a whole, and more intimate because the best solutions emerge only from in-depth knowledge of the circumstances and the people involved.

LEO is dedicated to the proposition that the most efficient, profitable strategy calls for the conversion of customer needs and wishes into specific corporate goals. The Listen stage delivers the raw material for that conversion. ●

Enriching the Product

In the Listen phase, the emphasis is on pinpointing the customer's real needs and the real nature of the problem. In the Enrich phase, the search is on for the best solution. The Enrich phase makes products and processes better — it enriches them by introducing greater quality and it also tends to enrich the owners of the organizations that utilize this phase of the LEO process.

Endgame

For company leaders, the Enrich phase requires a new mindset. After you have passed through the Listen stage, your horizons are open wide to possibilities that you had not seen before. But finding the right one for now, the idea that will achieve your immediate goal, requires that you alter your mental approach.

To get the most out of the Enrich process, you need to embrace change and the idea that what you have now and what you have done up to this point simply isn't good enough. That's not so easy for anyone, and especially for executives whose every move is studied, analyzed and critiqued by everyone else in the organization.

But there is a powerful message delivered to everyone when you sign on for change. It goes something like this: "Our company has to move beyond the status quo and adopt continuous improvement as our central strategy. And that goes for everyone in the company — including me!"

That's the attitude that a LEO deployment in general, and the Enrich phase in particular, calls for. It's the quality mindset. ●

LEO's Commitment to Continuous Improvement

The Enrich phase reflects LEO's commitment to continuous improvement, to the unending effort to achieve greater quality. Yes, the search for a solution to a problem must come to an end after a reasonable length of time and some decision must be reached. But management should not be too easily or too quickly satisfied with the search results. LEO subscribes to the belief that there is always a better, yet-to-be-discovered alternative.

Don't Compromise; Optimize!

His son was off at school, and Philip Stanhope, better known as Lord Chesterfield, an 18th-century British statesman, sent him a series of letters whose wit and wisdom have stood the test of time. This is one of my favorites of his advice: "Aim at perfection in everything, though in most things it is unattainable. However, they who aim at it, and persevere, will come much nearer to it than those whose laziness and despondency make them give it up as unattainable."

As Lord Chesterfield suggests, there are two basic ways of thinking about perfection. Either it is the absolute best that anyone or anything is or could possibly be, or it is that which most closely approaches that state at any given moment. Generations of philosophers have argued that any perfect world would have to leave room for improvement.

LEO is dedicated to that second idea, to the goal of continuous improvement as a corporate strategy. And nothing so clearly demonstrates that dedication as LEO's third leg, the Optimize phase. After all, it takes place, chronologically, after a team has come up with a method to put out the fire, or a solution to a flow problem or a new product design. Essentially, Optimize says to a company or organization, "Congratulations! You've come a long way. Now, let's go all the way and make things even better."

Continuous Improvement

That is not always a popular position. The temptation to stop after the Enrich phase, to take the solution and run with it, can be hard to resist. It seems so natural to breathe a sigh of relief once you have a way to remove the immediate difficulty and simply apply the remedy — and forget the whole thing. Why delay for a second? Why spend more time and money trying to come up with a better answer? Why worry about the future when you feel you have barely enough time, energy and resources to take care of the present?

The various answers to those questions all boil down to one word: *quality*. If you want to turn out high-quality products or services — the kind that will truly delight your existing customers and attract new ones — you need to keep raising the bar on quality. You need to keep straining toward perfection.

An All-Out LEO Deployment

The CEO wanted to change his company's whole culture to make it more customer-centric and he knew that Six Sigma could help in that regard. But there were a couple of problems. "To start with," he said, "I'm not Jack Welch. Aside from that, my people's knowledge level just isn't high enough for them to handle Six Sigma. It's too complicated."

Eventually, he turned to me with a question: "Do you know of any way to work a real, lasting culture change that's not so hard to get your arms around, that's not so technical?" I did.

Several months later, the CEO and I signed a contract for a full-dress LEO deployment at his company. We promised that the deployment would transform the corporate culture, given the full support of the project by him and his top aides. We also promised that, based upon our studies of the performance of the manufacturing plants, the organization would realize a savings of at least $85 million within 18 months.

As it happened, the company involved operated 12 plants with 20,000 employees, but one of the most important things to know about the LEO approach is this: It can be tailored to the needs and circumstances of virtually any company of any size, whether it be product- or service-oriented, profit or nonprofit. It can work as a full monty deployment for the entire organization, or on an in-and-out basis to cope with a single problem — or anywhere in between. And it is designed to aid company leaders in meeting their goals while raising shareholder value by reducing costs, lifting revenues and increasing profitability.

In that first conversation with the CEO, I asked him whether he was willing to learn the LEO system and personally lead the deployment. I also listed the four key aspects of a full-scale LEO deployment that he and his top executives would be responsible for:

1. **Commitment.** Become active, knowledgeable participants in the planning stage, strong advocates for the LEO approach and partners in the LEO deployment itself.
2. **Consistency.** Closely monitor the progress of the deployment to make sure that its goals and procedures are honored, and that personnel and financial resources are available as needed.
3. **Competency.** See to it that the training programs, including the individual LEO projects, are producing leaders who can maintain the LEO system post-deployment. Establish an environment of trust and patience during the deployment.
4. **Communication.** Use every means available, from the intranet to town hall meetings to personal workplace visits, to express your commit-

ment to LEO and to spread word of the deployment's progress. Foster two-way communication to elicit feedback, good and bad, concerning the deployment. ●

The Quality Mindset

For a LEO project to succeed, it must have the support of the company's leaders, managers and front-line people who are directly involved in the effort. But something more is required if LEO is to transform the company, allowing it to achieve unprecedented growth, profitability and overall quality. It requires that the individual people within the company, leaders and frontline employees alike, acquire a high-quality mindset.

That same equation applies to any world-class organization. Just consider what has happened to Toyota in recent years. For decades, the company was the very definition of world class — individual quality wed to process quality. In 2008, it passed General Motors to become the world's leading carmaker. But within a year, its reputation and its sales were in tatters.

Battered by reports of crashes of its cars as a result of unintended acceleration, Toyota recalled 3.8 million Lexus and Toyota vehicles late in 2009 — its largest recall ever. But that was just the beginning. The total was to rise to more than 11 million before 2010 was over, all because of high-speed incidents, including a fatal crash related to acceleration.

The company's process quality had clearly fallen, and it soon became obvious that there were problems with its people quality as well. After the first recall, the *New York Times* noted: "Toyota faced questions over whether it fixed potentially dangerous defects in new models without recalling those already on the road." The U.S. Transportation Department levied three maximum fines on the company for a total of $48.8 million.

"We now have proof that Toyota failed to live up to its legal obligations," said Transportation Secretary Ray LaHood. "Worse yet, they knowingly hid a dangerous defect for months from U.S. officials and did not take action to protect millions of drivers and their families."

The company's president, Akio Toyoda, apologized profusely. Seeking an explanation for Toyota's malaise, he spoke of a growth rate that "may have been too quick," suggesting that because of this, "priorities became confused." In other words, among those leading the company, profit was given a higher priority than performance. Profit trumped quality.

The kind of dishonesty described by LaHood — any dishonesty, for that matter — drives out individual quality. The LEO system is based upon honest data. If the information gathered in the Listen phase of a LEO project is false or misleading, for example, the project will fail.

For much the same reason, high-quality leaders understand how important honesty is to their success and to the success of their organization.

A State of Mind

"There is one thing I have learned that will help me if I apply it in my life," wrote one student. "That one thing is called LEO." Another excerpt: "Listen is the key when it comes down to anything."

When LEO was devised, it was intended to be of value to managers in trouble, not troubled youngsters. But the basic ideas behind LEO are simple and applicable in everyday life. They provide a template for intelligent, organized, data-based decision making in any circumstances.

I remember those letters when I considered how I might, as an individual, make things better in America, as well as globally. They helped in my decision to establish *Global Quality Awareness*, as it's known, which calls upon people to "Practice Individual Quality. Inspire Global Change." And the words of LEO that you have read so often in these pages now serve a broader purpose: Listen hard to others and to yourself; Enrich the lives around you by giving a little more every day; Optimize everything you do by setting your mind to excellence.

I believe that the LEO focus on individual quality that has worked so well for so many companies can also work for individuals and have positive effects on nations as well. The pursuit of excellence, and the commitment to quality, will set us on the path toward a brighter future. Dr. Seuss had it right:

> *Unless someone like you cares a whole awful lot,*
> *Nothing is going to get better. It's not.* ●

The Power of Thanks

How Social Recognition Empowers Employees and Creates a Best Place to Work

by Eric Mosley and Derek Irvine

THE SUMMARY IN BRIEF

Building a fully engaged, energized workforce is the key to business success. *The Power of Thanks* reveals how leading companies empower employees through social recognition, in which the practice of mutual appreciation and trust directs and rewards higher performance.

Eric Mosley and Derek Irvine, executives at the world-renowned employee-recognition firm Globoforce, explain why social recognition is so powerful and how you can apply it in your company. They show how a carefully planned and consistently executed Culture of Recognition business strategy inspires greater employee engagement and loyalty; stronger, more unified teams and departments; a creative, innovative company culture; improved customer satisfaction; and increased profitability and organizational health. Mosley and Irvine provide practical advice and proven examples for devising a powerful, growth-generating strategy that modernizes employee recognition for today's social, global, multi-generational and 24x7-wired workforce.

When employees participate in a culture that makes everyone a stakeholder in the organization's success, positive energy spreads like wildfire, and business results follow. Something so simple and powerful might work like magic, but it's really just common sense. It's smart management. It's long-term thinking. It's The Power of Thanks.

IN THIS SUMMARY, YOU WILL LEARN:

- Why culture is central to business success today.
- The difference between social recognition and other forms of appreciation.
- How social recognition creates happier employees and drives ROI and business results.

PART I: UNDERSTANDING ORGANIZATIONAL CULTURE

The Rise of Company Culture

The traditional model of employee loyalty rewarded by lifetime employment is long gone. The traditional method of top-down, command-driven productivity is also long gone. In their place, leading companies have discovered that company culture drives today's competitive advantage because it inspires the behaviors that create more value through work.

A distinctive company culture starts with a clear vision, but vision alone doesn't establish and sustain a culture. That happens when the values inherent in a vision inspire emotions that then drive new behaviors. The right behaviors drive change (the right behaviors *are* change — of the right kind). And when the new behaviors are encouraged, they affirm the vision that started the cycle.

It's the willingness to apply those values to everyday situations that drives a business vision forward. Values powered by emotions lead to behaviors that make change. And change affirms the vision and the values. It's a virtuous cycle.

What Is Culture?

Herb Kelleher, the legendary cofounder and chairman of Southwest Airlines, believed "Culture is what you do when people aren't looking." It's how employees behave when they step away from the power relationships in an organization and operate purely on instinct based on their own values. When those values are also shared with the organization, culture is nourished. Culture is nothing less than the aggregate of tens of thousands of interactions and decisions every day. Leaders of great companies reinforce their values by rewarding and celebrating the behaviors that express those values.

Creating a culture means choosing a limited number of values that define the company as surely as its products or logo do and then encouraging expression of those values in everyday behavior.

The CEO and HR set the task and the tone, but how can culture permeate the beliefs and behaviors of every person in an organization? There is only one way that is sustainable: The company can adopt the practice of *a culture of recognition*, in which every single employee is responsible for saying "Thanks!"— recognizing, celebrating, appreciating and promoting the desired cultural values.

You might call it an operating system for company culture — an enabling technology for proactive culture management. A culture of recognition is a set of beliefs, habits and values that affirm and drive all other values, actions and results of a company.

A culture of recognition engages, energizes and empowers employees; it can mean the difference between failure and success for companies in today's hypercompetitive marketplace.

The People-First Workplace

George Anders, a contributing editor at *Forbes*, notes that many of the fastest-growing jobs in the modern economy require a powerful sense of empathy. Empathy is the ability to put oneself in another's situation. Truly powerful empathy is the ability to understand and anticipate at a deep emotional level someone else's thoughts, feelings, perceptions, pleasures and displeasures.

Rebecca S. Clement, Publisher; **Sarah T. Dayton**, Editor in Chief; **Ashleigh Imus**, Senior Editor; **Amanda Langen**, Graphic Designer; **A. Imus**, Contributing Editor

Great HR managers have an automatic empathy, what psychologist Daniel Goleman called emotional intelligence. But it's not limited to HR managers. Great leaders in product design have an intuitive feel for how people will react to a dress pattern or the feel of a smartphone in the hand.

Silent empathy won't move a workforce. It must be expressed. The best way to express this is appreciation. At the most basic human level, recognizing effort and saying "thank you" has astonishing power to motivate others.

Payroll processing company ADP asked employees and HR directors in Great Britain, "Aside from pay, what motivates and engages you at work?" Fifty-nine percent replied, "Praise and recognition." That was by far the most important motivation after pay — more than employee benefits, clear paths for advancement, or even the flexibility to work where and when the employee wanted.

Why should praise and recognition — receiving thanks — be so motivating? In the context of the modern organization, giving and receiving thanks is a sophisticated form of communication in five ways:

- Thanks identify the right behaviors.
- Thanks are feedback. It tells employees they're on the right track.
- Thanks break through social and emotional barriers.
- Thanks create trust and social bonds.
- Thanks feel good.

The Positivity-Dominated Workplace

Positivity is the conviction that "it's up to me to make things turn out all right." Positivity looks at a business win and says, "We did this" and looks at a business loss and says, "We can turn this reversal into a chance to get better."

In the Positivity-Dominated Workplace, employees and managers are encouraging each other, learning from successes and failures, noticing and celebrating, and above all, recognizing the behaviors that embody company values and advance company goals.

Recognition matters because it reinforces the right actions, encouraging them to happen again and again, providing guidance and adding social value. Behaviors matter because in a workplace, behavior trumps intention. Engagement flows from people doing work they like well in a culture that appreciates and recognizes a job well done.

Two additional factors characterize the people-first workplace, from the mightiest global brands to the most successful small businesses. They are *authenticity* and *transparency*. Authenticity means people are living the same company culture that the CEO describes and that the HR department claims in job descriptions. Transparency is a relatively new quality of the workplace, accelerated by the Internet in general and social media in particular.

Because the reality of a workplace is now public information and a company's culture of whatever stripe must be authentic, the necessary task is to motivate people to celebrate and promote that authentic culture. This means focusing on things that create happiness and high morale so that a Positivity-Dominated Workplace can grow and thrive. That begins with understanding the power of giving and receiving appreciation.

Appreciation, Gratitude and Employee Engagement

While happiness at work makes people smarter, more engaged and more productive, people also have a similar but distinct need to achieve a sense of meaning in what they do. Happiness is about the self; feelings of meaning at work arise from the social context. The feeling that what you do has meaning beyond your own gratification is cultural. It is confirmed by satisfying a cultural set of values. In a society, it's noticed and confirmed by others. Meaning is associated with giving more than taking, with contributing to something bigger than oneself.

Assuming that it's good for employees to find meaning in their work, how can employers encourage that? What reinforces an employee's sense of belonging to something greater than him- or herself?

The answer is found in the social behavior of expressing appreciation and gratitude. The two go hand in hand: Appreciation means recognizing work well done. Gratitude is a bit more personal than appreciation — it means expressing thanks for a benefit one has received.

Appreciation and gratitude are powerful forces among employees because they satisfy the higher psychological needs of individuals and the higher social needs of groups. They confer meaning on actions because they show an action is either recognized as valuable (appreciated) or personally beneficial (gratitude) or both. This is a big deal in managing because it makes the workplace a source of meaning.

As appreciation builds a healthy culture, gratitude promotes a healthy workforce (and not just in terms of physical health). It's tempting to underestimate this simple truth about human beings: giving thanks benefits both giver and receiver.

Employee Engagement

Engagement is the HR hot topic of the decade. First, a definition: Engagement at work is the willingness to give discretionary effort to a job. It means voluntarily doing more than the minimum. It is an attitude confirmed by behavior. An engaged employee is aligned to strategy and committed to delivering on his or her goals as well as the strategic goals of the company. Engaged employees are important contributors to the company's culture and continually reinforce values that support the company mission as well as the bottom line.

The HR consultancy Towers Watson suggests that the way to sustain engagement is to see that a workforce is enabled (has an environment that supports productivity and performance with the right equipment, knowledge, help and other resources) and energized (has a sense of individual, physical, interpersonal and emotional well-being at work).

Empowerment and encouragement are additional factors that nurture and sustain engagement over the long run. Empowerment transfers the power to achieve results from the manager to the employee. Empowerment is the foundation of accountability — that is, delivering on commitments.

Encouragement costs practically nothing — a word, a bit of recognition, a gesture of appreciation or gratitude — yet it literally "gives courage" to an employee to act again, to go beyond the minimum, to break out of the sterile job requirements, to take risks, and to make the extra effort that defines engagement in the first place.

PART II: UNDERSTANDING SOCIAL RECOGNITION

Setting a Purpose and Vision

In the business classic *Good to Great: Why Some Companies Make the Leap … and Others Don't*, Jim Collins describes the "level 5 leader" as a frequently colorless public figure, yet one focused on many of the social mechanisms of an organization. His analysis shows the drawbacks of a heroic leader, including the obvious fact that an organization dependent on one person for its success gets in trouble when that person leaves, retires or dies. Great leaders, says Collins, live more often out of the public view but build behavior-based values like "facing the bad news" and a "culture of discipline" into their organizations' DNA.

Great leaders set a purpose and vision for a company by the goals they establish, the values they promote and the destination they describe. Then they empower the organization to build culture itself, guided by their vision. They hire people who will promote and demonstrate the right cultural values. They build and promote a social architecture that supports the culture they want.

Social Architecture

Social architecture is to culture what a foundation, beams and joists are to a building. Social architecture is found in a thousand small behaviors: communication, traditions, authority, privileges and "ways of doing things." Social architecture is useful because no manager can be everywhere, on every phone call, standing beside every employee whenever they're doing anything.

Three components of social architecture deserve special mention here: shared values, employee engagement and united execution create a high-performance culture. Social recognition is the link connecting all three.

Shared Values: Management teams spend countless hours concisely defining their company's values into a cultural vision that inspires employees to achieve strategic goals. Ideally, values should also differentiate a company from its competitors.

Unity matters. For a company's values to have an impact on employee behavior and performance, they must be understood in the same way by all employees regardless of position, division, geographic location or tenure with the company. The company's unique value set needs to be promoted, rewarded and propagated. Shared values are taught, retaught and honored when recognition draws attention to specific behaviors tied to a company value.

Engagement and Social Architecture: An engaged employee is a cornerstone of social architecture. If a spirit of innovation is a core cultural value, for example, then any time an employee suggests a new way of doing things, or a creative idea for a product or service, he or she is demonstrating that value. That's engagement — going beyond the letter of the job and promoting one value that makes up company culture. When others recognize, celebrate and appreciate individual acts of innovation, that value is reinforced socially.

United Execution: Ultimately, social architecture's value is to drive behaviors that support the company's mission and business goals. This requires united execution, which means that individuals function as a team, supporting each other's individual activities and goals as well as performing their own. Even if individuals share most company values and cultural beliefs, without united execution they risk error, mistrust and miscommunication.

With united execution, competition for rewards remains rule-bound and fair. People support and encourage each other because they understand that the larger goals they share benefit everyone.

Shared values, engaged employees and united execution can be a daily reality with a strong, supportive and inclusive social architecture. The tools that work best for building social architecture are the different forms of recognition.

The Evolution and Reinvention of Recognition

Today, recognition is a full-featured management practice. Like employer branding and financial management, it is a set of actions, rules and processes working together to achieve strategic goals. And like other management practices, recognition ranges from simple, tactical steps through enterprise-wide initiatives to long-term strategic practices. The progress of an organization from simple to sophisticated practice is the recognition journey.

Tactical Recognition: Tactical recognition focuses on the connection between a manager and an individual employee. The manager notices extra effort or good performance and recognizes it with an award and a personal message. "Catch them doing something good" is the slogan for this kind of recognition.

Enterprise Recognition: The second stage of the recognition journey is enterprise recognition, which means spreading the practice of tactical recognition across a company's different divisions and functions. Enterprise recognition, like enterprise financial management or procurement practices, establishes standard objectives, practices, ways and means to accomplish recognition's goals. Enterprise recognition makes recognition standard and scalable across big organizations, just as a purchasing department can standardize and scale the buying of office supplies.

Enterprise recognition falls short of recognition's true potential because it is layered onto a culture in the same manner as a benefit program. It stays in the human resources silo — a positive step forward, to be sure, but not answerable like other disciplines to management practices of measurement against goals. That represents a huge missed opportunity.

Strategic Recognition: Strategic recognition is the practice of integrating recognition with other management tools and practices, taking recognition beyond the HR domain and leveraging its power to shape behavior at all levels of the organization. Strategic recognition is the point at which the "soft" behaviors of recognition — which worked well at motivating employees — finally merge with the "hard" management practices of measurement, goal-setting, analysis and strategic execution. At this level, as with so many practices today, new value is realized by unlocking heretofore hidden data.

Technology initiatives and new product lines are supported with a sophisticated reporting protocol and tracking technology because they make a difference to the bottom line. Strategic recognition treats cultural performance with the same level of seriousness and support because it, too, makes a difference to the bottom line. Because tracking and monitoring tools are in place, practitioners use strategic recognition to manage the culture in detail.

Social Recognition: Social recognition is a new phenomenon made possible by the rise of Internet social technologies. It reaches beyond the manager or even the immediate hierarchical team to involve an individual's entire work circle — the people he or she interacts with on a regular basis, past colleagues who have moved to new positions in the organization, and anyone whom the individual wants to keep in touch with through the positive power of thanks.

Mobile recognition feeds the power of social recognition by ensuring the vast majority of employees, regardless of location or job type, can fully participate in the recognition program through their mobile devices (typically smartphones). The "access anywhere, anytime" availability of mobile today also helps ensure recognition moments are timely and occur very soon after the event deserving of recognition.

Insight: Insight is a term for the ultimate goal of the recognition journey, in which the practice of social recognition is integrated to all the talent-management practices beyond culture management. The key to insight is the capability of today's data-analysis technologies to record, interpret and make connections among the many activities labeled "talent management."

Social, Mobile and 24/7

If you feel buffeted by the pace of change in workforce management, fasten your seat belt. We're at the leading edge of four tectonic trends that are changing employee thinking, behavior and expectations at an ever-accelerating rate. The workforce is becoming more global, multigenerational, social and mobile. In a fifth trend, employers are borrowing from consumer technologies to design new systems of employee management.

Be mindful of these five trends as you consider a recognition solution, because they will change recognition and much more of your management tool kit in the near future.

Business Is Global. Is your organization multinational or global? The difference will predict how complicated a recognition solution will be. A multinational organization has locations or facilities in multiple countries, but each location functions in its own way, essentially as its own entity. A social recognition practice has to take cultural and economic differences into account to be equitable and effective.

Business Is Multigenerational. The Great Recession forced many baby boomers (born 1946–1964) to delay retirement around the time that 40 million members of the millennial generation (born 1980–2000) stepped into the workforce, squeezing Generation X (born 1965–1980) as that middle cohort advanced to their prime earning years. Today, as many as three generations work side by side as peers. Recognition acts as a unifier in a multigenerational workplace because it crosses lines of authority, seniority and social distance. A recognition moment confers respect and appreciation, which brings people together who might otherwise have a more remote workplace experience.

Business Is Social. We are social beings, and our workplaces are small societies. "Social business" means much more than social media. Work is interdependent, with all kinds of expertise needed at different stages of a project. As the workplace becomes more socially active in this sense, recognition reinforces the attitudes that facilitate cooperative work. As social sharing becomes more and more a part of how work gets done, recognition can encourage all to contribute.

Business Is Mobile. Another trend radically accelerated by technology is the recent shift toward mobile devices, chiefly smartphones and tablets. Social recognition among colleagues can — and should — be designed for use on mobile devices to increase participation. Employees should be able to share appreciation immediately, not waiting to get back to a desk, especially when that desk might be 1,000 miles away.

Business Is Borrowing Consumer Technologies. Today, consumer-centric design dominates. The reason is related to the global, multigenerational, social and mobile changes that are taking place: As the borderlines of time, space and behavior between "work" and "life" break down, businesses are more open to adapting consumer technologies and habits to the workplace. At the leading edge of consumer-centric design, video recognition is a recent innovation, taking advantage of the broad move in how we absorb information from the written word to video messages.

When video recognition is built into your program, it's even easier for someone to create a quick but meaningful video containing the powerful specific messages of appreciation but delivered in an intimately personal way. Video naturally conveys tone of voice and body language along with our words of praise.

PART III: PUTTING SOCIAL RECOGNITION INTO PRACTICE

Building a Social Recognition Framework

Recognition can and should be planned and executed in a company like any other management practice with the potential to drive bottom-line results, and therein lies the opportunity for competitive advantage. Other practices like compensation, financial discipline and quality control are so well established that your competition manages these in essentially the same way as you. When you elevate recognition to the level of other strategic practices, you create a fresh competitive advantage, one that is uniquely tailored to your company's culture, goals and strategy. Social recognition is one of the few practices that still create competitive advantage.

Here is a blueprint for building a strategically effective social recognition practice that seizes that competitive advantage. This blueprint includes plans in five areas: sponsorship, design, reach, adoption and rewards.

Sponsorship: The success of a strategic recognition program depends on sponsorship by organization leaders. When recognition's relationship to other strategic assets is understood and supported, its power is truly unleashed, and this can only happen with executive attention and approval. Social recognition earns support because it engages executives where they live — in the realms of competitive advantage, high performance and profits.

Social recognition needs commitment from all top executives. Executive participation elevates the program to strategic status. It increases general participation, focuses managers and battles the unfortunate tendency to say yes without real commitment.

Design: Recognition must be designed as carefully as any other strategic initiative, with a clear ambition, metrics and input from stakeholders. Why are you doing this? Without real, detailed goals, the practice of engaging and

motivating employees can become "recognition for recognition's sake," which typically results in another old-school program lacking accountability and relevance.

Establish a recognition ambition based on your organization's core values and strategic objectives. What are the hallmarks of your culture? What do you want to accomplish? How does it relate to your most important business drivers? What must be supported — profits, customer service, operational excellence, innovation and/or maximum product quality?

Reach: Social recognition creates a big winner's circle. In old-school recognition programs, a few people received large awards. Our partners have learned they can achieve substantial improvements by adding a lower range of awards with economic value to the program's portfolio.

Social recognition awards the top 10 percent. It also recognizes the 70 percent of people behind the top performers who carry the organization every day. These are the classic unsung heroes. They are the "Mighty Middle"— the people who dutifully attend to their tasks, are consistently polite on the phone and reliably complete work on time. A broad improvement in company performance requires bringing these people into the winner's circle. It's simple logic: Raising the engagement of a majority of employees will result in outsized performance improvements. To imagine otherwise is to waste that middle 70 percent's potential.

Adoption: Any new initiative requires a critical mass of adoption by employees to achieve its goals, and that's doubly true of a social initiative like recognition. Quick adoption by a large number of employees means better ROI for the program over time and faster results in terms of engagement, energy and performance.

You also need to brand your recognition program. Sometimes the name is nothing more than a label: "Acme Corporation Recognition Program." We advocate a single, unique brand identity for a company's social recognition program. Creating a unified brand promotes unity across divisions and borders. With one name known by everyone, the company has a one-company voice and a one-company mission around which employees can rally. Branding your social recognition program in this kind of disciplined yet creative way is a chance to reinforce key values that make the company unique.

Rewards: The era of the gold watch is long gone, so consider a few principles when determining the nature and size of rewards in a social recognition program.

Offer a great choice of rewards. Employees are individuals — this is a fundamental principle of social recognition. Each employee makes unique contributions, has unique tastes and desires uniqueness. The best managers, and indeed the best global organizations, learn that rewards are most effective when they honor the individual. Merchandise-only programs were designed before the advent of the multicultural, global organization, and they make little allowance for differences among cultures. A crystal trophy might sit well on a desk in Paris, but does it have the same meaning in Toronto or Miami?

Social recognition magnifies the moment of recognition with the power of choice. In a partnership of goodwill, the giver determines the value of the award, and the recipient determines the final object or experience awarded. In this way, the recipient becomes a participant in his or her own recognition, not a passive-if-gratified spectator.

Driving ROI and Business Results

There are additional business reasons to make recognition a strategic imperative.

Reducing Turnover. Turnover is a budget-killer for HR because the cost of replacing employees who quit ranges from 50 percent to 150 percent of a year's salary. For example, a company of 10,000 employees with annual salaries ranging between $30,000 and $150,000 and an 11 percent turnover rate spends more than $41 million in turnover costs! Compare that to the cost of a recognition program set at 1 percent of payroll ($4 million). Even if a recognition program reduced turnover by just 20 percent, it would more than pay for itself — and that doesn't include all the other benefits of recognition.

Becoming a Best Place to Work. What is the financial benefit of being a great place to work? China Gorman, CEO of the Great Place to Work Institute, offers some statistics contrasting the performance of the 100 Best Companies against the U.S. average: Turnover among the 100 best companies ranges from 50 percent to 65 percent lower than the U.S. median. The headcount growth — an HR proxy for expanding business — of Best Companies is five times the rate of the U.S. average (15.4 percent versus 3.2 percent). Finally, a boost in reputation recruiting comes with being on the list.

Owning a Coveted Employer Brand. Fifteen years ago just a few visionaries in human resources used the term "employer brand." Now it's commonly understood as a critical part of recruiting. The distinctive employer brand attracts the right candidates to apply for jobs and decreases the cost of attracting candidates through advertising and other marketing efforts.

Increasing Productivity. Implicit in the increased engagement and energy brought about through recognition, productivity is one of the chief benefits. Gallup finds 21 percent higher productivity in highly engaged workforces.

Revenue and Valuation. Global management-consulting firm the Hay Group's research shows that companies with top engagement scores show 2.5 times the revenue growth of companies with low scores. For public companies, revenue growth means a higher valuation in the market.

How Social Recognition Impacts HR

We are in the early stages of a pervasive technological movement grouped under the umbrella term "big data." Huge sets of data are examined by powerful analytic tools at unimaginable speeds to generate insights about the past and present and even to predict the future.

You already see the effects of this nascent movement: Weather forecasts are more accurate. Marketers detect trends before they are obvious and create products to serve those trends. Retailers stock shelves with just enough products to meet demand. Web pages contain eerily personal advertising.

Big data is working its way into talent management as advanced HR systems mine data of all kinds to make informed predictions about, for example, which employees are most productive and why, which valuable employees are "flight risks" (in time to do something about the situation), and who might be a great succession candidate for a key position.

HR has had a smaller but important taste of modern data analysis in recent decades with the advent of human capital management (HCM) software for payroll and benefits management, compensation analysis, cost containment and other practices. It has been able to help measure outcomes of programs like employee wellness initiatives. Adoption has been slow, however, compared to other practices.

Social recognition's data and practices advance HR with talent insight across the HCM life cycle, from the moment a candidate encounters a company, through the hiring process and during a career. In the past, these insights might come from a particularly sensitive manager or HR professional, but in a large organization there are just too many people and too much activity for a single observer to reliably detect hidden patterns. That's the power of big data analysis — it observes far more than a person can, and with the sheer power to run large data sets, it observes patterns that might otherwise go unnoticed.

A sophisticated social recognition program can show these patterns. When you analyze many thousands of recognition moments and comments, you can produce key insights about how jobs get done, how teams should be configured, how communication and learning and collaboration happen across the hall and around the globe, and where to find your company's "hidden influencers"— that is, people who might not wield formal power but who are so trusted and widely known that their opinion carries great weight with peers.

Benefits of Talent Insight

Social recognition and the data it yields contribute to broader talent management in the practices of onboarding, finding hidden value, documenting and promoting best practices, spotting the quiet but important employees, spotting "cultural energizers," learning and development, retention, change management, succession planning, years-of-service awards, work circles, identifying management trouble spots, improving performance reviews and separating quality from quantity.

Will predictive analytics ultimately make 100 percent accurate calls on who should work at what, where and with whom in an organization? People will always surprise you with their capacity to grow and change.

Social recognition and the Power of Thanks will surely make your company a very successful place to work. The people who show up every day to live your mission and values, who put so much of their lives into working together under your company name, deserve no less.

How to Translate Project Decisions into Business Success

THE PROJECT MANAGER'S MBA

THE SUMMARY IN BRIEF

Finishing a project on time and on budget is no longer a project manager's sole criteria for success, according to authors Dennis J. Cohen and Robert J. Graham. You are also held accountable for your contributions to the company's financial goals. As a project manager, however, you may not have the business knowledge necessary to make project-based decisions that lead to bottom-line success.

This summary presents the skills and knowledge you need to link project success to organizational success. Specifically, you will learn how to:

✓ **Take an entrepreneurial approach to managing projects.** You will learn to view each project in light of its contribution to the overall profitability of the company and begin to run projects as if they were business start-ups.

✓ **Understand the basics of accounting and finance.** You need to understand the basics of balance sheets and profit and loss statements and know how to adapt them to measure the impact of your project on the company's profitability.

✓ **Understand business strategy.** Your projects must be compatible with your company's overall business strategy, whether that strategy is to deliver world class service, provide leading-edge technology, or deliver operational excellence.

✓ **Manage projects for maximum results.** You will see what methods you should use to speed up the project.

✓ **Understand the customer.** Every project must be designed with what the customer and end-user want and need to solve a problem.

✓ **Calculate project costs and measure project success.** You will soon see exactly what costs must be considered when setting up a project. You will learn to measure and apply the direct and indirect costs your company invests in your project. You will also learn how to determine the life cycle of the end product of the project, and measure the value created by the project against the cost of producing it.

An Entrepreneurial Approach To Managing Projects

"Make it fast. Make it good. Make it cheap." So goes the project management folklore about what senior managers always ask for. Traditionally, project managers would reply with, "Pick two." And almost always, "Make it cheap" is one of the two project goals chosen.

It might not be the right answer. When project management and senior management understand the wider implications, they both realize that "make it cheap" might not contribute to successful business results as often as they think. More important than reducing the costs of a project is increasing its value.

In other words, as a project manager you must develop a framework for thinking about projects based on business concepts such as increasing economic value, or Economic Value Added (EVA).

A successful project, for example, might mean creating a high level of customer satisfaction, which produces more sales, which, in turn, creates enough cash flow to cover project and operating expenses, make a profit, and pay back the cost of the capital used to produce the product. At this point, the project begins to produce the economic value known as shareholder value.

Creating shareholder value requires project managers to act like entrepreneurs — treating projects like businesses — and think like CEOs — viewing each project as part of a wider organization.

Act Like an Entrepreneur and Think Like a CEO

What does it mean to act like an entrepreneur and think like a CEO?

First and foremost, it means understanding how organizations create value for their stakeholders — shareholders, customers and the business team. For shareholders, the business creates value when it provides a rate of return that meets their expectations for the level of risk they have taken. Cash flow is the fuel for this satisfaction. It is up to the business team to manage projects that deliver this necessary cash flow.

The problem is that many projects won't directly impact a company's bottom line. Project managers also need to consider the project's overall impact on the company's strategy to see where the project creates value. For example, new product projects often impact profitability and create high levels of profit, while a project that focuses on breaking into a new geographic market might be lucky to break even. But both projects contribute to the execution of the company's overall strategy.

A project's contribution to overall business success can be diagrammed and looks something like the chart on the next page.

At the top of the diagram is the ultimate goal: the project's contribution to business results. The boxes below

(continued on page 3)

Project Categories

Most organizations that engage in project planning categorize these projects into three groups:

New product, service, or facility development projects. These projects provide something entirely new in the organization. These projects generate new or greater income for the organization.

Internal projects. These projects involve infrastructure development and improvement and include reorganizations, reengineering, and other change initiatives as well as software and hardware initiatives. These projects generally don't produce new income. Rather, they produce cost savings and create operating efficiencies.

Client engagement projects. These projects benefit external customers or clients. Today, those clients expect more than they ever expected before and look for measures of increased economic value as proof of success.

The authors: Dennis J. Cohen is senior vice president and managing director of the Project Management Practice at Strategic Management Group. Robert J. Graham has developed a consulting practice in project management and is the author of *Project Management as if People Mattered* and *Creating an Environment for Successful Projects.*

An Entrepreneurial Approach to Managing Projects

(continued from page 2)

the goal represent the business factors that go into producing economic value; the lines connecting the boxes represent interactions among those factors. The left side of the chart represents the strategic alignment of the project with the company's overall strategy. The right side side shows the project's contribution to economic value.

As you explore the flow chart, you will see that there is a new project management paradigm developing. Projects are conceived and executed with an understanding of the dynamics of competition, timed for maximum cash flow, and represent an investment in competitive advantage. ■

Accounting and Finance: You Must Know the Basics

In the past, when project managers were given a project and a budget, they could afford to be ignorant of accounting and finance basics. Not today. To link project success to organizational success, project management must understand at least the basics of finance and accounting. This article reviews some of the basics.

Cash Cycle

Each company has a cash cycle. The cycle involves acquiring cash, using that cash to grow and to operate, and returning any cash necessary to the creditors and owners. For example, a company's cycle begins with a financing phase where the company must attract funds from financial institutions and investors to have the capital needed to start the business. It then invests the funds in labor and equipment required to develop the business (the investing phase.) In the operating phase, the company uses the funds to operate and adds funds generated by the business to the pot. Finally, in the returning phase, creditors and investors are paid. This is their return on investment.

Projects are just like start-up businesses, following the same cash cycle.

Financial Reports

Financial reports are required of all companies of any significant size. A company's financial reports consists of at least three basic statements: a balance sheet, an income statement and a cash flow statement. Each serves a vital function.

A company's *balance sheet* shows its assets and its liabilities. Assets, shown on the left side of the balance sheet, come in two kinds: current assets, which will be converted into cash in the next year or so, and long-term assets. The right hand side of the balance sheet tracks short-term and long-term liabilities as well as a liability called shareholder's equity. Shareholder's equity consists of stock and retained earnings, which are profits that could have been distributed to shareholders as dividends but were kept by the company.

The sheet is called a balance sheet because the left hand side always equals the right hand side, and can be represented by the basic accounting formula: Assets = Liabilities + Shareholder's Equity.

A company's *income statement* attempts to match revenues with the expenses associated

(continued on page 4)

Accounting and Finance: You Must Know the Basics

(continued from page 3)

with those revenues. A company's revenue minus its expenses equals its net income. If the net income is positive, the company has made a profit. If it is negative, the company has suffered a loss. That's why the income statement is also referred to as a profit and loss statement. Income statements are important for project managers because they match the cost of the project with the revenue or cost savings produced by the project.

A *cash flow statement* completes the basic financial statements. It tells someone examining the company from the outside where cash needed to run the business has come from and where it has gone. Internally, management can use the cash flow statement to see how much cash is free for use in the business. This free cash flow is the net cash generated by the operations of the business minus the cash used for investment activities. If free cash flow is positive, the company does not need to obtain additional investments; if it is negative, the company must find additional investments in either stock or bank financing to continue operations. ■

Corporate Strategy: It's Your Business, Too

All organizations have a strategy, explicit or implied, that upper management uses to guide decision-making.

In the past, top management acted as if strategic planning was a ritual rain dance. Every year a strategic planning process took place, with each upper manager scouting out threats and opportunities. These were then analyzed and became part of the strategic plan to be locked in a drawer until next year.

Today, change is happening too fast to rely on old methods of strategic planning. Now strategic plans must change as rapidly as your company's environment changes — which means everyone at the company must be aware of the strategic plan and take part in it. Project managers must understand their company's strategy and how their projects fit into it.

In its most basic form, strategy is the way a company orients itself toward the market in which it operates, and toward other companies in that market. Strategy answers the question of how the company will position itself in the market over the long run to secure a sustainable competitive advantage.

Most project managers are too involved in the day-to-day management of their projects to pay much attention to that strategy. This is a mistake. Project managers need to align their projects with the strategic choices made by the company.

For example, if the company chooses to emphasize product leadership, projects to develop new products will focus on innovation and speed, not customer service. If project managers don't buy into or understand company strategy, they might run the project with a focus inappropriate to the company's strategy and thus miss making a significant contribution to the execution of that strategy and the creation of economic value. ■

Why Project Managers Need to Understand Strategy

- ✓ Management is evaluating project managers on how well they implement company strategy.
- ✓ Understanding company strategy will let you make decisions during the project that match strategy. If the strategy is to be first to market, that's how you will manage your project, for example.
- ✓ Understanding your company's strategy will help you develop a team with common goals.
- ✓ Aligning your project with company strategy will help protect it from being canceled, since you can demonstrate the project's importance and relevance. And if the project does not match company strategy, you can understand why it is cancelled.
- ✓ Understanding strategy lets your project stay focused and on track.

Approaches to Company Strategy

Below are three basic approaches a company can take to developing a sustained competitive advantage. Choose one as your company's strategic focus, but make sure that your practices in the other two at least meet the industry average.

Customer Intimacy: Companies who choose this strategic focus aim to develop long-term relationships with their customers. Customers expect the best service and get it. Examples of companies taking this tack are Nordstrom's and Home Depot.

Operational Excellence: Other companies build their strategies around high efficiency and high volume. For example, a McDonald's anywhere in the world is likely to be virtually identical to other locations. Customers expect it, and McDonald's delivers.

Product Leadership: Companies that practice product leadership must be creative because they are targeting the segment of the population that consists of early adopters. These want the latest and best products and are willing to pay for them.

Increase Speed, Quality and Value of Projects

Project cycle time, or how long it takes a project to go from idea to completion, is crucial. Proper project management practices will shorten that time.

The sooner the project is completed, the sooner it can begin to produce its value and begin to pay back the investment used to produce it. Thus, reduced cycle time adds to cash flow, reduces the project's capital requirements, and increases economic value. Don't reduce cycle time by increasing manpower and working people overtime until they drop (a common method). A better approach is to increase the budget for good management practices.

How to Reduce Cycle Time

The following six practices will decrease the duration of a project, increase quality and decrease total costs:

1. Have one well-trained project manager. He or she should be enthusiastic and trained to manage projects. Don't appoint someone just because of technical expertise or availability. The designated project manager is the only person the team reports to; team members must know that he or she has the authority to make decisions and direct the project.

2. Develop a rapid prototyping process. Prototypes need to be developed quickly, even if they are not perfect. Presenting imperfect prototypes helps highlight problems and facilitates solutions to those problems. Customers have an opportunity to look at prototypes and offer suggestions for improvement. Today, prototypes are not specifications driven. Instead, prototypes drive specs.

3. Establish a core team for the duration of the project. Projects need an interdisciplinary core team of people from important departments who stick with the project from beginning to end. Core members typically come from engineering and information technology, marketing, production, customer and technical support, quality assurance, and the finance department. The team should also include customers or end users. A core team thus has access to a range of technical expertise, and can minimize handoff problems since every key department is involved.

4. Ensure that the team members work full time on one project. For the sake of speed, the core team — and other team members who join in — should work exclusively on one project before moving on to other projects.

5. Co-locate core team and other team members, especially on new product development projects. The more communication there is between team members, the better. Communication is easier if everyone is working in the same location. Some organizations like Chrysler and General Motors have even constructed special development centers for that purpose.

6. Develop upper management support. Project failure is often caused by lack of upper-management support. Once committed, upper management should continue to support the project through completion.

To the degree that these practices are optimized, cycle time will be reduced. ■

Cost Overruns Aren't Always Bad

Sometimes it makes sense to pour extra money into a project in order to finish it on time. According to a 1989 McKinsey and Company study, if a project is late for an amount of time equal to 10 percent of the projected life of the product, there will be a loss of about 30 percent of potential profit. But if the project budget is over by 50 percent, yet the product launched on time, there will be a loss of only about 3 percent of the potential profit. The advantage of being first to market offsets the additional cost. In other words, most companies will be better off pouring additional money into the project to get it out the door on time than they will be sticking to the old budget and finishing later.

The Folly of Multitasking

Multitasking, which requires people to work on more than one project at a time, is a sure way to decrease focus, decrease output and increase cycle time. Despite this, many organizations have embraced multitasking. The problem: It doesn't work. People are not so easily divisible. It takes time to shift from one project to another and back again. That time quickly adds up in a typical workweek, and can actually increase the amount of time it takes to complete projects because the time required to switch between projects is non-productive. If two-way multitasking is a minor folly, asking people to work on three or more tasks borders on absurdity.

Understand the Customer and the Competition

No matter what type of project you are directing, the project outcome will end up in the marketplace. This holds true, obviously, for new product development projects. It also holds true for internal projects, as they ultimately benefit the end user. Perhaps, for example, the project leads to more efficient operations or better

(continued on page 6)

Understand the Customer and the Competition

(continued from page 5)

trained sales and service staff.

As a project manager, you must understand the customer and deliver a result he or she wants and will buy — thus generating revenue for the company. The key is to understand the competitive forces at work in the market.

Build It and They Still Might Not Come

The first step to generating revenue is to design products, services and processes that help customers solve problems and meet or exceed customer expectations. Unfortunately, the traditional project manager's thinking has been that selling the product was not his problem, but the marketing department's. The implicit message was that, "if we build it, they will buy it."

That approach has proven wrong. Consider the ill-fated Iridium project, which aimed to use satellite technology to provide global telephone service. It turned out there was no market for the service once it was developed.

One way to avoid this mistake is to try to get a member of the marketing department on the project team. Most important, however, is for you as a project director to have a clear understanding of market needs. You should be able to identify what the customer or end-user really wants, understand the competition, make trade-offs between features and price or cost, and determine the timing of the product introduction.

Understanding the Market

Project managers need to look at the market for their end product or service. That analysis must include:

Size. How big is the market? For new product projects, the size of the market is the total annual sales of this type of product to all market segments. For in-house projects, it is the total number of end-users who will be affected by the project results. For client engagement projects, it is the number of client customers who will be affected by the project outcome.

Segmentation. What part of the market is the target? All markets are composed of segments, which are defined by customer attributes. For example, the clothing market is divided into male or female, young and old, high fashion and casual, and so on. Select a segment and stick with it. Companies that try to serve every segment tend to serve none well. Choose your customers, narrow your focus, and dominate your market segment.

Competition: Who is in pursuit of the same segment? The relevant competition consists of organizations that are aiming at the same segment with a similar strategy and with solutions to the same problems. You must know the competition, rate how your solution to customers' problems compare, and figure out how to convey the superiority of your product to customers.

Pinpointing the Competition

In order to compete, you have to know who your competitors are. That may sound obvious, but in practice it is harder than you think. Follow these steps to size up the competition:

1. Draw up a list of competitors in the market you have defined for yourself. For example, Coke could list only Pepsi as a competitor if it defined its market as the cola drinking public. If it defined the market as soft drink buyers, the list of competitors grows. If that market is expanded further to include all beverages, the list of competitors grows even longer.

2. Next, the project team agrees on who should be on the competitor list and then assigns team members to monitor specific competitors. Keep up with your assigned competitor's technological advances.

3. Finally, try to envision how new competitors might look and how likely they are to appear on the horizon. What are the barriers to entry? Are those barriers changing? You must also think like a new competitor. Whatever you could do to compete is probably what a potential competitor is doing out there right now.

Understanding the Customer

Project managers and team members must take time to understand the customer so that they can provide what the customer wants.

A customer is the person who actually pays for the product or service you are developing. That customer might not be the end-user — the person who actually benefits from the product or service. For example, mothers might buy condensed soup to be eaten by a child. The mother is the customer, but the child ultimately benefits from the production of the soup. You must please the end-user, not just the customer. If the child refuses to eat the soup, the mother will not buy it again. More likely, she will buy the brand of soup the child will eat.

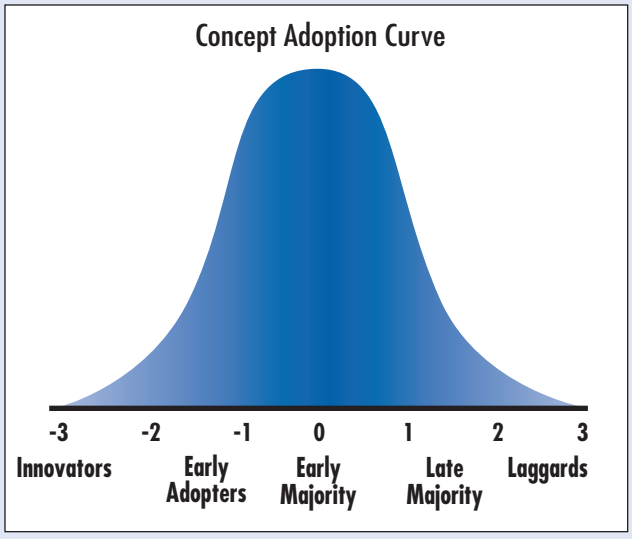
Both customers and end-users want you to solve problems for them with your product or service. The best way to solve customer problems is to create a prototype and put it into customer and end-user hands. Never rely on market data alone.

(continued on page 7)

Understand the Customer and the Competition

(continued from page 6)

The problem, of course, is that customers don't always know what they want. In order to reach them, you may have to have technical members of the team sit down with them. Here are some practical ways to get customer and end-user involvement:



1. **Put customers and end-users on the core team.**
2. **Directly observe end-users' problems.** Get out in the field and see the problems from their point of view.
3. **Develop focus groups to explain problems.**
4. **Develop prototypes to give end-users experience.**

A good understanding of the market will help the core team set the price. For new product development projects, that price is a reflection of the features, the competition, and the time of market entry. Features that customers want and need add to the price, while unwanted or unneeded features don't translate into a higher price. ■

Concept Lifecycle

Each product or service a company produces to solve a problem has a concept lifecycle. For example, take putting words on paper. Words can be committed to paper with a pen, a printing press, a typewriter, a dot matrix printer, an inkjet printer and a laser printer. Each of these concepts for committing words to paper has a lifecycle. If your company tried producing and selling a typewriter today, you would be too late in the product lifecycle to benefit. If you are selling a pen, you are probably still early enough in the lifecycle to make a profit.

Different customers will buy your product depending on where the product or service is in the cycle. Some customers are innovators, buying up the product very early. Others are early adopters, part of the early majority, the late majority, or laggards. The innovators are the first to buy a new product, while the laggards wait until everyone else has one. The concept adoption life cycle looks like this:

Calculate the Project Costs

Cash flow, break-even analysis, and return to shareholders are important concepts for project managers. Profit equals revenue minus costs. Thus, the revenue from a project must exceed its development and production costs. Today, much more so than in the past, project managers are responsible for calculating the cost of their projects rather than being the victims of an assigned budget that may not be in the company's long-term interest.

There are four types of costs that project managers need to be familiar with: variable direct costs, variable indirect costs, fixed direct costs and fixed indirect costs.

Variable direct costs are costs for the parts used to make a product. They are direct costs because they go directly into the production of the product. They are variable because they increase or decrease depending on the volume of the product you produce.

Variable indirect costs also increase or decrease depending on production levels, but they cannot be attributed directly to a product. For example, the plastic used to create a doll would be a variable direct cost, but the electricity used in the factory that makes the doll is a variable indirect cost because it cannot practically be assigned to a specific doll.

Fixed direct costs are incurred to run projects or production. For example, the computer hardware needed to work on a project is a fixed direct cost. The cost is fixed because it does not matter whether the company is using the computer or not.

A *fixed indirect cost* also does not change with production levels, but remains the same. It also cannot be directly tied to a product. An example of a fixed indirect cost is

(continued on page 8)

Types of Costs

	Variable	Fixed
Direct costs	1. Variable direct costs (example: cost of goods sold)	3. Fixed direct costs (example: building rent)
Indirect costs	2. Variable indirect costs (example: depreciation)	4. Fixed indirect costs (example: SG&A)

Calculate the Project Costs

(continued from page 7)

the computer center a large company might make available for its project managers. A fee is charged each month to the project managers according to the size of their project, but the amount of use does not change the charge.

Cost of Goods Sold

One set of costs that project managers should be familiar with are the "cost of goods sold." To calculate the cost of goods, you must add the cost of materials needed to make the product, the direct manufacturing labor costs, and the manufacturing overhead cost. These costs could be assigned directly to a project, but it would be too costly to break them down enough to place with the right project. ■

Why Finance Matters for Project Managers

Projects develop assets that produce a return to the company and its shareholders. Unless a business demonstrates its ability to return cash, it will not get the cash it needs to invest in and operate the business. No cash to invest means no new projects and no business.

If projects are investments, managers need to understand how they are financed. Unfortunately, too many project managers ignore the cost of capital — that is, the cost of acquiring the cash that makes the project possible.

The money to finance a project can be acquired in two ways: through lenders or shareholders — those who buy the company's stocks. Neither lets companies use their money for free. The cost of capital consists of the amount of money that companies have to pay their lenders or shareholders to compensate them for their investment and satisfy their expected return on that investment.

When companies turn to lenders for capital, they know exactly what the lender expects in return for the loan. The interest charges can readily be added to project cost. Shareholder expectations are not so easily converted into project cost because their specific expectations are not stated. Nonetheless, managers should attempt to estimate it when calculating project costs.

Before a project launches, there should be a careful investment analysis made. A project must return at least the amount of capital invested in the project plus the cost of that capital. If it does not, it will not add value for shareholders. ■

Projects Make the Business

Financially, a company is a portfolio of assets produced through projects. The present operations of any company were developed by past projects and improved and supported by current projects. Future projects will lead to the strategic implementation of future operations. If project outcomes do not meet investor expectations, then neither will the company.

The Project Venture Development Process

Good projects don't just happen; they are well planned and executed. If you want your project to add economic value to the company and further its strategic vision, you must plan accordingly. Here are the steps you need to take for each project:

Develop a Business Case. Begin by developing a business case for each project. The business case process forces you to focus on the desired outcome. State where the numbers in your projections come from, including anticipated sales volumes, and the production and operating costs. Make sure the assumptions that drive the numbers are realistic. Clarify why this project is a sound investment for the company.

Think Strategically. Consider projects in their wider context. How does the project fit into the company's long-term strategy? Does it support an existing sustainable competitive advantage, or does it create a new one? Describe the big picture and link the project to other projects for an overall view of how it all fits together.

Create a Business Plan. Before starting the project, develop a business plan. Do market research and scope out the competition. Be sure to assemble the core team and include them in this stage. Identify major milestones at which you will stop and check your assumptions and progress.

Execute and Control the Project through the Business Plan. Don't put away the business plan once the project has begun. Use it all along to guide the project and check your assumptions.

Transition Smoothly to the Project Outcome Lifecycle. The end of the project is the beginning of its implementation. Core team members should be along as guides. The team should also produce a final report with numbers, projections and assumptions about the success of the product or service the project created. These can then be checked against what really happens as a learning experience.

Operate and Evaluate. The project isn't over until the end of the project outcome lifecycle. Once the lifecycle is over, evaluate how well expectations were met. This serves as a way of celebrating success and learning from failure. ■

The Q-Loop

The Art & Science of *Lasting* Corporate Change

by Brian Klapper

THE SUMMARY IN BRIEF

The business environment has never been more fast-paced and competitive. Survival, let alone success, depends on an organization's ability to recognize possibilities, innovate, implement change and sustain that transformation. Yet a paradox exists. How does an established organization with a history of drawn-out planning and development cycles become nimble, innovative and responsive?

Brian Klapper reveals the "art and science" of lasting transformation based on a proven, repeatable model called "the Q-Loop"; it is a process that forms a complete circle — from ideation to complete implementation. Klapper explains: "It's called the Q-Loop because, as the name suggests, it's more robust than a simple circle. Far from going in circles, like so many strategies intended to implement change, *The Q-Loop* is anchored in both theory and practice, in art and science — it works every time."

The Q-Loop extracts the deep knowledge that resides with frontline employees, breaks down the inherent resistance to change, and converts them into passionate advocates who are fully invested in leading the organization to achieve transformational results. Fleshed out with actionable steps, suggestions and fresh insights, *The Q-Loop* provides practical guidance for all types of organizations.

IN THIS SUMMARY, YOU WILL LEARN:

- The path to maximizing your organization's collective IQ through ideas.
- A new method to ignite a grassroots mindset shift by focusing on and achieving your mandate.
- Ways to embed the Q-Loop into your organization.
- How to create an easy and transparent way to share ideas.

Introduction

The Q-Loop is a process that forms a complete circle — from ideation to complete implementation. The Q-Loop relies on the real heroes in the trenches of your company, the ones who know how to get things done and get people on board.

When you look at the illustration of the Q on the cover of *The Q-Loop*, you see that it shows lines before they enter into a loop. This represents ideas and initiatives as they are considered throughout the entirety of your organization. The Q illustration then shows the loop itself, as these ideas and initiatives are delivered to upper management to assess and prioritize in relation to your overall business objectives. Then these ideas and initiatives are delivered back down to frontline employees for refinement. Finally, these initiatives are delivered out from the loop to the rest of your organization and embraced by the front line because the idea was initially created by them.

Why the Q-Loop Works

It starts with a compelling story, one that originates with management but is written by employees. It recognizes that employees are motivated by their impact on their customers, company, colleagues and themselves, and it uses this motivation to help them lead the change. The Q-Loop allows employees to drive the agenda.

A successful Q-Loop decision process is critically dependent on both the span of influence and the bottom-up input mechanisms that support the loop. The Q-Loop can be deployed at multiple levels within your organization to improve current operations, to create new products and services, and to capitalize on market opportunities. This multi-tiered approach enables an organization to quickly mobilize Q-Loops to address specific projects and to pilot change. ●

PART ONE: ENTERING THE Q-LOOP

Adapt or Atrophy

Adaptation is essential to healthy growth and economic vigor, and this axiom is more true in this second decade of this second millennium than it has ever been in history. An ability to embrace industry changes, technological advancements, and evolving customer demands opens up your organization to opportunities that your competitors fail to see. It's a chance to shed your skin and explore new and profitable innovations. It's how an organization thrives now and long into the future.

Yet a paradox exists. While an overwhelming percentage of organizational leaders recognize the need to adapt, transformation rarely takes root in any lasting way. What can be done to convert this shocking rate of failure into overwhelming success for any organization?

The challenge is to

- Recognize the need for change, and overcome fear of it.
- Be scrupulously honest about your organization's current shortcomings.
- Get everyone in the company to buy in to your vision for the future.
- Offer the necessary tools to help deliver your vision.
- Successfully coax a behemoth from where it is today to where it needs to be tomorrow.

So Why Is Change So Hard?

If adaptation is a sign of a healthy organization poised to outpace its competitors, why aren't all change programs hungrily embraced and implemented with lasting success? We all fall into routines. Sometimes they're healthy ones, like going to the gym after work. Other times, they're less than ideal. Organizations are no different. Years of patterns lead to ingrained and deeply entrenched sets of beliefs and behaviors that extend into practices that are systemic and cultural. Change is risky because by definition, it involves doing something unproven, something that hasn't yet been shown to work.

Employees resist change for lots of reasons. They might simply disagree with the change or the rationale it's based on. Or they might believe the change will be a fad. Or there might be deeper psychological factors, such as a fear of learning new skills or losing authority.

However, for most change initiatives, lack of alignment among the leadership team is the primary cause of failure. Or there is not complete commitment to the vision and path. The initiative becomes bogged down by lack of consensus and stalls.

To execute strategy successfully, it's essential that you take your organization's current cultural temperature. That way, you'll understand its collective attitude toward change — both its openness to change and its points of resistance. By doing so, you'll determine the specific hurdles that will stand in your way as well as the people you can lean on to keep you moving forward.

There are numerous methods for assessing an organization's readiness for change. In my experience, focus groups, small-group meetings with key influencers and organization-wide employee surveys are most effective at deriving thorough and reliable results. ●

Ideas — The Lifeblood of an Organization

Drawn on a napkin, hashed out over the fourteenth hole, or devised while eating junk food late at night in a college dorm room, great ideas are the rich deposit on which organizations are founded. And organizations flourish because of new ideas. Quite simply, if a company doesn't recognize the need for a constant infusion of creative thinking and fresh strategic concepts, then that company most certainly won't be willing to take the necessary steps toward lasting change. Good, bad, brilliant, even god-awful, ideas propel a business to new heights. They distinguish an organization from the competition, delight customers and reward stockholders. Without them, organizations languish.

On the road from ideation to realization, however, a lot can go wrong. Great ideas are too often kicked to the curb, sometimes intentionally out of fear, sometimes despite heroic attempts to actualize them, sometimes because there's a collective belief that the status quo is good enough. Research has shown that employees in a negative environment, who are focused primarily on looking out for themselves and constantly defending their own space, are less innovative.

Nurturing an Atmosphere of Creativity

Fostering a culture of creativity and innovative thinking can be easier than you might think. Consider the following five ways to shake the tree of ideas a lot harder than you currently do:

Killing the status quo. In the same way that people hold deep-seated beliefs, organizations have sets of accepted core convictions about how to get things done. The first step to killing the status quo is to accept that these core beliefs exist and then challenging each and every one.

Altering your point of view. To break stubborn obstructions that stand in the way of new modes of thinking, you sometimes need to experience something firsthand outside of the office or boardroom.

Comparing your organization to others. This strategy is not about emulating other organizations; it's about stimulating surprising ideas that you might not come up with otherwise.

Imposing artificial limitation. It might be counterintuitive, but imposing limitations on your thinking can be an invaluable way to spark creativity. By constraining you, it paradoxically frees you to run wild within a smaller area.

Looking for unorthodox opportunities. To spur the ideation process, do not constrain your thinking only to improving products or services. Instead, rethink every touch point between you and your customers to improve how they currently interact with your organization. Perhaps you are forcing them to interact with you in a way that's less ideal, and you could improve it.

It is imperative that you begin to reward innovative thinking in meaningful, memorable ways. Through recognition and rewards, a healthy culture of competition may emerge. Managers should construct incentives that stimulate collaboration by encouraging innovators to share their inventions and insights within the organization.

There are two approaches to choose from to motivate and reward employees for their ideas, and both have their merits.

Intrinsic motivation. An intrinsic reward is one that comes from within. An employee's sense of intrinsic motivation can sometimes be enhanced with praise and added attention from management.

Extrinsic motivation. An extrinsic reward comes from an external source. The source of inducement can be powerful but can also be more short-lived than an intrinsic motivator. When an extrinsic motivation such as a monetary reward is removed, so is the enticement. ●

Launch Your Employees on an Idea Quest

Your assistant, junior associate, bank teller, barista, pizza maker, custodian or forklift operator might have answers to your organization's most pressing issues or fixes for time-wasting problems. But most organizations don't benefit from these valuable IQ points because management doesn't invite meaningful, focused input and collaboration from frontline employees.

The challenge is to focus your employees' combined brainpower by asking smart questions and facilitating the flow of information along fruitful paths to solve problems and discover opportunities.

Frontline experts see a great many problems and opportunities that their managers don't. The tremendous opportunity for organizations is to pull this knowledge from employees' day-to-day experiences, make decisions and act upon them through those same employees.

You need to cultivate a culture in which staff at all levels can easily share solutions for improving the business. When it comes to ideas, the biggest roadblock senior management often faces is the widespread, deeply entrenched belief that ideas from the rank and file don't matter. In many companies, this wellspring of valuable insight simply isn't encouraged, considered or rewarded. You might be shocked by how frontline employee participation lubricates the gears to get major change initiatives moving along smoothly.

I have worked in dozens of organizations that continue to use the age-old suggestion box as a means of generating ideas, and it rarely produces quality ideas. Why? Far too many suggestions, too many irrelevant ideas, too many redundant ideas, and a lack of transparency and recognition. I have developed a better strategy that can be used to solicit the most fruitful, strategic and relevant ideas from the collective intelligence of your organization. I call it Idea Quest.

The advantages of Idea Quest are numerous:

- It introduces a formal, disciplined process into what is often a helter-skelter, shotgun approach.
- It sharply improves organizational focus by recognizing an opportunity to be acted on.
- It quickly separates the best ideas from the worst so you can allocate resources effectively.
- It lets you evaluate the effectiveness of the ideation process.

Let's consider the five steps to effective idea quest in detail:

1. Focus employees on a specific mandate. While open-ended innovation has its value, the most successful systems for ideation define focused business challenges. Invite the appropriate employees and employee groups to generate ideas to address a specific business opportunity within a defined time frame.

2. Engage employees in meaningful ways. Use multiple mechanisms to motivate employees to become involved in your Idea Quest. Set a good example by having management participate. Make sure contributors share in the success of the result. Ensure that all ideas are welcome, and make it fun.

3. Create an easy and transparent way to share ideas. Participants should work independently or together in meaningful groups to develop ideas. The environment should be transparent so everyone can see all ideas and build on ideas submitted by others. Get people who do not normally work together to come together for this effort. Encourage out-of-the-box thinking that challenges the status quo.

4. Require that ideas be turned into a project plan. Without a workable written project plan, ideas can be abstract and extremely hard to evaluate. By requiring that ideas be presented as a simplified project plan, weaker projects must be strengthened or can be identified and scrapped so that stronger ideas can move forward. A basic project plan should consider at least an overview of the idea, the competitive advantage offered, the degree of difficulty, and estimated time, cost, revenue and team size.

5. Evaluate each idea, and respond promptly. When ideas disappear into a black hole, contributors become discouraged. Allocating adequate resources for evaluation is important. ●

PART TWO: GOING AROUND THE Q-LOOP

Focus on the Mandate and Form a Team of Heroes

Regrettably, the least common approach to problem-solving is fact-based solutions that rely on deep insight and analysis to solve the problem coupled with a deep understanding of why the problem occurred. Once the how and why are verified, root cause analysis can occur. And with root causes come meaningful insights that can be captured and applied across the organization in a once-and-done fashion.

Fixing this problem doesn't require substantial capital investment to begin. Getting started simply requires that you identify the right idea to turn into a mandate and build the right team to achieve it. If the process for getting started is followed as outlined below, the team should enjoy tremendous success:

1. Ensure senior management support. Without the full support of senior management, the remaining steps are pointless. A single project champion must also be identified. An important role throughout the project, this is particularly essential at the outset.

2. Choose the project. Before making a final decision, be sure to have a thorough discussion about resource availability and management support to ensure that the project can be effectively staffed. An understaffed or unsupported project can be doomed before it gets a fighting chance. Then dive in. Change efforts will not work if the organization is always thinking about change and rarely implementing.

3. Select the project champion. The project champion must be an executive who provides the vision for the team, reviews and supports its efforts, and acts as a team sponsor to the rest of the organization. Primary responsibilities are to maintain accountability for the effort, define the project mandate, leaders and members, and establish weekly commitment and project duration, to mention a few. It's no small task. So choose wisely.

4. Scope the work. The project scope describes in detail the project's deliverables, the boundaries and the work required to create those deliverables. The scope definition should be clear and understandable to all project stakeholders.

5. Write the mandate. For any team to be successful, it must have a clearly defined sense of purpose. This purpose comes from a well-crafted mandate. The mandate should state your team's goals and why achievement of these goals is critical to the organization. It should be brief, memorable and meaningful to all members of the team. Think elevator pitch, not long-winded speech.

6. Select the coach. An ideal coach is someone who is experienced in working with teams and can guide the team through the project. The coach generally works behind the scenes with the project champion and team leader. The coach should ensure a sense of urgency and plans upcoming meetings, reviews agendas as necessary, and helps to structure the analysis.

7. Select the team leader. The team leader is often — but not always — a manager or supervisor in the area where most of the change is likely to occur. The team leader is charged with creating and maintaining an effective working environment and helping the team resolve its problems. This person schedules and generally runs most team meetings and manages or delegates administrative details. Among the many desirable attributes of the team leader are people skills, technical skills, communication skills and project management skills.

8. Select the team members. Your company is full of heroes. The ones who know how to get things done, who have been consistently more effective than their peers. These heroes are your influencers, and must be the primary agents of change. If you can identify, train and galvanize these key influencers you will release tremendous organizational energy. Look for heroes out in the field and as far away from headquarters as possible. Heroes generally spend most of their time with customers.

9. Secure dedicated team space and team requirements. Prior to the team kickoff, the sponsor should secure a dedicated meeting room to accommodate the entire team plus several guests. This will become known as the team's war room, where they will be papering the walls with process maps, graphs, charts, interview notes and more. ●

The Corporate Lab: The Art of the Possible

A fundamentally transformative, proprietary experience I named The Corporate Lab™ is a unique force that drives the ability to produce lasting change around the Q-Loop. It's one that I have personally witnessed redefine the mindset and cultural attitudes within dozens of organizations. It is the next step toward achieving a lasting change initiative after focusing on the compelling mandate and forming a team of heroes.

My goal was to establish a highly flexible, scalable, reality-based platform that would build clients' capabilities in a number of different areas. I knew I needed to immerse participants in an environment that would precisely mirror their day-to-day workplace in terms of culture and behavior.

The basic philosophy of the Lab is that it weaves together traditional problem-solving, in the form of the scientific method, and a strong constructivist element. Constructivism holds that students learn best when making sense of something on their own with the teacher as a guide. The Lab lets participants discover, dream, desire and reach their destiny. It works by allowing participants to learn and implement the Q-Loop in just two days.

To achieve success, you must build a transformation program that allows change to be rapidly pulled across departments and throughout layers. Unless well-respected thought leaders at all levels embrace the change, the initiative will wither and eventually die. To create widespread passion, the workforce must be exposed to what could be, which will let them rethink their mental models, break free from their entrenched paradigms, and embrace the opportunity to learn.

Overview of The Corporate Lab

• **Getting started.** Approximately twenty client participants assume job responsibilities of a new operating division of NAVCorp, a $270 million designer, manufacturer and marketer of computer navigation-related products. Typically, participants take on very different roles from their current positions so that they gain new perspectives. The experience is not a game-like simulation. This company exhibits the complexity and depth of the participants' organization.

• **Setting the scene.** The Lab takes place in approximately 1,600 feet of contiguous space with 20 participants from different parts of the client company. Each participant has a workspace — frontline workers have cubicles, and senior management has a conference room. Participants receive a welcome kit, and a company overview video is watched. Participants receive their tablets, individually loaded with job requirements. These tablets let participants send and receive e-mails and notifications and perform the analysis required by the job.

• **FY1.** During the morning of day one, participants encounter a series of significant business challenges that can potentially cause customer defection. Participants experience familiar stress, anxiety, time pressure and inconsistent data, which leads to fatigue, frustration and failure. The experience shows how their conventional approaches to problem-solving are not sustainable. We then introduce The Klapper Institute's scientific method. We begin to discuss how these new skills can be applied.

• **FY2.** Fiscal Year 2 begins on the morning of the second day. FY2 helps participants experience how optimizing department-level performance without building connections across the organization fails to deliver the desired result. Participants start to feel the impact of internal focus versus customer focus and realize how bureaucracy inhibits a quick response to changing market conditions. They discover how hierarchical decision-making contributes to slowed actions.

• **FY3.** During the second and final afternoon of the Lab, participants operate FY3 of NAVCorp and apply all of the knowledge, new skills and — most important — radically new perspective to make dramatic performance gains across all financial, operational and cultural measures. Employees now also recognize that change is inevitable and embrace it as an ongoing part of their professional life.

The Corporate Lab drives the ability to produce lasting change around the Q-Loop. The Lab absorbs the cultural norms of an organization, which lets participants view familiar information through a very different lens. This new way of viewing their organization and themselves recalibrates their perspective and makes them open to change.

A Scientific Method for Achieving Your Mandate

It's time to learn the Results Triangle, which comprises three powerful steps designed for you to systematically and consistently deliver on the promises made to your customers. The three Ls of the Results Triangle are

Listen. Listen to both the customer and the business by interviewing customers and key stakeholders, analyzing past research and documents, assessing competitor positioning and mapping key processes.

Learn. Learning is the act of understanding the current operating environment, analyzing its performance, hypothesizing potential root causes, and conducting experiments to validate the hypotheses.

Launch. Launching initially begins with a series of rapid prototypes or pilots, followed by a carefully coordinated rollout and detailed monitoring.

Listen Phase Step 1: Listening to the Voice of the Customer

The customer must be considered at the start of all major change initiatives. Learning to listen to the cus-

tomer will help you identify the specific customer needs around which a product or business process will be designed or help you understand how customer needs relate to strategy development, growth, achieving operational excellence, or preparing for an IT implementation. Learning to listen to the voice of the customer will let you establish clear standards of performance based on actual customer input. It will also help you obtain a complete description of the factors that create customer satisfaction, including output requirements and service requirements.

I have been associated with organizations that have spent millions of dollars and many months surveying their customers. I take a radically different approach. I call my survey strategy the Rule of 10^3. This means 10 questions conducted with 10 customers, prepared and launched in 10 hours. For the focused work you are performing, if you can ask the precisely targeted 10 questions to the right 10 customers, you will learn 90 percent of what you need to know.

Listen Phase Step 2: Listening to the Voice of the Business

Listening to the voice of the business means generating a deep and thorough understanding of how the business is performing today. You should determine who should attend strategic planning sessions (six to eight people usually works best, and these should all be key decision makers).

Be careful, because everyone will want to attend, but contributing to strategic planning is different from merely attending the meetings.

Learn Phase Step 1: Hypothesizing the Root Cause of the Problem

Asking "why" in the right way leads to new insights and innovations that can yield elegant and powerful solutions. Repeatedly asking why, as a child might, is a source of continuous self-renewal. But asking why properly is an art.

I do not doubt that you and many of your colleagues are excellent problem solvers who generate solutions daily. But if you tend to solve the same issues repeatedly, you are not getting to the true root cause.

Brainstorming is an effective way to generate ideas to solve problems, make decisions and explore improvements. In true brainstorming, it is essential that you do not interrupt the thought process. It is a creative, free-thinking activity. As ideas come to mind, they are captured without bias on a flip chart or by some other recording device.

Learn Phase Step 2: Experimenting to Validate the Hypothesis

Now it's time to validate the hypothesis you developed for the root cause. Experiments are only effective if they deliver significant learning to the company. Although companies can save money by lumping experiments into one large test, experimenting frequently minimizes problem-solving delays and the cost of redesign. Given that new technologies drastically reduce the cost of testing, the need for frequent experimentation becomes more vital. But companies must be prepared to handle the increased load of information that comes with greater experimentation.

Launch Phase Step 1: Building a Pilot

It might seem counterintuitive, but to achieve your mandate, it's imperative that you build a pilot that's rough, rapid and right. In other words, it's not meant to be a finished product.

Depending on your mandate, there are several types of pilots that can be mixed and matched as needed.

Offline. This is not performed on actual customers or services but simulated by using old customer information to minimize any potential disruption in business.

Limited duration. Depending on the pilot, these can be run for a week, month or quarter, but they have well-defined stop and start dates.

Segmented customers or products. This provides scope to make the pilot more manageable by operating in one customer segment. Remember, you are after confirmation that the pilot is effective, not yet financial results.

Limited locations. Designed to make the pilot more manageable, this type selects one office, region or sales territory.

Once you run a successful pilot, your next step is implementation in the form of a broader rollout.

Launch Phase Step 2: Implementing Across the Organization

Cited as the number-one reason for CEOs failing, final implementation is possibly the hardest part of the entire Q-Loop. Certainly, it's the most important job for senior management, and it's the hardest discipline to achieve throughout an organization.

It's critical to know why 75 to 85 percent of implementation efforts fail. The most widely cited reasons are lack of top management commitment and lack of proper commitment of time and resources.

For successful implementation, there must be two components: dynamic leadership and an effective plan.

Launch Phase Step 3: Measuring, Monitoring and Providing Ongoing Feedback

Now that the groundbreaking ideas are approved and the team of heroes can finally exhale, you need to embark on the real beginning of hard work. The beginning, you ask? Yes, the beginning. This is where you translate all the ideas into action.

The trouble is that when it comes to successful implementation, execution tactics are just as critical as strategy. Detailed planning involves breaking work down into smaller parts.

I've found that achieving strategic planning and management goals requires an actionable plan that considers the people required to bring the plan to fruition. Sounds simple enough. Yet in practice, both plan and people have challenges and uncertainties that must be carefully managed. An inherent lack of accountability in the planning process leads to problems and sometimes complete failures in execution.

Everyone is accountable for his individual tasks, which are required to achieve the overarching organizational goals; some people, including the CEO, may be accountable for reinforcing the tasks. ●

PART THREE: EXITING THE Q-LOOP

Ignite a Wildfire of Pull

Now the questions are, "How can you be sure not only that this change initiative takes root but that future initiatives run smoothly as well? And how can you make certain that the energy you triggered over the past month gets embedded into your organization's DNA?"

Here is where the executive management team needs to take ownership of the process and be the true leaders they were charged with being. Too often, organizations set the strategic direction for the change, and then the leaders remain remote, leaving the actual change to less motivated people. It's a cause for defeat.

It's time to eradicate all detrimental attitudes and actions and replace them with the following four key strategies to ignite a wildfire throughout your organization for all future change initiatives:

• **Create and sustain real energy.** As soon as possible, create a new team and a new mandate. Use members of the previous team as advocates to promote the experience. Set clearly defined and well-communicated goals for the next 36 months. A principal reason that so many change programs collapse is that management fails to quickly move from talking to action. Focus on both quantitative performance and corporate health. And as you build your teams, identify key influencers at all levels, and bring them on board for specific initiatives.

• **Communicate goals and successes compellingly.** By demonstrating success, you encourage other areas of your organization to quickly embrace the approach. While the iron is hot, do everything you can to help the organization roll out the pilot and then quickly commence another high-profile project — or several simultaneously. Share as much information with colleagues as is appropriate during a project. Communicate the positive stuff in a tweet, a blog or by e-mail. Make sure senior managers live the change they want to see in the organization.

• **Raise employees' expectation.** Individuals in organizations, to embrace change, must also engage in a process that reshapes how they think about themselves, not just about their jobs. Change needs to become part of your organization's culture. The surrounding structures must be in tune with these new behaviors. Employees must be given the skills and support to do what's required of them. And they must see people they respect modeling it every day.

• **Ensure that transformation is an ongoing effort.** Transformation is a perpetual process, and it involves all members of your organization. Change is a constant. A one-off program doesn't address the need for the long-term change.

Greatness comes to the bold. Be bold. So many of my clients have been and continue to be, and it has served them well. When someone writes a book many decades from now about organizations that have weathered the years by remaining nimble, will you be on the list? Will you have left your competitors in the dust? Will you have achieved the ability to produce lasting change?

Now it's up to you. ●

RECOMMENDED READING LIST

If you liked *The Q-Loop*, you'll also like:

1. ***The 4 Disciplines of Execution* by Chris McChesney, Sean Covey and Jim Huling.** Battle the whirlwind of urgent activity required to keep things running by learning the four disciplines that make execution repeatable.
2. ***Changeology* by John C. Norcross, Ph.D.** Change is hard, but not if you know the five-step formula that Norcross provides. Backed by cutting-edge research, this process can make change permanent.
3. ***Adaptability* by Max McKeown.** McKeown draws on millions of years of evolution to create a practical, strategic set of rules that will make adaptation a part of your company's DNA.

Globalization In the Digital Age
Page 8

THE SUMMARY IN BRIEF

We live in an increasingly global world. Hollywood producers have to care about whether a movie will be a box office success in the United States and overseas. The CEO of Black & Decker has to care about the actions of its foreign competitors, Makita and Bosch.

Globalization is no longer an option; it is a strategic imperative for all but the smallest corporations. To stay competitive in the worldwide marketplace, business executives must lead their companies in developing and sustaining efforts to globalize their organizations. This is as true for firms in industries such as cement, construction and health care as it is for firms in industries such as semiconductors, television and automobiles. This summary offers the actions and mindset you'll need to emerge as a winner in your battle for global dominance.

What You'll Learn In This Summary

- **There are market opportunities worldwide.** To grab them, you must identify key markets and establish a strong presence in them.
- **Global presence isn't enough.** Turning a global presence into a global competitive advantage requires identifying and developing the opportunities for value creation that your global presence offers.
- **A global mindset is crucial for success.** Cultural and geographic diversity are a challenge as well as an opportunity. Develop a global mindset, and you will be able to adopt successful practices and good ideas at home and across borders.
- **The rules of the global game are being reinvented.** To reinvent your own rules, you must rethink the answers to the classic business model questions: Who are our target customers? What value do we want to deliver to these customers? How will we create this value?

THE QUEST FOR GLOBAL DOMINANCE

by Vijay Govindarajan and Anil K. Gupta

— THE *COMPLETE* SUMMARY

What is Globalization?

Globalization refers to growing economic interdependence among countries as reflected in increasing cross-border flows of goods and services, capital and know-how. The world really is becoming more global. But not all countries, industries and companies are becoming globally integrated at the same rate.

At the country level, globalization refers to the extent of the interlinkages between a country and the rest of the world. Historical and political reasons have caused some countries, such as Cuba, to remain relatively isolated while other countries, such as China and India, have made great strides toward global integration.

At the industry level, globalization refers to the degree to which, within the industry, a company's competitive position in one country is interdependent with its competitive position in another country. The greater the degree of interdependence, the greater will be the extent to which the industry is dominated by the same set of global players who face each other in almost every market. For example, the global wireless industry is dominated by Nokia, Motorola and Ericsson and the soft drink industry by Coca-Cola, Pepsi-Cola and Cadbury-Schweppes.

What is a Global Company?

A global company can be viewed along four dimensions: globalization of market presence, globalization of supply chain, globalization of capital base and globalization of corporate mindset. Globalization of market presence is the extent to which a company is targeting customers in all major markets for its industry. Globalization of supply chain is the extent to which a company is accessing the most beneficial locations worldwide for meeting its supply chain needs. Globalization of capital base is the extent to which the company is tapping into optimal sources of capital worldwide. Finally, globalization of corporate mindset occurs when a corporation understands global diversity and embraces it.

Four Essential Tasks for Global Dominance

Companies that want to become globally dominant players within their industries must:

- Lead their industry in identifying market opportunities worldwide and pursue these opportunities by building a presence in those key markets.
- Work relentlessly to convert global presence into global competitive advantage and identify and exploit value creation opportunities.
- Cultivate a global mind set, view cultural and geographic diversity as opportunities to exploit, and be prepared to adopt successful practices and good ideas wherever they originate.
- Constantly strive to reinvent the rules of the global game.

Build a Global Presence

There are six issues companies making the journey from local to global company must confront: choice of product; choice of strategic market; mode of entry; transplanting corporate DNA; winning the local battle; and speed of global expansion.

Choice of Product

If your company produces multiple products, your first decision will be whether to introduce all or some to the global market. Introducing all products at the same time carries a large risk. You must identify those products, business units, or lines of business that are good candidates. Evaluate each project along two lines:

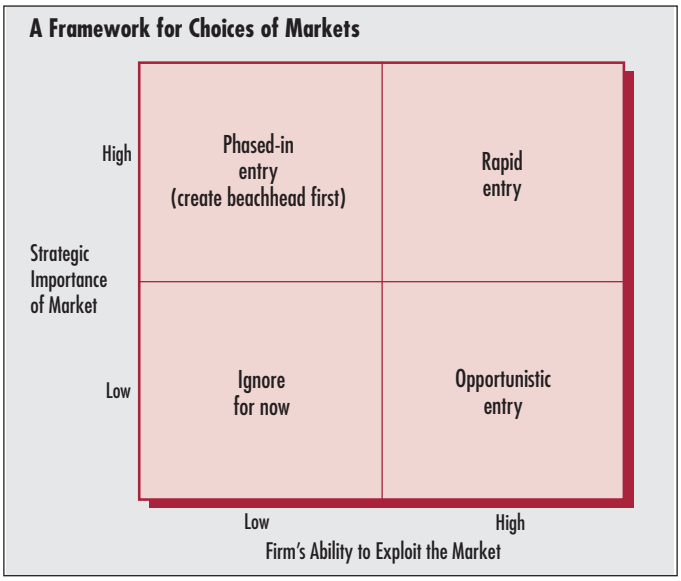
Build a Global Presence

(continued from page 2)

potential return (expected payoff) and potential risk (required degree of local adaptation.) The greater the need for adaptation to the new market, the less likely it can be exported. Pick a product or service that has high potential return and requires the least amount of reconfiguration.



Choice of Strategic Market

You could pursue opportunities in an ad hoc, random fashion, but a systematic and logical framework is preferable. Major considerations are the strategic importance of that market and your company's ability to exploit that market. If you find that one market has high strategic value and that you have the ability to exploit it, rapid entry is called for. If the market is of high strategic value but you have limited ability to enter it, consider establishing a beachhead first.

Mode of Entry

Once you have selected a country to enter and decided which products will be part of the launch, you must determine the appropriate mode of entry. Will you export products into the market, or will you set up local production? Will you use a combination of exports and local production? Will you export components for local assembly? Will you retain ownership and license or franchise your product or service, or will you acquire or grow a locally owned operation? You may also have to consider other partial ownership options such as joint ventures or affiliates. These factors dictate your choice:

- **The larger the market, the more likely that you will achieve efficiencies of scale by operating locally.** This minimizes tariff and transportation costs.
- **Sometimes shipping and tariff costs are too great.** Local production is then the answer.
- **Products that have to be greatly customized should be locally produced.**
- **The more dissimilar and unfamiliar the target market is to your current market, the more likely you will have to rely on a local partner or an acquisition.**
- **Watch out for a partner's ability to learn from you how to run the business while you don't learn from it how to operate in the market.** If your partner learns faster, he has an incentive to break ties and go it alone. He can, in effect, become your biggest competitor.
- **If you lack sufficient capital to go it alone, you have no choice but to find a partner.**
- **If government regulations require local equity participation, you also may have no choice but to go the partnership route.**

- **You must also decide whether you will set up production as a green field or make an acquisition.** Starting from scratch the green field way has the advantage of allowing you to take with you your corporate culture and management style. It also carries the risk that your entry will be delayed while you gear up.

Transplanting Corporate DNA

As you enter the new market, you will have to transplant the core elements of your business model, its core practices and beliefs — in short, its DNA. This is no easy task.

Consider what happened when Walt Disney opened its Euro Disney theme park near Paris in the early 1990s. The Disney dress code includes a ban on facial hair and colored stockings, and requires the use of appropriate undergarments. The French did not take kindly to being told how to dress, and hiring employees proved very difficult.

Transplanting core beliefs to a company you have acquired requires that a group of true believers in the company be transplanted so that the new beliefs can take root. This group must retrain and expose all workers and managers to the company's beliefs. Imbedding will take time.

When the Ritz-Carlton chain opened in Shanghai, the company had to embed its beliefs in its new subsidiary. The company believed the hotel needed significant upgrading if it were to reflect the company's core beliefs about what a hotel is and how it should be run. To that end, it brought in 40 expatriates from other units in Asia and around the world. What it did the first week worked magic to embed the company's standards of quality and service in the minds and hearts of employees. The renovation process for the hotel began with the employees' entrance and work areas. This served to sig-

(continued on page 4)

Build a Global Presence

(continued from page 3)

nal two radical changes; that standards were to be radically higher and that employees were valued. By renovating worker space first, the company reinforced the company belief that "We are Ladies and Gentlemen serving Ladies and Gentlemen."

Winning the Local Battle

Winning the local battle requires the global enterprise to anticipate, shape and respond to the needs and actions of three sets of players in the host country; its customers, its competitors, and the host country government.

Host country customers. Winning host country customers is easiest if the foreign market is similar to the one in the home market. But that is seldom the case. Consider what happened when Nike thought it could transplant its marketing approach to Europe. In the United States, Nike had become a huge success by projecting the image of an irreverent rebel who glorified the lowly sneaker, worshipped athletes, and rebelled against the establishment. Nike took that approach in Europe, running commercials featuring a French bad boy saying that he had won a Nike contract by insulting his coach. That did not play well in tradition-bound Europe.

Host country competitors. Expect retaliation from local competition. Remember, local competitors have an advantage — they know the local market. You have four possible defenses: acquire the competition, acquire a weak player and gain local advantage, enter a poorly defended niche, or stage a frontal attack. This last approach was taken by Lexus when it entered the United States market. It took on Mercedes and BMW, knowing they were constrained by high labor costs in Germany.

Host country government. In emerging markets, local government are often a key external stakeholder. Local government cannot be ignored. Companies must anticipate the regulatory climate and even explore helping shape it.

Speed of Global Expansion

When a company is building a global presence, it has to decide how fast it should expand globally. A rapid expansion is more appropriate if it is easy for competitors to replicate your recipe for success. Fast food companies expand quickly to arrive on the local market before local competitors copy their business models. The ability of management to manage global operations is another important consideration. ■

The Imperatives to Globalize

Five imperatives drive any firm to pursue global expansion, but each firm feels the imperatives differently. These are:

✓ **The growth imperative.** For many companies, developed country markets are mature, compelling them to look to emerging markets for fresh opportunities. For example, annual paper consumption per capita is about 600 pounds in North America, but 30 pounds in China and India. Were consumption to increase by just one pound per capita, the increase could keep five state-of-the-art paper mills running at peak capacity.

✓ **The efficiency imperative.** Whenever there are one or more activities in your value chain where the minimum efficient scale exceeds the sales volume feasible within one company, a global player has a cost advantage over a domestic one. By producing at peak efficiency and selling in more than one market, you can cut cost and beat the competition.

✓ **The knowledge imperative.** No two countries are completely alike. Companies must adapt products or services to dissimilar environments, which requires local know-how. In turn, these adaptations may benefit the company at home and abroad. For example, GE India developed a CT scanner that was simpler, easier to transport, and cheaper for the Indian market and can now use that technology in other markets.

✓ **Globalization of customers.** When domestic customers start to globalize, firms must keep pace with them. Executives who travel overseas, for example, come to expect the same level of service away from home as at home.

✓ **Globalization of competitors.** If your competition globalizes, and you don't, you become vulnerable to a two prong attack. First, the competition gets a first-mover advantage in a new market, and second, they can use a multi-market presence to cross-subsidize and wage a more intense attack back home.

Exploit Your Global Presence

In the early 1990s, PepsiCo established an ambitious goal to triple its international soft drink revenues. By the mid 1990s it had built an extensive global presence. The expansion did not, however, translate into growth and profitability. By 1997, the company withdrew from some major markets, including South Africa, and had to take a nearly $1 billion loss from international beverage operations. PepsiCo's international market share and revenues were actually shrinking, while Coca-Cola was growing. Securing a global presence isn't synonymous with possessing global competitive advantage.

(continued on page 5)

Exploit Your Global Presence

(continued from page 4)

Transforming global presence into solid competitive advantage requires systematic analysis, purposeful thinking and careful orchestration. Without a disciplined approach, global presence can easily degenerate into a liability that winds up distracting management and wasting resources. Worse yet, the end result can be a loss of competitive advantage in the domestic market.

To convert your company's global presence into global competitive advantage, you must pursue six value creation opportunities. You must:

● **Adapt to local market differences.** Differences in language, culture, income levels, customer preferences and distribution systems need to be considered. McDonald's adapts its menu to regional differences with lamb-patties in India and teriyaki burgers in Tokyo. *Business Week* produces different editions for the North American, Asian, and European markets. Be careful that your efforts to adapt to local tastes don't backfire, though. When TGI Friday's opened in Korea, the restaurant offered traditional local dishes like kimchi on the menu. Customers responded negatively, and surveys revealed that they had expected a visit to TGI Friday's to be "a visit to America."

McDonald's adapts its menu to regional differences with lamb-patties in India and teriyaki burgers in Tokyo.

● **Exploit economies of global scale.** As you build a global presence, you must convert the larger scale you will be working with (i.e. larger revenues and asset bases) into economies of scale. You may be able to do this through spreading fixed costs, reducing capital and operating costs, and pooling purchasing power.

● **Exploit economies of global scope.** Global scope refers to the multiplicity of regions in which a company markets. When a company finds it needs to provide similar goods or services across many regions, it can reap rich rewards. For example, McDonald's needs to provide identical catchup and mustard packets to its operation in every market. By using a single global supplier, it can reduce costs significantly over using multiple local sources, and can guarantee consistency.

● **Tap the optimal locations for activities and resources.** When expanding into global markets, your company may need to make location decisions based on factors like the availability of local talent. For example, when Microsoft sought to establish a corporate research unit in England, it located near Oxford and Cambridge universities. Significant cost reductions can occur if a company sets up shop where labor is inexpensive. Texas Instruments took this approach when it set up a software development unit in India.

Building World-Class Competencies

Once you have chosen the locations at which a particular activity will be performed, the next step is to build competencies at those locations. Many countries with lower wage rates also suffer from lower levels of productivity. Smart companies aren't prisoners of such statistics. Instead, they cultivate competencies in their work forces. This can be done successfully in locations where:

- ✓ **despite relative poverty, there is a large pool of highly educated workers such as in India, China and the Philippines;**
- ✓ **high unemployment levels mean a talented and motivated pool of workers;**
- ✓ **the company is starting from scratch, and can train workers.**

● **Maximize knowledge transfer across locations.** Every global company has what amounts to a portfolio of knowledge centers. After all, global companies develop unique knowledge as they exploit the resource and market opportunities of the local environment. This specialized knowledge pool can be leveraged to yield strategic benefits to the entire global enterprise. For example, Proctor & Gamble developed Liquid Tide using knowledge from operations in Cincinnati (ingredients to help suspend dirt in washwater), Japan (cleaning agents), and Brussels operations (ingredients that fight mineral salts in hard water).

● **Play the global chess game.** In the global competition between Kodak and Fuji, and Coke and Pepsi, each side can adopt one of two approaches: view it as a war and slug it out on a country by country basis, or view it as a chess game, attacking through coordinated action of all available resources. If you choose chess, one goal is to weaken the competitor in its current strongholds. For example, Fuji took on Kodak in its home market by aggressively cutting the price of multi-packs of film by as much as 50 percent and gained substantial market share. Another chess move involves preempting a competitor from building a strong presence in future strategic markets. ■

For another example of leveraging knowledge, go to: http://my.summary.com

Cultivate a Global Mindset

A person's mindset represents a theory of what the world is like and is the result of that person's efforts to make sense of the complex, changing and ambiguous information we are exposed to. To complicate matters, one's mindset tends to filter new information so that only that which is consistent with our existing beliefs reaches us.

For example, Kenneth Olsen was founder and CEO of Digital Equipment Corporation. In the mid-1970s DEC was the world's second-largest computer market and the market leader in the minicomputer segment. In 1977, Olsen observed that, "There is no reason for any individuals to have a computer in their home." That mindset resulted in his company's late entry into the personal computer market. It never recovered its footing, and by the mid 1990s it ceased to be an independent company. It was acquired by rival Compaq.

Just as individuals have mindsets, so do organizations. An organization's mindset is an aggregated mindset of individuals adjusted for the distribution of power and mutual influence among the group. Unless the CEO is extremely powerful, a company's mindset is far more than a carbon copy of the CEO's.

Organizational mindset can be changed. This happens when there is a change in the relative power of individuals who are in decision-making positions, a change in the way members of the organization interact, and a change in the mindset of those arriving from that of those leaving the organization.

What does it mean to say that an organization has a global mindset? Chiefly, it means that the organization is open to and aware of diversity across cultures and markets and can work with that diversity while, when necessary, challenging assumptions based on that diversity. For example, a manager with a global mindset can understand the role of unions in Italy or Spain while challenging the assumption that, "You can't do that in Italy or Spain because of the unions."

The ability to deeply understand diversity and yet challenge preconceived notions is illustrated by a U.S.-based household accessories company, Home Decor (not its real name.) Founded barely four years ago, the company is one of the fastest-growing manufacturers of household accessories, with a five-star customer base that includes some of the biggest and most prestigious retail chains in the United States. According to the CEO, who is an immigrant from China, the company's strategy is to combine Chinese costs with Japanese quality, European design and American marketing. The company understands that there are Chinese competitors, but they don't concentrate on quality, and that there are American companies with excellent product quality, but high cost. Home Decor has a mindset that lets it embrace diverse standards, and synthesize a business that capitalizes on the strengths while minimizing the weaknesses.

Building A Global Knowledge Machine

Whenever a company extends its presence across borders, it is confronted with diversity. Companies that view that diversity as an opportunity to create value for customers and shareholders have a powerful resource on their hands. The process of adapting products to each location forces each subsidiary to engage in at least some local innovation. Every such innovation represents the creation of new knowledge.

In a world in which the half-life of new knowledge is becoming ever shorter, an effective knowledge machine must excel at two central tasks: creating and acquiring new knowledge; and sharing and mobilizing this knowledge throughout the global network. How do you get people to continually come up with new and novel ideas? Try these:

✓ **Set stretch goals.** The easier the target, the less the need for new approaches. You need to set goals that are hard to achieve and require new thinking.

✓ **Provide high-powered incentives.** Stretch goals increase personal risk of failure. Unless the potential reward matches the higher level of risk, it would be irrational for smart people to stay with the company.

✓ **Cultivate empowerment and slack.** Stretch goals and high-powered incentives stimulate a demand for new ideas. In contrast, empowerment and slack are supply-side tools that play a critical role in increasing creative output. At 3M, for example, scientists are expected to spend 15 percent of their working time on projects of their own choosing.

✓ **Cultivate a market for ideas within the company.** Create a culture where an idea rejected by an immediate supervisor can still be shopped around.

✓ **Ban knowledge hoarding and turn knowledge givers into heroes.** You want good ideas to spread.

✓ **Rely on group-based incentives.** These reinforce the idea that knowledge should be shared.

✓ **Invest in codification of tacit knowledge. Write it down.**

✓ **Match transmission mechanisms to type of knowledge.** Some things are best transferred in writing or electronically, while other kinds of knowledge should be directly passed from person to person.

(continued on page 7)

Challenged in Knowledge Creation and Mobilization

Identifying and using intellectual property is often hampered by complacency, employees with low decision-making discretion, and the lack of support for innovative ideas by management. Knowledge acquisition is often hampered by failure to be an early mover and the inability to integrate external knowledge. Knowledge retention is hampered by employee turnover and leak of proprietary information to the competition. Other factors preventing use of intellectual property include the "How does it help me?" "Not invented here" and "Knowledge is power" syndromes.

Cultivate a Global Mindset

(continued from page 6)

IKEA's Learning Curve

When IKEA first tried to enter the United States market, it showed that it didn't yet have the right global mindset. Swedes constitute almost the entire top management team of the company, and fluency in Swedish was considered essential at the senior level. And when the company attempted to enter the United States, it replicated the traditional Swedish concepts that had made it a success in Scandinavia, without regard to differences in the target market. For example, it didn't offer home delivery, it opened Swedish style cafeterias in the stores, and it sold beds that needed Swedish sheets rather than sheets made to fit United States standard sheets. In short, IKEA saw the world through Swedish filters.

The company reexamined its U.S. operations, and began to understand that the needs and buying behaviors of American customers were different. It took time before the company was able to adapt the advantages its products offered to the needs of American consumers.

Advantages of a Global Mindset

A global mindset will allow the company to outpace its rivals in assessing market opportunities, and to convert its presence across multiple markets into global competitive advantage. It will be able to combine speed with accurate response. It will have an early mover advantage in identifying emerging opportunities, will experience faster roll-out of new product concepts and technologies, and rapidly and efficiently share its best practices across subsidiaries.

Cultivating a Global Mindset

The quest for a global mindset is a ceaseless journey. But four qualities will help. These are:

- **Curiosity about the world and a commitment to understanding how it works.**
- **An explicit and self-conscious articulation of the current mindset.**
- **Exposure to diversity and novelty.**
- **A disciplined attempt to integrate what you learn about cultures and markets.** ■

For another example of a company with a global mindset, go to: http://my.summary.com

Change the Rules Of the Global Game

Prior to 1995, most books were bought in bookstores or from printed catalogs. Then Amazon.com began offering books for sale on its web site. By mid-2000, over 20 million customers worldwide were buying books, CDs and other goods worth more than $2.5 billion annually from Amazon.com via the Internet. The retailer provides 24-hour-a-day convenience, global reach and a wider and deeper product mix than any conventional bookseller, while boasting lower prices and better customer service. Amazon.com illustrates that competitive advantage isn't just a function of how well a company plays by existing rules, but also of how well if can radically change those rules.

A Framework for Creativity

Transforming the game is fundamentally a creative undertaking that cannot result purely from a deliberate and purposeful process. Neither is it strictly a function of luck, accident or opportunism. In fact, it is possible to use an explicit and systematic framework to guide the creative process.

First, identify your current business model. A company's business model is typically created by answering three questions: Who are our target customers? What value do we want to deliver to these customers? How will we create that customer value? To radically change that business model, redesign the end-to-end value chain architecture to be more efficient, reinvent what value the customer receives, or redefine the customer base. Changing any of the three will radically change the other two. What you will be doing is essentially converting one internally consistent business model into another internally consistent business model.

Dell's New Business Model

Dell Computers went through a radical redesign when its founder, Michael Dell, looked at the old way of producing, selling and delivering personal computers. The traditional way was to build-to-stock. Computer makers

(continued on page 8)

Change the Rules of the Global Game

(continued from page 7)

would build the kind of computers they thought customers wanted, send them to warehouses, and distribute them to resellers and retailers, who then sold them to customers.

Dell's redesign worked like this: outsource all component manufacturing, and assemble the units in-house as customers placed orders directly with the company. Dell takes order over the phone or via the Internet. It works. Customers order directly because they don't need the hand-holding they did early in the computer revolution. Dell buys only those components it needs to assemble computers that have been ordered and doesn't have to pay a reseller. And there are no outdated, unwanted computers sitting in warehouses losing value.

Reinventing Customer Value

If you choose to reinvent customer value, consider making the move from selling discrete products to selling an integrated system of products and services. Be aware that customers may be reluctant to make you their sole source for products and services for fear that you will exploit your position. Therefore, be sure that your total product or service system includes only products that are best in class, that the system you design is really superior to getting the goods or services from multiple sources, and offer the bundle at lower cost than it would cost to get the items or services from separate providers.

Reinventing Your Customer Base

If you choose to redefine your customer base, be sure that there are real benefits to doing so. To work, the customer segment you discover must be so large as to result in dramatic enlargement of the entire industry's customer base. Examples include Apple Computers, which redefined the computer market to include every man, woman and child in the world, and Canon, which redefined the copier market to include individuals and small businesses.

Here's what happens when you redefine the customer: The new segment changes the value potential of the entire industry. Then the solutions companies design for the new segment begin to substitute for the historical solutions of the original segment. The real breakthrough occurs when the company dominating the new segment then leverages that dominance to use in a direct attack on the incumbent players in the original segment. ■

Reinventing Customer Value

Want to reinvent customer value? Here are some ideas to get you started:

✓ Move from selling software and hardware to supplying total business solutions.

✓ Go from selling insurance, banking, mortgages, or mutual funds to providing financial security and freedom by integrating financial products and services.

✓ Go from selling packaging material to supplying total packaging systems.

Globalization in the Digital Age

The emergence of the digital era has done more to bridge distance than any other development in the last few decades. Innovations include computers and the Internet, point and click interfaces, broadband connections, mobile communication, speech recognition, and wireless data transfer. Digital technologies are making the world highly connected. As a result, within the next five years, every company will likely be an Internet company or it won't be a company at all.

Globalization Imperatives for Newly Formed Netcentric Firms

For newly formed Netcentric companies, the pressures to globalize at Internet speed are enormous. The basic concepts behind business models pioneered by Yahoo!, e-Bay and Amazon.com, and the value propositions they offer, are globally applicable. The problem, of course, is that if these companies don't go global right away, someone else will take their concepts. The opportunity cost of delay is potentially very high. But for new companies, expanding rapidly has dangers.

Netcentric companies will have to resolve the dilemma. In most cases, it boils down to how early in its life should the company go abroad and how rapidly should that deployment happen. It can take one of four approaches: go global from the beginning, preemptively go global as quickly as possible, acquire potential competition overseas, or adopt a slow globalization strategy. The choice depends largely on the cross-border scalability of the enterprise's business model.

One Netcentric company that found its business model wasn't scalable was Internet retailer Boo.com. A well-funded venture, it intended to sell fashionable sportswear worldwide. It launched in November 1999 in 18 countries. Four months later it added 13 additional countries (and currencies, languages and fulfillment infrastructure.) It proved to be too much too fast. Two months later and well before its first anniversary, it was liquidated. Others have fared better, usually by going global at a less rapid pace. ■

The Reinventors

How Extraordinary Companies Pursue Radical Continuous Change

by Jason Jennings

THE SUMMARY IN BRIEF

For most businesses, success is fleeting. There are only two real choices: stick with the status quo until things inevitably decline, or continuously change to stay vital. But how?

Best-selling leadership and management guru Jason Jennings and his researchers screened 22,000 companies around the world that had been cited as great examples of reinvention. They selected the best, verified their success, interviewed their leaders, and learned how they pursue never-ending radical change. The fresh insights they discovered became Jennings's "reinvention rules" for any business. The featured companies include, among others: Starbucks — which turned itself around by making tons of small bets on new ideas (fresher store designs, better food products and free Wi-Fi were a few of the results); and Arrow Electronics — which found success by solving problems that drove its customers crazy and has become a $20 billion electronics giant by shifting its focus from selling commodities to custom tailoring solutions.

If you're ready to toss same old, same old out the door, *The Reinventors* will become your road map to successfully pursuing continuous change. It will help your company stay relevant for years to come.

IN THIS SUMMARY, YOU WILL LEARN:

- What constant change means and how to implement it into your business.
- What the Reinvention killers are.
- How small bets can lead to big payoffs.
- Who the best people are to have on your reinvention team.
- The benefits of being frugal.

Introduction

Your job as you know it and your business as it is currently run will eventually change. The only chance any of us have for prosperity is to constantly reimagine, rethink and reinvent everything we do and how we do it in order to remain relevant. We must all become reinventors, and we'd better do it quickly.

Compare the list of the top 25 companies in the Fortune 500 in the year 2000 and the year 2010. The results are shocking. Sixteen of the top 25 companies fell off their lofty perches in the span of only 10 years. That's almost two-thirds!

Dig a little deeper and you'll find that since the Fortune 500 list was first published in 1955, more than 90 percent of the companies on it have been mopped up by smaller rivals, gone bankrupt, shrunk so small that they have become inconsequential or simply closed their doors. Certainly these thriving organizations had the intellectual and financial resources to ensure their continued success, yet all of these companies failed to constantly evolve, change, grow and reinvent themselves, and eventually they were kicked to the curb.

Today a combination of stagnant Western markets, former third world nations embracing technology and becoming manufacturing powerhouses with middle classes larger than that of the U.S., technology that makes everything increasingly transparent and customers who believe that they can get exactly what they want when they want it at a price they're willing to pay all add up to a game-changing business environment. Anyone who thinks that they'll get a free pass and that they don't have to constantly reinvent their business has their head in the sand. ●

Constant Change and Growth

Buried in the hopes of workers are two mammoth problems with huge consequences for the owners and leaders of businesses of every size and that speak directly to the need for constant radical change and reinvention:

• If a business isn't growing, the people who want to make more money and have more responsibility won't get what they want when they want it, and they'll find a reason to leave and pursue better opportunities elsewhere.

• Unless a business is constantly undergoing radical change, it will never be able to stay ahead of its customers' constantly changing wants and needs, and its growth will first falter and then completely stop.

Two of the primary responsibilities of a business leader are to keep a highly motivated team of people together and to make certain the team stays ahead of a growing base of customers who have constantly changing wants and needs. Everything else can be managed.

There's *never* been a business that has reached a desired level of revenues or profits and then remained static or stayed at the same level for any significant length of time.

Every business must be constantly and quickly changing, growing and moving forward or they'll eventually find themselves in a downward spiral that will ultimately result in their demise. Stalled companies historically lose almost 75 percent of their market value and often see their CEO and senior team kicked to the curb. Their replacements get saddled with long odds against them. Not even one out of two stalled companies find their way back to a healthy (4 percent or more) top line growth.

Conventional Wisdom Won't Provide Continual Growth

Achieving and sustaining healthy growth is the biggest single challenge that every business will face during each day of its existence, because consistent growth simply isn't common, and profitable growth is even rarer. While studying companies around the globe, Bain and Company Research found that nine out of 10 businesses routinely fail to earn the cost of the capital invested in them. In fact, average annual growth in the 1990s was 1.4 percent and it was even less in the 2000s.

Building a Culture of Change and Growth

One of the most important decisions a leader will make is to determine what kind of culture the organization should have. Culture is defined as the shared attitudes, values, goals and practices of an organization; every group of people has a culture. Whether it's a small restaurant, a medium-sized office, or a multinational corporation with 100,000 employees, each group has a distinct culture — either the culture desired by the leadership and the one they constantly strive to spread throughout the organization or the one that exists by default. When a leader fails to provide the proper culture, one will still exist; it can best be described as one of every man for himself, each acting in his own best interests and to heck with the interests of the company.

If a leader truly wants to build a business committed to growth and change, then that message must become a vital part of the culture, and everyone must know it and practice it.

A Culture of Change and Growth Means a Better Tomorrow for Everyone

When a business is growing quickly, all the stakeholders — workers, leaders, customers, suppliers and investors — are happy and reap financial rewards. When a business isn't growing, those same stakeholders begin to suffer financially, imagine darker tomorrows looming on the horizon and eventually start looking elsewhere for better opportunities.

Workers: Unless a company is changing and growing, eventually wages get frozen, downsizing occurs, layoffs take place, and the company ends up with a disappointed, disillusioned and cynical workforce. Sooner or later the most promising and talented workers leave because they can't see a future that will allow them to achieve their full potential.

When a company is constantly changing and its revenues and profits are growing — assuming the ownership and leadership have learned the lessons that wealth must be shared with the people responsible for creating it — you'll likely find a happy and highly engaged workforce.

Customers: Customers, knowingly or not, seek an experience to accompany the product or service they're purchasing. The business that offers the best experience in that category wins.

When the money coming in the door isn't always increasing, there's no money to plow back into the business, which often signals the start of a downward spiral.

When a company is constantly changing, with revenues and profits being plowed back into the business to further improve the shopping and buying experience, you'll likely find engaged customers waiting for the next opportunity to spend money.

Vendors and Suppliers: When a company is growing, the vendors and suppliers with whom it does business are also able to grow and see a brighter future for themselves.

When a business stops growing, it frequently turns to treating vendors and suppliers poorly, constantly squeezing them on price in order to temporarily maintain its profit margins, delaying payments to momentarily bolster cash flow, and playing one supplier against another.

When a company is growing, it is more likely to acknowledge the importance of its vendors and suppliers and treat them fairly. In return, its suppliers frequently become trusted partners in uncovering new business opportunities.

Investors/Shareholders: If a company is publicly traded, then its shareholders demand either dividends or sufficient growth in the share price to justify their continued investment. If that doesn't happen, they lose interest and move on, looking for other places to invest their money.

When a company is changing and keeping the market on the edge of its seat wondering what's coming next, and when its revenues and profits are growing consistently, you'll generally find a happy group of investors and lenders fully prepared to help take the business to the next level. ●

Letting Go

Innovator Charles Kettering, the longtime head of research at General Motors and a prolific inventor, had warned his industry colleagues about getting caught in the trap of holding on to old ways. "An inventor is simply a fellow who doesn't take his education too seriously," he said. In other words, inventors are engineers who can let go of their expertness and achieve what

Apple's late CEO, Steve Jobs, called the "lightness of being a beginner again."

Before you can begin to embrace and implement continuous radical change and reinvention, you and/or your business have to let go of the reinvention killers that will destine your attempts for failure.

The Reinvention Killers

It's not possible to embrace change and reinvent a business until you're able to let go of the following eight reinvention killers:

Yesterday's Breadwinners. Every product or service has a natural life cycle that begins with an introduction, followed by growth, maturity and, inevitably, a decline as it becomes yesterday's breadwinner. There are no exceptions.

The bulk of revenues and profits of any service or product is generated during the growth and maturity phases. By the time it enters the phase of its natural decline, it should ideally have already been replaced with something more lucrative.

Ego. The ability of an organization to embrace radical change and reinvention is determined by the ego of the person in charge; substantive change is never initiated from the mid level or bottom ranks of an organization.

Keeping one's ego in check requires serious introspection, and answering the most intimate and revealing question anyone will ever ask themselves: "Is it all about you or are you truly doing what you do for the interests and greater good of the organization?"

Same Old, Same Old. "If it ain't broke, don't fix it" is a death knell for any organization hoping to change. The net effect of not challenging or changing anything until it's obviously broken is that a culture is created in which workers and managers become firefighters instead of proactive change agents. Any business that's constantly sending its managers to fix what's broken will become so preoccupied with temporarily fixing stuff in order to keep things the same that there will never be enough time for proactive reinvention.

Businesses that master the art of embracing radical change are quick to fix and change things before they're broken.

Conventional Wisdom. "Conventional wisdom" is a phrase used to describe ideas or explanations that have been generally accepted as truths based on the past. Using conventional wisdom to predict likely future results is an innovation killer, because none of the old metrics and rules hold up anymore.

If you possess an inquiring mind, then you've already got an advantage on this change killer. But if you don't, the only way to make certain it doesn't become a huge obstacle is to surround yourself with people who are prepared to constantly challenge the status quo.

Entitlement. Few things stand in the way of radical change and reinvention as much as a sense of entitlement. Entitlement is the misguided and arrogant belief shared by so many business owners and executives that their business has a right to continue to exist and do well simply by virtue of either being in business or having been successful at some point.

Greed. When the owners or leaders of a business are self-serving and greedy, treating the company as their own personal pocketbook, there's no chance for any significant change or reinvention to occur. When they talk about change or reinvention, it's only in the interest of tweaking things enough to keep things exactly the way they are for as long as possible, in order to fulfill their greed.

Short-timers. CEOs and senior leaders who are thinking about leaving a company have effectively already left. The biggest favor they can do the organization is to get out of the way and allow the business to change and grow. A shared human condition is the desire to leave an organization on an even keel, with everyone sharing fond memories. However, those desires are hardly the things that make risk taking, radical change, and reinvention possible as it puts change on the back burner.

Risk Averse. Some companies are averse to risk because they've actually seen so many of their peers fail. But it's irrational to be paralyzed by the fear of risk taking. Half of all new ideas fail because they don't get enough follow-up as they travel from off-site strategy sessions to everyday execution on the front lines. Leaders who troubleshoot their execution process and teach all managers how to get more follow-through can cut the odds of failure in half. ●

Kiss a Lot of Frogs

Each day, thousands of small and midsize companies make big, one-shot bets — and fail. We don't hear about most of them, just as we don't hear about people who lose the lottery; they aren't front-page news.

Businesses that do the best job of constant radical change and reinvention simply don't get blinded by the fairy tales of the biggest bets generating the biggest paydays. They realize that successful strategy is discovered by doing, and that doing has to be learned from making lots of small bets.

Starbucks Takes Small Steps to Get Big Rewards

When Howard Schultz stepped down as CEO of Starbucks in 2000, the company had enjoyed one of the most incredible runs of any global brand. Even though Schultz remained the company's chairman, the company's rapid expansion caused it to lose much of its brand's luster and soul. Then the recession hit. Customer traffic dropped precipitously, there was widespread employee dissatisfaction and many analysts who followed the company doubted the course could be corrected.

When Schultz retook the CEO reins in 2008, the first thing he did, he told the *Harvard Business Review*, "was admit to ourselves and the people within the company that we owned the mistakes we'd made." Next, in an effort to regain a sense of teamwork and re-establish the values within the organization, he took 10,000 Starbucks workers to New Orleans for a leadership conference. Additionally, Schultz closed 1,000 underperforming stores, eliminated 7,000 positions, revised the business plan downward to numbers they could hit, and embraced radical change and began making a dizzying series of small bets. Here are a few of the small bets placed by the company within the first 18 months of Schultz's return:

- New store design
- Wine and beer
- New products
- Mobile payments
- Big push in digital media
- Free Wi-Fi
- Via Ready Brew instant coffee
- New logo
- Starbucks Rewards card
- Starbucks Perfect Oatmeal
- Tea
- Doubling the number of stores in China
- Real-time monitors.

It's significant that the revenue generated by the large numbers of small bets Schultz made after retaking control of Starbucks is almost equal to the company's total annual profits.

How Many Small Bets Should You Make?

Every enterprise should be continually making as many small bets as can adequately be handled without disrupting the core business or putting it at risk. A small business with a handful of employees might be able to handle two or three concurrent small bets, while a large company with thousands of employees should probably be considering hundreds of potential small bets and implementing scores of them.

Make enough small bets that everyone knows they're being made and that doing so becomes a vital part of the culture of the organization. ●

Make Small Bets Smart Bets

SMART is an acronym to remember every time you make a small bet:

Specific. There is a detailed destination.

Measurable. Create a detailed roadmap with markers from the destination back to the starting point.

Accountable. Decide who is responsible at every checkpoint in the roadmap.

Resourced. Answer the tough questions: Is there enough time, money, and experience budgeted? Lack of one means you'll need more of the others.

Timed. Adhere to deadlines every step of the way so someone can track the follow-through.

Who Stays, Who Leads, Who Goes

In the past decade, there's been a change of epic proportions as most business owners and executives have come to understand that they don't stand a snowball's chance on a hot day of ever embracing change and growth without the right people who are focused and motivated every day at every level.

Buildings and plants don't matter, because anyone can build them; processes and efficiencies don't count, because they can be copied; and anything that any company makes, sells, or produces will eventually be done better, faster and cheaper by someone else.

Decisions about who goes and who stays, who leads and who follows will determine any enterprise's ability to embrace constant change, growth, and reinvention. Making the right decisions about people is a huge challenge. Dan DiMicco, CEO of Nucor Corporation, America's largest steel producer, says, "People aren't your most important resource — the right people are your only resource."

Who Stays (and Who Gets Hired)?

Companies committed to constant radical change and growth recruit and retain workers who exhibit the fol-

lowing six traits:

Basic smarts and eager lifelong learners. Make certain that potential workers possess not necessarily a formal education, but sufficient intelligence to play a role in an organization that's going to call for nonstop learning. And they have the ability to learn new things.

A good work ethic. Having a good work ethic means taking the initiative to get the job done, delivering as agreed without excuses or blame, being willing to make personal sacrifice for the good of the organization, and being loyal to the company and people with whom you work.

They truly like your company and want to climb some mountains. James Archer, founder, and Jorge Velarde, VP and CPO, of Multi-Chem, describe the culture of their company: "Our culture is about climbing a mountain," they say, pointing out that "any mountain climber will tell you it's not about reaching the top: it's about the journey, overcoming doubt, bravely going into the unknown. It's about accepting your constraints without letting them overcome your goals."

Optimistic. Companies that are committed to nonstop change and growth have no place for people who aren't able to imagine and see the possibility of better results tomorrow despite the problems and challenges of the moment. You need to look for people who are optimistic by nature instead of pessimistic.

Think like the owner. Charles Koch, the owner of Koch Industries, the world's largest privately held company, said, "You can't expect people to think and act like owners unless they understand how what they do creates economic value. And when people are taught how they not only create economic value, but that it's constantly measured and evaluated and that they stand to share in the profits, then thinking and acting like the owner becomes very easy."

They belong here. Steve Jobs frequently said, "Apple is an Ellis Island kind of company built on refugees from other companies. These are the extremely bright individual contributors who were troublemakers at other companies."

A workforce made up of people who share these traits will always be prepared for constant change and growth.

Who Leads?

The people chosen for leadership roles in companies committed to constant radical change and growth share all of the previous traits and the following five attributes:

Good leaders treat people well. "You've got to be good at treating people the way Nucor people deserve to be treated, how we want them to be treated and, most importantly how they want to be treated!" DiMicco insists.

Good leaders are good communicators. "Leaders need to be a coach, a mentor, a disciplinarian, a salesman; to lead their team so that they can accept change and take ownership," says DiMicco. Each of those jobs requires a good communicator.

They lead by example. Leading by example doesn't mean the manager is the best or first to do things, but it does mean that leaders who lead by example acknowledge what's really important and promote credibility, humility, accountability and fairness.

Build trust. Doing what you say, leading by example, showing consistency and fairness — these actions all build trust between managers and their teams over the long term. New managers often ask if there's something they can do that builds trust faster so they can get more buy-in and can hit the ground running. Here are four guiding principles for building the foundation of trust quickly:

- We trust those who speak our language.
- We trust those who ask good questions.
- We trust those who share our values.
- We trust those who listen.

Attract and keep talent. Good leadership is a virtuous cycle at Nucor, explains DiMicco. "As leaders and managers, we give our people the training, the tools, the resources and the opportunity … and then get the hell out of the way and let people succeed. Now that attracts talent, the kinds of people who want to be able to do great things, want to benefit from their own performance and the performance of their teams." ●

Forever Frugal

When companies haphazardly throw money at what they perceive their problems, challenges and opportunities to be, the real answers that could solve the real problems or allow them to embrace radical change and take advantage of the real opportunities are seldom found.

The Upside of Not Enough Money

Arrow Electronics is the quintessential example of thousands of interviews with successful entrepreneurs: "If you want to accomplish great things, what you need is a problem and not quite enough money." Arrow was once a very small business and is now a $22 billion

worldwide company that has constantly embraced radical reinvention and succeeded without a lot of cash.

The company began as a retailer with a single location. Realizing that their best opportunities existed in wholesale distribution, the leaders proved themselves adept time and again at letting go and discarding companies and business units that no longer fit the strategic direction of the firm. Arrow's reinvention efforts have been doubled under its current CEO, who promised that, going forward, the company will be involved in "everything that has an electrical part or component."

"Ours is a company that grew despite never having quite enough money," says Arrow CEO and chairman Mike Long. "If you can do the things that customers need done but that are giving them fits, and you scale that, you'll be very successful. We know that if it's complex, we can make money at it."

The Guiding Principle of Jugaad

Jugaad started as the Hindi word for an ultra-cheap vehicle first fashioned by rural Punjabi carpenters. Having nothing but empty pockets and a problem to solve, the local craftsmen took an old diesel irrigation pump, attached it to a wooden frame, and added wheels and the discarded steering system from a broken-down Jeep. They called this jalopy "jugaad," roughly translated as "using few resources and a lot of determination to find an innovative solution to a problem."

Since then, jugaad has come to symbolize the grassroots genius and entrepreneurial spirit of Indians working to overcome obstacle with creativity, urgency, and never enough money.

Indian businesspeople aren't the only ones to practice jugaad (think of the American phrase "Yankee ingenuity" or Sweden's principle of *lista*), but, as a culture, they have embraced this guiding principle with great gusto. Eighty-one percent of Indian businesspeople cite jugaad as the catalyst for their company's success.

Frugal Builds Teamwork

Every executive on the planet has thought it at some point: "If I only had more money, all my problems would disappear."

It's time to realize how wrong we sometimes are. Great companies that embrace radical change and enjoy constant growth find a new oath when solving problems and taking advantage of opportunities. They reject the urge to throw money at their challenges and discipline themselves to do more with less. They practice the Indian path of jugaad and discover that there's truth in the adage that all you need to accomplish great things is a problem and not nearly enough money.

Balancing the Ideas of Change and Reinvention

If the ability to function while holding two opposing ideas in your mind at the same time is the test of high intelligence, then embracing change and reinvention is the ultimate measure of business IQ. Here are eight opposing ideas that successful reinventors say you need to hold in your head:

1. Hold on tight and freely let go.
2. Be hard-nosed and soft-hearted.
3. Focus on a clear destination and search for new horizons.
4. Take big risks and make small bets.
5. Be frugal and still splurge.
6. Think big and act small.
7. Be highly creative and obsessively down-to-earth.
8. Thoughtfully work your plan and improvise without thinking too much.

Ask WTGBRFSTM: What's the Good Business Reason for Spending This Money?

One of the best frugal reinventors, Mel Haught, of Pella Corporation, teaches us to love dumb questions — good dumb questions, such as "Why do we do it that way?" that really clear away the hidden assumptions.

The best dumb question is one learned from two other frugal reinventors, Herb and Marion Sandler. The Sandlers built one of the most productive and innovative financial institutions by asking themselves and their managers over and over, "What's the good business reason for spending this money (WTGBRFSTM)?" The question made the Sandlers' company, World Savings, an icon of productivity. The business ran with half the staff of its nearest competitor, with each employee generating 40 percent more revenue than the industry average of $762,000 per associate, and it delivered double the average profit per employee. By doggedly asking WTGBRFSTM and demanding a good answer before making any expenditure, the Sandlers and their team achieved 20 percent average compound growth each year for 35 consecutive years.

When you examine all you've seen and lived through in business, the magic of asking WTGBRFSTM becomes very clear. How many times have you seen expenditures rationalized because "we did it last year"? ●

Don't Hesitate

Hesitation holds people and companies back from embracing change and reinvention. Until people are able to figure out how to deal with the natural tendency to hesitate and drag their feet because of their fear of the unknown, no meaningful reinvention will occur.

Why Do People Hesitate?

The most common mistake is for one to get stuck on the "plains of hesitation," a metaphorical place where the best laid plans and good intentions expire. Here are the nine most common reasons for hesitation:

We get too comfortable. There's no place in business for anyone who wants to be comfortable or complacent. If your desire to be comfortable is greater than your need to embrace change, it's probably time to call it a day.

We study things to death. Do you and your company have a set of guiding principles? Does everyone know them and use them to make all the decisions that must be made? Having a firmly entrenched set of guiding principles will allow you to skip the excessive studying and get over any hesitation you might have.

Lack of confidence. A lack of confidence exists in people and organizations that hear criticism, feel they're inferior, lack assertiveness, and/or strive for perfection. Confidence comes from winning, and winning only happens when you set your hesitation aside and get in the game.

We think the big deal will fly in the window. People and companies who embrace change and reinvention aren't held hostage by the hesitation that comes with waiting for the next big deal. They know their odds of being the beneficiary of the occasional big deal are greatly increased by doing loads of small deals, learning from each, and constantly incrementally increasing their business.

We think it's already too late. Author Harry Bernstein takes the cake for believing it's never too late to start. He published a short story when he was in his early twenties, but it wasn't until his wife of 67 years passed away that he began penning *The Invisible Wall*, the story of his hardscrabble youth in England before emigrating to the U.S. The book became a best-selling hit for Random House when Bernstein was — get ready for this — 96 years old.

Fear of losing what we have. We all wrestle with the fear of losing what we have. The refrain we constantly heard from the entrepreneurs and leaders during our research was to never bet the ranch, but to make lots of small bets, learn from them, and then scale. Smart moves seldom come from desperation. But once you have the level of financial security that makes you comfortable, stop hesitating and bet away.

Fear that nobody will pitch in. People are willing to pitch in, help out, and be part of something bigger than themselves. The task of the person leading the effort is to present his or her idea for growth or change in a way that makes sense and has a noble purpose attached to it, one in which people can see they'd be recognized for their contributions and maybe even have some fun.

Family pressures to not take the risk. The best advice on dealing with mothers, fathers, sisters and brothers pressuring people not to take any chances is as follows: Move 2,000 miles away, build your own life, visit twice a year, call frequently, love them and forgive them.

Lack of a financial safety net. There is no magic number for determining the financial safety net someone requires. Everyone's need for a safety net is different. When the lack of a financial safety net is causing the hesitation that's preventing change and growth from occurring, it's clearly an issue, and everyone has to determine their own tolerance for risk and what size safety net they need.

A Last Word of Advice

An ancient Chinese proverb says, "A man must sit in chair with his mouth open for awfully long time before a roasted duck flies in."

If you have made it this far, you must agree with the premise that organizations need to grow and that the only way to accomplish continual growth is by embracing constant change in order to stay ahead of your customers.

Don't hesitate. Here's to embracing constant change and reinvention. ●

The Responsibility Virus

Roger Martin

SOUNDVIEW Executive Book Summaries®

FILE: HANDS-ON MANAGEMENT

By Roger Martin

How Control Freaks, Shrinking Violets (and the Rest Of Us) Can Harness the Power of True Partnership

THE RESPONSIBILITY VIRUS

THE SUMMARY IN BRIEF

Are you a heroic leader? Or are you a passive follower? You may not know it, but chances are you act like one or the other, and it's doing serious damage to your company, your customers and your colleagues. The reason behind your harmful behavior? The fear that you will be held responsible for any failures — which often makes failure the inevitable outcome. This fear of failure and the behaviors it causes are what Roger Martin calls the Responsibility Virus.

The Virus infects corporations and nonprofit organizations large and small, with devastating costs for the institution and its employees. The heroic leader is one who takes on more responsibility than he or she can handle, while the passive follower doesn't take on enough responsibility. One cannot exist without the other. Heroic leaders are convinced their passive followers can't handle responsibility so they shoulder the burden while passive followers sense that responsibility is being taken away and withdraw further. But there is a cure.

What You'll Learn In This Summary

✓ **How to use the Choice-Structuring Process** to help people work together as a team while minimizing the likelihood anyone will seize or cede control of the decision-making process.

✓ **How to use the Frame Experiment** to see problems from the other side and come up with solutions that address the fear of failure.

✓ **How to use the Responsibility Ladder,** a development tool that works on building skills in delicate situations, allowing parties to assume enough responsibility to stretch their abilities without overwhelming them.

✓ **How to redefine Leadership and Followership** away from the heroic leader and passive follower model to a role that better suits the need to collaborate and become true partners.

Dynamics of the Responsibility Virus

Michael has caught the Responsibility Virus. As the new publisher of *Wapshot* magazine, he was hired to turn the magazine around. Sagging advertising revenues are the immediate crisis. Long-term, he needs to stabilize the magazine's revenue base by increasing the number of ad pages per issue and by increasing the average ad price. His first move is to hire a dynamic sales executive, Caroline.

Shortly after she comes onboard, she learns that a major advertiser is threatening to drop *Wapshot* from its ad plan. When Michael meets with Caroline, he's alarmed by her demeanor. Her confidence is shaken, and she asks for help with a presentation she's making to the advertiser to save the account. Michael panics and takes over the presentation. He saves the account.

The trouble is, he is called on over and over again to make similar presentations. The sales staff's confidence plunges, and Caroline begins to feel as if Michael is undermining her. From her perspective, Michael no longer looks like the dynamic leader he was earlier. She sees him frantically running from meeting to meeting and pitch to pitch. Michael is so busy, he has no time for the long-range strategic planning he was hired to do. Meanwhile, the magazine's owner is quietly looking for a replacement and Caroline threatens to quit.

The offices of *Wapshot* have been infected with a bad case of the Responsibility Virus, an opportunistic organism triggered by the experience of failure. The advertiser's decision to remove the magazine from its ad plan was a symbolic blow that undermined Michael and Caroline's immunity. How could it have been different? How could they have responded to ward off infection and avoid a full-blown outbreak?

Michael should have checked his panic and provided encouragement rather than a bail-out. He could have coached Caroline. Instead, he took over. And Caroline could have checked her fear and asked to brainstorm rather than for direct assistance. That would have constituted productive collaboration and utilized both their skill-sets in combination to produce an outcome superior to the outcome of either working alone. Instead, Michael assumed responsibility for engineering success and Caroline relinquished it.

Those who are infected with the over-Responsibility Virus often see their efforts as heroic and come to view those they are rescuing as sheep who would be lost without those efforts. The trouble is that taking more responsibility than necessary creates responsibility abdication in those whose responsibilities you are taking. At the same time, as your burden grows you begin to harbor resentment. Ultimately, over-responsibility leads to failure.

Role of the Fear of Failure

Failure often begets failure. In fact, fear of failure actually helps produce the very failure that we fear. Worry too much about spilling a cup of hot coffee, and your hand starts to shake. No one wants to get burned, but why do we fear failure to the extent that we do?

Fear of failure is personal, and it's also universal. Certain governing values lie behind most human interactions. These are:

- **To win and not lose in any interaction;**
- **To maintain control;**
- **To avoid embarrassment; and**
- **To stay rational.**

Over time, we become skilled in designing our interactions to avoid violating these governing values, even if the cost may be outcomes we don't like. Notice that the governing values are really fears — fear of losing, of not being in control, of being humiliated, and of becoming irrationally emotional.

Dynamics of the Responsibility Virus

(continued from page 2)

The flood of fear that we experience at the prospect of failure drives us toward the primitive response choice of "fight or flight." If we choose "fight" we seize total responsibility for the situation. If we choose "flight" we assume no responsibility. The desire to maintain control causes me to assume full responsibility and to preempt anyone else from seizing control even if doing so means we are trying to do things outside our area or level of expertise. Because we know we may be in over our heads, we tend to avoid collaboration or any situation where we may be exposed.

The problem with seizing control is that the "hero" who does so takes on the challenge alone instead of leveraging the skills and capabilities of others who could help with the task.

Static and Dynamic Conservation of Responsibility

The Responsibility Virus operates according to the law of Conservation of Responsibility. The name is borrowed from the field of thermodynamics, where the First Law states that energy in a closed system is neither created nor destroyed. For example, if a billiard ball is struck by a cue, the energy put into thrusting the cue forward is transferred to the ball, causing it to move forward.

There are two different kinds of Conservation of Responsibility and together they account for most of the damage created by the Responsibility Virus.

- **Static conservation between two individuals at a given point in time; and**
- **Dynamic conservation in a single individual over the course of time.**

What happens is this — as one person becomes over-responsible for a project or business, he takes on more tasks than reasonable or possible. Through his attitude, he makes clear that others should step aside. Rather than fight for control, the other party begins to act under-responsibly in direct proportion to the assumption of responsibility by the other party. Ultimately, the project fails or the company underperforms — but the law of Conservation of Responsibility continues to exert its influence. The over-responsible party becomes disillusioned, bitter and angry. He reacts by becoming under-responsible while the other party then by necessity assumes more responsibility. The cycle repeats itself until and unless the parties recognize the value of collaboration. ■

The Cycle of Over-/Under-Responsibility at the IDA

For Additional Information and an example of the Law of Conservation in operation, go to: http://my.summary.com

Costs of the Responsibility Virus

The first major cost of the Responsibility Virus is that it undermines the capacity for genuine, productive collaboration. Diminished collaboration among employees means that companies don't benefit from economies of scale as they grow and globalize. Large projects can't be integrated without taming the virus. The virus also undermines collaboration with other firms, customers and suppliers.

The Death of Collaboration

Collaboration occurs when two or more individuals share meaningful responsibility for producing a choice. *Sharing* means allocating responsibility in rough proportion to each party's choice-making capacity. *Meaningful* implies that sharing the load is important to the outcome — that separately the collaborators couldn't accomplish the task on a consistent basis without the contribution of the other. Collaboration occurs when "we're in charge" not when "I'm in charge and you're not."

Why is collaboration so hard? Because it violates the value: *maintain control*. Once responsibility is shared, we can no longer keep control of the recognition and

(continued on page 4)

Costs of the Responsibility Virus

(continued from page 3)

rewards that accrue from winning; collaboration therefore runs afoul of the first governing value: *win, don't lose*. Deciding how to allocate responsibility consistent with capabilities can lead to awkward conversations, thus violating the third governing value: *avoid embarrassment*. And if it gets emotionally messy it may violate the value: *stay rational*.

Looked at in light of the governing values, collaboration becomes the very embodiment of the threat of failure. The greatest obstacle to collaboration is that as soon as the collaborative path is initiated, control is compromised, failure cannot be kept at arm's length and embarrassment may ensue. These are the emotional risks that keep organizations from grasping the benefits of collaboration and the economies of scale that collaboration makes possible.

The Development of Mistrust and Misunderstanding

A second cost of the Responsibility Virus is the development of mistrust and misunderstanding. When fear drives work relationships, misunderstanding is a by-product. This happens because to protect against embarrassing conversations and loss of control the parties guess about, rather than ask about, the reasons and motivations of the others. Inevitably guessing at others' motivation leads to errors. The errors create further misunderstanding.

Unchecked misunderstanding then deepens even as each side thinks it understands the other. Each group's perceptions of the other party influence its treatment of the other group. Eventually the misunderstanding evolves into mistrust and resentment. Since the parties don't inquire into the reasoning and motivation of one another, they must fill in the blanks by guessing. The guessing often attributes improper or illicit motives, which are never tested. So when actions arise that are not inconsistent with the attributed nasty motives, the motives appear to have been confirmed and mistrust of future motives and motivation takes shape. Then resentment grows.

Misunderstanding, mistrust and resentment eventually bring about organizational rigidity. It becomes hard for any party to propose significant change because such proposals will be greeted with suspicion and mistrust. The ambient level of mistrust makes it hard to openly discuss any proposal and the true concerns — as a result, the potential resolution of these concerns is typically left buried, only to surface in obscure ways. The Responsibility Virus provides a powerful ally for the status quo in organizations.

How IBM Let Skills Atrophy

Skill atrophy as a side-effect of the Responsibility Virus can be seen in IBM's slow, painful descent. Through the 1950s, 1960s and 1970s, IBM's decades of rapid expansion, the leadership explicitly promised its entire work force lifetime employment. The guarantee was seen as critical to success because it was such an attractive inducement in recruiting. But it created an environment in which leadership assumed all responsibility. There was no felt need for all employees to collaborate with leadership to keep the company competitive. No one felt the need to hone business skills to maintain their value or to find another job.

This environment of under-responsibility in the work force and paternalistic over-responsibility in leadership produced a complacent culture that was blown off the road as the computer market fragmented in the 1980s. Layoffs broke the covenant and IBM workers found that their once vaunted skills had atrophied.

Atrophy of Choice-Making Skills

A third cost of the Responsibility Virus is the atrophy of choice-making skills.

Consider this scenario. Ned is the 71-year-old founder, chairman and principal stockholder of the STG empire. Even though it is well past midnight, he puts in a last call to one of the younger men he often runs circles around, the CEO of his long-distance phone business.

"Just checking in, Dick," he begins. "I see the numbers aren't turning around even with the new promotion strategy." This is another late-night interrogation which has become standard operating procedure. Also standard procedure is Dick's response — to see what Ned wants and not give him anything to attack.

"I'm disappointed that the numbers haven't turned around but I'm confident in the new strategy you laid out in the last board meeting," he begins. Immediately Ned reminds Dick that the strategy was just a suggestion and that Dick made the decision. Ned adds "I hope for your sake it turns out well." He finishes the late-night call with another "suggestion," that the company gear up its efforts to enter the consumer market.

The next day Dick gathers his team and tells them, "We're going after the consumer market. Ned sees it as a priority." They go ahead, and next quarter the results are worse than the quarter before, mainly due to the start-up costs of the consumer market initiative. At the next board meeting Ned explodes and demands to know "whose crazy idea was it to pursue the consumer mar-

(continued on page 5)

Costs of the Responsibility Virus

(continued from page 4)

ket?" Dick is on the way out as Ned orders an executive search firm to find a new CEO.

What happened to Dick was predictable. The Responsibility Virus claimed another victim. His decision-making skills had been seriously eroded.

In choice-making ability, as in any other skill, performance levels don't remain static. We either get better or we get worse. If we want to develop skills, we set reasonable goals that stretch our capabilities, placing us in a zone where we are neither anxious about failing nor bored with a routine task. Constant challenge is the only way to maintain the consistent upward tug that comes from assuming responsibilities beyond our current capacity. Without this beneficial tug, growth stops and atrophy sets in.

What happened to Dick was that under Ned's overbearing leadership, he never got a chance to hone his own decision-making skills. Instead, he slowly retreated from making the critical decisions he was hired to make to passively carrying out the chairman's bidding. Not only did Dick lower his responsibility levels, but his management team did as well.

Meanwhile, Ned swirled even higher into over-responsibility. He attempted to make all key choices across all his companies. Unfortunately, brilliant though he might be, not even Ned could stay on top of all the details. Ned is now seen as an intrusive owner whose usefulness has faded. ■

Tools for Inoculating Against the Virus

The challenge for all leaders is to find a choice-making process for groups that:

- **Produces robust and compelling choices, and**
- **Does so without violating the governing values, thus triggering the Responsibility Virus.**

This article examines tools that will help organizations battle the Responsibility Virus. These include the Choice Structuring Process, the Frame Experiment and the Responsibility Ladder.

The Choice Structuring Process

Ridding our conference rooms of the Responsibility Virus when a group is expected to engage in real decision-making requires setting ground rules. The leadership must convey the message that the decision will be the group's. Many members may not believe that — yet.

From there, coming to a decision is a seven-step process. It requires that the group:

1. Frame Choice. A choice is an irreversible commitment. The group must look beyond the problem it is expected to solve to discern the choices for solving it. The choice is framed when a minimum of two mutually exclusive options are identified that would neutralize the problem.

2. Brainstorm Possible Options. Framing the issue as a choice identifies a subset of options, but the next task is to broaden the list. Be inclusive. The list can be pruned later. Welcome options enthusiastically.

3. Specify Conditions. Before an option can make the cut as something to which the group can commi, the group must set the conditions that would have to be substantiated in order to believe it is a valid option. This is the time for those with reservations about an option to speak out. Specify what must be true for an option to be a good choice.

4. Identify Barriers to Choice. At this step, the group identifies those conditions embodied in the choices that it believes least likely to be true.

5. Design Valid Tests. Once key barriers have been defined, they must be tested in ways that the entire group finds compelling. The decision-makers must buy into whatever tests are chosen as valid. The goal is to design tests that will enable every member to commit to making a choice and taking action on the choice if the test confirms that the condition is valid.

6. Conduct Analysis. Test the condition least likely to hold up. If it proves to be wrong, then move to the next.

7. Make Choice. This is almost anti-climactic since the group already has a shared understanding of the logic of the available choices. Testing only serves to confirm that a choice is the right and best one.

The Frame Experiment

What if your choice process is already in terrible shape? Misunderstanding and mistrust have undermined collaboration. Then it is time for a remedial tool to fight the Responsibility Virus and mend frayed relationships.

The Responsibility Virus creates in each party the impression that the other players are progressively more extreme and negative. For us to maintain adherence to our governing values, the other party must, in our view, take on a set of negative attributes. The over-responsible party sees the under-responsible party as lazy and pathetic, while being perceived as controlling and domineering.

When faced with fear of failure, people will frame reality to remove the discomfort. For example, someone who finds no cooperation from others may frame her task as being to take control of the project, viewing herself as the best hope for the project's success. She would frame her view of the others' task as staying out

(continued on page 6)

Tools for Inoculating Against the Virus

(continued from page 5)

of the way and accepting the wisdom of her insight. We frame reality as a way to make sense of the world. As conditions grow worse, our frames grow more extreme.

The tool for breaking out of this self-sealing loop is the Frame Experiment. It arrests the downward spiral and provides the opportunity for an upward spiral to take shape. The existing frame sees oneself as knowing the right answer and the other individual as not getting it, and the task at hand as getting the other to see things "my way."

The Frame Experiment works to have the participant realize the frame he or she is operating under and adjust it. For example, when someone reframes herself from knowing the answer to having a wealth of data and experience but not seeing and understanding everything, the door is opened for movement. Having reframed her view of herself, she may be ready to reframe the other individual as someone who may see things she doesn't see and who can contribute to her understanding. This then leads to the task becoming accessing collective intelligence to make the best choice rather than getting the other party to see things her way.

The Responsibility Ladder

The Responsibility Ladder is a development tool for improving choice-making capabilities. It is a way of structuring conversations that will yield a better distribution of responsibilities, thus inoculating against the Responsibility Virus.

At the heart of the Responsibility Virus are unproductive conversations — or a lack of conversations — about decision responsibility distribution. The purpose of responsibility conversations is to divide tasks so that the responsibility assigned matches capabilities. This is the only way to maximize individual choice-making ability. These conversations should also build internal commitment and accountability. Finally, they create a sense of collaboration and mutual support.

Discussions of responsibility revolve around different rungs on a ladder — the Responsibility Ladder. At the lowest rung, there is no responsibility. You may have experienced this when a subordinate comes to you with a problem and expects you to solve it. At the next rung, the subordinate would ask you to solve the problem, but indicates a willingness to watch and learn. At the next rung, the subordinate describes the problem but asks for help. Next, the subordinate generates options but asks for a decision. Next, the subordinate provides options and makes a recommendation. Finally, at the top of the Responsibility Ladder, the subordinate considers options, makes a decision, and informs the other party.

Decision-making should not remain at either the top or the bottom level. A subordinate at the bottom needs to develop decision-making skills, while a subordinate at the top isn't being stretched enough in his position or has been infected by the Responsibility Virus. Levels 2 through 5 are where we want to be most of the time.

The goal of group members should be to move up the Responsibility Ladder over time while helping others to do the same. Everyone in your organization should be familiar with the rungs and what level of responsibility each represents. This creates a common language for discussions.

The Redefinition of Leadership and Followership

As head of strategy for WorldNet, a giant global communications firm, 42-year-old Henry is almost a decade younger than others at his level. He has always been identified as a candidate with high potential. His subordinates love him for his upbeat, can-do approach and his human touch.

Lately the CEO, Nick, has been treating Henry as a confidante, perhaps even as heir apparent. Nick put Henry in his present position to stretch his skills without overwhelming him. Henry had hoped for one of two business unit presidencies, but Nick did not want to push aside two other talented executives to place Henry in a position that might have been too much of a stretch.

One of the other executives, Bill, was having performance problems, so Nick asked Henry to help behind the scenes. Henry jumped at the opportunity, thinking that this was his chance to prove he was ready for Bill's job after all. And Bill, realizing right away that this was the CEO's idea, goes along with the plan. He gives Henry the thorny challenges and focuses on easier tasks.

Soon Henry finds himself doing his own and most of Bill's job, but without any public authority to do so. Henry races from assignment to assignment, and finds his reputation taking a beating. Eventually, Nick realizes he has to remove Bill, but also that Henry isn't going to make the successor list for Bill's position after all given his poor performance and his sinking reputation.

Henry has only done what we all expect of a leader. He was asked to solve a problem and he jumped to the rescue. His actions could even be seen by some as heroic. And Henry sought to win by pleasing his boss and mentor, to maintain control by carrying out the mission on his own, and to avoid embarrassment and stay rational by not talking to Bill about the real reason he was helping.

The "leadership" Henry tried to exercise was characterized by splitting responsibility unilaterally (Henry took the toughest tasks), seizing a disproportionate share (Henry saw Bill as incompetent and took over most of his

(continued on page 7)

Churchill and Kennedy as Modern Leaders

Two of the most cherished leaders of the 20th century, Winston Churchill and John F. Kennedy, are revered for asking their followers to take responsibility even more than they are revered for taking it on themselves. Churchill, promising blood, sweat and tears, exhorted his country to hold firm and not give up during the darkest days of the Battle of Britain. "Let us brace ourselves to our duties and so bear ourselves that if the British Empire and its Commonwealth last for 1,000 years, men will still say: this was their finest hour."

Kennedy's most memorable line was not a call for the government to take more responsibility. Rather, it was the admonition, "Ask not what your country can do for you; ask what you can do for your country."

In both cases, the call for greater responsibility on the part of the followers created a closer bond between the leader and his constituency, as well as a collective heightening of capabilities, resourcefulness and engagement in the task at hand. Churchill and Kennedy are both guaranteed their place in the pantheon of great leaders.

Tools for Inoculating Against the Virus

(continued from page 6)

job), making the seizing undiscussable (Henry's task was secret and keeping it secret protected him and his boss from embarrassing questions), and subjecting his performance to private testing (Henry was playing the hero but had no official role, so he was left to judge for himself whether his performance was adequate). Unfortunately, it is a model too many leaders today use.

The modern definition of "followership" is in many ways the mirror image of our view of leadership. If a leader is seen as a hero, the follower is characterized as a loser. This prejudice carries through consistently in structures ranging from social order among primates, to caste systems, to aristocrats and peasants down to our own modern penchant for risk takers over those who play it safe.

What really happened to Henry, who played the classic leader role, and Bill, who played follower? The Responsibility Virus got them. No one was spared embarrassment after all. Bill was mocked for becoming a shell of his former self. Henry was mocked for trying to cover up that he was doing Bill's job and therefore failing at his own. And Nick was exposed for trying to protect Bill. Both Henry and Bill lost big. In their attempt to protect themselves, they failed to protect anything. They both lost control of the situation.

What all three needed was a productive reframing of leadership and followership. Leadership and followership must be redefined to include:

- Splitting responsibility through dialogue rather than splitting it unilaterally;
- Apportioning responsibility in keeping with capabilities rather than being tempted to take on more than a proportionate share of responsibility or rejecting responsibility;
- Making the apportionment discussable; and
- Subjecting performance to public testing rather than private assessment.

A key feature of modern leadership, then, is the recognition that responsibility must be shared. Responsibility must also be divided in a way that takes into account capacity as well as encouraging professional growth of both leader and follower. Tasks must stretch abilities without overwhelming leader or follower. ■

Fighting the Responsibility Virus

Anyone can be mired in a state of under-responsibility. It happens when you know you're doing less than you could. You know that you're losing the capacity to do things that you used to be able to do, and you certainly aren't moving your skills forward.

Taking on higher responsibility would demand considerable initiative, but your lack of confidence makes that a scary thought. You don't like the feeling one bit, but you feel too conflicted about it to do anything but ride the gentle spiral downward.

Being stuck in this under-responsible state can be a serious matter and is often a contributing factor in depression. In psychology speak, it is "learned helplessness." It feeds on itself with increasingly negative self-assessments. Eventually, this will produce a crash. The over-responsive party will falter under the weight and fail. And the longer it takes for the crash to occur, the greater the cost of the Virus. There is less collaboration, greater distancing between leaders and followers, greater misunderstanding and mistrust and greater atrophy of skills.

Mired in Under-Responsibility

How can people pull out of the downward spiral of under-responsibility before the crash? What's required is a series of baby steps, each doable, each which builds momentum and reinforces the courage to take the next step. The steps require you to:

Visualize the End Result of the Path You're

(continued on page 8)

Fighting the Responsibility Virus

(continued from page 7)

Traveling. Realize that the over-responsible partner will take on greater and greater responsibility while you will continue to question your capabilities and accept an ever-less-challenging life. Eventually you will be seen as dead wood and be cut. Visualizing this worst case scenario should help you muster the courage to take action. What could be worse than a passive and pointless descent into self-loathing and obsolescence?

Reframe the Over-Responsible Party. Turn your focus on the over-responsible party. Conduct a Frame Experiment to see them in a more productive light. See yourself as capable but mired in under-responsibility and the other party as stuck in over-responsibility. Pledge to work toward a more productive sharing of responsibilities.

Pick a Burning Issue to Work On. Pick the issue of under-responsibility that bothers you most but which you think is addressable. The goal is to arrest the downward spiral.

Engage in a Responsibility Ladder Conversation. Engage your over-responsible counterpart in a conversation, the goal of which is to mutually agree on your taking a higher level and their taking a lower level of responsibility on your issue of choice. Use the Responsibility Ladder to structure the conversation.

Use the Choice-Structuring Tool to Gain Comfort. You can use the choice-structuring tool to explore what division of labor both parties are comfortable with.

Do It and Reflect. Your job is to just do what you agreed to do. Start to carry out the higher level of responsibilities. You may feel frightened at first, but remember that the stakes are far lower when compared to the worst case scenario you face.

Repeat the Above Six Steps Over and Over. Soon you will be out of the downward spiral and on your way to true partnership and collaboration.

Trapped in Over-Responsibility

For every person who feels mired in under-responsibility there is someone who feels trapped in and burdened by over-responsibility. Sometimes it means taking on harder tasks than you're capable of handling, but more often it means loading yourself up with everyone's work until you collapse under the weight.

Take heart**.** Except in rare cases in which power and responsibility become an obsession, the forces of static conservation of responsibility will break the deadlock. But how can you escape before the crash? Use the same steps that you would use if you were mired in under-responsibility. ■

The Challenge Facing Professionals and Directors

While everyone is prone to infection, the professional represents the most fertile ground for infection. Doctors, lawyers, dentists, engineers, consultants and educators share a common relationship structure that consistently gets them into trouble.

Professionals are by definition expert service providers uniquely qualified in their fields while those who seek them out generally are not. Thus it's easy to develop the attitude of over-responsibility. Professionals tend to be people who like achieving a level of expertise that sets them apart from their fellow man. They also get to play helper and get paid handsomely for their services.

Professionals can overcome the Responsibility Virus by using four tools. These are:

✓ **Redefining Leadership.** Professionals must redefine leadership from meaning taking over all responsibility to working with the client as much as possible. Give the client a productive role to play. Draw the client into a collaborative decision-making process.

✓ **The Choice-Structuring Process.** Recognize the power of choices. For example, patients should have as much information as possible so that they can make informed decisions about treatment.

✓ **The Responsibility Ladder.** Use the principles of the Responsibility Ladder to collaborate with the client.

✓ **The Frame Experiment.** Remember that the client may know something you don't. Reach out to the client and try to understand his or her reasoning.

The Challenge for Boards of Directors

Most CEOs look on their boards as just another constituency to be satisfied. CEOs tend to seize control from directors, who become more passive and dependent on the CEO. But especially in today's climate, directors needs to develop relationships based on collaboration and partnership.

The key tool for directors is to use the Responsibility Ladder to guide their thinking. The board must internalize the reality that no single level of responsibility is right for all choices. Sometimes the board wants recommendations, sometimes it wants the CEO to take action without consultation. The trick is to know what decisions belong on what level.

The board and the CEO need to redefine leadership and followership so that there is no clear leader and no clear follower among them. They must collaboratively set levels of responsibility and accountability that are suited to each of their abilities. ■

The Responsible Business

Reimagining Sustainability and Success

by Carol Sanford

THE SUMMARY IN BRIEF

The Responsible Business offers a new and strategic approach to doing business that holistically integrates responsibility into all aspects of an organization, allowing for returns at every level, business and social. Author Carol Sanford goes beyond the often well-intentioned but limited attempts at sustainability, to present a framework that allows organizations to bring responsibility into everything they do and reimagine success.

From innovation, product development and production processes to business management, strategic planning and shareholder development, Sanford shows how being a Responsible Business is a practical skill that can be applied day to day at every level of the business.

No longer just the role of a department or the job of CSR professionals, which was never the best path, successful responsibility and business efforts start at the business level, are then taken to the strategy level, and then can be consistently applied throughout the organization. *The Responsible Business* outlines a framework for building a consciousness infrastructure that applies a living-systems view to the business and inspires all of its stakeholders, including shareholders.

IN THIS SUMMARY, YOU WILL LEARN:

- How to understand markets, corporations and businesses as living systems.
- The five key stakeholders in a Responsible Business and their dynamic links.
- How to start shifting practices in business and translate the results into corporate and ecosystem returns.
- Six hazards that can get in the way of an organization's transformation.

Introduction

According to conventional business practice, responsibility has no inherent or fundamental connection to business, so responsibility needs to be added in. When added, it's usually in the form of a department or program assigned by management to an individual or group.

The very concept of "corporate responsibility" puts emphasis in the wrong place. Responsibility isn't a set of metrics to be tracked or behaviors to be modified. It is central to both the purpose and the prosperity of a business and must be pervasive in its practices. The question of how to be a Responsible Business is therefore relevant to all organizations — including nonprofits, governments and schools — that usually don't see themselves as businesses as well as those corporations that don't imagine themselves to be interested in responsibility.

If corporations and the businesses within them are to live and prosper, they must find ways to remain connected to their origins while cultivating and then adapting to changes in the world around them. Their long-term viability has as much to do with how well they create networks of relationships with consumers and other companies and industries that advance the health of all. In the long run, all living things must contribute to a world of expanding life. The alternative is a world where life steadily dwindles away to nothing.

By definition, therefore, a corporate or business entity is responsible to more than just itself. It exists in a larger whole — literally, as well as within the legal and operating framework of business — and it is responsible to the whole of which it is a part. How it governs its own existence influences every aspect of the whole.

The Responsible Business is itself a co-creative partner in ensuring the vitality and health of all the communities to which it belongs. All living beings either contribute value or receive it. The ones that endure are the ones that do both, even as the world changes.

The real challenge to becoming responsible is that most businesses erroneously see themselves as closed systems cut off from their environments — more like machines than organisms. Most businesses are unconscious of the real relationships that enable them to exist, and this blinds them to their responsibilities. Even worse, it blinds them to their opportunities.

PART I: REIMAGINING BUSINESSES OF THE FUTURE

Engaging Shareholder Value

Chad Holliday, who retired on January 1, 2010, from his position as CEO, chairman of the board, and president of DuPont Corporation, was one of the most sophisticated leaders when it came to managing the delicate diplomacy required for large-scale organizational change. Early on, Chad started making noises about the need to pay attention to the environmental effects of DuPont decisions and actions. He introduced changes in manufacturing procedures in each new business he headed, from Intermediate Chemicals to Fibers Group, first in the United States and then in Europe and Asia. He was subtle but determined.

In all that time, he never talked about corporate responsibility or sustainability. He just kept using the principle *Do what is right* to question and redesign work and production systems as well as product development.

As a by-product, the effects on Earth and communities were reduced, and new relationships and partnerships were built.

Chad realized that one of his greatest opportunities for change was shifting shareholder understanding. He felt that shareholders were too disconnected from the effect of corporate decisions, so he launched a campaign to educate not only his own shareholders but also the investment world as a whole. Chad helped design the UN Global Compact — a voluntary initiative for multinational corporations focused on learning, dialogue and partnerships — and took a position on its board. As part of that effort he helped develop the "Global Compact Governance Framework and "The Ten Principles," which articulate agreements that guide the global corporations' efforts to hold themselves accountable.

He also believed that transparency was a meaningful and effective way to bring about change and to educate all of a company's stakeholders. Toward this end, he set up a set of advisory boards for a number of DuPont businesses. The process of increased transparency served to educate investors on the effects of their decisions. It also had the effect of educating the DuPont leadership, which made deeper and more systemic understanding pervasive throughout the whole company. This forced management to question the usual business practices and get people reflecting with one another.

Panning for Gold

Five recurring themes or principles enable businesses like DuPont to go beyond corporate responsibility and become Responsible Businesses:

Reality: Evoke caring by connecting everyone in the organization to the real lives of its stakeholders.

Systemic Effects: Define responsibility in terms of consciousness of systemic effects rather than as best practices and programs. Systemic effects should be the only measures of success.

Systemic Wholes: Combat fragmentation by working systemically. Fragmentation is overcome by working with wholes, not parts: whole businesses, whole people, whole watersheds and whole systems.

Self-Direction: Redesign work to evoke self-developed people doing self-directed work that is self-evaluated within the context of business strategy.

Capability Development: Develop internal and external stakeholders through personal development and education in systemic approaches.

Stakeholders as Systemic Collaborators

Businesses are chartered to serve the common good by producing something of value that others seek but are unable to produce for themselves. Stakeholders are those who have an interest or *stake* in this production of value. Business aggregates a complex set of stakes, raises the value, and returns that value back to each stakeholder.

To honor a stake requires understanding and valuing it from the perspective of the stakeholder. It requires engaging in a relationship that is reciprocal: one receives the use of the stake, and in return one adds value to it. But that value needs to be in a form that is relevant to the stakeholder. Too often, in lieu of providing real value to stakeholders, companies offer self-serving interpretations of what they are returning and expect stakeholders to be satisfied with what they can get.

The only way to truly honor a stake is to have a deep understanding of what the stakeholders are investing in and what fair return they are counting on. A Responsible Business also consciously recognizes all the stakes that have been invested in it and works to increase value for all the stakeholders. This is its singular purpose. For a Responsible Business, the living entities — ecosystems, communities and individuals — that it affects are not externalities; they are part of the *body of the whole.*

Five Key Stakeholders and Their Stakes

There are five distinct stakeholder groups, each with a unique nature, that give a stake to a business in exchange for achieving the value they hope to realize. Taken together, the five stakeholders represent the whole context or universe within which a business operates.

Customers: Most companies tend to think of customers as *buyers* of products and services, but when customers are truly understood to be stakeholders, they are seen as *integrators* because they integrate products or services into their personal or work lives. The success of any business depends on how well that integration occurs.

Co-Creators: Co-creators include everyone who is involved in creating the product or service for the customer, including full-time and part-time workers, contractors and suppliers along the entire system of production all the way back to the original sources of raw materials. The focus is on the idea of creation rather than the narrower concept of employment, to underscore the extensive and diverse web of contributors to a company's offerings.

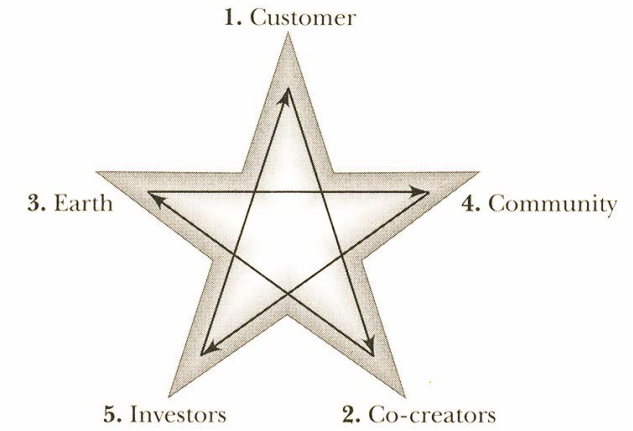
Earth: Earth is the primary supplier and the final recipient of everything produced by human enterprise. Most

companies still consider it a stretch to think of Earth as a stakeholder, but Earth is a way of symbolizing living systems interconnected in a seamless web of life and contributing to the evolution of the planet as a whole.

Communities: Communities are the social context within which businesses operate. To work in a systemic way, a business must take into account the effect it has on all of its communities. Anchoring itself to the stories, interests and concerns of specific communities helps a business become concrete and accountable in its decision-making process.

Investors: Investors get the output of a working system, which is ironic given that conventional business wisdom generally considers investors to be the beginning or preeminent stakeholders. But companies are not helping investors see themselves as part of larger wholes and making them aware of their effects. In the current business paradigm, the supposed needs of investors drive much of the decision-making process. For this reason, developing investors is a highly leveraged way to transform many destructive practices and promote health producing ones.

Geometry of the Responsible Business



The five key business stakeholders are connected in interwoven dynamic relationships. Stakeholder groups are nodes in a dynamic system that connect and influence one another. The key to becoming a Responsible Business is to learn how to understand and work creatively within this system.

To get a true picture of an alive, complex and evolving business, one must be able to think not only about its activities but also about the interactions with and among its stakeholders. This can quickly become an overwhelming task, which is why a framework depicting relationships within a whole helps to understand and manage the complexities of business stakeholders.

Systemic Stakeholder Framework

The pentad framework involves a five-pointed star, with each point of the star representing the five interconnected business stakeholders. The lines of the pentad represent a structure inherent in the relationships among stakeholders that enables them to be in harmony. Working with the pentad involves moving from point to point along the connecting lines that form the star.

It is important always to begin with the customer — the people who will actually buy a business's products or

The Stakeholder Pentad Framework

services — and then move to co-creator — the range of people and services a business employs in order to provide its products and services to customers. From co-creator we go to the third point, Earth, the living source of energies and raw materials. The next step is to go from Earth to community, the local people and institutions who allow and are affected by the presence and activities of a business. The fifth point is the investor, the people who supply the financial capital needed for a business to evolve.

The business community should understand *all* stakeholders as necessary aspects of a coherent whole. Businesses build systemic understanding when they use the pentad to describe their relationships with their stakeholders. This understanding leads to higher levels of creative thinking and a constant upward spiral in the quality of relationships, which is the essence of Responsible Business.

Be Value-Adding, Not Value-Added

The fragmenting worldview that is now the default mode in business tends to treat each of the pentad's stakeholder groups as a "thing" — a box or category for pigeonholing individuals and institutions. In reality, each of the points on the pentad refers to a living process, a particular way of seeking to improve the world. To use the pentad productively requires shifting from a *thing-based* to a *process-based* way of viewing the world. It requires seeing the world in terms of a *value-adding* perspective, where the world is made up of living systems, all of which are working with the larger systems they are part of to create more value.

The deep flaw in the concept of *value-added* lies in its assumption that value comes from production of an offering rather than its use. If value is derived from the making of

a product, then that implies that value can be added at a single point in time and that the creation of that value can be repeated over and over again. But the creation of value depends on continual improvement in how well and how holistically the product serves the user.

Five Stakeholder Imperatives

To work successfully with a stakeholder's value-adding process, a company starts by understanding stakeholder *imperatives*, the essential effects-in-use, which are the effects that products have in the lives of people who use them. The following are some guiding ideas that help portray stakeholders in terms of their imperatives and define business relationships that are genuinely value-adding to stakeholders and their world.

Value-Adding View of Customers: Customers and consumers seek to be fully alive. They nurture dreams and aspirations, and they engage in personal processes for adding value to what they care about. The product or service offering of a Responsible Business aims to do three things: enrich the lives of customers, their worlds and what they affect; create a better life than competing offers from other producers or companies; and be reliably there and reliably distinctive in the face of hazards and opportunities.

Value-Adding View of Co-Creators: A Responsible Business designs work systems that evoke expression of essence from all its co-creators. A Responsible Business therefore aims to pursue three purposes in this arena: enable co-creators to increase value to the lives of others; call on each individual to develop unique potential in a way that complements the working of a team; reveal and enable the worthiness of all people through fostering their creative expression.

Value-Adding View of Earth: Earth is made up of many living systems interconnected in a seamless web of life. A Responsible Business will aim to do three things: start from the essence of materials and their role in living systems; operate as a conscious member of ecosystems; improve the productive working processes of ecosystems.

Value-Adding View of Communities: Communities are living entities with coherent cores, and when properly engaged, they can be powerful allies in creating healthy businesses and economies. Within its communities, a Responsible Business will aim to do three things: design human systems to contribute to the evolution of uniqueness and health in a given place; inspire visionary leadership capable of manifesting integrative solutions through time; elevate the overarching principles that society chooses to be governed by in all of its pursuits.

Value-Adding View of Investors: What is imperative with regard to investors is to educate and engage real people and institutions in real wealth creation. In its work with investors, a Responsible Business will aim to do three things: generate durable returns and systemically beneficial effects; progress the industry's capacity, character and asset value; understand divergent forces, and leverage resources to create world-changing effects and business evolution.

PART II: THE MAP TO THE TERRITORY

Teaching an Organization to Star

To operate as a Responsible Business and to work with stakeholders in the way the pentad framework reflects, a company must face up to the limitations presented by its current culture, approaches to markets, strategic planning, workforce capability, and the way work is designed and carried out altogether. Although they will be approached differently in every business, the following four phases provide a path to follow to retrofit an existing business.

Phase One: Cultural Evolution. To begin, an organization must undertake a deep reflection on its culture, ideally going all the way back to its founding. This reflection is divided into four lines of inquiry.

1. Status: The questions, "How do we convey status, and how does that limit or advance us? What does it produce?" should be explored in a neutral way, without making anyone or any practice right or wrong. This can become a rich source of insight about which activities and behaviors need to change.

2. Symbol: A company needs to ask, "What is repeatedly held up to evoke an emotional response to a corporate ideal? What effect does that repeated evocation actually produce?" It is critical that all the symbols a company uses be authentic and meaningful.

3. Ritual: Next, a company asks itself, "What do we do over and over (probably unconsciously) to try to maintain form and uniformity? How do we need to transform our rituals so that they help people become independently creative in pursuing the path we are on?"

4. Taboo: "What taboos do we currently have that limit change and creativity? What taboos need to be put in place to unleash change and creativity?" When taboos become unconscious they can be counterproductive, even toxic, especially if they limit rigorous examination and discovery. However, some things need to be taboo, such as advancing an idea without rigorously examining it.

Phase Two: Strategic Direction. During this phase, a company directs the energy it has unleashed in phase one toward setting a systemic and compelling strategic direction. First, one must understand how the company's markets work to produce success, especially with regard to targeted customers. This includes understanding the effects of global and supply dynamics on the business. Second, one must consider what is unique about the business and how this uniqueness can be employed to create a nondisplaceable position in the market. Third, one must determine what managing philosophy the business will use with regard to governance and engaging its people to enable them to work effectively with one another.

Phase Three: Capability Building. Capability development is not training but is always accomplished in the context of real and necessary work by existing teams or by cross-functional teams that have been formed to develop new thinking in critical arenas. It generates capabilities needed for a strategically defined future state. A Responsible Business uses regular and ongoing meetings that combine both business and education to build three types of capability: business acumen, technological competence and critical systemic thinking skills in conjunction with personal development.

Phase Four: Work Redesign. Most businesses start change processes by trying to change the way they design and govern their work, usually by reorganizing or altering procedures. In contrast, work redesign brings an organization's governing processes into alignment with its cultural aspirations, corporate direction and developing capabilities. It can take years to accomplish, and it addresses three key aspects of organizational governance: structures, systems and processes.

PART III: REFRAMING HOW CHANGE WORKS

Responsibility Running Backward

The pentad depicts a chain of logic that begins with the living image of a customer and flows organically through co-creators, Earth, communities and investors. This flow results in improved health and vitality for all stakeholders. Reversing it has the opposite effect.

More often than not, companies turn the logic upside down and start from the wrong point, the investors. This initiates a degenerative process called *spinning the pentad backward*. When this happens, mental and creative energies focus narrowly on how to extract return from the system, and the process becomes extractive rather than creative. Assets and value that rightfully belong to others are appropriated in an effort to subsidize a return for a single stakeholder group. This is unproductive and unsustainable.

Spinning the pentad backward has resulted in periodic collapses in the U.S. economy. Investment banks, savings and loans, corporate giants like Enron and others have extracted inappropriate returns on investments through schemes that have left investors and ordinary people to suffer the consequences.

Not surprisingly, collapses of confidence often lead to community boycotts, lawsuits or demands for regulatory enforcement, costly for businesses in terms of both dollars and brand equity. Unbudgeted expenditures related to these community side effects then tend to push businesses into efficiency mindsets. They cut costs in order to free up the financial resources necessary to manage a situation that is spinning out of control.

The efficiency mindset eventually dooms a business to failure. Once efficiency and value extraction have set in, employees and co-creators become just another cost of doing business. It's not long before there are programs to reduce the size and cost of human resources, contractors, suppliers — all of the entities within the co-creative system. All of this results in a business that no longer serves its customers. Problems start to pile up.

It is never too late to reverse this state of affairs. There are two recurring themes in the methods for getting back on track. The first is to examine whether the business understands the stakeholder on each point of the pentad well enough to connect the stakeholder on the following point to it. For example, does the business understand its customers well enough for the co-creators to feel "fueled" with the spirit and inspired by understanding?

The second theme is an almost foolproof way to address any problems that arise. Go back to the customers and reconnect to them as living people. A company that does this key work reestablishes the basis for forward motion.

Design for Prevention and Cure

Continuous development is a lifelong process and a way of life for people and for organizations. In order to keep this work alive for years and decades, it's important to understand how things can go wrong and what to do about them when they do.

The following six hazards show just some of the ways that entropy can get the upper hand in an organization that's trying to transform itself.

Hazard One: Leadership Voids. The highest level of hazard comes from a change of leadership at the top, especially if it happens too early in the process or if too many committed leaders leave at the same time. Visionary and selfless leadership is necessary for a significant cultural change, especially if the goal is a self-organizing company in which hierarchies would evaporate.

Hazard Two: Homogenized Human Resource Programs. Once a company has decided to change, it has a natural and healthy tendency to want to know what's possible. But people who are good at running a business are not necessarily also good at assessing programs to improve the running of the business. Human resource departments are often delegated to carry out the assessment. Although there are many excellent human resource professionals, it is the field of expertise most contaminated by unvalidated assumptions.

Hazard Three: Pilot Programs. The idea of pilot programs is based on a bad assumption — that what has proved to work well in one place can be made to work everywhere. This assumption is the antithesis of the mindset of the Responsible Business, which dedicates itself to designing live and in the moment. First, what is learned in one effort won't necessarily be applicable or relevant in a new context. Second, people will correctly point out the differences between themselves and the pilot group, and they will refuse to adopt what was learned.

Hazard Four: Packaged Program of the Year. In contrast to the more organic approach that fosters internal locus of control, a packaged learning process almost inevitably results in a conditioned state of external locus of control. In the Responsible Business, consciousness or different modes of behavior is an instrument for self-directed self-development. Packaged and mechanical change processes do not build the capacity for responsibility; they build capacity for compliance.

Hazard Five: Corporate Philistines. The corporate world is filled with visionary leaders who believe that business is a way to do something good for all and a powerful platform to accomplish things that could happen no other way. But not everyone will accept an invitation to engage in personal development and to serve something larger and more meaningful than themselves. A wise leader will be prepared for the occasional saboteur.

Hazard Six: Undeveloped Co-Creators. Responsibility requires conscious understanding and intention about choices at every level. Responsible Businesses cannot develop without growing the sense of personal and collective responsibility in every co-creator.

PART IV: THE BIG PICTURE OF RESPONSIBILITY

A Responsible View of Capital

For better and for worse, the history of the modern era has in large part been defined by the emergence and development of the phenomenon of capital and the powerful energies it has unleashed. The problem comes from defining capital too narrowly in financial terms and accounting only for effects on one's own returns.

In recent decades the concepts of natural and social capital have been advanced by various economists and ecologists attempting to make economic theory more holistic. The stakeholder pentad extends this thinking to include five forms of capital, one for each stakeholder, and suggests some ways to build this enlarged perspective into successful business practices.

All stakeholders are investors — although they invest different forms of capital — and each expects some kind of return on investment. **Customers** invest their capital, which is an aspiration for integrity along with personal and business distinctiveness, in order to acquire what they are unable or unwilling to create for themselves. Customers and businesses also seek ways to express their distinctiveness, which is reflected in unique and appealing business offerings. Customer return on investment is a trustworthy relationship with a business and its offerings.

The **Co-Creators'** stake is to make a meaningful difference for people or purposes they care about. They invest their capital — intelligence and creativity — which is more than their existing knowledge or capability. The ROI that co-creators expect is the increased intelligence and experience that will allow them to invest in the next, more challenging application of creativity.

In pursuit of the capacity to regenerate itself infinitely, **Earth** invests the capital of resources that support living processes. Business activity is a small subset of Earth's larger natural economy of reciprocal exchange and maintenance. For all the green, sustainability rhetoric out there, the real work is to measure Earth's ROI by Earth's yardstick: resiliency, diversity, connectivity, complexity and capacity to evolve an increasingly complex web of higher-order ecosystems.

In pursuit of their stake in the vitality and viability of the places they live, **Communities** invest the capital of

unique identity and vocation manifested through a social and cultural web of relationships. These webs and communities' distinctive relationships with local ecosystems are what make possible the unique work of a particular place, and they give rise to the unique economic potential that attracts people to a community and from which it can manifest unique business offerings. A community's ROI is the increasing opportunity for the well-being of and meaningful contribution by every one of its members.

Investors pursue their stake — the value that flows from supporting other manifestations of creativity and steadfastness — by contributing the capital of accrued equity. Return on financial capital can be measured at three levels, only one of which is generally reflected in the annual report. The first is functional, related to growth and income, and is the generally accepted understanding of ROI.

A Responsible Business also accounts for a second kind of ROI: the return to its other stakeholders. This return on other kinds of capital extends the meaning and nonfinancial consequences of the financial investment. Without this kind of accounting, investors have no way of knowing whether or not their passive income has been generated from value-extracting or value-adding processes. The third nature of return occurs when a business improves how investors and capitalism are perceived in the world at large. This is measured by the confidence of the citizenry in the role business plays in fostering a healthy society and planet.

Thus, financial capital moves to a new platform in terms of how return is measured. The Responsible Business is no longer content to report financial return without considering the investment of other stakeholders.

The Future of Responsibility

The business unit, which has direct responsibility for all of the activities that affect stakeholders, is often the most effective organizational level from which to engage in work on corporate responsibility. At the same time, there is a unique role for corporations in the evolution of a more responsible business culture in the world. They must lead the way to the future of responsibility.

As Chad Holliday found when he finally had responsibility for the whole of DuPont, the scale and complexity of a major corporation made it difficult to directly affect the financial, social and sustainability goals of individual businesses, but it gave him an important platform from which to create dialogues that shaped thinking and behavior choices globally.

The following are a set of responsibility-based directions through which corporate leaders can begin to leverage the work of Responsible Businesses into the creation of Responsible Corporations:

1. Engage broad communities in enlivening public conversations about what it means to go beyond sustainability and corporate responsibility as they are currently conceived.
2. Engage business leaders and governments in dialogue to articulate global imperatives and give businesses a richer source of support to guide and evolve their own development.
3. Report progress toward enterprise-wide responsibility in annual reports rather than in separate corporate social responsibility reports in order to foster public dialogue.
4. Use quarterly meetings to educate investors and the investment community as a whole on the global imperatives of society and Earth; encourage investors to learn how it is possible to develop systemic wealth and how their own future and enduring returns are tied to the development of systemic wealth.
5. Work at the global level to help evolve business practices in their own industries in order to evolve Responsible Industries.

A Responsible Business aspires to grow responsible individuals. Indeed, it can't achieve its full potential if it doesn't. Working with the pentad is more than just good business; it is a means to sustain healthy democracies and a healthy global community.

There is much that companies will do to strengthen society and address the world's problems, just by the way they conduct business, if they rise to the challenge to grow responsible individuals. It is not a separate piece of work to be responsible for society. It is the work we do when we do business responsibly.

RECOMMENDED READING LIST

If you liked *The Responsible Business* you'll also like:

1. ***The Responsible Entrepreneur*** **by Carol Sanford.** Responsible entrepreneurs seek to transform industries and even society itself. Sanford presents a blueprint for the kind of leadership that is required.

2. ***Good Company*** **by Larry Costello, Ed Frauenheim, Laurie Bassi, Dan McMurrer.** The authors created the Good Company Index to look at Fortune 100 companies' records as employers, sellers and stewards of society and the planet. The results are clear: worthiness pays off.

3. ***The Speed of Trust*** **by Stephen M.R. Covey.** Covey gives readers all the key tools for cultivating trust in their relationships, while offering up the wisdom of other great business leaders on the topic.

THE SUMMARY IN BRIEF

The Revenue Acceleration Framework: A Proven Roadmap to Transform and Dynamically Grow Your Business is a structured approach to business growth that emphasizes alignment, system design, and the elimination of friction in sales, marketing, and customer success operations. Author Doug Davidoff argues that traditional approaches to growth are outdated, overly reliant on "more is better" thinking, and fail to adapt to the complexities of modern markets. Instead, the framework offers a more integrated and efficient path to scale revenue and reduce costs.

Davidoff himself has a strong business background. He formed VALU Travel Marketing with his parents and brother in 1994 and experienced all the challenges of raising capital through mortgages, failing to attract customers, and finding a new approach. In the end, the family business thrived and was acquired by a subsidiary of American Express. This book is the result of this initial hands-on experience plus 20 years of experience as a business growth advisor, founder and CEO of Lift Enablement.

IN THIS EXECUTIVE BOOK SUMMARY:

- Embrace a mindset of adaptability to the shift in buyer behavior and market complexity
- Adopt the Go-to-Market strategy through alignment of sales, marketing and customer success strategies
- Create a structure that enables the scalability and repetition of revenue operations (RevOps)
- Adopt a mindset of continuous improvement in the execution of these strategies.

Part I: Preparing to Win

What do businesses want? More sales! When do they want it? Now! This is a known meme, but the truth is that very few businesses manage to achieve it. The main reason? They do not have the mindset, strategy and methodology that ensure growth. This is what Revenue Operations is about.

The first element that needs to change is the mindset.

Chapter 1: The Revenue Acceleration Manifesto

Jack Welch said, "If the rate of change outside your organization exceeds the rate of change inside it, the end is near."

This is one of the key quotes that defines the concept of revenue acceleration. Jack Welch was the CEO of GE during their high growth days of the 1980s and '90s. And his words led to the definition of the Revenue Acceleration Manifesto:

"Change is not a choice; it is the only option outside of obsoletion."

In the current market, there are five major trends that determine who are the key players in the business game. These are:

1. Noisier Markets: Buyers are overwhelmed by an abundance of information, both online and offline. The challenge isn't just having a strong message—it's cutting through the noise with insight and clarity.
2. Sellers Are Less Present: Buyers conduct most of their research before engaging salespeople. Sales teams often miss opportunities by being absent during the critical "problem identification" phase.
3. Consensus Decision-Making: Buying decisions now involve larger teams with diverse priorities, increasing complexity and decision paralysis. Sales strategies must cater to multiple stakeholders.
4. Data Mismanagement: Companies have an abundance of data but lack the right questions or frameworks to make it actionable. Dirty or misaligned data contributes to poor decision-making.
5. Friction within Organizations: Misaligned teams, redundant efforts, and inefficient processes create "friction taxes" that hinder growth.

In this context, who are the losers? Unfortunately, the answer is most of the companies. They still operate on the "good enough" mindset, which is no longer enough.

At this point, it is important to make a differentiation between speed vs. velocity. Speed means barging ahead without a plan, running empty miles without a clear direction. On the other hand, velocity means directional progress, having a structure for growth. And this is essential for anyone who wants to see their company among the winners of the business game.

Chapter 2: Revenue Operations (RevOps)

A logistics company had years of steady growth behind them but reached a stagnation point. Their revenues remained at the same level, while their costs were going up.

At this point, they requested consultancy from Lift Enablement. The analysis showed that the company's structures and systems were left behind in their growth spurt. The consultants recommended "fixing the plumbing" – embracing the Revenue Operations (RevOps) solution.

RevOps is the strategic coordination of sales, marketing, and customer success to optimize revenue generation and reduce organizational friction. It includes seven disciplines:

1. Database management
2. Process compliance and optimization
3. Design, align, manage, and optimize the tech stack
4. Territory and compensation management
5. Data science, analytics, and metrics
6. Predictability
7. Behavioral science and user experience

It is equally important to understand what RevOps is not. It is not sales, marketing, or customer acquisition. It's the system that enables these functions to perform effectively.

Chapter 3: Why Frameworks Are Important

RevOps works if you create frameworks within your organization, Frameworks provide structure and clarity, enabling businesses to align efforts, eliminate inefficiencies, and scale effectively. They offer a common language and approach, fostering consistency in execution across teams.

Without frameworks, teams are working in different directions due to miscommunication and uncoordinated processes. In turn, this leads to redundancy, friction, and inefficiency.

One of the problems many companies encounter is that they get large revenues, but their profit margin stays the same.

Part II: The Four Key Components of the Go-To-Market Approach

Defining and aligning the essential components of a go-to-market (GTM) approach is key, as this can ensure organizations effectively deliver their value proposition and achieve sustainable growth.

Chapter 4: Go-to-Market Strategy

The Go-to-Market Strategy outlines how a company delivers value to its target customers. The first challenge is identifying who is your target client. Secondly, you have to answer five questions that will define:

- Your business model
- Your ideal customer
- Your unique value proposition
- How you position your business in your selected market
- How you acquire and retain customers and revenue.

Chapter 5: The Economic Model

Entrepreneurs need to understand the importance of considering cost efficiency when scaling growth and why it is essential to focus on profitable scalability, rather than expansion without a plan and without direction.

The key metrics used in any economic model include:

- Customer Acquisition Cost (CAC): The expense of acquiring a new customer.
- Lifetime Value (LTV): The total revenue generated by a customer over their lifecycle.
- Churn: The percentage of customers that you lose per year

As a practical application to demonstrate the importance of calculating these metrics, there is an imaginary case study involving Bilbo Baggins (yes, from Lord of the Rings) which demonstrates the importance of knowing how much you are willing to pay to acquire a customer, depending on how long they continue to buy from you.

In conclusion, nobody likes math, but it is impossible to exclude it from everyday business activities if you want to experience business growth. Or, in Joe Lewis' words "Everyone wants to go to heaven, but nobody wants to die."

Chapter 6: The Sales Model

One of the problems many companies encounter is that they get large revenues, but their profit margin stays the same. In most cases, this is due to the fact that the company does not have the right sales model.

Buyers are more informed and self-reliant, often researching extensively before engaging with salespeople. Thus, sales strategies must align with this reality by focusing on education and problem-solving.

Effective sales models prioritize understanding and solving customer pain points over pushing products. You must focus on engaging buyers earlier in their journey to guide problem identification and frame solutions.

The time of superstar salespeople is gone. Instead, companies must build scalable systems that enable consistent performance across the team. Instead of one-off successes, they should develop scalable and repeatable sales processes.

Chapter 7: Messaging, Positioning, and Narrative

One of the biggest parts of building a business is the effort you make to differentiate yourself from competitors. You are spending a lot of time and effort on it – but so are they. The key is creating consistent messaging and storytelling.

Imagine Michael Jordan – one of the greatest basketball players in the world. He does not introduce himself as such. He doesn't need to. In fact, every person or business that introduces itself as being unique or great is anything but.

Great companies define a very clear message, the "point of view" message, and they align everything and everyone behind it: sales, marketing, and customer success staff.

A strong marketing message has five components:

- Simplicity – no jargon, customer-centric, relatable

language

- Emotional – the message tells a story of human interest
- Concrete – the message is easy to understand
- Context – the message is relevant to the target customer
- Polarizing – the message must attract the right people and repel the wrong people.

Part III: Structure

It's essential to understand the foundational systems and infrastructure needed to support a scalable, sustainable, and effective go-to-market strategy. The key elements of this structure are creating alignment, reducing friction, and ensuring teams work within a well-designed framework.

Chapter 8: What Is Structure?

Structure serves as the foundation for scalable growth, enabling businesses to execute strategies effectively while minimizing inefficiencies. This is called the invisible hand that guides everything in your business.

The core idea behind your structure must be this: people take the path of the least resistance. Understanding the structure within which people operate helps your company understand how your clients make decisions.

Chapter 9: System Design

In this context the word system is not used in technology terms. Instead, it has the broader meaning, which encompasses all the elements that are impacting the people in your company.

To give a visual representation, a strong system for protecting a building against fire has both fire prevention and firefighting capacities.

The biggest trap is putting the equal sign between complicated and complex when talking about systems. Good system design must differentiate between the two. The correct path for designing a system has four steps:

1. empathize
2. hypothesize
3. analyze
4. synthesize.

In this process, you have to manage trade-offs: desirability, feasibility and viability. In an ideal world, you have all three. But we do not live in an ideal world, so you have to choose wisely in order to reduce friction, minimize complexity, and maximize value creation.

Chapter 10: The Tech Stack

Imagine a golf player who struggles to improve his game and reaches the decision to buy new clubs. The player experiences a small initial improvement, but the progress soon stagnates.

This serves as a parallel to the idea that that new tech will temporarily improve your business, but you won't see sustainable growth if you don't upgrade the underlying system.

Many businesses make the mistake of treating new tech with the "FOMO" approach – fear of missing out. They just have to have the latest tech tool – right now.

In reality, whenever possible, they should HIRE, not buy tech. This is one of the five principles for implementing an effective tech stack, explained in detail with the case study of how to implement a good CRM.

Chapter 11: The Scoreboard

The scoreboard is just as important in sales as it is in sports. There are various resources showing that what truly motivates salespeople is not money, but the idea of winning.

And this is why metrics are important. Success must be measured. But how you measure it is critical – and this is where metrics get involved. They guide your decisions, align efforts and drive accountability. So, you have to identify and measure the right metrics, not the vanity ones.

Remember, data is a tool and you use it to ask better questions. So, look at your scoreboard and measure the metrics, but don't let them replace your conscious decision-making.

Part IV: Approach

Now that we know the strategy and the tools, it is time to move to the execution and implementation of the Revenue Acceleration Framework. This consists of designing specific processes, methodologies, and playbooks to ensure consistent and efficient alignment between teams and strategies. The ultimate goal of these is to turn plans into scalable, repeatable actions.

Chapter 12: Approach Overview

You know the drill: work on your business, not in your

Processes are the backbone of operational efficiency ensuring that teams work cohesively and deliver consistent results.

business. But how do you do that? You must have a cohesive approach – to find your M.O. that allows your business to learn as it grows from a people-driven organization to a structure- and process-driven organization.

To this end, everyone in your organization must be aligned in a unified effort to reach the objectives of your business.

Speaking from my personal experience, I was advising a company that, despite having a talented sales team, was struggling to achieve its full potential. The root of the problem wasn't the team's skills but their lack of a clear go-to-market strategy and consistent messaging. Instead of training the salespeople more, the company needed to define its approach.

Chapter 13: Process

Processes are the backbone of operational efficiency ensuring that teams work cohesively and deliver consistent results. This idea is illustrated with a famous quote from Joe Madden, the manager of the Chicago Cubs, who said that the daily goal of the team is not to win, but to execute their game plan and process.

There is a profound truth in this quote – without a process in place, companies that focus only on the end result fail to achieve it. Well, in this case, why do so many business processes fail?

There are three main reasons why it happens:

- they're too rigid
- they are too vague
- they are focused only on the closing – the end of the process.

To map out an effective, strong process, the company must start with customer needs. They must design processes that enhance the customer journey, on each of its 5 stages:

- epiphany
- engagement
- intent
- selection process
- happiness.

You must be involved in the customer journey as early as possible to create a bigger snowball effect.

Chapter 14: Methodology

One of the common issues in many companies is the confusion between process and methodology. And this is why you should pay close attention to this chapter. The process is the map of what you do. The methodology is how you do it.

To give a better understanding of this difference, let's use a music analogy. There are just 12 notes in music (these are the processes). Yet, each composer in history, from Mozart to Bach to Bruce Springsteen creates completely different musical pieces. Each of them applies a different methodology to how these 12 notes are arranged on the music sheet.

When you are at the point of developing your methodology, you should already have your Go-to-Market model in place. It does not work the other way around. Your methodology is shaped by this model.

In building your methodology, you must remember a few critical aspects:

- buyer intent remains unchangeable – you cannot sell to someone who does not want your product
- work on your acquisition process, focusing on the three elements: engagement acquisition, customer acquisition, and revenue acquisition
- remember the "lift" principle in creating and maintaining engagement with your customers.

The five principles of building a methodology are:

1. Discover
2. Engage
3. Activate
4. Launch
5. Success.

Chapter 15: Playbooks

Playbooks translate strategies, processes, and methodologies into actionable, role-specific guides for teams. Yet, they often get a bad rep. This happens for several reasons. The most common is that they are not built for use. They sit nicely in a drawer or a folder on the employee's computer and it never gets referenced.

Or, these playbooks are too rigid or too vague – so they are unusable. Some playbooks are built on false assumptions and others are focused on how to close the sale, not how to help the client make the best decision.

Good playbooks must be grounded in reality. This reality is defined by several aspects:

- The average sale value
- The complexity of the sale process
- What you are selling – a product or a service?
- Your position in the market – leader or challenger?
- Who you sell to: early adopters, the majority or late adopters.

Part V: Putting It Into Action

When bringing the Revenue Acceleration Framework to life, you need to focus on execution, mindset, and alignment. Businesses can sustain growth by embedding the principles of the framework into their operations and fostering a culture of continuous improvement.

Chapter 16: Execution and Performance

When it comes to executing your strategy, one of the biggest things you have to learn is to step out of your system and look from the outside. How are you solving your customers' problem? Do you still follow that 80/20 rule? Then it's time to change your playbook and stop playing the game to the lowest denominator.

Instead, define your acceleration cycle in order to ensure consistent and predictable periods of execution and adjustment.

Remember, if everything is a priority, nothing is a priority.

Chapter 17: Revenue Acceleration Mindset

When you're in business, you tend to take yourself too seriously. You fear so much what you could do wrong. Instead, I want you to adopt this mindset "embrace the suck." No, it does not mean that your business sucks.

It means that you should abandon the right or wrong binary world and accept that these two concepts exist in a continuum. Thus, there are very few areas where you are totally right.

However, more than often, not being wrong is sufficient to build a successful business. So, move on and progress, instead of being stuck on the idea of being "right."

Also, learn to embrace friction as a tool that helps you progress. And learn how to think probabilistically, instead of discounting factors that create uncertainty.

Chapter 18: Succeeding with RevOps

Success is fascinating and difficult to determine where it comes from. Why do some individuals or organizations succeed while others with similar potential fail? Over time, it is clear that success hinges on small, consistent actions rather than grand strategies or shortcuts. This realization emerged from observations in various fields, from business to baseball coaching, and made me understand the importance of discipline, habits, and adaptability.

To succeed in business, you have to develop business acumen. This is an intuitive understanding of performance drivers and the ability to link processes or products to measurable outcomes.

And these days, having business acumen, especially in sales and marketing, gives you a tremendous edge in this overly-specialized world. It is also essential in RevOps. What most organizations do nowadays is copying examples of success, instead of cutting their own path.

But, since it is an emerging discipline, not all CEOs are open to integrating Revenue Operations (RevOps). If you want to sell them the idea, you must not focus on the process, but on the outcomes.

It is also important to understand that RevOps is not a magic formula, but a discipline best implemented when a company has achieved a certain level of maturity.

It focuses on reducing inefficiencies and supporting sustainable growth. However, its success depends on prioritizing high-impact outcomes over rigid process optimization.

Also, RevOps should be introduced incrementally, with clear starting points and iterative improvements. It thrives when aligned with a company's strategic goals and focuses on velocity rather than mere speed.

Last, but not least, remember that there is not a "right way" to implement RevOps. It is not a linear discipline, but a living, breathing one. Ultimately, its role is to enable your sales, marketing and customer success teams to achieve more and better results with less effort.

Conclusion

Decision-making plays a crucial role in business transformation. Companies such as Circle Industrial can undergo significant transformation simply by clarifying their go-to-market message.

Remember that change is inevitable. However, great change is purposeful. It's achieved through small, consistent decisions and actions. The fear of making decisions paralyzes the ability of many businesses to achieve their true potential.

Yes, it takes a lot of courage to make decisions, especially when the stakes are high. You will face a lot of critics. But remember that it is not the critics that count, but you, standing in the business arena, while they sit comfortably in the stalls.

So, you are encouraged to embrace decision-making as a key driver of business success. By making decisions, taking action, and learning from the outcomes, you can adapt to change, overcome challenges, and achieve significant growth.

Doug Davidoff, the founder and CEO of Lift Enablement, has directly advised more than a dozen companies that have sold for a combined value of more than $1 billion.Davidoff has decades of experience advising the leadership of more than 1,500 small and mid-market companies committed to serious growth. A Systematic Approach to Improving Procurement Costs, Quality and Relationships

THE SCIENCE OF HIGH-PERFORMANCE SUPPLIER MANAGEMENT

THE SUMMARY IN BRIEF

Purchasing controls your company's future. Organizations that know how to harness the full power of the supply web are going to beat companies that view the procurement function traditionally. To be strategically competitive, relations with suppliers must be considered at the senior executive level and managed carefully. In this summary, you will learn to use a high-technology procurement discipline called the Systematic Technology for Procurement (STeP) process to improve the relationship. Using the disciplined techniques in this summary, you will be able to set up a business environment for proactive supplier performance management.

What You'll Learn In This Summary

✓ **Form, train and charge a procurement team that will lead the procurement process.** You will see why having a team is superior to traditional deal-making at the highest executive levels.

✓ **Define your procurement strategy by identifying your objectives and inviting suppliers to be responsible for results rather than be mere suppliers of resources.** When suppliers are responsible for results they are more likely to be flexible and responsive to changing needs.

✓ **Prepare a Request for Proposal (RFP) that aligns your objectives, details your requirements, and outlines your contractual requirements.** A good RFP invites solutions and puts the focus on your objectives being met.

✓ **Evaluate, rate, negotiate, select and award a contract that meets your needs.** You will see exactly how to rate a proposal and how to keep suppliers focused on meeting your needs throughout the negotiation stage.

✓ **Manage the contract and reward superior results.** Once you decide that performance is what you want from a supplier, you must monitor the contract to be sure it is being delivered.

THE SCIENCE OF HIGH-PERFORMANCE SUPPLIER MANAGEMENT

by Randy A. Moore

— THE *COMPLETE* SUMMARY

Systematic Technology For Procurement

Unfortunately, the relationship between supplier and customer starts off dysfunctionally. This is because the supplier and the customer want two entirely different things. The supplier wants to give goods and services and take money. The customer wants to give money and take goods and services. For the supplier, money is the important ingredient in the relationship while the customer values the goods and services.

You must begin to understand who your good suppliers are and who to get rid off. You must learn to be the one who manages the relationship. Don't let your supplier's customer relationship management program (CRM) dictate the terms of the relationship. Instead, create your own Supplier Performance Management (SPM) program to manage your suppliers and their performance. To ensure you can manage supplier performance, you must pick manageable suppliers.

Supplier Performance Management

The objective of your supplier performance management program is simple: to improve the value of your suppliers' performance. Since roughly half of the average company's revenues goes to suppliers, then approximately half of its strategies for true gain to competitive position must be aimed at those programs and actions that make suppliers more efficient, effective and innovative. The buying organization must substantially increase the value derived from the purchasing transaction.

The value of goods and services has three dimensions: time, quality and price or money. Thus, there are three components to performance: *t* for time, *m* for money and *q* that relates to quality and quantity. When you change one of the three and hold one constant, the third must change. It works like this:

- If *q* is held constant and *t* must decrease, additional *m* will be needed;
- If *q* must increase, and *m* remains the same, additional *t* will be required; and
- If *t* can't be increased but *q* must be increased, then *m* must also be increased.

Four Basic Objectives of SPM

A good Supplier Performance Management (SPM) program requires your organization to achieve four objectives. These are:

1. **Aligning procurement strategies with organizational objectives so that maximum value is derived out of each deal.**
2. **Communicate requirements so clearly that there will be little need for changes later.** The supplier will know what you need and what must be delivered.
3. **Manage the process so that the supplier meets expectations and understands the need for superior performance.**
4. **Integrate company objectives into every contract.** The entire procurement department must buy into SPM or it won't work.

Toward a Systems Approach

To successfully manage supplier performance, you must apply a systems-engineering approach to procurement. This is what STeP is all about. A systems approach recognizes that there is a deal, and the deal is surrounded by a relationship, and the relationship is surrounded by a business environment that contains factors that impact both the buyer and the seller. Supplier management techniques that focus only on the deal fail to leverage the supplier base for true competitive advan-

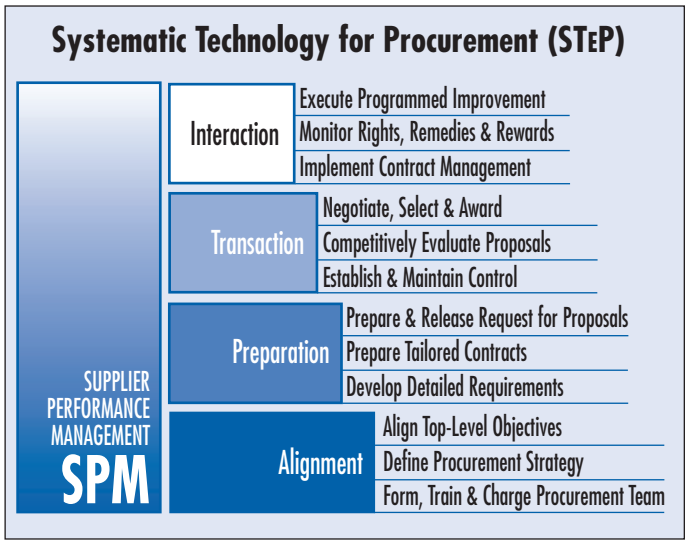
Systematic Technology for Procurement

(continued from page 2)

tage. Partnering and creating alliances or beating up on suppliers on price, quality and delivery aren't the answer.



What you really need to do is build a system that ensures fair value from your suppliers, and that system must build in a method for correcting performance deficiencies and motivation. In other words, you must create a system of remedies and rewards consistent with your business model. Don't rely on deals made on the fly. The worst deals are those made by executives on the run. Cutting a deal on a plane or the golf course and then telling the procurement team the deal is done except for the details is no way to manage suppliers.

The STeP System

This summary introduces the Systematic Technology for Procurement (STeP) process, which will allow you to take a systems approach to procurement.

There are four major components in the STeP process:

- **Alignment:** This entails ensuring that the procurement objectives are correctly synchronized with the overall strategy of the organization. Supplier performance management begins with management understanding what and how it expects the supplier to perform and what it plans to do if the supplier doesn't live up to expectations.
- **Preparation:** Once you know what and how you want the supplier to perform, you must find the appropriate supplier. This process typically involves creating detailed requests for proposals that meet all your needs.
- **Deal Transaction:** Once proposals are received, you must begin the negotiation stage. Push your own terms. Because you have gone through the alignment and preparation stages already, you know what you need and won't be persuaded to make the deal strictly on the supplier's terms.
- **Ongoing Interaction:** Once suppliers are on board, the planning that went on earlier will serve as a performance management tool. Managed properly, your suppliers will become a strategic weapon in the marketplace. ■

Alignment of the Procurement

The first of the four elements of the STeP system is to strategically *align* your procurement team.

Create Your Procurement Team

Your suppliers want to make as much profit from your company as possible. Your company's objective must be to ensure that it gets value for the money it spends.

To accomplish this, you first need to create a multidisciplined team. This team will be high-performance, with all members clear about purpose, roles, values, expectations, functions and goals. Members appreciate and use their differences in a nonjudgmental environment.

The team will do much more than create the procurement deal. It will ultimately be responsible for managing the supplier's performance for the duration of the contract. To create an effective team, you must be sure:

- **The team is composed of the right members.**
- **The team gets proper training.**
- **The team understands the company's objectives and how the procurement process fits in with those objectives.**

Building the right team takes time and money. Don't cut corners. You have two choices: implement a procurement process using a team approach or give the job to a procurement official and live with the outcome when you have to manage the deal.

The first choice might involve more time at the beginning as the team learns to work together and to integrate the organization's objectives into the procurement process. But in the end the result will be a procurement process that gives the company a competitive advantage. High performance demands teamwork from conception of the deal through to the completion of the work. Making the procurement team operate as a team is an essential part of making the supplier act like a team member.

Members of the Team

Everyone with a stake in the outcome should be represented on the team. At a minimum, the following disciplines must be represented either by full-time members or by advocates:

- **End User:** He or she must represent the needs of the user community. For example, if the team has been charged with procuring new storage methods for radio-

(continued on page 4)

Alignment of the Procurement

(continued from page 3)

logical images, the needs of general practitioners on location and radiologists who provide advice from a distance must be considered.

● **Legal:** A procurement agreement is a legally binding contract and must be prepared with the assistant of counsel. Having counsel as an actual and active participant makes more sense than waiting until the terms of the agreement have been reached only to have the lawyer object. Get a good deal-making attorney involved.

● **Procurement:** These members bring two important skills to the team. First, they are good deal makers. They also know how to administer a deal.

● **Finance:** The team needs financial expertise. It must know what the services or goods it is procuring should cost.

● **Technical:** Technical personnel can determine what service or product is required. Your team needs someone with enough technical expertise to understand your requirements and what is available.

● **Technical Writer:** This specialist can ensure that all communications between the team and vendors are clear, concise and consistent.

● **Senior Management:** On a critical deal, senior management participation is important. The role of a senior manager should be one of sponsor rather than participant. He or she should offer the team insight into the strategic importance of the procurement project.

Training the Team

Once staffed, the team must be appropriately trained. Jump-start the team with an experienced teamwork trainer or facilitator. The facilitator can show the team how to accomplish its goals without using a leader-follower model. The team will be less dependent on the leader's abilities. It will take longer to train the team, but the approach produces consistently superior results.

There are four areas team training must cover. They are:

1. Team Dynamics: Team members must understand something about team dynamics to understand what they are going through. A team facilitator can explain that they will go through the stages of forming, storming, norming and performing.

During forming, enthusiasm is high and the team is very productive. However, the next stage, storming, is characterized by defensiveness, argument and competition. If the team understands this is normal, it will pass and the team won't be torn apart. The next step, norming, is vital for high-performance teams. Members at this stage will focus less on the goal and more on harmony, team cohesion and trust-building. Members accept the need to maintain team rules. They then easily move to the performing stage. Then, and only then, can the team's focus be concentrated on the objectives the team was formed to accomplish and the team charge be formulated. The team charge is simply a statement designed to make team members understand the organization's objectives and a mandate to structure the best deal the team can manage.

2. Roles and Goals: To be effective, team members must assume the roles of timekeeper, record keeper and gatekeeper. Training must cover this and the need for structured meetings, team schedules and agendas.

3. Tools and Techniques: The tools and techniques the team needs are embodied in the Total Quality Management process. These are process-driven methods designed to gather data, reduce the data to useful information sets and prioritize requirements.

4. Team Decision Making: When all the data has been gathered and the information has been prioritized, the team must make decisions. These decisions must be based on consensus and reflect the organization's strategic goals and objectives.

Defining Procurement Strategy

The primary objective of a strategic approach to procurement is to create competitive advantage from the relationship between customer and supplier. To accom-

(continued on page 5)

Why Focus on the Procurement Process?

Why should you focus on the procurement process when you want to create greater profits? Because the alternative means of growing profitability have serious flaws. There are four accepted ways to increase profits. You can increase prices, increase sales volume, decrease operating costs or decrease procurement costs.

Increasing sales price is not an easy solution. Unless you can differentiate your product in the consumer's mind and add value, you won't be able to raise the price beyond what the market will tolerate. Increasing sales is not easy either. After all, if there was excess demand for your product or service, you would be able to increase the price and wouldn't have to consider increasing sales. Decreasing operational costs is also difficult. In many companies the focus is on the first three with no attention to the fourth, decreasing procurement costs. The missing ingredient in many organizations is a comprehensive and systematic initiative to leverage the supply web for competitive advantage.

Alignment of the Procurement

(continued from page 4)

plish this objective, the team working on a complex deal must strive to sustain leverage and power over the supplier from the creation to the performance of the deal. You can buy either resources or results. Resource contracts are agreements to procure specific items, products or services that are generic. For the most part, in high-technology procurement you are seeking results rather than just resources. In these contracts, you are buying a solution or an outcome.

Contracting for results requires your team to focus on the scope of the solution. You must decide what system is acceptable, what performance and reliability requirements you have and what results will satisfy you. The results must have time, money and quality measures.

Aligning Top-Level Objectives

You must create a business plan for the procurement. The plan should be distilled into a deal summary sheet that can be used to secure upper management buy-in. To create the plan, you must know what the top-level objectives are. Get key decision-makers and stakeholders together. The plan must articulate the result you are seeking. This will be your mission statement.

Once the results desired are clear, you must determine what the top-level requirements will be for the deal. Brainstorming can yield three to 20 top ideas that go to the heart of the results you seek. Once clear objectives have been articulated, they must be aligned within the organization. Concise briefing packages will be helpful as you brief stakeholders and senior management. ■

For Additional Information on why traditional teams fail, go to: http://my.summary.com

Preparation Within The Organization

Once your procurement team has aligned the procurement objectives with top-level requirements, you are now ready for the *preparation* element of the STeP process.

In the previous stage, you determined what results you need; the first step in the preparation stage is to detail those needs.

Develop Detailed Requirements

The next module in the STeP process can be accomplished by preparing a statement of work (SOW) that explains:

- **What** needs to be done.
- **Who** will be responsible for doing it.
- **Where** the work will be performed.
- **When** the work must be completed.

Your SOW will form the basis for monitoring the supplier's compliance. The SOW must be set up to allow you to easily measure supplier performance.

Be careful when designing the SOW. If you are contracting for results, you must avoid telling the supplier how to accomplish the job. Let the supplier worry about the "how" of performance.

Market Survey

Once you have gathered information from everyone in the company who will be affected by the contract, you can begin a market survey. The survey will gather external data on technologies that can be applied to your objectives and a list of possible suppliers. The idea is to identify as many technologies as possible that meet your requirements and as many suppliers as possible that can utilize those technologies to solve your problem.

Use a request for information (RFI) to find out what suppliers might meet your needs. The RFI should include:

- A statement of the procurement objective.
- A statement that this is only a request for information and not a solicitation for proposals.
- A statement that communication must be limited to a designated team member and that communicating with others is grounds for disqualification.
- A due date.

In addition, you will want information about the organization's structure and financial status, a description of its facilities and infrastructure that would be used to ful-

(continued on page 6)

Avoiding Additional Cost

One of the sneaky ways suppliers operate is to find ways to bill extra. They bid low on your project to get the contract and then hope you won't provide them with enough information to get the job done. For example, suppliers add extra money to the bill by claiming they have incurred additional costs due to delays and disruptions, or ask for an "equitable adjustment" when a new piece of data that was not available at the time the contract was negotiated led to additional work for the supplier.

You can guard against this by creating a procurement library. Have every department that will be touched by the contract contribute specific information about its needs. The library becomes the information repository for the team developing the contract requirements and a baseline of data for suppliers preparing their bids.

Preparation Within the Organization

(continued from page 5)

fill the contract, a list of key people and their qualifications, and information about technological capabilities now in place and being developed. References and contact person information should also be requested.

Tailor the Contract to the Deal

Writing the contract should not wait until the deal has been made. Instead, it should be part of the request for proposal (RFP). The contract will have four sections.

The first section contains the administrative elements of the contract, including party names, recitals, contact information, requirements for legal service, invoicing and payment instructions and shipping addresses. The second section contains the SOW, either as a referenced attachment or in its entirety within the body of the contract. The third section contains the standard contract language used by your company for most mainstream deals. Finally, the fourth section contains the specific terms tailored to the deal. These set the stage for performance management and future performance enhancements.

Prepare and Release the Request for Proposal

Your RFP should stand on its own. It has three functions:

1. To communicate the requirements
2. To solicit responsive proposals
3. To position the procurement team for evaluation and negotiation

The RFP should be divided into five sections. These, along with their minimum requirements, are:

The Executive Summary: Be sure it clearly and concisely communicates the basics of the proposed deal. Include the mission statement and the top-level requirements and a statement that indicated you expect performance promises to be an integral part of any response.

The Requirements Section: The SOW comes next. Be sure all requirements are listed as performance criteria. Avoid mandating methods and focus on requiring results.

The Terms and Conditions: These include the standard terms and conditions that your company uses in contracting as well as the specific terms and conditions unique to this deal, such as intellectual property ownership terms, rewards and remedies, specific warranties and an exit strategy.

The Proposal Instructions: This section lays out the technical requirements for responding, such as the due date, who to contact and how many copies to send.

The Evaluation Criteria: This section lays out what you expect from the vendor's response. It lays out your top-level criteria. You may want to consider letting suppliers know they are welcome to come up with alternative proposals, so if you missed a possible solution to your problem, creative suppliers can provide you with a better idea. ■

What Makes a Contract

"Contract" is a legal term. A contract is an agreement that includes:

- ✓ An offer and acceptance of that offer
- ✓ The passing of consideration between the parties — that is, evidence of an exchange of something of legal value, such as money for services or goods
- ✓ Parties that are competent (that is, they have the capacity to enter into an agreement)
- ✓ The purpose of the agreement is legal

In addition, the parties have to have genuinely consented to the deal — not tricked or induced by fraud, duress or deceit.

The Deal Transaction

The third of the four major elements that make up the STeP process is the actual *transaction of the deal*.

Establish and Maintain Control

When the RFP is out, you must guard against letting control of the process pass to the supplier. Suppliers will do their best to derail your efforts at competition. Don't allow it to happen. One approach is to schedule a presolicitation conference before you release the RFP. Those who attend will get a general idea of what you are looking for and may even begin sizing up some of the potential suppliers as teammates.

You also want to enforce communications discipline. Employees should be instructed that they are not to communicate with suppliers about the RFP unless they are designated as the team member who is to be the contact person. Vendors can and will try to get inside information about the RFP and will try to enhance their chances by soliciting support for their company. They must understand that doing so won't be tolerated and will be grounds for disqualification. Questions that come in through the approved communications channels must be logged in a controlled manner. All questions and answers should be made available to all suppliers. There should also be a cut-off time for any questions.

Shortly before proposals are due is a good time for a bidder's conference. Be sure that the team member who has been fielding inquiries leads the meeting. This reinforces that he or she is the person to turn to with questions. Use an agenda and don't let the meeting degenerate into an open forum on the RFP.

(continued on page 7)

The Deal Transaction

(continued from page 6)

Evaluate the Proposals

You have two goals to remember when evaluating proposals. The first is to select the proposal that assures your company it is receiving the best overall value for the project. The second is to ensure that the selection process was fair.

A senior staff member should be responsible for selecting the winning supplier. He or she will receive recommendations from the procurement team. The team is responsible for sifting through the proposals and using predetermined selection criteria to winnow down the proposals to those that best solve the problem posed in the RFP. You may want to use sub-teams to evaluate individual parts of the responses. For example, a technical evaluation team can evaluate the soundness of a supplier's technical approach while a cost/price evaluation team looks at the cost estimated and proposed pricing.

When the proposals arrive, they must all be evaluated to see if they comply with the minimum stated requirements. Those that fulfill the minimum requirements are then evaluated by the appropriate sub-team. Next, using the evaluation criteria and the relative weight you assigned each in your proposal, you must tabulate the scores. The procurement team will by now have set a competitive zone (CZ). The CZ is the score cut-off for vendors. You should now only have two or three supplier proposals. Those who beat the CZ score are included in the procurement briefs sent to the ultimate decision-maker. Negotiation now starts.

Negotiate, Select and Award

Don't make the mistake of selecting the winner and then entering into negotiations. You should negotiate with all the suppliers in the CZ. The proper sequence is to negotiate, then select and then award the contract. Negotiations will consist of several rounds with each supplier. They should be told they are in the top group, but must understand that they have not been selected yet. Be sure that each supplier also understands that a deal may be made with any of the competition at any time during the negotiations phase. This puts pressure on the supplier's negotiations team to quickly commit to your performance and price requirements.

The team members who do the actual negotiations must be very well prepared. One of the best approaches to negotiations is to understand the principle know as BATNA. BATNA stands for best alternative to a negotiated agreement. Having a BATNA is very powerful and merely means that you know what your alternatives are if you cannot reach agreement. You may be able to do the work in-house or you may have another supplier available. You might be able to partner with another company. The important factor is that you know what your alternatives are. Because you do, you won't feel as if you must make a deal. It is better to walk away from a deal than to have to live with one that is worse than the alternatives identified in your BATNA. ■

Ongoing Interaction With Suppliers

The day the contract is signed is the day the customer must begin managing the contract or the supplier will start managing the customer. Implementing the contract management is the first module of the fourth and final element in the STeP process: *ongoing interaction*.

Implement Contract Management

If you have used the advanced procurement process outlined in this summary, you will be working with a performance-based contract that can yield significantly superior results. Such a contract requires ongoing attention.

You must manage contracts if you are to establish baselines for rewarding superior performance and punishing sub-standard performance. Contract management includes tracking documentation and making sure that milestones are reached. Contract managers make sure the supplier delivers and that there are no excuses for not delivering.

Rights, Remedies and Rewards

If superstar athletes have performance rewards built into their contracts, why shouldn't your suppliers have them, too? In the game of business, the players are your employees and suppliers. High-tech suppliers are your superstar athletes. Adequate isn't good enough for them. In order to win, you need to adopt a team approach, with suppliers and employees working toward common goals.

Just as your company probably prepares annual reviews for its employees, it should provide annual reviews for its suppliers. Such performance reviews require three things: goal setting before the performance period, performance assessment after the performance period, and feedback.

Goals and rewards must be built into the contract. Rewards can be more powerful than punishments. Consider this example. A contract has a built-in liquidated damages clause that is triggered if the supplier misses a critical date. As the supplier prepared the bid, it calculated the likelihood it would miss a deadline and built the penalty into the price. The supplier wins because its liquidated damages are covered in the price, but you lose because a critical deadline was missed. If instead you build in a reward for meeting or beating the

(continued on page 8)

Ongoing Interaction With Suppliers

(continued from page 7)

deadline, you won't find yourself paying for the supplier's missed deadline.

Rather than liquidated damages clauses, high-technology procurement contracts can benefit from clauses aimed at identifying important milestones and working together to correct deficiencies if they occur. Setting up a reward pool or rewarding outstanding suppliers can provide powerful incentives for superior performance.

Long-Term Programmed Improvement

Today, business changes at a rapid pace, and the contracts negotiated with suppliers months ago may hinder your ability to respond. Now try to imagine what it would be like if your key suppliers worked in concert with you. Together you formed a coalition with common goals and objectives. It takes more than imagination to make this vision a reality. It takes a plan — a programmed improvement plan.

Programmed improvement is about understanding the competitive direction of your industry and finding the pressure points in the value chain so that your suppliers realize that it is in their best interest to team with you. Teaming wisely creates competitive advantages for both of you. Suppliers who take notice of your objectives and consider them in conjunction with their own objectives can create valuable partnerships.

There are several programs you can consider to create partnerships. These include:

- **Setting up supplier-tiers** is one approach. Suppliers who qualify for high tiers earn awards like preferential treatment in future contracts. Qualifying for a tier depends on meeting objectives that are of strategic value to your company.
- **Business Base Consolidation** of suppliers can work in organizations that are trying to reap the benefits of economies of scale.
- **Create a continuous improvement initiative program.** Encourage suppliers to continually improve through built-in incentives in contracts.
- **Create innovation initiatives.** Encourage your suppliers to share innovations that can benefit you both.

Managing the Unmanageable Supplier

What can you do when, despite your best efforts, you are faced with a supplier who isn't performing? The supplier may be behind schedule or may demand more money for work you assumed was part of the original contract. If you cannot persuade the supplier to perform as agreed, you must use what leverage you have.

Leverage can come from several places. You may find some in the contract itself. A good contract will provide remedies. If the supplier refuses to budge, you may have to sue or threaten termination. You may also find leverage in the market. Threatening to send out a new RFP could get the supplier's attention. Personal relationships can also provide leverage. Having the president of your company speak directly to the supplier's CEO can be effective. Finally, don't discount the leverage found in your checkbook. Performance can almost always be had for a price. ■

Why Manage Contracts?

The main reason to manage contracts is to avoid problems. You do this by:

✓ **Monitoring Your Responsibilities:** You must identify all contract requirements that drive the supplier's ability to perform. Failing to perform on your end may mean the supplier gets paid for its non-performance if your neglect meant the supplier couldn't fulfill its end of the bargain.

✓ **Monitoring the Supplier's Responsibilities:** Once your house is in order, turn to the supplier's performance. Make sure performance standards are met regarding the time, money and the quality and quantity required under the agreement.

✓ **Get Superior Short-Term Supplier Performance:** Use the positive incentives you built into the contract to motivate suppliers into higher performance levels.

✓ **Get Superior Long-Term Supplier Performance:** Long range, you want to encourage the supplier to make investments that will reduce its future costs and to bring you its best ideas first.

Creating Performance-Based Incentives

Consider creating a composite award pool. The award pool works like this:

✓ **Identify critical performance factors.** These must be critical to the success of your organization.

✓ **Create the pool.** Prior to finalizing negotiations, tell the supplier you want to set aside a portion of its profit as a performance incentive. Have it propose the number and tell it you will match the pool.

✓ **Negotiate performance milestones.** These are the goals that must be reached before money is paid out of the pool.

✓ **Hold periodic award fee events.** This keeps the supplier's eyes on the prize.

How Good Managers Cause Great People to Fail

THE SET-UP-TO-FAIL SYNDROME

THE SUMMARY IN BRIEF

When an employee does not perform up to expectations, managers typically believe the fault lies with the employee. Often this is true, but frequently the manager is complicit as well. Bosses create and reinforce a dynamic that sets up weaker performers to fail.

The "set-up-to-fail" syndrome begins innocuously, with a small act, such as missing a deadline. Once employees are cast (and often miscast) as "weak performers," they can do nothing right in the eyes of the boss. While the boss will see any miscues and setbacks as "confirmation" of his opinion of that employee, any of the employee's successes or proofs of high performance will be ignored. In response, the employee begins to live down to the boss's expectations, which, of course, only reconfirms those low expectations.

The goals of this summary are to unravel the biases, blinders and misperceptions on both sides of the boss-subordinate relationship and provide a way to interrupt the downward spiral of the set-up-to-fail syndrome.

What You'll Learn In This Summary

✓ How you, the boss, may be responsible for the self-fulfilling and self-reinforcing cycle that causes poor boss-subordinate relationships.

✓ Why you may have labeled a perfectly good employee as a weaker performer.

✓ How you are subtly letting subordinates know that you do not trust their work.

✓ How subordinates allow their bosses to view them as weak performers.

✓ The cost of the set-up-to-fail syndrome on the boss, other employees, and the organization.

✓ Why bosses are afraid to confront the problem or fix their relationships with weaker performers.

✓ How to intervene and change both your behavior and that of your subordinates.

The Set-Up-to-Fail Syndrome

A boss's job of meeting numbers and targets has grown more frenzied and complex. Bosses are responsible for working with project teams that span geographic boundaries, and they are also held to tougher performance targets in shorter time frames. They must also motivate and manage an increasingly mobile work force. With evaluation systems tied to results as well as employee satisfaction, managers are torn between empowering employees and making sure they deliver on commitments.

The authors of *The Set-Up-to-Fail Syndrome* expected the managers they studied would either be good or bad at this balancing act. Instead they found that bosses achieve the balance with some subordinates, but fail with others. Employees rated as "higher performers" felt that though targets were tough, they received encouragement and support. Employees rated as "weaker performers" did not feel the same levels of consideration, recognition or autonomy from the bosses.

What Happened?

Perceived weaker performers are not the best, but still perform above the firm's minimum threshold. Perhaps, however, they make a mistake early in their career at the company. As a result, a well-meaning boss gives more attention to the subordinate, who interprets the heightened supervision as a lack of confidence. The subordinate doubts his own thinking and ability, but the boss misinterprets the ensuing withdrawal as confirmation of weaker performance and intensifies involvement in the subordinate's affairs. The boss steers important and risky assignments away from the subordinate, and the frustrated subordinate retaliates by ignoring instructions and continuing to perform below expectations. *Once people are miscast as weaker performers they join in the syndrome themselves and live down to that image.*

The boss's reaction to the subordinate's behavior seems like common sense, especially if the underperformer truly cannot do his work. But often the subordinate just had a bad start, and the set-up-to-fail syndrome is compounded by the superior's behavior.

The Entire Organization Suffers

The syndrome ends up affecting the entire organization. Weaker performers share their misery with peers and their own subordinates. The boss's career development is at stake, because she appears unable to develop relationships with subordinates. The syndrome also affects productivity as HR personnel deal with people who quit or need to be transferred, and employees who feel bullied spend valuable time worrying about unresolved issues and taking more days off. ■

Don't Treat People As Second-Class Citizens

Past management research focuses on an average management style of a leader. Even 360-degree feedback focuses on the average behavior perceived by peers, superiors and subordinates, not the variance between responses. This variance in perception is very important. If every one of your subordinates was asked to describe your leadership style, how different would the answers be?

Dr. Jekyll and Mr. Hyde

The idea for this book began when the researchers found a Dr. Jekyll and Mr. Hyde in one of their subjects, "Jack." Jack supervised four business managers (BMs). BM1 and BM2 described Jack as people-oriented, treating them as equals, demanding but supportive, available but empowering. BM3 and BM4 described him as formal, mean, meddling, and never giving them a break. Similarly, Jack rated BM1 and BM2 highly while BM3 and BM4 received lower-than-average ratings.

When the authors confronted Jack he first referred to different levels of maturity among workers and thin

Don't Treat People As Second-Class Citizens

(continued from page 2)

skins. But when pushed about the clear split among the four people, Jack admitted that he behaved differently with them. He felt the need to show recognition and appreciation to the better performers, the "in-group," while the weaker performers, the "out-group," needed more counseling and teaching. Even though Jack believed in the benefits of delegation, coaching and recognition, he was deliberately acting differently with some of his subordinates.

So What?

The pattern described above emerged over and over with thousands of managers. There were two responses to this information. The first was, "Isn't it common sense to treat different employees differently?" Yes, but common sense is not infallible. Common sense suggests the world is flat. The second response was, "So what?" Perceived weaker performers have more negative attitudes toward their job and the company, so they need more oversight and support. But managers didn't realize their behavior could also lead to employees refusing to share knowledge, help peers, or volunteer for extra projects.

Reading the Boss's Mind

Subordinates are highly sensitive to comparative signals sent out by bosses. They watch body language, listen to what the boss says or doesn't say, and note the choices offered. You may think that even if you do treat employees differently it is barely noticeable, but subordinates are very perceptive. Below are six indicators of a boss's true beliefs:

1. Unsolicited Advice. Bosses tend to give far too much advice to "lower performers," offering help without considering what the subordinate has already tried.

2. Disguised Directions. Bosses offer quick and forceful suggestions to weaker performers, imposing solutions with subtlety ("This is only a suggestion …").

3. Disregarded Ideas. Bosses often give no weight to or ignore ideas from weak performers while giving high performers supportive feedback and the chance to "try it their own way."

4. Response to Failure. Bosses are quicker to seize on the failures of perceived weaker performers, sometimes unfairly.

5. Response to Success. Weaker performers rarely receive positive reinforcing feedback. Bosses are often incredulous when there is nothing to complain about.

6. Harsher Style. A manager's style toward lower performers tends to be one of "presumption of guilt."

These clues do not just affect weak subordinates. People are extremely susceptible to impacts on self-confidence and motivation, both strong impacts on performance. In the face of these undercutting behaviors from a boss, the desire to fight back has limits and is often short-lived. ■

Effects of Being in the Out-Group

When bosses treat perceived weaker performers differently, the subordinates can:

- ✓ Withdraw and reduce contact with the boss to avoid negative feedback.
- ✓ Cover up problems.
- ✓ Volunteer less unsolicited information to avoid attracting the boss's attention.
- ✓ Disconnect from the job, losing drive, enthusiasm and initiative.
- ✓ Stop fighting for her own ideas to avoid being rebuffed and second-guessed.
- ✓ Channel energies into outside activities.
- ✓ Lose motivation to make autonomous decisions or take action.
- ✓ Lose self-confidence from the boss's lack of trust and confidence.

A Vicious Cycle

Most managers feel their weaker performers are the hardest to deal with, and the slowest to improve. But they never consider that the difficulty may arise *because* of their own behavior, not *in spite* of it. Since few managers consider themselves the source of the problem, they do not respond properly. Because they don't see their own role, they create a vicious cycle based on the following problems:

Powerful Undertow of Expectations. Research shows that when interviewers send negative nonverbal signals, interviewees actually perform more poorly. Bosses don't understand the impact of even the subtlest of low expectations and don't understand why subordinates don't fight against it. *It is extraordinarily easy to turn high achievers into underperformers with constant rejection.* They can begin to doubt themselves, and lose enthusiasm within days.

Encouraging Underperformance. Not allowed to make autonomous decisions, having undermined self-confidence, and working under tight targets and deadlines, a subordinate does not have the freedom to think strategically, generate ideas, or develop and delegate to

(continued on page 4)

A Vicious Cycle

(continued from page 3)

his or her own subordinates properly. *Bad attitudes, low enthusiasm and resistance to change are to be expected from those who receive fewer choices, informal rewards, or challenging assignments.*

Self-Fulfilling Expectations. Combining the bosses' behaviors with their demotivational impact, performance improvement almost becomes impossible. Disregard and disrespect tears down self-confidence. With fewer opportunities and resources than higher performing colleagues, it is difficult to disprove the boss's opinion. From the boss's point of view *subordinates are exhibiting the very behaviors anticipated.* Bosses see no efforts to improve, only tangible evidence of trouble.

Bosses create a self-fulfilling process by their behavior. They actually create weaker performers in a way that blinds them to their own responsibility and spurs them to continue. The process becomes self-reinforcing, and turns into a vicious cycle that is difficult for either party to escape.

Caught in a Web

The subordinate's efforts to escape are precisely what draw him or her deeper into the cycle. A weaker performer's immediate reaction to micromanagement or unwanted help is to disconnect from the boss. This fuels the boss's anxiety and his or her desire to exercise greater control. The boss overreacts to any new performance anomalies because he or she feels cut off, and forceful intervention only further discourages the subordinate. Meanwhile the subordinate wastes time searching for more excuses in the face of the boss's intense scrutiny, instead of focusing on the future.

The subordinate's efforts to escape are precisely what draw him or her deeper into the cycle.

Not all subordinates give up immediately, but even those who try to pull themselves out of the out-group find that it is very difficult:

- It's hard to stay motivated with unchallenging assignments and lack of encouragement.
- It's easy to overstride in an effort to impress the boss, and they bite off more than they can chew.
- It's hard to live with conflict. Fighting bosses and their perceptions takes considerable determination and self-confidence and can be interpreted as aggressive or provocative. ■

Labels, Biases and Misperceptions

Most managers assume the subordinate did something wrong to harm the boss-subordinate relationship. But frequently the boss unilaterally decided, often mistakenly, that the subordinate had a problem. Unfortunately, once we label someone, we have a lot of trouble accommodating contradictory information.

Managers, like all people, tend to label and sort their subordinates into the in-group and out-group, to make their lives easier. Working in an uncertain and information-rich environment, bosses need to make decisions quickly; labeling helps by reducing ambiguity and saving thinking capacity for more complex issues. Unfortunately labels are unreliable indicators of performance and potential. While managers admit it requires months to make an appropriate appraisal of a subordinate, in practice it can take as little as a week. Though new information will emerge, the *anchoring phenomenon* — the tendency to give disproportionate weight to a first impression — triggers the labeling process.

Early Labels

Bosses develop early labels based on qualitative issues, such as personal chemistry, empathy or fit. Actual job performance in the beginning of a relationship is less relevant, which means that the boss can still see an in-group member, whose job performance is poor, as a good performer. Labels stick over time because managers are overconfident about their judgment. Experts in their field develop overconfidence because their judgment helped them move up the ladder, and they have little time or latitude to revisit labels after they are assigned. The performance differences they see in their subordinates currently are likely driven by their early labels.

Shaking the Label

Managers believe that they will change their minds and that subordinates can overcome their labels if they meet their performance targets. However, even in the face of contradictory evidence, people who hold an opinion usually become more convinced of it. To shake off their label, weaker performers have to change what bosses notice, how they interpret their observations, and the ways they remember these interpretations.

Incorrect labels remain intact because bosses suffer from selective observation, which turns their labels into sieves, straining out contradictory information. They also tend not to give credit where it is due. Even if bosses notice achievement, they may not assign credit to the

(continued on page 5)

Labels, Biases and Misperceptions

(continued from page 4)

person, but to the *situation*. Bosses also have selectively biased recollection that allows them to remember only what they think is relevant. Often good news from weaker performers is dismissed as unrepresented

In sum, the same behavior can be attributed differently depending on who displays it (see box below). ■

Subordinates Collude to Collide

Just as bosses develop snap opinions of their employees, so do subordinates. They make decisions based on rumors or misinterpretations of unexplained decisions — and may perceive that a boss has deliberately mistreated them, when actually the boss had no choice.

Because of time and attention constraints, managers often make quick decisions that are not necessarily optimal. Subordinates assume the decision was made rationally — that bosses weighed all the options, considered all of the outcomes, and made this specific choice, which they knew would cause distress, offense or embarrassment. Subordinates overestimate the power of their bosses, not realizing that they are also subordinates working within their own constraints. Subordinates are very sensitive to their relative treatment and tend to read errors of omission as errors of commission.

After attaching labels to their bosses, subordinates look for confirming information, just as bosses do. They remember what conforms to their labels and conveniently forget the aberrations.

Once in this mindset, a subordinate will begin to exhibit behaviors that the boss fears:

After attaching labels to their bosses, subordinates look for confirming information, just as bosses do.

● **Discounting Feedback**. Honest attempts at coaching by the boss are perceived as unsolicited and indiscriminate. Subordinates are unlikely to act on the advice because they view it as unhelpful or unworkable.

● **Bringing Up the Past**. Subordinates who nurse perceived past wrongs will likely try to restore equity in some way.

● **Standing Up to the Boss**. Subordinates may challenge the boss's positions or turn down assignments. For people in the out-group who feel powerless, the only freedom they have is to say "no" to the boss.

● **Provoking the Boss**. Subordinates may use the same behavior as standing up to the boss, but the intent is to make the boss act negatively to validate their own view of him as an unreasonable person.

● **Looking for Senior Allies**. Subordinates may try to circumvent their boss by appealing to senior executives. Though this kind of covert lobbying is now being facilitated in many organizations, bosses can still feel threatened, and can hit back.

Psychological Baggage

Overall, it is difficult to know who starts the set-up-to-fail syndrome. Is it the boss who makes a false first impression or the subordinate who overinterprets the boss's actions? The problem is that no one sees the full causal chain. They both blame the other and feel justified in restoring the balance by retaliating. Their alternate realities lead them to keep score differently and assign varying values to different harms. Bosses and subordinates must understand the psychological baggage in each other's mind before they can break the cycle. ■

Same Behavior, Different Takes

	"Model Employee"	*"Underperformer"*
Inferred Motive	To improve the welfare of others, to promote the effective functioning of the organization	To make himself or herself look good, to secure unfair share of rewards or resources

	Interpretation	
Observed Behavior	***"Model Employee"***	***"Underperformer"***
Seeking feedback	Sign of learning, orientation (desire to improve)	Sign of weakness, insecurity, or trying to prime boss's memory
Complimenting the boss	Useful, upward feedback	Flattery, brownnosing
Helping a colleague/ listening to problems	Altruism	Manipulation, coalition building
Not complaining	Sense of self-sacrifice, understanding of the greater good	Conformity tactic
Working long hours	Dedication, owning the issue, taking responsibility	Value of input over output, inability to prioritize, slow mind, or trying to make others look bad
Volunteering for a difficult assignment	Sense of responsibility, sense of obligation	Seeking visibility, unaware of own limitations
Running errands for the boss	Respect for boss's time	Sycophancy, bootlicking
Publicly thanking colleagues	Selflessness, team spirit	False humility, hypocrisy
Agreeing with the boss	Good judgment, respect, effective followership	Weak, useless, ineffectual

For Additional Information on how subordinates set themselves up to fail, go to: http://my.summary.com

The Cost of the Syndrome

In addition to the subordinate who feels she is working without support, the boss **suffers** because of the amount of time and opportunity that is invested in trying to improve the weak performer's performance. Increased involvement produces diminishing returns, and the boss may even have to devote more effort to simply maintaining a performance level. The uneasy relationship is also an emotional drain on the boss and her reputation is at risk if she is judged on her ability to develop talent.

When the boss can no longer handle the problem, the cost shifts to the **HR department**. HR helps managers deal with perceived weaker performers, and also deals with the consequences of failed relationships, such as grievance procedures, transfers, terminations and exit interviews — none of which is the value-added work of motivating, attracting and retaining talent.

The **team** also suffers. A boss's natural reaction to a lack of faith in lower performers is to overload higher performers. These people have more to do and spend less time on actual jobs. They may end up leaving the company or burning out.

Having a boss in the out-group also affects his **subordinates**. The task-related constraints, short resources and limited autonomy of the boss will trickle down to his subordinates. Subordinates will also feel the pressure that their boss is under. Many disenchanted managers inflict downward the very behavior they complain about from above.

All of this suffering filters through the **organization**. The disenfranchised talk to people in other divisions and engage in commiseration sessions. Customers may start to notice poor service, and suppliers and industry peers will begin to hear from employees. ■

Why Not Change?

If the cost on an organization is so great, why don't managers change their behavior?

First, they do not realize the full extent of the costs. They don't see the hours wasted complaining about management and avoiding work.

Neither do they feel personally responsibility for the symptoms they see, either because they have never been in the out-group or they do not want to acknowledge responsibility. Even when they do acknowledge a problem, many managers suggest firing the underperforming employees. But that only deals with the symptom. The out-group is not necessarily full of the worst performers; in fact, they frequently exceed the firm's minimum performance threshold. Termination involves the costs of rehiring and training, as well as the costs associated with decreased morale.

Why Bosses Avoid Feedback

Despite the difficulty and stress involved in staging an intervention and the reasonable belief that trying to fix the relationship is a waste of time, the boss should still make the time to overcome the subordinate's belief that the boss's criticisms are invalid.

Many bosses won't make the effort, however. Although managers expect their better performers to react well to even critical feedback, they suspect that weaker performers will not take it well, will not likely change, and that monitoring them will only waste more time. As a result, many bosses would rather bear a tolerable situation than risk giving feedback that will be ignored.

The problem is that managers may simply be framing the situation incorrectly.

Just as people label things to make them easier to understand, we tend to frame a decision to focus on the key elements and relationships. For instance, in the 1980s, American car manufacturers were trying to calculate the optimum size of production runs, taking the cost of changing over production lines as a given. The Japanese car companies framed the same problem by considering the most efficient way to produce the requisite models by reducing changeover times.

Bosses frame their interactions with subordinates based on their mental picture of the issue and relevant elements. Research shows that bosses frame stressful situations in narrow, binary ways that stay frozen during the discussion, even if the discussion does not go their way. The boss insists on getting the subordinate to agree with his "right" point of view. The subordinate realizes the only two options are to comply or resist. No one is open to other valuable ways of looking at the issue.

Unilateral Change

Other managers decide to dive into changing things unilaterally — devoting themselves to more coaching and giving the weaker performer new and challenging projects. This does not work because it is difficult for either the boss or the subordinate to forget past grievances, and it only focuses on the boss's behavior. Trying to break the cycle without the subordinate's active contribution is self-defeating. Though this Pygmalion process can work, it can also overwhelm the subordinate with too much too soon. It does not address the underlying reasons for the original problems and does not prepare anyone to deal with another problem in the future.

(continued on page 7)

Why Not Change?

(continued from page 6)

Unilateral action by the boss at best will move one member of the out-group into the in-group, and at worst will cause the subordinate to fail and the boss's labels to be further reinforced.

Bosses and subordinates must deal with the problem bilaterally by starting a dialogue to untangle their complicity in the unhealthy relationship, but starting the dialogue is hard. Subordinates fear looking feeble or whiny, especially by suggesting that their problem is really the boss's problem. Bosses feel very uncomfortable giving feedback especially to underperformers. So both parties know something is wrong, but refuse to address it. ■

For Additional Information on incorrectly framing feedback, go to: http://my.summary.com

Cracking the Syndrome

Once you recognize a problematic boss-subordinate relationship, you as a boss must take concrete steps to intervene and break the cycle. The first step is to mentally reframe the forthcoming discussion explicitly — including your contribution to the dysfunctions — instead of focusing on fixing the subordinate.

Bosses should also prepare by developing data to back up views and the openness of mind to take in the subordinate's input. By challenging their own views and "evidence," they will be more open to a challenge from others. Ask searching questions about the subordinate, his performance, and what blind spots and prejudices you might have.

Steps for Intervention

1. Set the Stage. Acknowledge the tension and admit some responsibility for problems in the employee's performance as well as a desire to improve the situation together. Make sure the subordinate feels free to discuss your behavior and choose an appropriately neutral place for the discussion.

2. Agree on the Symptoms. Resting on facts and data, not feelings, come to an agreement on the symptoms you are going to address. Identify the specific areas where you concur that the subordinate has struggled.

3. Diagnose the Causes. Jointly explore the causes of weak performance, including how your behavior as a boss has affected that performance. Make both sets of assumptions explicit. Express why you act the way you do so that the subordinate understands your constraints, and allow the subordinate to vent about past injustices.

4. Find the Cure. Agree on a joint contract of performance objectives that will allow the relationship to go forward. This should include action by both parties and not just focus on "fixing the employee."

5. Prevent the Relapse. Agree to more open communication in the future. The subordinate must start delivering and you should drop the selective observation and recall any biased attributions.

6. Monitor the Effectiveness. You must follow through on the contract as a process. Make sure performance targets are reached, that communication occurs, and that you reach closure at the end of the period.

The effort that goes into the intervention and the commitment of the two parties will determine how successful it will be and what kind of payback the boss will receive. The two dimensions that can improve are the subordinate's performance and the quality of the working relationship. Optimally, both will improve, but even if only one improves markedly, the costs of the syndrome are decreased. Should the intervention have a poor outcome, the boss still benefits from the preparation and coaching of his employees.

If You're the Subordinate

If you want to take the initiative for the intervention as a subordinate, it will be easier if a third party helps. Get your job in order, put yourself in your boss's position, make it easy for the boss to discuss, and don't rush the situation. Give the boss time to come up with his own side. The steps are similar to the steps above, but in this case the boss is probably unaware that he is part of the problem. To broach the topic considerately:

- **Concentrate on what you can do for the boss,** such as improving your behavior.
- **Don't get stuck if your emotions get the best of you.** Continue the discussion later.
- Allay fears by **understanding the boss's key concerns** ahead of time.
- Bring up the boss's contribution to the process by describing **how his behavior makes it hard for you to follow his own advice.**
- Hammer out and **jointly agree on a workable plan**.
- Deliver on your plan. ■

Feedback Is Not Always Rejected

Subordinates accept negative feedback more readily when:

1. The source is perceived as reliable.
2. The receiver trusts the intentions of the source.
3. The receiver perceives the process by which the feedback was developed as fair.
4. The receiver perceives the process by which the feedback is communicated as fair.

Lessons from the 'Syndrome Busters'

In trying to escape the set-up-to-fail syndrome, do not think it is necessary to treat all employees the same. Providing perceived weaker performers with more guidance up front is appropriate in a context that makes it easier for them to seek guidance and accept feedback. Consistent syndrome-busters have several ways to keep the boss-subordinate relationship on the right foot.

1. Frame the Relationship. Communicate frequently in the beginning of the relationship about priorities, performance measures and time allocation. Be explicit about your own work style, and what you like and don't like.

2. Develop Relationships. Spend one-on-one time with subordinates in the first few months listening to their needs and establishing a distinction between the person and the performance of the person, so that criticism of one does not seem like criticism of the other.

3. Resist Crude Labels. Do not categorize employees in simplistic ways and do not label prematurely, before a subordinate has time to improve.

4. Monitor Evaluations. Be careful about seeking, noticing and remembering facts that confirm initial conclusions. Actively search for disconfirming evidence and alternate explanations.

5. Intervene Early. Do not wait to give feedback, because it compounds mistakes and makes it more of an adversarial situation instead of an opportunity to explore assumptions.

6. Share Responsibility With Subordinates. Invite subordinates to act as joint custodians of the boss-subordinate relationship. Subordinates are also part of the set-up-to-fail syndrome, but may feel uncomfortable taking the first step to intervene. ■

Getting There

As you attempt to stop the set-up-to-fail syndrome in your relationships, you will find certain challenges in turning the ideas presented in this summary into action. Here are some ideas to make the changes easier:

Nurture or Nature. Although some people have personalities that make them naturally good at supporting and empowering all of their subordinates, the majority of bosses have to work at overcoming aggression, impatience and micromanagement tendencies.

Make Change a Priority. So many things clamor for your time that it is easy to put off personal development, but no change happens if it is not a significant priority. Because of the boss's responsibility in the set-up-to-fail syndrome and the self-fulfilling nature of the dynamic, it is very easy to put off change.

Transition Phase. Remember that modifying your behavior on a situation-by-situation basis is one thing, but modifying your approach so that it becomes "second nature" takes time.

As you try to change, you will find yourself reverting to your dominant behavior when the pressure mounts.

Enlisting Help. Resolve and willpower are important to make the change, but there are limits to going it alone. Establish relationships and structures to encourage ongoing feedback from colleagues and subordinates. Also, find an unbiased ear or mentor to listen to you and sustain your resolve.

Crafting Your Behavior. As you try to change, you will find yourself reverting to your dominant behavior when the pressure mounts. Find ways to override your automatic response by slowing down the conversation, listening, considering responses carefully, asking questions to get relevant information, postponing responses if necessary, preparing for conversations and interactions that may be difficult, and reflecting on conversations and interactions so you don't make mistakes more than once.

Preparing for Setbacks. Successful change includes improvements, plateaus, regressions and recoveries. It takes smokers an average of three to four attempts to break the habit in a sustainable way. Do not be demoralized by reversals: They will not destroy your subordinates' faith in your commitment if they believe you are truly working to change.

Investing in Yourself. Just as you may be willing to spend years developing the right golf swing, you may have to spend years developing your leadership skills. Maximizing subordinates' contribution is a critical skill, and it is worth all the investment you can make. ■

Personal Transformation

Andy Pearson, former head of PepsiCo and chairman and CEO of Tricon, realized he could change his behavior in his seventies. "There are a lot of ways to ask tough questions without killing somebody," he said. "I think I've gone from making my way by trying to be the smartest guy in the room to just asking questions and insisting that the answers be reasonable and logical." A colleague recalled that just three years before Pearson "was brutal. He'd just beat the crap out of us. I remember one time he told us, 'A room full of monkeys could do better than this!'"

THE SUMMARY IN BRIEF

Business leaders everywhere are struggling to understand how to build a sophisticated customer success organization and implement it into their businesses. ***The Seven Pillars of Customer Success*** is a framework designed to show you how to create and execute an impactful customer success organization, regardless of company maturity or industry.

Author Wayne McCulloch is a customer success leader at Google Cloud. He proposes that customer success is always there (physically or digitally), and this philosophy should be spread out across the entire company. It isn't just a little department that only owns the success of the customer; it is essential for the success of all departments. You have to build a culture of customer success inside your organization. When your company embraces a customer success philosophy and each department focuses on enhancing their moments of truth with their customers, you will see a better customer experience and an increased financial return.

IN THIS SUMMARY, YOU WILL LEARN:

- The importance of operationalizing customer success.
- The difference between onboarding and adoption.
- To leverage all departments for expansion.
- To view customers as a strategic part of organizational growth.

Pillar #1: Operationalizing Customer Success

The first pillar is arguably the most important pillar but is the least understood and the least mature. There are a lot of different definitions and interpretations of operationalizing customer success; the function has yet to be standardized. The customer success team delivers proven best practices at scale, in a repeatable way and with efficiency, to drive the desired outcome of your customer and your company, wrapped in an exceptional customer experience.

A Company Philosophy

Customer success should be a company philosophy, not limited to a department of people, although the customer success team carries the torch for the philosophy and coordinates customer success activities. We don't want one team to care about customer success; we want the whole company to care. So how do we make customer success a philosophy and not just a department? We help the rest of the company understand their role in making the customer successful. We can encourage the finance team to add little notes to the invoices such as, "We love working with you as a procurement team!" A simple example like this would help make the company more customer-centric. Correctly placing customer success within your organization will unleash its full power.

Pillar #2: Onboarding

At the Olympic Games in Rio in 2016, a Fort Lauderdale-born athlete named Jeffrey Julmis was running the 110-meter hurdles for his native country, Haiti. He had competed well enough in the quarterfinals and had advanced to the semifinals. Shortly after the race began, Julmis misjudged his spacing and tripped over the first hurdle. His arms and legs went flying, and when they made contact with the ground, they were all tangled up in the same hurdle that had done him in. Needless to say, because he tripped over the first hurdle, he didn't qualify for the finals. His Olympic adventure had suddenly ended. A poor onboarding experience is like tripping over the first hurdle.

Value Defined

What is customer onboarding? What does it look like? And why is it so critical? Customer onboarding is jointly defining a Customer Success Plan and proactively guiding a customer to achieve value one in the fastest possible time. Onboarding is the moment on the customer's journey when we can sit with the customer and confirm what we've learned from the sales handoff (or prior), ensure alignment around goals and milestones, reset expectations where there is confusion, and ultimately map out the Customer Success Plan with the customer. Next, we want the customer to clear that hurdle and have their first win.

During onboarding, you want to give your customer something they care about and value, so you need to sit down with them and agree on what value one should look like. Agree on a win your customer can share with their management that will help them (and your company) look good.

In one case, we were able to identify there was a risk to achieving value one, so we proactively got in front of it to remove it as a high hurdle to success. We suggested a much more feasible, value one. We suggested the "successful rollout and deployment of all new systems inside one airport." I explained this was a better value one because it would be a joint win early on. It would also give us a chance to work out the kinks and fine-tune our processes before we rolled it out across multiple countries. My customer's response? "Yeah, that makes more sense!"

Pillar #3: Adoption

Onboarding is a finite activity: it's the definitive period when the customer gets to know you. Adoption, on the other hand, never stops.

Value Adopted

Back in 2007, my boss at the time bought me my first iPhone. He gifted one to all of his direct reports. "This new Apple iPhone was just released this week and you should have one." I looked at the phone and thought, Why would I want this? I love my BlackBerry, and I can type 50 words a minute on it. It's my favorite device in the world, and you're giving me this thing that doesn't have any buttons on it and expect me to use it? The iPhone was too different, too foreign. I had no idea how to use it, and I didn't want to learn. I didn't adopt it because I didn't know how it worked. So I gave it to my executive business partner.

I can't remember the specific moment when I decided to bite the bullet and adopt the use of the iPhone, but when I did, my life invariably changed for the better. When I was first introduced to one, I couldn't be bothered, but today, I can't live without it. When customers adopt your product,

you want it to become something they can't live without. Better yet, they enjoy using your product. Customer adoption is achieving operational dependence, while simultaneously achieving business value by using the right features and functionality of the solution.

Pillar #4: Retention

Bain & Company, a management consulting firm headquartered in Boston, conducted a study that concluded a 5% increase in customer retention leads to a 25% increase in profits. Think about that for a second: a small increase in retention leads to massive profits for your company—each retained customer is very profitable.

Value Sustained

Customer retention is the carefully orchestrated process whereby the customer chooses to extend their relationship with you. The customer doesn't choose to stay with you because of the historical value you've driven for them—they stay because of the vision and promise of the future you have painted with them. They trust you because you have driven value in the past, but they will continue to work with you because of the future value you promise to provide.

The Deadly Churn

The breakeven point for a customer to start generating a profit is typically around the 18-month mark. This varies depending on industry, product type, and company maturity, but I have found that if a company churns a customer within the first 18 months, the company will typically lose money. On the other hand, if you keep a customer for five years, everything past month 18 is "practically" pure profit. Customer retention is one of the simplest ways to achieve profitability, ergo customer success can drive company profits.

Be the Growth Engine You Were Meant to Be

Customer retention means being continuously focused on the customers' desired outcomes. It means understanding your customers thoroughly, more than just their goals and desired outcomes. You need to know their personalities. Is the stakeholder driven by ego? Are they altruistic? Recognizing these nuances will change the way you approach an account. It will change the words you use and even the playbooks you write. Remember, a customer's goals and objectives are always changing.

Pillar #5: Expansion

Customer expansion occurs when a customer finds value in your solution and grants you the opportunity to increase that value.

Upselling

Upselling is buying more of the same thing you already have. It's supersizing your meal so you get a bigger portion of food. The most obvious example of this is supersizing your McDonald's fries, and upgrading from a medium to a large. Upselling is selling more of the same. Acquiring a new customer is more expensive than retaining an existing one. Upselling allows you to offset the cost of new customer acquisition.

Cross-Selling

Cross-selling happens when you offer your customer other products and services. If they already have a large order of fries, cross-selling means selling them a hamburger, a soda, and a piece of warm apple pie. A customer initially buys your solution because they have an issue or a challenge they're trying to solve. They come to you for one thing and may not be familiar with the other offerings you have. You might have software products and services that would help solve your customer's additional problems.

Know the stakeholder, identify priorities and room for improvement, connect the stakeholder to your findings, and bring in sales. With upselling, or customer education, you are explaining to your customer the opportunity they have to see increased value through the use of your solutions.

Pillar #6: Advocacy

Yesterday, I had a conversation with one of my biggest customers about their advocacy program. They are a $1 billion company with thousands of clients. "We have a ton of advocates," the stakeholder responded. "We always get thank-you notes and emails. And we have internal case studies and testimonials." "Wow, that's great," I said. "Do you capture that feedback and share it with the market?" "Oh, no. We don't do that." "Then you don't have customer advocacy." "What do you mean?" the stakeholder asked. "You have advocates, but you aren't leveraging them for advocacy."

Value Championed

Customer advocacy is more than just a pat on the back or a thank-you note from your satisfied customers. Customer advocacy is receiving great feedback and capitalizing on

it. Customer advocacy is a competitive advantage for your company because it assists in the acquisition of new logos and solidifies existing customers through a multitude of assets and programs. How can customer advocacy create a competitive advantage? It's like reading a review before you buy something. The more advocates you have spreading the word, the more evidence you have that your solution works.

Customer Acquisition through Building Advocacy

If we can create, find, and nurture advocates inside our customer base, marketing can amplify their voices via blogs, conferences, case studies, and references. Advocates are another asset that sales professionals can leverage to improve their sales process because ultimately, people trust other customers more than they trust you. You think you have the best solution (of course you do!), but your customers aren't necessarily looking for the best. They're looking for a partner that can drive the best outcome, and advocates can communicate that message.

Pillar #7: Strategic Advisor

Many of you think you need trusted advisors, but what you really need are strategic advisors. The Strategic Advisor Pillar focuses on how to elevate performance and value inside your customer base. A strategic advisor is someone who actively advises organizations on important strategic decisions, in an unbiased fashion, using deep industry knowledge and domain expertise, to deliver the best outcomes through business and digital transformation.

Why Do We Need Them?

Not only do strategic advisors look at the big picture to help solve overarching issues and challenges, but they also prove to your customers that your organization is knowledgeable about their business and the way they operate. Strategic advisors prove to your customers that you understand their priorities, processes, relationships, and politics. They also bring industry knowledge and in-depth understanding of their company's solutions. When you give your customer all that strategic advisor gold, it makes it that much harder to switch vendors.

Customer Success Managers respond to inquiries and incidents. They review results, analyze data, and examine events that have already occurred. They react. Strategic advisors, on the other hand, plot the course and look for deviations. They are heavily involved and own the Customer Success Plan. They hold firm in their recommendations (because of their experience) and aren't afraid to be assertive. They're prepared to push back and escalate if necessary because they want the customer to have success. A strategic advisor is an elevated layer of capability.

Customer success is here to stay, and how it looks in the future of your organization is entirely up to you. But I will tell you this, if you follow the pillars and take the steps outlined in this book, you're off to a really good start.

One of the world's leading customer success experts and a Top 100 Customer Success Strategist, **Wayne McCulloch** works with Google Cloud's entire SaaS portfolio as the Customer Success Leader. He's a keynote speaker and the recipient of multiple industry awards with more than twenty-five years of experience in customer-focused roles. THE SUMMARY IN BRIEF

There are countless ways to connect with your customers, who can use the tools at their fingertips to widely publish their criticisms and positive feelings about your company. Companies that have been around for hundreds of years can disappear in an instant if an upstart competitor co-opts their market share by earning more brand loyalty through deeper customer connections.

The Seventh Level: Transform Your Business Through Meaningful Engagement with Your Customers and Employees teaches business leaders a structure for garnering the attention of their customers and employees and engaging with them on deeper and deeper levels.

Author Amanda Slavin explains each level of engagement and how to get there. The culmination of this journey is the Seventh Level of Engagement: when your personal values and beliefs align with another's message, and you derive meaning and even identity from connecting with this brand, person, or concept.

IN THIS SUMMARY, YOU WILL LEARN:

- What the Seventh Level Framework is and how it can help you.
- The characteristics of each level of customer engagement.
- What you should do to move your customers to the next level.
- How to apply the framework to your internal relationships.

Introduction To The Seventh Level Framework

The Seventh Level Engagement Framework is a structure for creating engagement—for garnering the attention of your employees and customers. It can help you create a meaningful connection with other humans—be they employees, customers, peers, or stakeholders—and make changes within your company to increase engagement.

There are seven distinct levels of engagement. At the Seventh Level, customers are active participants in building and supporting the brands, companies, people, employers, or ideas they love.

Start with Your Seventh Level Statement. Before you can walk through this framework and reach the Seventh Level with someone else, you have to determine your own Seventh Level Statement.

Ask yourself: Who are you? What do you stand for? What do you believe in? What do you do what you do?

When you don't know your own Seventh Level, you end up trying to be something you're not, and your attempts to connect fail. Once you determine your Seventh Level Statement, you can use it to create meaningful, engaged relationships with the people in your life.

Level One: Disengagement

Someone at Level One is disinterested. Bored. Idle with their work. They're avoiding tasks, interactions, or attempts at communication.

At Level One, your audience doesn't respond to your efforts. You have to ask yourself if you're reaching out in the way your audience best receives information. Do they use snail mail or email? Have you announced your product in the channels they frequent? Do they use the same social media platforms you do? Don't try to be something you are not. Instead, identify how customers connect with who you are.

The beauty of online communication is having access to real-time data and metrics. Conduct market research to find out as much information about your customer as possible. Then target, optimize, test, pivot, and make sure you're converting at a very low-cost point. If it's not working, continue to pivot.

Level Two: Unsystematic Engagement

At Level Two, you need to clarify your communication. This can be a particularly huge issue in marketing. Companies often use jargon that no one understands, and they are surprised when customers don't want to buy anything from them. Or they want to communicate that they are a fresh, clean brand but choose colors that remind someone of McDonald's. The message you put out in the world needs to be aligned with your Seventh Level lens and your brand identity needs to communicate what you're trying to convey.

Think about what you are saying to your customers. You should be surveying your customers to understand the language they understand. A good rule of thumb: If you can't explain to an eight-year-old what you do, then your target customer probably won't get it either.

When you're communicating with employees, don't ask, "Does that make sense?" No one wants to admit not understanding. Instead, ask, "Did I explain that correctly?" This takes the pressure off them and puts it on you, the leader. And make your employees feel comfortable with the idea that they can come to you anytime if they don't get something.

Level Three: Frustrated Engagement

Level Three is characterized by a person demonstrating interest, only to have that interest wane due to distraction. Limit the distractions for your internal and external customers, because the world is distracting enough.

Make sure your website doesn't take too long to load. When a customer is asked to go to a landing page, make sure the pop-up you add to that page is relevant to what you're asking them to do and why they're there. Avoid vague messages: have clear calls to action.

Social media is inherently distracting. It's important to use the tools instead of letting the tools use you. If social media isn't employed in a way that pushes your customer base to a higher level of engagement by encouraging a specific targeted action, you're only hurting your messaging efforts.

The same thinking applies to a brick-and-mortar store. Work on creating engagement and meaning with your storefront instead of chaos and distraction. And to presentations. Tons of words and very few visuals don't speak to anyone.

This applies to your internal customers too. As a leader, how often do we ask something of an employee, then

Slack them with something else, then email them about yet another thing? We are constantly keeping our employees at Level Three: Frustrated Engagement, when we should set boundaries for each other.

Level Four: Structure-Dependent Engagement

Level Four is characterized by a person's active response to instruction when the suggested action isn't too demanding. In marketing, this may look like a social media engagement, such as when you post an image that says, "Comment below with your favorite ice cream flavor," and people comment.

Social media engagement in the form of likes, comments, retweets, click-throughs, and accumulated followers is, for many people, synonymous with meaningful engagement, and this is especially true at Level Four. The problem is that so many people are settling for Level Four engagement. This is more about tools using us than us using the tools. It says nothing about the quality of the response.

The metrics of how people interact with you on platforms such as Twitter and Facebook are crucial for measuring the effectiveness of your social media campaign and accomplishing goals such as generating leads and sales. But they aren't nearly enough to build legitimate brand loyalty. Use your Seventh Level Statement as your guiding force so you aren't obsessed with vanity metrics for no reason. Set a higher reason for the work you are doing and how it fits into a larger narrative.

Depending on the size of your audience, to maintain trust with subgroups who have shifted to lower than desired levels, you might need to segment your efforts—to customize how you communicate to each group.

In the workplace, Level Four engagement is common among low- and midlevel employees who clock in, complete the tasks they're given, and clock out. They lack initiative. But today, many people are looking for flexibility, a commitment to health and well-being, and purpose. This requires moving past Level Four.

Level Five: Self-Regulated Interest

Level Five is characterized by excitement, but the engagement is driven by self-interest rather than an interest in another person or organization.

Level Five in marketing often entails a sweepstakes, discount, referral code, or other incentive that entices customers to do something because they get something. The incentive isn't sticky, and when done carelessly can cause distraction. You must have a strategy to build a more meaningful relationship based on the incentive.

In the workplace, Level Five can look like giving employees comp days for working overtime—anything that incentivizes going above and beyond the bare minimum.

At Level Five, you still need to use your Seventh Level Statement in determining incentives to use and influencers and partners to work with. If you partner with a celebrity, for example, it's not just about how many followers or how many likes or comments they get but who is following them and what they are saying. Analyze the sentiment behind the comments, not just the number of comments.

Sweepstakes are also a key strategy for Level Five, but they have to mean something. Create a story behind the sweepstakes that communicates your brand.

In the workplace, for higher levels of engagement, you have to understand the needs of your employees, and they have to understand the company's needs. Higher levels of engagement require piquing an employee's interest and paying them the value they deserve. Often, it's not about the money. The key is finding out what drives or motivates your employees to do their job well and engage with the company.

Level Six: Critical Engagement

Level Six is characterized by a person feeling motivated and inspired enough to set goals to make a positive change in their life.

Level Six is a time to publicly share your core values that set your culture and distinguish you from competitors. It's about doubling down and ensuring you are living by the values you communicate. Make sure you are authentically aligned with your Seventh Level Statement when identifying your core values and communicate these core values so they are easily understood. Create a campaign around those core values to change the way people think about their lives.

Your internal goals must match your marketing message. Make sure you're walking the walk internally. Companies can inspire someone to become an activist or just to live differently, change their routine, or feel a little bit more strongly about a topic.

Testimonials are a huge part of Level Six: How did someone's life change by using your product? You don't have to be a philanthropic brand to inspire others.

In the workplace, companies that are structured as a bureaucracy are not set up to engage with employees at Levels Six and Seven. You want employees to feel a connection to the company's core values and start to adapt them to their personal lives. Moving toward a more self-organized workplace structure, away from a traditional rigid hierarchy to one that encourages employees to take ownership over their careers, is a great way to strive for the Sixth Level of engagement in the workplace.

Level Seven: Literate Thinking

When loyalty doesn't stop at a purchase and part of a customer's identity comes from the brands they use, the customer moves to the Seventh Level.

We're bombarded by content, writing, words, images, and videos all the time. How can brands that strive for Seventh Level Engagement connect meaningfully, deeply, and emotionally with their customers? At this level, stories are crucial. Books are a significant part of the Seventh Level. Sharing in long form in books and on LinkedIn leads to higher-level engagement.

At this level, it is about including your customers in your story and making them the hero. Make them feel special, seen, and heard, and they'll carry what you're doing forward. Companies announce exclusive offers, launch experiences, and new products to Seventh Level customers the day before the general public as a "thank you" for being loyal. This also activates Seventh Level customers to bring other customers up from lower levels.

Even these customers may be distracted by a million other things. It's important that you create a pathway for people to stay committed, which means that you have to also be committed to them. Loyalty and retention programs come to mind. You need to emotionally incentivize your customers by making them feel special.

This is a lot of work, but this relationship—and your job—will get easier, not harder, over time, the more energy and effort you put into it. That's because at Level Seven you are cultivating brand advocates who can spread your message just as effectively as you can! Maintaining Level Seven relationships is what separates the world's most beloved brands from those people forget about.

In the workplace, at the Seventh Level, employees are personally connected to the purpose of the company, not only to the benefits or their pay. They work there because of what the company stands for and does on a daily basis. A company should prioritize making its top-performing and most bought-in employees feel appreciated for their hard work and dedication to the organization's goals and values.

When you reach the Seventh Level, you'll see massive returns. Use the Seventh Level Engagement Framework across your entire organization. It's a flashlight shining light on how to build connections that can be used in every part of your life.

Amanda Slavin is the founder and CEO of the award-winning brand consulting firm CatalystCreativ. Amanda guides brands like Coca-Cola, Google, and WeWork to do good for the world without having to sacrifice their bottom line. She's spoken at events like SXSW and TED about how this framework is the future of meaningful connection, and had her work featured in Inc. magazine, Forbes, Fast Company, Wall Street Journal, and Time magazine.

The Solutions Focus

Paul Z. Jackson and Mark McKergow

SOUNDVIEW Executive Book Summaries®

FILE: HANDS-ON MANAGEMENT

By Paul Z. Jackson and Mark McKergow

The Simple Way to Positive Change

THE SOLUTIONS FOCUS

THE SUMMARY IN BRIEF

Traditional approaches to problem-solving assume a cause and effect between problems and solutions. The Solutions Focus *outlines a different way to attain goals that focuses on solutions not problems; the future not the past; and what to do as opposed to who to blame.*

To illustrate, we'll take an example in this summary: traffic jams on a highway caused by drivers abruptly changing lanes. The drivers behind the lane changers quickly apply the brakes, setting off a chain reaction that causes traffic down the line to come to a standstill. Examining the problem (drivers changing lanes) doesn't lead to a solution — there's not much you can do about the lane changers. Instead, the traffic authority in question applied a Solutions Focus mindset to find the solution (lowering speed limits during rush hour).

In The Solutions Focus, *authors Paul Z. Jackson and Mark McKergow give you the tools to head straight toward workable answers for your business or enterprise.*

What You'll Learn In This Summary

✓ **The SIMPLE Model.** The Solutions Focus methodology is built around a framework of six principles:

1. Solutions, not problems;
2. Inbetween — the action is in the interaction;
3. Make use of what's there;
4. Possibilities — past, present and future;
5. Language — simply said; and
6. Every case is different.

You will learn how to apply each of these principles to your own problems.

✓ **The Solutions Focus Tools.** You will understand how to apply certain Solutions Focus tools to help you implement the six principles of the SIMPLE model. The Solutions Focus Tools are: platform, future perfect, counters, scaling, affirmation and small actions.

Key Principles and Tools For the Solutions Focus

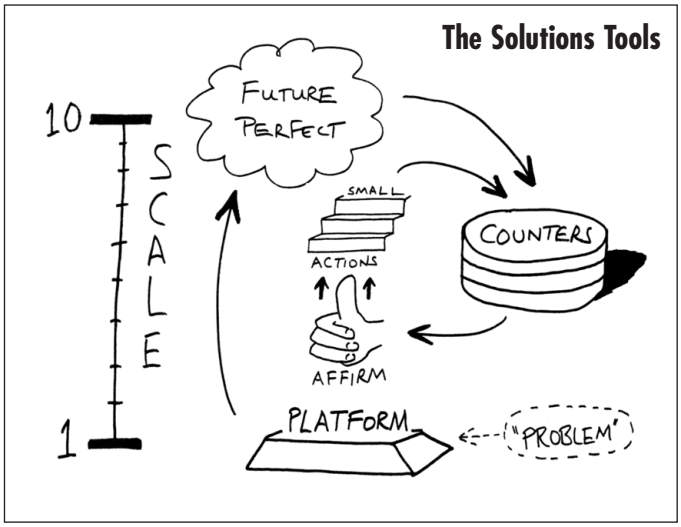
What is the "Solutions Focus"? The answer isn't complicated. The Solutions Focus is a different approach to solving workplace problems and focuses on a positive method of dealing with organizations, teams and people. The Solutions Focus means avoiding the pointless search for what causes problems and instead provides a direct route that leads to a solution. In other words, the focus is on solutions (not problems), the future (not the past) and on what's going well (rather than what's gone wrong). This approach can be summarized in the phrase: "Find out what works and do more of it."

Assumptions

There are a number of key assumptions and principles that underpin solution-focused work:

- **Change happens all the time; Your job is to identify and magnify useful change.**
- **There is no one right way of seeing the world.**
- **A detailed understanding of the problem doesn't translate into a solution.**
- **The solution's clues are there in front of you; You just have to see them.**
- **Intelligent small changes can have bigger impacts later on.**
- **It is important to stay solution focused, not solution forced.**



The Simple Model

The Solutions Focus methodology is built around a framework of principles known by the acronym SIMPLE. The six principles of the model are as follows:

1. **S**olutions not problems.
2. **I**nbetween — the action is in the interaction.
3. **M**ake use of what's there.
4. **P**ossibilities — past present and future.
5. **L**anguage — simply said.
6. **E**very Case is Different.

The Power of Simplicity

Every facet of SIMPLE is important, but the choice of acronym is deliberate. We choose simplicity because if we find a way that works then there should be no need

to make something more complicated than it already is. No matter how impressive sounding complexity or complication, organizations should strive for simplicity, directness and effectiveness.

The Solution Tools

The next six articles in this summary take each principle of the SIMPLE model in turn. As you read through these articles, you will encounter six solutions tools that help you apply the SIMPLE principle and achieve the solution you are seeking.

The first of these tools is the **Platform**. The Platform is a point of departure for the process of searching for what works. You need to establish the Platform early to support the changes that you are going to make.

Key Principles and Tools for the Solutions Focus

(continued from page 2)

You must next define the **Future Perfect.** This tool describes in detail a future *without* the problem that you are trying to resolve.

As you travel from the Platform to the Future Perfect, you need to accumulate **Counters** along the way. Counters are any resources, skills, know-how and expertise that will help you move toward the solution. Later in this summary, we'll see how asking the right questions can help uncover the counters that point toward a solution.

Your Counters will typically line up along a fourth solution tool: a **Scale** that helps you measure progress on your path to a solution.

Another important tool is **Affirmation** — to recognize, value and affirm the contributions that people are making in the solution search.

Finally, **Small Actions** are key in finding solutions. Often these small actions will push you further toward a solution by helping you discover new Counters.

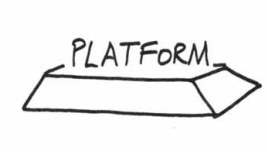
The illustration on the previous page shows one path or sequence toward a solution using the tools. However, different situations might emphasize different tools. For example, the solution to a strategic problem might be revealed by defining the Future Perfect. For another problem, finding Counters is the key step. ■

Solutions Not Problems

By focusing on solutions, you can encourage solution talk, negotiate solvable problems and establish who are change customers.

Problem Talk and Solution Talk

You enter the space of problem talk whenever you ask the client to tell you more about their problems, say what they feel are causing the problems, elaborate on when it's worst, find who's responsible for the problem and describe problems that are spawned by the problem.



Solution-based proponents need to avoid problem talk. Problem talk, according to the Solutions Focus, actually does very little in solving the problem and in fact may make the problem worse and even more insurmountable. Focus on the solution and the first signs of it appearing. This can shortcut many hours of fruitless delving into the problem.

Potential Pitfall: Too Much Problem Talk

A major challenge for a Solutions Focused practitioner is figuring out a way to keep the conversation focused on positive solutions and not negative problems. This is when you need to build a Platform from which you launch the search for a solution.

To build the platform you need to stop the problem talk by asking questions that embrace positive solutions. Such questions include:

- **What do you want to accomplish today?**
- **Will you be aware if you've made progress?**
- **What is the payoff for solving this problem?**
- **Are you confident that something can be done about this?**
- **What skills and resources have you used to solve similar problems?**
- **What works for you generally?**

The last question is important in uncovering the counters that might lead to solutions, as we will see in the article on "making use of what's there."

Potential Pitfall: No Customer for Change

One of the big tricks for the Solutions Focus consultant is figuring out who in the organization is actually open minded about beneficial change. A Solutions Focus consultant can try to drive a group toward a solution but that usually irritates the client. A better way is for the consultant to drive the group toward offering the right solutions for themselves.

Keep it SIMPLE: "Who is the customer for change?" It is possible to influence your clients even if they're not interested in positive changes.

For example, Peter Ackroyd is a safety management consultant who finds himself in challenging situations. His tactic is to figure out who among his clients are Greens, Ambers or Reds. Greens are open-minded to new ideas and change. Ambers are hesitant about change and Reds are fairly hostile to new ideas. Needless to say, Ackroyd always looks for the Greens and looks to work directly with them. The Ambers will go along eventually and the remaining Reds will probably submit to peer pressure, according to Ackroyd.

Potential Pitfall: Trying to Solve An Unsolvable Problem

Do you know what you want? The question might surprise you, but it is often needed when discussing problems. Many people are adept at describing what they don't want, but only have a vague idea of what they do want.

Is your solution described in vague or fuzzy language? Will you be able to tell if your problem has been solved?

This is where the Future Perfect tool is important. Imagine that you were to awake tomorrow and your

(continued on page 4)

Solutions Not Problems

(continued from page 3)

problem had completely disappeared. What would your world look like? What would be different? (Think in detail, not vague changes.) What will you be doing and saying differently? What will be the first small signs that the problem has disappeared?

The purpose of these questions is to elicit a specific image of the Future Perfect. Now you are no longer focused on the past and on problems. You have turned your focus to the future and the solution. ■

For another example of the solutions approach, go to: http://my.summary.com

Inbetween — The Action is In the Interaction

The key to understanding solutions is understanding what happens inbetween the people involved, as opposed to people in isolation or to a particular party. This systems approach was first written about more than 25 years ago. Systems have elements that are "inbetween their component parts." For example, leadership is something that is created between the behaviors of two people.

There are a number of advantages to thinking this way:

- **Individuals aren't blamed for what are in reality systemic problems.**
- **You get a more realistic feel for how the organization works.**
- **You get a broader sense of how to generate positive solutions.**
- **It allows you to approach wider systemic flaws as opposed to indefinite causes.**

Systems Thinking

Peter Senge is the foremost spokesman for the idea of using systems thinking for organizations. His views were outlined in a book called *The Fifth Discipline*.

For example, under his systems analysis, the correct way to understand a company's problems is to understand how a company's management and CEO think and learn. That's because managers act as designers of the company's informal "rules, strategies and policies."

These tacit rules of an organization — appropriate dress, who gets internet access, public rewards for good work, etc. — emerge somewhat on their own. The Solutions Focus offers a way of putting together the ideas of emergence and system dynamics in a useful way: In exploring complex interactions between people, there is a useful maxim to follow: the action is in the interaction.

Organizations As Interactional Systems

The assumption of a systems approach is that everything in an organization is interdependent with everything else. In other words, the Solutions Focus change agent is wary of attributing causal fault with one person or policy. How this actually works in practice was used during a study of traffic problems in London's packed M25 highway.

The cause of the traffic jams was related to drivers abruptly changing lanes. In fast-moving traffic, a driver abruptly changing lanes causes drivers behind the car to brake to avoid hitting the car switching lanes. This braking action ripples backward, with cars braking harder and harder to avoid the car in front. Eventually, the traffic toward the back is at a standstill.

This is a problem that can't be solved; drivers are going to continue changing lanes. What actually worked was a systemic change. It was found that if you actually slowed down speeds during rush hour, the overall traffic moved faster and more efficiently. Note that this solution — slowing down traffic — does not address the 'cause' of the problem — abrupt actions by the drivers. It simply allows those actions to occur without undesirable consequences.

Behavior Emerges Unpredictably

The goal of the "solutionist" is to allow people to make the small changes they can in order that bigger and better results might follow. For this to happen, the Solutions Focus coach has to believe in the freedom of the individuals that he's working with. Without freedom, no small changes can be made. And without small changes and steps, no larger overall changes can be accomplished.

For example, from 1914 through 1918, the British Pubs were ordered to close at the same time, which resulted in people drinking all they could before closing hour and then subsequently crawling home through the streets and getting into a number of nasty fights.

While drinking was the cause of the problem, the eventual solution had nothing to do with drinking (prohibition had demonstrated that attempting to eliminate drinking was doomed to failure).

Instead of attempting to fix the problem of drinking, the government used systemic thinking to arrive at the solution: more freedom for the pub owners to control their closing hours. This new freedom eliminated the systemic tide of overdrinking and subsequent fights. ■

For another example of interaction in action, go to: http://my.summary.com

Make Use of What's There

There are often clues to possible solutions to the problem in front of you — you simply might not see them. This is why you must learn to make use of what's there — to recognize that there may be much in what you already have that can be useful in building the Future Perfect.

There are a number of benefits of working with what's there:

- **What is already there is meaningful.**
- **The very process of caring about what workers say will make them feel more valued.**
- **It provides you with a positive entryway toward looking for positive solutions.**
- **It prevents you from imagining things that aren't there.**
- **This method will force us to root our solutions in what is already in front of us.**

Frankly, the alternative to this is looking for what isn't there, for example deficits, shortcomings, weaknesses, lack of cooperation from others. This is not a positive way to initiate positive solutions and it's not a necessary precursor for positive change.

Everything is a Useful Gift

One way to make sure you use what's already there is to adopt a mindset that "everything is a useful gift" — including the negative. The idea keeps you open-minded about every element of the work environment that you're exposed to.

For example, instead of thinking that the boss is brusque, you would take the positive attitude that the boss is very concerned about his or her time, and then you would work that into your solution analysis.

Accumulating Counters

Your goal at this stage of the process is to accumulate Counters.

A Counter, one of the Solutions Focus tools, is anything that will help you move toward a solution (one dictionary definition of a counter is a small disc used in bargaining). By accumulating counters, you are putting together a stack of "what's there" to help you build the solution.

Counters might include:

- **examples of the solution happening already;**
- **evidence of parts of the solution happening** (see example above right);
- **skills and resources that will help create the solution; and**
- **cooperation from others involved.**

Cool Glasses, or How to Recognize Parts of a Solution in Front of You

A Zeneca chemical plant in Italy gives us an example of a solution partially happening — also an effective counter in the search for a solution.

Workers at this chemical plant resisted efforts to have them wear safety glasses. A problem focus would have examined the problem by investigating, for example, the cause of eye-damaging accidents or trying to understand why workers would be willing to risk their health.

The problem was resolved, however, when someone noticed that the solution was already partially occurring. Specifically, this person asked, "When are our workers willing to wear glasses?" The answer: when the glasses were cool, fashionable sunglasses.

The plant developed safety glasses with mirror shades, and the result was unequivocal: The workers not only began wearing the safety glasses immediately, they even kept them on when they left the plant!

Honda's Bikes: A Solution Already Happening

For example, Honda's strategy for entering the U.S. market was to offer large motorcycles, since this was what U.S. customers seemed to want. The strategy was not working: Honda's big bikes were not selling.

Meanwhile, however, the Honda staff brought over for their own pleasure their smaller motorcycles — and people kept asking the staff where they could find similar bikes. This unsolicited interest was the solution happening in front of their eyes: sell small, not big, bikes. Fortunately for Honda, someone recognized this counter and the solution to which it pointed.

Build Cooperation—Or Expect Resistance

It should be pointed out that the Solutions Focus is a cooperative one. When you're starting the process you want to, frankly, agree with the client about his or her perceptions about the workplace.

For example, if it's clear that your client's workplace is a mess, and the client thinks it's tidy, you agree with the client. Later, try to find out what definitions are being used.

A consultant who uses the SIMPLE approach has to accept what the clients say or the approach won't work. Also, try to anticipate cooperation not resistance. If you encounter resistance to change, suspect that you are generating it and ask what you could do instead. ■

Possibilities—Past, Present and Future

Possibilities are central to progress. It's impossible to have a better future if you haven't already imagined it first, then worked toward it. When you don't work with possibilities, it's almost impossible to create smart change. The alternative path, knowing the failure of the past and the uncertainty of the future, leads to the negative route of accusation and "stuckness." It's much more helpful to focus on how matters can be different as opposed to how you failed in the past.

Possibilities Past

If there are victories or mythic triumphs that are a part of a company's past, then they should be remembered in order to handle the challenges of the future. Trumpet the fact that "our company survived the depression and therefore we shall thrive during the late '90s recession." It makes a big difference when an executive who has weathered tough times is leading you as opposed to one who has never achieved a significant victory.

Possibilities Present

The positive future can only be arrived at if there are positive trends in the present. When you're using this method, always concentrate on the positive things that a client is doing. For example, instead of dwelling on the problem of a writer who can't write because of time or distractions, get the writer to focus on when he or she actually gets writing done. This way the writer can use this information to replicate positive results. Solutions-focused questions lead to a story of possibility.

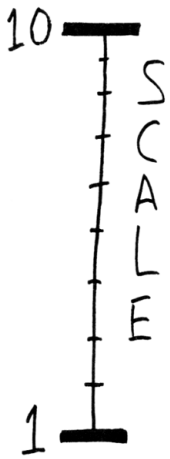
Possibilities Future

If you don't create the concept of the perfect future for the client then they will be less likely to reach the outcomes they want, know what they want, recognize it when it's happening and take the necessary steps to make those forecasted events come true.

Much of this has to do with the power of positive expectation. There was a study by researcher Robert Rosenthal several decades ago that proved this idea. He went to a class and randomly picked 20 percent of the students and told the teachers that these students had true potential to grow and excel. A year later it turns out that those randomly selected students outperformed their peers. This proves that positive expectations can yield positive results.

Offering Compliments

During this possibilities stage of the SIMPLE model, you will want to use the solutions tool of Affirmed. Make sure to look back on what's helping already, compliment yourself and others on whatever you're doing well and



use this affirmation as a stepping stone to action. Don't underestimate the power of a compliment. You will be surprised how you can reinforce the Solutions Focus by catching people doing things well and quietly mentioning them: "I like the way you did that," or "I enjoyed your work on that." ■

Language — Simply Said

The benefits of simpler language and words are threefold: creates a better chance that the participants will effectively communicate with each other, means more precise communication, and results in a "reduction of impressive sounding nonsense." There are also dangers inherent in using Big Words or complicated terms in describing situations. Those dangers are also threefold: big words often impede progress, you are not using people's own language, and you create the danger of labels and generalities.

Scaling

Scaling, in which you determine the progress of your efforts to reach a solution, is an effective tool for explaining the situation in exact terms. For example, you might begin with the question: "On a scale from 1-10, where 10 is the perfect future, where am I now?"

Scaling not only helps you communicate your situation, it also helps you analyze your progress. In order to answer the question above (for example, "I am at 3"), you will need to examine your situation carefully. If you are at 3, then what helped you get past 1 and 2? And what would take you a small step (say one point) higher?

The point is not to ask yourself, "How do I go from 3 to 10?" If you knew that, you'd already be at or near 10. The point is to understand what it takes to progress along the scale — to move from 2 to 3, then from 3 to 4 and so on.

Potential Pitfall Words Are Personal

Different people define the same words differently. One man's "terrorist" is another man's "freedom fighter" even though the same person might be involved in the same activities. Likewise, some companies have "idle daydreamers" and other companies employ

(continued on page 7)

Language—Simply Said

(continued from page 6)

"imaginative creators." Remember to always accept the words of the clients at face value. Your goal is to first accept the client's words and then try to direct the conversation to what can be accomplished and solved. Always make sure that you're moving toward answers and solvable problems.

Potential Pitfall: Words Are Not the World

Be careful when using words like "organization" and "teamwork." Organizations, in the context of the SIMPLE philosophy, should be thought of as interactional systems where there are many starting and stopping points.

To see how this works, the consultant should ask the clients how they define "good teamwork." The consultant should then move toward figuring out the small steps necessary for the client's team to move toward the goal of whatever the optimum of "good teamwork" happens to be.

Don't turn something dynamic, like teamwork, into something that's static. Likewise, whenever you talk about changing a company's "corporate culture" remember that you're trying to define specific interactions and activities. In other words, if you want to change your organization's culture, a promising start is to select some simple words to describe how people go about their affairs. ■

Every Case is Different

The primary maxim of Solutions Focus is, "Find what works and do more of it." One important idea of this maxim is figuring out what we mean by "works" and what specific aspects of the present situation appear to be helping, sustaining, and exemplifying this working. This will lead you to the secondary maxim of the Solutions Focus: "Stop doing what isn't working and do something different."

Following these two maxims will lead to a number of positive developments, such as:

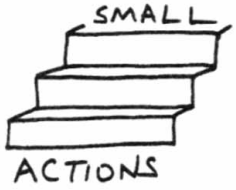
- **Better chance of reaching desired results.**
- **More relevance to the people involved.**
- **More apparent ownership of successful change actions.**
- **Enthusiastic rollout of ideas as results quickly occur.**
- **The avoidance of inappropriate theories and models.**

In other words, doing more of what works and less of what doesn't is a way of finding the solution that fits the particular problem you are trying to avoid — instead of trying to use a one-size-fits-all theory or methodology.

Other Pitfalls

In addition to avoid applying theories that don't fit the specific case, you must also avoid the pitfalls of:

- knowing too much and not being open-minded about the reality in front of you;
- relying too much on experts; and
- being "solution forced rather than solution focused."



Jazz pianist Art Tatum used to look for the bad notes in pianos he played on the road in order to play around with them and use them. You have to approach each business the same way: Appreciate what makes each organization unique.

Appreciate what makes each organization unique.

Small Actions

When you're doing more of what works and less of what doesn't, focus on the small steps and small actions that move you toward a solution. Small actions is the final of our six solution tools.

Don't try to make dramatic and sudden progress. Instead, attempt the small changes that are the most likely to succeed or the easiest. These are also actions that can be undertaken tomorrow and are specific and clearly defined.

For example, golfers who want to hit a ball from 50 feet out don't aim for the pin; they learn to aim for a line a few feet from where the ball is. Likewise, a thriving start up had big plans for blue chip clients and community activities. But they first decided that they had to decide upon what companies to mail letters to and what meetings to arrange.

After the Small Steps—More Counters

After you've made your small steps, it's important to determine how effective your small actions were. Your main intent is to find what works. And what actually works may not be what you expected. Start the review of all small actions with the questions of "What's better?" and "How did I do that?" Other questions that you ask should include what effects did you notice, who has noticed the small actions, and what do you think should happen next? ■

For an example of the power of small steps and counters, go to: http://my.summary.com

THE SOLUTIONS FOCUS: APPLICATIONS

The Solutions Focus can be applied to problems in a variety of domains — for example, organizational, coaching and team issues. The article below and at right focus on the first two types of issues. A discussion of team solutions can be found in the Inside Info section for this summary at http://my.summary.com. ■

Organizational Change

The Solutions Focus approach to organizational change includes defining the future perfect, finding counters, and taking small actions — all in a SIMPLE way. In organizations, this means you figure out what works by acting, questioning and watching.

Keep in mind that the "organization" is usually a group of people who are organizing themselves and their work. Your job as the Solutions Focus coach or manager is to figure out how the culture of a business and organization actually works.

How the Solutions Focus Tackled Problem Passwords

Employees at many companies have problems memorizing passwords — especially if the passwords change frequently — and this was no different at one particular Welsh company.

To resolve this problem, the company could have taken the problem-focus approach of asking, "Why can't people remember long lists?" or "What gets in the way of them remembering changes to passwords?"

Instead, the managers used the Solutions Focus method and asked instead how they could make a more memorable password system. They asked: "What do people easily recognize and remember?" These solutions-focused questions eventually led to the solution: faces. Many people have problems remembering long strings of letters and numbers. But people have an innate ability to recognize faces.

Today, whenever a person logs on to a computer screen, the user sees nine faces and has to spot the position of his or her first password face. Increased security is generated by using multiple screens — the first screen features the first password face, a second screen feature the second password face, and so on.

The entire password system has become more reliable and faster. Trials proved that the system worked very well and calls to the help desk for forgotten passwords decreased appreciably. The company introduced the system on the Internet in 2001. ■

For another example of the application of the Solutions Focus to organizations issues, go to: http://my.summary.com

Coaching Solutions

Coaching is one of the most popular applications of solutions-focused work in organizations. The Solutions Focus has origins in psychotherapy, and like therapy coaching takes place within small groups or even just two people. Coaching proves a potent mix when combined with the Solutions Focus. Here's how coaches can use the SIMPLE method to achieve solutions:

- ✓ **Solutions, not problems:** Remember to steer the conversation toward solutions. This doesn't mean that you ignore problems, but that you work toward getting the subject to think in positive outcomes and solutions. It's nothing new that a coach concentrates on positive goals, but the Solutions Focus states: "there is rarely any sense of emphasizing a problem or starting with what's wrong."
- ✓ **Inbetween—the action is in the interaction:** When you're a coach you are on the lookout for positive and helpful interactions. Your goal is to search for improvement solutions and figuring out helpful interactions for your client.
- ✓ **Make use of what's there:** Try to note the evidence of what's there. Learn to find counters that measure the client's performance.
- ✓ **Possibilities—past, present and future:** As a coach, a main aim is to generate a sense of possibility. You have to act as if progress is inevitable.
- ✓ **Language:** Keep the language simple. Refrain from using words like "self-actualization," "disempowerment" and "cross-functional mindsets," please. Also avoid negative words like "failure" and "hopeless," and use the client's own words when describing his or her performance.
- ✓ **Every case is different:** Your every assignment should be fresh and new. It should be looked upon as a new challenge. Your only expertise should be in understanding how each case is special and how that hinders or helps them reach their solution.
- ✓ **Optimism and pessimism:** The Solutions-Focused coach has to be positive. Positive people take credit for their success and blame their failure on circumstances beyond their control; pessimists do the opposite, blaming all of their success on flukes and taking their failures personally. During sessions, you should stress what's impressed you about the performer's performance, and offer views on how the performer's efforts to improve have been successful.

The Song of Significance

A New Manifesto for Teams

By Seth Godin

Seth Godin is the author of 21 international bestsellers that have changed the way people think about work. His books have been translated into 38 languages. Godin writes one of the most popular marketing blogs in the world, and two of his TED talks are among the most popular of all time. He is the founder of the altMBA, the social media pioneer Squidoo, and Yoyodyne, one of the first internet companies.

What Can We Do to Make Work Better?

From the very beginning of his book, Seth Godin says that his purpose for ***The Song of Significance: A New Manifesto for Teams,*** is to help his reader create teams based upon true leadership. He does not believe that the current way of the working world is, in fact, working, and he wants to help people center work around helping people create significance and meaning. The way Godin sees it, management is letting employees down, and employees are, in turn, letting managers down. This is partially because bosses want good work for little money while workers want to be paid well for their work. Industrialists, on the other hand, want to take away the worker's power, and one means to do this is by taking each job and breaking it down into many smaller jobs. This does not serve either employees or customers as it dehumanizes people. This does not have to be the case, however. Organizations work well when people seek increase, but too often, people are caught focusing on safety. This can lead to both burnout and dissatisfaction.

Significance

Godin believes that what people truly want is agency in their work. Agency refers to giving people control over their time and also encouraging them "to choose what [their] contribution looks like." Employers are at times reluctant to give their employees this agency because it is "antithetical to controlled industrial piecework." Godin believes that agency is key to giving people a sense of dignity in their work as it allows them to be treated like human beings and not like machines.

As an example of a company that does not give its employees agency, Godin examines McDonalds. Here everything is made as uniform as possible. Mechanization like this can give people jobs and create efficiency, but "late-stage industrial capitalism is different. It doesn't know where to stop. It not only captures those seeking safety, but also shackles those seeking significance." Companies that focus on such industrial processes will often win out over those who give their employees the opportunity to pursue significance. Companies exist on a continuum with some constantly surveilling employees while others rely on people for whom the very work is their reward. There are many companies that fall between these two extremes. Companies have to decide where they want to fall.

Godin explains that many companies seek outsourcing and automation as much as possible. Unfortunately companies sometimes take advantage of these options. He does not see real value being created this way. Rather he believes that real value is "created by personal interactions, innovation, creative solutions, resilience, and the power of speed."

Trust and Growth

Godin examines Amazon. It is one of the most managed companies in the country, but it faces such a serious problem with turnover that the company may eventually run the risk of running out of hires who have never worked for the company. Part of the reason for this is that people face very little opportunity for growth. No one can find significance because employees are not asked for their input.

Godin discusses surveillance, in particular surveillance on recorded phone conversations. Because of this surveillance, companies can better evaluate employees manning telephones. This is not always the best way to ensure success. Godin says, "The people you hire to follow instructions are rarely the people who will help you build something of innovation and substance." As companies seek to squeeze everything they can out of every asset, eventually employees will walk away in search of better opportunities elsewhere.

Managers Versus Leaders

Godin sees a difference between a manager and a leader. Where a manager seeks compliance, a leader "seeks to create the conditions for people to make a change happen." Attempts to treat people with dignity while using discipline to enforce compliance no longer work very well. The promise of the industrialists was that there would be a reward if people did what they were told. The effect, however, is low workplace satisfaction and low upward mobility. One way to find good leaders, Godin says, is to look at the people they have led and where they have gone to. The job of a leader is to help plant seeds for years to come, so the employees of solid leaders will often go on to become successful.

Godin sees a problem with the very idea of human resources. This is because companies squeeze resources, and employees ought not be squeezed. He believes companies need to "create value, cause change, and make a difference by leading with humans instead of treating them as cogs in a soulless machine." He says that human beings evolved to notice and avoid fearful situations. Industrialists have noticed this and have taken advantage of it. Managers threaten firing to underperforming workers, and as this triggers ancient fears, it becomes an effective way to keep employees in line. Godin says, "dancing with fear requires significance, tension, and the belief that we're doing something that matters."

Godin defines the Japanese word kokoro as an expression of personhood. It is "the dignity and connection we seek in the things we do and the way we're understood." He believes companies need to provide this kokoro to their employees. This respect needs to flow all the way to frontline workers. They need to be made to feel safe, however, before they will be able to contribute substantially.

Impediments

Meaningful work can be scary. People may face resistance which is a "natural, personal aversion to doing important or creative work." People need to be willing to make and keep commitments. There are numerous traps Godin says people can fall into such as avoiding solutions just because they are not perfect or focusing too much on discomfort. He believes that often just naming these traps can help people overcome them. Organizations need to overcome fear and mere compliance because "great work creates more value than compliant work."

The concept of enrollment is key to Godin's claims. He believes that employees need to be enrolled in the company or the project in order to make significant contributions. Organizations have gotten off track due to industrialism, but he believes they can go back and reclaim their human nature. He says, "enrollment, mutual connection, federation, recognized dignity, and the journey of increase: together these create the conditions for a powerful, reliant way forward." It is up to leaders to create these conditions.

People need to feel safe. After that, they seek affiliation and status. These are important, but Godin believes what people most want is significance. By this he means being able to impact the world around and making the world different than it would be had they never existed. Tension is not necessarily something to be avoided. He believes that tension and enrollment are partners. Enrollment as Godin describes it is "the desire to be right here, right now." None of this can be created merely through extrinsic means such as money. People must also be motivated intrinsically as well. This type of work of significance requires people to be present both where they are and where they want to be.

Working Environment

Godin says that "Significant work is project work." This project work is where people find significance. Because of this, leaders do not have to know how to do every aspect of a job. Rather, they need to be able to assemble a team competent to do these jobs. Miracles in the world of work do not happen instantaneously. Rather they are deliberate. It is not individuals who change the world. Rather it is connected people who work on significant projects. As an example of a successful way that a company sought significance for their employees is Barnes & Noble. James Daunt managed to turn the bookstore around by giving individual stores agency over their own shops.

Godin believes that people are dissatisfied with work when it is based on a lie. There are numerous commitments organizations need to make to their employees. One of these is providing a sense of belonging. Instead of working under the assumption that business thrive most when poorly working cogs are replaced, he believes organizations need to give people a chance to make a difference. Organizations need to support human dignity.

> Leaders should be looking for people who live up to standards rather than those who simply follow in obedience."

Likewise, companies need to embrace mistakes. Part of finding solutions is finding and then rejecting faulty solutions. Godin says, "If you're not trying things that don't work, you're not trying hard enough." He also extols taking responsibility and giving credit. Instead of relying on a traditional organizational chart, Godin advocates building a culture "around taking responsibility." People can be hesitant to approach criticism because of how they are conditioned to receive it and how others give it. Good feedback, however, is beneficial. People may see feedback as a threat if they think it will lead to getting fired, but really it is crucial if people are to improve.

Mutual respect is a non-negotiable for Godin. He does not want bullies around an organization because bullies kill connection which he already established as being crucial. To build this respect, every human encountered must be treated as though they are worthy of respect. Godin says, "an institution can't serve or collaborate with those who refuse to offer respect in reciprocity." Similarly, leaders should be looking for people who live up to standards rather than those who simply follow in obedience. People who do the right thing even when there are no possible negative repercussions are living by their standards.

Real Skills

Godin urges people to stop referring to interpersonal and leadership skills as soft skills and instead refer to them as real skills. He believes that companies hire based on vocational skills and retain employees for those same skills. Real skills are just as important, but they are often overlooked, and when people have weak real skills they often are not fired or even retrained. The ability to communicate with other people is the hallmark of a real skill, and yet the majority of managers claim to be uncomfortable speaking with those they manage.

Empathy is part of what is necessary to be a good listener. This requires people to acknowledge that other people experience the world differently than they do. Other people do not understand the world in the same way that we do, and people need to be humble in their listening and acknowledge that the other party may be hearing something differently than the speaker meant it. This requires people to acknowledge that they are dealing with human beings, not machines.

Godin encourages his readers to consider the meetings they hold. Conversations are key for businesses, but meetings can subvert this. Godin discusses the company Zapier that successfully implemented a week without meetings. To take the place of these meetings, the company employed numerous asynchronous and direct messaging procedures whereby employees could communicate with each other. They found that this method rewarded people who were working hard because their input made them directly accountable. Not all meetings are bad. Meetings which encourage two way conversation and in which only necessary people are invited can be productive. Meetings are most productive when there is a specific decision to be made.

Creating a Significant Organization

Godin then seeks to help his reader create significance within their organization. Many of these concepts have been covered in prior sections, but he adds to them at this point in his book. One of these methods is to embrace uncertainty. Godin does not believe in fake posturing if a person does not know the way forward. Rather, he encourages his reader to be clear about what they do not know. This allows others to offer suggestions and contributions. Godin also asks people, when they encounter novel situations, to avoid putting the situation into a familiar box. When they put it into a box, they have a tendency to believe they know what to do with it. This could prove helpful at times, but when the person is wrong in their assumptions, it creates problems. Wonder can open the door to moving forward.

Seth Godin has encountered a corporate world set on industrialization, and he sees this as a major cause of dehumanization in the workforce. People merely following directions are not invested in a company, and they are not going to put the safety of their job at risk in order to bring needed change and humanity to their workplace. The flow of his book, The Song of Significance: A New Manifesto for Teams, can be choppy and hard to follow at times as it is broken up into 144 different sections. Its purpose, however, remains clear and noble: to create a workforce in which all people can be treated with dignity and both the organization and the individuals invested in it can flourish.

What Are the Pitfalls of Implementation?
Page 8

THE SUMMARY IN BRIEF

In 1996, Robert Kaplan and David Norton introduced the Balanced Scorecard performance measurement method, which included not only traditional financial measures but also such qualitative measures as employee satisfaction, corporate mission and customer loyalty. In *The Strategy-Focused Organization,* they show how the following five principles transform the Balanced Scorecard from a tool for performance measurement to a tool for creating a strategy-driven performance management company:

1. Translate the strategy into operational terms. Use the Balanced Scorecard to describe and communicate strategy in consistent, insightful, operational terms.

2. Align the organization to the strategy. For organizational strategies to work, they must be linked and integrated across many functions — finance, manufacturing, sales, marketing and so forth. The Balanced Scorecard can link these disparate and dispersed functions.

3. Make strategy everyone's everyday job. Use the Balanced Scorecard to educate the organization about strategy, help employees develop personal objectives, then compensate them based on their adherence to and implementation of the business' strategies.

4. Make strategy a continual process. Use the Balanced Scorecard to link strategy to the budget process; review strategy regularly in management meetings; and develop a process for learning and adapting strategy.

5. Mobilize change through executive leadership. Through a method of mobilization, governance and strategic management, executives can embed new strategy and new culture into their management systems, creating a continual process to meet the strategic needs of today and tomorrow.

Formulating strategy is one endeavor. In this summary, you will learn how to make strategy work.

THE STRATEGY-FOCUSED ORGANIZATION

by Robert S. Kaplan and David P. Norton

— THE *COMPLETE* SUMMARY

In today's business landscape, it has never been more important to implement solid strategies — the unique and sustainable ways by which organizations create value. Yet, research reveals that companies have an increasingly difficult time executing the strategies they need to remain competitive. One reason for this is clearly that while these strategies, and the business issues behind them, are changing constantly, the tools for measuring the effectiveness of these strategies have not kept pace.

Many corporations still use tools that measure success in terms of tangible assets — investments in inventory, property, equipment, etc., and the resulting returns. The decentralized nature of business that prevails today, however, values more intangibles (knowledge, capabilities, relationships). Constant changes in technology and the competitive environment dictate that all business units, support units and employees be linked to strategy — and that all have a common language to communicate strategy, as well as the processes and systems to implement it.

Strategy-Focused Organizations have transformed the Balanced Scorecard from a performance management tool into a strategic tool.

The Balanced Scorecard was initially conceived as an organizational performance measurement tool that included non-financial as well as financial measures. By ensuring that all of the objectives and measures inherent to it are derived from an organization's vision and its resulting strategy, Strategy-Focused Organizations have transformed the Balanced Scorecard from a performance management tool into a strategic tool. Com-panies like Mobil, CIGNA and Chemical (Chase) Retail Bank have used the Balanced Scorecard approach to focus their organizations on strategy by adhering to the five key principles that will be explained in detail in this summary:

1. **Translate the strategy into operational terms.**
2. **Align the organization to the strategy.**
3. **Make strategy everyone's everyday job.**
4. **Make strategy a continual process.**
5. **Mobilize change through executive leadership.** ■

Principle 1: Translate Strategy into Operational Terms

In order to be a Strategy-Focused Organization, you must put strategy at the center of your organization's management process. Strategy cannot be executed if it cannot be understood; it cannot be understood if it cannot be described. In the past, however, there has been no generally accepted framework for describing strategy and the value created from intangible assets.

The Balanced Scorecard links the intangible and tangible assets in value-creating activities. Using strategy maps of cause-and-effect linkages, it describes how intangibles are mobilized and combined with other assets to create value-creating customer value propositions.

Specifically, strategy maps illustrate the processes for transforming intangible assets into tangible customer and financial outcomes, providing executives with a framework for describing and managing strategy in a knowledge economy. The example illustrated on the following page (of a fashion retailer specializing in women's clothing) shows the key components of the strategy map.

Four Perspectives

The strategy map and Balanced Scorecard provide a framework to look at a value-creation strategy from four different perspectives:

1. **Financial —** the strategy for growth, profitability and risk, viewed from the perspective of the shareholder.
2. **Customer —** the strategy for creating value and differentiation from the perspective of the customer.
3. **Internal business processes —** the strategic priori-

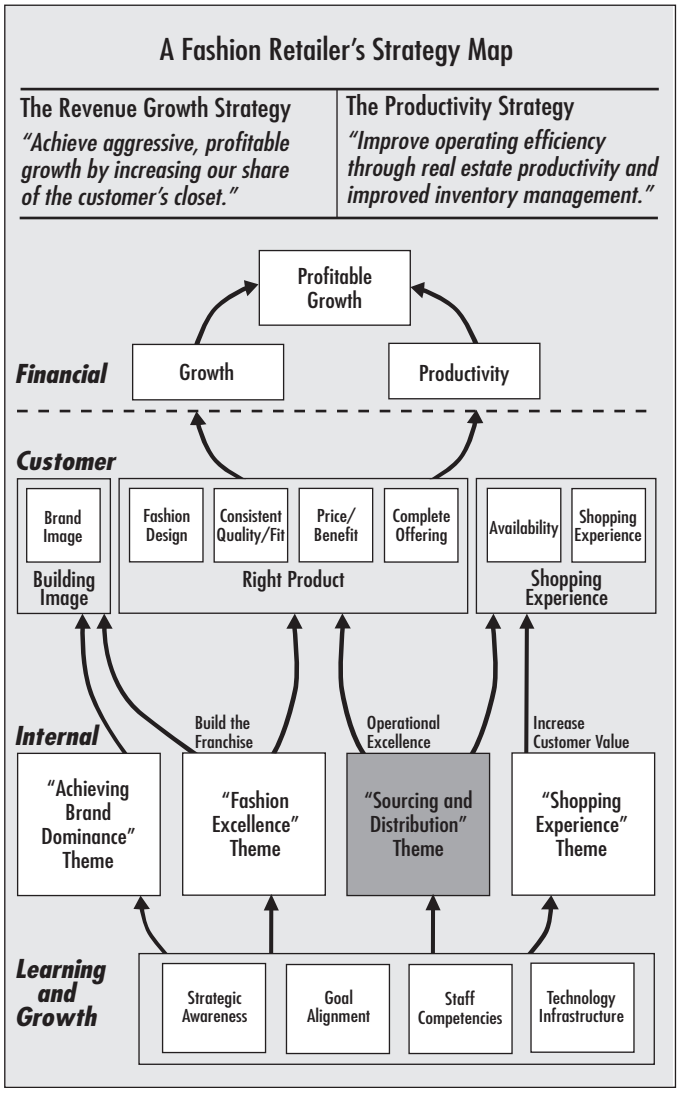
Principle 1: Translate Strategy into Operational Terms

(continued from page 2)

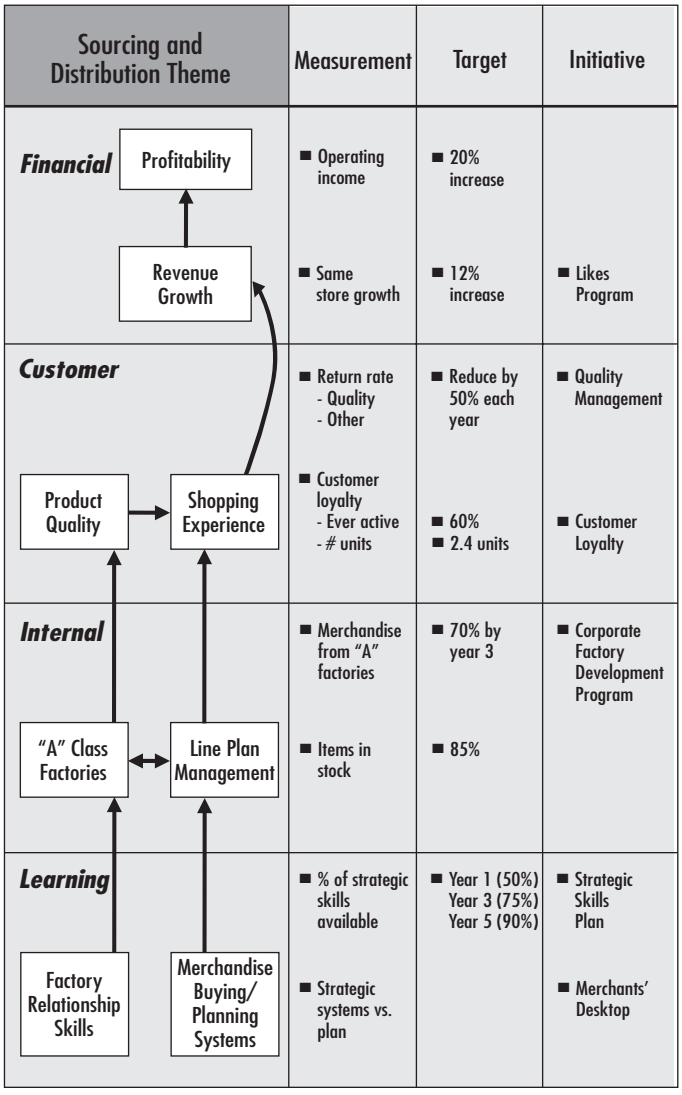
ties for various business processes, creating customer and shareholder satisfaction.

4. **Learning and growth** — the priorities to create a climate that supports organizational change, innovation and growth.

The arrows in the strategy map show the cause-and-effect relationships between elements in each perspective, clearly displaying how such intangible assets as strategic awareness feed into themes that eventually yield tangible results.



Within each of the strategic themes, a second strategy map and Balanced Scorecard [on the right] breaks down into detail how the theme affects the customer objectives that result from the theme. In this example, we see how **sourcing and distribution** affect customer objectives of product quality and product availability that, in turn, drive customer retention and revenue growth, as well as the internal processes (factory management and line programming) that contribute to those objectives.



In Balanced Scorecards, value-creating processes and critical roles for intangible assets are clearly portrayed, in the correct context of how those intangibles create value, providing the measurement and management framework for knowledge-based strategies. ■

Principle 2: Align the Organization to the Strategy

The Balanced Scorecard provides a powerful framework for business units to describe and implement their strategies. A Strategy-Focused Organization, however, requires more than just having each business unit use its own Balanced Scorecard to manage a great strategy; the strategies and scorecards for all such units should be aligned and linked with one another. Synergies can then

(continued on page 4)

Principle 2: Align the Organization to the Strategy

(continued from page 3)

develop from efficient interactions between those units — interactions which must be explicitly recognized in the strategies and scorecards of each unit.

Many organizations share common business processes and require a corporate role to ensure their most effective use; others share common technologies and knowledge. A corporate scorecard should articulate the rationale behind keeping different business units operating within a corporate structure rather than spinning them off into individual, independent entities.

A corporate scorecard can clarify two elements of a corporate-level strategy:

- **Corporate themes —** values, beliefs and ideas that reflect the corporation's identity and must thus be shared by all business units.
- **Corporate role —** the actions mandated at the corporate level that create synergies at the business unit level.

Shared Services Units

Organizations can also create synergies by aligning the internal units that provide shared services. These shared service units are created at a corporate or division level because of economies of scale and the advantages of specialization and differentiation that these units can create — for example, purchasing, manufacturing, distribution, real estate, etc.

Shell Services International

The Shell Services International (SSI) division of the Royal Dutch/Shell Group of Companies provided nonroutine services in consultancy, IT, business services and human resources to Shell's business units. SSI used the Balanced Scorecard to develop multiple levels of service, in accordance with the needs of the business units it served. This multi-level system was achieved largely due to the enhanced measuring capabilities that the Balanced Scorecard provided, including cost figures and performance measures related to the following:

- **Customer satisfaction.**
- **Quality/speed of support.**
- **Customized technical measurements.**
- **Business alignment/ease of doing business.**

These measurements and resulting service-level agreements changed the mindset of the business units from focus on cost-related factors to quality and service-centric concerns.

For example, the Limited (an apparel retailer with eight retail divisions, each with its own target audience and retail chain) has a real estate division, which acquires and manages retail properties. The real estate division is a single organization that can be deployed to the benefit of all eight retail divisions.

The Limited also has one division that manages the relationships with factories that supply products for the eight retail divisions. The company has found that it is more cost-effective to concentrate such expertise in a single shared services division, rather than have each of the retail divisions manage its own capabilities in those critical areas.

The challenge is for the centrally supplied service to be responsive to the strategies and needs of the business units it serves. These units should be aligned through the creation of a Balanced Scorecard for the shared service unit that adds value and responsiveness to the strategies of the business units. In an ideal world, there would exist a top-down strategic architecture that defines the corporate role and how shared service units contribute to the corporate strategy; often, however, this architecture does not exist. In the absence of that architecture, shared service units can use the Balanced Scorecard in a somewhat different manner, using one of two models: the strategic partner model and the business-in-a-business model.

The *strategic partner* model allows for the shared service unit to be a partner in the process of the business units' development of Balanced Scorecards. Successful Balanced Scorecard companies typically first develop scorecards for business units that sell products and services to external customers, then develop shared service unit scorecards. The linkage between business unit and shared service unit scorecards requires four components:

1. **A service agreement between the business units and shared service unit that defines expectations about services and costs.**
2. **The shared service unit scorecard, which reflects its strategy to support the service agreement with the business units.**
3. **A linkage scorecard, in which the shared service unit accepts accountability for improving selected measures on the business unit scorecards.**
4. **Customer feedback from the business units on the performance of the shared service unit.**

The *business-in-a-business* model can be employed when business units do not have Balanced Scorecards; in such situations, the shared service unit must view itself as a business and the business units as its customers. The shared service scorecard defines the relationship. This

(continued on page 5)

Principle 2: Align the Organization to the Strategy

(continued from page 4)

approach works best in such functional organizations as human resources, IT, finance, marketing and R&D. The scorecard enables executives of these functional units to build a management approach that motivates their organizations to be customer-focused and competitive. ■

Principle 3: Make Strategy Everyone's Everyday Job

In the past, aligning all employees to a strategy was not critical. In the age of sequenced, repetitive, task-based manufacturing jobs, employees did not have to understand or implement strategy; they simply had to perform the narrow tasks management assigned them and trained them to do.

Today, this type of work is virtually obsolete, replaced by knowledge-based work. Employees must be aligned to the strategy in order to create value. Indeed, there are several critical factors that require intense alignment of employees to organizational objectives:

- While many companies focus on employee satisfaction by bulking up compensation and benefits packages, this satisfaction does not imply commitment from the employee to the goals of the company.
- Companies might claim that employees are their most valuable asset, but the frequency with which they check employee attitudes and skills reveals a different story.
- Not all employees are equally important to their employers; those who directly affect customer experiences and relationships are not always the ones who are given the most compensation and training.
- Some companies are implementing programs to involve customers more directly in the hiring, training, and rewarding of key employees.

Strategy-Focused Organizations understand that, ultimately, employees are tasked with implementing strategy, and are often the ones who come up with the innovative ideas that make strategies work. These organizations use the Balanced Scorecard in three distinct processes to align their employees to the strategy: creating strategic awareness, defining personal and team objectives, and linking incentives and compensation to the Balanced Scorecard.

Creating Strategic Awareness

Employees must learn about and understand the strategy before they can help implement it. Executives must use communication processes at the launch of their new strategy, starting with education and followed by 1) testing to ensure that employees understood the message; 2) checking that employees believe the strategy is being followed; and, 3) determining how many are teaching others about it. Think of a product launch. You wouldn't put a new product on the shelves without telling customers about it; don't expect the strategy to generate much excitement or buy-in if you haven't evangelized it to your employees.

Your communications program should have the following objectives:

1. **Develop an understanding of the strategy throughout the organization.**
2. **Develop buy-in to support the strategy.**
3. **Educate the organization about the Balanced Scorecard measurement and management system for implementing the strategy.**
4. **Provide feedback, via the Balanced Scorecard, about the strategy.**

Defining Personal and Team Objectives

Employees must understand how they can influence the successful implementation of the strategy. Homogeneous organizations whose outcomes are easy to measure — sales organizations, for example — can focus on a few primary metrics. More complex organiz-

(continued on page 6)

Sears' Strategic Learning Maps

Sears, Roebuck and Co. uses visual representations of strategy, or learning maps, to help employees understand the changes that are occurring and how they can contribute to successful implementation of change initiatives. These maps consist of images and pathways designed to create employee discussions of a strategic theme.

One such learning map helped Sears develop a vision of its future in retail sales. The map showed a winding street that started with pictures of the retail environment in the 1950s, and progressed through successive decades until the street showed the environment of the 1990s: Wal-Mart, J.C. Penney, The Limited, etc. The maps were accompanied by tables and charts that defined the context for employees to respond to three strategic themes about the company: that it was a compelling place to shop, work and to invest. Employees had to answer the question, "What are the implications of these themes on our business and our team?"

Through use of the map and a series of town hall meetings, Sears communicated its vision and enabled employee involvement in the day-to-day efforts required to make that vision reality.

Principle 3: Make Strategy Everyone's Everyday Job

(continued from page 5)

tions must share the outcomes and strategy they are trying to achieve. They will allow individuals and teams to define personal objectives that can influence and will have an impact on the organizational objectives.

The city of Charlotte, N.C.'s Department of Transportation (CDOT) linked the department's Balanced Scorecard measures to the department's high-priority programs and assigned individual work teams to each of those programs, including measurements of accountability and performance. Each of the 41 programs had a one-page report that included their objectives, the action steps required to implement the program, the desired outcomes, responsible managers, critical factors and program-specific performance measures. This method and its inherent accountability factors enhanced the motivation of frontline teams by mapping their day-to-day activities up to high-level business unit and corporate objectives.

Linking Compensation to the Balanced Scorecard

Employees should feel that their organization's successes result in shared rewards for those who brought about those successes — namely, the employees. Conversely, when the organization experiences shortfalls, employees should feel some pain. Incentive and reward systems provide the link between organizational performance and individual rewards.

Citicorp (now Citigroup, Inc.) linked the three tiers of its Balanced Scorecard (corporate, business unit and personal performance) to levels of compensation. The performance of the business unit, for example, was based on six dimensions: financial performance; customer/franchise performance; strategy implementation; risk and control; people; and community standards. Each component of the business unit's performance scorecard was scored either below par, at par, or above par with bonuses at branch management level tied to those scores. This scheme provided strong incentives for managers not to under-perform on any of the six performance dimensions. ■

National Bank OFS: Using the Scorecard as a Budget Filter

National Bank Online Financial Services (OFS) used its Balanced Scorecard to develop a process to screen and rank budget initiatives. Management first sorted initiatives into two categories — "strategic" and "business as usual" — by grading each initiative on a set of three criteria:

1. Helps OFS achieve a strategic objective (defined by the strategic themes on the Balanced Scorecard).

2. Builds competitive advantage.

3. Builds sustainable points of differentiation.

The second screen focused on the initiatives that drew upon the resources from several functional units and required significant costs and time to implement. The effect of these screens was to separate operational budgeting tasks from strategic budgeting tasks. Senior management only wanted to consider strategic projects that could create new capabilities for supporting strategic objectives. And it worked — the two screens filtered hundreds of initiatives down to about a dozen, which were then ranked and considered for the budget based on the strategic themes from the Balanced Scorecard.

Principle 4: Make Strategy a Continual Process

One reason so many organizations have difficulties in implementing strategy is that these companies have at least one (sometimes many) disconnects between how they manage strategy and how they manage operations. These companies use their budget as a planning and control system, creating a loop that defines resources allocated to operations (inputs) and the performance targets required to hit their budgetary goals (outputs).

Strategy-Focused Organizations use a "double-loop" process, integrating the management of budgets and operations with the management of strategy. The Balanced Scorecard creates a reporting system that allows the progress against the strategy to be monitored and corrective actions to be taken as required. The scorecard also serves as a link between the operations control process and the learning and control process for managing strategy.

This management system enables you to do three essential things:

- **Link strategy and budget.** Stretch targets and strategic initiatives on the Balanced Scorecard link the rhetoric of strategy with the rigor of budgets.
- **Close the strategy loop.** The Balanced Scorecard links with feedback systems to provide a new framework for reporting and a new strategy-centered focus for management meetings.
- **Test, learn and adapt.** The Balanced Scorecard explicitly states the hypothesis of the strategy, allowing it to evolve in real time as new ideas and directions emerge from the organization.

(continued on page 7)

Principle 4: Make Strategy A Continual Process

(continued from page 6)

Two Processes

Strategy-Focused Organizations must view their budgets for financial numbers and resource allocation as arising from two different processes: operational budgeting and strategic budgeting.

Operational budgets consist of a forecast of the revenues expected from sales of goods and services and the expenses expected to be incurred, under efficient operations, for the goods and services to be produced and delivered to customers. Spending decisions can be determined by first estimating the production and sales volumes for the next period, then forecasting the demand for activities, calculating the resource demands, and determining the actual resource supply.

Operational budgets reflect expenses expected to be incurred to support recurring operations; this aspect of budgeting is informed by the Balanced Scorecard because of its connection to the business model for growth in existing businesses. Operational budgeting does not, however, represent the most significant opportunity for the scorecard to redirect and align the organization to its growth strategy, particularly if the strategy represents a distinct departure from the past.

Strategic budgeting authorizes the initiatives required to close the planning gap between desired breakthrough performance and that performance that is achievable by continuous improvement and business as usual. It authorizes spending initiatives that enable an organization to develop new products and services, new capabilities, new customer relationships and expanded capacity for future growth. The Balanced Scorecard helps organizations determine the quantity and mix of spending in their strategic budget. ■

Principle 5: Mobilize Change Through Executive Leadership

Implementing new strategies requires large-scale change; the term transformation has emerged to differentiate the scale of change required by business strategy from the continuous improvement that organizations routinely perform. The leaders of Strategy-Focused Organizations lead transformations, not small-scale changes.

Getting transformations started, however, is often a challenge commensurate with the scale of the change. Some companies engage in strategic transformations out of a "burning platform" motivation — their organizations were failing, and drastic measures were in order. Some examples include:

✓ Bob McCool, of Mobil North American Marketing and Refining (NAM&R), who implemented strategy-based organizational changes after his company's expenses and capital had doubled, its margins had flattened, and its volumes were trending downward.

✓ Gerry Isom, of CIGNA, who used the Balanced Scorecard to turn around the Property and Casualty division of the company when its ratio of outgoing expenses to incoming premium revenues far exceeded the industry average.

✓ Bill Catucci, of AT&T Canada, who came to the company when it was close to bankruptcy, losing $1 million every day.

In other cases, the companies were successful; rather than resting on their laurels, however, their leaders created stretch targets to eliminate complacency and drive creative efforts. Some examples include:

✓ Jack Welch, who, shortly after becoming CEO of General Electric, energized the company by declaring that every division should become Number One or Number Two in every market they served. The change transformed his company from a lumbering giant to a giant with the speed and agility of a small enterprise.

✓ Douglas Newell, who, as head of the Internet banking division of National Bank OFS, set a goal to become the Number One Internet banking company in the world. Newell used the Balanced Scorecard to set stretch targets that kept the division ahead of the pack in the fast-moving world of the Internet.

These and other leaders set remarkable goals, goals that fell far outside their organizations' comfort zones, goals that required total organizational commitment to achieve them. They also recognized the benefits of using measurement to lead their change efforts. Executives that create Balanced Scorecards for their strategic initiatives help build their strategy, the team to implement that strategy and the commitment from the team that is required for success.

It's easy to build a business plan that addresses and meets specific growth objectives; the hard part is identifying how that growth will be achieved. The Balanced Scorecard helps organizations specify in detail the critical elements for their growth strategies:

- **targeted customers where profitable growth will occur;**
- **value propositions that lead customers to do more business and at higher margins with the company;**
- **innovations in products, services and processes;**
- **investments in people and systems to enhance processes and deliver differentiated value propositions for growth.**

(continued on page 8)

Principle 5: Mobilize Change Through Executive Leadership

(continued from page 7)

Without clear specifics on these elements, employees cannot reinforce one another's efforts to implement strategy.

Ultimately, however, the ability to create a Strategy-Focused Organization depends less on structural and design issues and more on the leadership of the organization's senior executive. The leaders listed above created a climate for change, and provided the vision for what that change could accomplish, as well as the governance process that promoted communications, interactive discussions and learning about their strategies.

Indeed, most of these strategy-focused leaders found that their most important challenge was communication of their strategy to those whose job it was to implement it. They had to gain the hearts and minds of all their middle managers, technologists, sales forces, frontline employees and back-office staff. They developed their visions of what success would look like and the outcomes they wanted to achieve, then let their employees help find innovative ways to accomplish the strategic mission. In so doing, they found it more effective to communicate vision and strategy, rather than to try to control the actions of their subordinates; they used the Balanced Scorecard as a communications tool, not a control tool. ■

What Are the Pitfalls of Implementation?

Although many companies enjoy the benefits from their Balanced Scorecard management systems, implementation failures do occur. More often than not, these disappointing results are self-inflicted, owing to factors internal to the business rather than attributable to external events. These pitfalls tend to fall into two categories: design failures and process failures.

Design Failures

Some failures occur when companies build poor Balanced Scorecards. They may use too few measures in their perspectives, failing to obtain a balance between the outcomes they are trying to achieve and the performance drivers of those outcomes. Others include too many measures and never identify the critical few.

Failures also occur when units within the company are not aligned with an overall strategy. If each unit follows its own path in developing a Balanced Scorecard, organizations will not have a common strategic vocabulary — they will instead have a "Scorecard Babel." The management system collapses when each unit approaches its scorecard differently, with no overall link to group or corporate strategies. Senior leadership is then unable to mobilize at any level, local or organization-wide.

Process Failures

The most common causes of implementation failures, however, are due to poor organizational processes, which tend to fall into at least one of seven common categories:

- **Lack of senior management commitment.** Senior management must articulate the organization's strategy and bring about consensus if consensus about the strategy is difficult to achieve. They must also be emotionally committed to the strategy, investing time and resources to see the strategy through.
- **Too few individuals involved**. Commitment must come from the appropriate decision-makers in an organization to keep business practices in line with strategic goals. The excuse that individuals (particularly key senior managers) "already attend too many meetings" is not a valid one.
- **Keeping the scorecard at the top.** The opposite error of not involving senior executives is to involve only senior executives. For the scorecard to be effective, it must be shared with everyone in the organization.
- **An over-long development process** (the Balanced Scorecard as a one-time measurement project). Some teams believe they only have one chance to launch the scorecard, so they want to produce the perfect scorecard, spending months refining it — so long, in fact, that it never gets implemented. The most successful implementations, however, start with missing measurements; the organizations simply learn by doing.
- **Treating the Balanced Scorecard as a systems project.** Sometimes, the Balanced Scorecard is implemented by consultants that specialize in installing large systems. These consultants spend months and millions of dollars automating and facilitating access to thousands and millions of data observations collected by the company. This has little to do with the engaging strategy that should be at the center of the Balanced Scorecard management system.
- **Hiring inexperienced consultants.** Using inexperienced consultants or consultants who deliver their favorite methodology under the rubric of the Balanced Scorecard is a recipe for failure.
- **Introducing the Balanced Scorecard for compensation only.** Linking strategy to compensation is a powerful lever to gain the attention and commitment of individuals to strategy. Some companies, however, forget that they must translate the strategy into terms each of their employees can understand and use in their everyday activities — a key component of implementation. ■

Fourteen Management Principles From the World's Greatest Manufacturer

THE TOYOTA WAY

THE SUMMARY IN BRIEF

Toyota is the world's most profitable automaker. Its "secret weapon" is lean production — the revolutionary approach to business processes that it invented in the 1950s and has spent decades perfecting. Today, businesses around the world are trying to emulate Toyota's remarkable success by working to implement the company's radical system for speeding up business and service processes, reducing waste, and improving quality. It is a system that is derived from balancing the role of people in an organizational culture that expects and values their continuous improvements, with a technical system that is focused on high-value-added "flow."

To help other companies learn to continually improve on what they do, Professor of Industrial and Operations Engineering at the University of Michigan Dr. Jeffrey K. Liker describes the results of his year-long research into Toyota and its managers, executives, suppliers and training centers. While detailing the company's culture, processes and people, Liker provides readers with a management model that can be used to transform business across industries, and the key principles that drive the techniques and tools of the Toyota Production System and the management of Toyota in general. These principles embody the long-term philosophy, processes, results, people, partners and problem solving that drive the organizational learning at Toyota, and can make the Toyota Way work for any organization.

What You'll Learn In This Summary

- ✓ How to foster an atmosphere of continuous improvement and learning.
- ✓ How to satisfy customers and eliminate waste at the same time.
- ✓ How to get quality right the first time.
- ✓ How to groom leaders from within rather than recruit them from the outside.
- ✓ How to teach employees to become problem solvers.
- ✓ How to grow together with suppliers and partners for mutual benefit.

THE TOYOTA WAY

by Jeffrey K. Liker, Ph.D.

— THE *COMPLETE* SUMMARY

PART ONE: THE WORLD-CLASS POWER OF THE TOYOTA WAY

Using Operational Excellence As a Strategic Weapon

Toyota first caught the world's attention in the 1980s, when it became clear that there was something special about Japanese quality and efficiency. Japanese cars were lasting longer than American cars and required much less repair. By the 1990s, it was apparent that there was something even more special about Toyota compared to other automakers in Japan. It was the way Toyota engineered and manufactured the autos that led to unbelievable consistency in the process and product.

Toyota designed autos faster, with more reliability, yet at a competitive cost, even when paying the relatively high wages of Japanese workers. Equally impressive was that every time Toyota showed an apparent weakness and seemed vulnerable to the competition, Toyota fixed the problem and came back even stronger.

Today, Toyota is the third-largest auto manufacturer in the world, behind General Motors and Ford, with global vehicle sales of over 6 million per year in 170 countries. Auto industry analysts estimate that Toyota will pass Ford in global vehicles sold in 2005, and if current trends continue, it will eventually pass GM to become the largest automaker in the world.

Quality Reputation

Much of Toyota's success comes from its astounding quality reputation. In 2003, Toyota recalled 79 percent fewer vehicles in the United States than Ford and 92 percent fewer than Chrysler. According to a 2003 study in *Consumer Reports*, 15 of the top 38 most reliable models from any manufacturer over the last seven years were made by Toyota/Lexus.

The Toyota Production System is Toyota's unique approach to manufacturing. It is the basis for much of the "lean production" movement that has dominated manufacturing trends for the last 10 years. Lean manufacturing is a five-part process that includes defining customer value, defining the value stream, making it "flow," "pulling" from the customer back, and striving for excellence. To be a lean manufacturer requires a way of thinking that focuses on making the product flow through value-adding processes without interruption (one-piece flow), a "pull" system that cascades back from customer demand by replenishing only what the next operation takes away at short intervals, and a culture in which everyone is striving continuously to improve. ■

How Toyota Became The World's Best Manufacturer

The most visible product of Toyota's quest for excellence is its manufacturing philosophy, called the Toyota Production System (TPS). TPS is the next major evolution in efficient business processes after the mass production system invented by Henry Ford.

Although Toyota now has more than 240,000 employees around the world, in many ways it is still a large "family business" with considerable influence still exercised by the founding Toyoda family. To understand TPS and the Toyota Way, and how the company became the world's best manufacturer, it is helpful to understand the history and personalities of the founding family members who left an indelible mark on the Toyota culture.

Sakichi Toyoda was a tinkerer and inventor who grew up in the late 1800s and invented a sophisticated automatic

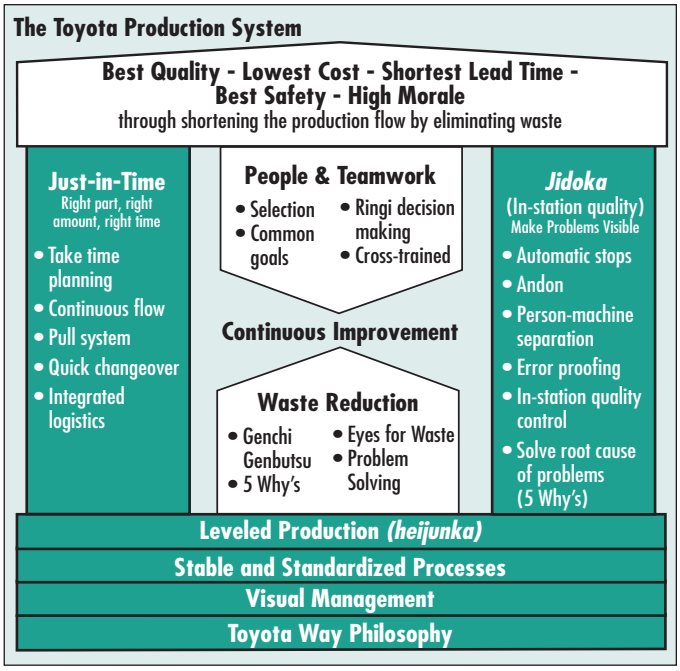
How Toyota Became The World's Best Manufacturer

(continued from page 2)

power loom. In 1929, Sakichi sent his son, Kiichiro, to England to sell the patent rights to his "mistake-proof" loom. With that money (100,000 English pounds), he started the Toyota Motor Corp., and tasked Kiichiro with building the car business. After studying mechanical engineering and engine technology at the Tokyo Imperial University, he built the company on his father's management approach, but added his own innovations. As his father had driven his success with *jidoka* — automation with a human touch, or "mistake proofing" — Kiichiro contributed the second pillar of the TPS: Just-in-Time, a system based on the U.S. supermarket system of replacing products on shelves just in time as customers purchased them.

TPS evolved to meet the particular challenges Toyota faced as it grew as a company. It evolved as Taiichi Ohno, Toyota's plant manager who was assigned to improve Toyota's manufacturing process in 1950, and his contemporaries put these principles to work in the shop through years of trial and error. Out of the rubble of WWII, they accepted the challenge of matching Ford's productivity "with a creative spirit and courage," solved problem after problem, and evolved the new production system. Infused with the teachings of American quality pioneer W. Edwards Deming, TPS became a powerful philosophy that all types of businesses and processes could learn to use. ■



Eliminating Waste

The Toyota Production System is *not* the Toyota Way. TPS is the most systematic and highly developed example of what the principles of the Toyota Way can accomplish. The Toyota Way consists of the foundational principles of the Toyota culture, which allow TPS to function so effectively. Though they are different, the development of TPS and its success are intimately connected with the evolution and development of the Toyota Way.

When applying TPS, you start with examining the manufacturing process from the customer's perspective. The first question in TPS is always "What does the customer want from this process?" This defines value. Through the customer's eyes, you can observe the process and separate the value-added steps from the non-value-added steps. You can apply this to any process — manufacturing, information or services.

Toyota has identified seven major types of non-value-adding waste in business or manufacturing processes, and an eighth has been added. These are:

1. Overproduction. Producing items for which there are no orders, which generates overstaffing and storage and transportation costs because of excess inventory. Ohno considered this to be the fundamental waste because it causes most of the other wastes.

2. Waiting (time on hand). Workers merely serving to watch an automated machine or having to stand around waiting for the next processing step, tool, supply, part, etc., or having no work because of stockouts, lot processing delays, equipment downtime, and capacity bottlenecks.

3. Unnecessary transport or conveyance. Carrying work in process (WIP) long distances, creating inefficient transport, or moving materials, parts or finished goods into or out of storage or between processes.

4. Overprocessing or incorrect processing. Taking unneeded steps to process the parts. Inefficiently processing due to poor tool and product design, causing unnecessary motion and producing defects. Waste is generated when providing higher-quality products than are necessary.

5. Excess inventory. Excess raw material, WIP, or finished goods causing longer lead times, obsolescence, damaged goods, transportation and storage costs, and delay. Also, extra inventory hides problems such as production imbalances, late deliveries from suppliers, defects, equipment downtime, and long setup times.

6. Unnecessary movement. Any wasted motion employees have to perform during the course of their work, such as looking for, reaching for, or stacking parts, tools, etc. Also, walking is waste.

7. Defects. Production of defective parts or correction. Repair or rework, scrap, replacement production, and inspection mean wasteful handling, time and effort.

8. Unused employee creativity. Losing time, ideas, skills, improvements, and learning opportunities by not engaging or listening to your employees. ■

PART TWO: THE 14 BUSINESS PRINCIPLES OF THE TOYOTA WAY

Long-Term Philosophy

Toyota's biggest contribution to the corporate world is that of providing a real-life example that a modern corporation can thrive in a capitalistic world and be profitable while doing the right thing, even if it means that short-term profits are not always the first goal.

Every person interviewed in Toyota's engineering, purchasing and manufacturing departments, in Japan and the United States, has a sense of purpose greater than earning a paycheck. They feel a greater sense of mission for the company and can distinguish right from wrong with regard to that mission. They have learned the Toyota Way from their Japanese mentors and the message is consistent: *Do the right thing for the company, its employees, the customer, and society as a whole.* Toyota's strong sense of mission and commitment to its customers, employees and society is the foundation for all the other principles and the missing ingredient in most companies trying to emulate Toyota.

● **Principle 1: Base Your Management Decisions on a Long-Term Philosophy, Even at the Expense of Short-Term Financial Goals.**

The purpose of Toyota is *not* to make a quality product that will sell well and make money for owners. That is a requirement in order to achieve the mission. The true mission, according to its North American Mission Statement, has three parts:

1. Contribute to the economic growth of the country in which it is located (external stakeholders).

2. Contribute to the stability and well-being of team members (internal stakeholders).

3. Contribute to the overall growth of Toyota.

The poignant message is that the company must enhance the growth of society or it cannot contribute to its external or internal stakeholders. Toyota challenges its workers to contribute to Toyota and make a place in its history. Toyota genuinely wants its associates to grow and learn, to invest in long-term technologies, and create lasting customer satisfaction with the goal of getting repeat business for life.

The Toyota Way is about adding value to customers, employees and society. It provides a framework for Toyota to make short-term and long-term decisions, and it rallies employees around a shared purpose that is bigger than any of them. ■

Guiding Principles at Toyota

1. Honor the language and spirit of the law of every nation and undertake open and fair corporate activities to be a good corporate citizen of the world.

2. Respect the culture and customs of every nation and contribute to economic and social development through corporate activities in the communities.

3. Dedicate ourselves to providing clean and safe products and to enhancing the quality of life everywhere through all our activities.

4. Create and develop advanced technologies and provide outstanding products and services that fulfill the needs of customers worldwide.

5. Foster a corporate culture that enhances individual creativity and teamwork value, while honoring mutual trust and respect between labor and management.

6. Pursue growth in harmony with the global community through innovative management.

7. Work with business partners in research and creation to achieve stable, long-term growth and mutual benefits, while keeping ourselves open to new partnerships.

The Right Process Will Produce the Right Results

Toyota leaders truly believe that if they create the right process the results will follow. Within the next six principles are most of the TPS tools for improving manufacturing processes as well as the more routine processes for product development and service organizations. Important and powerful as these tools and processes are, they are only the tactical or operations aspects of the Toyota Way and becoming lean. These tools are far more effective when they are supported by a company-wide, long-term management philosophy.

● **Principle 2: Create Continuous Process Flow to Bring Problems to the Surface.**

A good place for any company to begin the journey to lean is to create continuous flow wherever applicable in its core manufacturing and service processes. Creating flow means linking together operations that otherwise are disjointed. When operations are linked together, there is more teamwork, rapid feedback on earlier quality problems, control over the process, and direct pressure for people to solve problems and think and grow.

Flow is at the heart of the lean message that shortening the elapsed time from raw materials to finished goods or services will lead to the best quality, lowest cost, and shortest delivery time. Flow also tends to force the implementation of many of the other lean tools and philosophies, such as preventive maintenance and built-in quality (*jidoka*).

● **Principle 3: Use "Pull" Systems to Avoid Overproduction.**

The Toyota Way is not about managing inventory; it is

(continued on page 5)

The Right Process Will Produce the Right Results

(continued from page 4)

about eliminating it. Very early on, Toyota started thinking in terms of pulling inventory based on immediate customer demand. In the Toyota Way, "pull" means the ideal state of just-in-time manufacturing: giving the customer what he or she wants, when he or she wants it, and in the amount he or she wants.

● **Principle 4: Level Out the Workload (*Heijunka*).**

Fujio Cho, the president of the Toyota Motor Corp., said: "In general, when you try to apply the TPS, the first thing you have to do is to even out or level the production. And that is the responsibility primarily of production control or production management people. Leveling the production schedule may require some front-loading of shipments or postponing of shipments, and you may have to ask some customers to wait for a short period of time. Once the production level is more or less the same or constant for a month, you will be able to apply pull systems and balance the assembly line. But if production levels — the output — varies from day to day, there is no sense in trying to apply those other systems, because you simply cannot establish standardized work under such circumstances."

● **Principle 5: Build a Culture of Stopping to Fix Problems, to Get Quality Right the First Time.**

Quality (*jidoka*) should be built in. This means that you need a method to detect defects when they occur and automatically stop production so an employee can fix the problem before the defect continues downstream.

Jidoka is also referred to as *autonomation* — equipment endowed with human intelligence to stop itself when it has a problem. In-station quality (preventing problems from being passed down the line) is much more effective and less costly than inspecting and repairing quality problems after the fact.

● **Principle 6: Standardized Tasks Are the Foundation for Continuous Improvement and Employee Empowerment.**

Whether your employees are designing intricate new devices, styling new attractive products, processing accounts payable, developing new software, or working as nurses, they are likely to respond to the idea of standardizing their work in the same way: "We are creative, thinking professionals and every task we do is a unique project." If you are not in manufacturing, you may be surprised to learn that even workers on the assembly line believe they have a knack for doing the job best their own way and that standards will simply set them back. But some level of standardization is possible and is the backbone of the Toyota Way process.

What can be perceived as negative or ineffective becomes positive and effective within the Toyota Way and builds collaborative teams rather than conflict between employees and management. Standardized work was never intended by Toyota to be a management tool to be imposed coercively on the work force. On the contrary, rather than enforcing rigid standards that can make jobs routine and degrading, standardized work is the basis for empowering workers and innovation in the workplace.

The critical task when implementing standardization is to find that balance between providing employees with rigid procedures to follow and providing them the freedom to innovate and be creative to meet challenging targets consistently for cost, quality and delivery. Standards have to be specific enough to be useful guides, yet general enough to allow for some flexibility.

● **Principle 7: Use Visual Control So No Problems Are Hidden.**

Visual control is any communication device used in the work environment that tells us at a glance how work should be done and whether it is deviating from the standard. It helps employees who want to do a good job see immediately how they are doing. It might show where items belong, how many items belong there, what the standard procedure is for doing something, the status of work in process, and many other types of information critical to the flow of work activities. In the

(continued on page 6)

The Three M's

The Toyota Way document refers to the "elimination of *Muda, Muri, Mura.*" The three M's are:

✓ *Muda — Non-value-added.* The most familiar M includes the eight wastes mentioned earlier. These are wasteful activities that lengthen lead times, cause extra movement to get parts or tools, create excess inventory, or result in any type of waiting.

✓ *Muri — Overburdening people or equipment.* This is in some respects on the opposite end of the spectrum from *muda. Muri* is pushing a machine or person beyond natural limits. Overburdening people results in safety and quality problems. Overburdening equipment causes breakdowns and defects.

✓ *Mura — Unevenness.* In normal production systems, at times there is more work than the people or machines can handle, and at other times there is a lack of work. Unevenness results from an irregular production schedule or fluctuating production volumes due to internal problems, like downtime or missing parts or defects. *Muda* will be a result of *mura.* Unevenness in production levels means it will be necessary to have on hand the equipment, materials and people for the highest level of production — even if the average requirements are much lower than that.

For Additional Information on visual control and eliminating wastes, go to: http://my.summary.com

The Right Process Will Produce the Right Results

(continued from page 5)

broadest sense, visual control refers to the design of just-in-time information of all types to ensure fast and proper execution of operations and processes.

Visual control goes beyond capturing deviations from a target or goal on charts and graphs and posting them publicly. Visual controls at Toyota are integrated into the process of the value-added work. The *visual* aspect means being able to look at the process, a piece of equipment, inventory or information, or at a worker performing a job and immediately see the standard being used to perform the task and if there is a deviation from the standard.

● Principle 8: Use Only Reliable, Thoroughly Tested Technology That Serves Your People and Processes.

At Toyota, new technology is introduced only after it is proven out through direct experimentation with the involvement of a broad cross-section of people. This does not exclude new or cutting-edge technology. It means the technology has been thoroughly evaluated and tested to ensure it provides added value. Before adopting new technology, Toyota will go to great lengths to analyze the impact it may have on existing processes.

First, it will see firsthand the nature of the value-added work being performed by the workers for the process. Toyota will then use a pilot area to improve the process with the existing equipment, technology and people. If it determines that the new technology can add value to the process, it is then carefully analyzed to see if it conflicts with Toyota's philosophies and operating principles. If the new technology is acceptable, the guiding principle is to design and use it to support continuous flow in the production process and help employees perform better within Toyota Way standards.

Ideally, the new technology will be used right where the work is being done so it does not require a person in an office to input the data. The important principle is to find ways to support the work process while not distracting people from the value-added work. ■

The Disappearing Taurus

The Donnelly Mirrors (now Magna Donnelly) Grand Haven plant, which produces exterior automotive mirrors, was so disorganized when management began implementing lean manufacturing that no one could see much of anything except waste. One day a Ford Taurus mysteriously disappeared. It had been in the factory so they could try fitting it with some prototype mirrors. When it vanished, they even filed a police report. Then it turned up months later. Guess where it was. In the back of the plant, surrounded by inventory. Donnelly associates now tell this story to illustrate how far they have come since implementing lean.

Add Value by Developing Your People and Partners

It seems the typical U.S. company regularly alternates between the extremes of stunningly successful and borderline bankrupt. The solution to severe problems is often to bring in a new CEO who will take the company in a radically new direction. This roller-coaster ride is exciting and even works in bursts. Then, when something goes wrong, someone else preaching a still newer direction replaces him or her.

In contrast, Toyota's President Fujio Cho grew up in Toyota and was a student of Taiichi Ohno. He and Ohno provided a theoretical basis for the Toyota Production System (TPS) and the Toyota Way principles in order to teach them throughout the company. Cho was the leader of the Georgetown, Ky., plant — Toyota's most important venture in the United States. He was a board member and came into his new role when the company was already successful. At Toyota, the new president or CEO does not need to come in and take charge to move the company in a radically new direction to put his or her imprint on the company. The leadership role of Cho focuses on something entirely different.

● Principle 9: Grow Leaders Who Thoroughly Understand the Work, Live the Philosophy, and Teach It to Others.

Even when Toyota promoted someone from an unusual part of the company to save it from impending doom, there has never been a sudden change of direction. Perhaps this is the concept of eliminating *mura* (unevenness) at work at the executive level. Throughout Toyota's history, key leaders have been found within the company, at the right time, to shape the next step in Toyota's evolution.

Another important leadership tenet of the Toyota Way is the effort leaders make to support the culture year after year so it can create the environment for a learning organization. In W. Edwards Deming's terms, Toyota uses "constancy of purpose" throughout the organization, which lays the groundwork for consistent and positive leadership as well as an environment for learning.

● Principle 10: Develop Exceptional People and Teams Who Follow Your Company's Philosophy.

First, look at the system dynamics of your organization. Building excellent people who understand and support your company's culture is not a matter of adopting simple solutions or an afterthought for applying motivational theories. Training exceptional people and building individual work groups need to be the backbone of your

(continued on page 7)

Add Value by Developing Your People and Partners

(continued from page 6)

management approach, an approach that integrates your social systems with your technical system. You need a social system and a culture of continuous improvement to support positive problem-solving behaviors and motivate people to improve.

● **Principle 11: Respect Your Extended Network of Partners and Suppliers by Challenging Them and Helping Them Improve.**

Auto industry suppliers consistently report that Toyota is their best customer — and also their toughest. We often think of "tough" as difficult to get along with or unreasonable. In Toyota's case, it means the company has very high standards of excellence and expects all its partners to rise to those standards. More importantly, it will help its partners rise to those standards.

One way that Toyota has honed its skills in applying the TPS is by working on projects with suppliers. Toyota needs its suppliers to be as capable as its own plants at building and delivering high-quality components just in time. There are many methods Toyota uses to learn with its suppliers and, in the Toyota Way style, these are all "learning by doing" processes, keeping classroom training to a minimum. The important learning happens through real projects on the shop floor. ■

Continuously Solving Root Problems Drives Learning

You cannot be sure you really understand any part of any business problem unless you go and see for yourself firsthand. It is unacceptable to take anything for granted or to rely on the reports of others. Tables and numbers might measure results, but they do not reveal the details of the actual process being followed every day.

● **Principle 12: Go and See for Yourself to Thoroughly Understand the Situation (*Genchi Genbutsu*).**

Literally translated, *genchi* means the actual location and *genbutsu* means the actual materials or products. But *genchi genbutsu* is interpreted within Toyota to mean *going to the place to see the actual situation for understanding*. *Gemba* is a term that has become more popular. It refers to "the actual place" and means about the same thing as *genchi genbutsu*. The first step of any problem-solving process, development of a new product, or evaluation of an associate's performance is grasping the actual situation, which requires "going to *gemba*."

Toyota promotes and expects creative thinking, and innovation is a must, but it should be grounded in thoroughly understanding all aspects of the actual situation. This is one of the behaviors that really distinguish someone trained in the Toyota Way — they take nothing for granted and know what they are talking about, because it comes from firsthand knowledge.

There is a surface version of *genchi genbutsu* and a much deeper version, which takes many years for employees to master. What the Toyota Way requires is that employees and managers must "deeply" understand the processes of flow, standardized work, etc., as well as have the ability to critically evaluate and analyze what is going on.

● **Principle 13: Make Decisions Slowly by Consensus, Thoroughly Considering All Options; Implement Decisions Rapidly (*Nemawashi*).**

For Toyota, how you arrive at the decision is just as important as the quality of the decision. Taking the time and effort to do it right is mandatory. In fact, management will forgive a decision that does not work out as expected, if the process used was the right one. A decision that by chance works out well, but was based on a shortcut process, is more likely to lead to a reprimand from the boss.

Toyota's secret to smooth and often flawless implementation of new initiatives is careful, upfront planning. Underlying the entire process of planning, problem solving, and decision making is careful attention to every detail.

This principle includes the important process of *nemawashi*: *Make decisions slowly by consensus, thoroughly considering all options; implement rapidly.* The process of *nemawashi* is often used to describe how junior people build consensus by developing a proposal and circulating it broadly for management approval. In the *nemawashi* process, many people are giving their input and this generates consensus. By the time the formal proposal comes up for a high-level approval, the decision is already made.

● **Principle 14: Becoming a Learning Organization Through Relentless Reflection (*Hansei*) and Continuous Improvement (*Kaizen*).**

Toyota is an outstanding learning organization because it sees standardization and innovation as two sides of the same coin, melding them in a way that creates great continuity. For example, Toyota has judiciously used stability and standardization to transfer individual and team innovation into organization-wide learning. It is one thing for individual employees to come up with innovative ways to do things. But to be transferred to organization learning, the new way must be standardized and practiced across the organization until a better way is discovered. This is the Toyota Way of learning — standardization punctuated by innovation, which gets

(continued on page 8)

For Additional Information on five elements of decision making, go to: http://my.summary.com

Continuously Solving Root Problems Drives Learning

(continued from page 7)

translated into new standards.

The philosophy of Toyota and its experience support the belief that if it focuses on the process itself and continual improvement, it will achieve the financial results it desires. Continuous improvement (*kaizen*) can occur only after a process is stable and standardized. When you make processes stable and have a process to make waste and inefficiencies publicly visible, you have an opportunity to learn continually from your improvements.

A key to learning and growing, not only within Toyota but in Japanese culture, is *hansei*, which roughly means "reflection." According to George Yamashina, who runs the Toyota Technical Center, *hansei* had to be introduced to U.S. managers because: "Without *hansei* it is impossible to have *kaizen*. In Japanese *hansei*, when you do something wrong, at first you must feel really, really sad. Then you must create a future plan to solve that problem and you must sincerely believe you will never make this type of mistake again. *Hansei* is a mind-set, an attitude. *Hansei* and *kaizen* go hand in hand." ■

PART THREE: APPLYING THE TOYOTA WAY IN YOUR ORGANIZATION

Using the Toyota Way to Transform Technical and Service Organizations

As companies experience extraordinary improvements on the shop floor, it is natural to ask how this can apply to technical and service operations. Many service companies that initially look at Toyota are attracted most by the technical TPS principles of flow and how they can apply them to a highly variable and often chaotic process.

Creating lean flow is the technical backbone of the TPS in both technical and service organizations. There are five steps to creating flow in technical and service organizations. They are:

1. **Identify who the customer is for the processes and the added value they want delivered.**
2. **Separate out the repetitive processes from the unique, one-of-a-kind processes and learn how you can apply the TPS to the repetitive processes.**
3. **Map the flow to determine value added and non-value added.**
4. **Think creatively about applying the broad principles of the Toyota Way to these processes using a future-state value stream map.**
5. **Start doing it and learn by doing using a Plan-Do-Check-Act (PDCA) cycle and then expand it to the less repetitive processes.**

The key to applying the TPS in any environment is to focus on the value-added operations and work to eliminate waste. This is more challenging for service operations, because defining the customers and understanding their needs can be tricky. But with extra effort, it can be done.

It is impossible to define value in a service operation without first understanding its *core value stream*. Once you define the core value stream, then all support service operations must view their roles as supporting the core value stream. The leaner the core value stream, the leaner the support operations can be. Generally, it is recommended to start by applying the TPS to the core value stream and then branch out to the support functions. ■

Build Your Own Lean Learning Enterprise

If there is anything to learn from Toyota, it is the importance of developing a system and sticking with it and improving it. You cannot become a learning organization by jumping willy-nilly from fad to fad.

The Toyota Way model was intentionally built from the ground up, starting with a philosophy. And the philosophy starts with the chief executives of the organization. Their goal should be to build an enterprise for the long term that delivers exceptional value to customers and society. This requires long-term thinking and continuity of leadership. It might take decades to lay the foundation for radically transforming the organization's culture. Here's what we know about changing a culture:

1. **Start from the top — this may require an executive leader shakeup.**
2. **Involve from the bottom up.**
3. **Use middle managers as change agents.**
4. **It takes time to develop people who really understand and live the philosophy.**
5. **On a scale of difficulty, it is "extremely" difficult.**

Understanding and Commitment

A prerequisite to change is for top management to have an understanding and commitment to leveraging the Toyota Way to become a "lean learning organization." This understanding and commitment extends to building the lean systems and culture and, the most difficult for Western companies, sustaining and constantly improving the system. ■

How Today's Best-Run Companies are Achieving Economic, Social and Environmental Success – and How You Can Too

THE TRIPLE BOTTOM LINE

THE SUMMARY IN BRIEF

Expectations around corporate responsibility have been increasing for decades and people today are perhaps more concerned about corporate behavior than at any time since the Great Depression.

While the recent focus has been on financial integrity, the scope of corporate responsibility has been growing steadily since the 1960s when companies first began to play a leading role in assuring the safety of their products and the sanctity of the environment. Corporations today must answer not only to concerned investors, but to a variety of increasingly empowered stakeholders demanding that they promote diversity, eradicate poverty, foster public health, guard against child labor, protect human rights, oppose corrupt regimes, eliminate hunger, measure and report their results and actively engage with them about all of it.

Call it the age of accountability: corporate leaders that want their companies to survive for the long haul must develop a more integrated, responsible and sustainable way of doing business – driven not by philanthropy or government regulation but by the hard and fast truths of succeeding in a global economy. They must find ways to provide an array of benefits to the world even as they enrich their shareholders.

What you will learn in this summary:

- ✓ ***How to create an enterprise that is truly sustainable.***
- ✓ ***How to do business in an interdependent world.***
- ✓ ***How sustainability is different and more important than corporate social responsibility and corporate philanthropic efforts.***
- ✓ ***How companies can become more profitable by doing the right thing.***
- ✓ ***How to measure the impact of an organization's activities on the world.***
- ✓ ***How companies are reaching out to their harshest critics and seeking new forms of collaboration, innovation and partnership to improve results with startling success.***

THE TRIPLE BOTTOM LINE

By Andrew W. Savitz with Karl Weber

— THE *COMPLETE* SUMMARY

PART ONE: THE SUSTAINABILITY IMPERATIVE

The concept of sustainability originated around a growing awareness in the 1980s. It has since come to denote a corporation that creates profit for its shareholders while protecting the environment and improving the lives of those with whom it interacts. It operates so that its business interests and the interests of the environment and society intersect. ■

Selling Hershey

July 25, 2002, was a day like any other in the picture-perfect town of Hershey, Pennsylvania, home of the world-famous Hershey bar. Tourists strolled Chocolate Avenue, gawking at streetlights shaped like Hershey Kisses and shopping for candy-themed souvenirs at dozens of gift shops. Bedazzled children and obliging parents lined up for tours of Hershey's Chocolate World and squealed with delight on the 10 roller coasters in nearby Hersheypark.

All of these pleasures had one thing that united them even more than their chocolate flavor: the steady stream of income they produced for Hershey's 12,000 residents.

On July 25, 2002, the *Wall Street Journal* ran a story which revealed that Hershey Trust, the charitable organization that owned a controlling stake in the Hershey Foods Corporation and thereby in the future of everyone in town, was planning to sell to the highest bidder.

A coalition of angry citizens formed within hours. It included former CEOs of Hershey who hated the idea of selling the company they'd nurtured; leaders and members of the union that represented 2,800 employees at the Hershey plant; alumni of the Milton Hershey School, the remarkable educational center for orphans created by company founder Milton S. Hershey himself; and thousands of business owners and residents of central Pennsylvania who feared the death of a town they cherished. How had Hershey's leaders so badly misgauged the reaction to their plan?

Lessons From the Chocolate Mess

Business leaders in all industries can learn some basic lessons of sustainability from the Hershey fiasco:

- **Focusing on profit alone can backfire.** The managers who made the decision to sell Hershey were doing the right thing by purely financial yardsticks. But in today's business world, the financial bottom line is not the only (or even the most important) measure of success. Executives also must consider the social, economic and environmental impacts on anyone with a stake in the outcome.
- **Businesses are accountable to more people than they realize.** Hershey management acted as if their fiduciary duty was the only interest that mattered. They forgot about other crucial individuals and organizations with a vested interest in their actions.
- **Bad things can happen to good companies that fail to take a broad view of accountability.** Well-intentioned, well-managed organizations like Hershey that focus exclusively on shareholders as if they were the only stakeholders that matter are headed for trouble.
- **Stakeholder engagement is an increasingly critical component of successful management.** Companies have legitimate reasons for keeping secrets and for confining decisions to a small circle of insiders. But bringing your stakeholders inside the tent on matters that might affect them is increasingly a matter of responsible corporate citizenship and sophisticated risk management. ■

The Sustainability Sweet Spot

Business leaders with a superficial understanding of sustainability think of it as a distraction from their main purpose, a chore they hope can be discharged quickly and easily by writing a check to the United Way or allowing employees to volunteer for the local cleanup drive or food kitchen and then get back to work.

This approach reveals a fundamental misunderstanding. Sustainability is not about philanthropy. There's nothing wrong with charity, but the sustainable company conducts its business so that benefits flow naturally to all stakeholders, including employees, customers, business partners, the communities in which it operates and, of course, its shareholders.

The vision of a company that renews society as it enriches its shareholders may seem remote, but think about sustainability as the common ground shared by your business interests (those of your financial stakeholders) and the interests of the public (your nonfinancial stakeholders). This common ground is what we call the sustainability sweet spot: the place where the pursuit of profit blends seamlessly with the pursuit of the common good.

The overlap between winning increased market share and supporting healthier lifestyle habits is a sweet spot for PepsiCo. If the idea of healthy products sounds like a stretch for a company famous for its sugary sodas and salty snacks, think again. Having purchased Tropicana and Quaker Oats, PepsiCo has made the healthy-product sweet spot the fastest-growing segment of its North American portfolio. Social responsibilities have thus helped PepsiCo earnings per share grow at a prodigious 13 percent in 2004 and to surpass Coca-Cola in market cap for the first time in history. ■

The Age of Accountability

Whether you find or even look for the sweet spot, the principles of sustainability can improve the management of your business by:

- **Protecting the business,** which includes reducing risk of harm to customers, employees and communities; identifying emerging risks and management failures early; limiting regulatory interventions; and retaining the explicit or implicit license to operate granted by government or the community at large.
- **Running the business,** which includes reducing costs, improving productivity, eliminating needless waste and obtaining access to capital at lower costs. Eco-efficiency is a basic component of sustainability that applies to running your business. It means reducing the amount of resources used to produce goods and services, which increases a company's profitability while decreasing its environmental impact. The underlying theme is simple: pollution is waste and waste is anathema because it means your company is paying for something it didn't use.
- **Growing the business which includes opening new markets,** launching new products and services, increasing the pace of innovation, improving customers satisfaction and loyalty, growing market share by attracting customers for whom sustainability is a personal or business value, forming new alliances with business partners and other stakeholders and improving reputation and brand value.

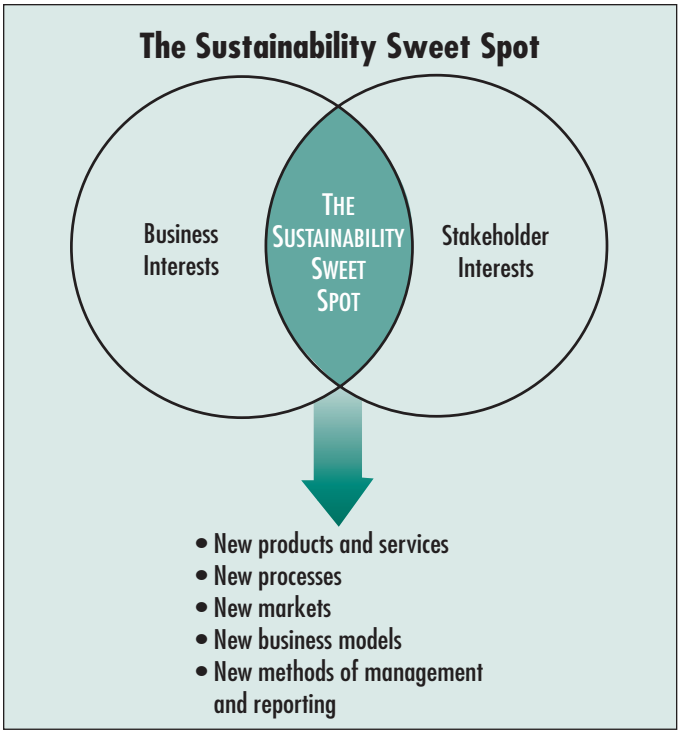
An Old Idea Made New

DuPont's sustainability philosophy dates back more than 200 years to when the firm was an explosives manufacturer. The underlying social principle was simple and suited to the times: "Don't blow up the workers – and mind the town as well." It took another 200 years for DuPont (and society at large) to develop a comparable concern for the environment. By then, DuPont had helped create more than 250 hazardous waste sites, which it has so far spent $1.2 billion to clean up.

A More Interdependent World

The relationship between vendors and purchasers has become far more complex. Procter and Gamble and Wal-Mart, for example, recognizing their financial and operating interdependence, now work closely together to develop information and logistics technologies that will benefit both. Mutual dependence isn't merely financial. It is reputational and legal.

Doing business in this emerging world – freer, more interdependent, wired and filled with powerful, vocal stakeholders – demands a high degree of accountability. You can't pretend you are operating in a vacuum. Instead, you're in a crowded neighborhood where everyone knows your business.



A Wired World

The spread of freedom, the growth of a worldwide economy and business interdependence are all being driven by an astounding explosion of global communications advances.

You are now doing business in a world where what you say can easily be drowned out by a multiplicity of voices over which you have no control.

Adidas, which outsources 83 percent of its global manufacturing to Asian companies, owns almost no tangible assets. What the company does own is intangible: ideas and patents, financial and management resources,

(continued on page 4)

For additional information on a map to the sweet spot, go to: http://my.summary.com

The Age of Accountability

(continued from page 3)

business relationships, brands, knowledge and goodwill – most of which depend on its reputation. And if 75 percent of your assets are intangible, it's obvious that an attack on your reputation can be financially devastating.

An Imperiled World

A number of events and trends have reinforced the sense of a shared and fragile world including the discovery of acid rain; repeated oil shocks in which political, military or financial troubles in the Middle East that create economic dislocations in the rest of the world; ecological disasters like the Exxon Valdez oil spill, the Bhopal chemical disaster and the Chernobyl nuclear disaster; the hole in the Earth's ozone layer; the HIV/AIDS catastrophe and the 2004 tsunami disaster.

In what seems a smaller and imperiled world, it is difficult for any business to say that social, economic or environmental problems across the state, nation or globe are irrelevant. People assume that anything that happens anywhere on Earth may affect them directly or indirectly, and they are extending these assumptions to the businesses they patronize or for which they work.

A Socially Conscious World

Popular culture reinforces these concerns. Movies from *Silkwood* to *A Civil Action* to *Erin Brockovich* have lionized environmental heroes and vilified polluters. Actor Leonardo DiCaprio drives a hybrid Toyota Prius, rock star Bono is on a crusade to alleviate poverty and actor Richard Gere is deeply involved in the fight against AIDS.

The mind-blowing outpouring of funds in response to the tsunami in South Asia was unprecedented in scope but it followed naturally on the heels of similar outreach efforts – Live Aid, Band Aid, Farm Aid. Tens of millions of today's young people know what's happening around the world and they care.

A Corporate World

Even as our world increases in complexity and interconnectedness, governments in many regions are in retreat – practically, philosophically and politically – from some of their traditional social responsibilities.

A graphic example of the shift in power from the public to the private sector came in the aftermath of the Hurricane Katrina in 2005. While the entire U.S. government fumbled the disaster relief effort, giant companies with powerful logistical capabilities such as Wal-Mart, Home Depot, PepsiCo and Federal Express provided more effective relief than the feds, responding to the stranded masses days before the U.S. government.

The shift in power from the public to the private sector means that societies at large will be looking to business to help solve social, environmental and economic problems.

A World of Investor Activists

Corporate shareholders are becoming more engaged with social issues. From mainstream investors to endowment managers for religious and educational organizations, investors have begun to push corporations to pay more attention to non-financial risks.

Both the number of resolutions and their success at drawing votes from shareholders have been steadily increasing. Between 2001 and 2004, shareholder resolutions related to social responsibility increased 51 percent, from 739 to 1,116. Each year, dozens of resolutions are withdrawn by corporate dissidents after negotiated settlements are reached in which the companies yield to most or all of the demands.

In addition, more investors are choosing investment opportunities on the basis of companies' environmental and social records, a practice commonly referred to as socially responsible investing (SRI). ■

Business Responds

Just as individual businesses are responding to sustainability, so are many institutions.

Colleges and business schools have dramatically

(continued on page 5)

Business Responds

(continued from page 4)

expanded coverage of sustainability issues in their curricula. Some universities have academic centers focused on corporate responsibility that work with and develop case studies about affiliated companies.

Corporate reporting is another way sustainability is being incorporated by the business sector. Approximately 3,000 companies around the world voluntarily issue reports covering environmental, social or other sustainability issues and the number grows every day. Endorsing this trend, stock exchanges in France, the United Kingdom, South Africa and many Scandinavian countries require or strongly recommend broad nonfinancial disclosure as a condition of listing.

The Dow Jones Sustainability Index (DJSI), created in 1999, tracks the financial performance of the leading sustainability driven companies worldwide, helping investors examine sustainability as a defining measure of corporate performance. Currently, the DJSI World Index includes 250 firms drawn from 59 business sectors in 23 countries including such industry giants as GE, Toyota, Hewlett-Packard, Citigroup, Pfizer, Unilever, 3M and P&G.

Perhaps most telling, the International Organization for Standardization (ISO), plans to issue guidelines for social responsibility in 2008 similar to those it has issued on quality. ■

For additional information on how Disney fought a boycott lodged by a religious organization, go to: http://my.summary.com

Embracing Accountability

Sustainability requires a detailed understanding of your interdependence in relation to those with whom you interact – whether as a company, a department, a plant or an individual manager. It means embracing and partnering with your stakeholders rather than assuming that they are adversaries to be defeated, skeptics to be lectured to or, at best, temporary allies to be held at arm's length.

Stakeholders Have a Vote on Your Future

The notion that you must partner with your stakeholders may seem counterintuitive at first. Most companies maintain a distant, if not outright antagonistic, relationship with nonbusiness stakeholder groups such as environmentalists, community organizers, social justice advocates and shareholder activists. Many stakeholders have ways to influence your decisions. In some cases, they have a direct vote: shareholders aligned with activist groups have been increasingly successful at forcing proxy votes on social and environmental issues. Outside the corporate structure, citizens in the city, state or nation where you operate can vote for or against your company indirectly be electing or defeating government officials who are friendly to your company's interest.

Customers can vote with their wallets by choosing to shop elsewhere when they are offended or by flocking to patronize you when they consider you supportive of their values. Activist groups can orchestrate rallies or organize boycotts against you; employees can stage walk-outs or sick-outs.

The giant retailer Wal-Mart, for example, is now beginning to reach out to environmentalists, community organizations and others whom it previously scorned. The company launched an expensive advertising campaign and created a communications "war room" to present its side of the controversies in which it has become embroiled. ■

For additional information on the backlash against sustainability, go to: http://my.summary.com

PART TWO: HOW SUSTAINABILITY CAN WORK FOR YOU

Where Do You Stand Today?

When speaking about the challenges of corporate responsibility, Dennis E. Welch of Northeast Utilities (NU) used to say, "If you want to transform your company, it helps to have a crisis."

Welch should know. He was given the job of transforming NU from the inside after it found itself the subject of a massive criminal investigation by the U.S. Environmental Protection Agency and the Connecticut Department of Environmental Protection. Welch is no masochist, but he recognizes that at many companies, transformation change begins with the pain of an ad hoc response to an immediate crisis.

Turning Crises Into Opportunities

The sooner you can create a big-picture vision to give context to today's problem, the sooner you can begin transforming crises into opportunities – a practice we like to call sustainability jujitsu. Nike learned this the hard way. The use of child labor in outsource manufacturing plants by suppliers of clothing, shoes and sporting goods was a festering issue among social advocates throughout the 1980s and 1990s. But most American companies that marketed or retailed those goods did little to address the problem until *Life* magazine pub-

(continued on page 6)

Where Do You Stand Today?

(continued from page 5)

lished a story titled "Six Cents an Hour," in June 1996.

Nike showed a willingness to learn from the crisis, eventually launching a six-point reform effort which included requirements that all new employees in factories making Nike products be at least 16 years old, that free middle school and high school classes be provided to workers and that independent Non-Governmental Organizations (NGOs) be permitted to monitor working conditions at Nike.

Determining Where You Stand

A crisis often motivates a company to embrace sustainability. But a crisis can carry you only so far. What's the next step? You should begin looking at where your organization stands today: its strengths, weaknesses, opportunities and risks in relation to the sustainability imperative. We suggest looking at four areas:

1. What your company says: Its reported policies and performance in regard to the environment, labor, health and safety concerns and other sustainability issues, and what it is saying and measuring internally.

2. How your company operates: The environmental and social impacts of the company's practices and processes on employees as well as up and down the supply chain and in the communities where the company operates.

3. The nature of your company's business: The impact of the products and services the company offers as well as its business and profit models.

4. How sustainability applies to your industry: The particular ways in which sustainability is being defined in your industry in terms of specific performance or reporting issues. ■

Key Sustainability Issues in Selected Industries

Each industry has a unique set of sustainability issues. Here are a few examples:

✓ **Pharmaceuticals:** Demand for new business models to make medicines affordable and accessible in the developing world.

✓ **Agriculture and biotech:** Need for measures in response to criticism and fears surrounding genetic modification of seeds and food organisms.

✓ **Pulp and paper:** Creation of certification programs designed to guarantee environmentally friendly means of harvesting timber.

✓ **Computers and telecommunications:** Need to narrow the digital divide through philanthropy and development of bottom-of-the-pyramid products, and electrical trash.

✓ **Apparel:** Demand for intensified scrutiny of supply-chain labor and environmental practices.

Shaping Your Strategy

You've analyzed the current sustainability status of your company or business unit and developed a general sense of its strengths and weaknesses. Now it's time to translate those strengths and weaknesses into business opportunities.

Minimization and Optimization

A fruitful way to think strategically about your business's sweet spot is to think in terms of minimization and optimization.

Minimization means reducing the size of your footprint in terms of the adverse environmental, social and economic impacts of your activities. Minimization is aimed at reducing ecological damage, reducing employee accidents and decreasing harm to the community. Here are some examples of "being less bad," so to speak:

- **Look for processes and procedures that generate waste.**
- **Look for areas of stakeholder conflict.**
- **Benchmark your company against others.**

Optimization is "being more good." We use the term to mean producing positive benefits in the three areas of environmental, social and economic impact. Optimization aims not just to reduce pollution but to restore the environment; not just to eliminate employee accidents but to create a healthier, happier workforce; not just to decrease harm to the community but to revitalize it. Here's what to do:

- **Push minimization efforts toward optimization.**
- **Look for new product and service ideas that grow out of your sustainability efforts.**
- **Look for new markets that are hidden in the margins of more obvious, traditional markets.** ■

Launching Your Program

There's no single correct starting point for your sustainability program. Starting with strategy is an excellent approach, but not the only way to begin.

For many companies, the answer is to go after the low-hanging fruit: to start by grabbing a few early victories with projects that are easy and obvious, that meet an established need, such as customer demand or a requirement to cut costs.

Here are some ways to identify some early wins for

(continued on page 7)

Launching Your Program

(continued from page 6)

your business:

- **Look at your customer's needs.** Volvo followed this approach when it made auto safety a differentiated factor and a sales strategy in the 1980s.
- **Work with your supply chain.** Examine your supplier code of conduct or individual contracts to see what requirements are in place.
- **Leverage your current position.**
- **Start with your current skill set.** Don't try to be all things to all people.
- **Anticipate an impending change.**
- **Empower individuals.**

Goals, Process and Key Performance Indicators

One easy way to get some traction is to consider how sustainability could be built into your existing business goals. You'll need to define specific goals, both to establish what you're trying to accomplish and to make it possible to measure whether you're getting there.

You'll need procedures and Key Performance Indicators (KPI) that will allow you to reach your goals. Following are some ideas about how to define sustainability metrics for reporting purposes:

- **Establish goals that further the primary objectives of your business.**
- **Strive for simplicity by keeping the number of goals small and mutually reinforcing.**
- **Make sure goals are clear and understandable.**
- **Develop clear, consistent definitions of every term and measurement unit.**
- **Strive to define every goal and KPI in terms of a number.**

Getting Organized

Because of the wide range and interdisciplinary nature of activities that fall under the rubric of sustainability, many companies start with a task force to define and drive their efforts.

A sustainability department can be an important resource for managers throughout the company, offering expertise, resources, connections and coordination. But locating sustainability in its own department risks isolating it as an "add-on" to core business processes.

In the long run, integrating sustainability into operations is the only way to go. Like quality, sustainability must be built in, not added on. Sustainability can be the specialized province of a handful of experts, but it's far more effective to educate your operating managers about sustainability and let them apply this knowledge to their own goals and strategies. ■

Managing Stakeholder Engagement

Taking a fresh view of yourself and your company is one of the many concrete benefits you can derive from stakeholder engagement – provided that you enjoy real rather than sham engagements. It's not about pretending to listen to your stakeholders, it starts with active, empathic listening: trying to understand and accept the viewpoint of even your worksite enemies and experiencing your business as they do.

One of the hardest aspects of accepting your opponents' point of view is bearing with a degree of tunnel vision on their part. Many advocacy groups feel that they are trying save the world and they view their favored issue as being of paramount importance to that salvation. ■

Special Stakeholder Challenges

Sustainability involves issues of communication, shared vision and the balancing of interests with all your company's stakeholders, both inside and outside. Among the most crucial challenges are those with the other companies in your value chain. These include companies both upstream (those who supply you with raw materials, finished products, skilled or unskilled labor and services of all kinds) and downstream (distributors, marketers, retailers, middlemen and others who help you deliver goods and services to customers).

Once sustainability is on the agenda, the nature of the relationship changes. Now profit may no longer be the defining consideration in mapping out contract terms. Thus when Nike, newly focused on sustainability issues, negotiates contracts with supplier factories in Asia or Latin America, the discussions are not solely focused on increasing profit margins, reducing costs, improving efficiency and guaranteeing quality.

Complexities of Responsible Value-Chain Management

It would be easy if value-chain management was simply a matter of applying your company's internal policies up and down the chain. The reality is complicated by a range of factors:

- **Varying legal and regulatory regimes.**
- **Social and cultural differences.**
- **Difficulties of enforcement.**

Because of these and other constraints, pushing your entire value chain toward greater sustainability can be a tricky balancing act. Today, for example, Levi's has considered phasing out operating in China because of

(continued on page 8)

Special Stakeholder Challenges

(continued from page 7)

that country's human rights record. In other countries where child labor provides a family's only income and where human rights are protected, Levi's pays contractors to keep the children in school to age 14. ■

For additional information on who your stakeholders are, go to: http://my.summary.com

The Future of Sustainability

Almost two decades after the word was coined, the idea of sustainability continues to evolve. As more companies explore its implications in their own industries and businesses and among their own networks of stakeholder connections, new ways of envisioning and creating the sustainable company are being spun off.

Lean Thinking: Perfecting Business Processes

A lean-thinking company constantly examines the life cycle of every product or service it creates, seeking to manage that cycle in accordance with the following principles:

1. **Understand the value created by each product:** identify with precision the real sources of benefit to consumers and others that are provided by any good your company offers.
2. **Identify the value stream for each product:** study your company's processes to determine which activities are contributing to real value and which are depleting it.
3. **Make value flow without interruptions:** organize all your business processes to reduce waste of time, money, energy and other resources.
4. **Encourage customers to pull value through the entire system:** use modern communication and information sharing so that the process of creating value can be driven by actual customer needs.
5. **Pursue perfection at every stage:** constantly examine, redesign and re-examine each step in the life cycle of any product or service in search of incremental improvements in efficiency.

Dematerialization: More Value, Less Product

Dematerialization is based on the surprising – yet ultimately obvious – realization that consumers don't necessarily want the physical materials used in manufacturing, shipping and using many products

When you buy a television, you don't want a box of electrical components – so many pounds of glass, plastic, metal, silicon and other materials. You want the fun, information and entertainment you derive from watching TV. If the materials could be reduced or eliminated altogether while keeping the benefits TV provides, everyone would be better off. Take for instance today's large, flat-screen televisions which contain much less material than the small-screen, big-cabinet units in most living rooms a generation ago. And old-fashioned vinyl record albums have given way, first to smaller CDs and then to completely dematerialized MP3 files stored by the thousands of tiny digital players.

From Products to Service

Pushing dematerialization further, many companies are exploring ways to transform the goods they sell into services, thereby providing the same value at less cost or more value at the same cost. Consider Zipcars, the growing business that leases cars by the hour or the day. It's a smart new business model that also creates huge environmental benefits.

Rethinking the Corporation

Sustainability does not necessarily require companies to de-emphasize profit or accept diminished financial results. But it will eventually demand that businesspeople abandon a short-term, single-minded focus on maximizing shareholder value and recognize that corporations exist to serve other stakeholders as well.

If the ultimate purpose of business is the efficient provision of goods and services that society wants (not just what investors or customers want) then an array of stakeholders, not just shareholders, have a legitimate interest in how a company uses its resources.

The Ennobled Enterprise

Imagine an enterprise expressly created for profit and for social and environmental prosperity. What would it look like? We can get a glimpse of what such an ennobled enterprise might look like by considering the current phenomenon of social entrepreneurship, a discipline that has found its way into the curriculum of some 30 U.S. business schools. ■

Using the Power of Insurgent Strategy To Put Your Business on Top

THE UNDERDOG ADVANTAGE

THE SUMMARY IN BRIEF

The Underdog Advantage *is about a set of principles that have been proven to win and to build a winning attitude, character and culture in the most difficult circumstances. These are principles that can drive your business, marketing and communication strategies and transform your company. And they can transform your career. Established and refined over centuries of military and political experience, these principles have worked on the battlefield and at the ballot box. For 25 years, business has been applying these principles globally to corporate strategy. They have been used to develop competitive strategies, crisis solutions, and cultural changes.*

The advantages of the incumbent seem to have diminished or even disappeared in today's brave new world. Today's consumers are empowered with a tsunami of instant information. As a result, consumers of information feel overloaded, and the tried-and-true rules of mass marketing have been tried and are no longer true. According to David Morey and Scott Miller, two strategy consultants who have worked with Microsoft, The Home Depot, McDonald's, Disney, Coca-Cola and Nike, it's the underdog's day. In The Underdog Advantage, *they present the insurgent strategy's key concepts and describe how to develop them into effective tactical planning.*

What You'll Learn In This Summary

✓ How the rules of leadership, business and communications have completely changed.

✓ How to instill the kind of insurgent behavior found inside today's most highly competitive and successful organizations and individuals.

✓ How to promote insurgent strategic planning and execution in every aspect of your company's operations and communications.

✓ How to create a spirit of innovation in your company that leads to new and different approaches to every aspect of your operation.

✓ How to expose individuals to new ways of thinking and infuse them with insurgent principles that they can apply to daily business challenges.

Adopt the Political Campaign Model

There are no excuses on the morning after Election Day. There are no equivocal results — you win or you lose. If you get 49.9 percent, you take a hike.

The political campaign model is a simple model that is easily understood at every level of an organization. Insurgent political strategy was made for today's challenging business environment. The political campaign model clearly frames a company's objectives and focuses its people on winning. It creates a bolder, more aggressive spirit and drives the organization to settle for nothing less than a win over the competition. It creates an "Election Day" finish line in terms of getting results.

As noted by Marc Gobé, author of *Emotional Branding: The New Paradigm for Connecting Brands*, "Brands have to be elected to be part of the culture now." This strategy is clearly evident at Red Bull, which dispatches legions of foot soldiers in "mobile energy teams" that tote a huge can of Red Bull on the trunk — raiding college campuses, construction work sites, health clubs, and anywhere else that they can generate word-of-mouth acceptance and "votes" for their product. This is how Red Bull carefully and methodically built and grew a core audience — with deliberate stealth, effective low-cost spending, and a "do the doable" grass-roots marketing campaign.

Election Day

Every strategic goal in your company should have its own Election Day, and the results should show that it either "won" or "lost" on that day. Chances are that you are in the campaign mode whether you realize it or not.

The insurgent political approach has been used successfully for centuries by revolutionaries across the globe in politics, war and business. It is what drove America's own revolutionaries: Jefferson, Adams and Washington. And it is what drives the insurgents who rule U.S. markets today: Starbucks Coffee, Wal-Mart and Southwest Airlines; Bill Gates, Rupert Murdoch, Charles Schwab and Oprah Winfrey. They all have boldness, an outsider's perspective, curiosity and imagination. They also have classic insurgent leadership skills, planning and tactics.

Although overpowering force still dominates many markets, it is a very expensive way to win. Insurgency is becoming the most effective and efficient way to win.

Even if you are a market leader, *you must make a commitment not to act like the incumbent,* no matter how overwhelmingly you may dominate your market. Insurgent strategies will not only help you continue to gain ground, but will also help you develop more satisfied customers and happier, more productive, and totally committed employees.

Change Rules

Today's incumbents must learn to adopt a political campaign model and utilize insurgent strategy. Change rules the markets today, and the rules of change greatly favor the insurgent because the insurgent embraces and loves change. The traditional structure of markets is crumbling under the weight of the information revolution. The information revolution's effect has been to provide consumers with infinitely more choices in every marketplace and infinitely more information about those choices. Today's consumers know more and demand more, so product integrity — how your product or service lives up to its inherent brand promise — is more critically important in this environment than ever.

Adopt the Political Campaign Model

(continued from page 2)

Frito-Lay

One great example of a top-tier brand playing by the insurgent rules of the bottom tier is Frito-Lay. After decades of putting its faith in mass advertising, Frito-Lay has put its faith in product — which strongly implies that it has put its faith in customers. The core of Frito-Lay's marketing is product differentiation, which is in a constant state of development and change. That's because Frito-Lay annihilated its major, mass-marketed brand competition, and because it was forced to turn its attention to the local and niche snack brands that might otherwise have nibbled it to death, market after market.

Frito-Lay pulls products before customers get a chance to sense that those products are stale (stale, in terms of having been "seen" or "raised" by competitive options). For the insurgent Frito-Lay, new products mean new forms, flavors and packaging concepts. In the 10 yards of shelf space that Frito-Lay controls in the snack section of a supermarket, every five feet or so there is a "keeper" brand, flanked by several "temporary" brands. It's the combination of keeper and temporary brands that builds the franchise and Frito-Lay's brand.

To adopt the political campaign model, you must focus on delivering the win; develop an idiot-proof strategy that delivers the win; and create a more results-focused, aggressive spirit. To do this, you must adopt the reality of a campaign, define "Election Days" for every business objective, model insurgent leadership, and prepare a change map that describes where you and your competitors are. Finally, commit to changing the dialogue in your market. ■

For Additional Information on an insurgent spirit at the helm of 7-Eleven, go to: http://my.summary.com

Do the Doable

There is one core principle that drives nearly every decision within a successful political campaign: Do the doable. Today, it's about real results. Business is focused on performance now: not buzz, glitz or excuses.

Winning always begins with practical dreaming. A company must have a clearly defined destination in mind. First, define what winning will mean in the broadest, but clearest, possible terms: How is it going to change the future? Define the future in detail. Tell a great story. This is the future that will result if your company, product or service achieves real success over the next three to five years. You need to define the future in the context of your customers' lives, because your success will be achieved *only* if your customers achieve the future you have defined. Microsoft's mission statement in the 1980s is a perfect example of this: "A computer on every desk and in every home." Do the best job of defining the future and you'll have the best chance of controlling it.

Your company's people want to be part of something great. It takes energy and focus to win in markets today. This comes from understanding that you're a part of a big-picture effort that is going to change people's lives. Define goals in a sequence based on order of difficulty — "do the doable" means "win the winnable" first.

Many new and insurgent brands find an opportunity in the seams ignored by the big incumbent brands. Arizona Iced Tea, for example, wanted placement in stores anywhere except on the soft drink aisle. And today, it has ended up with three or four placements — near bottled waters, near bagged teas, near juices, and sometimes off on its own. It even helped to create a "new age" beverage display category in many stores (and immediately started trying to break out of there).

Arizona Iced Tea didn't follow the leaders on packaging, either; it pioneered a 20-ounce can, as opposed to the standard 12-ounce cans and 16-ounce bottles.

Develop a 'Must-Win' Attitude

To get real results, set achievable goals and develop a "must-win" attitude toward reaching them. But to win, do the doable. Winning today requires a clarity and realism superior to that of the market incumbent. Don't even think about objectives that are impossible to reach. Think about success in terms of a set of steps that will lead to a big, but achievable win. List all of the elements of your success as objectives, even if that means listing 10 or 15 objectives for your plan instead of the traditional three or four.

Next, establish your objectives in order of difficulty. Knock off the easiest (most winnable) ones first. By establishing your objectives in order of difficulty, you create "momentum objectives." Winning each one makes the next one easier to win. Creating momentum objectives also preserves your resources for the harder challenges that lie ahead. Generally, political campaigns budget from Election Day backward, realizing that up to 60 percent of the budget will be spent in the campaign's last two weeks.

Today, most brands cannot afford to carpet-bomb their way through the markets. You've got to get much more out of much less. Most businesses adjust to that reality by cutting back on budgets for traditional strategies and tactics. The best way is to establish new strategies and tactics for this new reality. Don't retreat, rethink. ■

For Additional Information on how Patagonia defines its core values, go to: http://my.summary.com

Move the Movable

Don't waste time and energy fighting for votes you can't get. "Move the movable" describes how to develop a better strategy — the objectives are your destination; the strategy is your road map. Developing a move-the-movable strategy starts with defining your movable market targets. In business, the best use of your marketing and sales resources and the best way to move an internal or stakeholder audience is to focus on attitude.

Demographic and psychographic segmentations are useful, but you should impose attitudinal segmentation on top of these definitions. Attitudinal segmentation tells you where to place your resources in order to get the win. It focuses you not only on where to start your success, but also on where to start the momentum that will ensure that success.

Attitudinal Segmentation

An attitudinal segmentation map looks like this:

HO SO UNDECIDED SOS HAS

- **HO = Hard Opposition.** These people hate your candidate, and they'll endure a driving blizzard to vote against that candidate. Write these people off. Battling with them wastes resources and energy, demoralizes yourself and your colleagues, and energizes the enemy.
- **SO = Soft Opposition.** These consumers prefer your competitor's brand. But they're not loyalists. In consumer marketing, the soft opposition often has attractive long-term potential. Note the words "long-term." This is exactly where *not* to start your campaign.
- **Undecided.** Campaigns will do anything in order to move the undecided on Election Day, including buying votes. Because buying votes is not very effective, they must be bought over and over again, which is expensive.
- **SOS = Soft Support.** These are the consumers who like your brand, but don't buy it often enough, don't buy enough of it, or aren't willing to pay a premium for it. Moving the soft support is easier and cheaper than moving the undecided, you don't have to compromise your value system to move soft support, and the movement of soft support to hard support creates true market momentum. Today, the most effective and efficient way to move the undecided is by creating movement of the soft support. There is a tipping point when more and more see, hear and feel more and more demonstrating their choice in the marketplace. When that avalanche happens, you get buried in money.
- **HAS = Hard Support.** Do anything you can to hold the hard support, and do whatever you can to activate them to help you sell more by helping you move the soft support. Hard support can also help you develop strategies that will move soft supporters. Do "loyal voter research" to understand how they define the product and product experience.

Once you understand the product in the minds of your hard support, test their personalized brand positioning among soft supporters. When soft supporters increase their usage of any product or service, the activity has a seismic effect on the marketplace. Do market research to create this attitudinal segmentation among market targets. It can also be done informally, with internal or small client audiences.

How can you develop a strategy that moves soft support to hard support? Remind them constantly of the benefits you provide them and remind them constantly how you do that uniquely. Activate the hard support to recommend your brand to others, and transfer ownership by developing a strategy with soft supporters. Listen and allow those whom you lead to shape your strategy for action. Make it clear how their input has been incorporated into your strategy. Incorporate a "we hear you" message into any change in operations, product, or service/support.

Early Adopters

The first consumers of new products are called "early adopters." Early adopters strongly influence other consumers and lead others to new products through their demonstrated behavior in the marketplace and their word-of-mouth advertising. To hold on to early adopters, maintain and upgrade or refresh the relevant and differentiated benefits that brought them to your product. Develop more effective marketing for them by developing more truly new ideas, and ensure they can find your brand by implementing wide distribution and packaging that stands out among the competition. ■

Don't Buy the Undecided

Price promotion is essentially buying votes. Marketers keep using price promotion because "it works." The problem is, it works for everybody. Unless you can develop the lowest price in the marketplace every day, you don't have real market differentiation. Nobody did or ever will get rich promoting to the undecided.

The low-cost operator — like Southwest in the airline business or Dell in computers — *doesn't have to have the lowest price at any given time*, because it's established its brand as having a low price all the time. On any given day, American or Delta will dive down below Southwest's prices to create a "sale." This buys a day's worth of loyalty. Southwest holds its loyal customer franchise by refusing to play the games the big airlines play with their passengers.

Moving the undecided is imperative. But buying the undecided is stupid.

Play Offense

Consider the clarity an insurgent brings to the marketplace competition by defining itself against a big, bloated, bureaucracy-loving incumbent — against a marketplace "enemy." Even a great company like Microsoft can lose its focus until it finds such an enemy. For example, in 1994, the enemy was Novell. In 1995 and 1996, it was Netscape. In 1997 and 1998, it was Sun. And today, it's Linux and the so-called open systems.

To win, the insurgent must constantly take the battle to the incumbent. The insurgent must play offense. Your people can't play to win if they don't understand the stakes of the game. Define winning in these three ways:

1. **How will winning make customers' lives better?**
2. **What will winning mean for the company and all its stakeholders?**
3. **What will winning mean for each employee?**

One great way to sharpen your definition of success is to find an enemy. Often, the best enemy to define is a problem that innovation will solve: It may be a problem that consumer education will solve; it may be a problem created by a big player's marketplace domination.

Represent Choice and Change

In order to instill an insurgent culture, you must make your brands and your company represent choice and change in the marketplace. Incumbents hate choice and fear change. Your job as an underdog is to destabilize and disrupt. Force choice. Force change. Make everything about your brands represent change and refreshment of the incumbent's marketplace offer. Build your brand around the concept of change and choice in these five key dimensions: active presence, relevant benefits, competitive differentiation, brand credibility, and change imagery.

Creating an insurgent culture depends upon change leadership at the top of the company. Lead by example. Set the example of taking action. Taking action creates leadership differentiation.

The *Washington Post*'s Katherine Graham inherited the undistinguished regional newspaper following the suicide of her husband in 1963. In 1971, CEO Graham faced a critical decision: Should she publish a leaked Defense Department study detailing Vietnam War deceptions, called the Pentagon Papers? Either way, the consequences of her decision might put the entire company at risk.

Graham concluded that *not* printing the Pentagon Papers would contradict the company's very soul and purpose. She published — and started a trajectory that helped transform modern journalism. Soon thereafter, Graham was making tough and correct calls on covering the Watergate scandal and managing a 1976 strike. And the *Post* went on to both a Supreme Court vindication over its decision to publish the Pentagon Papers and to become one of the top 50 IPOs over the past 25 years.

You want to create an action culture — a culture of people who take the initiative and are willing to take responsibility for their decisions. Create an atmosphere that rewards action at every level. Celebrate action even when it doesn't result in success.

Disrupt the Marketplace

As an insurgent, disrupt the marketplace. The insurgent brands in every market's bottom tier create most of the innovative thinking in every category. These days, these insurgents can ride that innovation right to the top.

Most big companies in global markets are constantly preparing to fight the last war — the war of mass marketing. To beat them, never fight on their terms or on their turf. Instead, represent everything they are not; meet their market tactics not with the same, but with the opposite. The incumbent doesn't want to change and will resist changing at almost all costs.

Control the market dialogue and you win the market. Here are three ways in which insurgents drive the marketplace change and control the dialogue:

1. Define yourself. To be fully energized, your entire company system must know not only *what* you believe but *why* you believe it. They must understand *how* you will make decisions and what drives every decision.

2. Define your business. Define your brand and your business with extraordinary efficiency and effectiveness.

3. Define the future. Define the future context and you win the opportunity to control it.

The insurgent always fights the battle on the field and in the minds of the citizenry. Celebrate every win to create a sense of victory. This will motivate the sacrifices necessary for the revolution to succeed. But never, ever declare the war won. Stay connected to your customers by remaining in constant, fluid dialogue with them. ■

Ben & Jerry's Challenges a Rival

Ben & Jerry's challenged the incumbents, such as Häagen-Dazs, head-on in true "David and Goliath" style. Its very first commercial employed a simple jingle that said: "There ain't no Häagen, there ain't no Dazs, but there are two real guys named Ben and Jerry!" Faith Popcorn, the futurist and consultant on consumer trends, best characterized this approach as a "real sell, delivering a real message in a real way." As diehard idealists who refused to compromise, Ben and Jerry vigorously identified themselves as "hippie capitalists," wedded to their values and flaunting them in every manner possible.

Communicate Inside-Out

Throughout the 1980s, IBM literally fell apart from the inside out. The computer giant had a confused mission, an unfocused strategy, lackluster employee attitudes, and an outdated culture — played out in undifferentiated products and strategies in the marketplace. It took Lou Gerstner in the early 1990s to refocus and reenergize its employees from the inside out and reclaim IBM's great success and legacy. To understand the power of Gerstner's inside-out success, consider the view of IBM in the 1980s as a powerless, slothful giant.

Under Gerstner's command, a few hundred employees were fired, and many new "Gerstnerites" were hired. But it was the thousands of long-term IBM employees who turned the company around, by turning around their perceptions of themselves, the company, and their conviction to succeed. They went from the worst to first by creating an insurgent strategy from the inside out.

Three groups are part of the definition of "inside": employees; system partners, including suppliers, distributors, sponsors and investors; and friends and family (i.e., stakeholders). Selling inside-out is more important now than ever. You can no longer expect blind faith and unquestioning commitment.

Energize Your Internal Culture

Energizing your internal culture demands communicating and reinforcing employees' core values — their sense of what the company believes and the values for which your brand stands. This means defining your organization's *conviction* and the larger *context* of why these employees come to work each day, adrenalized about their own success as a part of the organization's success. "Success cultures" create an emotional context and an environment of excitement and open communication. They stand for something far greater than the products they make and the services they provide.

Nike stands for unbending excellence on every playing field; Coke stands for the refreshment of mind, body and spirit in everything it does. Chip Coe's company, Smartwool of Colorado, makes socks and underclothes for skiers and hikers. His people firmly believe their fanatical dedication to quality has a direct relationship to the skier's performance.

Your job as a manager must be to wage the equivalent of an insurgent and ongoing campaign inside your organization to ensure your ultimate success.

Attitudes Create Behavior

Perceptions create attitudes, and attitudes create behavior. So the behavior you need is a result of the right attitudes shaped by the right perceptions.

- **Understanding insiders' perceptions and attitudes will be the foundation for the development of your inside-out strategy.** Turn the microscope around. Define these insiders' most basic perceptions and attitudes. Effective strategy is impossible without this information and analysis.
- **Develop attitudinal segmentation among employee and market partner groups.** This will tell you where to focus your communications for the best effect.

Since you can't win in the marketplace until you win in your own company and system, here are nine keys to inside-out communicating:

1. *You must sell your own employees before you can sell anyone else.*
2. *Assume that your employees are sophisticated and cynical.*
3. *Never tell them; sell them.*
4. *Monitor employees' perceptions and attitudes.*
5. *Overcommunicate key themes and messages.*
6. *Create employee satisfaction the way you create customer satisfaction,* by defining expectations in advance, overdelivering on a key benefit, and reminding them of what you are doing together.
7. *Make sure you can define your business insurgency and market revolution* in a "what we believe" speech.
8. *Remember that tone and style are as important as substance in driving an inside-out strategy.*
9. *Create an insurgent culture within your company.* ■

Forget Reality: Perceptions Rule

Microsoft used to scoff at market research and marketing in general, claiming that product development was simply about making "cool stuff." But, at the same time, the company has always devoted a hefty share of its total resources to its usability labs. These labs focus on how people use software, how they use PCs and other devices, how they work and think about work, how they decide on purchases, and so on. Invariably, Microsoft uses this competitive intelligence to find new ways to get closer to its end users and to these consumers' needs and wants.

Listen

Without listening, dialogue is impossible. Without constant, perceptive market research, effective strategy formation is impossible. Perceptions and attitudes are changing faster and faster. The only choice in this environment is constant dialogue: the market conversation.

Research is often the best way to get into this dialogue. Research, particularly qualitative research, can be done informally as well as formally — just start asking questions and listen to the answers. This is where the best CEOs not only begin thinking about their future

(continued on page 7)

Forget Reality: Perceptions Rule

(continued from page 6)

business challenges, but also monitor progress and learn about perceptual dangers and opportunities.

The key to research is to ask the right questions — to develop points of inquiry that penetrate most deeply and attract and inspire the most relevant and useful answers.

Great research begins with great questions, including: What surrounds your customers' world? How do they see the future? What do they dream about? What's in their hearts? Where is their pain? What's relevant and different? Are they movable? How can you overdeliver on their expectations? How can you best define yourself? How can you control the dialogue in your favor?

To answer these questions, you can't simply rely on analyzing consumer behavioral data from the market or polling for current opinions. These techniques give you a clear picture of what was, but not of what will be.

Customers' Perceptions

Today, your business should use *presearch* to dig deeply and pragmatically into customer perceptions of the future. Presearch is a powerful tool to help identify the most compelling and relevant set of customer strategies, themes and messages into the next market.

Presearch can be conducted qualitatively or quantitatively. Qualitative focus groups are particularly powerful in helping us understand the way in which new information moves a collective psychology, together, in discussion. Qualitative in-depth interviews, with their one-on-one focus, are among the most helpful research methodologies to establish initial strategic assumptions that can be tested through quantitative research.

In order to find out what today's customers want, start with five critical perceptual axes along which a company, product or brand must position itself to gain marketplace momentum. These five axes are:

1. Control. People want to regain control of their time, finances, kids' education, families' safety, and health care.

2. Customization. Customization lets people feel that companies care about their own needs, wants and dreams.

3. Convenience. Time-pressed consumers don't just appreciate convenience: They demand it.

4. Choice. Providing choice within an existing brand family isn't easy, but it's totally necessary.

5. Change. When customers reward a product or service with their loyalty, it's because that brand makes constant change and refreshment part of its value proposition.

Remember, pigs fly — as long as your customers believe they do. It's their party. And we get into it only at their invitation. Be careful with that relationship and respectful of customers' views. ■

Rebels With a Cause

Ten candidates have identified themselves as having a passion for playing offense, for controlling the dialogue, for riding ahead of the forces of change, and for taking advantage of nontraditional marketing strategies and communications tactics. These companies are:

- ✓ Ben & Jerry's
- ✓ Google
- ✓ Jet Blue
- ✓ Krispy Kreme Donuts
- ✓ Linux
- ✓ MobileOne Singapore
- ✓ Nokia
- ✓ Patagonia
- ✓ Red Bull
- ✓ Starbucks

Herd the Details: Remember, Everything Communicates

Everything that you say and do is important in defining the value of your brand and the success of your company. True market insurgents pay attention to the details because, quite often, that's all they have to control. They agonize over the fine print on the back of the label. They put messages about quality on the inside of their bottle caps. They swarm all over customers in their showrooms. Most of all, they worry about the product — its quality and its integrity.

Ray Kroc's Philosophy

McDonald's founder Ray Kroc was a famous stickler for nanodetails. His motto for the level of operational discipline he expected from owner/operators was, "Clean the corners. The middle will take care of itself." That's why Kroc insisted that his franchisees be actively involved in their businesses: "You cannot buy a McDonald's restaurant as an investment; it's your main business or it's not your business."

Even today, the average franchisee in the sprawling McDonald's system operates just three stores. And today's "back to basics" management under Mike Roberts will still drum an owner/operator out of business for running a sloppy restaurant. Kroc instilled fanatical attention and an "everything communicates" microscopic focus on everything within the property lines, from the front counter to the far reaches of the property. He understood how important the little things are to customers, particularly at a restaurant.

Details need direction. It's not enough to tell your people to care about the little things. You must tell your people exactly what the details should be communicating. The most effective way to create a discipline for controlling the details of your company and brand is to form everything around one core communications strategy. Your company's core message must define who you are

(continued on page 8)

Herd the Details: Remember, Everything Communicates

(continued from page 7)

in terms of the relevant and differentiated benefits that you provide for all constituents. It should also provide some reasons why the relevant benefits should be believed. Your core communications strategy tells your people what's important.

Hub-and-Spoke Relationship

Your company's core communications strategy should connect to every other strategy in a hub-and-spoke relationship. Do an "everything communicates" audit of your company and your brands. Include everything that your customer might come into contact with. Start inside your own company and work outward toward the marketplace and then to usage and customer support. Try to include in the audit every word and image, from first impressions to relationship management. Ask of every single thing in this audit, "What does this communicate?" Then ask, "How can we make it better communicate our core message?"

Every aspect of your company should add value. That's why everything is marketing. Everything that you do and say is either selling or unselling your value. That's why the everything-communicates audit is so important — because the details can unsell just as surely and effectively as the broad strokes can.

You must develop a strategy and a tactical discipline to express the brand in every possible detail — in everything you do and say, in everything and everybody that has anything to do with the brand. ■

Deal With Crisis as SOP

Stew Leonard, Jr., who runs the famous Stew Leonard's Dairy Stores in Connecticut, treats every instance of customer dissatisfaction as a crisis — and has created a model for dealing with crisis on any scale. When a customer brings a half-gallon of milk back to the store saying that it smells funny, the employee who opens it up to smell it is putting his or her job on the line. "No questions asked" is the policy, and Stew Junior enforces it strictly.

At Stew Junior's, the employee takes the milk back immediately and, importantly, doesn't just provide a replacement half-gallon in return. Instead, it's up to the employee to be creative and "oversolve" the customer's problem. For example, the employee may give the customer a half-gallon of ice cream to go along with the milk. This "crisis response" is considered everyday modus operandi at Stew Leonard's.

Don't manage a crisis: Solve the crisis. Tell the truth. Tell it all. Tell it fast. Create an organization that deals with crisis as standard operating procedure.

Train for Every Possibility

Train for crises the way airline pilots do at Flight Safety. Train for every possibility. Develop scenarios that define the worst that can happen. And develop checklists of actions to take. Not only will this help you solve crises, it will also make your everyday actions and communications sharper.

Here is an example of a crisis checklist:

1. Solve the next crisis before it happens. Assume that what can go wrong will go wrong — sometime. Create a core strategy group consisting of your executive team plus product experts, market researchers, corporate counsel, and communications managers. Create the mindset: *You will not just survive the next crisis, you're going to turn it to your advantage.*

2. Count to 10 — but not to 11. Stop, breathe, think and act. Step back, remain cool, think and work out solutions. That keeps the whole organization cool and collected. And that can keep you in business.

3. Segment your target constituents. Find out who must be moved and who can be moved. Define the hard opposition, soft opposition, undecided, soft support and hard support. Pay particular attention to the soft support. It's vitally important to activate them to support you.

4. Form a core communications strategy. Drill down to the details — remember, everything communicates. In a crisis, it's the details that communicate most vividly because of the increased scrutiny. If you try to manage a crisis without a strategy, you'll be in constant defensive mode — which is where you don't want to be.

5. Get control of the dialogue. Get control of the dialogue in a crisis at the very beginning. Tell the truth: Define what you know, when you knew it, and what you're doing about it. Only the truth solves crises. If there's heat, take it sooner rather than get fried later.

Start at the Core

6. Communicate inside-out. Start at the core of the crisis and focus first on your internal audiences. After all, they're the ones who are most directly and profoundly affected by a crisis. Get this right and nothing else matters. Get it wrong and your operations freeze up.

7. Play offense. No attack should go without response. Correct every single inaccuracy quickly. Speak clearly, speak simply, and let your actions communicate as often as possible.

8. Develop strategy for the "other side" of the crisis. Winners plan, and only planners win. Develop a strategy for what you'll do when you win.

9. Keep in touch with reality. Keep a sense of dialogue with your key audiences. Make attitudinal research a launching pad for your actions. ■

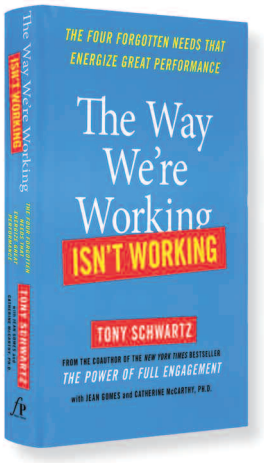
Make the Move to Better Energy Management



Review by Chris Lauer

THE WAY WE'RE WORKING ISN'T WORKING

by Tony Schwartz with Jean Gomes and Catherine McCarthy, Ph.D.

© 2010, Free Press, 334 pages, $28.00, ISBN 978-1-4391-2766-7

In a world where overtime work is often mandatory and keeping a job often means sacrificing personal time for a professional career, it's easy to wonder whether all of that extra work truly adds up to a better life. Does putting in all of that extra energy on the job move us any closer to our goals, or is it just leading us to less satisfaction and an early grave? In *The Way We're Working Isn't Working,* author Tony Schwartz and two of his colleagues from the consulting firm, The Energy Project, examine the performance problems every leader, manager and employee faces in the working world, and offer a multitude of helpful suggestions for getting more from our time and energy.

Schwartz knows much about the link between energy and performance because he has been studying and writing about how people do their best work for the past 30 years. His books on the subject include *The Power of Full Engagement*, the best-seller that he co-authored with sports psychologist and business consultant Jim Loehr, and *What Really Matters: Searching for Wisdom in America.*

The Energy Project

Today, Schwartz is president and CEO of The Energy Project, a consultancy that helps people and organizations find ways to improve their energy, engagement, focus and productivity through the science of high performance. He is also a successful executive coach to dozens of corporate CEOs and senior leaders.

Schwartz and the chief operating officer at The Energy Project, Dr. Catherine McCarthy, were pivotal in moving the organizational world away from the concepts of time management and into the realm of "energy management" in October 2007 when their article "Manage Energy Not Time: The Science of Stamina," was published in the *Harvard Business Review.* In that article, Schwartz and McCarthy describe how The Energy Project helped three Fortune 100 companies and their leaders improve engagement and performance in their organizations.

The other co-author of *The Way We're Working Isn't Working* is consultant and executive coach Jean Gomes, who is senior vice president of The Energy Project and chairman of The Energy Project Europe. His work with Sony and The Energy Project is one of the subjects of that 2007 *Harvard Business Review* article.

Uncovering the Path to Success

In their work as consultants and in their book, the authors offer advice that can help anyone become happier and more productive, as people, employees, team members and leaders. Their words of wisdom describe a path to personal and professional success. But that success goes beyond short-term rewards. It's a sustainable, long-term success that continues even when we're not struggling so hard to get it. The reason their advice moves us from mere daily successes to a more durable, long-haul success is because it focuses on creating positive and permanent habits that lead to healthier and happier lives.

According to Schwartz and his colleagues at The Energy Project — as well as a multitude of researchers, business leaders, psychologists and other experts in a variety of fields — enduring personal and professional success comes from a clear focus on the four sides of energy expenditure and renewal, which extend from four innate needs that we each must address.

Focusing on Energy

Schwartz writes that these needs are really "energy" needs: physical, emotional, mental and spiritual. He adds: "By moving rhythmically between activity and renewal in each of these four dimensions, we fulfill our corresponding needs: sustainability, security, self-expression and significance. In the process, we build our capacity to generate more and more value over time."

> **… the latest science shows that quiet time, meditation, daydreaming and rest breaks improve the work we do when we return to active mode.**

Satisfying these four needs — needs that rise above a simple survival mode in which we are merely meeting our material needs and desires — means that we are creating value and enjoying the powerful benefits that result from it. These benefits define the success we seek, and they include the goals all people and organizations strive to achieve: engagement, positive energy, focus, creativity, innovation, productivity, satisfaction, passion and performance. In *The Way We're Working Isn't Working*, Schwartz and his co-authors offer a powerful system for maintaining the energy we need to regularly create all of these important aspects of a healthy individual and organization.

Real Fitness Goes Beyond Exercise and Diet

The sustainable success that Schwartz describes begins with taking better care of our physical bodies. On the most basic level, when we create healthy practices in our daily lives, we are more fit and ready to face the world at the peak of our abilities. He explains that real fitness goes beyond physical exercise and eating right, although those are both vital to maintaining high energy levels. Regular times for relaxing and renewing ourselves also play an important role in high performance.

Schwartz offers dozens of studies to show that when we set aside time to take care of our bodies through regular action and renewal, we are better prepared to create value. With this in mind, he points out that businesses that take the latest research seriously can improve their own performance by developing business practices that take the energy needs of their people more seriously. This includes creating corporate policies that give people time to exercise during the day for active energy renewal or encouraging regular rest breaks for passive renewal.

Every day, new research appears that backs up Schwartz's claim that time to relax helps us perform. For example, in the June 7, 2010, issue of *Newsweek*, reporter Sharon Begley supports the idea that relaxing and making time for energy renewal can actually improve how people's brains function when they get back to work. In her article "The Hidden Brain: What Scientists Can Learn From 'Nothing'," she writes that the brain's relaxed mode serves many important functions that help it perform better when it gets back into gear. She quotes neuroscientist Alvaro Pascual-Leone, who points out that the brain's resting state prepares it for future challenges. "The resting activity seems to create images about what to expect from the outside world," Pascual-Leone explains, so we can be better prepared for challenges when our busy lives resume. In other words, the latest science shows that quiet time, meditation, daydreaming and rest breaks improve the work we do when we return to active mode.

Our Need to Feel Successful

The second core need that Schwartz discusses in *The Way We're Working Isn't Working* is our need for security, which reflects our emotional satisfaction. When we feel appreciated and cared for, and we feel that others value us for who we are and what we do, then we feel emotionally successful.

The other two core needs that must be kept in mind when we are trying to feel successful are the need for self-expression and the need for significance. Self-expression, which means we feel free to express our individual talents and skills, is a need of the mind. Significance, on the other hand, is the spiritual need for a sense of meaning, in work and life. When we feel that we are doing work we believe in or stand for, we feel spiritually satisfied and successful.

When we are meeting all four of our energy needs — physical, mental, emotional and spiritual — we are working and living at our best. Throughout the book, Schwartz presents the skills and tools that can help anyone get closer to meeting all four of these needs. He also describes how organizations can encourage and support their people in meeting these needs so they can perform at their best, creating more value for their people, the organization and their customers.

Creating Rituals

An important aspect of the book is that its advice is based on sound evidence from a variety of fields, includ-

ing nutrition, cognition, strength training and brain science. By bringing many results from the latest research together into a single program of sustainable energy creation, it offers a complete guide to creating the essential habits — or rituals — that can help us maintain the professional and personal success we seek.

Schwartz explains that the four keys to physical sustainability are nutrition, fitness, sleep and rest. Each of these forms of active and passive renewal is essential to the physical energy that we need to become more successful. The main point that he makes when discussing this energy need is that improved performance depends on creating better habits that allow us to move rhythmically between periods of action and rest.

> … the four keys to physical sustainability are nutrition, fitness, sleep and rest.

Anyone with even the most basic grip on his or her physical needs can understand this lesson almost intuitively: We do great work, we rest; we do great work again because we are refreshed. But Schwartz goes the next step by citing valuable new research that shows how truly important that resting period is to high performance.

Sustaining High Performance

For example, one study done by Florida State University Professor Anders Ericsson shows how important regular rest was to the highest performers in a group of young violinists at the Music Academy of Berlin. Divided into three groups based on their performance levels, the violinists demonstrated not only that practice was vitally important to their sustained high performance, but also that regular and prolonged sleep was "the second most important activity when it came to improving as violinists," Schwartz writes. He explains that the best violinists slept almost an hour longer than those in the lowest performing group. Considering that the average American sleeps only 6.5 hours each night, this study suggests that regular periods of renewal are an integral part of the high-performance equation. In addition, Ericsson's research also shows that the top two groups of violinists also took more naps than the lowest-rated group. The best musicians napped for about three hours each week while the lowest performing group napped for a total of less than an hour each week.

Another fascinating discovery that this study and others found was that deliberate practice should also be limited for the best results. Basically, we can operate for about 90 minutes at our peak of performance. Then we need to take a break. Four hours of practice, broken into 90-minute periods, is pretty much the maximum time that the best performers practice. If they go longer than that, they get exhausted. Organizational leaders can benefit by keeping this information in mind when they are creating guidelines for their people. Encouraging regular rest breaks for mental and physical renewal after long periods of extended work can help people recuperate so they can return to peak performance again.

One tip that Schwartz offers that can help anyone maintain optimal performance is to eat more energy-rich foods, and eat them more frequently. He explains that eating good foods — including lean proteins and complex carbohydrates rather than junk foods that are filled with caffeine, sugar and simple carbohydrates — in moderation at least every three hours is a great way to keep blood sugar and energy levels stable.

Boost Your Emotional Energy

Beyond mere survival needs and physical needs, our emotional needs and sense of security must be met to be able to perform at our best. When we feel devalued, Schwartz explains, we become distracted by fear and our energy dramatically drops. When these things happen, our creativity and productivity are at their lowest. A better way to raise our emotional energy level is to cycle between what Schwartz calls our "Performance Zone," where we feel calm, optimistic, challenged, engaged and invigorated, and our "Renewal Zone," where we feel carefree, peaceful, mellow and receptive.

Employers and other leaders can help their people move more effectively between these two zones by helping them feel more appreciated at work, Schwartz writes. One way to do this is by putting more focused and conscious attention toward showing people that they are appreciated. According to the Gallup Organization, employee retention, productivity and engagement are directly linked to the relationships their workers have with their direct superiors. Employers who give their people regular recognition or praise for doing good work create better performers. When employees feel that someone at work cares about them or encourages their development, they feel more emotionally connected to their work. When we feel more connected, we become more successful at work.

The Ability to Focus

At the mental level, we all have a core need for self-expression, Schwartz writes, which involves where we place our attention and how well we focus. The best performers fluctuate between a precise, tactical focus that is logical, analytical and methodical, and a big-picture focus that is more intuitive, imaginative and open-ended. The most successful people, studies show, move fluidly

between times of narrow concentration and wide focus.

Schwartz points out that Google has put this kind of research into action by encouraging its engineers to set aside up to 20 percent of their time to work on projects that they choose, so they can do the creative thinking necessary to reach longer-term goals, beyond daily work responsibilities.

When employees have more control over where and how they focus their attention, Schwartz explains, and they are better able to make purposeful decisions about where they put their attention and for how long, they are better able to develop their capacity to focus on their work.

Finding Significance in Work

And finally, the need for significance represents the spiritual energy quarter of the four-part program that Schwartz and his colleagues from The Energy Project define throughout *The Way We're Working Isn't Working*. We all need to have deeper meaning in our lives, which is made up of deeply held beliefs and values as well as a clearly defined sense of purpose. Since our beliefs, values and purpose are best expressed through our actions, we demonstrate our significance through our behaviors and renew them by "nurturing our awareness of what we stand for," Schwartz writes. To tap into the power of our spiritual energies, we must learn to rhythmically move between exercising our most significant behaviors and nurturing our best values. Passion, perseverance and focus are born from the rituals we create around our fluctuation between these two sides of our spiritual energy.

How do you nurture your spiritual energy? That's for you to decide, since it is such a personal part of who you are. Schwartz writes that serving others should be balanced by taking time to renew ourselves, otherwise we could face "compassion fatigue" which can leave us depressed or burned out.

One company that acknowledges the need for significance in the lives of its people is Zappos.com, Schwartz writes. Leaders at Zappos encourage their people to make real connections with customers to build stronger relationships with them. They have found that this type of genuine connection helps to make their customer service representatives proud to work for the company. Enduring relationships help employees find significance in their work. This significance, in turn, helps them provide an exceptional experience to the company's customers.

Gateway to Competitive Advantage

What happens when an organization recognizes the physical, emotional, mental and spiritual needs of its people? The short answer is competitive advantage, as the many case studies, examples and research results explored throughout *The Way We're Working Isn't Working* demonstrate. But the longer answer goes deeper than a simple business benefit. Along with the measurable benefits that can be achieved by recognizing people's four energy needs, and by shifting organizational policies to accommodate those needs, there are even greater advancements that can be made when the advice offered in this book is applied. One is greater organizational resilience as external and internal changes increase every day. Another benefit is more effective employees who are more satisfied on and off the job.

Along with improvements in employee morale, productivity, engagement, job satisfaction, retention and performance that result when employers tap into the results of the latest studies that focus on people's energy needs, there is something else that both employees and their organizations can gain when people's needs to regularly expend and renew their energy are formally and informally acknowledged by their employers. The most important benefit that everyone can enjoy when new systems and rituals are put in place that recognize the value of balancing intense effort with regular, restful renewal, is a greater sense of personal and professional success. ●

The authors: Tony Schwartz is the founder, president and CEO of The Energy Project, which helps individuals and organizations harness the science of high performance to fuel energy, engagement, focus and productivity. He co-authored the best-seller *The Power of Full Engagement* with Jim Loehr and has written three other books.

Jean Gomes is senior vice president of The Energy Project and chairman of The Energy Project Europe. Catherine McCarthy is chief operating officer of The Energy Project.

How to Measure, Manage and Improve Board Performance

THIN ON TOP

THE SUMMARY IN BRIEF

Corporate boards of directors have seen better days. The roles played by corporate boards and the people who direct them are misunderstood by stakeholders, employees and the general public. Many see boards as ineffective groups of former top executives who have settled into retirement and attend board meetings now and then to keep busy.

But "corporate governance" has become an important topic in the executive suite. Given the high-level scandals of recent years, companies are concerned that corporate boards not only make decisions that improve a company's profitability, but that they conduct their activities in an organized, efficient and ethical manner.

In Thin on Top, *Bob Garratt discusses the current condition of corporate boards, dispels troublesome myths and gives step-by-step recommendations on how to help board members and directors learn, develop and perform.*

What You'll Learn In This Summary

✓ **There is a difference between managing and directing an organization** — Effective board directors must create strategic direction for an organization, not just manage day-to-day operations.

✓ **To be effective, board directors must understand their roles** — The director is the "boss of the board" charged with steering it to wise decisions about moving the company forward while maintaining control.

✓ **The ten universally applicable "directorial duties"** — These duties are guidelines for directors that form a useful basis for improving corporate governance.

✓ **Why corporate boards fail** — Many directors let ignorance of their roles or personal and group cowardice create conditions in which negative things happen.

✓ **How to develop an effective board** — Continuous training, learning and evaluation are the keys to improving a board's performance.

The Future of Corporate Boards

There are basic differences between managing and directing an organization, and most of today's corporate board directors are actually glorified managers. There is a crisis in corporate governance in both the public and private sectors that is a complex mixture of board directors' ignorance, strategic incompetence and greed.

A key to resolving this crisis is to induct, train and evaluate directors as true professionals. Unless a systematic upgrading of directorial competence and board performance takes place, our corporate and economic systems will sharply decline.

The crisis in corporate governance exists because the roles and responsibilities of corporate boards are not understood by politicians, business executives or the general public. As a result, public confidence in corporations and the people who run them is at an all-time low. Developing effective corporate governance and board performance is essential to solving this problem.

We must install a system for selecting board directors and training, developing, evaluating and regulating them, which will bring the type of rigor to the boardroom table that is usually found at other levels of the business. In other words, we must learn how to measure and reward directorial — apart from executive — competence.

It's wrong to assume that friends of the CEO or distinguished executives from other companies will automatically become effective board directors. Experience is required, but not sufficient, for a place at the boardroom table. Only distinct directorial skills will do, and these skills are difficult for many existing and aspiring board members to obtain.

It's no secret that most board directors aren't fully competent. Most can't distinguish between managing a business and directing one, and their success has come from being effective managers, not from giving strategic direction. Most board directors are given that role late in their careers, and it doesn't occur to many of them that they must be trained to become a competent board director. ■

The Crisis of Corporate Governance

Corporate governance is the activities, processes and values of the people and board structures that must cope with the rapidly changing demands of shareholders and stockholders.

Many businesses haven't made the connection between the demands of shareholders and those of stakeholders. Stakeholders are individuals and groups who have the power to sanction board actions. If anything, boards have turned their backs on both shareholders and stakeholders and have created inappropriate reward systems for executives. We have over-praised "celebrity chief executives" and over-rewarded the clever maneuvering of financial professionals.

It's time to return to basics, to remember what companies are for, to manage businesses correctly and create value. We must reaffirm and rigorously apply rules on the roles, tasks, duties and liabilities of boards of directors. Diligently enforcing these rules will prevent most of the "directorial disasters" we read about in our newspapers every day.

Myths of Corporate Governance

The following are three powerful, widely held organizational myths that are obstacles to effective corporate governance:

1. The myth of the all-powerful chief executive.

Many chief executives believe they "own" the organization that employs them and have total freedom to do whatever they want with it. This is not true. CEOs aren't "free agents"—they're directly accountable to the board

The Crisis of Corporate Governance

(continued from page 2)

of directors and, ultimately, to the shareholders. CEOs must use care and sound judgment in their work, and nurture and develop the company for future generations.

2. The myth that a director's primary duty is to the shareholders.

The second major myth of corporate governance is that the main responsibility of a director is to the shareholders. This is not the case. In most societies with a developed system of commercial law—including the US and UK—the moment a director is appointed to a board, his or her main loyalty switches from those who appointed them to the company itself.

3. The myth of executive and non-executive/independent directors.

The third myth is that there are two types of directors, executive and non-executive. This is not true. In case-law countries the only term used is director, and even then much of the description of the director's role is found in the Insolvency Acts rather than company law. The key assumption is that the board acts together as a group of equals around the boardroom table, driving the enterprise forward while keeping it under control. ■

For Additional Information on the myths of corporate governance in the U.S., go to: http://my.summary.com

Back to Basics: Reasserting The Superiority of the Board

Directors who are unaware of their role, rights, duties and tasks cause abuse of the direction-giving process around the boardroom table. This usually leads to under-performance by both the board and the business.

A main problem of ineffective board directors and boards is a misunderstanding of the roles and tasks of the CEO. A chief executive is not a full member of the board but reports to it. Though CEOs often behave as if they own the corporation, they do not. Most of today's problems with corporate governance are caused by this incorrect assumption.

A true chief executive reports to a board, debates with it, takes instructions from it, but is not a voting part of it. The title Chief Executive Officer illustrates that this is the head of the executive function—the operational side of the organization—not of the board.

How Chief Executives Take Unlimited Power

Given many board directors' lack of legal and practical knowledge, it's easy to see how we have reached the point at which shareholders and stakeholders are demanding much higher levels of competence from directors. But instead of relying on boards, most companies still rely on a powerful chief executive to get things done. Those CEOs usually have the power to "bet the business" with very little input or criticism from the board.

There are four main reasons for this over-reliance on a powerful CEO:

1. Most people chosen to become board directors have little or no knowledge about board roles, tasks and liabilities.

In 1992 the Institute of Directors in London surveyed its members and found that less that eight percent of the directors had even one day's training in being a director. Internationally, that figure was even less than eight percent. By 2001, the number of directors who had been trained for the role had increased to only 15 percent.

These percentages make a very disturbing comment about the global condition of effective corporate governance. There seems to be a general acceptance of the fact that one of the most important jobs in an organization—directing the board and its future—is given virtually no training.

2. After a successful managerial or professional career, many board directors don't want to "rock the boat" by asking probing questions of a powerful CEO.

If directors are for the most part ignorant of their roles and tasks, they don't want to make this known, even within the board. As a result, such directors are more likely to ask questions that relate only to their previous discipline and avoiding any position that might put them in an embarrassing spotlight.

3. A misperception by the public that the chief executive's role is not only important in itself but symbolic of the cultural philosophy of the company.

Chief executives may be no more competent than any other board member, but they are assumed by most, inside and outside the corporation, to have absolute competence and are granted absolute power.

One reason is that with weak board directors and chairmen, criticizing the CEO or managing director is often viewed as beyond the board's authority.

Also, since the board chairman is not the boss of the company and its day-to-day affairs, the chairman is viewed as less important to the company's welfare then the CEO. In addition, most people view the corporate board as an amusing, useless anachronism. Finally, the media and the general public tend to emphasize the chief executive role, rather than the board, as the leadership of a company.

4. Shareholders, trustees and the general public have no knowledge of the board's true roles and tasks.

(continued on page 4)

Back to Basics: Reasserting The Superiority of the Board

(continued from page 3)

Educating shareholders and the general public on what boards should be doing is key. But there is still a ways to go. For example, corporate governance is not a serious part of any MBA program.

In the end, boards of directors will re-establish their credibility only by recapturing their role of properly giving direction and providing control. To do this effectively, the chief executive role must be moderated and the board director's role enhanced in the minds of all players. ■

The Ten Directorial Duties: Back to Basics

The ten duties of a board director are designed to be universally applicable. They're a useful basis for developing improved corporate governance. They ask a board and its director to behave within the legal and ethical bounds of:

1. The duty of legitimacy.

It is essential for a board and its director to stay within national and international law. Many directors find themselves, usually through a lack of knowledge of their role, ignorant of the ways they can be held corporately and personally liable.

2. The duty of upholding the three values of accountability, honesty and openness to stakeholders.

Accountability to the owners. The owners' appointment of a board of directors is based on the assumption that the directors will be fully accountable, corporately and individually, for their actions on behalf of those owners.

Honesty in dealing with the board and stakeholders outside it. Honest dealing is the key to board competence and prevents board corruption, including the abuse of power and privilege. It is based on mutual trust and having confidence in your colleagues.

Opening the decision-making process to the owners of the company. Many directors, especially new ones, are horrified by the lack of rigor in their board's decision-making processes. Shareholders should be aware that there is an agreed and transparent process by which decisions are made by the board.

3. The duty of trust.

Board directors have their company entrusted to them for the future. But in these turbulent times, that duty conflicts with the desire of some shareholders to take their money quickly and run. While the owners of the business have the right to overrule the directors at a general meeting, it's unclear how courts would rule if the directors show that shareholders' demands could threaten the future of the business.

4. The duty of upholding the primary loyalty of a director.

From the moment a person is elected as director, their primary loyalty must be to the company as a legal entity, rather than to those who appointed them. Directing is

(continued on page 5)

The Legal Foundation of Boards

Let's go back to basics again, specifically to the legal basis for the theory and structure of boards.

By the mid-nineteenth century, the original, closely held ownership of companies couldn't direct or control increasingly complex businesses. Managers were now employed as agents of the owners to interact with both customers and the workforce.

But as businesses expanded further, so did the need for capital. With the original owners often unable to supply it, the search for capital spread wider. As the original ownership became diluted, legislation in the form of company law was needed to regulate the relationship between the managers and the more distant owners.

In 1776, Adam Smith was concerned that in the long run, centuries before the anti-globalization movement, the new corporations could gain the power to destabilize society through:

- ✓ **Unlimited life**
- ✓ **Unlimited size**
- ✓ **Unlimited power**
- ✓ **Unlimited license**

Smith argued that corporations could potentially become a force for harm as well as good. He realized that those companies would need effective regulation inside, through a controlling group elected by the owners, and outside, through the legislators.

Smith's second and equally radical idea was the development of a board of directors made up of "merchant adventurers." The concept of a board of directors under a governor developed with the formation of the East India Company in 1600. This company was based on the novel assumption that previously autonomous merchant adventurers would do better to pool their funds and become owners of a "joint stock" company. It was only after the mid-eighteenth century that the idea of the company itself having a separate legal personality and limited liability was accepted. This paved the way for boards of directors becoming more common.

The Ten Directorial Duties: Back to Basics

(continued from page 4)

all about exercising judgment, corporately and individually, and this issue is always a contentious one.

5. The duty of care.

Directors must perform their roles and tasks competently. They must be careful in what they do and how they do it, and ensure that what they decide is for the benefit of the company, not themselves.

It's essential that directors know what they should be doing and are evaluated on the results.

6. The duty of critical review and independent thought.

The responsibilities of a board director can seem intimidating to a new—or incompetent—director. Every director must be sufficiently self-aware and mature enough to make their own judgment on the best direction for the health of the company.

7. The duty of delivering the primary roles and tasks of the board.

The roles of the board can be described as four intertwined dilemmas. 1) Driving the enterprise forward while keeping it under control; 2) Knowing the day-to-day workings of the business while developing a longer-term overview of developments outside the business; 3) Balancing short-term, local demands with broader regional, national and international trends; and 4) Focusing on the commercial needs of the business while acting responsibly toward other stakeholders in your society.

8. The duty of protecting minority owners' interests.

This is another aspect of honest dealing. In most developed economies this is not a major issue because regulators are making it more difficult for minority shareholders to be treated poorly. But in countries where the rule of commercial law is weak, minority shareholders are not given enough respect.

9. The duty of corporate social responsibility.

On this issue, it's easy to take an extreme position and much more difficult to take a moderate, balanced one. But that is what any board must do if its enterprise is to survive. Corporate social responsibility must be built into directors' business calculations.

10. The duty of learning, developing and communicating.

Too many directors still assume that the reward of a directorship is the acknowledgement of a long and successful executive career, not the beginning of a new one. They assume they don't have to learn anything new. But accepting a directorship is the start of a new and challenging career. It requires a systematic retraining to break away from the old professional behavior and acquire an approach that emphasizes policy-making and strategic thinking. ■

The Triple Bottom Line

After an unfortunate series of events at one of its oil rigs caused bad publicity, political damage and potentially negative long-term economic effects, Royal Dutch/Shell Group learned that its "science and reason only" approach to corporate issues didn't work in a customer-oriented society. The company recognized that, as a major international investor and employer, it must play a positive role in both economic and social development through its choice of investments and corporate behavior. Shell set out to reposition itself and its reputation by accepting its corporate social responsibility. It developed the concept of the "triple bottom line"—it now strives to reach established goals in three essential areas:

- ✓ **Financial performance**
- ✓ **Physical environmental performance**
- ✓ **Corporate social responsibility performance**

Why Boards Fail: Power and Corruption on the Board

A common public perception of corporate boards is that they're always up to some form of corruption or another. In reality, that's the exception, not the rule. But many directors let ignorance of their roles or personal and group cowardice create conditions in which bad things happen.

A fundamental building block for any board is trust: trusting each other and being trusted by the owners and stakeholders. Trust is defined most simply as "having confidence" in oneself and in others. Directors need to know that once a decision is made, the other directors will stay committed to it outside the boardroom and be comfortable living with the consequences. A lack of trust, especially when big egos are involved, usually causes great uncertainty and diverts the board's attention from their primary duties.

The Abuse of Board Power

For the last two decades, the media have been intensifying their campaigns against incompetent, corrupt businesspeople. But these attacks have been general in nature. To achieve focus, we must consider specifically the abuse

(continued on page 6)

Why Boards Fail: Power and Corruption On the Board

(continued from page 5)

of power by the managing director or CEO, especially around the boardroom table. Its debilitating effect on board performance has rarely been examined in detail.

The ideals behind the three values of corporate governance best practice — accountability, probity and transparency — are rooted firmly in the notion that people with an official position in the private, public, or not-for-profit sectors should not abuse their office. They should be paid sufficiently to do their job well without the temptation of bribery or greed, or the need to exploit their position to support their families or friends.

The Shadow Side of Boards

At what point does the interaction around the boardroom table stop being legitimate discussion and turn into bullying, harassment, discrimination and the abuse of power? That point has been reached when a director and/or board members feel they can't fulfill their roles and are becoming depressed, have low morale, don't participate and show signs of absenteeism, sickness, self-censorship and under-performance.

A great deal of such abuse comes not from one powerful person, but from collusion, implicit or explicit, among board members to avoid dealing with differences between the members and to maintaining the status quo regardless of the negative impact on the company.

The Chairman's Neutral Role

All boards are political. It's human nature that a group of people with big egos is going to be very competitive. This is where the psychological aspects of boardroom abuse come into play. This will ultimately spell disaster for any board because the members' psychological energies are focused on fighting interpersonal battles rather than on developing imaginative, practical strategies.

The interplay of the powerful personalities around a boardroom table will always need careful handling. This is the chairman's job, and it's a demanding one. While powerful personalities often enjoy controlling others, they do not enjoy being controlled themselves.

The chairman is technically neutral and must declare his interest in the issues under discussion. Very basic training in the processes of chairing a board will allow a chairman to umpire a board in a neutral manner. When his interests are in conflict, he must relinquish the chair, letting a director who is neutral on that subject chair the meeting.

Professionalizing Board Performance

Originally, boards were designed to ensure proper auditing and development of a company's purpose, vision, values and performance. These needs must continuously be monitored and developed for any board to be effective.

Training and coaching directors to competence — giving them directorial knowledge, skills, and attitudes — then celebrating the diversity around the boardroom table is essential. Only then can the true power of a board be released. Working in such a group should be an enjoyable experience. After all, the word "company" derives from the Latin *companio*, which means an association of people coming together in trust to break bread. ■

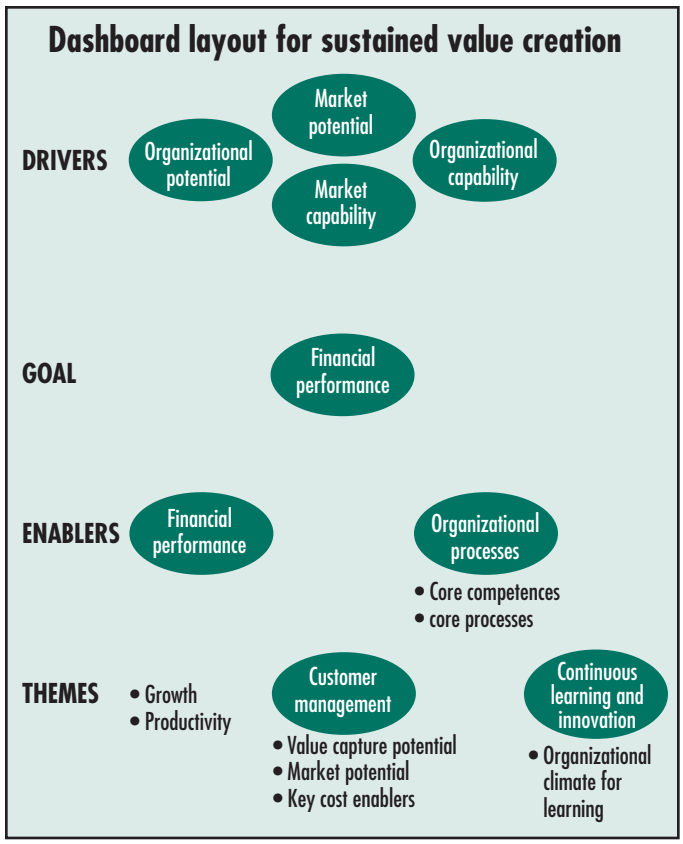
Directorial Dashboards: The New Board Metrics

On most boards there has been an over-reliance on management numbers. But directors are not managers. They must keep their eyes on a different pattern of figures, so they need a *directorial dashboard* to help them oversee total business performance.

If boards use only the balance sheet, profit and loss account, and management accounts, they tend to be seduced into micro-managing and cost-cutting rather than generating revenue.

Directorial Dashboards

Directorial dashboards measure the performance of both the board and the total business. The approach is to develop systems that clearly reveal the performance of the company and its subsidiaries in such a way that the board can monitor and understand trends.



The dashboard concept helps the board focus its attention on key business performance indicators, prioritize actions that need to be taken, implement strategies and learn from the results.

On a car's dashboard, there are three critical dials: a speedometer that shows the speed at which the car is traveling, an odometer that measures miles traveled, and a fuel gauge that tells how much fuel is in the tank. Using a simple business analogy, if the business's "engine" is running efficiently, the speedometer and odometer can show overall business achievement in terms of the number of miles that must be traveled to achieve its goals. The fuel gauge measures the cash flow that keeps the business engine running and tell the directors when they must take action to keep the business from stalling.

The Number of Dials on a Dashboard

How many "dials" should there be on a directorial

(continued on page 7)

Directorial Dashboards: The New Board Metrics

(continued from page 6)

dashboard? Since the main dial will show added shareholder value, between seven and ten dials are needed to assess the opportunities, risks and costs involved in making a strategic decision, as shown in the example above. ■

Developing the Learning Board

Many boards don't have a total process for their decision-making or the consistent leadership and support of the chairman. They often don't understand that decision-making is a continuing cycle of learning from their decisions on the four board dilemmas rather than a simple process of saying "yes" or "no" to executives' proposals. What is usually lacking is a linked, rigorous sequence for making effective strategic decisions.

Strategy and Uncertainty

Nothing is ever certain in the world of directing. Even the seemingly "easy controllables" of internal performance can cause unexpected problems when, sales targets are not met, staff are unruly, budgets are overspent, project times are extended or customers do not pay. Such examples are heard frequently around the boardroom table. But all these examples are from the operational world of executives, and it's not the directors job to resolve executive problems. Their job is to oversee the pattern of executive performance within the context of delivering the board's policies and strategies. The board must not be seduced into trying to micro-manage such problems.

The Board's Strategic Learning

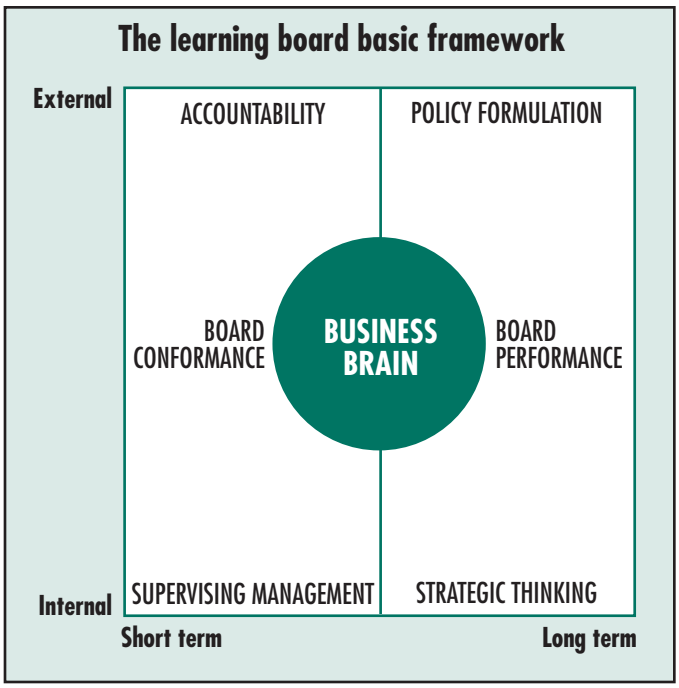
All learning has a moral dimension—we learn good and bad things all the time. The key question about board learning is whether we learn in a "good," open, questioning manner or in a "bad," unquestioning, blame-giving and information-hiding manner. It is crucial for directors to be viewed by the colleagues and their stakeholders as aware of their roles, tasks and duties in relation to developing their strategies. To do this effectively, they must be comfortable generating a range of ideas for implementing their strategies and giving organizational leadership by learning from their decisions and being true to their values.

The Learning Board Process

The model the author has developed over the last 15 years to help professionalize directors is called the *learning board*. This model has been effective in bringing directors from a basic understanding of their roles, tasks, and duties to a higher, more professional level. Two conditions must be met—that the chairman and managing director are totally committed to making this change happen, and that they are willing to learn and change—for the process to succeed.

The learning board model was constructed using the two fundamental roles of the board—driving the enterprise forward while keeping it under control—then adding both business timelines (short-term and long-term) and business perspective (internal and external) dimensions. This concept is fully formed by adding the four key tasks of a board:

- **Formulating policy and foresight.**
- **Strategic thinking.**
- **Supervising management.**
- **Accountability.**



The four board tasks of the learning board model can be fleshed out by adding detailed tasks and assessable behavior in a cycle of board learning.

The sequence begins with *policy formulation and foresight,* which involves:

- **Stating organizational purpose.**
- **Giving organizational vision and values.**
- **Creating an effective emotional climate and organizational culture.**
- **Monitoring the external environment.**

The link to *strategic thinking* is through the board's

(continued on page 8)

Developing the Learning Board

(continued from page 7)

crucial strategic debates and risk assessments on the relationship between monitoring the external environment and positioning in changing markets. This is the crucial debate of the board. These decisions are the lifeblood of the organization because they generate future revenue streams and lead to:

- **Setting corporate direction.**
- **Reviewing and deciding key resources.**
- **Deciding implementation processes.**

The second crucial board debate is over the relationship between implementing strategy and ensuring organizational capabilities, which test whether the proposed strategy is workable and properly resourced. The board and executive learning from this helps inform the rest of the *supervising management* tasks:

- **Reviewing key business results.**
- **Monitoring budget control.**
- **Overseeing management performance.**

Ultimately, *accountability* takes the main place in the board's annual learning cycle as the board alone is responsible for the total control and performance of the business and must account for its stewardship in order of legal precedence to:

- **The company (as a separate legal personality).**
- **The owners.**
- **The regulators and legislators.**
- **The other stakeholders.** ■

Professionalizing the Board

The end of a board's decision-making cycle is not the end of its learning, it's simply the start of a new round of higher-quality learning.

Board Evaluation and Appraisal

The first step in board evaluation and appraisal is to create a system of benchmarking for individual and group capabilities. The techniques for board appraisal are no different from any other appraisal system:

1. Identify key performance areas (tasks) and value-based behaviors (processes) that reinforce the business's purpose and vision.

2. Develop a system for assessing board members and assess them regularly and rigorously.

The Basis of a Board Appraisal System

The simplest system of board and director appraisal consists of five elements:

1) A review of the self-disciplinary processes of the board, essentially its self-control mechanisms.

2) A review of its working processes, especially its budgeting of time and development of its competencies.

3) A review of its future income-generation and control mechanisms.

4) A review of the values used in learning opportunities offered to the board.

5) A review of the overall performance of the business and the board's specific contribution to shareholder value.

Developing the Content of Board Training

An effective board-appraisal process reveals the need for training and development of the individual directors. A problem with today's director development is that training is a replica of the "mini-MBAs" being taught to directors using the functional areas of accounting, human resources, strategy, marketing, procurement, etc. This type of education is not helpful for board directors.

In the future, the development of director and board competencies must be very different. Training should cover the following topics:

- **Working on a board effectively.**
- **Performing the legal roles, tasks and accountabilities of the board.**
- **Formulating policy.**
- **Developing strategic thought.**
- **Assessing risks.**
- **Effective board decision-making.**
- **Implementing and learning from strategy.**
- **Funding.**
- **Overseeing organizational change.** ■

The Seven Ways to Make Tough Decisions Easier and Grow Business in Good Times and Bad

TOUGH MANAGEMENT

THE SUMMARY IN BRIEF

Faced with shrinking budgets, smaller staffs, shorter deadlines, more demanding customers and an unrelenting call for innovation and growth, many executives and managers are feeling "highly stressed." The old management paradigms aren't working, which means we need a fresh, bottom-line approach designed for what really works in today's business environment. This new approach is what business strategist and CEO of NFI Research Chuck Martin offers in this summary.

Based on more than two years of surveys of more than 2,000 senior executives and managers, this summary provides managers with a new way to tackle tough decisions in today's high-pressure business world and deliver the results their companies need for sustained growth.

In it, Martin also explains how successful business leaders have met the demand to do more, deliver more and grow more by using practical, powerful and proven techniques — without raising stress levels. By focusing on actual results and forcing the hard decisions, you can learn to communicate and collaborate while remaining flexible. This summary offers real solutions to real problems in the real world.

What You'll Learn In This Summary

The seven skills every manager should know. These are:

- ✓ How to focus on results.
- ✓ Ways to force the hard decisions.
- ✓ Better ways to communicate more clearly.
- ✓ How to remain flexible.
- ✓ Ways to prove your value to the company.
- ✓ Better ways to force collaboration.
- ✓ How to be a tough manager without being a tough guy.

Tough Management

Work today is more demanding than ever before. The bottom-line orientation required for budget-constrained organizations is the new reality. The need for improved output has increased without there being a proportionate increase in personnel. This situation drives shareholders, executives and managers to demand more from their employees and themselves.

Everyone is in the same situation with the work mantra of today: *Do more with less.* Everyone is affected by the burden and the burden will fall on you, the people you manage, your customers, their customers, and the managers and employees at all of those places.

Tough management is a way to approach work. It is a reasonable, practical and organized way to reach decisions more easily, make your numbers more consistently, have those around you understand where you stand, and increase your business.

Here are some of the reasons why the business world of today is tougher than it has ever been:

- **The workload has increased for 80 percent of executives and managers over the past few years and significantly increased for more than half of them.**
- **Compensation has not increased significantly for 90 percent of executives and managers.**
- **Today's workplace is highly stressful, with 80 percent of executives and managers saying they are stressed, with a third feeling highly stressed.**
- **The social contract between employer and the employee has changed thanks to actions by both parties.** The amount of time an executive or manager will stay with a company has changed from decades to years.

Businesspeople state that keeping an overall perspective is one of the most important skills for success. ■

The Seven Rules of Tough Management

There are seven rules that comprise tough management. These guidelines can help overworked managers make tough decisions more easily and grow the business:

1. Communicate clearly. Tough management requires an abundance of communication that is clear, concise, timely and truthful. Clear communication that is clearly received aligns those creating strategy with those executing it throughout the ranks.

2. Force the Hard Decisions. It is tough to make the hard decisions when they need to be made. Managers need to collect all the necessary information available at the time, make the decision, communicate it and then move on. People are at the heart of the toughest decisions, but they still have to be made.

3. Focus on Results. Tough management demands that every person identify the results that matter most at any given time and determine actions that produce those results. It also means being realistic about what results are being demanded, and ensuring all parties agree on the necessary tools and time frame needed to deliver those results.

4. Remain Flexible. Managers need to be organized so they can change directions quickly to keep pace with the changing needs of their organization and customers. It also requires stopping actions — such as institutionalized tasks, projects or meetings — that waste time. You should view yourself more as a "virtual enterprise."

5. Prove Your Value to the Company. You must align yourself with your company's values so that you can prove your value. This translates into accepting new challenges and becoming the person to whom everyone turns for solutions. Keep in mind that there is a fine line between proving your value and the organization taking advantage of you.

The Seven Rules of Tough Management

(continued from page 2)

6. Force Collaboration. Tough management requires teamwork at every level. This requires new levels of information sharing and a willingness to learn.

7. Practice Tough Management Without Being a Tough Guy. You can deliver valuable results without being brutal to subordinates in the process. You have to improve morale, protect the talent, recognize superior work and provide what is necessary for people to do their jobs betters. ■

Communicate Clearly

Communication is king in business. Tough management requires an obsessive attention to the effectiveness of all communication, including the what, when, how, and most importantly, the why, of what you are communicating. Businesspeople, in this noisy and fast-paced world, must share ideas, discuss tasks, and clearly communicate vision and direction.

One senior executive at a small company explains, "Effective, consistent communication is the key, because by so doing a leader can attract and retain the only sustainable competitive advantage there is: a focused, motivated and committed work force."

It can be difficult to convince without the ability to communicate well. If members of a department or business team communicate well, much can be accomplished. Specific tasks become clear and each member understands his or her role.

Clarity of Communication

Though communication is the most important skill for executives and managers, the majority of them are not clearly hearing directives from those above them. "Communicating up, down and sideways is a daily task that takes energy and time. The time and effort invested keeps us all focused on our goals and is well worth it," according to one senior executive at a small company.

Tough management requires more listening as part of the overall communication process, to determine what was heard compared to what was said.

Tough management also requires easy access to management and almost an overabundance of communication. The secret of effective communication is to ensure that everyone who needs to hear the message does, in fact, receive it in a timely fashion.

Joe Puglisi is the chief information officer (CIO) of EMCOR Group, one of the world's largest specialty construction firms with about $4.6 billion dollars in annual sales. Puglisi answers his own phone, and the people who work for him do the same. "People can get to me easily and I make sure I can get to my people whenever I need to," says Puglisi. His group uses e-mail, meetings, instant meetings and telephones all the time. He opposes instant messaging because he thinks it's too intrusive.

Tough management requires that communication be constant and in a continual loop. Peter Baker reports directly to Puglisi as the director of applications at EMCOR. He is constantly in communication with his boss as well as his peers, customers and vendors. He sees his role as maintaining the communication bi-directionally. "We're all straight up and down the line," Baker says.

It's a cultural decision to allow the free, bi-directional flow of information in an organization. This means that hoarding of information is not tolerated.

A side benefit of this free flow of information is that people can make correct decisions relatively quickly. That's because all stakeholders are already following the details and discussions leading up to a decision. "In our group, everyone has the information, so consensus is pretty quick," Baker says.

Corporate Truth Versus Street Truth

The result of bad communication is a disconnection between strategy and execution. One of the toughest challenges businesses face today is how to bridge the gap between the top executive's vision and the reality of the managers and workers who must make that vision happen.

Managers and employees generally are closer on a day-to-day basis to customers and their short-term demands and needs, which may not be the same as the demands and needs of the corporate strategy. This gap can be the ultimate undoing of a leader's strategy, as well as total frustration in the ranks, as managers see a distance between what their leaders say and what their customers want. It is the difference between "corporate truth" and "street truth."

The *corporate truth* is what the chief executive or cor-

(continued on page 4)

Monthly CEO Lunches at Westminster Savings

Tough management requires not only clarity in communication, but also increased frequency and checks for effectiveness. Barry Forbes, CEO of Westminster Savings in New Westminster, British Columbia, invites 25 of his employees to lunch every other month. No managers attend, and the employees are invited to ask any questions they wish. Forbes uses the meetings to explain the "why" of why the company does things. The workers have his telephone number and e-mail address and he encourages them to contact him. The credit union is the leader in its market and has less than 10 percent annual employee turnover, which is low for the industry.

Communicate Clearly

(continued from page 3)

porate leadership announces to the world, to Wall Street or even to the company's own employees about what the company is going to do.

The *street truth* is the reality of the company's managers and employees, who hear the message and determine how much of that pronouncement actually will be realized. The street truth is more closely aligned with the day-to-day realities of the managers and employees who do the work.

The Communication Gap

Poor communication is one of the primary reasons behind this gap between corporate and street truth. The gap results when executives do not effectively communicate their messages to their subordinates, leaving managers to draw their own conclusions about the company's direction. Managers then behave according to their own understanding of how to act, based on other things, such as customer expectations, self-interest and individual relationships.

Puglisi identified this gap five years ago. "The higher up you go, the closer you are to strategic thinking. In the trenches, it's how to get through the day. Skills are lacking in linking those things together. Senior management should appreciate that and keep the lines of communication open through the ranks."

The Last Third

The EMCOR CIO has one advantage that other people in his position might not have: He was the company's first corporate CIO and he had the option of starting his group with a policy of open and total communication.

Yet there are downsides to even the best communication efforts. It can be called "the law of the last third." What this means is that a third of the people will buy in immediately, and the second third will have some questions but will still follow along. The last third of the people causes problems because they never buy in. Many top executives have to keep communicating the message until everyone buys in.

One of the reasons communication isn't clear within organizations is that senior executives and managers look at and live in somewhat different worlds. For example, senior executives find hiring and firing their toughest decisions, but managers find changing jobs their toughest hurdles. Senior executives have different perspectives than managers about customer expectations, challenges and compensation. Tough management requires understanding the context in which others live.

The 50 Percent Rule

With so much on the plate of every executive and manager, it is challenging to take the appropriate amount of time to communicate effectively. When resolving an issue or a problem, executives and managers should adhere to *the 50 percent rule*. This means that more than half of the communication from the superior should involve listening and not talking.

John Nadeau is the president of Chest Physical Therapy Services, a New England-based health care agency that deploys therapists to children with cystic fibrosis. He says this: "You can get more from people by pulling it from them than you can from pushing demands onto them. Most people derive happiness from a job well done. That can be a powerful driving force in their daily work lives."

Effective, Truthful Communication

Gord Huston, president and CEO of Envision Credit Union in British Columbia says, "Yesterday, the validity of the information was based on who was delivering it. It was command and control. Today and tomorrow it is the message itself that will be judged, not who is sending it. People have to be honest."

Tough management requires frequent and consistent communication. Once communications are fine-tuned so that messages are easily conveyed and well understood, decisions at the top can be understood all the way through the ranks. This also makes it easier to convey in a clear way when and why a tough decision has been made. ■

For additional information on statics about communication, go to: http://my.summary.com

Force the Hard Decisions

Not all decisions in business are created equal. It is only natural to follow the easiest path and wait longer to tackle decisions that are more difficult and complex. Tough management requires the exact opposite: Executives and managers must make the tough calls as soon as possible and encourage those around them to do the same and then move on. When you make the tough calls you may not make many new friends, but it will create a new sense of respect for the decision-making process.

Tough Calls and Time Frames

It's tougher to make the hard decision at work than it looks, and it gets harder the higher up the ladder you go. Bad calls cannot only hurt your company but can also hurt your personal career.

Timing and the amount of information play significant parts in making the difficult decisions. "Making a tough decision when I don't have enough knowledge or information is the hardest thing I have to do," says the manager of one large company.

Decisions often become more difficult higher in the ranks because at that level, more people and potentially more of the business can be affected. However, there are some tough

(continued on page 5)

Force the Hard Decisions

(continued from page 4)

decisions that can have dramatic professional and personal consequences, either positively or negatively.

The Emerging Business Organization

When IBM identifies a potential sea change in a market, it creates what it calls an EBO — an emerging business organization — to analyze that market and determine what role, if any, IBM should play in it. For example, when the Internet and the World Wide Web were up and coming, IBM established an EBO and ultimately determined that the company should make serious investments in e-business, which it ultimately did. The company also set up EBOs for life sciences and grid computing.

IBM recently made the tough decision to enter the Linux market, and Doug Dreyer, now the worldwide program director of Linux strategy and business, had to make the tough choice to join the Linux group at IBM. IBM made the tough call to change the traditional legacy approach of using custom engineered products, and introduced off-the-shelf products based on standards. Dreyer said, "We saw Linux and open standards as game-changing technologies … it was a gamble on timing."

Ducks and Eagles

The big problem in making the hard decisions has to do with the personal and professional well-being of the person making the call. No one wants to be perceived as the bad guy when there are families to support.

When it comes to making the tough decisions, there are generally two types of managers, either ducks or eagles. The ducks tend to follow the lead duck, don't really make any waves and certainly never take a chance to make a bold decision. They are followers. The eagles are significantly more independent and look at the organization in a broader context. They are doers.

Three steps are included in the hard decisions: collecting information, making the decision and communicating it, and moving on. Different approaches are appropriate for different circumstances. You are either a duck or an eagle.

The decisions that are toughest to make are those that affect someone else's life. One manager notes, "The entire layoff process is gut wrenching, from identifying individuals, who are friends, to performing the task." Yet the tough decision has to be made and executed. The key is to actually make that decision rather than procrastinating and letting the situation linger too long. Success also involves identifying the most important tough calls that need to be made and knowing when to make them.

Segment Tough Decisions by Time and Level

Decisions that are strategic generally fall into the longer time frames, while tactical decisions should be made within a shorter time frame. Antonio Monteiro, the chief information officer of Internet Securities, says his tough decisions fall into four time frames: "I put decisions into four buckets: today, 30 days, a quarter and a year." He adds that buying a new piece of infrastructure might be a one-year decision while a downed computer system would need more immediate attention.

Tough decisions have to be made at all levels of an organization for several reasons: The decision maker gains ownership of the hard decision, the immediate ramifications are more quickly known, not all tough decisions can be centralized because there are too many of them, and no one has enough information to make every tough call. Tough decisions have to be made in the context of "seeing around corners" because the long-range implications of what looks like a smart decision today can turn out to be negative tomorrow. ■

Focus on Results

The bottom line is the bottom line. Whether a specific company focuses on profits, sales, customer satisfaction or any other measurement, everyone in every organization faces some fundamental measurement he or she has to make, either individually or as a department.

Tough management requires every person to determine precisely what results matter most to him or her at the time and create the proper focus to achieve those results. Every action should have consequences that produce results. To focus an action on results, ask: How does it affect our customers, how does it affect our staff, is it on strategy, who else should know about the decision, how does it affect the numbers, and is there a better action that would produce better results?

The following guidelines will help you stay focused:

- **Limit your involvement.** Don't get involved in every aspect of everything going on around you. Businesspeople can truly be responsible only if given responsibility without second-guessing.
- **Remember strategy.** Don't let events distract you from the overall strategy and direction of the organization. Stay focused on what matters.
- **Keep others focused.** Some people in business have short attention spans. This means that you have to focus their attention for them.
- **Pick your time.** Select the right time to get something done. Identify employees' best time to focus, based on the situation and tasks at hand, and then it is heads-down time.

Working Smarter, Working Harder

Working more hours won't cut it anymore, primarily because many managers are getting to a point where

(continued on page 6)

Focus on Results

(continued from page 5)

there are no more hours left to work. The only solution is to work smarter.

Here are some quick tips for working smarter and harder: Manage expectations all the way along the line, determine precisely what others are expecting, clearly articulate your expectations of results, ask for clear definitions of others' expectations of results, clearly and frequently communicate the status of work toward those results, and put a number on everything so progress can be measured.

Delegation, Meetings and Realistic Results

Tough management sometimes requires letting go and empowering others in order to gain results. Delegation requires crystal clear communication so that people know precisely what is expected of them. Ways to improve delegating include: being surrounded by good people, articulating a strategy and direction, making sure people understand the message, checking to make sure they have the proper tools to do their jobs, and letting them do their jobs.

Tough management also means fewer meetings. No business manager sees increasing the number of meetings as a way to increase productivity. You should ask yourself these questions before you go off to your next meeting: Is this meeting necessary for me to attend? What is the potential ultimate benefit of this meeting? Should this meeting be canceled or eliminated for good? Why are we having this meeting?

Tough management requires business leaders to be more realistic in the results they demand from those who work for them. It's no secret that many organizations have become more results-oriented in recent years. The economy, market conditions, increased competition, price pressures, globalization and more selective customers all have forced businesses to watch the bottom line more closely. Everyone is doing more with less, while unforgiving shareholders and top management are expecting even more. Tough managers need to insist that original demands remain consistent and that those who are expected to deliver are properly equipped.

Customer Expectations

A big payoff for tough management is at the customer level. Businesses are facing higher customer expectations, and those who are not tough inside their organizations on issues such as clear communication, forcing hard decisions, and results orientation will pay at the customer level.

The overwhelming majority of senior executives and managers say their customers' expectations are higher today than in the past. The real-time world of today, with always-on access to everyone, has changed what people have come to expect. "Information technology has played a significant role in raising customer service expectations, particularly from an immediate access to information perspective," says one manager. "Customers also expect to interact with empowered employees."

When you focus on results, it requires a new view as to what results are being delivered and to what customers. While all customers are important, not all are of the same value to a company. Segmenting customers by value potential will become more common, so the best customers will continue to get the best service. The rules of tough management will satisfy higher customer expectations, which can, in turn, provide the motivation for new ideas, approaches and performance. Those who miss this will simply lose the business.

- **Recharge the workplace.** People in business also need to continue to learn and grow. Recharging the workplace involves remotivating the individuals in that workplace. Individuals can take a few steps to help get charged for the work ahead: Change something about the job or the actual work at the job, stop and think about what you do every day, and take it upon yourself to learn something new about your organization. ■

Remain Flexible

The longer someone does something, the easier it is for that person to keep doing the same thing. Tough management requires that managers identify habits, challenge and break them, and insert an added degree of flexibility into their work life. Even while communicating effectively, forcing the hard decisions and focusing on results, individuals must organize themselves to remain flexible enough to change directions quickly when necessary and adapt to changing conditions.

Flexibility is critical for the manager today because it is the relief valve in a world of work where executives and managers continually face increased stress and mounting numbers of projects. Flexibility, in both work and personal life, is a key to tough management. To remain flexible, you must try new approaches, learn from others and encourage others to be flexible as well.

The Spiral of Stress

The top causes of stress are deadlines, customer deadlines and conflicting responsibilities. Many managers are working from deadline to deadline, with no breathing room or time for assessment. These pressures come from the manager's superiors, peers and subordinates.

The number of hours of work is also rising and contributes to the spiral of stress. One tool managers can use in order to complete their tasks is a list. Lists — the

(continued on page 7)

Remain Flexible

(continued from page 6)

majority of business lists have six to 10 items — keep managers on track by setting priorities. These lists are not static. Executives and managers have several reasons for keeping lists: predetermining the day, keeping track and insurance (if it's on the list, it's not likely to be forgotten).

Morphing

One way to remain flexible is through morphing, which essentially means taking the shape of the environment.

For example, DuPont, the oldest industrial company in the Fortune 500, found itself in a changing world in the late 1990s as the knowledge economy took hold in the marketplace. DuPont, a 200-year-old company, reorganized itself around the concept of "One DuPont" with the focus of creating science-based solutions for customers. The refocus on customers was similar to the approach Lou Gerstner took when he stepped in at the helm of IBM.

DuPont adopted Six Sigma — a quality improvement process for achieving close to zero defects. It was created in order to apply a universal quality metric regardless of product complexity. After Six Sigma was well underway throughout DuPont, the company found itself morphing to remain flexible. DuPont's move toward using Six Sigma for revenue growth from its initial focus on cost savings happened over a period of time. It was a process, not an event.

Sometimes flexibility means knowing when to stop the organization from heading in a direction. In the case of DuPont, senior executives held a series of meetings to determine what should be stopped, and simply stopped those projects. It takes tough management to stop projects. It's easy to start projects within organizations, but when it comes to stopping a project or process in an organization, it's a different story. Almost 40 percent of top leaders say that stopping something is extremely or very difficult.

The Virtual Enterprise

Managers must also become more flexible in their personal careers. They can do this by living the "what if" life at work. This means that they should be constantly evaluating and re-evaluating work scenarios that can affect them personally. Gone are the days of getting out of college and working for one institution until retirement, with full pensions intact.

Tough management requires being realistic in how you view your relationship with your job. While this doesn't mean that there should be no loyalty to the company, you should have more loyalty to yourself and view yourself as a virtual enterprise. Kimberly Barnes, a high-powered saleswoman, says: "I think of myself as a consultant collecting a W2. You can't expect to stay anywhere a long time these days."

Employee loyalty just isn't what it used to be. Mergers and acquisitions, company closings, corporate corruption and intense pressure in the workplace contribute to the decline in employee loyalty. Tough management demands that management creates incentives to keep good people. In order to improve employee loyalty, tough managers need to do the following: Improve company culture, increase trust, create advancement opportunity, promote the stability of the company, provide autonomy and challenge, provide job stability, provide fair compensation, provide flexibility and monitor benefits. ■

E-Mail Overload

E-mail overload is out of control, threatening to negate the great productivity of fast, ubiquitous electronic communications. Companies lose millions of dollars in productivity because of e-mail. Spam is expected to cost U.S. businesses roughly $10 billion a year. The real hit is being felt at the individual level, as managers and employees spend hour after hour and day after day scrolling through message after message, trying to sift through to those that matter. "E-mail is killing me," says one vice-president, who gets more than 100 messages per day.

As a challenge, pick a week, perhaps a summer week, and don't use any e-mail at all. Use that extra time to actually talk to managers and customers. You might even use it to do some extra thinking.

Prove Your Value to the Company

Even though most senior executives and managers feel they are more valued today than a few years ago by the people for whom they work, that value can still be increased. The people and departments that deliver results receive the investments and growth opportunities; that's what tough management is all about. The top 10 ways to be more valued by your organization are: increase revenue, do more with less, increase profit, communicate more, cut costs, provide creative ideas, assume more responsibility, collaborate more, share more information and spend more time with customers.

As you attempt to align with your business' value, it is important to assess the less tangible parts of the value. For example, there is great opportunity for businesses to sell things that can't be seen. Consumers around the world in one year spent $3.5 billion for cell-phone ring tones. More than $1 trillion was spent on insurance. The point is there is tremendous revenue in things that you can't see.

Once your superiors understand how the value you provide is aligned with the value the business is attempting to provide, your worth to the organization will rise. By taking on more challenges in areas that are the most important to the business, you increase your value even more. ■

Force Collaboration

Tough management requires teamwork. Collaborating with others at every level of the organization is a critical skill for success for executives and managers. With the economic and competitive pressures companies face today, a more integrated approach is needed for solving problems. Forced collaboration involves priority thinking, information sharing and a willingness among employees to learn.

Collaborating with others can improve a person's ability to create work relationships, better utilize those relationships and view them as critical resources. A manager describes the need this way: "Resource management, internal and external, may be the single most important skill that executives and managers must possess in the future — where and how to find the information that you need to get the job done. That requires both management and networking skills to establish and manage relationships. Managing relationships is resource management."

Organizations that encourage collaboration with highly interactive participation by all team members can provide that organization with the great advantage of focusing all energies in an agreed-to direction.

Forced collaboration frees time for executives and managers all the way down the line, as more conflicts are resolved between departments and divisions. The forced collaboration at the MasterCraft Boat Co. in Tennessee requires that each person learn more of what the other departments are doing and the critical elements for their success. This approach helps link all the small successes to the greater strategic success of the business, as each department head becomes more aware of the impact of what he or she did on the other departments. ■

Tough Management Without Being a Tough Guy

While the first six tenets of tough management deal with quantitative improvement, such as focusing on results and forcing hard decisions, the seventh deals with the qualitative aspects: improving your work life and that of the people around you. This can be done while still maintaining a tough — but fair — posture. After all, tough management does not require treating subordinates brutally.

It takes an understanding of the situation of those being managed in order to practice tough management without appearing to be coldhearted. For example, the hours worked by executives and managers have gotten out of control. The myth of the eight-hour day has all but vanished and the nine-hour day is falling by the wayside as well. The challenge is for businesspeople to disconnect. The key is to understand that everyone is in the same situation. Managers and those being managed are all working at the same feverish pace. You have to force yourself as well as those around you to pause and take a break; otherwise, you all will lose perspective.

Compensation

It's not just the time put in at work that causes stress; it is the actual workload that you and your colleagues face during that time. Responsibilities have increased for most workers, but only 10 percent have seen their compensation rise significantly. Economic pressures of the last few years have forced companies to trim staff while maintaining and even increasing the workload. Tough management requires that leaders take the time to check if those who have taken on additional work are being fairly compensated for their work, which is not always the case.

Here are a few ways you can change focus from work's daily grind: Take a two-hour lunch, go home early one day, think, exercise and read. Taking more breaks from work may not change the work or the workload, but it can improve the attitude of those charged with doing it.

Recognize Someone

To practice tough management without appearing tough requires that you recognize those around you for a job well done. These are, in order, the top 10 ways people want to be recognized for their work: a bonus, increased compensation, personal thank-you, increased responsibility, promotion, e-mail from a superior, personal note from a superior, recognition at a company event, time off, and a phone call from a superior.

One of the best ways to practice tough management without being a tough guy is to stop what you're doing; look around your group, department or company; and identify someone who needs and deserves a pat on the back. Thank a customer for buying your product. Thank your family for appreciating how hard you work when you are not at home. Thank the chief executive who clearly articulated the company's strategy and direction. If everyone did this, there would be a more appreciative office environment. ■

Traction
By Gino Wickman

Gino Wickman's passion is helping people get what they want from their businesses. To fulfill that passion, Wickman created the Entrepreneurial Operating System (EOS)®, a holistic system that, when implemented in an organization, helps leaders run better businesses, get better control, have better life balance, and gain more traction; with the entire organization advancing together as a healthy, functional and cohesive team. He is the founder of EOS Worldwide, a growing organization of successful entrepreneurs from a variety of business backgrounds collaborating as certified EOS Implementers to help people throughout the world to experience all the organizational and personal benefits of implementing EOS.

Time to Strengthen and Re-Energize Your Business

Survey any group of entrepreneurs and you will find a common set of frustrations. Feelings of limited control, concerns with people inside and outside of the operation, bottom-line profits, stifled growth, and feeling stuck and stymied after trying several strategies to get things moving in the right direction are all sources of stress, fatigue, and overwhelm for many entrepreneurs. If you count yourself among those entrepreneurs who have made a great start but are ready to take their business to the next level, this book is for you.

Every leader and every business will face challenges. That is part of the experience and fully to be expected. However, it is possible to ease the burden of typical roadblocks and elevate your leadership abilities and your business results by identifying and applying a set of core principles. In ***Traction: Get a Grip on Your Business,*** author and hands-on business consultant Gino Wickman shares his highly effective Entrepreneurial Operating System (EOS). The book does not offer a quick fix or a secret sauce. Instead, it provides entrepreneurs and leaders with a "practical but thorough method to help strengthen and re-energize your business."

Wickman believes that you already have everything you need to succeed. You just have to put all of the moving parts into the right places within the system and before you know it, your business will be running like the well-oiled machine you've intended it to be. And get this. Part of the system calls for you to step back and allow your operation to become a "self-sustaining organism," which can be life changing in the most positive way.

If you are looking to "melt away the five common frustrations," you need only read on to learn how to implement basic tools that have been proven effective for countless other organizations before you. In the end, you will be "more in control, happier, and less stressed" and be left with a business that is "more profitable, more focused, and staffed by great employees."

The Entrepreneurial Operating System

Systems are simply a group of core components that function

Book Snaps™ is a publication of Soundview Inc. • 225 Wilmington West Chester Pike, Suite 202, Chadds Ford, PA 19317 USA. • © 2021 Soundview, Inc. All rights reserved. together to serve a whole. In the case of the Entrepreneurial Operating System, the system is centered around your business and the core components are vision, people, data, issues, process, and traction. The very fact that the system is organized into a limited number of groups is freeing. Instead of worrying about every little thing, you can target your energy and focus on just six key areas.

Vision

All business owners who find a baseline level of success know that they need to create and communicate a compelling vision of where the business is, where it plans to go, and how it plans to get there. What happens sometimes, though, is that leaders create a vision that is overly complicated or they fail to communicate it in a way that other people in the organization find useful. A vision that is not embraced and put into action is simply a poster on a wall. In order to be effective, leaders must make sure that everyone in the organization can see the vision just as clearly as the leader themself. The process of creating, clarifying, and above all, communicating your vision is the first step in gaining traction.

People

Entrepreneurs who find success eventually learn that they cannot and should not do everything on their own. They need help, expertise, opinions, ideas, support, and strategy from others. Assembling a team of people that will take your business to the next level is all about putting the right people in the right seats. This is not a new idea but it has always been offered as a piece of nonspecific advice. Wickman erases the murkiness by explaining simply, but very clearly, what makes a person or position "right" within your organization.

"The right people" have values that are aligned with the core values of your organization. They "fit and thrive in your culture." They are people that you like to be around and they make your workplace better. "The right seat" means that those people who have been selected as being the right ones are put into positions that leverage their "greatest skill and passion" within your organization.

You can analyze each team member to determine if you have chosen the right person by using Wickman's People Analyzer tool. List out your company's core values and choose a team member. Go through each value and assign a plus, minus, or neutral for how that person stacks up against each value. At the end of the exercise, it will become visually evident who is "right" for your business and who is not.

To determine if you have placed people in the right seat, Wickman recommends looking at them through the lens of what he calls "GWC." This stands for "get it, want it, and capacity to do it." Does the person in the seat understand the roles, responsibilities, and concepts required to perform the job? Do they want the job? Do they have the capacity to actually perform? If the answer is no to any of these questions, it is highly likely that you have made a "seat" mistake.

Data

Even when leaders have the absolute best intentions to remain objective, at the end of the day, we are only human. Without clearly defined and measurable metrics, decisions invariably come down to "ego, subjectivity, emotions, and intangibles." To make decisions that are productive for the company, a leader has to rely on factual information.

The leading and most important tool a leader will learn to use for this component is a Scorecard. This is a "weekly report containing five to 15 high-level numbers for the organization" that enables you to keep your finger firmly on the pulse of your business. To create your company's unique Scorecard, you and your leadership team will engage in a six-step process.

1. Through contributions by all on the leadership team, make a list of 5-15 categories of data that need to be tracked in order to have a grip on your business on a weekly basis. Examples include sales activity, accounts payable and receivable, or weekly revenue.

2. Determine which team member is responsible for providing the data for each category on a weekly basis and communicate their accountability for it.

3. Decide what the goal number will be for each category. These goals should align with and be tied to the company's one-year plan.

4. Fill in the Scorecard with next week's date, which is when you will start tracking.

5. Assign the task of physically filling out the SCorecard to appropriate team members and figure out how they will receive the numbers from the person accountable for them.

6. Commit to keeping track of and actually use your Scorecard! Over time, patterns will emerge that will drive decision making based on facts, not feelings.

Issues

In the course of running a business, problems are going to come along that must be addressed. Wickman labels such obstacles as "issues" and believes that the expediency with which a leader is able to solve problems when they arise is directly proportional to how successful the leader's business becomes. If problems are left to fester and linger, they can cause the downfall of your organization. Instead, they should have the light shined brightly upon them rather than be hidden away, ignored, or covered up. "Unresolved issues take up time and energy." Solve them and your business is free to move forward.

The first critical step in ensuring that problems are dealt with is to foster a culture in which everyone feels safe and secure being open and bringing attention to issues. This starts at the top. You must work hard to reward, not punish people who bring problems into the light of day. You must be open yourself, admitting mistakes and embracing them as opportunities for growth.

Most entrepreneurs don't understand how powerful process can be. . . "

Once the environment is ripe for sharing openly, the team should keep an active list of issues that are related to the values, plans, and goals of the organization. Prioritize issues that have a more immediate impact and put them through a simple system called "The Issues Solving Track." In this process you and your team look to your issues list and methodically identify, discuss, and solve issues. This sounds incredibly simple but of course, it is a bit more nuanced than it may appear at first glance. Of paramount importance is for team members to look for underlying causes of the stated issues on the list. Things are often not what they seem without some digging.

Process

In the context of the Entrepreneurial Operating System, process refers to the way you operate your business. In Wickman's experience, this component is often completely overlooked by leaders, much to the detriment of their organization. The problem is not necessarily that leaders don't have processes that they use. The problem is that many of them keep these systems inside their own heads, not explicitly sharing and implementing them with their team.

"Most entrepreneurs don't understand how powerful process can be, but when you apply it correctly, it works like magic, resulting in simplicity, scalability, efficiency, and profitability." Systemizing your business requires two major steps. First, you have to take the time to get the existing systems out of your head and onto paper. You must document all of the core processes that keep your business running. This will work best if you engage the entire leadership team. This way you can all agree on what your core processes actually are and what language you will use to describe them. There will be processes for every major department of the business, such as HR, sales, operations, and so forth.

Next, you have to get everyone on the team on board with following and using the systems. This also starts at the top. If leadership fails to buy into the importance of the systems, those they lead will also fail to use them. Make it clear how each system works, how it fits into the bigger picture, and communicate the intent to hold all people accountable for sticking to them.

Traction

The best laid plans and processes will fall flat if you do not execute them well. This is where the rubber meets the road and your business either takes off, moving forward with speed, or simply spins its tires, getting nowhere fast. To strengthen this frequently weak component of propelling a business forward, leaders will have to model and institute two disciplines across the entire organization. One is called "Rocks" and it relates to "clear 90-day priorities" for every single person in the organization. The other is called a "Meeting Pulse" and it allows for focus, alignment, and communication at all levels of the organization.

"Rocks" are a handful of the top priorities for your organization over the next 90 days. This breaks down your big vision into manageable chunks that can actually be accomplished over the time frame of one quarter. You will have Rocks for the company as a whole, for teams, and for individuals. They must be "specific, measurable, and attainable" like all achievable goals.

Holding productive meetings is not a waste of time. Rather, they can serve as the "moment of truth" for any organization. Meeting Pulse measures the heartbeat of your organization. These well planned and run meetings will provide information similar to that of an EKG machine. They will show spikes, slow downs, and steadiness. Wickman recommends using both weekly and quarterly meetings to take the pulse of your company.

Leaders who can understand the context of the core components will find that mastery of them is well within reach. Tackling workplace problems like meetings, prioritizing work, and assembling the right team are not new topics for leaders. However, the Entrepreneurial Operating System is different in the way it assembles the six disciplines "into a complete system of running an entrepreneurial organization." Each tool contributes to the overall effectiveness of the entire system. The integration and strengthening of the "Vision, People, Data, Issues, Process, and Traction Components us what makes the real magic occur."

If your business feels stagnant and you find yourself hitting a proverbial wall in growth, it could be because of a shortcoming in the way you are running your organization. In Traction, Gino Wickman shows you how to run and build your business in such a way that is fully aligned with your core values, your core focus, and for the greater good of the company itself through the deliberate and thoughtful implementation of the Entrepreneurial Operating System.

This process is hard and takes time, but shifting your organization from a state of chaos to one that is strong in the Six Key Components will result in measurable progress and free you from being inextricably tied to the daily life of your business.

How Firms Build Mutual Trust and Win Together

TRUSTED PARTNERS

THE SUMMARY IN BRIEF

It may seem anomalous to say that trust is the glue that holds businesses together, particularly in these days of mergers and acquisitions, of "free agent" talent available to those companies willing to pay top dollar, or of multinational firms either absorbing or being toppled by tiny, tech-savvy startups. Yet, in increasingly competitive environments, trusting relationships both within and between companies free partners to be creative and innovative, and to step up to the challenges that lay before them.

In *Trusted Partners*, Jordan D. Lewis provides solid advice on how to develop, improve or repair trust in every aspect of your business alliances. Lewis bolsters his points with case studies that demonstrate the successes that are possible when trust is built and sustained in every business relationship. Among the secrets he shares are the following:

- The eight conditions for trust to exist in every alliance.
- The conditions and practices that must be established early in every alliance, including the criteria and responsibilities for joint leadership.
- The strategies that must be enacted in order to combine each firm's objectives, and how to use those results as a guiding framework to develop the alliance.
- Ways to align both organizations around mutual objectives, thus helping to develop planning and policy-related strategies that support continuity if people in the process leave to pursue other interests.
- Keys to effective implementation of an alliance, as well as post-implementation governance.
- Ways to repair a broken trust, from diagnosing failure to getting the alliance back on course.
- Methods you can follow to sell alliances to customers, including educating them on the value of trust between both allied partners.
- Steps to develop a trusting alliance between entities involved in an acquisition or merger.

TRUSTED PARTNERS

by Jordan D. Lewis

— THE *COMPLETE* SUMMARY

How to Build Trust in Alliances

Many businesses form partnerships that, for one reason or another, wind up being dysfunctional at best, professionally fatal at worst. Take the example of Northwest Airlines and KLM Dutch Royal Airlines, which combined their networks linking Holland and the U.S. KLM wanted to build a global airline; with an eye on future financial flexibility, it tried to oust Northwest's co-chairmen, who were trying to position KLM to engage in a leveraged buyout for much more than the Dutch carrier wanted to spend. Neither side discussed their contrary objectives with one another, causing a schism that almost sunk an extremely profitable partnership.

What was lacking in this partnership was trust. The two companies shared resources, joint ownership and subsequent profits, but never acted as an alliance — a cooperation between groups that produces better results than can be gained from a mere legal transaction or contract agreement. Companies in an alliance cannot merely call each other partners, they must actually function as partners. The glue that holds alliances together is trust — a bond that must be initiated, sustained, and grown throughout the life of the alliance.

Depending on Each Other

Mutual trust is a shared belief that you and your alliance partner can depend on each other to achieve a common purpose. As the Northwest/KLM partnership suggests, trust exists only under specific circumstances, such as having shared objectives. While trust does not imply easy harmony, in a trusting business relationship, conflicts motivate you to probe for deeper understandings and search for constructive solutions. Each firm must be able to depend on the other to get results that exceed what a transaction could do. That notion leads to a set of eight conditions for trust:

1. Mutual need creates the opportunity. An early step in weighing a possible alliance is to determine whether it will serve an important objective in your firm. Then, determine the best way to achieve that objective, comparing the merits of internal development, alliances and acquisitions. Involve the units that the alliance will serve in the partner selection process; nothing discourages teamwork more than imposing an unwanted partner on your people.

The Eight Conditions of Trust

1. Mutual need creates the opportunity.
2. Interpersonal relationships make the connection.
3. Joint leaders deliver both firms.
4. Shared objectives guide performance.
5. Safeguards encourage sharing.
6. Commitment creates enthusiasm.
7. Adaptable organizations support alignment.
8. Continuity sustains understandings.

2. Interpersonal relationships make the connection. Alliances live through people — this is how all the parts come together, and how deep trust is strengthened, creating value and solving even the most difficult of problems.

3. Joint leaders deliver both firms. When top executives work closely together, those below them know it's safe to cross internal boundaries. In contrast, polarization at the top virtually assures conflicts below. The alliance between Hewlett Packard and Canon was strengthened by the solid, trusting relationship between HP's Doug Carnahan and Canon's Takashi Kitamura, who could not only cut through serious problems together, but who also genuinely liked each other.

4. Shared objectives guide performance. If your objectives are not mutually agreed upon and aligned, expect discord. It can be surprisingly difficult to develop common objectives between partnering companies (remember the Northwest/KLM example). The way to achieve effective mutual objectives is to develop them from those of each firm. If your mutual objectives are met, your individual ones will be as well.

5. Safeguards encourage sharing. Cooperation

(continued on page 3)

How to Build Trust in Alliances

(continued from page 2)

entails sharing information and making investments with a partner. How far you go depends on your conviction that sensitive data will be protected, and that an equitable sharing or distribution of the data, assets and resources you develop together will be effected should the alliance ever end. These agreements must be worked out before the alliance begins.

6. Commitment creates enthusiasm. An alliance excels when each of your firms invests its best effort — assigning its finest people, backing them with needed policies and resources, and adjusting organization to meet expanding needs.

7. Adaptable organizations support alignment. Organizations that collaborate well internally — between departments — often form excellent external partnerships. Companies that manage by objectives on the inside make better partners because they more easily link their internal objectives to their alliance objectives.

8. Continuity sustains understandings. To maintain superior performance, you and your partner must be confident that your successful collaboration will extend into the near and distant future. When those involved in an alliance move on to other opportunities, the attitudes and understandings those people brought to the alliance must be carried on. Continuity is an invaluable condition for mutual trust. ■

Pick Team Players

Alliances are among people, not just companies. For example, if you compare alliances to transactions, you'll note that negotiation of a transaction produces a detailed agreement — timing, quantity, delivery, payments, etc. Once the deal is in writing, it can be handed off to other parties, who can act on its provisions without having ever been involved in the deal to that point.

In crafting an alliance, on the other hand, the central goal is to develop a creative team between the involved firms in order to produce new value. You cannot document intangibles like shared understandings of each other's situation and how to manage change (both of which will be needed to forge a successful partnership). More to the point, support cannot be easily transferred to other, uninvolved parties.

Invest in Relationships

Start investing in relationships now. Interpersonal relationships are the conduits through which understandings flow in an alliance. You must reach a level of mutual comfort and understanding such that, if trouble surfaces, you can discuss it logically and candidly. An alliance may fall on hard times; personal relationships should not. You must select the right people and develop an intimate understanding of the individuals and politics in each firm. Personal relationships help you discuss these issues candidly, develop constructive understandings and reach practical conclusions.

When your discussions with people from another company first turn to business, begin by sharing your views. Cover key people and possible constraints, and identify issues that you must resolve before implementation, including deal breakers for either firm. Begin to divulge information slowly, gauge reactions, and monitor your own reactions as your counterparts begin opening up as well.

Ensure Joint Leadership

Joint leadership is key; only with joint leadership can you expect joint followership. From early negotiation through implementation, you will need consistent joint leadership at policy and operating levels. At the policy level, leaders must define a shared vision, building on separate and shared objectives and gaining alignment within firms as the alliance proceeds. At the operating level, leaders must develop mutual objectives, guide team building and produce results.

You must also invest in team development in an alliance, just as you would internally. In an alliance, however, team building requires more attention. With unfamiliar people and organizations, those involved must learn how to gauge their counterpart's judgments, adapt to one another's ways, and develop shared norms. Team members should thus be designated only as the alliance develops.

For example, when Proctor & Gamble formed an alliance with Wal-Mart, teams were comprised of people who could think out of the box and build relationships — people whose interpersonal skills were valued above their dry intellect. The same general rule guided management team building in the alliance between Ford and ABB Paint Finishing. Key roles in the alliance's management structure were reserved for people with good attitudes, communication skills and problem-solving prowess. Relationships overrode function, to great success. ■

Define a Single Purpose

Superior results emerge from blending your separate abilities in a way that best meets your mutual purpose. Indeed, the sole criterion for deciding what goes into an alliance should be whatever creates the most value for both firms, as defined by mutual objectives. These objectives must be used to plan every aspect of the alliance, from policies and resources to job assignments and organizational design. To not do so means risking

(continued on page 4)

Define a Single Purpose

(continued from page 3)

failure on a dramatic scale.

Developing Mutual Objectives

Setting mutual objectives in an alliance requires more breadth and clarity than is typical for doing so internally. Be aware, however, that a mutual objective may not be an obvious combination of your separate objectives; sometimes creativity helps. Use these ten steps to develop mutual objectives:

1. Begin by having each company define its own priority objectives for working with the other. Again, take nothing for granted — even objectives that are intrinsic to the culture of your firm must be listed.
2. Together, define your shared vision — a qualitative summary of both firms' priority objectives.
3. Derive mutual business and financial objectives that, when met, will achieve your shared vision.
4. Make sure that meeting your mutual objectives will satisfy each firm's separate objectives.
5. Rank mutual objectives in terms of priority and desired implementation sequence.
6. Derive subordinate mutual objectives for each function and activity to be involved in the alliance (for example, objectives from customer selection, value proposition, sourcing, cycle time, etc.).
7. Go into enough depth to ensure that your operating-level objectives have the clarity to guide day-to-day actions.
8. Define future objectives, such as those for development, that will need attention soon.
9. Identify each firm's objectives that must be met separately from your objectives, such as retaining customer leads.
10. Define organizational boundaries in each firm that separate shared objectives from conflicting internal objectives. ■

Global One's Fractured Alliance

The partners in Global One — the alliance of Sprint, Deutsche Telekom and France Telecom — failed to define their mutual objectives, and paid dearly. After agreeing to build an "international business," the firms never got around to discussing in depth the implications of that objective. Busy with other matters, management in each partner firm assigned much of the negotiation to attorneys, who, in turn, focused on tax, financial and legal issues.

The results were predictable. Once Global One was underway, Sprint thought the alliance's main purpose was to give them the worldwide network they needed. Deutsche Telekom believed that fending off domestic rivals should be the alliance's primary objective. France Telecom wanted priority given to projects that would boost their image alone.

The organization that emerged lacked practical guidelines for such basic objectives as investment priorities and network integration, making a seamless network impossible. Each individual unit has headed in its own direction, with little bearing on how its partners are affected; performance has thus been dismal, and a breakup is imminent.

Align Your Organizations

Once your mutual objectives are defined, you must forge an alignment of your organizations — to get the needed parts of each company to work in concert. Your objectives should be the focus of the joint business plan and will guide alignment within each firm.

As with any good business plan, an alliance plan begins with these objectives and describes important factors (markets, products, resources, etc.) in enough detail so that those who will contribute know what is expected of them. The plan should also spell out how both firms will actually cooperate. In deciding what each firm will do, bear in mind that all alliance activities must be connected, and that the more new links you must create, the harder the alliance will be to manage. Indeed, streamlining should be an objective for most alliances to ease management and cut costs and cycle times.

Once authority is delegated to each of those links, you must set internal boundaries, to avoid conflict with other activities in either firm. IBM and Apple found this out the hard way, in their joint software development venture, Kaleida. Inside Apple, one software group created roadblocks to Kaleida, because the new venture competed with the group's work. At the same time, both IBM and Apple barred Kaleida from acquiring the tools that outside programmers would need to design Kaleida-based products. Both companies were developing tools for the new venture themselves, but when Kaleida needed those software tools, the tools weren't ready. Without these, Kaleida's products could not meet even basic software standards.

After you clear out conflicts, you must align each partner's incentive systems with shared objectives. While effective teamwork with a partner does not require that you reward performance in the same way, you should motivate people to achieve the same objectives. At HP, for example, employees are formally assessed on results at both the business unit and product/project levels; each

(continued on page 5)

Align Your Organizations

(continued from page 4)

level must adequately reflect the contributions of individuals. Canon, conversely, has a more group-oriented culture and uses a combination of group and individual performance measures to encourage work toward shared objectives. The two different approaches toward incentives still align toward the same goal. ■

Orchestrate Many Units

When a company is comprised of closely related business units, allying them with another firm's similarly related units can produce far more value than connecting just one part from each; the trick is to get leaders at all levels from each business to pull together. To be included in an alliance, each of the participating units must satisfy the same eight trust conditions (as previously outlined), and several additional guidelines at the corporate level as well as at the local or individual level.

In order to achieve best performance at the corporate level, insist on the following requirements:

- Give leaders enough authority to make or obtain needed decisions in desired time frames.
- Constantly reinforce desired patterns of behavior for local levels.
- Change budgets and accounting systems as necessary.
- Include local participation in overall governance.
- Encourage and facilitate experience sharing across the alliance.
- Emphasize conflict resolution at the local level.

It is also imperative to stress requirements at the local or individual unit level, as follows:

- Seek a local role in partner choice.
- Ensure that the subordinate trust conditions (for example, local mutual need) are met at each link.
- Model local governance on overall alliance governance.
- Tie performance measures and incentives to local and overall success. ■

Take Nothing for Granted

An alliance is like a foreign body that has been grafted onto separate organizations; to keep it alive, you must guard against rejection from each one. To accomplish this, you must have a solid start and be able to avoid breakdowns that can strangle an alliance. In other words, you can take nothing for granted. Every aspect of the partners' respective buy-in for the alliance must be addressed and explored. Here's how:

Planning for Continuity

The final steps in aligning organizations is recognizing the pitfalls of discontinuity and working toward maintaining continuity in the pursuance of shared objectives. Discontinuity weakened and undermined one of the earliest computer outsourcing alliances, between IBM and Kodak, which lost one of its architects to a competing firm six months into the partnership, then gradually lost key leadership one level below her.

There are ways to avoid — or at least greatly reduce — the problem of continuity in an alliance, notably in three particular areas:

1. The careers of key individuals. To ensure continuity, keep people in positions longer than normal, create career ladders at key links to compensate for less job rotation, and develop transition plans for people who will take key alliance positions.

2. Training, incentives and rewards. Steps you can take in this area include having joint training in trust practices for newcomers from both firms, giving key people mentoring roles after they move on to other positions, and arranging for people who will be joining an alliance to attend meetings as observers.

3. Management tasks geared toward maintaining continuity. Specifically, you should reduce staff turnover by making employment more attractive; discuss candidates for key alliance positions with your partner to be sure of a good match; articulate shared norms at all alliance meetings and actively use them as a guide; and regularly and visibly remind everyone that even when people change, continuity is expected in partner relationships.

Define performance measures. Develop ways to monitor progress in your venture by making shared measurement the foundation of your joint management. One set of measures should compare alliance progress with what market transactions would do; another set compares results with your objectives and plans.

Get everyone on board. Take on the demanding task of ensuring that everyone understands their respective roles in the alliance, investing their efforts in the success of the endeavor.

Make your meetings special. Alliance meetings must be distinct from those within a firm. The goals of such meetings are to help keep the two firms stretching together by creating a need for mutual learning and addressing issues that present a higher risk of polarization. Encourage creativity, reinforce trust, and encourage participation from everyone involved.

(continued on page 6)

Take Nothing for Granted

(continued from page 5)

Anticipate tough issues. Because new issues surface all the time, make it a habit to review potentially divisive matters frequently, then settle them early or have contingency plans. Small issues can get bigger and harder to correct if they are not addressed early.

Don't try to win (even when you're right). Know when to back off a sensitive issue, even when you feel it might be easy to press your views on a partner. Engage in conflict resolution techniques and make constructive problem solving a habit. Always give your partner's thinking weight, particularly if the issue is important to that partner's company.

Communicate widely. While communication is important in every company, it is even more so in an alliance, due to the fact that you do not share the kind of fabric that connects companies on the inside. Provide updates to your alliance partner when meeting within your company to keep individuals across levels at both entities on the same page. ■

Repair Broken Trust

The KLM/Northwest alliance changed course only after both firms realized their backstabbing and maneuvering was eating away at their ability to compete with rival airlines. Mutual need had been overshadowed by competing objectives, and individuals who should have been joint leaders did not assume that role. Once those leaders moved on to other opportunities, the first roadblocks to trust left with them, allowing the companies to start the slow process of repairing the broken trust between them.

How Trust Gets Damaged

The most common reason for damaged trust is a lack of effort to build that trust in the first place. If initial expectations collapse as an alliance proceeds, there may be a misconception that the trust between entities was broken; in fact, it likely never existed at all.

Trust can also be damaged through inattention. When partners stop working at their relationship, issues that require better understanding are never settled. Rather than try to understand and reconcile differences, the partners chose to endure growing discomfort and simply get through the business of working together. These alliances almost never last, and when they do (if trust is somehow repaired), the resulting alliance may be different from the original plans of its participants. Renewed trust can expand partners' ambitions and shared horizons — factors that need to be addressed in order for the alliance to proceed.

Mending trust

Mending the weakened trust in an alliance must begin by attending to the basic trust conditions (out of the eight listed) that have failed. If mutual need, for example, is unclear, you must address it first; or, if those involved recognize mutual need but have grown apart, you must work on those relationships before you can reassemble the other building blocks of trust.

When you search for the roots of weakened trust, you must consider the practices that earn trust, as well as the underlying conditions that support the practices. Tasty Wares (a joint retail alliance owned by two food companies) went through fire before it got on a productive path, hiring and firing three general managers in an attempt to improve deteriorating performance before its board recognized they had never truly defined their objectives for the venture. Each executive they had brought in and let go had been given mixed messages, then jettisoned when he could not deliver. The company had failed to address underlying and overarching trust conditions. ■

Hostility at Tasty Wares

When hostility dominates an alliance, repairing trust can be even more difficult. The parent company of Tasty Wares, a pseudonym for a retail business owned by two food companies, were rivals — and often used the venture to defeat suggestions made by the other, even when doing so hurt all involved parties. It took the combined efforts of a new human resources vice president at one parent (who had not been involved in the hostilities) and an existing counterpart at the other parent (who had been fed up with the situation) to repair the trust and get Tasty Wares back on track. They did several important things to achieve the renewal:

- *They forged a personal trust between each other.* The renewal began on a ski trip the two HR executives took together.
- *They recruited senior management in the effort.* The duo interviewed managers at all levels to pinpoint where trust conditions had been violated. They then got the buy-in of their respective division presidents, as well as an ad-hoc team of senior managers.
- *They got away from it all.* The HR duo, their division presidents, and the executive management team convened a three-day meeting away from company offices to address the alliance's problems. It was during that meeting that the executives truly understood in detail why they needed each other. A dialogue began from there.
- *They got top-shelf commitment.* Under the joint leadership of the two presidents, Tasty Wares ended its losses and regained market share, adding over $50 million to the annual profits of each parent company.

How to Sell Alliances to Customers

The closest kind of relationship you, as a supplier, can have with a customer is through an alliance, but many customers are hesitant to engage in such intimate dealings with their suppliers. The reasons for this are many and varied. For most customers, purchasers are evaluated on how low a price they pay suppliers, rather than the value they receive. Likewise, most salespeople on the other side of the transaction are gauged by narrow criteria, such as short-term revenue gains. Neither side has much incentive to align themselves with the other — a consequence of short-sighted leadership and lack of trust.

By using the eight trust conditions as a guide to selecting customers and selling them alliances, you have a better chance of reaping the healthy revenues and margins that are the reward in such partnerships. You should also use market research to identify receptive market segments, and company-specific analysis to narrow your search to the best prospects.

Next Steps

Once you have a list of promising companies, meet with each to assess whether its organization can perform as needed and how an alliance with your company would add unique value. Also, gauge whether the firm is interested in your company as a supplier, and explain how what you propose will work.

The next step is to meet with the key change leader(s) at your target company, to start building rapport and mutual understanding. Make sure your meetings with the target company include a cross-functional contingent, not just members of its purchasing department. Solicit support from relevant buyers and include them in the decision-making process.

Address all concerns raised by the prospective customer and prepare to explain in detail how your proposal will work. Invite staffers to make on-site visits and set up future meetings, when necessary, to keep tabs on the process and to address new concerns as they arise.

Finally, the work of building an alliance does not stop with the sale. Because competitive markets keep improving what your customer can get from transactions, an alliance has to continue advancing to remain useful — this commitment to continuous improvement is inherent to any alliance. ■

Craftsman Covers It All

Within each target customer segment it identifies, the Chicago-based Craftsman Custom Metal Fabricators sets up half-day seminars for any prospect that expresses an interest in what the firm offers. The presentations, aimed largely at engineering staffs, act to convince prospects that it functions as its salespeople say. The company also invites prospects to its facility to observe its operations first-hand, to allow potential customers to be confident about the match, and to provide them with enough understanding about how Craftsman works (as Craftsman knows about the prospects' businesses).

The results are encouraging, to say the least. Fifty percent of its qualified prospects enter into an alliance with Craftsman.

How to Trust a Rival

A decade ago, who would have guessed that entities such as Visa and American Express, Coke and Schweppes, Kodak and Fuji Photo, and countless other bitter rivals would find reason to cooperate with one another at any level, much less form alliances? Today, however, the logic is sound; markets demand better performance from companies, many of which find they cannot excel on their own at everything they must do to meet those demands. Rivals who have so much in common make natural allies.

Start with a Mutual Need

In order to successfully partner with rivals, you must, as always, start with a priority mutual need. For example, General Electric and Pratt & Whitney, competitors in the aircraft engine market, recognized that neither company alone could meet the operating cost reduction demands imposed by Boeing for a new version of the 747 aircraft. GE and Pratt allied to meet the need, and continue to do so, even though their status as rivals causes some awkwardness and friction on occasion. Simply put, both companies recognize the alliance is the best way to develop engines.

Interpersonal relationships are essential, more vital to alliances between competitors than it is to those involving non-rivals because rivalry creates more opportunities for misperception and conflict.

Prepare for instability and termination. Have an exit strategy, or a "prenuptial" agreement worked out with your partner from the very beginning of the alliance. This type of agreement is imperative in an alliance of rivals, since one partner in an alliance may not be able to proceed in a market on its own.

What's In and What's Out

You must also separate alliance activities from conflicting, competitive ones in each firm. Indeed, extra attention must be given to boundary creation and man-

(continued on page 8)

Instability Sinks Autolatina, Ford

Ford and Volkswagen's joint South American venture, Autolatina, illustrates the need for negotiating deal termination up front. The rationale for the alliance was to help the automakers cope with an economic crisis there; once the Argentine and Brazilian economies regained strength, competitors entered the market, causing VW to choose to abandon the alliance. Although Ford decided to tough it out, it lacked the smaller cars that accounted for the most volume.

VW stayed as well, on their own, and captured significant market share. Ford, conversely, lost $645 million in its South American division in one year.

How to Trust a Rival

(continued from page 7)

agement, since there is greater chance of resistance to cooperation and more potential for using an alliance to undercut the other firm. The most productive and creative joint behavior is possible only when you can fully sort out cooperative and competitive outlets and operations on a day-to-day level.

Once again, the Canon/HP alliance provides a terrific example. In the laser printer business, both companies cooperate in product development, but compete in sales, marketing and pricing. Though many early product development tasks are performed jointly, each firm develops its own final product to support its own business strategy. The competitive operations for each company are structured so that they occupy a separate organizational space from the cooperative operations. ■

How to Build Trust in Mergers and Acquisitions

Since most mergers and acquisitions are made with a focus on deal making and not implementation, forging a trusting alliance between the merging companies can be difficult. For the best results, you must acquire or merge in a way that grows trust widely. Building trust starts with the same steps used to develop alliances on the outside, and proceeds through implementation to establish the conditions for trust on the inside.

Seek Understanding

For a start, both sides must understand one another. When lead executives and members of their teams take time to understand one another's issues, culture, people and politics, fewer mistakes or surprises occur later. Chrysler and Daimler-Benz became the world's third-largest auto company by blending two very different cultures — Chrysler's knack for cost cutting was merged in with Daimler's superior engineering prowess. Executives from both companies encouraged staffers to invest in relationships to minimize misunderstandings and gain a better grasp of what each brought to the table.

Set Priorities

Each company's priorities must be identified up front, before the merger or acquisition takes place. You also should map out how each firm works, going into enough detail to identify distinct processes and informal networks.

In the Daimler/Chrysler deal, each company had to identify and understand how the other was run. Although cost cutting was a top objective for both firms, there were several serious issues to address. For instance, Daimler was accustomed to a single, straight-lined organizational chart; Chrysler's organization was a Web of dotted lines and cross-reports. Chrysler's negotiation team explained it all in detail.

Develop Shared Objectives

Once you have identified your distinct issues and priorities, use them to develop shared objectives; these will become the basis for agreements on key integration issues. These top-level issues (such as senior management, planning and preparation, and team building) must be locked down quickly. Appropriate leadership at the top must be established. If both units will remain significantly intact, management should stay in place; in contrast, if a purchased firm is to be absorbed into the buyer, new management will take up positions. Leadership will depend on your objectives, cultures and the skills of the individuals in management positions.

> ***Shared objectives will become the basis for agreements on key integration issues.***

Implementation

Once the deal is done, implementation involves two sets of tasks.

First, you must create teams and post managers to effect a smooth transition, mapping out inter-unit processes and determining how to best align and combine activities and accountabilities, using your shared objectives as a guide.

Second, you must build trust into the combined organization, emphasizing relationships and shared processes and successes.

When correctly implemented, the trust and cooperation established will set you on your way to creating a profitable future together. ■

THE SUMMARY IN BRIEF

In today's fast-paced, always-on world, our ability to make good decisions is under threat. We're overwhelmed by data, distracted by digital noise, and bombarded with conflicting narratives—all of which distort how we hear, interpret, and act. It's not just a matter of poor judgment—it's a crisis of perception that affects everything from personal relationships to public policy. ***Tune In: How to Make Smarter Decisions in a Noisy World*** explores how context and cognition collide to shape our decision-making, and reveals how most people mishear and misjudge in subtle, predictable ways. The book introduces the PERIMETERS™ framework, outlining ten psychological traps—from Power and Ego to Emotion and Storytelling—that quietly influence our thinking and impact how we interpret the world around us.

Author Nuala Walsh doesn't just diagnose the problem. She provides clear, practical strategies to help individuals, leaders, and organizations "tune in" more intentionally. The result is sharper judgment, better decisions, and stronger communication—whether in boardrooms, communities or conversations at home. Tune In empowers you to filter the noise, hear what matters, and make smarter, more ethical choices. It's a timely call to listen better—and lead wiser.

IN THIS EXECUTIVE BOOK SUMMARY:

- Discover how fast living and digital noise derail decisions.
- Learn why mishearing leads to predictable human error.
- Explore how the PERIMETERS™ traps distort judgment.
- Reflect and reinterpret what you hear with SONIC strategies.

Misjudgment in a Noisy World

Decision-making doesn't exist in a vacuum. Our ability to tune in to the most relevant voice is dictated by our context. Despite the advances of the 21st century, our fast-paced, data-driven and highly visual world affects how we think, what we hear and ultimately, what we decide.

While modern technology provides more platforms than ever to express our voice, the volume of conflicting, competing and contradictory voices dominates the airwaves. Despite increasing societal pressure to hear the voices of customers, employees, stakeholders, voters and marginalised groups, that ability to tune in has been severely contaminated.

Countless channels broadcast messages 24/7. Notifications and newsfeeds bombard the mind, making it impossible to pause long enough to decode them and decide what serves us best. Instead, we judge events in a spinning ecosystem of digital noise, data overload and misinformation. The result?

Most people hear less than ever before – and in turn, feel less heard. Moreover, if you don't hear others, you've less chance of your message being heard.

To control our decision context, we must understand how it's influenced by a tapestry of factors from culture to climate, character and the company we keep. I argue context combines with cognition to mold our interpretation, the essential step before judgment that dictates decision quality.

Mishearing, Misinformation and Misjudgment

Amid so much noise, we can't hear ourselves think. Specifically, four factors subtly but substantively shape judgment, steering us to think in more binary and short-term ways:

1. A fast-paced, frantic lifestyle accelerates short-termism: We live in a world of instant meals, instant money, instant pain-relief and instant weight loss. Today's fast-paced ecosystem amplifies the probability of making fast-paced decisions. The problem occurs when problem-solvers jump to conclusions rather than reflect.

2. Data overload distracts and overwhelms the mind: An unintended result of the modern information tsunami is an overloaded, distracted and inattentive mind. We tune out. We're drowning in data, pumped and dumped on us all day long. Our brains can't cope. Our ability to distill what matters shrinks rather than expands.

3. Visual stimuli increase what we see and reduce what we hear: Thousands of images on smartphones, television, TikTok and Instagram overstimulate our brains. While this serves and satisfies us, the problem is we assume that what we see is much more reliable than what we hear.

4. Polarised systems and structures embed binary perspectives: We reduce choices to 'either/or' conditions. Is a policy good or bad, right or wrong, positive or negative? While one-dimensional classifications make sense, if our world is punctuated with oversimplified categories, segments or choices, it prohibits lateral thinking.

These factors diminish the time, attention and patience available to reinterpret the most important information and conversations. As a result, we mishear what's said or, alternatively, infer what's not said. We misinterpret what we think was said rather than reinterpret what was actually said. This accelerates a rush to misjudgment and predictable human error.

Judgment Killers: Blind Spots, Dead Spots, and Dumb Spots

Any scandal you read about or decision dilemma you face can be traced to a suite of biases which either accelerate or decelerate a rush to misjudgment. You've likely heard of bias blind spots but perhaps are less familiar with deaf spots or even dumb spots. Blind spots overemphasise what we see, literally and figuratively. The biggest error is not pausing to decode information. Deaf spots amplify the tendency to mishear, tune out or not hear. Dumb spots occur when we self-silence as others can't hear our voice. Each of these psychological phenomena cause us to misjudge what we see, hear and say.

You Can't Trust All You Hear

Our judgment is a composite of internal and external factors. When uncertain, under pressure or intense scrutiny, several unconscious factors activate the tendency to think narrowly and limit what is really heard, namely Power, Ego, Risk, Identity, Memory, Ethics, Time, Emotion, Relationships and Stories - the PERIMETERS traps.

> . . . in high-stakes cases, reappraisal and reinterpretation are essential steps that come after listening and before judgment.

Several traps play out in most everyday situations. When these limit your perspective and derail your best judgment, that's the PERIMETERS Effect.

Of course, we want to believe the overpromising politician, backslapping colleague, worshipping priest or silver-tongued salesperson. But in high-stakes cases, reappraisal and reinterpretation are essential steps that come after listening and before judgment. As the great Russian composer Igor Stravinsky once declared, "To listen is an effort, and just to hear is no merit. A duck also hears." Interpretation matters.

The Perimeters: Judgment Traps

Investor Warren Buffet tells how he met a Polish woman who escaped a Nazi concentration camp. She still struggled to trust people, having seen too much and lost too much. She said something unforgettable: "When I look at people, the questions I ask is 'would they hide me?'"

That's a bounded perimeter view. We all have filters for viewing the world, assessing situations and reading people. It's neither right nor wrong. How you judge people is simply a product of what you've seen, what you've heard and how you've lived. Each of these bias-triggered PERIMETERS traps binds our thinking, so we tune out, risking misinterpretation of a situation, strategy or stranger.

Power-based Traps: Charging Ahead

Power is context specific. In some situations, you're the powerholder, but in others, you're not. Power might belong to the assistant upgrading your hotel room, the banker approving your mortgage or the traffic warden clamping your car.

Hunting and holding power derails our judgment. For instance, obsessively hunting power can reduce your power base rather than enhance it. That said, strategic use of power is a tremendous asset.

Throughout history, leaders like Nelson Mandela, Abraham Lincoln and Martin Luther King Jr. have been applauded for using their voice to advance democracy and human rights. Every day leaders of corporations, clubs and communities use their influence for good. Some do it at scale. Presidents construct libraries, sporting legends build academies, and foundations distribute wealth. That's using power for good. Whatever power you hold, it should be used for good. Whatever power you want, hear what voices matter.

A major driver of using power for good is of course ego and the desire to self-congratulate. Just as ego can be a force for good, ego is one of the most toxic and least acknowledged decision derailers.

Ego-based Traps: Nothing Compares to Me

Egotism operates on a spectrum. In small doses, idle boasting and displays of vanity are harmless. We all do it to feel good. In larger doses, the hunt for recognition and reward can be career kryptonite. As power rises, so does ego. The more successful you are, the less likely you are to doubt yourself or hear shortcomings. Our overconfidence makes us poor at spotting or accepting incompetence. How can we make good decisions if we don't realise, let alone accept, our own failings?

Regardless of industry or life stage, you can stem bullish tendencies and shrink ego by collecting disconfirming data, alternating views and recalibrating expectations. Humility is the hallmark of good judgment, making us more willing to ask questions and question answers, assertions and beliefs.

Humility is not a foreign science or dark art. It can supercharge innovation, artistic differentiation and social good, especially when combined with power.

On the other hand, when ego dominates decisions, rational calculations of risk evaporate. Individuals and organisations are so convinced by the sound of their own logic that overestimation of reward and underestimation of regret results.

Risk-Based Traps: Decision Roulette

Formula One drivers, fire crews, suicide bombers, skydivers, hunger strikers and mountain climbers all have

one thing in common. They risk their lives for ideologies, causes or dreams.

Few decisions are risk-free. Most people want maximum reward for minimum risk. Decision-makers make the best risk-reward choices they can with the best intentions, information, time and capacity available.

For some, risk-taking is an essential part of their DNA and personality. People pride themselves on the title of risk-taker, worn like a badge of honour. Like power, ego and risk, even unmanaged identity can contribute to misjudgment.

Identity-based Traps: Photoshopped Lives

Preconceived identity can be a trap no matter how successful you are or what profession you hold. We have pre-formed impressions of actors, moms, teachers, junkies and traders. We don't expect the king to curse, presidents to 'grab crotches' or leaders to embezzle funds.

We like people to stay consistent with their words, appearance and positions. If people, processes and systems are consistent, it makes the world more stable and controllable. It provides elusive certainty and comfort in a type of mental sorting. The desire for consistency simplifies reality but omits complicating shades of grey. Employees, customers, voters and viewers value the predictability of products and promises. Yet this desire to satiate what others want is a mental trap that stifles creativity and evolution. It holds you back.

The best asset you have is yourself so be yourself. Knowing who you are and what you stand for enables freedom of expression. It allows you to speak up and have a voice, ingrained in your DNA and your memory. Sometimes, unconscious memory interferes with your judgment, which is the next set of decision derailers.

Memory-Based Traps: Recall Roulette

When individuals forget processes, misinterpret conversations or recall fictitious events, misjudgment cascades. Lives are lost, money squandered and relationships cratered. Yet memory is the least acknowledged PERIMETERS trap.

What we hear is what we remember. If we mishear, we're more likely to misremember. We think that what we remember is accurate, but several factors impact our judgment, such as overload, distraction and stress.

It's understandable as we're overloaded with so much information we can't process it into memory. When we misremember, forget, repress and distort data, decision risk accelerates, contributing to human error. Memory-based misjudgment is best considered alongside the temporal traps, amplified by nostalgia and hindsight. The most easily identifiable decision derailer is recall bias.

Underpinned by neurological processes, memory is based on distorted recollections that form in our neural networks. Memory operates like a highlights and lowlights movie reel with missing scenes. We unconsciously edit the movie and replay certain narratives - a snarky comment, rude remark or insensitive statement. Sometimes it's our wittiest moments too! Yet what we experience isn't always what we remember.

The Decision Ninja leverages memory as an asset, recording important occasions and statements. Remembering your fiduciary responsibility and moral obligations boosts ethical decisions rather than derails them - discussed next.

Ethics-based traps: Conscience Chaos

The voice of arrogance and ambition often supersedes the voice of conscience and compassion. For instance, many well-meaning leaders decide with a business lens rather than a moral lens and downplay conflicts of interest. In the moment, doing the right thing gets tuned out. Some compensate for wrongdoing by performing kindnesses, then justifying wrongdoing as revisionist historians.

There are numerous examples from pharmaceuticals, banking, manufacturing, law and sports to illustrate how easily misconduct fuses with power, emotion and ego to constrain the right voices.

The ethics-based PERIMETERS traps dominate a noisy world where it's hard to hear the voice of conscience amid the daily din of data, disinformation and distraction. Nowadays, individual, corporate and national perpetrators are increasingly behind held to account and brought to justice. But progress is slow, selective and the world isn't always fair. The worst offenders can escape justice.

Scores of inspirational voices take the right path and reinterpret motivations with a moral filter. Institutions play a role by dialing up rewards and punishments to stem the routinisation of deviance. Every effort makes a difference.

Human vulnerability to power, ego, risk, identity, memory and even ethical traps depends on a temporal mindset.

Human vulnerability to power, ego, risk, identity, memory and even ethical traps depends on a temporal mindset. Are you thinking through the consequences? Are you wedded to past decisions and the voice of nostalgia? While seemingly irrelevant, these decision dealers impact the Time-based PERIMETERS traps.

Time-based traps: Here Today, What Tomorrow?

Time isn't something we think about as a decision influence. It's too abstract. Yet we unconsciously tune in and evaluate situations with a past, present or future orientation. Time-related factors such as impatience, nostalgia and procrastination curb reasoning, derailing the choices we make.

Temporal biases distort what we hear. In a hurry, we use the gist of conversations rather than the detail to reach conclusions. Most people prefer to live in the permanent present with a short-term mindset, despite proven long-term benefits. Some fear change and stick with what's familiar rather than experiment or reinvent strategies. Others recast choices after the fact, thinking "It worked before, it'll work again." The majority of us are awful at predicting how we'll feel in the future and are inconsistent over time.

Most of us unconsciously decide with a past, present or future lens. No approach is risk-free. Too much living in the future leads to daydreaming and nothing gets done. Living in the past risks getting stuck in a rut, not letting go and sacrificing perspective. Living in the present stops us learning from history. Temporal derailers will always challenge you to some extent but even helicopter awareness can alleviate decision damage. It's a huge advantage for the Decision Ninja, especially when emotions ride high- perhaps the greatest set of PERIMETERS traps of all.

Emotion-based Traps: Rollercoaster Reasoning

Sometimes, adrenaline-filled emotions like anger or envy destroy objectivity. When we don't like what we hear, we panic or deny information to avoid doleful regret. Fortunately, emotional intelligence and self-regulation enables distancing for greater hearing and reasoned decisions.

No situation or decision is devoid of emotion, it's a complex web. The phrase "emotion decides and reason justifies" is so cliché it's ignored, like the drone of airline safety instructions. But it has merit. In its vice-like grip, we're more likely to flip out or freeze, mishear and tune out reason than we realise.

The successful Decision Ninja learns to regulate emotions and manage leakage in daily conversations. To gain perspective and reduce intensity, some employ self-distancing techniques. At its core is situational reappraisal, the ability to identify and label the vagabond bias-inducing emotion.

Interpreting communication means deciphering implicit messages. It requires your willingness to pause long enough to gain a better understanding of what's really meant or what people are trying to say. Awareness of the power of pausing and the PERIMETERS traps is a significant step forward and a source of relative influence and peace of mind. Ask yourself who else might suffer if you don't pause and reflect? This is particularly the case when it comes to the effect of collective others in our decisions - the Relationship-based traps.

Relationship-based Traps: Crowd Contagion

Who do we hear in a crowd? When do we tune in? When should we tune out? The collective voice can deafen decision-makers when it matters most.

Derailment starts with the need for belonging. We obsess about what others think, comparing ourselves to strangers and affiliates. We act as 'they' do. We overweight difference and our relative ranking. Ironically, if unsure, we elevate crowd opinion. Assuming the crowd is correct, we imitate its behaviour as it's easier to go along with the group. The problem is we can lose our voice in the crowd and contradict private views to fit in. Notwithstanding the crowd's power to inspire order, stimulate reform, boost social cohe-

sion and sometimes promote justice, we tune out the voice of objectivity when it matters - even if we know better.

No PERIMETERS trap is all bad news. The crowd often remains a prevailing force for good. At a societal level, activism can change laws, reform countries and bring attention to neglected voices. Your relationship with the crowd changes perspective. Knowing which crowd to tune in to is easier than you may think. That said, one factor will determine whether you tune in or out of the crowd: the lure of the narrative it tells.

Story-based Traps: Great Explanations

Story-based decision traps increase vulnerability to misjudgment when we pay too much attention to social, political and organisational narratives. These traps amplify deaf spot risks and encompass elements of ego, power, time, ethics and crowd relationships.

Story-based decision biases have one thing in common: they feed mishearing, misinformation and misjudgment. Instead of seeking truth, we're swept up in Spielberg momentum and become inattentionally deaf. It's the fodder of fake news. No one is immune from mass delusional beliefs including government leaders, academics and policyholders.

It's human nature to weigh stories over scientific data. It's why fake news and conspiracy theories spread. It's why smart people believe in mystical seances, fairies, Santa and the paranormal. Conversely, it's why positive narratives boost well-being, resolve conflict and inspire innovation.

Storytelling is a gift. The Tinder raconteur gets the date, the defendant goes home, the politician gets elected and the candidate gets the job - only if they tell a better story than everyone else. Throughout history, stories have transformed behavior and attitudes, pointing to past victories, present suffering and future triumph.

You have a personal and professional narrative even if it's hard to articulate. If you don't control your narrative, your narrative will control your judgment as well as your reputation. Like the 12th juror, when you make any decision, you have the power to change other people's lives. It's a huge responsibility that should be used wisely and with the utmost respect. Hearing what matters helps hone a next-generation skill. That's the focus of Part Three.

Tuning In: Just-in Time Judgment

The PERIMETERS traps and associated biases have just revealed how much we can't trust what we hear. What you hear isn't all there is, and what you say isn't necessarily what people hear.

In a noisy, full-on, tuned-out world, well-intended decision-makers typically rely on first impressions and don't slow down long enough to probe contradictions, coincidences or inconsistencies. We haven't time. The result is a Molotov cocktail of misinformation that fuels predictable human error, collateral damage and avoidable regret.

If you don't slow down, you can't selectively filter the voices you hear. If you don't reinterpret filtered voices, you can't get judgment right. If you can't get judgment right, you can't get decisions right. Better judgment saves time, money, relationships and reputation. It only takes a reasonable commitment to temper the adrenalin rush and selectively tune in to voices that matter in a given situation and discard the rest.

The benefits of tuning are apparent at the individual, organisational and societal level. Tuned-in individuals will be more persuasive, differentiated and even popular, while organisations become more trusted, sustainable and productive. A tuned-in society can hope for more tolerance, equity and harmony. Predictable damage can be avoided with greater preparedness. While the human condition is bias-prone, that's different to being bias-destined. When you see, hear and speak the truth, you multiply your performance impact and connection with others.

In this final part, I provide a roadmap for the tuned-in Decision Ninja to counteract the biases delineated in the PERIMETERS traps. It's a fast track to being a happiness superspreader and a wiser 12th juror. For leaders, influences and powerholders, it's both a fiduciary and a moral obligation.

Hearing What Matters: Sonic Strategies

Listening interpretatively, intentionally and selectively is a choice. If you decide you want to be a successful Decision Ninja, you first adopt the right frame of mind, treating judgment as a controllable factor before consciously assessing any unconscious decision risk and selecting a counter strategy.

Decision-makers can reflect, reinterpret and reappraise more with the strategies encapsulated in the mnemonic SONIC.

- Slow down long enough to recalibrate and reinterpret what we hear - or don't.
- Organise your attention. Does your big decision have some, all or none of your attention? Unconsciously, you might magnify the dilemma disproportionately, which thwarts rational judgment, or deny reality in the ostrich effect.
- Navigate novel perspectives. We care too much about being heard and not enough about hearing others.
- Interrupt mindsets. Every smartphone buzz or blink interrupts your headspace and creative flow when you're writing, speaking or strategising. The University of California Irvine estimates that it takes 23 minutes to revert to a pre-interrupted state!
- Calibrate situations, strangers and strategies. Recalibration of what you hear can be achieved with the PERIMETERS bias checklist. This is available on the website www.nualagwalsh.com.

There's no silver bullet or perfect judgment, but decisions can always be made better. Even mild effort will pay off and boost sonic intelligence. The trick is to start small. Even a 1% differential would save time, effort and money. All anyone can do as we try to make a difference, not just for ourselves but for those in our care, is our best.

In Tune: The Decision Ninja

As a Decision Ninja, in your personal and professional context, you have the power to write your own story and construct the best possible ending. It's free and sometimes, takes only seconds.

By hearing others, those who hold power and influence have the opportunity to heal a divided world, calm conflict and alleviate senseless violence. Those who tune in consciously and strategically will literally make the world a better place.

I hope the perimeters of your worldview are broadened a little more with this book. I hope you tune in to what matters and hear things that others don't. Above all, I hope that others hear your voice and you achieve what matters most to you. Thank you for tuning in.

Award-winning author **Nuala Walsh** is CEO of MindEquity Consulting, non-executive director and former FTSE 50 Chief Marketing Officer with 30+ years in global investment management. Zooming In On Your Next Read

Unreasonable Hospitality

The Remarkable Power of Giving People More Than They Expect

By Will Guidara

Will Guidara is the founder of Thank You, a hospitality company that develops world-class destinations and helps leaders across industries transform their approach to customer service. He is a former co-owner of Eleven Madison Park and the NoMad, and is the cofounder of the Welcome Conference, an annual hospitality symposium. He has coauthored four cookbooks, was named one of Crain's New York Business's 40 Under 40, and is a recipient of WSJ Magazine's Innovator Award. He lives in the Hudson Valley with his wife, Christina, and their daughter, Frankie.

Lessons In Hospitality for Every Business

Unreasonable Hospitality: The Remarkable Power of Giving People More Than They Expect is Will Guidara's book about the importance of hospitality in the restaurant industry, but he hopes that his message will resonate with readers from across all industries, both those serving the public and those serving other businesses. Through his years in the restaurant industry, Guidara has found great meaning in going to extreme measures to make people feel welcomed and appreciated, both his guests and his employees. Viewed through this lens, he views being able to serve people as an honor, a noble endeavor. *Unreasonable Hospitality* walks Guidara's readers through his many years in the hospitality industry, leaving the reader with wisdom he gleaned along the way. His book sets out to demonstrate to others how this unreasonable hospitality can completely change a business for the better.

Guidara opens his book with an event that he and his partner, Daniel Humm, considered a failure. Their restaurant had been named one of the world's 50 best restaurants, but when they arrived at the ceremony, they learned that they came in 50th place. Despite the honor that being named to the list was, the two had been hoping for a better placement their first time on the list and left the ceremony feeling disappointed. What Guidara learned from this experience was that even though their restaurant, Eleven Madison Park, was truly an excellent establishment, it had yet to do anything revolutionary. Guidara realized that most of the restaurants higher on the list excelled at innovation. What he wanted to excel at, however, was how his restaurant takes care of people. To him, hospitality means going far beyond just doing a competent and efficient job. It is about making people feel spectacular and forging a true connection, and this is what he set about doing. For Guidara, this type of service is selfish because it makes him feel wonderful being able to serve people in this way. Because of this, when unreasonable hospitality is employed, the employee, the business, and the customer all thrive.

Hospitality

Guidara grew up in the world of hospitality. His parents met while they were both in the hospitality industry, and Guidara graduated from the School of Hotel Administration at Cornell. His mother became a quadriplegic due to brain cancer, and he

remarks in his book about a meal he had shortly after his mother died when the chef invited him and his dad into a special private dining room overlooking the kitchen. Despite the night being the saddest of Guidara's life, he still had one of the best evenings of his life thanks to the hospitality of that chef. This event showed him "how important, how noble, working in service can be."

Guidara goes on to explain how important it is to exhibit hospitality to a person's employees. He explains the philosophy of restaurateur Danny Meyer who believes in Enlightened Hospitality or the act of prioritizing employees over all else. Meyer believes that if a business takes care of its employees then those employees will take care of everybody else. Guidara goes on to explain how important intentionality always was to his father, a man he exhibits great respect for. By intentionality, Guidara "means every decision, from the most obviously significant to the seemingly mundane matters."

Upon graduation from Cornell, one of Meyers partners, Richard Coraine, offered Guidara a job, and Guidara's father urged him to take the position explaining that it is easier to learn to do things the right way the first time around than to break harmful habits. He could learn these enlightened ways from Coraine's business. Guidara talks about lessons he learned when he first entered the business. One of these lessons is to embrace optimism and to try to infect a room with your own energy rather than let the energy in a room influence you. He remembers a time when the general manager, Randy Garutti, gave him the keys to have him close up one night. This helped instill in Guidara a sense of ownership over the establishment and allowed Guidara to know that he was trusted. He tries to give his own employees these same two graces. He also discusses the importance of a shared language between employees engaged in an enterprise.

Restaurant Versus Corporate Smarts

In his next chapter, Guidara compares restaurant smarts to corporate smarts. At his job at the time, Guidara was being educated in restaurant smarts. This type of smarts prizes creativity and autonomy and places hospitality at the center. It can sometimes be in opposition to corporate smarts which frequently prizes control and can sometimes stifle creativity while prioritizing business acumen. While learning about corporate smarts at this new job with Restaurant Associates, Guidara learned how important profit and loss statements are, and he excitedly anticipated the day he could get his hands on them. Both restaurant smarts and corporate smarts are important in running a successful restaurant, and Guidara maintains that "creativity was going to be the main ingredient in striking a true balance between restaurant-smart and corporate-smart." To walk this line, Guidara works by the 95/5 principle in which 95% of a business is financially managed very closely, and 5% is managed extravagantly. This 5% is important to Guidara because he believes that it is here where the greatest impact is made.

Building a Team

Guidara began to get frustrated by the pull between the cooking staff and the dining room staff that frequently occurs at restaurants and in which the dining room staff are less respected than those who work in the back. Guidara realized that while the food is very important, so is the service aspect of a restaurant. Guidara was offered a position at Eleven Madison Park as the general manager, but he was hesitant to take the position because he did not believe he wanted to work in more fine dining establishments in no small part because the chef was often so far exalted among other employees. He met with the chef, Daniel Humm, and they decided to have "open communication between the kitchen and the dining room staff." They decided that both the front end and the back end would run the restaurant. They believed they could create an organization that could do both what is best for the food and for the service.

What Guidara and Humm set out to achieve was a cool restaurant, one that married excellence with fun. Guidara quickly learned that there were tensions at EMP between the employees who had been there for years and the newer employees. The older employees were used to a more relaxed environment than the newer ones who mainly came from fine dining establishments. Guidara realized that he needed to get the more established employees on board with his new plan, and this required communication and consistency. Guidara relied on his principle of taking care of his people to do this. He started out his tenure by listening to all members of his team. Then he worked on locating the strengths of all of those team members. He worked on giving both ample praise and correction, but the latter was given with little emotion and in private. He believes both types of feedback need to be constantly given. He also instituted thirty minute meetings every day. He believes that these meetings are crucial in creating cohesive teams. They are one of his ways of treating his employees with hospitality.

Guidara believes in the importance of good training and rules as long as they are sensical and help an organization move forward. To him, tradition is no reason to continue doing something a certain way if it is no longer working for the people or their organization. Genuine relationships are a key aspect to the service profession, and sometimes these relationships require breaking down barriers..

When hiring people, Guidara started to recognize that servers who came from the world of fine dining often had hard habits to break. What he was looking for was people who demonstrated true hospitality who find a reward in making a person's day better. Hiring is important, he maintains, because in the process of hiring a person, the manager is hiring someone who will represent and support both the manager and the entire team. Because of this, Guidara is a proponent of hiring slowly. He started a practice of hiring multiple people at a time and treating them as a class that can grow together and help one another. He maintains that while it is unenjoyable to be short handed, it is better to be short handed for a bit and then hire an exceptional person than to hire someone who will not be good for the organization in the long term. Guidara looks to make caring cool in his organization. He wants employees who get excited about being really invested in their work and in the company. This passion, vulnerability, and enthusiasm is key to Guidara.

> [People] can give up trying to achieve perfection, or they can get as close to it as they possibly can."

Guidara believes it is important to give all people a sense of ownership over their place of employment. To facilitate this, his restaurant starts every new employee out working at least temporarily as a food runner. This allows employees the opportunity to see the business from a different perspective. Guidara and his colleagues instituted ownership programs whereby employees are given specific challenges the restaurant faces and are tasked with figuring out a way to make the systems work better. While these programs initially take a lot of work to oversee, Guidara believes the time is worth it. Through this program, people are able to solve problems, save money, and become more invested in their workplace. Guidara is a firm believer in giving people more responsibility "before they're ready" because most people will live up to the challenge. He also gives his employees the opportunity to teach classes to the rest of the staff about issues that are important to them and that they are knowledgeable about. Guidara believes in the importance of investing in his teams. People cannot perform well if they are not filled up themselves. Therefore, at times he has had to realize that he has to scale back on his plans if he wants to maintain the morale of his employees.

Perfection

Guidara goes on to discuss excellence and perfection. He understands that perfection is unattainable, but he believes there are two roads people can take with that knowledge. They can give up trying to achieve perfection, or they can get as close to it as they possibly can. He chooses the latter. In his team, they "chased excellence in every element of what we did." This is important because "that precision in the smallest of details translated to precision in the bigger ones." In other words, excellence in the small things matters. Guidara believes that excellence becomes evident when employees are promoted within to ever higher roles, and he also makes it a priority to promote from within rather than from outside the organization.

A Culture of Respect

Guidara allows that when everyone is invested in excellence, disagreements are bound to arise. He also maintains, however, that people have to care for one another while they also care about the business's mission. His company's rule is to never go to bed angry. While he admits that this advice does not always work in marriages, he believes it is important that employees do not leave work still angry with each other, and he thinks a key part of this is listening to the other person. When two people cannot come to an agreement, he believes it is often important for the wishes of the person who cares more about the issue to win out.

Guidara believes that both affirmation and criticism are important for those in positions of leadership. Many people enjoy giving out affirmation, and he insists that when people are praised for the work of their team that they direct that praise to the appropriate team member. Criticism, maintains Guidara, is an investment in another's work. It helps an employee become better. Guidara also believes in the importance of a leader apologizing and showing vulnerability to team members in order to gain trust.

Towards the end of his book, Guidara goes back to his principle from the beginning: unreasonable hospitality. He works hard to make every aspect of his guests' experience excellent. One example of this is eliminating the podium at the door and scouring the internet for pictures of guests before they arrive, so his employees can greet the guests by name, without a podium and an ipad between them. He relays numerous instances in which he and his staff went far beyond guest expectations in both large and small ways that made the dining experience truly memorable for those dining at his restaurant. He hires people whose specific job is to create unique experiences for guests, calling these experiences Legends. Performing these Legends frequently benefits the employee as much as the guest because employees delight in the feeling of joy they are able to impart. Guidara cautions his reader against worshiping practicality. Often he says a person should not focus first on practicality and instead should focus on how to make dreams a reality.

Eventually Guidara and Humm worked their way through the ranks of the best 50 restaurants, finally achieving their coveted number one spot. Throughout his book, Guidara attempts to share his secrets to success with his readers in order to allow them to apply the same principles of his success to their own endeavors. In what reads like a narrative, Guidara's readers are given a blueprint laying out the most important ingredients for the culture Guidara and his company attempted and succeeded at fostering. In this way, Guidara's book is relevant to anybody trying to create a respectful, human-focused culture centered around the principle of excellence.

Breaking the Supply Chain to Unlock Hidden Profits

VALUE NETS

THE SUMMARY IN BRIEF

If your company is like most, substantial profits are locked away where you would least expect to find them — in those activities commonly called the supply chain. Whether your company is a young dot-com company or a seasoned incumbent, enormous new value can be found and unlocked in the operating end of the business — how you handle orders, source components, build products and get them to customers.

The key, according to authors David Bovet and Joseph Martha of Mercer Management Consulting, is for your company to adopt an entirely new business design, the **value net**.

Value net design combines strategic thinking and recent advances in supply chain management, resulting in a flexible system that is driven by customer choice, not the company. This customer-driven system — with a mindset focused on *value creation*, not *supply* — replaces the traditional supply chain business design that fails to deliver the exceptional convenience, speed, reliability and customization that today's customers demand.

In this summary, you will learn how to use the business design methodology first introduced in *The Profit Zone* (written by a Mercer Management Consulting team of authors led by Adrian Slywotzky) to develop your company's value net business design.

Specifically, you will learn how to:

- choose among the different types of *value propositions* — service, convenience or customization — that you must offer customers;
- define the *scope* of the business design — which activities need to be performed, and by whom, to deliver the value proposition;
- capture *profit;*
- gain *strategic control* to keep those profits coming in; and
- *execute* the transformation from supply chain company to value net company.

But before you begin dealing with these five elements of the new business design, you will first learn in more detail how the value net improves on the old supply chain model — and why your company needs this new value net design today.

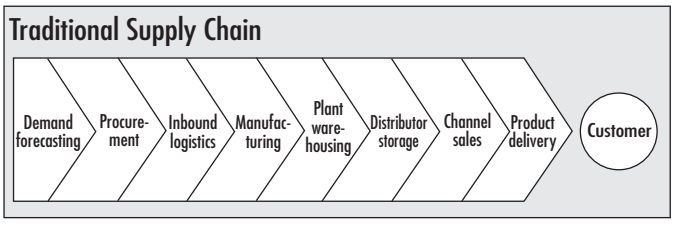
VALUE NETS

by David Bovet and Joseph Martha

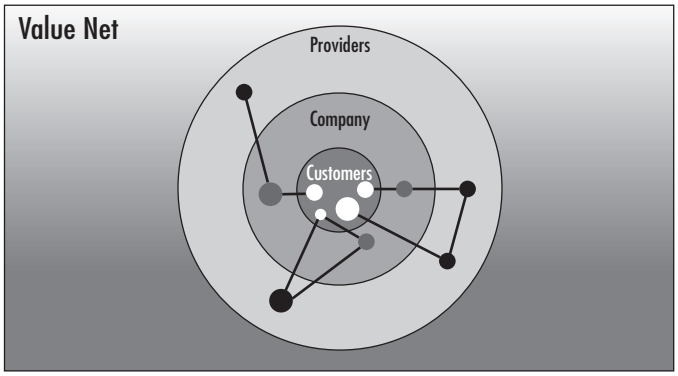
— THE *COMPLETE* SUMMARY

The Power of Value Nets

A new business model is emerging. If you've ordered a computer over the Internet, you have already been in contact with this model. It links increasingly stringent customer requirements to flexible and cost-effective manufacturing. It uses digital information to move products rapidly, bypassing costly distribution layers. It adapts to constant change. This new model, which is replacing the traditional supply chain business design, is the **value net.**



Value Net Defined



A value net is a fast, flexible system aligned and driven by customer choice. It is a dynamic, high performance network of customer and supplier partnerships and information flows. A value net begins with customers, and builds to satisfy actual demand. It is nothing like the old supply chain theory, which relied on manufacturing products and pushing them through distribution channels in the hope that someone would buy them. In fact, a value net is not about supply; it is about creating value for customers, the company and its suppliers. The value net replaces the sequential links of the supply chain (see figure below) with a network of two-way customer/supplier relationships.

Customers Choose

A value net views every customer as unique. It allows customers to choose the product or service they value most. Manufacturing, delivery and associated services are differentiated to meet the needs of each customer segment, profitably.

Companies like Dell Computer, Gateway, furniture maker Miller SQA, and delivery innovator Streamline.com are in the vanguard of creating value nets. These companies allow customers to configure their own orders, then build and deliver them to their doorsteps in a matter of days. No hassles. No mistakes. No excuses. And they are killing competitors who cannot do the same. If you want to survive and thrive in the new economy, you must learn to respond to customer demand the way these companies have. When you adopt the value net as your business model, you will.

A value net looks nothing like the old supply chains, which relied heavily on demand forecasting followed by manufacturing and delivering products or services to a customer who might or might not want the product. Instead, a value net places the customers at the center of the entire process, as shown in the figure above.

The choices of these customers are captured in real time and transmitted digitally to other value net participants. In the next concentric circle, surrounding the customer, is the company. It controls the customer contact points by accessing customer information, nurturing the relationship, and managing satisfaction through digitally integrated service and support.

At the outer circle of the value net are the providers who perform some or all of the sourcing, assembly and delivery activities.

Five Characteristics of Value Nets

There are five characteristics distinct to a value net business that give it an edge over a traditional business design that relies on supply chain thinking. Value nets are:

(continued on page 3)

The authors: David Bovet and Joseph Martha are vice presidents with Mercer Management Consulting's Supply Chain Strategy Team. Bovet is a well-known speaker on the subject of supply and value nets. Martha leads the Supply Chain Strategy Team, building Mercer's supply chain practice into a market leader.

The Power of Value Nets

(continued from page 2)

Customer-aligned. Customer choices trigger sourcing, building and delivery. Customers command the value net.

Collaborative and systemic. Each activity is assigned to the partner best able to perform it, with many operational activities delegated to specialists.

Agile and scalable. Value nets are responsive to changes in demand, new product launches and rapid growth. Working capital shrinks and process time is collapsed.

Fast-flow. Order to delivery cycles are fast and compressed. Delivery is fast and convenient, at the customer's plant, office or home. Inventories are low.

Digital. E-commerce is a key enabler, and new digital information pathways link and coordinate the activities of the company, its customers and its providers.

Herman Miller's Value Net

You need look no further than office furniture maker Herman Miller for an example of value net design. A new unit, Miller SQA, makes office furniture with a twist. Its products and the entire furniture-buying experience are designed to be "simple, quick and affordable." Take, for example, the ordering experience. With the use of a digital interface, customers can configure a purchase to order. Once an order is placed, the information suppliers will need to build the furniture is instantly transmitted for just in time delivery. So fast and efficient is the operation that order to delivery time is measured in **days** not **months**. Orders are being shipped 99.6 percent on time and complete. It's no wonder sales are growing at 25 percent a year.

Time for a Value Net Design?

Take this test to see if your company or one of its units needs to migrate from supply chain to a value net design. Look for the following indicators and ask yourself the tough questions they raise:

✓ **Your business isn't meeting customer demand for speed, reliability and convenience.** A good product isn't good enough anymore. Today's customers want rapid fulfillment, on-time delivery and convenience in doing business with you, and won't settle for less.

✓ **Your customers are defecting.** Your most profitable customers don't necessarily fit the "average" mold. Don't let the customers who want customized offerings shift their spending to the competition.

✓ **You worry about being "Amazoned."** You need to meet the Internet challenge and view e-commerce as an opportunity, not a threat.

Supply Chain vs. Value Net

Supply chains and value nets differ in five key ways.

Old Supply Chain	New Value Net
One size fits all	Customer-aligned
Arms length and sequential	Collaborative and systemic
Rigid and inflexible	Agile and scalable
Slow and static	Fast-flow
Analog	Digital

✓ **Profits are migrating elsewhere.** If your revenues per customer are stagnating, you need to change your business design to compete with all players, including the incumbents and the dot–coms.

✓ **You equate "customer-centric" with a good marketing department.** Nothing could be further from the truth today. Superb service doesn't happen when it's designed after the product and service mix decisions have been made.

✓ **Your managers view suppliers as enemies.** Think partnership rather than playing one off against the other. Collaborative initiatives define value nets.

✓ **Senior executives view the supply chain as an operational issue**. It must be much more if your business is going to be reshaped into a value net. ■

Value Nets and Business Design

There are profound changes occurring in the marketplace. The change drivers include:

Demanding customers. Consumers and business customers today want it all. They want speed, service and customization, all at a low price. Overnight and even instant delivery is becoming the norm for a growing spectrum of goods and services. Books, clothing and computers arrive at a consumer's doorstep in a few days. Today, with leisure time scarce, customers want and will pay for time-saving convenience, delivery, support and maintenance, and ultimate disposal of a wide range of products.

Digitization of the economy. The digitization of the economy is revolutionizing the way companies do business. The Internet is the most visible manifestation of

(continued on page 4)

Value Nets and Business Design

(continued from page 3)

digitization, and the catalyst for thousands of new businesses. But many of these new businesses have been better at designing fancy web pages than fulfilling their potential as value nets. The key to success is speedy e-fulfillment rather than a slick order page. Meanwhile, whole industries are being transformed by the power of the Internet. Postage stamps and music can now be delivered digitally.

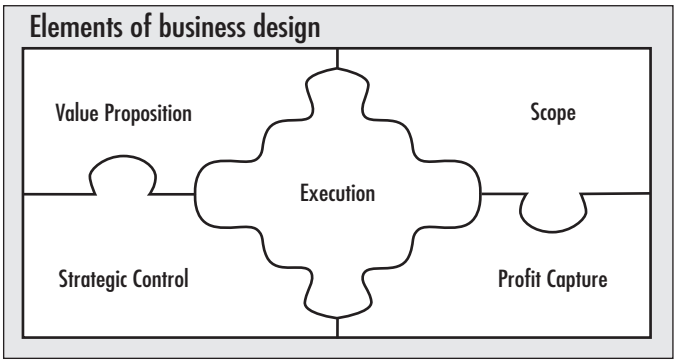
Digital technology is impacting every aspect of business. Software can connect customer orders directly to shop floor activities, algorithms optimize production automatically, wireless global positioning systems guide deliveries, and remote sensors control machine maintenance.

High competition. Competitive pressures are emerging from unexpected quarters. Obscure entrepreneurs can launch new ventures that suddenly threaten established businesses. Venture capitalists are major players.

Globalization. Finally, globalization is providing new markets and new supply sources as never before. Low-cost, low-skilled labor is located in one nation, state-of-the-art contract assembly plants in another, and a pool of technically specialized workers can be tapped in yet another country.

Value Migration

The four change drivers just described cause value migration. Value migration is the flow of profits and value away from outmoded business designs toward others that are better designed to maximize utility for customers and profits for companies. A perfect example is the computer industry, which has shifted from traditional manufacturing and distribution to a build-to-order model. Dell Computer and Gateway together benefitted from this shift to the tune of $134 billion in added market value from 1990 to 1999. During the same time, more traditional computer manufacturers Digital Equipment and Compaq created only $22 billion in market value. Migration patterns like these are signals that business redesign is needed.



Business Redesign

There are three essential factors that determine market value. These are the growth rate of profits, capital efficiency and the ability to sustain profitable growth.

Taking into consideration these three factors, Mercer Management Consulting developed a business design model based on five key elements:

✓ **Value proposition —** what the company will offer to potentially profitable customers.

✓ **Scope** — which activities need to be performed and by whom.

✓ **Profit capture** — how the company aims to earn a compelling return on shareholder capital.

✓ **Strategic control** — the ability to protect the profit stream over time through sustainable advantages.

✓ **Execution** — the human capabilities and digital technology that hold all the elements together.

The first and third elements represent the company's ability to grow profitably. The second element represents the efficiency with which the capital is employed. The last two elements determine a company's ability to sustain profitable growth over time. These five elements are the keys that will help you create a value net company. ■

Value Proposition: Crafting the Offer

The first piece of the business puzzle is understanding customer needs and serving them with unique products and services that respond to each segment's most relevant priorities. It is no simple matter. The value proposition is the utility-creating product or service that a company offers to customers. In many cases, product and service are tightly bound together. Purchase decisions are determined by the service and information attributes that enhance tangible products; a pleasing store ambiance, next day delivery, expert assistance and after sale service. These are the *service wrap*.

Three Powerful Value Propositions

The innovators who have capitalized on the demographic and social trends that are emerging offer three powerful value propositions. These are:

✓ **Super service** — including speedy and reliable delivery;

✓ **Convenient solutions** — delivering complete and targeted services addressing a broad set of customer needs; and

✓ **Customization** — providing customized products and services, bundled together in unique ways.

To take advantage of these value propositions, you must target them at the right customers: those who

(continued on page 5)

Value Proposition: Crafting the Offer

(continued from page 4)

place a high value on the offer and are profitable to serve. The key is to stay focused on the needs of specific profitable customer segments, develop a proposition they value highly, and design a value net capable of profitably delivering on the proposition.

Super Service in Action

Super service is a quantum leap. Super service delights the customer and differentiates the provider. It may be product availability, quality service or easy returns, or it may be rapid, reliable product delivery. There are two key aspects of super service: speed and reliability.

Consider what happened when the nation's fifth largest auto insurer, Progressive, changed its delivery design to make settlements happen fast. Until the 1990s Progressive took days or weeks to settle a claim. The company had banker's hours. Every Monday started with taking loss reports. The rest of the week was spent catching up, as claims agents were dispatched into the field. Then the CEO redesigned the organization to respond immediately when the customer called. Before long, the company had an on-the-spot system for settling claims. An Immediate Response® fleet of 1500 Ford Explorers equipped with cell phones, laptops and wireless modems made it possible for claims adjusters to access the company's databases immediately and settle claims on the spot.

Shrinking Leisure Time = Demand for Service and Convenience

Shrinking leisure time and larger household incomes have boosted the demand for all types of services, from house cleaning to personal chefs. They have also spurred demand for time-saving conveniences like home shopping and delivery. Busy people don't like spending their scarce leisure time doing routine errands or milling around malls. At the same time, the public appetite for fast and reliable service has mushroomed. E-mail and fax provides fast communication, as do cell phones, pagers, ATMs, one-hour photos, 10-minute loan approvals, downloadable software and drive-through liquor stores. You now have a culture in which people expect that anything can and should be available anytime, anywhere.

Reliability at Cemex

Cemex has almost made reliability its trademark. The company is the world's third largest cement producer, and sells cement, ready-mix concrete, aggregates and clinker primarily to the construction industry. It has operations in 10 countries and sells in 60.

Reliability is an important virtue in the ready-mix business since delivery delays can wreak havoc with construction schedules. Yet reliability is difficult to achieve since many customers, unable to control their own schedules, frequently cancel or reschedule orders. For years, delivery was chaotic. Then the CEO began to rethink the entire operation with an eye toward reliability.

Using state-of-the-art communications and information systems, Cemex now boasts "Quality cement available anywhere, anytime." The delivery of cement product is now tracked from plant to customer via wire, satellite and the Internet. The company now boasts a 98 percent on-time performance using a 20-minute delivery window.

The end result for Progressive has been increased customer retention, increased referrals, reduced fraudulent activity, reduced car rental costs and rising insurance premium revenues. While the rest of the auto insurance industry grew at an annual rate of about five percent, Progressive has grown at a rate of 25 percent.

Reliability is the other component of super service. Reliability means predictable, on-time delivery of "perfect orders," as expected by the customer. A perfect order is one that is shipped on time and complete and received at the customer's desired location within a precise time window, in excellent condition, and ready-to-use. It includes the flexibility to respond to last minute changes requested by the customer.

Convenient Solutions

Convenient solutions is another powerful value proposition. Customers today are looking for solutions. To offer this, you must do two things well: pinpoint the convenience needs of the customer, and deliver the solution without a slip. Value nets pinpoint needs by capturing critical customer information at "touch-points" during the ordering and selection process, while tracking order status, and during delivery and maintenance.

Streamline.com for example is one of the new breed of companies providing convenient Internet-enabled home delivery of goods and services. Streamline was created as a service enterprise, offering scheduled delivery of

(continued on page 6)

Value Proposition: Crafting the Offer

(continued from page 5)

groceries, personal care products and dry cleaning. Streamline's aim is to simplify the lives of busy families by eliminating the need for trips to the supermarket, the dry cleaners, the florist, and so on.

Streamline Delivers

Streamline's targeted customer segment is the busy suburban family with children, high income and homes close to its distribution facility. The set of products and services include food and non-food items that ordinarily would require trips to many stores. Customers place orders via the Internet directly into the company's order entry system. These are then routed to the warehouse management system. The warehouse is supplied by dry grocer vendors, a local bakery, a top of the line meat supplier, a UPS package service, Blockbuster Video, and dozens of others.

Each customer is on a fixed weekly schedule, and selects items for the week at least one day before delivery. There is a "Don't Run Out" list, along with a selection that the customer can change. Delivery is to the customer's special refrigerated "Box" in an accessible part of the house such as a garage. Customers pay $30 monthly for the service, plus the price of goods purchased. The company has identified a consumer problem and provided a convenient way to solve it. Streamline has created a value net. ■

Scope: Deciding Where and How to Play

Every business must define the critical activities it will perform in creating value for customers, maintaining strategic control of the customer interface, and capturing the profits it needs to prosper. These activities represent the scope of the business designs. Scope decisions determine what activities must be performed to deliver on the company's value proposition and who will perform them — the company or outside partners. Three categories of scope must be incorporated in the value net design: customer choice, production and delivery.

Choiceboards

The choiceboard is a new phenomenon made possible by the Internet. Companies now can enjoy real-time two-way interaction with customers. When you configure a personal computer at Dell or Gateway, you are using a choiceboard. Choiceboards have four key elements. First, choiceboards involve a fast two-way conversation between the company and its customers.

A Virtual Company

SOHO Inc. is a virtual company with an expansive mission, a narrowly-defined scope and brilliantly-executed value net operations. The California startup makes ergonomic computer desks and sold $8 million dollars worth of them in 1999. Initial capitalization was a mere $100,000. SOHO used 14 suppliers and six retail partners from around the U.S. Those partners do everything except marketing, order entry and customer service. The company now operates on $400,000 working capital and fixed costs per year and does no advertising. Instead, SOHO relies on offering retail partners promotional discounts in return for premium shelf or catalog space.

Second, a choiceboard captures real demand by linking their desires to its operational design. A choiceboard allows companies to determine real choice instead of guessing it from customers' purchases. Companies can observe buyer reactions and gain accurate insights into exact customer preference. Third, a choiceboard allows choice management by the company as it makes available limited choices. For example, Gateway is using choiceboards to manage demand by steering customers to components that are in better stock positions, resulting in lower inventory and superior profits. Finally, a choice board allows product definition as each customer configures a product or service to his requirements.

Value-Enhancing Delivery

A value net does not see delivery as an afterthought. Instead, delivery is an important opportunity to enhance the value of the offer, delight the customer and make money. But delivery is more than getting the product from the company to the customer. It includes physical delivery, installation and training, ongoing support, product returns and end-of-life retrieval.

Outsourcing

Value net companies face a major question, "Which activities should we outsource to others?" They place a high value on delivering performance through whomever has the ability to execute with superior efficiency and added value. You should control customer touch-points like ordering, customer service and delivery, and outsource other functions as needed.

Outsourcing provides flexibility and scalability, all ideal characteristics for a young start-up company. If you are an entrepreneur with a vision for a new product or service, you can take that concept to market faster and with less cash by outsourcing production, distribution and

(continued on page 7)

Scope: Deciding Where and How to Play

(continued from page 6)

other functions, creating an almost virtual company.

Every company needs to understand that the best place to play in the interconnected world of customers and suppliers is not constant. Outsourcing is about collaborative business cultures and support for the spread of technology. Outsourcing is no longer a trade-off between lower cost or better service. Both are possible. ■

Profit Capture: Casting the Net

A company can grow if it has a powerful and appealing value proposition. But growth only benefits a company when it can capture profit from the value it creates for its customers. A value net uses elements of its operating design to generate and capture superior profits.

Profitable revenue generation is driven by the ability to provide super service and convenient solutions. On the cost and asset side, value net designs drive profits through magnitude reductions in inventory, extremely efficient operations processes and the ability to grow rapidly with limited cash for working capital or fixed asset investments.

Profits from Super Service

Companies that provide superior service are often able to charge a premium for that "customer wrap." Companies can also increase profits by increasing profitable volume rather than raising margins.

Consider an example from the fashion industry. Rapid and reliable delivery plays a critical role since customer tastes can change in the blink of an eye. Fashion retailers know what's hot today may be on the clearance rack tomorrow.

Rapid and reliable delivery plays a critical role [in the fashion industry] since customer tastes can change in the blink of an eye.

The key in the fashion industry is to make products available when and where they are hottest. The Limited has designed a supply chain delivering $10 billion worth of goods through the company's ten main brands. Getting the trendy new products into stores quickly is a must. To maximize profits, the company has developed an operating design that prioritizes time, service and cost of delivery in that order.

How do they do it? They meet every Monday night for an "information scrub." By 10 p.m. the conference room walls are lined with data on what's selling where. Product redeployment plans are developed, and products are shifted. The Limited can get the right products to the right stores and change the floor layout of every store within 72 hours.

Iomega Slashes Inventory Stockpiles

Iomega, a $1.7 billion manufacturer of data storage systems, demonstrates the benefits to be gained when companies create direct information links in the supply chain. The company creates several i2 Technology software packages. These packages, including the Demand Planner, the Factory Planner and the Supply Chain Planner, enable an efficient information flow through the company's value net. With the software deployed, the company has slashed inventory by 50 percent.

Money in Solutions

There is money to be made by value net companies that provide a more complete solution for customer needs. Nowhere is this more true than in the business-to-business world. GE Medical is an example of a company that realized the value of providing a complete solution to a customer problem. Broken medical equipment costs the medical profession plenty in lost time. So GE began servicing not just its own equipment, but other makers' equipment also. By 1998, services represented almost half of GE Medical's revenues.

Cost and Assets

By adopting a value net system to replace an older system, companies can dramatically cut costs and optimize asset usage. Companies do this by melting inventory stockpiles, achieving operations effectiveness through digitization, and growing without cash.

An important factor in shrinking inventory levels is reduced product complexity. Remember that about 90 percent of customer demand is satisfied with about 10 percent of a product line. Don't complicate matters with too many choices. Concentrate instead on mass customization rather than a large inventory of every possible combination. One powerful technique is to use standard components to reduce inventory. You must also manage supply reliability by building supplier relationships rather than stockpiling components for a rainy day.

Digital technology forms the backbone of a value net. By digitizing the manufacturing of custom doors, for example, Weyerhauser has turned "a dead dog" plant into a profitable center. Gone are hand-written notes stapled to doors as they move through the production line. Door design instructions are now delivered via computer. ■

Strategic Control: Staying in the Game

After companies begin making money through profit capture, they must turn to strategic control to protect those profits over time. Value net companies achieve strategic control through mechanisms like a **brand** that provides differentiation in the eyes of the customer, through a **hook** that holds customers, through a solid provider **relationship** with supply partners, through **innovative design** that puts your service ahead of others', and through a **low price** that competitors find hard to match. The more your value net focuses on brand and hooks, the less likely competition will move in and deprive you of long term profitability. The more it focuses on design innovation or low price, the more likely you will face significant competition in the future.

Value net companies hook customers with superior service and convenience. Consider Ritz Carlton Hotels. The chain keeps a database that lets a returning customer skip the usual check-in questions, no matter in which hotel the original information was gathered. ■

Value Net Brands

Product brand can account for as much as 100 percent of sustained profitability. Consider examples like Coke, Tide, Advil and Sony. Over time, brand holders can spend less on customer acquisition, experience fewer defections, and charge a premium for the name. Brands are more than names for products, however. Value net companies like Gateway don't have a distinct product. Instead, the brand is comprised primarily of the value associated with customization and rapid delivery.

Designing for Execution: Realizing the Net

Execution is the fifth element of value net business design. It translates business design into fast, reliable and flexible value-creating activities. Execution links all other design decisions. Nothing else you have done to create a value net will work unless you can execute. Mess up execution and you are out.

You will have to create a breakthrough culture with leadership vision, an entrepreneurial team, simple and clear goals, and new skills. Visionary leadership requires commitment from the top; it does not percolate from the bottom. Once the visionary leadership is in place, the next big challenge is to get people on board who can carry through that vision. A team-oriented culture is essential. Everyone must be on board, including the rank and file.

Value net companies must also take full advantage of digital technology to communicate with customers and suppliers. ■

Lessons from the Innovators

The companies who are successful value net operations can offer valuable lessons for any company that wants to reinvent itself as a value net company.

Customer Focus

First, clarify the offer. Successful value nets don't try to be all things to all people. Instead, these companies identify and target market segments and offer value propositions with powerful appeal to those segments. Value nets then deliver to that segment.

Second, use a choiceboard as your customer interface. A choiceboard's ability to accurately gather customer preferences and feed them digitally to supply partners lays the groundwork essential for customer knowledge and rapid turnaround.

Third, compress the order-to-delivery cycle so that customers get the speed they want. And finally, provide convenient delivery no matter what your product or service is.

Operating Effectiveness

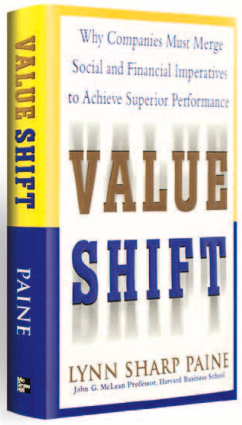
Customer focus must be complemented with effective systems for production and distribution. Operational "innards" must be digitized to make good on the promise made to customers. Learn to build to order. Design your net to be fast, to provide customization, and to respond to actual orders, not guesses about what customers want.

Next, select strategic supply partners, including outsourcing partners, who can offer flexibility and scalability.

Digitizing the Value Net

Design the information flow first. Decide which partners need and should have access to information, taking into account that suppliers may also work for competitors. Then automate communications across the value net, especially communications from customers. Use software to harness bits to power decision-making. Automate processes where you can.

Management Techniques



Adopt simple and clear goals to drive successful performance. To make the transition from supply chain to value net company, don't create a formal organizational structure. Instead, use a small, strong, entrepreneurial team that sees the company vision, identifies the goal, and works across functions to build the value net. ■

Why Companies Must Merge Social and Financial Imperatives to Achieve Superior Performance

VALUE SHIFT

THE SUMMARY IN BRIEF

There is an emerging new standard of corporate performance that encompasses both moral and financial dimensions. This book describes the turn to values in the past decades, interprets what is motivating this phenomenon and why it is significant, and explores the implications of this movement for management practice as well as organizational strategy and corporate leadership.

Whereas in the past, companies were measured purely on their financial performance, they are now held to a different standard. How they demonstrate moral intelligence in their dealings with employees, customers and other constituencies is becoming as important as increasing shareholder value. Companies are no longer just convenient devices for pooling capital. In this summary you will learn about the development of the moral personality of the corporation and how it is changing the face of business.

What You'll Learn In This Summary

✓ **Does ethics pay?** You will discover why corporate ethics do provide financial benefits, but that alone is not a good justification for ethics.

✓ **The new corporate personality.** You will see how companies have evolved from amoral entities to moral actors in society.

✓ **The new definition of outstanding corporate performance.** You will learn that outstanding corporate performance is no longer just a measure of financial performance, but also a measure of investor, employee, customer and community wants.

✓ **How much accountability?** You will find out how managers must change their perspective to succeed in the face of the new performance standards.

✓ **Achieve the new performance standards.** You will learn how to use the manager's compass to navigate through complex situations and satisfy both ethical and economic standards.

✓ **The center-driven company.** You will see examples of companies innovating to become "center-driven" companies that marry NPV (net present value) and MPV (moral point of view).

VALUE SHIFT

by Lynn Sharp Paine

— THE *COMPLETE* SUMMARY

The Turn to Values

Until recently "business ethics" was considered a contradiction in terms. The market and corporations were amoral, and ethics generally meant corporate philanthropy. In light of recent corporate scandals, ethics has now become an important corporate concern. More than a frill or indulgence, values are becoming an integral part of effective management.

When asked about their interest in values, executive rationales cluster into the following main areas:

- **Risk management.** Values can manage and eliminate risks associated with corporate and individual misconduct.
- **Organizational functioning.** Values build a well-functioning company that encourages cooperation, inspires commitment, nurtures innovation and energizes the organization's members around a positive self-image.
- **Market positioning.** Values shape a company's identity and reputation, build its brands, and earn the trust of customers, suppliers and other partners.
- **Civic positioning.** Values establish a company's standing and reputation in the community as a progressive force for social betterment, or as a solid citizen that obeys laws and pays taxes.
- **A better way.** Values are worthwhile and fundamental principles of responsibility, humanity and citizenship, and need no corporate justification. ■

Does Ethics Pay?

When AES Corporation went public in 1991 its prospectus stated that in a conflict between values and profits, the company would try to adhere to its values, even if that diminished profits. Because of this position — at that time, extraordinary — the SEC insisted that the values be listed in the prospectus under "risk factors."

Attitudes are changing, and executives are beginning to see that ethics stances can actually have a dollars and cents value.

The Cost of Scandal

Certainly, managing a company without ethical standards can lead to illegal acts and scandals. Allegations trigger customer defections, leading to depressed revenues. Employees doubt the company's future, and injured parties file lawsuits. Investors demand higher returns, credit ratings are downgraded, funding costs rise, and the financial pressure is felt throughout the organization. Politicians and lawmakers call for more investigations and hearings, which exacerbate the deterioration.

Rewarding Principles

Avoiding high-profile scandal, however, is not a compelling case for values. What about the low-grade misdoings, such as betrayals of confidence, neglected promises, and evasion of responsibility?

Principles that rule out these behaviors lead to many cost advantages. Workers who are truthful, reliable and conscientious reduce the cost of expensive oversight and monitoring. A high level of trust can lower contracting costs for agreements with prospective customers and suppliers.

Trustworthy companies usually have an easier time dealing with non-corrupt politicians and regulatory agencies. They are more likely to be believed when making an argument. Self-imposed commitments can also reduce compliance costs by reducing the need for restrictive laws and regulations.

Commitments to truth, reliability, fairness and respect enhance management and efficiency. Without them unnecessary time and money go toward evaluating proposals, resolving disputes and mobilizing teams, because nothing can be taken at face value.

Reputation is key. A good reputation attracts customers, employees and investors, which leads to increased revenue, market share, access to talent, and premium prices for the company's goods or for the company itself.

Though the links between values and economic value can be difficult to track, because they are often indirect or remote in time, they are numerous. ■

Reality Check

Despite all the positive arguments for ethics, it is unrealistic to ignore the tensions that inevitably arise between profits and values. Moral indifference has rewards too.

Very often it is advantageous for companies to break the law or be dishonest. Using child labor, exploiting the morally lax desires of consumers, and offering bribes in an industry where all competitors do so are situations where the relationship between ethics and economics falls apart.

When economic concerns trump ethical choices, "ethics pays" proponents often point out the long-term perspective. Decisions made ethically can show immediate economic losses, but long-term gains. Decisions based on poor values, such as cutting corners or altering books, can show short-term gains, but later discovery of the deception can obviate the gains overnight.

However, how long is the long term? Is it right to do what is good for the long term if it makes staying competitive in the short term impossible?

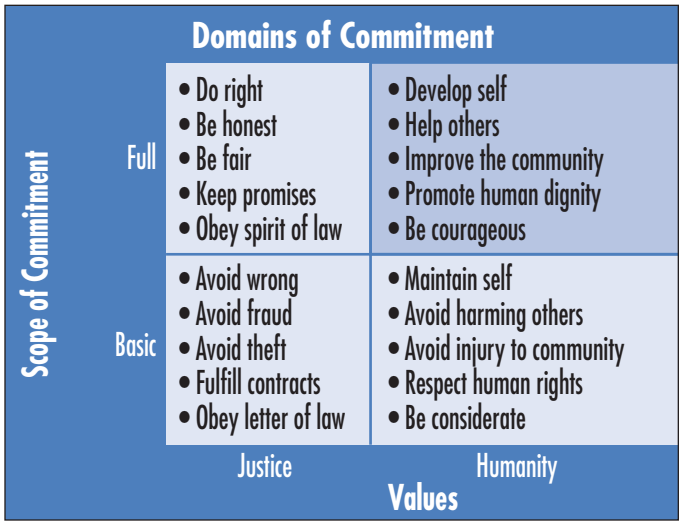
The relationship between ethics and economics is dependent on the values in question.

Values, Reward and Penalties

The chart above right shows the difference between the basic standards of values dealing with justice and humanity and full commitment to these values.

The financial case for values is generally accepted in the lower-left quadrant and is usually backed up by law. Companies that do not respect these values can easily lose customers, incur fines, and lose their reputations. In the lower-right and upper-left quadrants, financial gains depend more on the extent of the rewards from adherence to those values — or the penalties from breaching them.

In the upper-right quadrant, the financial benefits become tenuous. These diffuse values are not easily measurable and do not help anyone in particular, therefore neglecting them illicits few complaints or specific negative consequences. In addition, these values have no limit, and chasing them endlessly would lead to bankruptcy. The gains in this quadrant are more in terms of employee commitment and reputation gains, which indirectly lead to financial gains.



The Ladder of Commitment

This view of commitment to values leads to a "ladder of commitment."

First level: Based on adherence to a minimum set of standards. Cost and risk driven.

Second level: More far-reaching commitments including consideration and positive mutuality. Based on a combination of penalties, rewards and risk management.

Third level: Striving toward leadership and self-improvement, even contributing to community problems you did not create. Driven mainly by rewards.

Context is key to the idea that "ethics pays." Economic gains described in this matrix assume economic and political freedom, free-flowing information, an educated population, and a functioning legal system. The absence of these conditions make injustice and fraud quite profitable, and the economic benefic of values disappears. ■

The Corporation's Evolving Personality

The recent value shift in international companies needs more explanation than financial benefits. It also comes from subtle developments in the "personality" of the corporation that affect how companies are perceived, what is expected of them, and how they are evaluated.

From Fictional Entities to Moral Personalities

For centuries, companies were fictional, soulless entities that were not expected to act as moral agents.

In the mid-19th century, corporations became umbrellas for shareholders, and as corporate capital and influence grew in the early 20th century, academics began to view them as real entities. As the role of the shareholders diminished and the corporation developed a legal personality — it could sue, be sued, and was responsible for its own debts — it became harder to think of the corporation as a fiction.

By mid-century the corporation became an institution rather than a private business device. This implied the corporation had responsibilities beyond its shareholders — a moral personality.

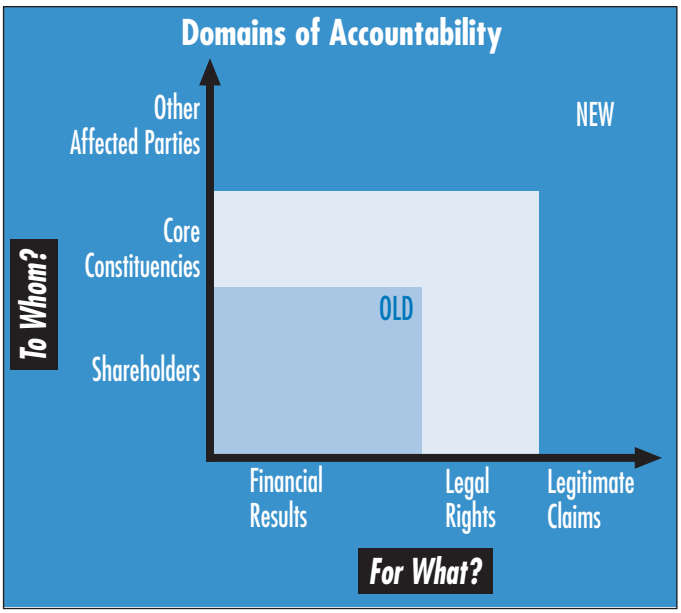
Society's Dominant Institution

Managers deal with moral decisions every day, and

(continued on page 4)

The Corporation's Evolving Personality

(continued from page 3)



corporations are routinely dealt with, discussed, and judged as moral agents. When people protest a company's environmental policies, boycott an unethical company, or employees feel gratitude to a corporation for treating them fairly, they assume that companies are objects of moral assessment and concern. Even the business media covers stories of moral controversies, misconduct and safety concerns with as much zeal as it reports profits, economics and corporate mergers. Some economists still feel it is absurd to ask corporations and their managers to behave in a morally defensible manner, but practice has outpaced theory.

Every day people work for corporations, invest in them, buy from them, provide services for them, and regulate them. Corporations provide most of our food, transportation, utilities and entertainment. They guide our behavior through marketing, employee policies and campaign donations. Of 1997's $18 trillion in U.S. business revenue, 88% when to corporations. In 1998 approximately half of Americans owned stock. Corporations are society's dominant institution, and if we granted them exemption from morality, we would exempt morality from 80-90% of our lives.

In the last 30 years, discussing company values, commitments, and responsibilities — attributes of moral actors — has become commonplace, and recent legal findings and decisions have encouraged and even required more moral behavior. The growing acceptance of this turn to corporate morality is the key to understanding the recent turn to values. ■

A Higher Standard

Companies are being evaluated as if they were responsible human beings. A new yardstick is emerging for assessing corporate performance that holds them to both moral and financial standards. A high-performance company that competes unfairly, mistreats employees, or neglects its civic role is becoming an oxymoron. This is reflected in the growing number of "most admired" and "most respected" company surveys.

Whether people are deciding where to work, buy, or invest or what companies they want in their communities, they are including moral considerations with financial ones.

Employee Perspectives: Employees want to be respected, treated fairly, and recognized for their contributions. They appreciate honesty in colleagues and managers, consideration for their health and safety, and opportunities for learning as well as making a positive difference in the world.

Customer Perspectives: Customers want to deal with companies that are reliable and treat them fairly. They want products that provide quality and performance, but they are also interested in the health, safety and environmental risks of what they buy.

Community Perspectives: Communities want companies to clean up their messes, minimize negative impacts of their activities, obey local laws, protect the environment, and help solve community problems.

Investor Perspectives: Shareholders want transparency, timely information, reliable forecasting, fair treatment, and opportunities to be heard.

An expanded sphere of accountability is hard for managers to accept when previously they were only accountable for financial results.

Though it seems more demanding, the higher standard only asks companies to do the same as all moral actors — respect the legitimate claims of others as they conduct their business. ■

Moral Questions at Shell and Nike

Questions about nonfinancial issues affected both Shell and Nike in the 1990s. Their environmental and human rights decisions had serious effects on their financial performance, but also caused both companies to focus on these issues. Shell not only had lower sales after the Brent Spar and Nigeria controversies, but their employees and shareholders wanted clarification on the company's stance. After Nike was attacked for the poor labor practices of its suppliers abroad and the decline of its market share and share price, the company did an about face and concentrated on improved worker conditions and social responsibility.

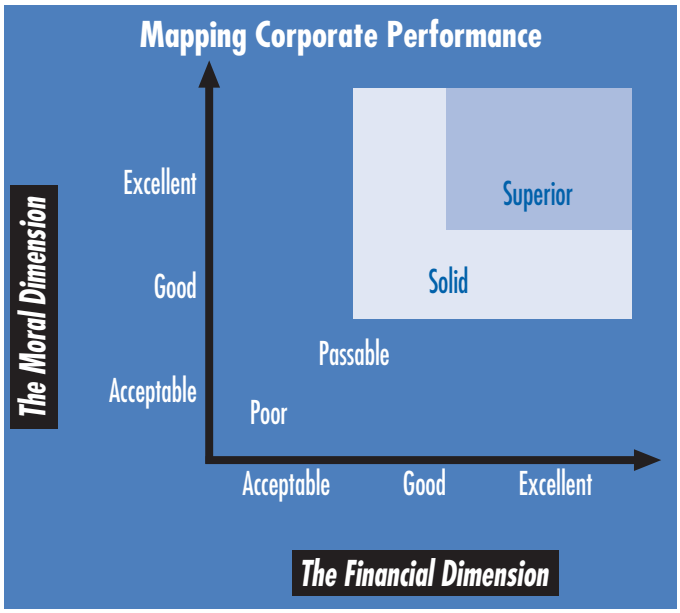
The New Value Proposition

After thoroughly examining the issue of "ethics pays," it is clear that the phrase "ethics counts" is more appropriate.

Using the *financial* argument for ethics has a dangerous underside. If you can make more money by lying, exploiting workers, or falsifying financial records, then ethics only pays when the risk of getting caught is too high. Using a purely financial argument for ethics undermines the idea that ethics have innate value, which is unwise in a world where companies are increasingly judged by a composite "ethico-nomic" yardstick. Superior companies must excel in both areas.

Measuring Moral Performance

There are myriad ways to assess financial performance, but measuring moral performance is inherently more difficult. Referring back to the "ladder of commitment" here are three levels of assessment (see chart).



- **First level/Acceptable:** Companies adhere to the law and avoid gross wrongdoing and offenses against basic justice.
- **Second level/Good:** Companies comply with the law, observe norms of fairness and responsibility, seek mutual gain in dealings with others.
- **Third level/Excellent:** Companies comply with the law, observe norms of fairness, seek opportunities to make additional contributions. ■

Ethics Counts

It is difficult to match *values*-based measures with *financially* based measures. Responsibility, dignity, citizenship have no obvious correlation with revenues, costs and profits. After a helicopter crash in an airfield, an investor thinks of production loses, and a social service provider thinks of safety and security. Both are valid, but they cannot be collapsed into each other. Companies must find a way to engage both points of view and speak both languages fluently. The phrase "ethics pays" is inappropriate, because values are not a component of the ultimate goal of financial success. "Ethics counts" casts values as a full partner with economics in a quest for outstanding performance.

When moral and financial considerations have their own standing, conflict will inevitably arise. Though there is no standard way to choose between them, acknowledging the conflicts honestly will allow clearer trade-offs and creative solutions.

Ethics counts also has value-added in the truth, loyalty, gratitude and reciprocal respect it engenders among stakeholders. Though impossible to measure in monetary terms, this value-added that comes from the energy produced when values are respected is very important for companies. ■

For Additional Information on criticisms of corporate values, go to: http://my.summary.com

Performing at a Higher Level

Many companies believe "having values" means having a list of values, and "implementing values" is a discreet staff activity unrelated to line management. Companies create specialized programs in diversity, environmentalism and ethics as they receive external pressure to do so. In actuality, meeting the new performance standard is a more comprehensive and fundamental process.

In the early 1990s Sears attempted to increase its lagging performance by setting quotas for its car mechanics. The mechanics began lying to customers — exaggerating problems and the work done to fix them. The plan was to align the employees' financial interests with those of the shareholders, but Sears incorrectly assumed financial performance was the only component to superior performance. By 1992 the company was under investigation by 44 states for misconduct. Similar problems caused downfalls at Columbia/HCA, Sunbeam Corporation and Enron. The problem was not the concepts of alignment of performance-based incentive, but how the concepts were applied.

In addition to incentive and compensation systems, all other systems — hiring and development, planning and coordination work, measuring and reporting performance — must be aligned to allow the company as a whole to behave as a moral actor. There should be a fit

(continued on page 6)

Performing at a Higher Level

(continued from page 5)

or correspondence between a company's guidance systems and the expectations of the new performance standard. Additionally the company's organizational design must support the trust and information transfer that is necessary to meet the new standards. Rolling out a new values statement is not enough.

A Company That Made It Work

A prime example of a company that organized itself to be a moral actor from the beginning is the energy company AES. The founders, Roger Sant and Dennis Bakke aimed to create a new form of business that would be socially responsible and profitable. They believed power companies should do more to protect the environment, and that companies should approach social responsibility in an integrative way. In their company, all people would be treated as adults, defined as:

- **Thinking, creative and capable of making hard decisions.**
- **Willing and able to assume accountability and responsibility.**
- **Unique and deserving of special treatment.**
- **Positively disposed to work in groups.**
- **Eager to make a contribution or join a cause.**
- **Fallible, even intentionally so at times.**

An Organized Framework

Sant and Bakke recognized the importance of strong financials, but as a by-product of fulfilling a legitimate corporate purpose. They started AES in 1981 and crystallized their core beliefs as a way for their employees to carry out the company's purpose. The values were integrity, fairness, fun and social responsibility. When AES experienced financial difficulties in 2001, it had a framework in place to review its operations and identify ways to improve its economic performance, strengthen its values, and tighten accountability mechanisms.

Having an organizational framework in place worked better than the piecemeal approach used by so many companies that causes initiative-fatigue, confusion and cynicism. AES has no diversity initiative or empowerment program. These concerns are embedded in the company's basic management systems. When we accept that companies are moral actors, these values become an inherent part of management's job. It turns economic functions into economic responsibilities that management has to answer for and includes them in the same category as all of their other responsibilities. Ethics are part of the structure along with finances and not perceived as add-ons. ■

For Additional Information on how AES integrated values into its structure, go to: http://my.summary.com

A Moral Center

Values implementation is not a task that should be delegated. Executives define and shape values through everything they do, and at the same time everyone in a company does values implementation every day. The approach must be comprehensive, management-led and oriented toward a moral center that recognizes social and economic responsibilities. A moral center is defined by the answers to these questions:

- **Purpose:** What is the company's purpose? Besides creating wealth and using resources efficiently, what is the company's contributions to society? How do its products and services add value to people's lives?
- **Principles:** What are the company's guiding principles? What precepts guide the conduct of its people in carrying out its purpose? What are its nonnegotiable standards? Its ideals and aspirations?
- **People:** What is the company's concept of the person? Who counts as a member of its moral community? Whose interests are considered in its decision-making?
- **Power:** What is the scope of the company's power and authority? To whom and for what is the company accountable? How is decision-making authority to be allocated within the organization? ■

The Decision-Making Compass

No matter how well a company's organization and systems are set up to achieve the new performance standards, a company's success comes down to the quality of its decision making. Moral scrutiny from stakeholders will only increase as the pressure to perform financially increases as well. All employees will have to become more sensitive to the moral aspects of their dealings and more skilled at identifying ethical issues and making decisions that are morally and financially sound.

The Right Questions

Companies need a structured management decision process to identify and evaluate moral concerns. This book's framework exploits the power of asking questions, which is essential to many business processes including strategy formulation or evaluating an investment.

The core question in ethics is "How should we live?" It breaks down into subsidiary questions: "What should we aim for?" "How should we conduct ourselves?" "What do we owe others?" "What rights do we have?" Each of these questions suggests a mode of moral analysis that can be used for decision-making.

- **Purpose:** Will this action serve a worthwhile purpose?

(continued on page 7)

The Decision-Making Compass

(continued from page 6)

- **Principle:** Is this action consistent with relevant principles?
- **People:** Does this action respect the legitimate claims of the people likely to be affected?
- **Power:** Do we have the power to take this action?

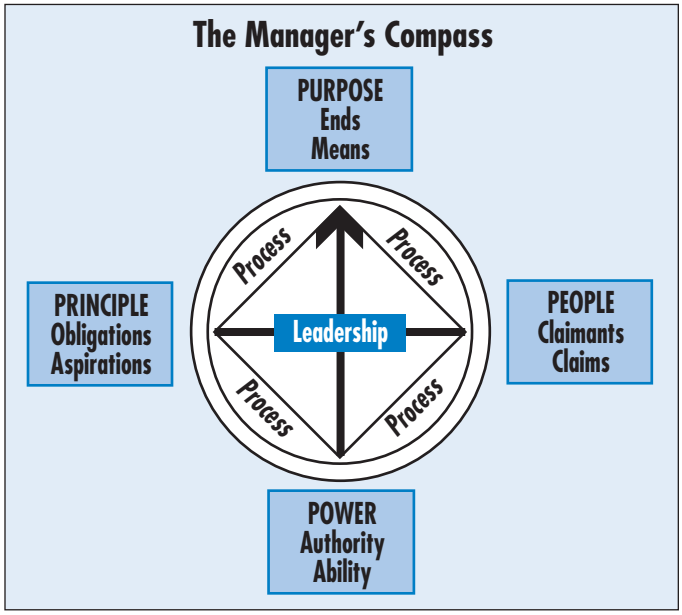
Once an issue is identified, the four kinds of questions explicate different features of the situation so they can be inspected and compared with other features, and then evaluated and addressed.

Together the four lenses create a compass for the manager that helps to chart a reasonable course through conflicting demands. Hopefully in the end, the course of action will satisfy all four criteria.

Product Failure: A Case Study

In the early 1990s Lotus Development Corp. and Equifax Inc. combined their core competencies to develop Lotus Marketplace: Households, a database that included information on 80 million households, allowing small businesses and nonprofits to effectively target their mailings.

There was an enormous outcry when the companies announced their product. Concerns focused on whether people had consented to be included in the database, how people could have their names removed, and how the data would be secured from falling into the hands of criminal elements.



After a review by the Direct Marketing Association, it was determined that the new product needed an effective way to opt out and a strict screening mechanism for buyers. The makers would also need to educate the public, which erroneously believed the database included detailed records of actual purchases rather than general buying propensities.

The extra precautions and changes made the cost of continuing with production prohibitive, and Lotus and Equifax cancelled plans to ship the product.

How the Compass Would Have Helped

If Equifax and Lotus had used the manager's compass in the early stages of development, they could have avoided such great costs. Marketplace could have been designed or marketed differently, or perhaps not even pursued.

An analysis of principles would have shown that Equifax's own statement of fair information practices included at least two relevant principles about use of data and privacy. The DMA's ethics handbook advised that customers whose data might be rented, sold or exchanged for direct marketing purposes should be periodically informed of the potential. The U.S. Fair Credit Reporting Act laid out specific directives for the proper use of credit and other consumer information. Even generally accepted ethical principles would have raised many of the same issues.

Similarly, conducting a stakeholder analysis of the people involved would have directed the team's attention beyond the small business consumers for whom the product was designed. They would have considered the other parties with interests at stake, such the data subjects, government regulators and lawmakers, and even public advocacy groups such as the ACLU Project on Privacy and Technology, which eventually helped spearhead the campaign against Marketplace.

Correcting for Blind Spots

Without a systematic process of moral analysis to inject the moral point of view into deliberations, decision makers are vulnerable to the blind spots and biases in most frameworks.

Competitive analysis does not consider stakeholder impact, social contribution or conformity to legal and ethical norms. Cost-benefit analysis often necessitates assigning monetary value to things that cannot be measured in money, like human lives. Difficulties can also arise because it does not clarify what is a cost and a benefit and for whom.

Today's companies need a methodology for integrating the moral point of view into decision-making. Where companies are expected to create wealth while conducting themselves as moral actors, managers will need to practice "center-driven" decision-making, the target zone of acceptability in the overlap of values and economics. ■

The Center-Driven Company

As the corporation becomes moralized and the new performance standard sets in for the foreseeable future, companies will need leaders who can meld high moral standards with outstanding financial results.

To become center-driven, companies must make fundamental and comprehensive changes in their operating systems. Though there is no specific model for a center-driven company, Royal Dutch/Shell, which has been implementing their sustainability model since 1988, is a good example.

- **People are committed to both moral and financial excellence.**
- **Guidance systems are aligned with financial and nonfinancial accountabilities.**
- **People use decision frameworks that integrate social and financial considerations.**
- **People assess its performance along moral and financial dimensions.**
- **People engage each other and external parties as moral actors.**
- **Company as a whole displays the competencies expected of a moral actor.**

A center-driven company defies traditional methods of operation and develops creative innovations to satisfy both moral and financial obligations, as demonstrated by the two case studies below.

Workforce Restructuring at Telia

In 1995, Sweden's Telia Group, an Internet and communications company, found that it needed to lay off 5,000-7,000 employees because it was overstaffed, and the current employees did not have the skills for the rapidly growing industry. Instead of a traditional layoff, Telia's redeployment team worked with unions to provide training, vocational guidance, study grants, business support and job placement support to the employees. As a result, 2,800 employees were given new positions with their improved skills, and the rest moved to other jobs, started businesses, went back to school, or retired. Fewer than 1.5 percent were given notice. The program saved the government $135 million, the affected employees $85 million, and benefitted Telia by $310 million.

Irrational Managers?

Telia's efforts, as well as the efforts at Manville (see above right) were a foregone conclusion, though they seem no more than common sense. These innovative thinkers waged uphill battles against the status quo. Conventional wisdom said that these managers were thinking about the wrong things.

Minimizing negative effects of restructuring on Telia Groups' employees was considered the work of government, families and communities. Manville's Bill Sells was breaching his fiduciary obligation to shareholders by putting the interests of employees and customer ahead of shareholders when the law didn't require him to. From an orthodox perspective these managers acted irrationally, but from a center-driven outlook they were normal and rational.

As moral actors they discovered a practical path that enabled the company to remain competitive while respecting the rights of others and minimizing the collateral harm caused by their activities. They still satisfied the orthodox, even though traditional managers many never have envisioned the path or experience the concerns that led to it.

A Philosophy of Management

Center-driven management is not a technique or collection of best practices, but a philosophy of management grounded in assumptions about business that challenge key tenets of traditional management.

These assumptions include the premise of a corporate personality; that superior corporate performance consists of moral and financial excellence; that corporate accountability extends beyond shareholders; that corporate conduct consists of all actions taken by its members or representatives on its behalf; that human behavior is multifaceted and can express mixed motives and varied aspirations; that rationality means using reason to enhance life; and that progress is not inevitable and needs to be fought for continuously. Companies looking to achieve the new performance standards will need to cultivate leaders who understand these broader accountabilities. ■

Managing Safety at Manville

Bill Sells was head of Manville Corp.'s Fiber Glass Product Group in 1986 just four years after the company declared bankruptcy because of a liability disaster involving their asbestos production. A study came out announcing that fiberglass could cause cancer. Sells quickly mobilized his colleagues to have several weeks of discussion on what to do.

After discussing possibilities from doing nothing to exiting the fiberglass business, Sells' team decided on an aggressive communications and relabeling campaign to disclose the potential risk to employees, distributors and customers, and they agreed to indemnify their customers against cost incurred from end-user injury claims. Manville did not lose very much business, and ended up gaining goodwill from thankful customers.

The Five Strategies for Explosive Corporate Growth

VENTURE CATALYST

THE SUMMARY IN BRIEF

Business leaders have two missions: first, meet or beat Wall Street expectations on a quarterly basis; second, roll out the new technologies and products that will ensure continuous double-digit growth (as measured by market capitalization and the creation of shareholder wealth) over the next three to five years. Internal organic growth or traditional acquisitions and mergers cannot yield the kind of double-digit growth now being sought by investors. According to author Donald L. Laurie, only those companies that include ventures as an integral part of their strategies can achieve exceptional and sustainable growth. By ventures, Laurie is referring specifically to "new business enterprises that entail a certain amount of risk." After extensive interviews with corporate leaders of both high-growth companies and venture capital firms, and drawing on his own experience as a high-level corporate advisor, Laurie identified the five key strategies for developing the next great business: invent, invest, venture, partner and integrate.

What You'll Learn In This Summary

✓ **Inventing New Businesses:** Close to 90 percent of Corning's revenues come from products invented within the past five years. You'll learn the step-by-step process that Corning uses to create these new products.

✓ **Investing in New Businesses:** Investing in new businesses offers a short-cut to new technologies and processes.

✓ **Building a Venture Division within Your Company:** You'll learn how to develop a strategy to use when working with venture capital firms.

✓ **Creating Partnerships to Build New Businesses:** Take your latest technology developments to an experienced "business builder" and you both can win.

✓ **Acquiring and Integrating New Businesses:** Pairing up with another company pursuing similar product developments will create powerful synergies.

✓ **Case Studies in Venturing.** Five case-study companies will illustrate the five venture strategies: invent, invest, venture, partner and integrate. The case studies cover business models, value-added activities and preconditions for success.

Five Paths to Sustainable Corporate Growth

Explosive yet sustainable growth depends on a "venture" mentality — the desire to boldly build the next great business. Based on his research and experience, author Donald Laurie found five distinct routes to using ventures as a means of fueling corporate growth:

1. Invent the next great business. In this strategy, a new business is "born and grows under the corporate roof," according to Laurie.

2. Invest in the next great business. A number of companies are establishing in-house corporate venture groups that commit the company's money and resources to entrepreneurial ventures.

3. Venture the next great business. Companies that follow this path collaborate with venture capital firms on new businesses.

4. Partner the next great business. Independent and distinct companies can establish partnerships that create new businesses.

5. Acquire and integrate. Acquisitions can help companies integrate new capabilities, know-how and technology.

Critical Factors

In each of these five venture strategies, three factors are crucial.

First, the company must have a clear **business model** of how it will build a new business and how it will generate revenues.

Second, the company must have unique **value-added activities** that make its business model work.

Finally, each company must recognize that certain **preconditions for success** must be in place. For instance, every venture strategy requires capital and a forward-looking leader, as well as space for innovation and compensation that encourages risk-taking.

Each of the firms researched followed a well-developed, step-by-step process for creating growth.

The Rewards of Entrepreneurship

Through ventures, both large and mid-sized companies can develop the strategies needed to maintain a high level of innovation and growth. The process is daunting, since it requires adoption of an entrepreneurial spirit among all levels of management (see above). But the rewards are clear. Johnson & Johnson has seen its annual revenues increase from $11 billion in 1989 to almost $29 billion by 1999 since dedicating corporate resources to venture activity. ■

Laying the Groundwork

Large corporations who want to move from their traditional, cautious strategies to growth strategies built around ventures must be ready to:

- **Change their corporate mindset.**
- **Redefine their concept of organization.**
- **Alter their need for control.**
- **Expand their capacity for speed.**
- **Broaden their tolerance for mistakes.**
- **Modify their risk potential.**
- **Shift a portion of their investment capital from incremental R&D to internal and external ventures.**

By partnering with entrepreneurs, who have experience with quickly moving a product concept to market, a large corporation can leverage its distribution, marketing and research capabilities, for a synergistic effect that can lead to phenomenal success.

The author: Donald L. Laurie is founder and chairman of Laurie International and of Oyster International LLC. The author of *The Real Work of Leaders*, Laurie is an advisor to industry leaders and an investor in early-stage ventures.

Invent the Next Great Business

Companies that know how to leverage their expertise in technology, marketing and manufacturing capabilities are the ones who can succeed at regularly inventing the "next new thing." For example, 84 percent of Corning's revenue comes from products that did not exist five years ago.

In this article, we will study Corning as an example of how to invent the next great business.

Corning's Business Model

Corning's corporate motto, "Discovering Beyond Imagination," captures the belief that the highest ROI on new products will result from those that directly address unmet, unserved customer needs. In focusing on this motto, Corning is not afraid to get rid of divisions that are no longer performing or have begun to decline, including its one-time flagship Corningware division.

Corning uses five steps in nurturing an idea into a product:

1. Building Knowledge. By participating in cross-functional "roadmap" teams of technicians and managers that meet regularly, employees develop a common view of trends, discontinuities and other events that are shaping the future. Each member relates these trends to customer needs, and identifies what each of their products brings in relation to those needs.

Road-mapping helps Corning identify the product specifications for next year's products — as well as the technologies it will need to build or acquire within the next five-year period in order to develop the products of the future.

2. Determining Feasibility. Once the idea and technology are selected, Corning involves its customers and in-house staff in experimenting with proposed applications that could evolve from the combination of the two.

At this stage of the venture process, Corning addresses these questions:

- Will the technology achieve the intended objective?
- Can the idea be developed into a product with significant market potential?
- Can we achieve proof of concept?
- Can we build a working prototype?

3. Testing Practicality. When this stage is reached, cross-functional teams in marketing and manufacturing, as well as research, test a prototype product to decide whether there is a substantial market, whether the price-to-value is acceptable to the customer, if it can be manufactured in volume — and ultimately, whether Corning should continue to pursue the development of the product.

Is Your Company Ready to Invent the Next Great Business?

If you want to invent the next great business, you must do the following:

- ✓ **Assess your company's history of innovation, its experience and its culture.**
- ✓ **Define the company's ambition for internal ventures.**
- ✓ **Rethink organization and control models.**
- ✓ **Commit capital and define the investment decision process.**
- ✓ **Create infrastructure and support.**
- ✓ **Understand the venture process.**
- ✓ **Let the entrepreneurial team members select themselves.**

4. Proving Profitability. Just because a new product idea is possible doesn't mean that Corning will develop it. Corning must first determine the profitability of the idea. For example, teams study whether the company will have any advantages in either technical competencies or cost leadership.

5. Commercializing. Almost as soon as a new product is launched, Corning takes it back to the drawing board. The product's manager takes responsibility for extending the line and looking for new breakthrough businesses.

Corning's Value-Added Activities

Corning's dedication to a culture of innovation and attracting and keeping top talent are central to its enviable track record of creating successful new products and businesses.

The company uses — and supports — the accumulated wisdom and experience of its highly talented work force. For example, it periodically holds informal "Growth Day" exhibitions. At these events, the company's entrepreneur-managers present their products and businesses. The goal is to support their efforts, not review them. Rather than scrutinizing their budgets, top management asks them what they need.

Corning also understands the value of keeping smart people; in addition to its state-of-the-art facilities and resources, it offers an attractive compensation plan.

Corning's Preconditions for Success

A top-down belief in creating conditions that allow its employees to be entrepreneurs is one of the preconditions for Corning's success in creating new products and spinning off new businesses. As well as its culture of

(continued on page 4)

Invent the Next Great Business

(continued from page 6)

innovation, Corning holds its employees accountable: Bonuses are tied to performance.

Another fact that cannot be overlooked is the relative health and growth of the telecommunications industry, the members of which make up a significant portion of Corning's customer base. ■

Invest in the Next Great Business

After inventing, the second strategy for explosive corporate growth is investing in the next great business.

Venture capital spending, in which companies commit capital and other resources to independent, external ventures, is experiencing rapid growth. In the period from 1996 to 1999, for instance, the number of companies investing in external ideas jumped from 30 to 330, as the amount corporations spent on these investments soared from $100 million to $17 billion annually.

There are strategic and financial advantages to taking this path — for both the corporate investor and the entrepreneurial companies. The corporation can gain new technologies and related applications, as well as exposure to new markets; the entrepreneurial company can gain status and acceptance by aligning itself with a larger company.

Case Study: GE Equity

GE Equity, one of 28 business units within GE Capital, invested almost $4 billion in 300 businesses in 2000, only five years after it was created. Forty percent of those 300 businesses grew out of opportunities within GE itself: Individual GE employees, or divisions, brought their ideas to GE Equity.

GE Equity's purpose is to help GE businesses grow, and to provide a buffer for GE should its earnings slip. If that happens, GE Equity would be able to liquidate selected holdings and "fill the gap."

GE's Business Model

As seen with Corning in its invention strategy, developing and adhering to a strict, step-by-step process is central to GE Equity's success in venture activity. Called the Business Management System, or BMS, GE Equity's process begins with a thorough due diligence procedure, which includes an investment overview (covering investment rationale and considerations), an industry and company overview, and a description of the target company's marketing strategy and value proposition. This thorough process reveals each investment prospect's top two or three risks, and evaluates its management team.

After the due diligence process is completed, the next step in the BMS is a portfolio management system to track the expectations and performance of each investment prospect.

Each prospect is coded according to performance level. Red is the most underperforming classification; companies that are coded red undergo more rigorous monthly reviews by the general manager, risk manager and investment manager.

At the same time, a financial management system is instituted so that management can allocate investments across industries and stages of investment. This financial team focuses on anticipating liquidity events so that GE Equity is able to deliver specific quarterly results.

GE Equity's Value-Added Activities

What are GE Equity's value-added activities that have made its investment strategy a success?

GE Equity's excellent analytical process is based on both decision and probability theories, and is applied systematically to its investment strategies and decisions. The company is committed to working with "the most knowledgeable people in the industry and the company — people who can provide their probability assessments on certain key variables," according to a company spokesperson.

And it parlays this analysis to managing investment portfolios as well.

GE Equity's Preconditions for Success

GE Equity's preconditions for success include an unambiguous commitment and genuine "fondness" for entrepreneurial ventures — from the top down. Furthermore, GE Equity does not dominate the companies in which it invests — instead, it supports and respects these smaller companies consistently. ■

Is Your Company Ready to Invest in External Ventures?

If you want to invest in external ventures as a strategy for corporate growth, you must do the following:

- ✓ **Assess your company's readiness and ambition for corporate venturing.**
- ✓ **Define your ambition and priorities.**
- ✓ **Determine the role of operating units in your investments.**
- ✓ **Develop management capabilities and systems.**
- ✓ **Be explicit about strategic benefits.**

Venture the Next Great Business

If your company is not prepared to become an investor, another approach is to build strategic partnerships with experienced venture capital firms.

There are two dominant routes to pursue. In the first, you become a passive investor and will either make or lose money as the fund is liquidated over its 7- to 10-year lifecycle. As a limited investor, the corporation has limited exposure to deal flow and does not participate in investment decisions.

In the second route, corporations can become limited partners in industry-specific ventures funds (i.e., health care, information technology). Using special rights agreements, some companies have been able to gain early access to venture capitalists' deal flow, which opens up opportunities to invest either independently or alongside the venture firm. The advantage with this second route is the ability to locate new emerging technologies sooner.

Many venture capitalists are the first to spot innovative, early-stage ventures that large corporations would otherwise rarely discover on their own. In addition, venture capital firms have expertise in matching deals with each corporation's strategic goals and have access to a continuous deal flow. Corporate scientists' deep understanding of technology and science is a good match with venture firms, who are well-versed in creating deals and building businesses with speed.

Nortel Networks invests with a select group of venture capitalists in the telecommunications industry, and is used here as an example of how to pursue this strategy to corporate growth.

Nortel's Business Model

Since it became independent of AT&T and Bell Canada in 1976, Nortel's core competency has been its ability to continuously seek out "discontinuities" in either markets or technologies. Because its executives realized that the most disruptive, cutting-edge technologies were at small start-ups and venture capital funds, it chose to target this type of firm. Additionally, Nortel was uniquely poised to reap immense benefits by matching its knowledge and know-how in data transmission with innovative ideas from telecom start-ups.

Nortel's strategy involves seeking companies that it can eventually acquire, partner with or develop as customers or original equipment manufacturers (OEMs).

Nortel's Relationship Network

To maximize its venturing strategy, the company formed a two-person team to create a systemized method for approaching investments.

Is Your Company Ready to Invest with Venture Capital Firms?

If your venture strategy includes investing through venture capital firms, you must do the following:

- ✓ **Clarify your investment strategy and your purpose in investing.**
- ✓ **Determine the level of capital and the venture leader in whom you are willing to invest over the next five years.**
- ✓ **Define the characteristics of attractive venture partners and your value added.**
- ✓ **Leverage your learning.**

The team first devised a filtering method to gain access to the greatest number of deals through the least number of venture capital firms.

Starting with the 100 or so venture capital firms in the telecommunications field, the team identified the venture capital keiretsus, loosely formed groups that invest together. It then narrowed the 20 top venture capital firms in its industry down to less than 10 firms that appeared most able to match Nortel's goals. Each of these was a leading venture capital firm in its keiretsu. Today, these firms are the basis for the company's "relationship network" that allows it access to close to 95 percent of the innovations in its industry.

From this initial strategy the company has formalized its venture investment policy, naming 11 directors of business development to work with the venture capitalists. In a four-page letter of agreement with each firm, Nortel's expectations are clearly defined, including any preferential treatment the company requires, the services the VC firm will get in return, and the information in the VC firm's deal flow that Nortel will be able to access.

Nortel's Value-Added Activities

Nortel's side-by-side collaboration — through its relationship management, screening and selection process and its emphasis on acquiring entrepreneurial firms — are the back up to its business plan. Its business unit directors, with specialized skills in both technical and financial areas, offer a good balance to the VC's ability to take risks.

Nortel's Preconditions for Success

Nortel shares its know-how in technology. The VC firms, in turn, act as the eyes and ears for any companies that might make a strategic match for Nortel. In addition, Nortel allows any of its VCs 30 days exclusive consideration for any company that Nortel spins out from its internal venture program. ■

Partner the Next Great Business

Because of the need to manage current operations and budgets, many executives often overlook the vast potential of their companies' intellectual property and technology. As a result of this oversight, exacerbated by an unwillingness to share proprietary information with other companies, company leaders miss opportunities to use partnerships to create new, disruptive businesses — either profitable spin-off businesses or businesses in their competency — that have the potential for explosive growth.

By partnering technology or know-how with experienced business builders, companies can stake a claim in next-generation platforms, products, systems and services.

For example, a consumer products company with cleaning technology contributed its knowledge and capital to a start-up that was managed by experienced business builders, who received a 20 percent of the new business as well as a business-building fee.

To illustrate how partnering can help achieve corporate growth, this article will look at XL Vision, Inc.

XL Vision: Creating an Enterprise Factory

Within four years of its founding, XL Vision had created $3 billion in new wealth and five companies, two of which had gone public. Unlike most "incubator" models, XL Vision considers itself a long-term holder in the companies it creates. Its business model is based on the relationships it creates with Fortune 100 companies, and on its ability to leverage technology from these large global companies.

Like the other companies detailed in this summary, XL Vision has developed a systematic approach to building new businesses. There are six "imperatives" to XL Vision's business model:

1. **Bat 100 percent in business creation.** Unlike VC firms, which factor in a 30 to 40 percent failure rate, XL Vision's thorough screening process and due diligence is driven by the goal of hitting 10 out of 10.
2. **Imbue each new company with a long-term growth strategy based on a solution to a subtle or not-yet-identified customer need.**
3. **Go for an IPO within three years.**
4. **Produce at least one new public company every year.**
5. **Create one new company every year.** Keep the pipeline full; every time one company goes public, start a new one.
6. **Achieve a $1 billion market capitalization for each new company within a year of its IPO.** The founders of XL Vision are convinced that it takes just as much effort to build a company with a $50 million market cap as it does to create one with a $500 million cap, so they believe in aiming high, building products or companies that will fit within large and growing markets.

Is Your Company Ready to Partner the Next Great Business?

If you want to partner the next great business, you must do the following:

- ✓ **Make sure that the business idea is unique and disruptive.**
- ✓ **Explore the advantages and disadvantages of going it alone and maintaining total control versus partnering with experienced venture managers.**
- ✓ **Understand what you do well and where you need help.**
- ✓ **Agree on principles and terms that will govern the business relationship.**

XL Vision's Business Model

XL Vision's business model consists of four building blocks: Discovery, Down Select, Strategic Positioning, and Execution of the Plan.

Discovery. XL Vision's expertise is in electro-optics and electro-optical devices for different industries. When a company approaches XL Vision with a need for a new product that XL has the technology to create, they build the product and then turn over all the "discoveries" made in the process of developing the product (i.e., the technologies, intellectual property) to the outside company. XL Vision retains the rights to the intellectual property for other, noncompeting applications. Because it is in constant close contact with customers, XL Vision is able to anticipate unmet service needs that its technology can be used to meet.

Down Select. Because XL selects only one project each year, most projects are rejected. The founders admit it took some time getting used to throwing out so many ideas, but they have come to believe that this is what's necessary to achieve their 100 percent hit rate.

Over the years they have developed the capacity to spot winners by focusing on market size, market growth rate, competition and strength of intellectual property. They also examine not-so-obvious criteria, including technical experiments, alpha product test reports, customer focus groups, partner focus groups and distribution channel analysis studies.

(continued on page 7)

Partner the Next Great Business

(continued from page 6)

XL Vision's founders have come up with a 3-to-1 rule. Basically, entrepreneurs must be able to prove to them that the product or service they are proposing will either save three dollars or add three dollars to the bottom line, and that it will only cost one dollar to do so.

Strategic Positioning. An internal start-up team at XL Vision is assigned to the "incubie" while it is still undergoing experimentation with its technology and market position. The team stays with the project for an average of 18 months, during which time it is planning strategy and meeting with customers, and then adapting the product and reframing the strategy as needed.

Execution of the Plan. Now XL Vision names a new director, or "CEO" for the project and the start-up team passes on the project to this person. Different skills are needed for this stage of the process: someone who is focused, driven and execution-oriented.

At the same time, ownership of the new company is being transferred to shareholders via a process that allows for tax-efficiency as well as setting the stage for a long-term relationship. By selling the shares as cheaply as possible, XL Vision provides a very low-risk option with a high-gain potential to the shareholders. By allowing its corporate partners to buy a share of the venture, it is motivated to continue with other productive business relationships.

XL Vision's Value-Added Activities

Being market-oriented has allowed XL Vision's founders to continually leverage their technology to create new products that fill unmet needs. That, and a disciplined process for integrating the skills of technologists and entrepreneurs, is unique to XL Vision.

XL Vision's Preconditions for Success

A combination of process, analysis and entrepreneurial talent, as well as constant cultivation of its business relationships and its own internal culture, has given XL Vision an edge in building new businesses. Part of building its own internal culture includes monthly meetings of its three-person Innovation Council. At these meetings, members evaluate the company's processes and its results to see if any adjustments need to be made, and implement any that are needed. Attitude and personal drive have also contributed to XL Vision's success. As founder John Scott often says, the company's only competition "is the old way of doing things." ■

For another short example of a partnership venture, go to: http://my.summary.com

Acquire and Integrate the Next Great Business

It is important to distinguish between standard mergers and acquisitions — in which acquirers buy a customer base and established product lines — and the acquisition of cutting-edge ventures to build growth.

Cisco Systems, Inc., recognized early on the benefit of acquiring ventures that could give its own internal research and product development teams a mach-force jump start and yield continual growth for the firm. Almost as an aside, the company's rapid rate of acquisitions also enabled it to find a steady source of talent to support its expansion.

Cisco's Business Model

To achieve its goals of becoming the one-stop shopping source for network connections for the telecommunications industry, as well as becoming the builders of the Internet infrastructure, Cisco looks for companies with engineering talent that is working on cutting-edge solutions. It can then combine the acquired innovation with its impressive sales network.

Cisco clearly defines three overlapping market segments that it targets, and hones in on companies that are offering unique innovative solutions to these markets. The targeted market segments are: large corporations, educational institutions, government agencies and utilities with complex networking needs involving multiple locations and different computer systems; small- and mid-sized companies that need their own intranet data networks, connections to the Internet, and secure data links with business partners; and information service companies (such as telecommunications carriers, Internet service providers, cable companies, and wireless communication providers).

Cisco's Value-Added Activities

Cisco employs its sales force to be its eyes and ears for new opportunities. Internally, it is constantly rewriting software that eases integration of acquired products into the Cisco Systems portfolio, a capability for which it is well known. Attitude also plays an important role in the company's acquisition strategy. Besides believing that it is simply cheaper, quicker and easier to acquire companies that are further along in the research chain with new solutions, Cisco has developed a highly structured procedure for integrating its acquisitions.

Cisco's Preconditions for Success

"Shared chemistry" between Cisco and its acquired company is essential, and a simple exercise for determining a fit is carried out early in the negotiations

(continued on page 8)

Is Your Company Ready to Acquire and Integrate?

If you want to acquire and integrate the next great business, you must do the following:

- ✓ **Develop technology and product maps.**
- ✓ **Assess the quality, focus and payback of research and product development.**
- ✓ **Define your venture acquisition strategy.**
- ✓ **Build the team to acquire and integrate.**

Acquire and Integrate the Next Great Business

(continued from page 7)

process. Executives from both companies are asked to write down what they consider to be the three most important benefits that the other will receive from the proposed merger. Another basic premise is that both companies must have a business need that neither can meet on their own. ■

For a case study that applies all five venture strategies, go to: http://my.summary.com

Basic Steps in Venturing

There is, of course, no such thing as a fail-safe 10-step process for creating a successful venture. Any success will need the right mix of an attractive market, a committed entrepreneur, a unique idea and so on. However, it is possible to identify five fundamental phases that will occur in a typical, successful business-building process:

1. **Mining opportunities.**
2. **Refining and strengthening the business model.**
3. **Developing the product, platform and business.**
4. **Executing the business-building process.**
5. **Growth.**

Each of these five phases calls for different leaders, priorities, and goals and milestones.

Mining Opportunities

The first step in mining opportunities is to generate ideas. External ideas will come from a variety of sources, including entrepreneurs, investors and other venture capitalists. Internal ideas will come from a company's managers and employees, who can be on the lookout for venture opportunities around the world.

The next step is to screen and rigorously evaluate ideas. Be sure that you have clear criteria for your new ventures, for example the minimum size of a new market.

Refine and Strengthen the Business Model

Once you believe that you have an idea that might work, you need to refine and strengthen the business model of the new venture.

The first step is to clearly define the problem that the new venture will solve — in other words the strategic logic that underpins the business model.

The next step is to conduct a due diligence of the new venture's market, technology, competition and economics. To put it bluntly: Are you going to make money?

The third step is to look closely at the technology involved. How long, realistically, will it take to get a product ready for prototype and beta testing?

This phase requires a mix of people, including strategic thinkers, venture managers, technologists and people with market and manufacturing knowledge.

Developing the Product, Platform and Business

Early entrepreneurs can guide the initial strategic thinking, development, initial experimentation and beta-testing activities of a new venture. Now, however, is the time to bring in an execution CEO to begin the operations and implementation phases of the process.

The original processes designed to shape the business model and develop and test the initial product must now be replaced with brand, sales cycle, manufacturing and logistics management processes. Recruiting key management, developing the go-to-market strategy, establishing pre-production runs and securing operating capital are just some of the issues that need to be addressed at this stage.

Executing the Business-Building Process.

The business is now operating. Sales, marketing, engineering, manufacturing, finance and planning are in place and working. Sales and marketing people, for example, are getting feedback from the field. Engineering and product development are working with sales and marketing to refine the product based on this customer feedback.

Production people are applying product development and engineering modifications to the manufacturing process. Finally, the finance people should be tracking actual versus projected costs, revenues and return on investment.

Growth

In this phase, you will want to emphasize productivity, efficiency and improvement at all stages in the business cycle: manufacturing, logistics, sales and delivery. In addition to improving processes, leaders need to focus on serving strategic customers, building the brand, supporting acquisition efforts and expanding globally. ■

Management: Strategies

We Are Smarter Than Me

How to Unleash the Power of Crowds in Your Business

by Barry Libert and Jon Spector and Thousands of Contributors

THE SUMMARY IN BRIEF

Five years ago, the notion that a group might be smarter than any of its members was a complete nonstarter. By definition, groupthink was the lowest common denominator; everyone knew that a camel was a horse designed by a committee. Today, thanks to several best-selling books, we know better.

But even now, although *crowdsourcing, wikinomics* and *open-source technology* have become buzzwords in the business world, there is no practical guide to translate those concepts into usable tools and techniques.

This summary fills that gap.

Many companies have benefited hugely from harnessing collective power, but not all have succeeded. There are many pitfalls to be avoided and obstacles to be overcome in tapping the wisdom of communities.

If you are willing to take on the challenge, you have a good chance of being handsomely rewarded. Communities can help companies invent new products and services, improve customer service, boost sales, turbocharge manufacturing, tap into new sources of financing, and make everyone a leader.

IN THIS SUMMARY, YOU WILL LEARN:

- Ways to make your company a more productive, more profitable and better place for the people who work there.
- How businesses of all kinds can make the wisdom of crowds work for them.
- How to tap into the power and talent of the online masses.
- How companies can profitably and cost-effectively make the most of the knowledge and resources held by communities of like-minded people.

THE COMPLETE SUMMARY: **WE ARE SMARTER THAN ME**

by Barry Libert and Jon Spector and Thousands of Contributors

The authors: Barry Libert is currently the CEO of Mzinga, a provider of business social networks that help companies improve their performance by leveraging the power of "community." He is also the co-founder of the "We" project with Jon Spector, vice dean of the Wharton School at the University of Pennsylvania and current CEO of The Conference Board. Through the use of wikis, more than 4,000 contributors representing the top B-schools and organizations were able to contribute their expertise to the writing of the book.

Look What We Can Do

At the ripe old age of 15, the Web has already changed human society so profoundly that historians have begun comparing the Internet Age with the Renaissance and the Industrial Revolution. The Web has connected nearly a billion people. With that many brains as its motivating force, the transformation forged by the Internet has morphed from quantitative to qualitative: The power of the collective "we" is nearly unfathomable.

Each of those brains has some 10 billion neurons linked to one another through about 10,000 synapses. Now all that individual brainpower is tied together and amplified by the power of technology: The new and potent "we" is far smarter than any singular "me." For the first time, humans can act in mass collaboration, using the kind of collective intelligence once reserved for ants and bees — but now with human IQ driving the mix. The result is a quantum increase in the world's ability to conceive, create, compute and connect. We are only beginning to comprehend the consequences.

Web 2.0

Cyber watchers say the Internet has evolved in two distinct stages: Web 1.0 and Web 2.0. In both of them, the Net has been a hugely fertile market where people turn data into money. But Web 1.0 winners profited (mainly in the dot-com boom) by cornering data for themselves and riding the price up. Web 2.0 innovators do the opposite. They believe that information becomes more valuable as more people use it.

Instead of tightly controlling the code behind a new software program, for example, they let anyone alter or add to it, confident that the users will contribute their own ideas and improve the program for everyone. The miracle is that, by giving away access, the owners can actually reduce their own costs while winding up with a better product, certified as such by its volunteer creators — a product that can win more customers.

Crowdsourcing

As a business model, the process is called open sourcing or *crowdsourcing* — it turns over tasks traditionally performed by employees to the Internet multitude. And it has claimed some memorable successes, particularly on the product development front. Mozilla's Firefox open-source Web browser, for example, has been downloaded more than 300 million times and is used by an estimated 70 million to 80 million people.

Some 5 million users per month swear by Wikipedia, the free online encyclopedia created and updated by Internet volunteers to the tune of 2 million articles and counting. Any visitor can edit *most* of its articles, although some, such as the entry on George W. Bush, are protected by volunteer administrators. That's because ideologues and mischief-makers occasionally take liberties with the facts, but the process is self-correcting as other users and administrators set them straight.

'Innovation Jam'

By harnessing the power of crowds, more businesspeople can make — and are making — better decisions and bigger profits. In mid-2006, for example, IBM invited its entire community — employees, their family members and customers — to take part in a brainstorming session to identify potential areas for innovation. In the first session of the "innovation jam," fully 150,000

online volunteers were given 72 hours to come up with ideas. They produced 46,000 suggestions, which the company's staffers sifted and evaluated; then, in September, the online conclave assembled again to vote on the ideas with the most potential.

IBM's CEO, Sam Palmisano, has promised to put as much as $100 million into developing the 10 winning ideas — and he will have a hand in the final choice. Though still in its infancy, crowdsourcing is already rewriting the rules of business, posing major challenges and opening up unprecedented opportunities.

Go From R&D to R&WE

For businesses large and small, it's no inconsequential decision to let customers dictate what is sold. New product development is among the most important activities any enterprise undertakes. A business lives or dies on the strength of what it offers, and it's understandable that leaders often resist losing control over the basic nature of the goods they sell.

But there's much to be said for tapping the collective wisdom of a community — customer or otherwise — for product ideas and improvements. In the case of customers, it gives them a vested interest in the results and all but guarantees that they will like — and buy — what they've created.

Many innovative organizations have pioneered product development by people not on their payroll. These businesses range from food giants to the inventors of a popular virtual world that has confounded skeptics who believed that only nerds would sign on. These organizations' commitment to the collaborative process ranges from cautious to total immersion.

Procter & Gamble

For generations, the research and development (R&D) team at Procter & Gamble — 9,000 strong — had been the stuff of business legend, cranking out dozens of high-profile, high-profit new products year after year. But in 2000, A.G. Lafley, the company's newly arrived chairman and CEO, stunned his prideful researchers. They were not, he announced, producing winners big enough or fast enough to significantly boost corporate revenues. His solution was drastic: By the end of the decade, half of all new P&G products and technologies would have to come from outside the company.

The object, Lafley insisted, was not to supplant the mighty in-house R&D effort, but to supplement it. That turned out to be a vastly difficult venture, though, and no wonder, given the company's size and complexity. For one thing, the internal communication systems had to be reinvented to make it possible for all parts of the company to exchange data and brainstorm. Then that information had to be made available to noncompany entities, including suppliers and distributors.

Another stumbling block was the resistance of many of P&G's key researchers. Some complained that the proposed changes in their way of doing things would stifle creativity. Others feared a loss of power and prestige if their information and work had to be shared.

Lafley persevered. His most drastic move was a giant step into crowdsourcing. P&G put together a global community made up of high-tech entrepreneurs and open networks such as NineSigma and included the retired scientists and engineers of YourEncore and the marketplace for intellectual property exchange called Yet2.com. P&G has also gone to InnoCentive, a network of 120,000 self-selected technical people from more than 175 countries who receive cash awards if their ideas prove out.

P&G is closing in on Lafley's goal. As of 2006, the company was deriving 35 percent of its ideas from outsiders. Meanwhile, R&D productivity has soared 60 percent. A whopping 80 percent of its product launches are successful, compared to 30 percent for the consumer-products industry as a whole. And it spends 3.1 percent, or about $2.1 billion, of its more than $68 billion in annual worldwide revenue on R&D, much more than others in the industry.

Virgin Mobile USA

Virgin Mobile USA, the cell phone company, used 2,000 carefully selected online customers — "Insiders," as Virgin called them — to keep it abreast of trends and promising opportunities. Virgin described the group as "a team of elite, young and active customers," and it rewarded them with free calling minutes and phone upgrades.

Pitfalls in Crowdsourcing

If collaboration isn't done right, it had best not be done at all. Gartner Research has predicted, with 80 percent certainty, that by 2010 more than 60 percent of Fortune 1,000 companies will have some form of online community that can be used in marketing — but with the same degree of confidence, Gartner says half of those will be so poorly managed that they will do more harm than good.

A joint venture of Richard Branson's Virgin Group and Sprint Nextel, the company went to its Insider community for help on everything from designing phones to coming up with names for service plans. As one officer of the company put it, "Ultimately, what we want to do is put young consumers backstage."

R&D Tips

Here are three tips to keep in mind when performing research and development:

- **The medium is not the message.** A company's goal is to convince us, as the necessary "we," to take part; the means of communication, although important, is secondary.
- **Know your neighbors.** Identify and understand them well.
- **Tread firmly but carefully.** Seeking the help of outsiders, even when they're part of some amorphous, unseen community, can be threatening to in-house staff. Make your intentions clear and stick to them. Do everything possible to accommodate the concerns of the resisters. ●

How May We Help We?

All sorts of businesses are transferring much of the service function onto the shoulders of the customers themselves. Traditionally, customers who had questions about a product — how to put it together, why it wasn't working properly, how to use it to the best advantage — would call the company's help line and talk with a customer service representative.

That's still possible, but it's not as easy as it used to be. Getting through to a service representative can take 30 minutes or more, and even then, customers are liable to get shifted from one level of expertise to another. Meanwhile, under pressure to reduce costs, many businesses have begun charging substantial fees for telephone support. After the warranty on Dell computers expires, for instance, the company collects $39 for each tech support call unless the customer has paid $189 for a one-year service contract. Apple iMac customers get to purchase a three-year version for $169.

Online Support

The alternative these companies offer is a visit to their online version of customer service. Typically, there is a FAQ (frequently asked questions) page and probably one or more forums where customers can pose a question and have it answered by others who volunteer their time and wisdom.

For companies that offer it, online support has been a double boon. They save money by freeing customer service personnel for other work, while also building a cohesive, loyal community of repeat customers who can be tapped for other purposes — say, to test new products.

Bill Rose, founder and executive director of the Service and Support Professionals Association, noted not long ago, "Most customers want to be seen as experts and recognized as gurus in their fields." A number of people in customer service communities simply enjoy interacting with other like-minded individuals and helping them solve their problems. ●

Customer, Sell Thyself

Procter & Gamble is in the business of turning out consumer products by the barrelful. As its Web site boasts, "Three billion times a day P&G brands touch the lives of people around the world." But the company has another, very different line of business as well. It offers up the services of hundreds of thousands of moms and teenagers as word-of-mouth marketers — for its own product divisions and those of other organizations as well.

Donna Wetherell, of Columbus, Ohio, is one of those "mom connectors," as they're called. She's employed at a customer service call center, where she's known as "the coupon lady." That's because she's always passing out P&G coupons and sharing news of new products with her 300 co-workers.

All of us like to chat about the goods we buy and use. Each week, the average person mentions specific brands 56 times in the course of 100 conversations. And studies have shown that today's customers rely far more on what their friends and colleagues have to say about a product than on the ads they see on television. That's why, whether in person, on the phone or online, the messages carried by Donna Wetherell and her connector colleagues are so often welcome. "We know," says Steve Knox, chief executive officer of Vocalpoint, "that the most powerful form of marketing is an advocacy message from a trusted friend."

Vocalpoint and Tremor

P&G's word-of-mouth operation has two distinct pieces: Vocalpoint and Tremor. The Vocalpoint unit focuses primarily on P&G products and boasts 500,000 mothers of children under 19. The Tremor unit focuses mainly on products from clients other than P&G and includes 250,000 teenagers. Proprietary research techniques enabled the company to find teens and moms

who are gregarious and rich in friends. The average teenager has 25 friends on her instant message buddy list, while teen connectors have 150 or so. Mom connectors talk to 25 or so people a day, versus five for the average mother.

When P&G set about introducing its new dishwashing detergent, Dawn Direct Foam, it hired Vocalpoint to organize a crowdsourcing campaign. This is how Steve Knox describes what happened next: "Our connector moms looked at this product and went, 'Wow! That's so cool. My kids would want to help.'" That reaction led Knox to establish the talking points for his word-of-mouth army. In discussions with friends and colleagues, they would offer some "helpful hints" on how to get kids to do more chores around the house.

After that, Knox explains, "Dawn became a natural part of the conversation." The results: "We nearly doubled Dawn's business in the test market."

Consumer as Marketer

What started at P&G as a means to better peddle its own products has now become a profit center with clients ranging from cereal maker Kashi to cable channel Animal Planet to lubricant manufacturer WD-40. P&G CEO A.G. Lafley likes to say, "The consumer has become the marketer."

Procter & Gamble's success with word-of-mouth sales is just one example of the role this revolutionary breed of crowdsourcing can play in a marketing program. Merchants have relied on their customers to "spread the word" about their goods at least since the earliest Egyptians bartered their grain for olive oil or honey in the markets of Memphis. It's just that mobilizing huge numbers of people to take on that risk, and paying them nothing or next to nothing to do so, puts a whole new, directed spin on an old spontaneous practice.

By far the majority of P&G's connectors are upbeat about its products, but of course, there are no controls on what they actually say. Some comfort can be found in studies that show that when Americans talk about brands, positive mentions outnumber negatives by a ratio of 6 to 1.

Basic Change

The growth and public popularity of customer reviews and other examples of crowdsource marketing speak directly to a basic change in the nature of the relationship between you and your customer. The old commercial model, in which you presented the products for sale and the customer simply chose among them, is fast eroding. Today the customer is increasingly calling the shots. She's telling the world whether she likes or hates particular products she's tried. If you invite her, she's also up for making a few suggestions on how you might improve a product. Tomorrow she will insist on your coming up with new products that precisely meet her taste, telling you how they should be marketed and distributed, and proclaiming how well you've handled those tasks.

You can try to hold back the tide, maintaining your old way of doing business. You can find out what the customer wants and provide it. Or, best of all, you can determine where she's headed and get there ahead of her. ●

If We Build It, We Will Come

With millions of people clicking away on their digital cameras, millions of images were sitting around on computers. Most of the photos weren't professional quality, but there were an awful lot of good shots just taking up space. So it wasn't long before microstock houses, as they're known, began to appear on the Internet to tap that huge supply of digital images. The newcomers charged customers as little as $1 for a royalty-free license.

The pioneer was Calgary-based iStockphoto, which giant Getty Images bought in 2006 for $50 million. The iStock library holds more than 1.7 million images from 36,000 members, and it has been blessed with Getty's advanced search and index technology, which makes it easier for customers around the world to find just what they're looking for. The photos might not be up to the

Tips for Encouraging Customers to Sell

Here are three tips that can help you move customers to sell your product:

- **Know your fans.** Do some extra research to spot customers you can inspire to become your new, auxiliary sales staff. Tap your marketing people to find customers who have called or written praising the product and those who have a long track record of purchasing it.
- **Make them happy.** Word-of-mouth volunteers like being able to get across their point of view to other customers and to companies' management as well. They enjoy being on the inside.
- **Tap the talent.** Any sizeable community has large numbers of talented people — writers, artists, photographers — who are eager to see their work on display.

quality you'll find at Getty Images itself, but they have been selected by the company's editors, so they're apt to be just fine if you're putting together an office newsletter or even a magazine spread. And the price will be right.

iStock introduced a payment system that has become the industry standard. The minimum purchase is $12, which gives you 10 credits; images cost between one and 15 credits per download. The prices rise with the image size and resolution. iStock photos are downloaded at the rate of one every 2.5 seconds.

One reason for the site's success has been its welcoming content from contributors. The images are accompanied by symbols indicating how many of their photos have been sold through iStock and whether the work has been chosen for special attention on the site. Articles on the site offer photographic and design advice, and forums enable contributors to exchange news and speak their minds. The royalties many receive are impressive — exclusive contributors earn, on average, $1,000 a month. Also, they're happy about having other people see their work.

The advantages over traditional business models are huge. At iStock, contributors not only create the product being sold, but they also deliver it in a market-ready format and list it in the appropriate keyword category. With little or no product inventory expense or traditional overhead, the company can price the product far below that of old-model competitors.

Many communities are willing — indeed, eager — to become involved in creating products. Year after year, there are improvements in the technology that allow the crowd to produce content. Year after year, new online entries take advantage of the power of community, limited only by desire and imagination. ●

Welcome to the World Bank of We

Suddenly, there are sites that provide financing for business ventures that might otherwise never get off the ground.

When Buddy, her cuddly Bichon Frise, hurt his paw, Lyn Townshend of Longmont, Colo., refused to accept the so-called Elizabethan collar, the uncomfortable plastic cone that makes a dog look as though its head is stuck in a lampshade. So she sewed an elastic strap onto a sock and put the sock on Buddy's paw and the strap around his body, effectively covering the wound and keeping the dog from licking and chewing the dressing. She called it a Strock, combining strap and sock, and it was much more comfortable for the dog — not to mention much less embarrassing for its owner.

Best Buddy Pet Products

In fact, it was such a success that Townshend decided she had the makings of a commercial venture. Early in 2006, she formed Best Buddy Pet Products and began turning out designer Strocks on her home sewing machine. The new version was waterproof, came in different sizes to accommodate cats and noncanine pets, and used adjustable Velcro straps. On just her third sales call, Townshend won the endorsement of a veterinary hospital that was part of a 600-strong chain. Suddenly, it looked as though she would have to be ready to produce Strocks by the hundreds — without receiving payment until she delivered the finished goods.

What Townshend needed was a loan. The problem was, she had no income and a record of credit card delinquencies. Not surprisingly, she was turned down by her local bank and by the Small Business Administration.

Prosper.com

What to do? Wikinomics! Turning to Prosper.com, she joined the community's Business Owners Cooperative, made up of past and would-be borrowers. She posted her loan request on her page at Prosper and would-be lenders bid on it, until finally she was funded by a total of 77 people. On May 21, 2006, she landed a loan of $9,500 at 12.75 percent interest — considerably less than she would have had to pay on a credit card. She used it to buy office equipment, arrange for mass production at a nearby factory and get her product trademarked.

Prosper.com is a leading example of the power of community as financier, but it is just the latest twist in the ancient practice of people-to-people lending. Seventeen hundred years ago, long before there were banks or an Internet, there were communities in China called *lun-hui* whose members helped each other borrow cash. For centuries in the Caribbean, Africa, Korea and Vietnam, there have been local money pools. Members contribute a set amount each week and take turns picking up the total at the month's end. Known as *susu* in the Caribbean, *kaes* in Korea and *hui* in Vietnam, these lending societies are common in immigrant communities across the United States. As it happens, that's exactly how Prosper.com came into being.

The Web site came online in February 2006. It works very much like eBay, except that what is being auctioned is a loan. Registration is free. Borrowers get a page on the site to list the size of the loan they want — the upper limit is $25,000 — and the interest rate they're willing to pay. They also present their reason for the loan and as much information about themselves as

they think will help attract lenders. Prosper.com runs credit checks on potential borrowers, assigning them one of eight scores. It also provides the borrower's debt-to-income ratio. The auction can last from three to seven days, at the borrower's discretion.

Successful borrowers pay Prosper.com a 1 to 2 percent fee when a loan comes through, while registered lenders pay a 0.5 to 1 percent annual servicing fee on their outstanding loans. Just over a year after its founding, the company had marked up 11,100 loans totaling more than $65 million. Approximately 2 percent of funded loans in dollar terms, or 3 percent (339 loans) of funded loans in unit terms, have defaulted.

Other examples of social lending communities include Zopa and CommonAngels. Approaches might vary, but in all cases, the focus is on finding ways to minimize the lender's risk by providing the maximum amount of relevant information. ●

Make Everyone a C-We-O

Can a community successfully determine the direction of a company, making strategic decisions about what products or services to pursue and how to create, market and distribute them?

The answer, to date, has been no — and not for lack of trying. Perhaps the most thorough and intensive effort so far was undertaken in June 2005 by Rob May, an engineer, entrepreneur and founder of Businesspundit.com. He established a project called TheBusinessExperiment.com (TBE), which quickly attracted more than 800 members, all of them eager to participate in what promised to be a historic, groundbreaking venture. Together members selected a product — another Web site — and it was eventually designed and launched. Sad to say, in March 2006, just nine months after its birth, TBE was voted out of existence.

Cambrian House

Cambrian House relies on a community of 30,000 individuals to come up with new ideas, try them out, suggest improvements and then connect with other interested members to build and commercialize them. Points toward a share of any eventual profit and cash up front are awarded to idea inventors and those who spend time adding or improving features.

As of spring 2007, all four of the company's underwritten crowdsourced products were proceeding on course, with more than 200 other ideas under development by the Cambrian House community without any interference from the company itself.

So here we have a successful example of a community taking on some managerial duties, although there needs to be an asterisk beside that sentence. In the TBE project, the attempt was made to enlist the community in actually developing a chosen product — an attempt that eventually failed. At Cambrian House, employees perform and manage some tasks (designing, manufacturing and the like) if the company invests in or works directly with a community member's project.

These two examples leave the door open to the possibility that communities will eventually be able to handle substantial management tasks. ●

Lead From the Rear

All through history, leaders have sought to persuade or compel communities to change their ways. The more drastic the change desired, the less likely the success.

Wikinomic communities can often perform real-world tasks faster, better and cheaper than individuals can. But building a successful community is no simple matter. Here, as in all aspects of business, from hiring to marketing, the price of great rewards is great risk. And that has never been so true as in the era of Web 2.0, when a seemingly minor mistake can snowball into a fatal disaster with lightning speed.

Guidelines

The following guidelines are intended to help companies avoid some of the pitfalls along the Web 2.0 road:

1. Lead from the rear. The whole point of crowdsourcing is to access the fresh, powerful ideas and instincts of the community. The company's role is to provide direction and then stand back: Interference with communal processes defeats the purpose. When overzealous managers interrupt and derail the conversation, valuable ideas are lost.

2. Know when to step in. Communities have built-in self-correcting capacities. Troublemakers get squelched or ignored; bad information gets corrected. When intruders hinder a community's operations and remain unchecked, the company should not hesitate to step in. If the misinformation being bandied about might cause someone to make a potentially harmful or costly mistake, managers owe it to the community — and to the company — to clarify ASAP. In all cases, such intrusions should be brief and hedged with explanations.

3. Form a club, a real community of like-minded people. Creating a vibrant community is all about creating a critical mass of good minds and spurring them to spark off each other. But the odds of success improve when the members share the same general outlook — it simply makes it easier for them to communicate and cooperate.

4. You can't hide, so don't even try. It's an inescapable truth of this transparent age that sooner or later — and mostly sooner — the errors a company commits will be exposed for everyone to see. When a mistake is made in working with a community, the best course is to admit it without delay, apologize and make sure it's not repeated.

5. Forget about perfection. Anything that gets members of a community talking is good. Anything that slows that conversation is bad. When a company communication is too flashy or too finely tuned, it can rapidly shut down discussion and make it impossible to get the valuable feedback the company seeks.

6. Stir things up. There's nothing quite so blah and unproductive as a homogeneous, complacent community Web site. Companies need to make sure that contrary opinions are encouraged, that members start challenging the revealed wisdoms of the group. It's in the play of argument and counterargument that fresh ideas rise to the surface.

7. Say thank you. Companies that sponsor communities need to remember that a transaction is taking place. The members of the communities are sharing themselves and their talents in ways that have value for the companies, and their contributions deserve to be acknowledged and rewarded.

8. This is not a one-night stand. Communities take time to develop. Attracting a cast of valuable characters who share common interests cannot be accomplished overnight, and establishing and strengthening the personal relationships so necessary to a productive environment is a long-term proposition. This should not be rushed.

Join the Crowd

The world as we've known it is changing all around us, and a big part of that change is in the nature of the connections among people and between people and their employers. Computers, cell phones, iPods and the Internet are making us more distinctly individual and independent. We spend more time away from the office, working and traveling, and a great deal more time online, accessing information for our work and communicating with colleagues, suppliers and customers.

Although the Internet has made workers more independent, it has also led them to create communities built upon collaboration. In other words, our degree of separation from our customary work life has increased, while, at the same time, we have never been so widely connected.

Altering the Nature of Work

Experts such as Gartner Inc., a Connecticut-based technology research and advisory company, expect that these developments will drastically alter the nature of work over the next decade. Freed from dependence upon the company for infrastructure and resources, employees will provide intangible services from their own personally customized workspaces. They will rely on networks of people, many of them unaffiliated with their employer, for advice, information and best practices.

Inevitably, their relationship to the company will be transformed. The expertise they have chosen and developed will allow them to move easily from one employer to another, erasing whatever vestiges of company loyalty remain. They will insist that collaboration, much of it remote, replace the traditional authoritarian interactions of manager and employee.

As Gartner put it in a recent report, the new relationship will be one of symbiosis. Indeed, the corporation as it now exists, with its armies of salaried workers in identical cubicles, will gradually disappear. Instead, there will be virtual communities that will be able to mobilize teams of specialists to take on necessary tasks for customers.

Collaboration

Companies still have plenty of time to prepare and meet these work changes. Leaders need to examine their management and support policies and adjust them to fit the more collaborative model their newly independent employees seek. A policy carved in stone simply doesn't suffice for the new-breed workers who thrive on challenge and are constantly seeking out-of-the-box assignments that will boost their expertise. At the same time, companies should become knowledgeable about the care and feeding of virtual networks and communities, which play such an important role in the work life of the newly independent worker.

RECOMMENDED READING LIST

If you liked *We Are Smarter Than Me*, you'll also like:

1. ***Wikinomics* by Don Tapscott and Anthony D. Williams.** Using the collaborative-software "wiki" concept as their theme, the authors address how the Internet's social network offers new, decentralized ways to produce content, goods, services and profit.
2. ***Outside Innovation* by Patricia B. Seybold.** Innovation is what keeps companies at the top of their fields, and Seybold shows that the best way for companies to do this is to involve passionate customers in every aspect of their product and service design.
3. ***Citizen Marketers* by Ben McConnell and Jackie Huba.** In homes, dorm rooms and planes around the world, millions of people are exercising their influence on what we buy, even though they have no official connection to those products and services. "Citizen marketers" are forming growing communities of enthusiasts and evangelists, getting the word out about what products they love or hate.

THE SUMMARY IN BRIEF

Every year, millions of top performers are promoted to management-level jobs—only to discover that the tactics that got them promoted are not the tactics that will make them effective in their new role. In ***Welcome to Management***, Ryan Hawk provides practical, actionable advice and tools designed to ensure that transition is a successful one.

He presents a new three-part framework distilled from best practices drawn from in-depth interviews with over 300 of the most forward-thinking leaders around the world, as well as his own professional experience going from exceptional individual producer to new leader.

Offering valuable research and powerful, practical strategies, ***Welcome to Management*** will help high performers make the leap from individual contributor to manager with greater ease, grace, courage, and effectiveness. Welcome to management!

IN THIS SUMMARY, YOU WILL LEARN:

- The three key steps for becoming an effective manager.
- Why managers must first lead themselves before leading others.
- The importance of trust, vulnerability, and ownership in company culture.
- Why managers must lead, manage, and coach to be excellent and achieve results.

Introduction

You've just been promoted and are in a new management position. Congratulations. You are now the subject of the dinner table conversations of every person who reports to you. You are now responsible for the careers of those who report to you. You are now "the boss."

Few first-time managers know what it really takes to lead, to earn the trust and respect of your team, to develop a culture that leads to high performance, or to communicate in a way that moves people. Being promoted up the ranks is exciting, but unfortunately, the typical organization does an underwhelming job of preparing its new managers for success.

As a result, moving from team member to team leader will be the toughest transition of them all. The following three sections, lead yourself, build your team, and lead your team, are designed to help you make the leap from individual contributor to manager.

PART I: LEAD YOURSELF

You can't lead anyone else successfully over the long term until you take ownership of leading yourself. This is why before we start looking at how to manage your new responsibilities as a leader, we must begin with focusing on you.

There are two foundational reasons why focusing on leading yourself well is the proper starting point to learning how to lead others:

Building skills. Having the qualifications necessary to get that new management job is not the same as having the skills to do the job of leading others. You are about to discover that issues you thought were obviously black and white as an employee are now shrouded in shades of gray as a manager, and the skills that made you an excellent performer in your previous role are quite different from those required for your new responsibility—getting others to be excellent performers.

In order to develop these skills, refine them, and keep them honed and relevant, you are going to have to embrace the mindset, attitudes, behaviors, and habits of a self-driven learner.

Earning credibility. Do not expect respect, buy-in, and attentiveness from your team as an automatic benefit of your new role and title as their boss. Compliance can be commanded, but commitment cannot. People reserve their full capacity for emotional commitment for leaders they find credible, and credibility must be earned. Whether on the field or in the office, the best way to go about earning the credibility that leads to commitment is by modeling the behaviors you want your team to exhibit.

Lead Yourself on the Inside

To lead yourself well, we must begin by taking a hard look at what is happening in your heart and mind. The real work of leadership begins inside your own head.

What are the commonalities of those who sustain excellence over an extended period of time? These six words: Build yourself into a learning machine. "Learning machine" efficiently captures two important concepts: thoughtfulness and intentionality.

A person who is a "learning machine" is intentionally and constantly seeking new information with the goal of becoming better. Machines are not organic; they don't spontaneously generate. They have to be built. The same is true for a person to become a learning machine. Consider the Cycle of Learning, which involves four steps.

Step One: Learn

The beginning of any learning cycle starts with the intake of information. Taking charge of this process means proactively seeking information from people you trust and from those who have been where you want to go. There is no substitute for reliable expertise and the wisdom of experience. Learning can be sourced from three categories: mentors, virtual mentors, and coaches.

Mentors are people who have done what you want to do or have attained the position that you want to attain. Mentors are usually able to look at where you are in your career and offer specific guidance about how to move forward. The best mentors are those with whom you can build a real relationship. This is critical because the most important role a mentor fills is that of being the source of direct, honest feedback to help you improve.

Virtual mentors are people you may never meet but who teach you from afar. Books are one of the greatest ways to learn from experts from all over the world. Thanks to the power of fiber optics, cellular communications, and ubiquitous Wi-Fi access, you can watch videos of your virtual mentors wherever you are. Wherever you get your information, it's important to be selective about the knowledge you take in.

Coaching isn't about competition; it is about skill develop-

Disciplined leaders seek out opportunities to test themselves by purposefully and aggressively seeking out discomfort.

ment. No matter the domain, if you are aiming to improve yourself by developing a skill, you need someone who understands that skill to be on your sideline, wearing the coach's hat.

Step Two: Test

It is only through the kinetic energy of putting ideas into use in your daily life that you can test your understanding of what you have learned and the value of that knowledge. But practice must be accompanied by a feedback mechanism involving an expert. Scholar Anders Ericsson outlines a four-step process for "deliberate practice":

1. Set a specific goal.
2. Cultivate intense focus.
3. Ask for immediate feedback.
4. Seek frequent discomfort.

Step Three: Reflect and Adjust

Once you have taken the action that puts the new information you've learned into practice, it is tempting to move on immediately to the next new thing you can learn. Doing this short-circuits the process and skips a vital step: thoughtful reflection on the action you just took. Turning your learning and growth into an iterative cycle requires a look-back period. After the implementation work is done, set aside time to analyze your implementation efforts and ask yourself, "Did the steps I took based on the new information work?" "If so, why?" or "If not, why not?"

Step Four: Teach

There is something unique about the power of teaching others that cements what you have learned. Think about any moment that you were asked to give a presentation. It could have been for an assignment back in school or a project given to you by your boss at work. Regardless of how well you ended up doing the actual presentation, the preparation you put in was a powerful engine for learning to take place.

According to the authors of a study published in the September 2018 issue of Educational Psychology Review, the tactic of self-explanation boosts learning and understanding more than other methods, such as note-taking, problem-solving work, and hearing the material explained to the learner.

All of this internal, mental effort is designed to do one thing: to get you out from behind the walls of a fixed mindset and put you into the swift currents of a growth mindset.

Lead Yourself on the Outside

People who have discipline are able to do hard things. Why? Self-discipline gives them the ability to control their feelings and overcome their weaknesses, the ability to pursue what they think is right despite a multitude of temptations to abandon it.

In the words of pioneering baseball mental skills coach Harvey Dorfman, it is through self-discipline that one "is a master of, rather than a slave to, his thoughts and emotions." Therein lies the secret to turning all the intellectual learning discussed above into real, tangible change in the physical world. This process starts with mastering what we do with our bodies, with our time, with our effort.

Disciplined leaders seek out opportunities to test themselves by purposefully and aggressively seeking out discomfort. You can't know how far you can go without regularly putting yourself in situations where you are stretched beyond the known and the comfortable.

Everyone will face adversity. Succeeding comes down to how you choose to respond in those moments of difficulty.

Your Presence Is Required

Great leaders know that being among the people they lead matters a great deal. Abraham Lincoln maintained a practice of hosting "ordinary people" in his office, where he would talk with them and listen to what was on their minds. Frustrated by the effects on his schedule, Lincoln's aides tried to cut the presidential face time sessions short: "Mr. President, you don't have time to keep talking with these ordinary people."

"You're wrong." Lincoln would respond. "I must never forget the popular assemblage from which I have come."

There's no better way to tell whether the river you have to cross is 20 feet deep or two feet deep than by wading into it yourself. Be in the territory. Show up. Your presence is needed to make better, more informed decisions. This will build credibility with the people you lead.

Is it hard to travel to all the locations of your team members? Yes, of course it is. Managing a team is not for everyone.

Managing Your Time

Knowing where your time goes and being strategic and intentional about what you spend your time doing represent a huge lever that turns efforts to lead yourself into successfully leading others. For Peter Drucker, that meant applying a simple, three-step process:

- **Recording time**. Much like tracking one's spending as a means of budgetary control, make an accounting of where you spend your time throughout the day.
- **Managing time**. Remove the unproductive tasks that take time but don't produce value.
- **Consolidating time**. Manage the scheduling of time so that "discretionary time" (when your presence or attention isn't required by someone else) occurs in the largest blocks of continuous time possible.

Preparation: The Greatest Medicine for Fear

As a manager, there are countless moments in which you will need to be excellent at your craft. Your willingness to prepare properly for these important moments is critical to sustaining excellence as a leader.

For example, most people are not excited about going to a meeting. How can you change that as a manager? How will you open the meeting? What is on the agenda? What story can you share with your team to evoke the emotion and spark the ideas necessary to succeed that day?

How will you prepare for your one-on-one meetings with each team member? Have you thought about the unique qualities and personalities of each person and how best to connect with them?

PART II: BUILD YOUR TEAM

All of that takes prep work. It takes intentional effort and thought. To do it excellently, a manager must put in the time to think and be ready for the moment.
The building phase is the work of earning the respect of current and future team members and constructing the type of culture in which people want to do excellent work. Cultures of excellence come from leading with vulnerability to create a place of psychological safety and empowering your team to have ownership over their work.

It starts with understanding what it means to build an excellent culture and how we, as leaders, work to do it and sustain it on a daily basis so that it lasts. That means creating a place where intellectual curiosity and creativity are encouraged, and understanding when tough decisions of change have to be made.

Cultivate the Culture

Culture is the combined essence of the people in the organization. It's the collective energy of the people on the team, in the organization, and within the business. The way we actually interact—the social system—results from the culture created by the people in it. And unsurprisingly, the leader is vital in setting the culture.

Hopefully, the work of building your culture is intentional, but guess what? Whether it is the product of thoughtful design or mindless inertia, your results will flow from the culture you build.

If you've done the work to earn the respect of your team, you will then be in a position to start building a culture you want to have. Respect is regarding someone with high esteem because he or she has been deemed worthy. Consider the following seven keys:

- **Demonstrate competence**. You possess the necessary and critical skills required to lead in your organizational context.
- **Exhibit conviction**. You display assurance that the chosen course of action will lead to positive results.
- **Set high standards**. You aim high, both for yourself and your team.
- **Listen to your team**. You listen to feedback and you incorporate that feedback appropriately.
- **Work hard**. You put in the time and effort necessary to get the job done.
- **Do the difficult**. You do the hard things, like holding people accountable, confronting bad behavior, and staying true to your values even when it hurts.
- **Be consistent**. Your words, actions, decisions, and

investments are in alignment.

There are undoubtedly many different components to building a healthy, performing culture. Three in particular are valuable: trust, vulnerability, and ownership.

Trust is the foundation for everything you will do with your team. Yes, you will have to earn it, but it doesn't stop there. Equally important and maybe even harder to do: You will have to learn to trust your team members. Regardless of your entry point, as the new manager you will have to build trust and overcome the skepticism that's resulted from previous bad experiences.

Vulnerability is about connection. People connect more with those who are open and willing to share where they're weak. As the leader, we must work to create a safe place for our team members to share truth. In order to gain trust, we must give trust, and the quickest way to build trust is to share your own vulnerabilities.

The key to making it OK to be vulnerable is establishing an environment of psychological safety. Dr. Amy Edmondson, a professor at Harvard Business School, defines psychological safety as "a climate in which people are comfortable being (and expressing) themselves."

The most successful teams are made of people who have **ownership** over their decisions and their actions. It's very simple: People don't feel ownership if you tell them what to do. According to Gallup, only three in 10 U.S. workers strongly agree that at work, their opinions seem to count.

Empowering your team means that you're able to give them responsibilities and let them run with them, and then help them learn and grow from the experience after.

If you're used to being an individual contributor, the idea of delegation may feel counterintuitive. Empowering someone else to do the work is difficult if you feel they won't do it as well as you can. And often, they can't—at least not initially.

However, your goal is to scale your team, your business, and your group beyond you. It won't ever scale beyond you if you never give your team the opportunity to rise to the challenge, to fail, and to learn.

Manage the Roster

The most important decisions you make as a manager are those about the makeup of your team. Surrounding yourself with excellent people will be the single greatest determining factor in your success or failure as a leader.

Building your team well requires accurately analyzing what you have, correctly identifying what you need, and developing a deep understanding of what you're looking for beyond the simple skills needed to do the task.

The key to making it OK to be vulnerable is establishing an environment of psychological safety.

Hiring: What Are You Looking For?

In order to build the right team, first, it is necessary to understand what you value in a person. The specificity of the role you must fill is obviously an important part of the equation. But, too often, hiring managers focus on those spec requirements as if they are the most important parts of the hiring decision.

Taking this approach is a huge mistake and results in a great hire only by sheer luck. Far more important than the tangible skills you can find in multiple candidates or deliver through effective training is the makeup of the person who will be a complete asset to your team. To get this right, you must be intentional.

Sit down with your personal board of advisers and create your list of "must-have" or "nonnegotiable" qualities. Avoid the temptation to enumerate generically desirable virtues. For this to be an effective guide for your hiring process, you need to tease out why each of these qualities is important to you and your business.

After defining what you value in a teammate, now comes the hard part: figuring out how to accurately assess if the candidates you are interviewing possess those skills. Simply asking straightforward questions like "Do you have humility?" is not likely to yield any real insights.

The interview is when candidates are on their very best behavior. If they're late for their interview, that is a big red flag that speaks volumes about their punctuality and what

you should expect from them as a member of your team.

Get them out of interview mode. Take the candidate to lunch or dinner. Walk around the office and speak casually. How do they behave when they are more relaxed and their guard isn't up because they're not sitting in an interview?

Dig deep. Most candidates prepare for the basic interview questions. The best interviewers focus on the follow-up questions. Do your homework. When making a decision for who you're bringing on your team, it's worth the time to speak with as many people who know the candidate as you can.

Firing: When Pruning Is Required

There will be times when the only path to sustaining excellence is telling someone that they will no longer be part of your team. Manage a team for any length of time, and you will have to do it, so it is necessary to understand how to do it well.

The first time an employee hears in person from you that her work is not meeting the standards expected of her cannot be during the meeting in which she is being let go over it. Such a scenario is grossly unfair to the employee involved, and despite being obviously so, it happens with alarming regularity. There are also legal implications at stake. Document and be clear with the employee from the instant things start going south.

Don't do this alone. Talk regularly with close mentors. Meet weekly with your human resources partner. Make sure that you are not missing any possible detail, either in the legal and policy requirements governing the termination of an employee but also the good faith effort to help a struggling employee avoid this fate.

Write a script. Stumbling on your words during a termination meeting can lead to bad consequences. It is not uncommon for employees to file wrongful termination lawsuits based on managers saying something they shouldn't have during the final meeting. Write your script, and share it with human resources, as well as your mentors. Once it's been deemed correct, stick to it.

PART III: LEAD YOUR TEAM

Now, it is time to lead your team. How well you are able to do that will hinge on how well you master the art of being an excellent communicator. That means understanding the power of story and how to really connect with your team. It is through communication that the work of influence happens.

Now is the most critical time to get to know your team and understand what makes them go, because making them go is now your job. How well others perform is now the measuring stick for your performance. You are now responsible for steering the ship without getting to put your hands on the wheel. It's quite a different problem to solve.

And it all comes down to the results. As the leader, you are ultimately responsible for the results that your team produces.

Spread the Message

Effective communication is the lifeblood of effective leadership. Your team must understand the big picture mission of the team, as well as their specific role that contributes to the accomplishment of that mission. They must know exactly what you expect of them at all times. Your team can't know and do these if you don't clearly communicate with them. If the team doesn't have vivid clarity, then it is you, the leader, who is responsible for the failure in communication.

How Much and How Often

How much you say can be as critical to having your message heard as how you say it. Brevity is important. It is the whetstone great communicators use to give their messages a honed, razor-sharp edge.

Great comedians, writers, speakers, and movie directors know how to cut unnecessary fluff. When you are watching a movie that is the work of a gifted director, everything you see onscreen is there for a specific reason. A lot of time, money, and effort went into producing scenes and clips that never made it out of the editing room because they proved not to be necessary to telling the story.

Just as important as how much you say is the frequency and cadence of your communication. When you're a new manager, it is best to err on the side of overcommunicating with your team. Frequent communication can allay fears and build confidence as your team gets to know what you're about.

They'll see that you want to hear from them and that you will do your best to keep the channel open in both directions.

When it comes to communication, it's important to always remember its purpose: connecting with other people. We communicate to build relationships, express feelings, share ideas, and work together to accomplish what we could not do on our own.

The key to connection is to avoid the (manager) monologue.

Great management is figuring out how to work within the current constraints of the system you are in.

Instead, the conversation is about helping the other person figure out the answer that will motivate them to move forward.

How

How you communicate with your team will depend in large part on the way your workplace is set up and the cultural expectations of the organization. However, regardless of those specifics, the best form of communication is done in person.

In their landmark management book ***In Search of Excellence***, Tom Peters and Robert Waterman coined a simple phrase to describe this most basic form of leading others. They called it "Management By Wandering Around," now often referred to simply as MBWA. The purpose of MBWA is to connect with your people through the serendipity of random interactions, to gain a qualitative understanding of what's happening on the front lines.

However, there is a fine distinction between successfully employing MBWA to better know your team and their work versus crossing over into the dreaded practice of micromanaging.

If you're communicating with your team via email, remember that economy of words is essential. Have a purpose for every single email you send. If you start forwarding a bunch of meaningless emails with a note saying, "See below," the chances that your team will read them will drop dramatically. If they sense your emails have no point most of the time, your people are going to delete them and miss the important messages that you do send.

Make the Grade

When you raise your hand and step into the role of the leader, you are making the choice (whether you are conscious of it or not) to be responsible for the results of the team. Yet there's a lot more to it than simply saying, "I'm responsible" and being the one who has to answer to others (a boss, a customer, a board, investors) for those results.

Being accountable for your team's performance is a part of team leadership, but so, too, is the accountability you owe *to your team* to do the things that will help them achieve those results. This side of leadership is much harder and far more complex, which is why it is done well so rarely.

To be excellent, you need to lead, manage, and coach.

Leading

The act of leading is about providing purpose, direction, and inspiration to the group. It presents a vision, sees the big picture, and devises a strategy to accomplish the mission at hand.

To lead well means to have what author Robert Greene calls "a third eye"—a way of guiding you toward the larger picture while avoiding getting trapped in the hell of tactics. A great leader has an overriding sense of where she is taking the team at the macro level.

Strategists think beyond a single battle or even a series of battles. They are focused on the playbook of the long game, in which they expect to survive multiple defeats and still push forward to victory.

To lead like a strategic visionary, you must start by thinking like one. That means thinking through a progression of lenses, from the most high-level and general to ground-level and specific: from mission to vision to strategy to tactics.

Managing

Great management is figuring out how to work within the current constraints of the system you are in. It is the administration and stewardship of resources. It is because those resources are always limited—always—that the act of managing is even necessary.

Resource constraints demand creativity. When you don't have the luxury of throwing more money or people at a problem, you must be able to step back, identify what it is you're trying to accomplish, and find a different way to do it.

Managing limited resources is only one arena that requires the manager's attention. Another ubiquitous but ever-true cliché vying for the manager's attention is "managing change." As your competitive business market never stops changing, so, too, will the ways your company conducts its affairs internally.

When done well, how you manage change can serve as the steady bow of your team's ship, helping it cut through the turbulent waves of change while still staying on your prescribed course.

The primary reason change is met with resistance is uncertainty. No one likes uncertainty. One way to help your team navigate change successfully is to help them focus on what *isn't* changing. To overcome your team's resistance, intentionally couple your messages about the coming change with reassuring reinforcements of continuity.

Coaching

If leading is about strategic vision and managing is about administrative stewardship, then coaching is about developmental teaching. To be a coach is to give instruction delivered not to educate or inform but to improve.

For the manager of a team, coaching in this manner falls into two types: coaching for professional development (performance) and coaching for personal development (growth).

The best coaching for performance happens in the moments closest to when the performance happens. These regular, immediate bursts of micro-coaching should happen daily. Helping your team make the minor tweaks that improve their skill level doesn't require huge chunks of time devoted to training efforts.

Coaching for the personal development of your employees involves more long-term thinking. In this mode of teaching, your goal is to help them grow as a person in ways beyond their job performance.

This requires having conversations about their career ambitions in a focused, one-on-one setting. Or sharing with them books, podcasts, or other tools for self-improvement aimed at their individual needs and strengths.

These development conversations are a critical tool for creating the type of culture where people want to do their best work. When people know their boss has their long-term interests at heart while also working on short-term ways to help them improve their work, the quality of their performance improves dramatically.

Leaders—the ones worth following—are those who see themselves, their team, and the challenges before them with unvarnished honesty. They are intentionally aware of the gaps, shortcomings, and blind spots. They see reality, but they don't accept it as destiny. Instead, they set to work to fill in those gaps, overcome those shortcomings, and illuminate the blind spots.

Leaders undertake these efforts in the belief that improvement of themselves and their team is not only possible but inevitable if one follows the process, embraces learning with humility, and inspires others to do the same.

What Matters Now

How to Win in a World of Relentless Change, Ferocious Competition and Unstoppable Innovation

by Gary Hamel

THE SUMMARY IN BRIEF

What Matters Now is Gary Hamel's impassioned plea to rethink the fundamental assumptions we have about management, the meaning of work and organizational life. He asks, "What are the fundamental, make-or-break issues that will determine whether your organization thrives or dives in the years ahead?" The answer is found in five paramount issues: values, innovation, adaptability, passion and ideology.

Values: With trust in large organizations at an all time low, there is an urgent need to rebuild the ethical foundations of capitalism.

Innovation: Innovation is the only defense against margin-crushing competition, and the only way to outgrow a dismal economy.

Adaptability: In a world of accelerating change, every company must build an evolutionary advantage. The forces of inertia must be vanquished. The ultimate prize: an organization that is as nimble as change itself.

Passion: In business as in life, the difference between "insipid" and "inspired" is passion. With mediocrity fast becoming a competitive liability, success depends on finding new ways to rouse the human spirit at work.

Ideology: Today, businesses need more than better practices; they need better principles. Bureaucracy and control have had their day. It's time for a new ideology based on freedom and self-determination.

IN THIS SUMMARY, YOU WILL LEARN:

- How social media is dramatically transforming the way human beings connect, learn and collaborate.
- How innovation is the responsibility of every single individual.
- How to defeat bureaucracy, astonish customers and outrun change.
- How to build a company that's truly fit for the future.

THE COMPLETE SUMMARY: **WHAT MATTERS NOW**

by Gary Hamel

The author: Noted business thinker and strategist Gary Hamel has been on the faculty of the London Business School for nearly 30 years. He is the founder of the California-based think-tank The Management Lab. His most recent initiative is The Management Innovation eXchange **(www.managementexchange.com)**, a pioneering effort aimed at reinventing management by harnessing the power of open innovation. Hamel is the author of five books and numerous articles for the *Harvard Business Review* as well as the *Wall Street Journal*, *Fortune* and the *Financial Times*.

Preface

Obviously, there are lots of things that matter now, including social media, "big data," emerging markets, virtual collaboration, risk management, open innovation and sustainability. But in a world of fractured certainties and battered trust, some things matter more than others. While the challenges facing organizations are limitless, leadership bandwidth isn't. That's why you have to be clear about what *really* matters now. So ask yourself: What are the fundamental, make-or-break challenges that will determine whether your organization thrives or dives in the years ahead? For me, five issues are paramount: values, innovation, adaptability, passion and ideology.

SECTION 1: VALUES MATTER NOW

Putting First Things First

If you are a leader at any level in any organization, you are a steward — of careers, capabilities, resources, the environment and organizational values. Unfortunately, not every manager is a wise steward. Some behave like mercenaries — by mortgaging the future to inflate short-term earnings, by putting career ahead of company, by exploiting vulnerable employees, by preying on customer ignorance or by manipulating the political system in ways that reduce competition. What matters now, more than ever, is that managers embrace the responsibilities of stewardship.

To my mind, stewardship implies five things:

1. *Fealty:* A propensity to view the talents and treasure at one's command as a trust rather than as the means for potential gain.
2. *Charity:* A willingness to put the interests of others ahead of one's own.
3. *Prudence:* A commitment to safeguard the future even as one takes advantage of the present.
4. *Accountability:* A sense of responsibility for the systemic consequences of one's actions.
5. *Equity:* A desire to ensure that rewards are distributed in a way that corresponds to contribution rather than power.

The critical point is this: Because the decisions of global actors are uniquely consequential, their ethical standards must be uniquely exemplary. It's easy to feel sorry for Mark Hurd, the former Hewlett-Packard(HP) CEO who was pushed from his perch over what seemed to be a relatively minor infraction of HP's ethics rules. I don't know whether justice was done in that case, but I do know it's a good thing when influential leaders are held to high standards.

As we struggle with the uniquely complex challenges of the 21st century, it is good to remind ourselves that what matters most now is what's always mattered: *our bedrock values*.

Learning from the Crucible of Crisis

In July 2007, just weeks before the debt bomb exploded, Chuck Price, Citigroup's chief executive, defended his bank's gung-ho risk-taking in an interview with the *Financial Times*: "When the music stops, in terms of liquidity, it will get complicated. But as long as

the music is playing, you have got to get up and dance. We're still dancing." The last time I heard an excuse that lame it came from a 13-year-old: "But Dad, everyone's doing it."

The freedom of every human being to pursue his or her self-interest is an essential prerequisite for an open economy, but it is not an adequate moral foundation for capitalism. In *The Wealth of Nations*, Adam Smith, the patron saint of capitalism, made a compelling, if slightly depressing, case for self-interest:

It is not from the benevolence of the butcher, the brewer or the baker that we expect our dinner, but from their regard for their own interest. We address ourselves, not to their humanity, but to their self-love, and never talk to them of our own necessities, but of their advantages.

The Moral Superiority of Capitalism

The moral superiority of capitalism rests on the fact that in a free market the only way to do well is to do well for others. Critically, though, the grocer doesn't feed us because he is concerned about our hunger — he feeds us because there is a profit in doing so. Capitalism is animated by self-interest, but when it's not tamed by moral self-discipline, it can easily become mendacious. When that happens, the powerless get abused and the ignorant get duped, legislators get bought and safeguards get trampled. The "invisible hand" of the market is a wonderful thing, but when not guided by a deep sense of moral duty, it can wreak all sorts of havoc.

Though his acolytes seldom acknowledge it, Smith's philosophy was more nuanced than the previous quotation suggests. In *The Theory of Moral Sentiments*, Smith begins thusly:

How selfish soever man be supposed, there are evidently some principles in his nature which interest him in the fortunes of others, and render their happiness necessary to him, though he derives nothing from it, except the pleasure of seeing it.

To free market zealots, I would say the following: One doesn't have to disown an economic philosophy to recognize its shortcomings. So stop being so defensive!

All of us who have a stake in the future of capitalism have a nondelegable responsibility to make it better — and we must start by raising our own ethical standards and by challenging others to do the same. ●

Renouncing Capitalism's Dangerous Conceits

In 2010, Google formed a new social innovation unit that it describes as a think/do tank. Housed in the company's operational core rather than in its philanthropic foundation, Google Ideas is aimed at harnessing the company's innovation prowess and convening power in order to tackle some of society's most pressing problems — such as nuclear proliferation and failed states. One of the first efforts launched by Google Ideas was the Summit Against Violent Extremism (SAVE), held in the Dublin Convention Centre in June 2011. The event brought together jihadists, white supremacists and gang leaders, as well as some of their victims and a slew of academic experts. A representative participant, T.J. Leyden, was once a skinhead leader and is now executive director of Hate2Hope. Google hopes that forums such as this one will help to surface radical new approaches to seemingly intractable problems. Though it's too early to assess the success of the program, it is worth noting the principles upon which Google Ideas seems to be based:

1. In the long run, the interests of shareholders and society at large are convergent. Making the planet a "better" place serves the interests of business, and making businesses "better" serves the interests of every human being.
2. A company's social legitimacy can never be taken for granted — it can and will be challenged, so live with it.
3. Citizens and consumers expect companies to be not only socially accountable, but socially entrepreneurial.
4. Systemic problems can't be solved by a single institution or by people sitting around conference tables. Businesses are uniquely equipped to help mobilize relevant parties and get "boots on the ground." They need to be energetic partners of public institutions and NGOs.
5. "Don't be evil" (Google's famous mantra) is a *de minimus* standard. Today, a company needs a proactive strategy for buttressing its social balance sheet. Here, as everywhere else, the only option is to *lead*! ●

SECTION 2: INNOVATION MATTERS NOW

Defending Innovation

In recent years, left-brain types had the upper hand while starry-eyed innovators have struggled to get a hearing. Nevertheless, before innovation slips any further down the list of corporate priorities, we need to remind ourselves that we owe *everything* to innovation.

- **We owe our existence to innovation.** Our species exists thanks to 4 billion years of genetic

innovation. Since time immemorial, life has been experimenting with new genetic combinations, through sexual recombination and random mutations. As human beings, we are the genetic elite, the sentient, contemplating and innovative sum of countless genetic accidents and transcription errors.

- **We owe our prosperity to innovation.** Most of us do more than subsist. From the vantage point of our ancestors, we live lives of unimaginable ease. Between the years 1000 and 1820, global per capita income rose by a scant 50 percent. Over the next 12 decades, it grew by 800 percent. Put simply, innovation rescued humanity from privation.
- **We owe our happiness to innovation.** Humans are the only beings who create for the sheer pleasure of doing so. Forget the Renaissance, the Enlightenment and the Industrial Revolution — ours is the golden age of innovation, and we should take delight in that fact.
- **We owe our future to innovation.** Today, humanity's most pressing problems aren't merely technological; they're social, cultural, political, and global in scope. That's why, like Thomas Edison, we must innovate around innovation. Luckily, there are new meta-innovations (like idea markets, crowdsourcing and folksonomies) that can help us innovate across disciplines, borders, institutions and ideologies. This is the only way we'll solve the make-or-break challenges now facing our species. Our future, no less than our past, depends on innovation.

So don't give up. Innovation isn't a fad — it's the real deal, the only deal. Right now, not everyone believes that, but they will — even all those corporate cost-cutters with shriveled right hemispheres. ●

Deconstructing Apple

Over the past decade, Apple has produced a mind-boggling parade of accomplishments.

Having once been dismissed as a footnote in the personal computer industry, it is now the market leader in computers costing $1,000 or more. Apple's share of the industry's most profitable segment is estimated to be a whopping 90 percent.

Today Apple is the world's largest music retailer, a milestone reached just six years after the launch of its online music store in 2003. The 10 billionth song sold on iTunes was downloaded on Feb. 24, 2010.

Though it was a late entrant into the mobile phone business, Apple currently makes more money from its roughly 5 percent of the global handset market than Nokia makes with its 30-plus share.

Apple opened its first retail store in 2001. At the time, many retail analysts panned the strategy. Today, though, Apple's sparse, elegant shops generate four times the revenue per square foot of its big box competitors, and its Fifth Avenue store in New York is rumored to be the most profitable retail outlet in the world.

Since the launch of the company's App Store in 2008, Apple has become the world's largest software distributor.

The Most Valuable Company in the World

As I'm writing this, Apple's market value is $361 billion, making it the most valuable company in the world.

How in the world could one company accomplish all this? How in the heck do you build an organization that is capable of reinventing not just one industry, but five or six — including computing, music, retailing, mobile phones, software, and (just maybe) media and publishing as well? Most companies never reinvent one industry; no other company in history has reinvented a handful.

When you ask yourself, "What sort of values would a company have to venerate if it wanted to duplicate Apple's success?" the answers seem almost intuitive.

Be Passionate. Great success is the product of a great passion; it arises from the tireless and inventive pursuit of a noble ideal. And for Apple, that virtue is beauty. During his unveiling speech for the iPad, Steve Jobs remarked again and again, "It's just so amazing to hold."

Lead, Don't Follow. While Apple doesn't always pioneer a new product category — there were MP3 players before the iPod and smartphones before the iPhone — it always sets itself the challenge of radically redefining the status quo.

Aim to Surprise. As a company, Apple seems committed to exceeding expectations — to wringing little gasps of delight from even its most jaded customers. That's why I think the company's penchant for prelaunch secrecy is more than competitive paranoia; it's simply the way you produce the same sort of gee-whiz delight that a parent aims for on Christmas morning. Apple wants to bewitch us.

Be Unreasonable. Greatness doesn't come from compromise, from resigning oneself to the trade-offs others so blithely accept. It comes when trade-offs get transcended, when either/or gives way to both/and. Apple gets this, and frequently challenges itself to do the impossible — like producing products that are both gor-

geous and functional. Apple proves that a company doesn't have to choose between high value and low cost. Not only is it one of the world's most innovative companies, it's also one of the most efficient.

Innovate Incessantly and Pervasively. At Apple, innovation isn't a strategy or a department; instead it's the basic material that goes into everything the company does. From the wafer-thin MacBook Air to the App Store to the Genius Bar, innovation infuses everything Apple does. Apparently there are a lot of people at Apple who realize that innovation— in products, services and business models — is the only strategy for creating long-term value. If so, they must be relieved that innovation is still a sideshow in so many of their competitors.

Sweat the Details. Apple is justifiably celebrated for its sense of aesthetics — but great design isn't just about bold strokes, it's about getting all of the tiny things right that conspire together to make a product truly exceptional. In Apple's case, it's the magnetically-attached power cord on every laptop, it's the gorgeous packaging that surrounds every iPod, it's the single billet of aluminum that gives structural integrity to every MacBook — plus a lot more stuff you can't see.

Think Like an Engineer, Feel Like an Artist. A company can't produce beautiful products if bean counters win every argument.

Executives often wrongly equate "good value" with "low price," when what "good value" should mean is amazing value for the price. Historically, many of Apple's products carried a premium price tag, but customers anted up because they also delivered superior fun and functionality. Put simply, hyper-rational executives produce ultra-boring products.

The bottom line: Apple's unique success is a product of its unique values — which are uniquely innovation-friendly and customer-centric.

Apple may have patented a lot of things, but it hasn't patented the values that made it, for a time at least, the world's most successful company. Apple is proof positive that innovation matters now! ●

SECTION 3: ADAPTABILITY MATTERS NOW

Changing How We Change

The payoffs to investing in adaptability are many. First, a resilient organization should be able to avoid the sort of big earnings shocks that can slice a company's market value in half. Executives often complain that investors overreact to small earnings misses, but I'm not so sure. In recent years, investors have seen a lot of companies self-destruct when they missed a paradigm shift, underestimated a new competitor or simply stopped innovating. When a company's earnings disappoint, investors have to ask themselves: Was this a blip, the result of an easily corrected operating glitch or is this an early warning sign of a structural decline in the long-term profitability of this company's business model? Executives will always claim it's a blip, but investors have learned to be wary of glib assurances. The safest thing to do is dump the shares, and then buy them back later once the problems have been remedied.

Investors Like Predictability

Investors like predictability and will pay more for a less volatile earnings stream. Though short-term earnings can be manipulated with accounting tricks, adaptability is the only thing that can deliver a smooth, upward slope over the long run. An adaptable company rethinks its strategy without having to walk through the valley of the shadow of death; it reinvents itself before getting mugged by the future. As a result, it experiences fewer financial reversals and its share price commands a premium. This is reason enough to care about adaptability, but there's more.

An adaptable company is one that captures more than its fair share of new opportunities. It's always redefining its core business in ways that open up new avenues for growth. If it had been more adaptable, Best Buy might have seen the opportunity for delivering movies online and beat Netflix to the punch; Coca-Cola might have preempted Gatorade in the sports drinks business; and General Motors, rather than Toyota, might have developed the world's best-selling hybrid. An adaptable company is always reinventing itself, always pioneering new markets.

An enterprise that is constantly exploring new horizons is likely to have a competitive advantage in attracting and retaining talent. A dynamic company will have employees who are more engaged, more excited to show up to work every day and thus more productive.

Building organizations that are as resilient as they are efficient may be the most fundamental business challenge of our time. Adaptability *really* matters now. ●

Future-Proofing Your Company

Today our world is dominated by large-scale organizations. We rely on them as consumers, work for them as employees and depend on them as investors. And yet, these organizations often seem to fail us. As consumers, we are often the victims of their indifference, of rules

and policies that are efficiency-focused rather than service-focused. As employees, our voices are often ignored and our creative energies wasted. And then, when the inevitable crisis occurs, we are asked to bear a disproportionate share of the costs. As investors, we watch our portfolios shrink when once-great companies miss a turn in the road. All of us have a huge stake in our organizations, and we need them to be far more resilient than they are today.

Like those long ago management innovators, we can dream, too. We can dream of organizations that are forever looking forward and jump at every opportunity to better the human condition. We can dream of organizations where the enthusiasm for change is palpable and pervasive, where individuals, ennobled by a sense of mission and unencumbered by bureaucracy, rush out eagerly to meet the future. We can dream of organizations where the fearless renegades always trump the fearful reactionaries, where the constituency for the future always outguns the constituency for the past. We can dream of organizations where the drama of renewal occurs without the trauma of a turnaround. And, if we're daring and inventive and determined, we can build these organizations. That's what matters now. ●

SECTION 4: PASSION MATTERS NOW

Exposing Management's Dirty Little Secret

Consider the 2007-2008 Global Workforce Survey conducted by Towers Perrin (now Towers Watson). In an attempt to measure the extent of employee engagement around the world, the company polled more than 90,000 workers in 18 countries. The survey covered many of the key factors that determine workplace engagement, including the ability to participate in decision making, the encouragement given for innovative thinking, the availability of skill-enhancing job assignments and the interest shown by senior executives in employee well-being.

Here's what the researchers discovered. Barely one-fifth (21 percent) of the employees surveyed were truly engaged in their work, in the sense that they would "go the extra mile" for their employer. Nearly four out of 10 (38 percent) were mostly or entirely disengaged, while the rest were in the tepid middle. There's no way to sugarcoat it: This data represents a stinging indictment of management-as-usual.

Management Issues

Only 38 percent of employees believe that "senior management [is] sincerely interested in employee well-being." Fewer than four in 10 agree that "senior management communicates openly and honestly." A scant 40 percent believe that "senior management communicates [the] reasons for business decisions," and just 44 percent of employees believe that "senior management tries to be visible and accessible." Perhaps most damning of all, less than half of those polled believed that "senior management's decisions [were] consistent with our values."

My conclusion from all of this: If we're going to improve engagement we have to start by admitting that if employees aren't as enthusiastic, impassioned and excited as they could be, it's not because work sucks; it's because management blows. ●

Building Communities of Passion

First, if you're a formally appointed leader, and you want to turn sheep into shepherds, you have to take off your leadership mantle and say to people, "I don't have a plan, what's yours?" That's humbling, but it's the only way to release the latent talents within your organization.

Second, you have to let people find the work that best suits their interests. This is the key to building a community of passion. When you force people into slots, you get slot-shaped contributions; you don't get bold and aston-

Putting Individuals Ahead of Institutions

Building human-centered organizations doesn't imply a return to paternalistic, corporate welfare practices of the 19th century. Most of us don't want to be nannied. We understand we live in an uncertain world, where no one can guarantee our job security. We also understand that individual interests vary, and that no single organization can reconcile all our competing demands. Nevertheless, we expect our institutions to be our servants and not the reverse. This implies organizations that are built around some simple but important principles:

- Decentralize wherever possible.
- Emphasize community over hierarchy.
- Ensure transparency in decision making.
- Make leaders more accountable to the led.
- Align rewards with contribution, rather than with power and position.
- Substitute peer review for top-down review.
- Steadily enlarge the scope of self-determination.

ishing contributions. If you want the unexpected, you have to give people the freedom to *do* the unexpected.

Now, can you run an airline this way, or a semiconductor fab line? I don't know, but I bet you can run parts of the organization like this. One thing I'm sure about: If you want to take full advantage of the extraordinary talents that exist in your organization, you'll need to ask yourself each day, "What can I do to make this place feel less like a hierarchy and more like a community?" ●

Reinventing Management for the Facebook Generation

The experience of growing up online will profoundly shape the workplace expectations of Generation F. At a minimum, they'll expect the social environment of their worklife to reflect the social context of the Web, rather than a mid-20th-century bureaucracy.

With that in mind, I compiled a list of work-relevant characteristics of the social Web. Here are five of the post-bureaucratic realities that tomorrow's employees will use as yardsticks in determining whether your company is "with it" or "past it."

1. **All ideas compete on an equal footing.**
   On the Web, every idea has the chance to gain a following, or not. Ideas gain traction based on their perceived merits, rather than on the political power of their proponents.
2. **Contribution counts for more than credentials.**
   When you post a video to YouTube, no one asks you if you went to film school. When you write a blog, no one cares whether or not you have a journalism degree. On the Web, what counts is not your resume, but what you can contribute.
3. **Hierarchies are built bottom-up.**
   In any Web forum there are some individuals who command more respect and attention than others, and have more influence as a consequence. Critically though, these individuals haven't been appointed by some higher authority. Instead, their clout reflects the freely given approbation of their peers. On the Web, authority trickles up, not down.
4. **Leaders serve rather than preside.**
   On the Web, every leader is a servant leader; no one has the power to command or sanction.
5. **Tasks are chosen, not assigned.**
   The Web is an opt-in economy. Everyone is an independent contractor and everyone scratches his or her own itch. ●

Reversing the Ratchet of Control

Take a moment and ask yourself: How many policies in your company exist only to preserve the fiction that the higher-ups really are in control? How many rules enforce standardization at the expense of initiation and passion, while delivering few if any performance benefits? Better yet, post those questions on an internal wiki and invite your colleagues to join forces in reversing the ratchet of control.

SECTION 5: IDEOLOGY MATTERS NOW

Challenging the Ideology of Management

Here's a word that probably doesn't get much airtime in your organization: ideology. Do a search of your company's internal website and I'm willing to bet you won't find a single reference. That's a problem. As managers, it's our creedal beliefs that prevent our institutions from being more adaptable, more innovative, more inspiring and more noble-minded. We are limited by our management ideology.

A Viable Philosophical Rival to Freedom

Does control have a viable philosophical rival? Sure, *freedom*. People who are free to follow their interests, choose their allegiances and make their own commitments, *flourish*. And what we need now more than ever are organizations that allow human beings to do just that. An organization will never be fully capable unless it's fully human. The trick, of course, is getting beyond the rhetoric. We need an ideology that is radical *and* potent, one that emancipates employees, demolishes top-down hierarchy and still produces solid business results.

Can we find smarter ways of managing the tension between control and freedom? Yes. Can we overcome the systemic incompetencies of our control-besotted management structures? Yes. Two extraordinary companies have been built around the ideology of self-determination: W.L. Gore and Morning Star. These aren't poofy startups or flaky experiments. They are large, process-intensive businesses and they're industry leaders. What you won't find in either of these companies is a formal hierarchy, a trickle-down power structure or employees who feel like serfs. What you will find is a dynamic balance of yin *and* yang, of freedom *and* discipline, of accountability *and* autonomy.

Is it easy doing battle with bureaucracy? Nope. You can't empower the many without disempowering the few, and the few probably won't like that. Indeed, that's one of the reasons the bureaucratic model has been so sticky: It provides a powerful rationale for the organizational caste system. Like the rest of us, CEOs, VPs and department heads are jealous of their prerogatives. They would like to believe that it's impossible to manage without a management hierarchy, but it's not. ●

Escaping the Management Tax

Managers the world over have spent the last decade wringing inefficiencies out of their operating practices. Now they need to face the fact that management itself is a swamp of inefficiency. Some of these inefficiencies show up on the P&L, but it's the ones that don't, such as decision lags, hidden biases and disempowerment, that may be the most costly. In a global economy, there's no place for inefficiency to hide, so companies that don't find a way to reduce the management tax will ultimately find themselves at a profound disadvantage.

Whatever the uncertainties, two things seem certain. First, with a bit of imagination it's possible to transcend the seemingly intractable trade-offs (like freedom versus coordination) that have long bedeviled human organizations. And second, you don't have to be crazy to dream of organizations where managing is no longer the right of a vaunted few but the responsibility of all. ●

Aiming Higher

Solving the world's toughest problems or, more modestly, creating organizations that are deeply human will require more than scientific breakthroughs; it will require new ways of planning, organizing, collaborating, allocating, motivating and yes, controlling.

As managers, we're pragmatic doers, not starry-eyed dreamers. And yet, as human beings, we are ultimately defined by the causes we serve and the problems we struggle to solve. Though big problems don't yield big advances, small ones never do.

It was that thought that brought 36 management experts together in Half Moon Bay, Calif., in May 2008. Their mission: to create a roster of make-or-break management "moonshots" that would inspire innovators everywhere. Here are the top three:

Moonshot #1: Ensuring That Management Serves a Higher Purpose. Tomorrow's management practices must be focused on the achievement of socially significant and noble goals.

Moonshot #2: Embedding the Ethos of Community and Citizenship. In tomorrow's interdependent world, collaborative systems will outperform those characterized by adversarial, win-lose relationships.

Moonshot #3: Humanizing the Language and Practice of Business. Tomorrow's management pioneers must find ways of infusing mundane, commercial activities with deeper, soul-stirring ideals, such as honor, truth, love, justice and beauty.

Getting Started

Maybe you have an idea for how to make progress on one of the management moonshots. Perhaps you've come across an unconventional management practice that has redefined the boundaries of what's possible. Or maybe you're just curious about what other organizations are doing to escape the limits of management-as-usual. If so, visit www.hackmanagement.com, the world's first open innovation project aimed at reinventing management. There you'll find hundreds of case studies from the world's most progressive organizations, and a multitude of radical proposals for reinventing management as we know it, all of which are organized around the management moonshots.

The key takeaway is this: We have the chance to make a new beginning. We don't have to live with organizations that are ethically challenged, inflexible and inhuman. We can build organizations that are noble at their core, that honor every creative impulse, that change before they have to, that stir the heart and that are bureaucracy-free. Doing so won't be easy, but I hope now you have enough inspiration and instruction to make a start.

What matters now, more than ever, is that you question your assumptions, surrender your conceits, rethink your principles and raise your sights — and that you challenge others to do the same. We know broadly what must be done to create organizations that are fit for the future. The only question is, "Who's going to lead and who's going to follow?" How you answer *that* question matters most of all. ●

RECOMMENDED READING LIST

If you liked *What Matters Now*, you'll also like:

1. ***Good to Great* by Jim Collins.** Collins' follow-up to his bestseller *Built to Last* sheds light on virtually every area of management strategy and practice.
2. ***The Future of Management* by Gary Hamel.** Hamel describes the steps your company can take now to build your "management advantage."
3. ***Competing for the Future* by Gary Hamel and C.K. Prahalad.** The co-authors develop a coherent model for how today's executives can identify and accomplish no less than heroic goals in tomorrow's marketplace.

The 4+2 Formula for Sustained Business Success

WHAT REALLY WORKS

THE SUMMARY IN BRIEF

Business is full of mysteries, but none greater than this: What really works? Today's managers realize all too painfully that many, many things matter in achieving business success, but few of them can tell you much more than what worked for them. They spend years guessing at what really matters in business, and guessing wrong — they pursue fads and follies without getting to the heart of the fundamental practices that create business success.

The authors of What Really Works *conducted a 10-year study that turned 50 academics and business consultants loose on dozens of companies, looking for the answer to that elusive mystery — What really works? From that study emerged the 4+2 Theory, which provides the correct combination of primary and secondary management practices that form the crucial practices that achieve lasting business success.*

What You'll Learn In This Summary

✓ **How to make your strategy clear and focused.** Managers must devise and maintain a clearly stated, focused strategy that is clearly communicated, and effectively understood by employees, customers, partners and investors.

✓ **How to execute your strategy flawlessly.** You must be efficient in your planning and perfect in your execution.

✓ **How to build a performance-based culture.** Performance makes the difference — the setting of performance standards and consistent achievement of those standards drive a company in the right direction, consistently.

✓ **How to make your organization fast and flat.** Cut through the layers and silos and create an open, communicative and effective organization.

✓ **How to make talent stick around and develop more.** Going outside the company for talent might occasionally be necessary, but you likely have a star or two in your organization right now, waiting for their chance to shine.

✓ **How to make industry-transforming innovations.** Keep your organization off life support by supporting research and development.

Primary and Secondary Management Practices

There are eight management practices — four primary and four secondary — that directly correlate with superior corporate performance, as measured by total return to shareholders (TRS). Winning companies achieve excellence in all four of the primary practices, plus two of the secondary practices — hence, the 4+2 formula. All eight practices have features that are both intuitive and counterintuitive.

The Four Primary Management Practices

The four primary management practices are strategy, execution, culture and structure.

Strategy. Managers must devise and maintain a clearly stated, focused strategy. Whatever your strategy — whether it is low prices, innovative products, or some other initiative — it will work only if it is sharply defined, clearly communicated, and effectively understood by employees, customers, partners and investors.

Execution. Companies must develop and maintain flawless operational execution. You might not always delight your customers, but you must make sure you never disappoint them. Winners consistently meet the expectations of their customers by delivering on their value proposition, slashing operational costs, and increasing productivity consistently, year in and year out.

Culture. Organizations must develop and maintain a performance-oriented culture. It is the setting of performance standards and consistent achievement of those standards that make the difference. How one deals with poor performers is also a key factor.

Structure. Companies must build and maintain a fast, flexible and flat organization. Simpler and faster are the best goals for all reorganization efforts.

The Four Secondary Management Practices

Any combination of two secondary management practices (talent, leadership, innovation, mergers/partnerships), when combined with the four primary management practices, can make a company a winner. Each secondary practice, however, has its own surprises.

Talent. Companies must hold on to talented employees and work to find more. The most important indicator of the depth and quality of talent in your organization is whether you can grow your own stars from within, not whether you can buy or rent talented outsiders.

Leadership. Firms must keep leaders and directors committed to the business. Boards that choose great chief executives can see significant gains in performance. Good boards must possess at least two significant characteristics: They must truly understand the business, and be passionately committed to success.

Innovation. An agile company keeps turning out innovative products and services, and anticipates disruptive events, rather than constantly reacting to them.

Mergers/Partnerships. Internally generated growth is essential, but companies that can also master mergers and acquisitions are more likely to be winners. Companies that do two or three small deals each year, consistently, are more likely to be successful than organizations that do large deals only occasionally. ■

4+2 in the Real World

How does the 4+2 formula work in the real world? Take, for example, Dollar General Corp., a retailer that brings in $5 billion in annual sales by targeting customers making under $20,000 a year, placing its stores in small towns and low-income areas, selling half its

4+2 in the Real World

(continued from page 2)

wares for $1 each, and catering to customers who spend, on average, less than $8 on any given visit. Dollar General excels because it exemplifies the 4+2 formula in its across-the-board pursuit of all four primary practices, while also carrying through on two of the secondary factors.

Primary Practices

Strategy. Dollar General maintains a clear focus on its chosen market of low-income customers. The company's strategic purpose is to help its customers improve their standard of living by selling them high-quality goods at the lowest possible prices. The organization's customers are pursued by many companies, but almost as an afterthought; most go for more affluent clients and fatter profit margins. Dollar General, on the other hand, deliberately focuses on its "salt of the earth" customers.

Execution. The company consistently delivers on its promise to provide quality goods at everyday low prices; the stores are replete with bargains designed to astonish customers. Since its stock is basic consumer goods, Dollar General holds no special sales, nor does it rely on advertising to bring in new customers. The company passes on the savings of a "word of mouth" marketing strategy to customers.

The company's suppliers are also eager to do business with Dollar General, because it guarantees their products high volume and limited competition. Each store carries, on average, 3,500 items, or stock-keeping units (SKUs). Each year, the stores review their SKUs to ensure they are still delivering value; as a result, the store drops 150 to 200 items, replacing them with new ones.

Culture. Winners design their corporate cultures to support the highest possible levels of performance, fulfilling their strategies and satisfying the specific needs of their markets. In accordance with this focus, excellence in management at Dollar General starts with adherence to the fundamental value of hard work, the dignity of work, and the dignity of every person.

Dollar General's commitment to the overall well-being of its customers goes beyond providing affordable, quality goods. In its inner-city stores, where the company has invested heavily in community career development, it runs learning-center work programs, as well as programs that teach people to read, write and earn their high school equivalency diplomas.

Structure. Dollar General possesses a lean, quick organization that responds rapidly to market changes without wasting time or incurring unnecessary costs. Its corporate structure, no matter how big the company becomes, must always remain simple and productive.

Secondary Practices

Dollar General also excels in two particular secondary practices: talent and leadership.

Talent. The company watches out for its store employees, offering stock options and profit-sharing bonuses in an effort to make all employees feel like owners, operators and independent merchants. Employees at the company's headquarters are likewise treated very well, and can take advantage of an on-site day-care center, training center, fitness center, dry cleaner, ATMs, travel agent, and other first-class amenities.

While the corporate campus was intended to be a magnet for talent, in the end, it is Dollar General's strong corporate culture and values that attract and keep the most appropriate employees to achieve its goals.

Leadership. The dedication, intelligence, and personality of Dollar General's CEO Cal Turner, Jr., have played a major role in making the company a winner. Turner recognizes the talent and solid ideas of his employees, and is very quick to give and share credit. He also recognizes when things aren't working, such as in 1987, when he set a new leadership tone by replacing 200 of his top executives with more seasoned professionals. He did so in order to be able to gain truthful advice from his people, not simply to have a corral of "yes men" agreeing with everything he said or did. ■

Make Your Strategy Clear and Focused

One thing most managers can agree upon, at least in principle, is that growth of one's core business should be one's major strategic focus. In the heat of the moment, however, when too many entities within the organization demand too much support, too many leaders allow their resources to be nibbled away for lesser purposes, while their core business languishes. That doesn't happen in winning companies, where leadership observes five mandates of strategy management:

Build a strategy around a clear value proposition. A value proposition is not so much a statement of what you want to be, but of what you are. It connects a company's ability to deliver a product or service with the needs of a targeted market segment. Clear value propositions are essential; winners' value propositions are rooted in a deep, certain knowledge of their customers and a realistic appraisal of their own capacities.

Develop strategy from the outside in. Winners in every industry are guided by the words, actions and behaviors of their customers, partners and investors in creating their strategies. They don't (as many do) insist

(continued on page 4)

Make Your Strategy Clear and Focused

(continued from page 3)

on following their "instincts" in devising strategy. They don't prattle endlessly about their "feel" for the market. They don't write off failed product lines as victims of bad timing. They ask for feedback, and see that it is incorporated into strategy.

Remain alert and flexible to address changes in the marketplace. In a blizzard of ideas and innovation posted on the Internet and spread by cell phone, spotting the new developments that will have an impact on a particular business is tougher and more important than ever. Winners possess antennae sensitive enough to pick up early on marketplace trends and changes that count. Winners do not shrink from the challenge of keeping track of it all. They develop ways to anticipate change, and tools that help them take advantage immediately.

Clearly communicate your strategy. For strategy to be implemented properly, it must be presented and explained first and foremost to the people who will be bringing it to life — your managers and employees — and those who will benefit from it — your customers. By sharing strategy, a company paves the way for its products and sells itself to its customers. It also invites customers to become partners in the chain that leads from raw materials to finished products to sales.

Keep growing your core business. Company leaders like to talk about growth. The word itself quickens the pulse of many executives. It's a sign of progress, a proof that the organization is vital and alive. It is also one of the chief measures by which markets judge a company. True winners embrace growth, but in an intelligent manner. They grow within their core business or niche, building their growth businesses before the potential of their core is extinguished. This dynamic approach to growth is essential for long-term success. ■

For Additional Information on a company that developed strategy from the outside in, go to: http://my.summary.com

'Quantification Johnson' Turns Around Campbell Soup

When David Johnson arrived at Campbell Soup Co.'s headquarters in 1990 as CEO, he joined a company whose sales were flat, its profits in decline, its market share dwindling, and its stock price in the doldrums.

He immediately turned his attention to cutting costs and raising productivity. Within nine months, he had closed down or sold 20 plants, slashed the work force by 15 percent, sold unprofitable overseas businesses, and ditched dozens of unprofitable product lines. The plants that survived the ax were instructed to bid for business that had been handled by the deceased operations, forcing plant managers as never before to focus on cutting costs and improving productivity.

For his flawless execution in cutting costs and holding both executives and managers accountable for meeting bottom-line goals, the new CEO was given the name "Quantification Johnson." He was also witness to an annual growth of 18 percent for each of his first five years in charge.

Execute Flawlessly

Most of our days as businesspeople are spent making incremental decisions about small, everyday matters. Every so often, however, inspiration hits, and we find ourselves at a fork in the road, with one path leading to familiar ground, and the other leading into new territory, toward a future rich in promise and uncertainty. To fully embrace these opportunities, we must achieve superior execution, which can only be done through intense and continuing study and constant effort, along with a willingness to try something new. Flawless execution is also dependent on meeting three key mandates.

The first is to **deliver products and services that consistently meet customers' expectations.** Winning companies excel behind the scenes, developing the systems and processes that produce the products customers see and use, and that meet customer expectations. Winners consistently deliver the quality their customers expect. While perfection is not necessarily required, customers recognize poor quality, and their trust in a company evaporates when they see it.

Flawless execution also requires you to **empower front-line employees to respond to customer needs.** The moment when the customer interacts with an employee, your organization's chances for success are on the line. Winning companies understand that front-line people must be given the authority to make real-time decisions, along with the training that will help them make the right ones.

The final mandate is to **constantly strive to improve productivity and eliminate all forms of excess and waste.** The goal is to achieve perfect operational execution, constantly improving systems and processes, hiring better people, routing waste and inefficiency. Winners recognize there is no way they can be truly flawless in outperforming competitors at every turn. Instead, they determine which processes are most important to meeting customer needs, and focus resources on making those processes as efficient as possible. ■

Build a Performance-Based Culture

In some corners of the business world, culture is only now beginning to be taken as seriously as other aspects of management and business, such as operations. Winners become winners, though, because virtually everyone in the organization is performing at a high level — an effort brought about by a focus on culture.

Too often, companies fool themselves into believing they are doing well because they have better results than the previous year. While year-to-year improvement is indeed a positive measurement, it is also an insufficient one, because it does not take into account the performance of one's competition. A cutback in expenses of 2 percent in a given year is no cause for celebration if your rivals have cut back 3 percent.

A high-performance culture constantly raises the bar, aiming to surpass top-ranked companies in one's immediate industry, as well as those in other industries. When stretch goals turn out to be unreachable, a company often finds opportunities (such as outsourcing possibilities) it might have otherwise missed. Such a culture requires businesses to observe four key mandates.

Four Key Cultural Mandates

1. Inspire all to do their best. Winning companies seek to design and support a culture that promotes high levels of individual and team performance: one that holds both employees and managers responsible for corporate success. Along with that responsibility, employees and managers are empowered to make many more independent decisions, and are urged to find ways to improve company operations.

2. Reward achievement with praise and pay-for-performance, but keep raising the bar. People must earn a livelihood, and the greater our income, the greater our psychic satisfaction in a job well done. Winners recognize extra money in one's wallet provides at least a modicum of inspiration, so they use financial rewards to urge employees to higher levels of performance. They also develop programs to give productive employees public recognition of their achievements.

3. Create a work environment that is challenging, satisfying and fun. There is a fine line between a high-performance culture and a high-anxiety culture, and leaders cross that line at their peril. Winners maintain a pleasant, satisfying workplace, and reap the benefits in increased teamwork, trust and efficiency.

4. Establish and abide by clear company values. Good behavior promotes good business. Conversely, weak or nonexistent values will, in the end, destroy lives and ruin enterprises (as shown by Enron, WorldCom, and other recent examples). Winners abide by the mandate to establish and live by a strong value system, one that is well-considered and well-communicated. Implicitly or explicitly, such values should be part of every communication a company sends employees and every interaction between employees. ■

For Additional Information on a company's successful pay-for-performance strategy, go to: http://my.summary.com

Make Your Organization Fast and Flat

Some procedures and protocols are absolutely necessary to the smooth functioning of any large organization. But there is such a thing as having too much of a good thing. Superfluous bureaucracy is a tax on the value your employees create. It leads to impatience, which can devolve into an unhappy acceptance, which breeds indolence. Winners are dedicated to trimming away every possible vestige of unnecessary bureaucracy.

In every business, there is a natural drift toward complexity. The urge to add permanent new rules and procedures to existing processes reflects a desire to quick-freeze current results. It can also reflect a manager's desire to fix his or her control of the process in concrete. Winners are aware of this drift, and have established systems to prevent it. They also observe three essential rules of keeping organizations fast and flat.

First, they **eliminate redundant organizational layers and bureaucratic structures and behaviors.** Simplifying the structure of a company yields many benefits, not the least of which is the ability to make decisions quickly. Too often, promising ideas get hung up in bureaucratic traffic, slowly inching their way through the layers of approval that must be met before being put into action. Winners, on the other hand, consider ideas rapidly, setting reasonable limits to deliberations. They are able to do so because they have kept the layers of bureaucracy to a minimum. This means they can also turn on a dime and reverse course, if necessary.

The second essential rule for keeping organizations fast and flat is to **promote cooperation and the exchange of information across the whole company.** Even when a company is not held up unnecessarily by the silos of long-time privilege and resulting turf wars, it can suffer from boundary problems. Competition for resources can be fierce, with technical discoveries and best practices held close to the vest of people defending their own turf, teams or departments. Such impenetrable boundaries pose a danger to the performance of a company as a whole. Winners combat this by establishing programs to foster cross-functional cooperation, and by

(continued on page 6)

Make Your Organization Fast and Flat

(continued from page 5)

opening communication between departments.

Finally, winning companies **put their best people closest to the action and keep their front-line stars in place.** The futures of winning companies rest not on the brilliance of their executives, but on the dedication and inventiveness of their managers and employees. Winners tap into this well of creativity by cutting away layers of command, becoming more front-line driven. They also strive mightily to keep their best front-line people at the fore, working side-by-side with their star performers to keep operations moving ever forward. ■

Make Talent Stick Around And Develop More

Winners dedicate major human and financial resources to building an effective, innovative work force and management team. They also show a distinct preference for developing their own stars from inside the organization, and an ability to retain their top talent, in part because they recognize the value of this talent in creating a high-performance organization. The existence of a talent-rich environment also attracts people from outside a company. No organization can have too much talent, and winners pursue it outside and inside their ranks, even though new hires tend to be more expensive.

Winners demonstrate special skill in satisfying four mandates:

1. Fill mid- and high-level jobs with internal talent whenever possible. Winning companies devote major resources to preserving in-house talent and developing their own stars. It is much cheaper to do this than to go into the marketplace to buy stars who may be untested. Talented people under your roof are a known quantity.

2. Create and maintain top-of-the-line training and educational programs. Employees who have bonded with an organization are more likely to give their best efforts to their jobs. The company that helps employees rise through the ranks, supplying training and educational assistance, is well-positioned to create these bonds.

3. Design jobs that will intrigue and challenge your best performers. The late, great Washington Redskins football coach George Allen once said, "The achiever is the only person who is truly alive." There is an unstated assumption that bright, talented people want to be challenged, want to achieve greater and greater things. One way to keep them achieving is to give them assignments with incrementally greater responsibility attached.

4. Become personally involved in winning the war for talent. Winners focus on grooming talented in-house employees for higher-level jobs. Senior executives in winning companies are very much aware of the recruitment imperative, and involve themselves in helping their companies win the war for talent. ■

For Additional Information on a company that's winning the talent war, go to: http://my.summary.com

Valspar Makes Room For Employees to Move Up

One corporation that has a strong commitment to filling job openings from within is Valspar, a paint and coatings provider based in Minneapolis. The company has 6,500 employees in more than 80 locations around the world, and a 30 percent annual growth in return to shareholders.

When it makes an acquisition, Valspar merges more than just facilities and technology from the purchased company into the parent fold — it also integrates key people from the new company's management into Valspar's management. This policy raised a potential problem — how to handle talented parent company employees whose promotions might be held back by incoming managers from the newly acquired business.

Valspar responded to the situation by combining its acquisition efforts with a major program to achieve internal growth. As company president Bob Pajors once noted, "People will not be satisfied without internal growth. Employees have to know that there's a place for them to move up, too."

Make Your Leaders Committed to Your Business

There are few events of greater significance to an organization than the selection of a chief executive. The best CEOs are able to communicate their vision so convincingly that others will adopt that vision as part of their own personal agenda. They also have unquestioned integrity, in word and deed. When the company is confronted by a moral dilemma — a product defect, for instance — there is no hesitation: The company will do the right thing, quickly. The CEO walks the talk.

When leaders demonstrate their true and firm commitment to their beliefs, they reinforce their leadership roles. Employees see that the chief executives live by their words and can be trusted, and that trust is precious, particularly when times are hard. No one wants to hear bad news, but it goes down better when it comes from a trustworthy leader.

(continued on page 7)

Make Your Leaders Committed to Your Business

(continued from page 6)

Winners that excel at leadership management practice a shared dedication to several key precepts.

First, they **inspire management to strengthen its relationships with people at all levels of the company.** Winning companies believe in fostering strong relationships between management and employees. They understand that such relationships are the key to building a positive attitude in the ranks toward a company and its goals. When CEOs present themselves as flesh-and-blood people — as fellow employees, rather than as masters — they can foster positive attitudes that translate into improved company-wide performance.

They also **inspire management to hone its capacity to spot opportunities and problems early.** Chief executives and their top aides, in general, know how to deal with the immediate problems of their organizations. Winning companies that excel in leadership place a major emphasis on improving management's ability to anticipate change and its potential impact on the organization. They want to make certain that the organization isn't blindsided by new regulations or trends, and that they are alerted to forthcoming business opportunities.

The third key leadership management practice is to **appoint a board of directors whose members have a substantial financial stake in the company's success.** Boards of directors play a significant role in the fate of their companies. The best way to inspire directors to take a truly informed and active role is to make sure they have a major financial interest in the company: Their personal money should be at risk. When it is, directors select and support superior chief executives.

Finally, winning companies **loosely link the pay of the leadership team to their performance.** Members of top management need to be rewarded for their achievements in dollars, as well as in shares of company stock. However, the executives' remuneration should reflect their performance against a set of corporate goals. In most winning companies, these goals are defined in terms of profits or stock price — if the targets are missed, bonuses are not forthcoming. ■

Nucor: 'We All Run the Place'

The giant steel maker Nucor expected its management to connect with all levels of its organization. CEO Ken Iverson demanded it of all his executives, and led the way by example, making regular tours of the company's plants and making himself available to workers for question-and-answer sessions.

Iverson's focus on improving relationships extended to every individual Nucor plant. At the Crawfordsville mill, smack in the middle of Indiana cornfields, the general manager, Larry Roos, explained the importance of such communication.

"I think it's very important for everyone to know that [managers] are accessible and can talk about everything," Roos noted. "I get lots of feedback from the managers, but I know a lot more about what's going on by being out there talking or listening to everybody. You break down some of the idea that there is a big difference between management and people — we all run the place."

Make Industry-Transforming Innovations

What passes for technical achievement in most companies — marginal, incremental improvements to products — would never pass muster at organizations that excel in innovation management. Their eye is on the main chance, a breakthrough that will transform their industry. At such companies, this goal drives every aspect of the organization. If they fail to continue innovating, the company itself will stagnate and die. The very premise on which many organizations exist is to stave off this mortality, to create breakthrough innovations, one after another.

Innovation isn't limited to product lines. The application of new technologies to the internal workings of a company can yield savings so great as to give it a huge edge, and transform its industry in a different way.

Winners that show expertise in innovation tend to fulfill three key mandates:

- **They introduce disruptive technologies and business models.** Great ideas move mountains. The garden-variety idea is a staple of personal and corporate life — a better way to do something basic or an incremental improvement. Innovations that improve on old products or yield modest but profitable new ones represent the vast majority of successful business ideas. But for most companies satisfied with nothing less than double-digit increases in growth and earnings, modest improvements do not suffice. Their focus is more on the blockbuster innovation — one that will set the competition back on its heels.

- **They exploit new and old technologies to design products and enhance operations.** There is a natural tendency to emphasize the innovations and technologies that directly affect the products and services that companies rely on for their sales and profits. The impact of innovation on the internal operations of a business can

(continued on page 8)

Make Industry-Transforming Innovations

(continued from page 7)

be quite important to the bottom line. Winning companies that shine in the innovation practice found ways to use technical breakthroughs to advance both internal and external goals.

● **They don't hesitate to cannibalize existing products.** One of the oldest accepted practices in business is that a company will not bring out a new product that competes with existing products until the existing products are long past their prime earning days. Winning companies, however, believe in cannibalization. Given the ever-shorter shelf life of so many products, a head start is essential to get the most from an innovation before competitors rip it off and commoditize it. ■

For Additional Information on a company that cannibalizes its customer base, go to: http://my.summary.com

Polaroid Loses Its Innovative Edge

Polaroid was a company built on a disruptive technology, the instant camera. In its first decades, the company dedicated itself to finding more such breakthroughs, funding its research and development (R&D) entity at an enormous level. Eventually, as the instant camera became less and less of a player in the consumer photography market, Polaroid sunk deeper and deeper into debt, as few of its new inventions attracted customer interest.

In 1995, Gary Dicamillo came aboard as CEO, and immediately called for a refocusing on the "neglected" instant photo business. He presided over the introduction of the I-Zone instant camera, a minor hit with teenagers, but could not lead Polaroid into a leading position in the burgeoning digital camera market. By spring of 2001, the company's share price was $3, down from $45 in 1995, when Dicamillo took over. With over $1 billion in debt and no new innovations on the horizon, Polaroid filed for Chapter 11 bankruptcy protection in October 2001. The once great company had lost its ability to create breakthrough, innovative products, and had suffered the ultimate consequence.

Make Growth Happen With Mergers and Partnerships

Diversification is good — sometimes. Mergers in the last century have mainly been driven by the desire to broaden a company's portfolio of offerings as a hedge against the downside of its industry's economic cycle. Indeed, in the 1960s and 1970s, many corporations merged in an effort to achieve "synergy" — the additional value to be realized by a company as the result of its purchase of another. Many of these synergies never materialized, and the companies involved in these mergers were simply weighed down with debt. Companies in the United States still merge for these same reasons, many of them with the same negative results.

Among winners that excel in merger management, diversification is not a mandated goal. These companies pursue acquisitions as a route to growth, but only when the move leverages the buyer's or seller's existing customer relationships, or the two companies complement each other's existing strengths.

How to Grow Through Mergers and Acquisitions

Since it is difficult for any company to find enough internal sources of growth to keep up with the need for expansion, growth by mergers is a secondary practice that many winning companies pursue. To grow through mergers and acquisitions, keep the following in mind:

1. Acquire new businesses that leverage existing customer relationships. If growth is the target, then one's immediate goal should be to expand the customer base. One of the easiest ways to accomplish this is to acquire companies whose customers will purchase your goods and whose goods will be attractive to your customers. This is an expensive route, particularly in the short term.

2. Enter new businesses that complement your company's existing strengths. Diversification for the simple sake of diversification is generally a losing proposition. For acquisitions to work, make sure they match up well with your company's own profile.

3. With a partner, move into new businesses that can use the partnership's talents. Partnerships are to mergers what dating is to marriage — companies and individuals that merge must adjust to (or suffer with) each other's strengths and weaknesses in a permanent arrangement with no guarantees of a satisfactory conclusion. Partnerships or alliances do not demand that partners change to accommodate all of each other's idiosyncrasies. While they both benefit if the business venture is successful, they remain separate entities.

4. Develop a systematic capability to identify, screen and close deals. If you're entering into a merger or partnership, devote substantial resources to developing an efficient, ongoing process that covers the various aspects of deal-making. Mergers and partnerships are too important to be left to ad-hoc decisions. Form a team of people who have the requisite investigative, financial and business skills to make the relationship work. ■

The Core Group Theory of Power, Privilege and Success

WHO REALLY MATTERS

THE SUMMARY IN BRIEF

Recent events in Corporate America have taught us that when an organization claims to make decisions for its customers or shareholders, it is not necessarily speaking the truth. In reality, there is another group within each company whose needs and desires are the real drivers of most decisions — a Core Group of people "who really matter."

While Enron, Tyco and others have given the concept of the Core Group a bad name, bestselling author Art Kleiner explains in Who Really Matters *that companies need Core Groups to supply the energy and direction they require to be successful. By observing the Core Group's members' day-to-day activities, communications and management decisions, Kleiner argues that the astute employee can recognize decisions before they are made, and can be ready to react to change. Eventually, if that person is able to navigate to a position of influence, he or she can join the Core Group.*

What You'll Learn In This Summary

✓ **The Core Group Comes First.** In most companies, customers are further down the list of priorities than you might think.

✓ **The Core Group Influences Decisions.** Core Groups help people focus their decision-making process on the needs and requirements of a specific few.

✓ **How to Spot Common Core Groups.** Find out how you can determine which kind of Core Group is the true driving force in your organization.

✓ **How to Determine Power and Legitimacy.** What is the difference between "positional" power and legitimate power? The answer may help shed some light on your company's internal politics.

✓ **Knowing Your Boundaries.** If you are not in the Core Group, you are a transactional employee, or an employee of mutual consent, and your entire relationship with your organization is based around this positional issue.

✓ **How to Manage the Core Group.** Find out why senior executives cannot make decisions without considering the goals of the Core Group.

The Core Group Comes First

One of the great lies of corporate culture is, "The customer comes first." In every company, agency, institution and enterprise, there are people who *really* come first, a Core Group of people who *really* matter. The makeup of the group differs from one company to the next, but each activity the organization undertakes — from creating wealth to meeting customer needs to training its people — is done with the goal of fulfilling the perceived needs and priorities of this group.

Core Group dynamics explain why some companies act frugally for years to turn a profit, then squander it all on ill-advised mergers, disproportionate pay for senior executives, or impropriety in their business dealings. It is because of Core Group dynamics that businesses evolve into corporations with one primary purpose — to extract wealth from all constituents (including employees, customers and neighbors as well) and give it to senior executives.

We Need Core Groups

Yet, a Core Group is not inherently bad or dysfunctional; indeed, it serves as an organization's source of energy, drive and direction. Without an energetic and effective Core Group, all efforts to spark creativity and enthusiasm sputter out. Startups need entrepreneurial Core Groups that put themselves at risk for the company's future. Large, well-run companies need a Core Group of senior leaders who can permanently merge their identities with that of the organization. Even the most hierarchically strict organizations — military units, for example — depend on their Core Groups to maintain, among other things, the level of mutual respect that soldiers need to operate above and beyond the limits of their orders.

There is always an implicit, almost unconscious bargain of mutual commitment in organizations — the people of the organization agree to make decisions on behalf of their Core Group, and the Core Group members agree to dedicate themselves as leaders to the organization's ultimate best interests. The organization goes wherever its people perceive that the Core Group needs and wants it to go; if you want to know what a company stands for, explore the characteristics and principles of its Core Group. ■

'The Customer Comes Eighth'

Back in the early 1980s, Exxon Oil Co. held an employee conference to announce its new "core values." Number one on the list was the simple statement, "The Customer Comes First."

That evening, division executives discussed the values statement over dinner. One brash young rising star, a fellow named Monty, proposed a toast. "I just want you to know," he began, "that the customer does not come first." Monty pointed at the president of the division. "*He* comes first." He named the European president. "*He* comes second." He named the North American president. "*He* comes third." Monty rattled off four more senior executives of the division, all of whom were in the room. "The customer," he concluded, "comes eighth."

A stunned silence overtook the room before one of the executives smiled, and the gathered group burst out into hysterical laughter.

It was the first truth spoken all day.

The Effect of the Core Group On Decision-Making

The basic building block of organizational action is not the job, the team, the project or even the dollar — it's the decision. Organizations are essentially the sum

The Effect of the Core Group On Decision-Making

(continued from page 2)

of all the decisions made in them over time. Some decisions, made at the top of the hierarchy, have immense pull on the direction of the whole system; the decision to close a plant, for example, affects many other decisions at other levels. But even the decision to change an order of paper clips from a chain store to a local distributor may help chart the course of the organization's future in some small but significant way. And there are many, many decisions like that made every day, by many people, interdependent of one another, yet cumulatively affecting the direction of the company in a significant manner.

Hence, the importance of Core Groups. Every critical decision in an organization is made amid a maelstrom of conflicting priorities, constraints, competitors and constituents. It must be shrunk down to a manageable size in our minds, or we couldn't function.

When faced with a complex decision, you might ask yourself, "How comfortable would so-and-so be with this decision?" There is probably a range of "so-and-sos" — your boss, executive team, unions, customers and so forth. Even if you don't go through such a litany when you make a decision, your colleagues and fellow employees do, and that's what sets the direction of the organization. The influence of these key people trumps all other concerns, simply due to the cumulative effect of the decisions made throughout the organization.

Imagine that you could make a list of all the so-and-sos in everyone's mind, in aggregate — all the people who influence all the decisions made through the course of a year. Some names would stand out as significant, but only to certain members of the organization. Other names would stand out as important to the whole organization. There would also be some classes of people ("stockholders" or "key customers," for example) that take on significance for the entire organization. Each of these individuals or groups represents not only itself, but an image of the direction of the organization — a view of where it may go. These are the members of the Core Group. ■

The 'Hive Mind' Dictates Direction

The term "hive mind" was coined by writer Kevin Kelly, who associates it with a form of mid-1980s computer game called Cinematrix, which gives an entire audience shared control of a cursor on a large screen. Each audience member is given a joystick, and an on-screen "paddle" moves according to the aggregate pull of everyone connected to those joysticks. If you moved your joystick, you would see your team's paddle move accordingly, but only if enough people moved it in the same direction along with you. If people moved the paddle in different directions, their efforts canceled each other out.

Eventually, in the course of a game, a kind of two-way feedback manifested itself. The crowd didn't just move the paddle; the paddle also moved the crowd. Individuals found themselves becoming attuned to the paddle's direction, and they acted accordingly. If they felt contrary, they could move their joystick against the crowd's general direction and be ignored; they could anticipate where the paddle needed to be and be the first to move it in that direction, causing the hive mind to take shape behind their own mind.

Organizational decision-making is like that game, in that thousands of decisions are made by many, many people each day, for a variety of motives. All these decisions add up, without any coordination, to an overall purpose — a collective imperative for the organization's every move. When one becomes attuned to those moves, one can guess with reasonable certainty in which direction the hive mind is traveling.

Common Core Groups And Their Membership

The size of the Core Group can be large or small, depending on the organization. For example, quite a few e-business companies in the 1990s perished because they tried to use Core Group status (in the form of stock options) to attract employees. They distributed so many stock options and other perquisites that they created an enormous de facto Core Group that was unsustainable.

There are, however, a number of different kinds of Core Groups, in companies both large and small, public and private. Among them are the following:

- **The Deceptively Subservient Bureaucracy.** A long-standing Core Group remains in place forever while putative bosses come and go. The goal of the enterprise is to protect the position and status of its established bureaucracy, regardless of how bloated it might be.
- **The Organization That Is Almost Too Nice for a Core Group.** Some organizations are just so idealistic that no one wants to overtly admit he or she has any power or influence over anyone else. The net result of this situation is that everyone senses (however unspoken) that someone else has control over the situation, and resentment builds up under the surface. Sometimes, the resulting Core Group can explicitly be established;

(continued on page 4)

Common Core Groups and Their Membership

(continued from page 3)

otherwise, one or two people will tend to influence decision-making through manipulation, while maintaining the fiction that everyone is equal.

- **The Indigestible Acquisition.** AOL buys Time-Warner; AT&T buys NCR; anyone buys anyone, and there turns out to be significant groups of old-heritage people who simply cannot be brought into the new company. The acquired Core Group remains in place, refusing to be dissolved, and still influencing the people in the acquired part of the business.
- **The Hidden Cabal.** Every large organization has an administrative assistant or secretary who is assumed to "run the place" — he or she is privy to top-secret information and acts as a gatekeeper, managing access to the top of the hierarchy. Actually, in most cases, the administrative assistant is only aware of everything that happens, but is unable to influence it. Meanwhile, behind the scenes, there probably are some quiet influencers — members of informal professional networks — who know how to shift the direction of people's decision-making and covertly do it.
- **The Charismatic Random Star.** This pattern generally centers around one or two mercurial, rainmaking Core Group members who have license to be indulged, with the rest of the organization scurrying to keep up, tying up loose ends and complaining about the lack of stability. They continually collude, of course, in the same randomness that they complain about.
- **Silos, Stovepipes and Chimneys.** When Core Group members continually avoid conflict by avoiding each other, the people who report to them and watch them for signals often do the same. The resulting rivalry becomes more intense the more the functions of each respective group duplicate each other; the legitimacy of each is dependent on how it can show up the cluelessness and intransigence of the others.

Of course, all of these categories are gross oversimplifications. Real-world Core Group dynamics are immutable and indistinct, so very much a matter of perception and interrelationship. To determine a Core Group's true characteristics, one would have to tap into the mindset of the organization's people to determine whose interests they consider when they make a decision.

Are You in the Core Group?

Where do you stand in relation to the Core Group at your company? Are you in the "Group Loop" or standing outside it? Ask yourself the following questions:

- Are you visible to the organization? Do you feel the company sees and values you?
- If you say something significant, do you hear it repeated until it makes its way back to you?
- Are you given raises, credits, promotions and perks before asking for them?
- Do you receive such gestures when being courted for a job, only to have them drop away when the organization is able to take you for granted?
- Do you have a basic sense of well-being about where the organization is going, and why? Is your ideal job situation similar (or equal) to where you work currently?
- Do you get hints from people throughout the organization that they would like to know what you think, but few people actually ask you?
- Does your organization love you? Do you love it in return?

A Special Kind of Love

Membership in the Core Group is like a passionate love affair between the corporation and the object of its affection. There are so many stories about organizations laying the world at their lovers' feet, stories that offer glimpses of fairy tale-like perks and privileges:

In 1989, ITT's chief executive, Rand Araskog, published a book that, some months later, was about to be remaindered (sold at low costs to inexpensive outlets). A partner at a media purchasing supply firm received a call from an ITT public relations manager, expressing the fact that he didn't want Araskog or anyone else to see the book on some one-dollar table. The media firm purchased all remaining 25,000 copies for a dollar apiece, stored them briefly, and then dumped them.

When McCaw Communications introduced its cellular telephone technology in the United States, those who knew the industry could always tell where the service would be introduced next — by looking at founder Craig McCaw's vacation plans. Places where he was traveling soon had excellent service. Even today, the best way to guarantee you'll have great cell-phone service is to buy a home near a phone company executive.

Relocated Corporations and Their CEOs' Homes

In the 1970s, author William H. Whyte studied corporations that had moved their headquarters from New York City to its suburbs. He and his research staff plotted the location of 38 relocated corporations vis-à-vis the homes of their senior executives; the average distance from the CEO's home was eight miles.

These are not business stories. These are love stories about organizations trying to make individuals feel special. The perks are simply the most visible symptoms of the companies' infatuated state. ■

For Additional Information on the Core Group, go to: http://my.summary.com

Power and Legitimacy

As employees, we cannot vote our bosses into the Core Group — this is not a democracy. We do, however, vote in another sense: with the quality and commitment of our decisions. We depend on the boss for direction, and he or she depends on us for legitimacy. If we enlist wholeheartedly in an individual's cause and make our decisions accordingly, then we have delegated a much stronger kind of power to him or her.

On the other hand, if we comply grudgingly with commands from our boss, we tend to produce an atmosphere of resentment and tedium. People notice this; they also notice the meager results that typically emanate from such a lack of commitment. All of this makes an impression, and our boss' status in the Core Group grows weaker.

'Positional' Power Versus Legitimacy

The boss has "positional" power based on his or her spot in the organization's hierarchy, which boils down to his or her ability to compel people to follow orders. Bosses without much legitimacy can use incentives, threats, discipline, bullying and so forth, to get people to do things. None of these, in the long run, is as effective as legitimacy. It is legitimate leaders (particularly in times of crisis) who make the most difference; positional leaders simply lack the standing to do much.

If legitimacy seems like a thin, momentary kind of power, compared to the power of authority, it is in part due to long-standing attitudes about the way power should work — there was always someone in royalty, or even some Higher Being, who demanded (and, in most cases, received) total obedience. In today's world (at least in democratic societies), authority is relative — we carry our bosses around in our heads.

Why, then, do we simply go along with the status quo, or legitimize our bosses who do not deserve legitimacy, simply because they are bosses? There are two reasons — first, we tend to do what we think we're supposed to do, because we do not think we have a choice. Second, we legitimize the status quo because to do otherwise taxes our capability; it is quite difficult to make every possible decision in a matter. It is simply more possible to act in favor of those who have legitimacy in our minds, even if our relationship with them is antagonistic. It is easier to think about what the boss would like to do, rather than having to figure it out from scratch each time. ■

Know Your Boundaries

If you want your dignity intact, and you're working at a modern job, you must know what organizations are good for and what they are not good for. They are innately set up to fall in love with the Core Group — that's what they're good for. However, just because you are among the 95 percent of people in your company who are *not* part of the Core Group does not mean the organization is not good for you. Indeed, in many ways, you may be better off having a non-Core Group position, especially if you are not ready to commit your life to any particular organization.

It's Business, Not Personal

First, however, you must recognize your situation for what it is, and not be distracted by an illusory Core Group status that you do not actually share. You may have strong and satisfying relationships with people in the organization (including people in the Core Group), complete with certain perks and benefits, but you cannot count on the organization to operate on your behalf if it doesn't have to. Indeed, the organization might not see you as an individual, only as the results you produce and the demands you make on it. The organization will not notice if you leave; it will simply fill the space left by your absence. It's business, not personal.

If you are not in the Core Group, you are a transactional employee, or an employee of mutual consent. Your job is defined by an implicit or explicit contract between you and your employer, in which you might be

(continued on page 6)

The Brand Called 'You'

In 1997, in the midst of the dot-com boom's super-healthy job market, Tom Peters (author of *In Search of Excellence*) announced a new strategy for employees of mutual consent — the "Brand Called 'You.'" Good riddance to company loyalty, he said — it had always been a kind of indentured servitude left over from the days of hidebound bureaucracies. He exhorted audiences to package on-the-job personae for themselves — to find those attributes that, with a little refinement, could comprise their own unique selling position. They could then accentuate those qualities into a continuous presence that people wanted to buy — a personal brand.

Unfortunately, the strategy doesn't work for most of us — maintaining a personal brand is all-consuming. It means applying the same rigorous discipline to your life that companies like Coke, Starbucks, Disney and other companies apply to their products and services. That works fine for companies, but in people, it's typically called "shameless self-promotion." It's what makes such "brand-called-me" personalities as Oprah Winfrey, Martha Stewart, Geraldo Rivera and Donald Trump (even Tom Peters himself) morph so easily into caricatures.

Know Your Boundaries

(continued from page 5)

asked to provide a level of commitment and interest aside from simply showing up. The organization has the right to promote, demote, deploy and discard you. Either side can break off this relationship at any time (subject to the terms of your agreement).

Core Group members, likewise, have contracts, but theirs are formalities, secondary to the organization's willingness to please them. Even if your company is essentially good-hearted, you cannot expect it to watch out for you. Most of its members don't have the space or time to pay much attention to you, except on an individual basis: They are too busy watching the Core Group. A clear, coherent transaction turns out to be a much more solid foundation for a working, mutually beneficial relationship than an illusory Core Group relationship. ■

For Additional Information on the brand called Welch, go to:
http://my.summary.com

Leading the Core Group

If you're a senior executive, you have the broad power to give commands (to promote people, for example, or to set targets or authorize decisions). Those commands are, however, constrained by guesswork — you cannot specify how people interpret your commands, or how they interpret information. Nor can you specify how people will lead individual projects. Your greatest formal power comes from the fact that you represent the last line of authority in your organization.

As CEO, you are also constrained by Core Group priorities. There are other Core Group members besides yourself, often with conflicting goals — key constituents, labor unions, regulators, major customers, etc. You have influence over these Core Group members, but not total control. In the end, you might have good reason to override the needs and priorities of other Core Group members, but you must do so in a manner that does not have undesirable, long-lasting consequences.

The CEO's Choices

Executive leverage lies in sending signals and establishing constraints; setting an environment and context out of which a Core Group can emerge. Among the things you can affect are the following:

- **The paths by which people are recruited, promoted, trained, rewarded and laid off — and, most important, the assumptions about employees of mutual consent that underlie those paths.**
- **The visible ways in which senior executives pay attention, and some of the channels through which that attention is made obvious.** Employees take careful heed when Core Group members listen — from that, they learn what things are most relevant to the Core Group, and, thus, the organization.
- **The patterns of information and communication flow**. When communication from the Core Group is well-conceived, deliberate and consistent, the entire enterprise can be educated, over time.
- **The support given for entrepreneurialism and error.** People who are trying new things need the freedom to say no to trivial requests, and the freedom to experiment without fear of vulnerability. These things will only happen if the Core Group supports them.
- **The quality of your own leadership.** The Core Group members must recognize their privileged place within the organization and the commitment that it requires.

Believe it or not, there exist organizations where nearly everyone is in the Core Group — where decision-

(continued on page 7)

SRC's Expanded Core Group Pitches In

Springfield Remanufacturing Corp. (SRC), a Missouri-based industrial equipment and business-service company, is known for its "open-book management" — executives deliberately educate their employees in all the financial numbers of the company's business. Staff members "huddle" weekly to discuss financials and to discuss strategies. They take the company's growth and prosperity personally, in part because, due to employee stock-ownership, nearly all shares of the company are theirs.

Once, in the early days of the company — when outside investment was hard to come by — the organization took a hit when it lost one of its key customers, whose revenues had been an integral, irreplaceable part of its business plan. Burdened with an extraordinary 89:1 debt-to-equity ratio, an enormous cash crunch even if it were profitable, and an unforgiving creditor, CEO Jack Stack felt he had no choice but to let everyone in the company's plant know exactly how bad things were.

SRC's people appreciated his honesty and the opportunity to learn and to proactively take part in saving their jobs. Indeed, each employee felt a sense of "ownership" of the organization's problems, pulled together, and watched his or her spending. All this became even more apparent in 1988, when the staff at the plant voted to defer a bonus and chose to build up the company's long-term strength instead.

Leading the Core Group

(continued from page 6)

makers take into account all of the members of the organization whenever a decision is made, and everyone works on behalf of everyone else. These organizations have expanded their Core Groups without gargantuan salaries or extravagance, by establishing a design that makes it clear where people stand, and by following through on the idea that everyone's welfare and development is an organization-wide priority.

There are structural elements that enable the organization to pursue this path, among them employee stock-ownership plans, nonhierarchical decision-making, and in-depth training. None of these, however, are panaceas in themselves, but when they are combined together in a comprehensive and consistent design, the result is often an "Expanded Core Group" organization. In this type of organization, it is easy for everyone, from the CEO on down, to take the needs and priorities of everyone into account when he or she makes a decision.

Such workplaces require careful attention on one hand to reporting procedures and financial controls, and on the other hand to the way in which people learn and grow personally. In the process, they automatically foster a Core Group-style attitude about the business among people throughout the organization, and they encourage people to make decisions on behalf of all employees.

Handling Diversity

Regardless of whether you lead an Expanded Core Group organization or one in which the Core Group is much more exclusive, diversity is a Core Group issue. If conversations about diversity in an organization bypass the Core Group, the organization has, in effect, not dealt with diversity at all, regardless of how many lawsuits have been filed or workshops conducted.

But a million workshops will not address the Core Group diversity issue unless the Core Group leads the way. Only Core Group members can break a "glass ceiling" in the organization that prevents certain types of people from entering the Core Group no matter how valuable or worthy they might be. Regardless of the particulars of the group or groups it excludes, the Core Group sends a message that it's mandatory to treat some people as innately worth more than others. Over the course of time working for organizations, people tend to internalize this attitude; they treat others as worth less than themselves because of lower rank. This attitude is often unconscious, eventually pervading organizational life.

Why should we care if an organization's leadership is closed off from a significant portion of its members? Consider the question from two perspectives:

First, suppose that you are a member of the Core Group. Your strength comes, at least in part, from your insularity and cohesion. You talk easily together, and you look for people to join you who will also be able to talk easily. Regardless of whether they approve of that insularity, people in the organization see the ways in which you as a group depend on it. Yet, how do you know you aren't missing something important as a result of that insularity? If others in the organization are aware of this, how do they get both the permission and the wherewithal to bring it to your attention?

Glass Ceilings

Second, consider the perspective of the people who are systematically excluded from the Core Group and blocked by glass ceilings in your organization. They want to be promoted, but not at the expense of changing the way they think, talk and act. And what if they change all that, and still don't fit in?

No one but the Core Group members can decide how inclusive your Core Group can be, but consider this — a Core Group needs to understand the lives of its organization's constituents, which means being willing and able to engage them and learn from them. ■

For Additional Information on a glass ceiling story, go to: http://my.summary.com

Building a Portfolio of Equity

In order to be effective in any company, you must build up organizational equity — the kind of equity that you can create yourself, which increases your influence in your organization, and helps you fulfill your own dreams. You might ordinarily think of equity as the assets, transformed into stock, that shareholders own, but this definition is far too narrow.

Equity is any share of accumulated wealth, including such intangible forms of "social capital" as relationships and reputation. Equity gives you leverage in an organization (and in life, in general); it also accrues exponentially, with the same emotional dynamics as a savings account. There are dozens of types of equity that an individual can accumulate, including the following:

- **Fungible financial equity.** Have you amassed sufficient funds to enable you to walk away from an organization if you find the Core Group untenable?
- **Rainmaking equity.** Do you have the ability, the contacts or the approach necessary to raise money or business?
- **Credential equity.** Are you at the level or position in your field that will enable you to make satisfactory career moves, even if they are linear?

(continued on page 8)

Building a Portfolio of Equity

(continued from page 7)

- **Reputation equity.** Do others honor your ideas?
- **Relationship equity.** Do you know the right people — the people who can help you challenge the top without fear of losing your job?
- **Capability equity.** Are you able to gain new capabilities and skills?

Building different forms of equity helps cement loyalty to an organization, aligning you with the purpose of the enterprise, thereby building the strength of the whole system. In the absence of that help, you can at least build equity for yourself, and lead a rich, rewarding life in the workplace, regardless of your relationship with the Core Group. ■

For Additional Information on your own portfolio of equity, go to: http://my.summary.com

The Shadow Core Group

In most organizations, open conversation about the Core Group is frowned upon, because it triggers deeply emotional feelings about privilege, power and rank. Yet, it's difficult to not talk about the Core Group, particularly when one realizes its impact on the organization. People seriously trying to influence a company can only be effective if they understand the priorities of the Core Group, as opposed to people's perceptions of those priorities. That means raising awareness of "who really matters" dispassionately, without triggering a backlash, either from Core Group members or on their behalf.

There are ways to accomplish this, primarily by establishing your proficiency as a deliberate intervenor. Intervention in a complex system is an art form in itself — the art of crafting legitimacy for a set of new ideas. The best way to begin to do this is to convene an informal team of compatriots who feel the same way you do — a "shadow" Core Group that goes everywhere the real Core Group goes, one step behind. This helps prepare you all for the time when your ideas become more formally adopted (if they ever do), for the time when you enter the Core Group, or for the dealings that you may ultimately have with the organization in a more authoritative role.

Raise Consciousness

The purpose of your shadow Core Group is to raise consciousness — to build new awareness of the purpose and potential of the organization among Core Group members, decision makers throughout the organization, and yourself. Your group can do this in a number of different ways:

- **By moving deliberately to widen the shadow Core Group to embrace and include real Core Group members.** "Conversations that don't include the Core Group are *about* change," says Peter Garrett of Dialogue Associates. "Conversations that include the Core Group *are* change."
- **By understanding how the Core Group defines success and framing your project as a method or milestone for accomplishing their success.** Ask a Core Group member what, in his or her opinion, would constitute success in a particular endeavor. If you do this well, three things will happen: 1) You will learn some things from what he or she says; 2) he or she will have the chance to become intrigued, amplifying your ideas through sharing them with others, and gaining you allies you don't even know you have; and 3) you will warm them up for the time when you move another step in the endeavor.
- **By waiting for the right moment before asking for certification.** There is a time when you need a budget approved, a check written, or a contract signed. Don't rush that moment; rather, do as much as you can before that moment to demonstrate your own capability.
- **By learning how to hold high-quality conversations.** Conversations that touch on Core Group issues require "space" — the thoughtfulness and presence you bring to the interaction, and the time and cadence of the conversation — to keep your conversation partner relaxed and more likely to trust you.
- **By getting the whole system in the room.** All members of the Core Group — and there are probably more than you realize — have something to tell you that will be critically important, and if you overlook it, you might be setting yourself up for conflict later.

Amplify Positive Defiance

- **By amplifying positive defiance.** Some people, in an effort to "speak truth to power," tick off the Core Group by telling the Core Group's members what they've done wrong. Instead, you'll want to find people who deviate from the norm by doing the kinds of things you think are significant moves in the right direction, then draw attention to them.
- **By articulating misperceptions.** Show people the difference between what the Core Group truly wants and needs and what people perceive the Core Group to want and need.
- **By practicing.** Set up places where you can try to intervene without inordinate risk, then determine what worked, what didn't, and what you can do differently next time. ■

Avoiding the Blunders and Traps That Lead to Debacles

WHY DECISIONS FAIL

THE SUMMARY IN BRIEF

For more than 20 years, Ohio State University Professor Paul C. Nutt has studied how decisions are made and has written extensively about what works, what doesn't and why. His key finding in all this work is startling—decisions fail half of the time. Organizations spend vast sums of money and commit significant amounts of resources without realizing any benefits. Failures can be traced to three blunders and seven traps that ensnare decision makers; avoiding these blunders and the traps they set will cut one's failure rate significantly.

What You'll Learn In This Summary

In this summary, you will learn how to do the following:

✓ **Navigate around potential blunders.** Learn how using failure-prone practices, making premature commitments and engaging in unwise investments can derail your decision-making process, and why these blunders are so easy to make.

✓ **Identify ensuing traps.** If you are unable to avoid making a decision blunder, you will likely be ensnared in one of seven traps that lead to failure. Whether you fail to manage opposing forces, provide ambiguous directions, choose only evaluation data that supports your point, or fall into any of the other ensuing traps, the decisions you make will be compromised, usually at great cost. Getting around these traps is imperative.

✓ **Learn from others' mistakes.** Nutt provides many examples of individuals and companies that fell into traps that turned their decisions into debacles — from stalwart organizations like Disney and Ford, to lesser-known businesses and people. These case studies provide a bevy of lessons for you and your organization.

✓ **Make the right decisions.** Nutt does more than show you what others did wrong; he also gives instructions on how to avoid each blunder and trap, providing tips and techniques on consistently using the right tools and procedures to make the right decisions, every time.

Blunders to Debacles

Why is there so much failure in corporate decision-making processes? Can companies take corrective action to prevent future failures? The answers can be found in three blunders: failure-prone decision-making practices, rush to judgment and poor allocation. The chain of events that leads to failure begins with one of these blunders, which leads decision makers toward traps that ambush them.

Failure-Prone Practices

Two of every three decisions use **failure-prone practices**. Decision makers seem oblivious to the poor track record of these practices. Without help in determining what does and does not work, the widespread use of these practices will continue, for a number of reasons:

Decision-making practices with a good track record are commonly known, but uncommonly practiced. Nearly everyone knows participation prompts acceptance, but participation is rarely encouraged.

Managers often play the "blame game." For example, bad but low-cost practices are pushed to avoid blame for increased costs.

Failure is often placed at the doorstep of things beyond the manager's control. Government regulations or unexpected budget cuts offer convenient excuses to not pursuing better practices.

Premature Commitments

Decision makers often jump on the first idea that comes along, make **premature commitments**, then spend years trying to follow through on those commitments and make the idea work. Decision makers, like most people, fear the unknown and seek self-gratification, two circumstances that run counter to the sometimes lonely endeavor of making difficult decisions. When answers are not readily available, grabbing on to the first thing that seems to offer relief is a natural impulse.

Wrong-Headed Investments

Blunders are made when decision makers make **wrong-headed investments** of their organizations' time and money for costly evaluations and little else. To make matters worse, these evaluations are often defensive — carried out to support an idea someone is wedded to, trying to show it will work. Such decisions often breed suspicion from those who suspect a hidden agenda at work, a circumstance that results in even more evaluation expenditures, which increase as more justification is demanded. Little time or money is spent to investigate claims, set objectives, measure benefits and risk, or manage the forces that can derail a decision. Decision makers blunder when they fail to see any of these things as a worthy undertaking. ■

DECISION-MAKING TRAPS

Debacles follow a chain of events that unfolds as blunders create traps and traps bring about failure. The blunders of using poor decision-making practices, rushing to judgment, or misusing available resources point unsuspecting managers toward seven traps that can ensnare them:

- *Failure to Reconcile Claims*
- *Failure to Manage Forces Stirred Up by a Decision*
- *Ambiguous Directions*
- *Limited Search and No Innovation*
- *Misuse of Evaluation*
- *Ignoring Ethical Questions*
- *Failure to Learn*

When caught in any of these traps, managers are apt to make a bad call that can become a debacle. ■

Failure to Reconcile Claims

Imagine that a board member is alarmed by a loss in market share, because it matches with the amount that a competitor's share has grown in the same time period. The board member issues a call for action, such as improving the quality of the company's products. The

Failure to Reconcile Claims

(continued from page 2)

call for improved quality is a "claim" and points to an "arena of action," product quality.

Decision makers get trapped when they buy into such a claim without looking further. In this case, before making a decision, the decision makers must ask themselves, "Is product quality the real reason for loss of market share?" The relationship of the original concern — the falling market share — and the subsequent claim — low product quality — is dubious. In many cases, however, the original concern is not made clear, so that a claim is accepted without question.

The Waco siege shows the disastrous results that can occur when claims are not carefully investigated.

Debacle at Waco

In 1993, a rumor surfaced that the Branch Davidians, a religious sect led by David Koresh, were building an arsenal in their Mount Carmel compound, just outside Waco, Texas. When the Bureau of Alcohol, Tobacco and Firearms (ATF) attempted to serve a search warrant, a shootout ensued, leaving four agents and two Branch Davidians dead and 20 agents wounded. The bungled warrant attempt prompted Attorney General Janet Reno to call in an expert team of FBI negotiators and behavioral experts, who initiated talks with the Branch Davidians, as SWAT teams and the FBI's elite Hostage Rescue Team (HRT) surrounded the compound.

The standoff ended when the SWAT and HRT units stormed the compound. Fires of unknown origin swept the wooden structures, killing 87 people.

During the standoff, unresolved disagreements created one trap after another that ensnared Reno and her agents. Motives were never questioned. Conflicting or unsubstantiated concerns, motivations and claims (from the desire for revenge for the agent deaths to the claim that Koresh had molested children) were never sorted out. Rather than trying to reconcile these claims, Reno chose to pick the one that seemed most compelling.

Avoiding the Trap

In order to avoid this trap, decision makers need to uncover the concerns — in many cases there are hidden or conflicting concerns among stakeholders — that motivated the claim. To avoid making decisions based on unsupported or misleading claims, decision makers should:

- Seek out stakeholders with different points of view and ask each to provide a list of his or her claims and the concerns and considerations that prompt them, before selecting an arena of action.
- Reconcile contradictions in the claims being offered by exploring the concerns and considerations supporting each. Refashion a claim that embraces the crucial concerns and important considerations.
- Find common themes in conflicting claims to make a diagnosis. ■

How Blunders Prompt Traps

Traps	Failure-Prone Practice Blunders	Premature Commitment Blunders	Misuse of Resources Blunders
Failing to take charge by reconciling claims	Support for claims and its arena of action assumed by the decision maker	First claim (or claimant) that seems important is accepted	Failure to look for hidden concerns or considerations and the more pressing claims that they suggest
Ignoring barriers to action	Power and persuasion used to implement decisions	Action taken before social and political forces are understood	Interests and commitments of stakeholders go unexplored
Providing ambiguous direction	Direction assumed and never clarified	Unwilling to acknowledge a concern without offering a remedy	Little time spent to identify desired results
Limiting search	A quick fix or what others are doing is adopted	Pressure for answers makes the conspicuous solution seem timely and pragmatic	Little spent on a search for ideas or for innovation
Misusing evaluation	Evaluation used to measure costs, ignoring benefits	Defensive evaluation used to justify the conspicuous solution	Money spent defending ideas and not in exploring their risk
Overlooking ethical questions	Values behind ethical questions are overlooked	All decisions are seen as ethically neutral	No time or money spent uncovering values
Failing to learn	Fail to see how perverse incentives operate to cover up outcomes	Expectations demand good outcomes	Few resources used to learn or to do so without removing perverse incentives

For more on stakeholders, go to: http://my.summary.com

Failure to Manage Forces Stirred Up by a Decision

If a decision is perceived as jeopardizing one's turf and the needs for achievement, self-esteem, recognition, security, social relationships, values practices, and the like, people become aroused.

However, the reasons for opposing a decision are not widely shared, so they are lost on the decision maker. Opposition takes shape in subtle ways through delay,

(continued on page 4)

Failure to Manage Forces Stirred Up By a Decision

(continued from page 3)

token compliance and attempts at negotiation to hold up a decision or limit its use. If opponents are powerful enough, there may be a pitched battle to block a decision.

The savvy decision maker heads off both types of resistance by shaping the decision to practices, resources and relationships valued by people.

Failure and Success Tactics

When a decision maker encounters resistance, he or she can use one of many tactics to make the decision a reality. Two basic tactics are commonly seen in debacles and failed decisions:

Persuasion calls on the decision maker to collect arguments that support a preferred course of action and to garner endorsements of experts, then combine them with salesmanship to achieve the desired effect. When the best available arguments are unable to sway people, however, failure is likely.

An **edict** issues a directive without the decision maker consulting the people who have a stake in the changes the decision would bring.

Decision makers in more successful implementation efforts employ one of two more positive tactics than persuasion and edict:

Intervention is the least employed tactic and the most successful. To carry out an intervention, you must demonstrate the imperative to act to the problematic stakeholder and others with interests not yet managed. To do this, you must do the following:

Benchmark current performance against norms, to demonstrate the inadequacy of that performance.

Offer illustrations of how business practices can be improved. Committees are sometimes used as a sounding board for ideas.

After a decision has been installed, show how the actions overcame the performance deficiencies.

Decision makers use **participation** by delegating aspects of the decision to others, such as a task force. Participation can range from comprehensive participation — when the decision is completely delegated to a fully representative task force — to token participation. ■

For more on the different types of participation , go to: http://my.summary.com

Burn Care: Intervention at Work

Convincing hospital stakeholders to accept a burn care center demonstrates how intervention can overcome resistance.

Hospital trustees are wary of offering high-cost services like burn care because third-party payers (Medicaid, HMOs, etc.) do not insure the full cost of treatment. To overcome this objection, a hospital CEO must show how the cost for burn care could be covered by a variety of sources — endowments, reimbursements, cheap resident manpower, etc. The CEO must present trustees with a demonstration of financial feasibility and a description of how other hospitals have enhanced their image (and, thus, their endowments) with this service. A candidate for the burn care director position must then demonstrate to trustees treatment procedures and staffing, showing how resident recruitment has been enhanced at other facilities that have added such a service, stressing that future recruitment might be compromised if burn care is not offered.

If the trustees buy in sufficiently to warrant a pilot test, the hospital CEO must, at the conclusion of the pilot, report back to trustees. His or her report must provide data on image, resident recruitment and costs, resulting from the pilot test of the unit.

Ambiguous Directions

Decision makers must have a clear direction set for the decision. Where is this decision going? What is it meant to accomplish — in other words, what are the expected results? A joint venture between The Ohio State University and the University of Arizona illustrates the importance of clear directions.

From Dream to Boondoggle

When The Ohio State University (OSU) and the University of Arizona entered into a partnership to build a new telescope, it seemed like a match made in the heavens. The two universities would share the cost of building the telescope in Arizona, providing the schools' astronomy departments with valuable "viewing time" and national prominence. Over the span of three years, however, the project grew to include an international partner and another college. The size of the proposed telescope grew as well, and the cost of building it doubled.

In a short time, due to other circumstances, OSU found itself in a budget crisis, which saw the resignations of both the university president and the chair of the astronomy department, the two main champions of the project at the university. State legislators stepped in to head off a "boondoggle" that was draining tax money from Ohio to build a telescope in another state. Eventually, the new university president canceled the telescope, leaving OSU with payments due its partner, the University of Arizona, and lots of planning costs.

(continued on page 5)

Ambiguous Directions

(continued from page 4)

What Happened?

A direction can liberate, limit or conceal. It liberates when it opens up possibilities. It limits when it sets boundaries. It conceals opportunities when expectations are ambiguous.

What was the purpose of the telescope? Each of the OSU champions had different claims. The university president wanted the project to enhance the university's reputation. The chairman of the astronomy department was looking for a better astronomy facility.

Had "national reputation" been clearly defined as the direction of this decision, decision-makers would have been faced with a broader set of options when considering their decision. Was an expensive telescope the more cost-effective — and effective — way of enhancing the university's reputation?

One problem is that the Ohio State University decision makers focused on an idea (a new telescope) instead of an objective (enhancing the university's reputation). An objective identifies specific, quantifiable desired results. It works as a direction because it focuses a search on those expected results, thereby giving everyone involved freedom to look at any solution that can realize those intended results. ■

Limited Search and No Innovation

"Keep your options open" is sage advice. When making a big-ticket expenditure, such as buying a car or a house, we identify several options before settling on one. Yet, many decision makers making weighty decisions drastically limit their search for different options. Others embrace the idea found in a claim and avoid search altogether. Opportunistic behavior drives our search when the pull of a quick fix or the push of a pet idea — such as John Wolf's pet idea of a flower show to commemorate a historical event (see box at right) — take precedence over the objective search for the right solution.

Avoiding the Trap

Decision makers must take the time to search for different options and solutions before deciding on a plan for action. The best searches include:

● **Integrated benchmarking.** Benchmarking becomes difficult when there are difficulties fitting a benchmarked idea to the borrowing organization's situation. It is better to look for ideas in several organizations, seeking best practices to be amalgamated into a plan.

● **Repeated Solicitations.** In a multi-cycle solicitation, decision makers set out to learn about possibilities and apply this knowledge to fashion a series of more sophisticated searches; each search incorporates what is learned from previous searches. A repeated solicitation calls upon you to engage in a process of reflection in which possibilities are carefully studied as understanding about possibilities grows, offering opportunities for learning. Repeated solicitation produces superior results, but, as a tactic, it is rarely used.

● **Innovation.** Decision makers look for a new idea without references to ready-made plans, practices of others, or the ideas of vendors. The prospects of this approach having success improve considerably when an objective is used to guide the design effort, and when multiple options are developed.

None of these were considered in the case of AmeriFlora. The agendas of John Wolf and his fellow organizers and their predetermined solutions stifled any kind of broad search or innovation, resulting in a costly, embarrassing disaster for the city of Columbus. ■

For an example of integrated benchmarking, go to: http://my.summary.com

Why AmeriFlora Never Happened

Columbus, Ohio, set out to celebrate the 500th anniversary of the "discovery" of America by Christopher Columbus with the largest Quincentennial in the U.S. John Wolf, a local businessman and community power broker, had the idea to create a celebration against the backdrop of an international garden exposition, which came to be known as AmeriFlora. The show was seen by local politicians as an attention grabber that would enhance the city's image, and by Wolf as an opportunity to cement his position as a community leader.

Controversy and spiraling costs plagued AmeriFlora almost immediately. Organizers were secretive and controlling, making a shared vision impossible to realize. New infrastructure that the public would be able to use after the event (for example, a monorail) never materialized. Local residents opposed the event for traffic and other inconvenience reasons. Event commissioners went on lavish junkets to Europe.

AmeriFlora never happened, for a number of reasons. Artificial deadlines and group think cajoled commissioners into buying into the event without giving it much thought. The event's aims were never clear (the commemorative element of the event was lost as soon as Wolf began pushing the floral expo). Dealings with neighbors (who were also stakeholders) were adversarial and bullying.

Misuse of Evaluation

Decision makers who set out to support a preferred idea get drawn into defensive evaluation. Vast sums invariably are spent to find evidence that validates what a decision maker wants to do or must support. Little, if anything, is spent on claim investigation, implementation, direction setting, or searching for new ideas.

These kinds of evaluations ignore possible risks, painting a rosy picture in order to support a presupposed conclusion. For example, AmeriFlora's proponents made favorable assumptions about ticket sales to conceal the project's risk from those who funded it. Disney's analysis of its EuroDisney deal — a notorious debacle in recent decision making — drew top management away from questions about its risk.

Evaluation tactics used by decision makers differ in the type of information collected and how an inference is made. Two tactics that tend to work best are analytic and bargaining evaluation. Each provides convincing information to support a proposed choice, which is more apt to lead to success.

In an analytical evaluation, data is gathered from various sources (archives, pilot tests and the like) and inferences are made from the data using analytical tools. Archival information gleaned from records can be manipulated to estimate benefits of options. Pilot tests enable decision makers to try out an idea in a field setting to estimate a benefit.

Bargaining tactics in evaluation bring stakeholders to agreement about the choice to be made by following a course of action that all can support. Ranking or voting follows a period of negotiation and information sharing. When using this tactic, it is imperative to give all involved parties a voice. Users and stakeholders in a position to block a decision will be less inclined to do so if asked about their preferences before a decision is made. ■

Ford's Pinto Fiasco

Defensive evaluations that lack a clear direction produce argumentative and misleading conclusions. In 1970, Ford had a problem with the gas tank in their Pinto model; the tank was located in the back of the car, six inches from a flimsy rear bumper, which made it susceptible to devastating fires when impacted from the rear. When a Federal investigation revealed dozens of deaths and injuries as a result of the tank's location, Ford was pressured to fix the Pinto, or recall it — two courses of action that ran counter to CEO Lee Iacocca's vision of providing "a 2,000 pound car for $2,000."

Instead, the company conducted a cost-benefit study, placing monetary values on lost lives, injuries and damaged cars. The study deemed that paying "benefits" to injured parties or families of deceased drivers was cheaper than fixing the cars, so they opted to not fix the cars.

Ford officials focused on the cost of a recall, indicating that this was all that mattered. Critics contended that more should have been spent on measuring the consequences of not fixing the defective gas tank. The company's defensive evaluation had perilous consequences, for the company, its customers and the American auto industry in general.

Ignoring Ethical Questions

A person's ethical stance is rooted in his or her standards of fairness and justice. What one believes to be fair and just is imposed on a decision and how the decision is made. Decision makers apply standards of fairness and justice to what they see, which may or may not capture what actually takes place. Both the appearance and the reality of an ethical lapse can spell trouble.

Ethical issues can erupt at any point in the decision-making effort. Claims can seem wrong-headed and provoke opposition. Decision makers feeling pressure to act may barge ahead and run over people whose interests could have been served or preserved. Adopting an idea that pops up outside of a formal search may seem to be a clever way to take decisive action. To others, the idea may raise questions about your vested interests — even if there are none. Whose interests are being served and whose are neglected will always pose an ethical issue.

Failure to apply personal standards when making decisions at work sets an ethical trap. People who suspend personal ethics and substitute the ethic to serve the organization are driven by four things:

- **Self-indulgence.** The lust for power and the lure of greed corrupts both public officials sworn to a higher standard of conduct and private sector managers expected to act in the best interests of their company. John Wolf's actions in the AmeriFlora debacle — from the idea of the flower expo to the selection of managers and location — were based around the self-indulgent motivation to cement his influence in the community.
- **Self-protection.** People in organizations get caught up in doing what is asked. "Going along to get along" persuades people to support choices they would otherwise oppose out of fear that opposition would be costly to their careers. They fudge data in order to support an idea; they line up to tell higher-ups what they want to hear.
- **Self-righteousness.** The "rightness" of a cause seduces zealots, and organizations have lots of people with causes. Together, they fashion a cache of solutions, with a champion who will do whatever it takes to secure

(continued on page 7)

Ignoring Ethical Questions

(continued from page 6)

the adoption of an idea he or she believes to be right or needed. Disney officials acted as if any means available to realize the concept of EuroDisney was justified, regardless of the facts of culture and economics.

● **Self-deception.** People slide into the posture of advocate through many small endorsements over the years, eventually easing into the firm belief that the superior's agenda merits their steadfast support. While being loyal to the boss seems reasonable and expected, this requires that subordinates treat every situation as requiring them to do whatever it takes to support higher-ups. ■

Failure to Learn

Decisions produce outcomes with consequences. Learning requires an assessment of these consequences and the actions taken to realize them. The ideas extracted from such assessments codify best practices and how issues were resolved.

Hoping to deflect blame and protect prerogatives, some decision makers maneuver to keep their decisions from receiving a post-mortem. There is also a natural reluctance to reveal information that could expose mistakes and errors. Perverse incentives, misleading outcomes and a "hindsight bias" also coax people to conceal information, forging a climate in which one tells others as little as possible.

Perverse Incentives

Perverse incentives coax subordinates to do things higher-ups insist they do not want. A perverse incentive can be implicit or explicit — explicit perverse incentives reward the wrong things, while implicit perverse incentives lurk in the climate in which decisions are made.

Misreading Outcomes

Windfall successes and bad luck failures also set a trap. A windfall outcome can hide bad practices, but many find it difficult to separate outcomes from the decision-making practices applied to generate those outcomes. Bad practices can be present in decisions that turn out well due to good luck; conversely, good practices can be present in decisions that turn out poorly due to bad luck. You must distinguish between them in order to make any assessment meaningful.

When practices are appropriate and outcomes are good, assessment is directed to context — the time, topic, urgency and other aspects in which the good results were realized. Failing to appreciate context can lead you to export a good practice to a situation for which it is ill suited.

Better forecasts are needed when decision-making practices are good and the outcome is bad. Learning stems from uncovering assumptions buried in the forecasts to detect risk. Both decision-making practices and forecasts can be faulty. Addressing one without the other leads to incomplete learning. Begin by assessing the forecast and its assumptions, then select tactics with a good track record that fit your circumstances.

Hindsight Bias

Once a decision and its results fall far below expectations, observers sometimes blame the decision maker for ignoring warning signals that might or might not have been apparent at the time the decision was made. If, for instance, a parole board releases a prisoner with an exceptional behavior record and that person commits a crime shortly thereafter, critics may accuse the parole board of overlooking key evidence that might have prevented the prisoner from being released.

Decisions must be reviewed with all of their ambiguities and uncertainties to set aside the biases in hindsight. To conduct an impartial review of a decision, first you must disguise the outcome, since people are remarkably adept at gathering facts consistent with a known outcome. Give a reviewer access to the same information originally provided to the decision maker, under the same conditions; this will help you avoid the bias that hindsight typically engenders. ■

The Challenger Disaster

Another example of hindsight bias occurred in the aftermath of the Challenger space shuttle disaster of 1986. There was a known risk in low-temperature launches — the O-rings in the rocket booster did not seal properly in temperatures below 50 degrees Fahrenheit. Engineers in several reports documented these concerns, and NASA decision makers were aware of the reports. NASA administrators, however, contended that nothing would ever get launched if they listened to the advice that comes pouring in from all quarters during a countdown.

From the vantage point of hindsight, the shuttle disaster seems preventable — a prior prediction was made and verified, but ignored. Before you buy into this explanation, though, consider how creeping determinism emerged from the hearings investigating the disaster. Once critics listened to testimony, the risk of O-ring failure became far more certain than it was at the time of the launch. This determinism makes the explosion seem preordained, the failure to heed warnings the sole cause of the disaster, instead of one of many contributing factors.

For another example of hindsight bias, go to:
http://my.summary.com

AVOIDING THE BLUNDERS AND TRAPS

Decision debacles follow from being caught by one or more of the seven traps set by making one of the three blunders. When you are able to avoid the blunders and sidestep the traps, your chance of success increases by 50 percent. There are three essential moves you can make to avoid blunders: stay issue-centered, use resources wisely and adhere to best practices through each stage of the decision-making effort. ■

Stay Issue-Centered

In debacles, decision makers often make premature commitments by grabbing onto the first idea that pops up, an idea that often is, at best, misguided and, at worst, wrong-headed. Even when decision makers try to contemplate possibilities before taking action, the pressure for rapid action can become intense. To deal with this pressure, decision makers must stay "issue-centered" by maintaining an exploratory mindset and pausing to reflect.

The urge to "fix" something is out of sync with the needs of decision-making. Making the decision calls for an exploratory mindset, an appreciative inquiry, in which skillful questioning is used to get to the bottom of things. Discover what gives life to the issue being contemplated. Get various points of view in meetings and other forums, and challenge those listening to reflect and make sense of what is heard.

The urge to "fix" something is out of sync with the needs of decision-making.

Pausing to reflect when one is pressured to act can be difficult to begin and harder to sustain. When challenged to "get on with it," remind people of the alternative. Ask them to recall the last time people in the organization rapidly "got on with" fixing a problem, and how much follow-up work was required to fix the fix. Ask the critic to visualize the chaos, the squandered energy and the smoldering resentment. Ask if spending some time to pause and reflect today is a good investment to avoid all this tomorrow. ■

Use Resources Wisely

In debacles, little time or money was spent on anything but defending the quick fix with a defensive evaluation. Evaluations become tainted and suspicions arise when observers see a preoccupation with what the decision maker wants to do or must do to satisfy others. The cycle of suspicions provoking defensive evaluations grows until huge sums of money have been spent on evaluation and little on anything else. This pulls funds away from other decision-making activities, such as investigating claims and reconciling different views.

A key message to take away from the debacles discussed here is to make your decision-making investments wisely; to do so, make most of your investments early on. Spend time and money to stay issue-centered by uncovering and exploring claims and the concerns and considerations that prompt them. Use groups or network with people who can block the decision to find out their interests and ways to manage them. This introduces you to political realities early on, so political rationality can be incorporated into your actions. ■

Adhere to Best Practices

Debacles are riddled with failure-prone decision-making practices. Best practice calls for a discovery process that emphasizes process stages found to have the greatest impact on success. Use the following sequence of tasks called for by the discovery process:

Manage forces that can block action. Implementation brings social and political issues to the forefront by uncovering the interests of people who can block action. Opposition can be expected when these interests are threatened.

Set a direction. The direction indicates the results wanted, guiding the search for ideas with an outcome in mind.

Search widely for ideas. If claim, implementation and direction have been attended to, the remaining steps are much easier to carry out, and there will be far less controversy in doing so.

Evaluate options. Evaluation is straightforward in a development process. The direction specifies what is wanted, such as lower cost, making a cost criterion an appropriate and reasonable way to measure benefit. It takes away the political overtones of using evaluation to defend a course of action, replacing it with an evaluation that documents benefits and the likely risk in realizing them.

Confront ethical questions. Decisions often pose ethical issues for people; a decision that seems ethically neutral to a beneficiary may have a very different look to others. These ethical issues can be neutralized by finding actions that embrace the values stakeholders believe are crucial.

Learn about missed opportunities. Learning helps you find out what worked, what didn't and why. Various obstacles complicate learning by hiding the information required to make such assessments. Learn to get around these obstacles. ■

Seven Essential Lessons for Surviving Disaster

WHY SOME COMPANIES EMERGE STRONGER AND BETTER FROM A CRISIS

THE SUMMARY IN BRIEF

We've all seen companies that go through disasters, companies such as Tylenol, Enron, WorldCom, Firestone, Union Carbide and others. Some companies emerge stronger from such disasters and others fade away into oblivion. Was there something about their approaches to the problem that allowed them to survive or perish?

Why Some Companies Emerge Stronger and Better From a Crisis *illustrates how to survive a crisis and grow.*

In this summary, you will discover seven essential competencies that companies need to learn in order to survive a major crisis. Many of those answers are counterintuitive. For example, if you act in the public's best interest, you'll not only feel better, but it's more profitable in the long run. According to crisis management expert Ian I. Mitroff, the modern global enterprise has to be reorganized around crisis management.

What You'll Learn In This Summary

✓ How crises can arise with unprecedented frequency, complexity and destructive power.

✓ How to face seven essential challenges for surviving disaster.

✓ How to equip your people to stay strong and focused in the face of a crisis.

✓ How the need for careful planning did not originate on Sept. 11, 2001.

✓ How crisis management is a systemic process of thinking about a range of potential crises, how they can happen and how one crisis can trigger another.

✓ How to assemble a crisis tool kit.

✓ Why every company should have a chief crisis officer and departments for crisis learning and early warning-signal detection.

WHY SOME COMPANIES EMERGE STRONGER AND BETTER FROM A CRISIS

by Ian I. Mitroff

— THE *COMPLETE* SUMMARY

Overcoming the Challenges of Crisis Management

America's organizations and institutions are in dire trouble on every conceivable front: physically, intellectually, morally and spiritually. First, their operations, plants and infrastructure have been the objects of direct terrorist attacks and other criminal threats. Second, the fundamental assumptions upon which their crisis plans and procedures are based have been seriously undermined, if not proven false, by recent events. Third, a series of unprecedented corporate scandals involving WorldCom, Enron and others has eroded their moral compasses. Fourth, they have been dismissive and destructive with regard to the spiritual needs of their employees and customers. In short, America's organizations and institutions are in crisis, big time.

Before 9/11, corporate America was basically unprepared for a wide variety of crises, including terrorism. Four years after the tragedy, the situation really hasn't changed that much. A crisis for an organization is an extreme event that literally threatens its very existence. At the very least, it causes substantial injuries, deaths and financial costs, as well as serious damage to its corporate reputation.

Surviving Today's Threats

Most executives and organizations, unfortunately, are prepared for only a small number of worst-case scenarios. There are seven potential challenges that all organizations need to face and overcome if they are to survive today's threats.

Learning the following lessons can help every organization to anticipate, plan for and survive the crises that are an inevitable part of life:

1. Right heart. Crises extract tremendous emotional costs. As a result, crises demand exceptional emotional capabilities, or emotional IQ. Effective crisis management demands high emotional capacity and sensitivity, and emotional resiliency.

2. Right thinking. Crises demand that we are capable of exercising on-the-spot creative thinking. They demand that we are capable of thinking "*outside of the box that contains the box!*" Effective crisis management demands high creative IQ.

3. Right soul. Effective crisis management requires a special type of inner spiritual growth, or spiritual IQ. Without this, our world is rendered meaningless by a major crisis. Nothing devastates the soul as much as a crisis.

4. Right social and political skills. Effective crisis management requires a special type of political and social IQ. This is needed to get the leaders of an organization to buy into crisis management.

5. Right technical skills. Crises demand that we know different things and that we do things differently. This is technical IQ. For example, to outwit terrorists, we have to learn to think like a controlled paranoid without becoming a terrorist, a paranoid or a psychopath.

6. Right integration. Effective crisis management requires that we integrate previous forms of IQ; thus, integrative IQ is required.

7. Right transfer. New skills are needed in the new global economy. Without integrative IQ, more and more white-collar and professional jobs will be lost and the United States will become a jobless economy. New knowledge and new forms of IQ, such as aesthetic IQ, are needed because they allow us to see the world anew.

Proper Attitudes

Crisis leadership is not just good for business, it is also

Overcoming the Challenges of Crisis Management

(continued from page 2)

necessary for the existential, emotional and spiritual bottom line. No person, business, organization, institution or society can survive for very long without crisis leadership. ■

The Crisis Society: The Rise of the Abnormal

Mary Douglas is the CEO of Rural Books, a company she established 10 years ago. Rural Books produces field books and guides for identifying and cooking wild fruit, nuts, berries and the like. In the 10 years of the publisher's existence, no one had ever suffered any illness from following its books' recommendations.

One morning, Douglas woke to the news that the media had linked one of the company's books to the deaths of a family of four, as well as the serious illness of many others.

On hearing the news and pondering the possibilities, she exclaimed, "Oh my God. What am I going to do? I don't have the foggiest clue as to where to begin."

Because Douglas and her top management team had never received the proper training in crisis management, they were unable to think outside the box. As a result, they were unable to imagine and anticipate the types of product tampering that applied to their business.

If Douglas and her top team had received proper training, they would have been prepared for the strong and often overwhelming emotions that are a critical part of every major crisis. If she and her team had faced the challenges and learned the lessons that successful crisis leaders have to teach, they would have been able to respond faster and better, substantially lowering both the economic and the emotional costs of the crisis or crises they were facing. Douglas and her team would have recovered sooner and with far fewer costs.

The first thing that Douglas and her company should have done is understand what is fundamentally different about today's world — that crises are literally built into the fabric of modern societies.

The Failure of Conventional Ways of Thinking

America's organizations and institutions have become breeding grounds for crises of all kinds. Conventional management is of little help in the face of major crises such as Enron, WorldCom, space shuttle explosions and mad cow disease — just to name a few. Conventional thinking simply can't anticipate and cope with "abnormal states of mind."

There is a difference between normal and abnormal accidents. Normal accidents are unintentional failures of complex systems, where abnormal accidents result from intentional sabotage which is intended to destroy or severely disrupt the company. Leading-edge organizations have found a way to reduce — but not eliminate entirely, for that isn't possible — the potential for major crises, both abnormal and normal. This means that the business has to act like a controlled paranoid in order to anticipate the worst that can happen to it. ■

Right Heart: Emotional IQ

To understand why Mary Douglas and her top executives were unprepared for the crisis that occurred, it helps to look back to the year before the crisis happened.

Douglas was chairing the regular monthly meeting of her top executive team. In addition, Head of Risk Management and Security Bob Hunt, who was not a permanent member of the executive team, was there as a special guest. Hunt was invited to deliver a special report that he had prepared on the major risks facing Rural Books. His report showed that the most probable and costly risks facing the company were fire and water damage due to spring floods. With little fanfare, the Rural Books executive committee immediately approved an expenditure of $250,000 to protect and upgrade the company's facilities.

The second part of Hunt's report was not as well received. He had recently attended a three-day seminar on crisis management. Hunt explained that crisis management took a much broader view of risks than traditional risk management. Citing the example of 9/11, Hunt suggested that Rural Books ought to brainstorm how other types of crises — for instance, product tampering — might apply to their business. Unfortunately, because Hunt could not suggest any specific examples of product tampering that might apply to Rural Books, his proposal fell on deaf ears.

Normal Vs. Abnormal Business

To understand why Rural Books' executive team was not prepared for the crisis that struck the company, one must understand that the qualities that make for success in running a business in normal times are not the same qualities that make for success in managing a major crisis, certainly not in abnormal times. Crises demand that we confront and overcome feelings of denial, fear, betrayal and the exposure to severely traumatic situations. To manage these kinds of feelings and emotions, one needs to develop a capacity for resilience. This requires Douglas and Rural Books' top executive team to undergo a rigorous and systematic program of pre-crisis psychological training. They need to take both a personal and an organizational audit of their psychologi-

(continued on page 4)

Right Heart: Emotional IQ

(continued from page 3)

cal capacities to confront and to survive major crises.

Denial and Trauma

Denial was the first defense mechanism that was at work in Douglas' response to Hunt. She denied outright that terrorism and product tampering were even remote possibilities. Unconsciously she diminished the potential size and the importance of a particular set of crises.

Denial involves denying unpleasant feelings associated with potentially traumatic events *before* they occur. In contrast, trauma involves the denial of feelings *after* a traumatic event has occurred. In either case, the feelings, fears and emotions surrounding a potential or already experienced crisis are too painful for the conscious mind to accept.

Betrayal

One of the most striking features of crises is that they are experienced as major acts of betrayal. In all likelihood, the leaders at Rural Books will be viewed as villains — as having betrayed their employees, their surrounding community and their customers — because they had not thought about the particular crisis that the company experienced and for which they were not adequately prepared. They will be vilified even though there may have been very little, if anything, that they could have done to prevent the crisis.

Crises are generally experienced as major acts of betrayal because people need to have someone to blame for a crisis. Blaming is one of the principal ways in which we cope with the strong emotions that crises stir up.

Betrayal is the failure of a person, organization or a society to act and behave in accordance with ways that they have promised. Most acts of betrayal are unintentional. However, in the case of Enron, there are strong reasons to believe that the company exhibited the characteristics of a sociopathic organization.

Recovering From Crises

We demonize those who have betrayed us. This is true whether the betrayer is an individual, organization, society or even a civilization. Someone or something is always demonized as a result of a major crisis.

To recover from a major crisis, one has to go back, to rebuild and to readjust the perceptions of those that one feels are responsible for causing the crisis in the first place. One has to "re-humanize" the dehumanization that has taken place with regard to one's betrayer. Even in the case where the betrayer, villain or guilty party has accepted responsibility for his or her actions, has admitted it openly and has even tried to make amends, it is still very difficult to accomplish this change in perception.

Train in the Psychological Impacts of a Crisis

It would be eminently desirable if Douglas and her top management team had been aware of all these forces and factors before the crisis, and trained in the psychological impacts of crises. Without such training, they merely react, and in most cases, poorly, to highly emotional, stressful and traumatic situations. The emotional crisis will be compounded by all of the powerful feelings that will be unleashed in Rural Books' leaders and stakeholders. They will most likely be blamed for the crisis, for their not having done more to foresee it, even if they couldn't have prevented it. This is why pre-crisis trauma and psychological training is essential.

Every organization should hire consultants who are experts in trauma and the psychological effects of crises. Such experts are invaluable in creating realistic simulations that will give people a feel for the strong emotions that they will experience as the result of a crisis. If an individual or organization is not prepared for a crisis, it will lose valuable time and energy in treating its own psychological wounds instead of responding to the wounds of others. The psychological factors are among the most important factors in how an individual, organization or society responds to a major crisis. To de-emphasize and to neglect them is merely another form of denial.

Crisis leaders learn one of the most valuable lessons of all: *the fact that one is aware of one's own denial does not mean that everyone else in the organization is aware of theirs.* They have also learned: *do not become paralyzed by your fears and those of others.* Give people time and space to vent and to work through their fears and anxieties. And never dismiss them: This only makes the fears and anxieties worse. ■

Right Thinking and Right Social and Political Skills

One of the most troubling aspects of major crises is that they "unravel the knitting." Crises are crises precisely because they don't abide by narrow and artificial boundaries. The "key principles" that are suitable for running an ordinary business are not the same principles that will get you through a major crisis.

In today's world, all businesses are in all other businesses all of the time. In addition, all crises are in all other crises all of the time. Therefore, we need to "unbound" the assumptions we have about an organization.

For example, Rural Books is potentially in a large number of businesses, many of which are related only indirectly to the book publishing industry. It is also involved in a number of ancillary businesses that facilitate the conduct of its primary business. For example,

(continued on page 5)

Right Thinking and Right Social and Political Skills

(continued from page 4)

Rural Books is involved in finance, quality control, education, manufacturing, environmental and wilderness preservation, television and video, travel, retail, entertainment, health and publicity, and other businesses.

We need to unbound the pictures we have created. This is precisely what responsible troublemakers do very carefully, in stages, over time. For instance, in order to accomplish this "unbounding" for Rural Books, Bob Hunt would have to understand the company better than the organization's top leaders do. He would have to develop a plausible scenario of how each kind of crisis could happen to the full range of businesses that Rural Books is in. He would have to sell *both* broad views of Rural Books *and* detailed crisis scenarios. He would have to develop scenarios over time as he learned more about the Rural Books system and as some crises developed. He would have to meet with other crisis managers in parallel organizations to learn from them what they had done to sell crisis management successfully to their respective organizations.

Gather Information From Multiple Channels

Hunt would also have to gather information simultaneously from multiple channels regarding the desirability and necessity of a broader crisis management program. Executives of other organizations would have to get together periodically to share information on the crises that they have faced and why other members of the industry should consider preparing for them. Hunt would have to convene an internal Rural Books stakeholder conference. He would also have to interview people in all of the company's businesses to discover the "ticking time bombs" that they see in their respective parts of the organization.

Taking on this daunting series of tasks is precisely what differentiates those organizations that are in the "Crisis Prepared Zone," or are constantly striving to be in the zone, from those that are not. Taking an unduly narrow view of the risks to which you are subject can lead to failure in a crisis. A narrow view of risks is insufficient for a company to be protected. ■

Right Integration: Integrative IQ

William James, founder of that distinct brand of American philosophy known as pragmatism, developed a unique theory of truth. His is a theory of problem solving for complex problems. It is a theory of critical thinking and of how to formulate complex problems from multiple points of view. For James, a single perspective of any problem is automatically wrong. A single perspective cannot hope to capture all of the subtleties and complexities that are characteristic of real problems.

Universities Are Complex Systems

Perhaps more than any other modern institution, the university illustrates how complex the world is today. Although education and research are the primary businesses of the modern university, the number of additional businesses that universities operate in order to accomplish their main mission is very large.

For example, most major universities are in the hotel business, serve thousands of meals daily, and have to service hundreds of rooms, both on and off campus. Therefore, safety and security are primary concerns. Most universities have their own police, safety and security forces. Thousands of meals are served daily. In recent years, selling clothing with the university logo has been a huge business and includes hats, sweat shirts, license plates and so on.

Universities are also in the entertainment and special events businesses. Sports are big business. Universities also host all kinds of visitors, from speakers to concerts, celebrity shows, traveling Broadway companies and the like. They are also in the facilities and property management business. In most major cities, a university is the city's largest private employer. In fact, many major universities are on the order of billion-dollar-a-year businesses.

Truth

Truth is a thoroughly human creation. People create it through their actions in an attempt to achieve desired ends. For James, truth is not an abstract concept that is independent of human purposes and ends. Truth is not something that is "just out there." Truth is in fact the management of ways and styles of knowing. Knowledge cannot be decoupled from knowers — that is, from the processes by which humans know things. Truth is thus the management of several different types of knowers. This is precisely what makes James so powerful and his ideas so relevant to crisis management.

Real problems are by their very nature ill-structured or ill-defined. At least in the very beginning, when problems first present themselves, they are not already or automatically well-defined or well-structured. Only for well-structured problems do we know all of the available courses of action, their outcomes, their consequences, and their benefits versus costs associated with them. In contrast, an ill-structured problem is precisely a problem for which the full set of means is not known, let alone their consequences.

All of us are problem solvers *and* problem managers. Whatever structure or definition a problem possesses is due to our efforts. Problems become defined and structured through our efforts — that is, through the process of our working on them.

(continued on page 6)

Right Integration: Integrative IQ

(continued from page 5)

The problems of the world are not normally the captive of a single academic discipline or corporate function, such as finance. Most real-world issues are complex mixtures of different disciplines and functions — they are interdisciplinary and cross functional. They are transdisciplinary because they are beyond any of the known disciplines.

The same is true of crisis management. Crisis management is inherently transdisciplinary. Different stakeholders do not see the same courses of action or the same outcomes of the "same" crisis. For instance, Rural Books' crisis is not a single problem or a single crisis. Instead, it is a whole system of problems and crises that are highly interdependent and interactive. One cannot even begin to define the company's crisis, let alone pretend to manage it, independently of all the other problems and crises to which it is connected and to which it gives rise.

Ill-Structured Problems

The basic problem with ill-structured problems is the presence of strong conflict over the definition as to the nature of the problem. The steps of problem formulation and problem representation are thus central to facing ill-structured problems. No two stakeholders or crisis management experts will have the same definition of a crisis or a minor problem. Indeed, intense disagreement is one of the major features of ill-structured problems.

A mess is the *product* of the interactions among all of the various problems that constitute the mess. Thus, *a crisis is an ill-structured mess*, a highly interactive set of problems each of which is ill-structured in itself.

Crisis management is essentially a theory of complex problems. Even more basic, it is a theory of critical thinking. This appreciation is absolutely essential to the management of fuzziness, for fuzziness is an inherent property of real-world problems.

There are no checklists for crisis management. Crisis management is open-ended, unbounded problem formulation. Everything connected with crisis management is inherently fuzzy. To put it mildly, crises are slippery. If every business is now in every other business, then every business has the potential to experience the crises of every kind of business. Crises demand that we take an expansive view of the world. This means confronting and mastering underlying emotions, fears and anxieties with regard to crises. ■

Right Technical Skills: Technical IQ

The tenets of crisis management that have been developed for treating normal accidents are no longer sufficient. What is needed is the ability to think comprehensively about normal *and* abnormal accidents. Many companies develop and refine plans to improve the ways in which they handle emergencies of the kind they have confronted in the past. But they now face bigger threats from calamities they have never faced before. As a result, they are fighting new wars with old strategies.

All organizations need to develop special skills to come to grips with abnormal accidents and change their frames of reference. The key lays not so much in drafting manuals as in developing learning processes that give executives the mental capabilities, confidence and flexibility to envisage abnormal crises. Here are some tools to help them prepare for crises:

A Crisis Tool Kit

- **Wheel of Crises.** Some companies prepare effectively for abnormal crises by thinking of them randomly. One tool that can be used to help top-level executives think randomly is a giant wheel of crises. On the wheel, like the spinner on a child's game, is a list of all the families of crises that a company can face. Executives take turns spinning the wheel, and when the pin stops, participants discuss all of the normal and abnormal crises of that particular kind that they can imagine.
- **Internal Assassins.** People who know the organization best can also develop abnormal situations for which they should be prepared. Special techniques such as role-playing can get them to temporarily think like villains, internal assassins or terrorists. They must suspend their rational thinking and use their intimate knowledge of the company's products, procedures and systems to cook up ways to destroy it. Their scenarios can expose weaknesses in the system.
- **Mixed Metaphors.** Most crisis-prepared companies regularly send executives to crisis forums, where companies from diverse industries discuss crisis planning. They also rigorously apply the metaphors of other industries to examine themselves from unusual perspectives, and they learn from the scenarios for which other companies have prepared. For example, banks may be equipped to handle cyberattacks because computer crime is easy to imagine in the context of the industry. But they might be less likely to think about explosions, for which chemical companies must always be prepared.
- **Spy Games.** Proactive companies don't hesitate to bring in outsiders to test their vulnerability to abnormal crises. Smart companies hire journalists, lawyers and consumer affairs experts to stage hypothetical attacks on them. During a security check at one U.S. company, a reporter discovered that there were a number of confidential files that had been dumped in a basement where anybody could access them.

(continued on page 7)

Internal Assassins in the Insurance Business

The "internal assassin" technique can change an organization's attitude toward crises. A $1 billion U.S. medical insurance company used the exercise to determine if financial fraud could force it into bankruptcy. The company created three fake terror teams made up of senior executives. Their jobs were to arrange swindles and schemes done by both crooked employees and crooked outsiders. The company was surprised and embarrassed by how many schemes could be performed without being detected by the company. Afterward, the company formed a number of counter-assassin teams to prevent and detect swindles. Several months later, the groups concluded that the company was most vulnerable to one fundamental situation and fixed the problem. By looking at its vulnerabilities systematically, the company was able to close the door on an entire category of threats.

Right Technical Skills: Technical IQ

(continued from page 6)

The criminal mind-set is so different from most people's that executives can figure it out only by bringing it inside the organization. Banks hire former robbers to test security procedures. Casinos use professional gamblers to detect gambling fraud. Many companies use former hackers to identify weaknesses in their computer networks.

Think Like a Controlled Paranoid

There is a framework for thinking like a paranoid without being or becoming one. This framework is based upon the known types of paranoia. These pertain to a person's body, a person's immediate family and organizations, the culture of an organization or society, and the mind of a single individual.

Thinking like a controlled paranoid is merely one way of managing fear. On the one hand, too little fear leads to denial. On the other hand, too much leads to paralysis. Thus, one of the prime purposes of emotional or psychological preparation for crises is the ability to confront fear directly without being overwhelmed by it.

Here is one of the principal ways of thinking like a controlled paranoid: *Take every proposed action, or agent, that you can use to protect yourself from a major threat, and then flip its properties on its head.* For example, you might use Cipro to treat anthrax, but what if the Cipro supply itself has been sabotaged?

The purpose of thinking like a controlled paranoid is to help prepare the mind before horrendous acts occur by understanding how paranoids and terrorists think. The more horrific the act, the more this kind of thinking is absolutely necessary. The more preparation that one has in thinking about the possibility of horrendous acts, the better one is able to cope with them. ■

Right Transfer: Aesthetic IQ

American corporations have been built on two powerful but faulty assumptions:

1. An organization is nothing more than the sum of separate, self-standing and isolated silos.

2. As new problems and issues arise, new departments, functions and silos can be added to the basic design without disturbing it in any essential way.

Both of these assumptions are dead wrong.

Today's crises have the potential of wreaking extreme financial havoc and, in some cases, destroying the corporation. As recent history showed with the demise of Arthur Andersen, it is possible for large organizations to go out of existence as the result of a major crisis.

Too many executives believe that adding an infrastructure for crisis leadership is tantamount to adding another layer of corporate bureaucracy. This is not the case. All structures are not the same: Enabling structures are not the same as bureaucratic ones. The integration of appropriate structures allows global corporations to give proper autonomy to local operating units. This is because local units know local markets better than bureaucrats ensconced at headquarters. Yet, global corporations must have the machinery for responding to crises that affect the whole organization. A crisis in one locale can swiftly escalate to become a crisis for an entire organization. Therefore, both globally integrated and locally responsible structures are needed.

The Chief Crisis Officer

If today's organizations are to respond effectively to the crises they face, they will need a chief crisis officer. There is no longer any excuse for every organization's *not* having a full-time, senior executive in charge of the crisis capabilities of his or her organization. Organizations need world-class crisis learning and signal detection centers to monitor early warning signals for potential crises. A major function of crisis learning centers is to study the patterns associated with past crises, to distill critical lessons from these patterns, and to ensure that the organization puts these lessons into practice so that the potential for crises is lowered considerably. Although all crises cannot be prevented, being prepared for *any* crisis speeds up recovery time.

A crisis center conducts regular audits and training exercises, installs mechanisms to contain crises, and develops programs to help executives communicate with

(continued on page 8)

Right Transfer: Aesthetic IQ

(continued from page 7)

internal and external stakeholders during a crisis. It also identifies or sets up alternative work sites in case the company's plants or offices are destroyed. ■

Right Soul: Spiritual IQ

One of the reasons so many organizations are prone to major crises is that they emphasize the so-called rational aspects of the human mind to the exclusion of the so-called emotional aspects, or vice versa. For instance, if one emphasizes the supposedly rational aspects of a crisis to the detriment of its emotional aspects, then one will tend to prepare only for those crises that have a high probability of occurring *and* a high consequence associated with their occurrence. That is, one will not only use risk management but will believe also that risk management is the basis of crisis management. As a result, one will ignore not only certain types of crises, such as terrorism, which is extremely unpleasant to contemplate emotionally, but also the emotional and existential aspects of all other crises. The emotional and existential are integral parts of spirituality.

The Constant Search for Meaning

In order to understand how crises perturb our basic sense of meaning, purpose and justice in the universe, it is first necessary to have a deep understanding of spirituality. In the context of crisis management, being spiritual requires one to practice a systemic, integrative form of crisis management. If one practices spirituality primarily for financial or instrumental gain, then neither spirituality nor financial gain will result.

Dealing with emotions — indeed, even acknowledging them in the first place — is one of the most important struggles that takes place in every person's life. If we do not deal with emotions, we and our organizations remain underdeveloped. Spirituality deals with the whole person within the context of the whole organization. Here is an example:

How Benetton-Turkey Dealt With a Major Crisis

A crisis began when Italy refused to extradite a Kurdish leader back to Turkey. This particular rebel leader had been accused of being behind the deaths of over 30,000 Turks. As a result, Turks threatened to boycott and possibly attack Italian brands like Ferrari, Perelli and Benetton. The Turkish people felt as if they were betrayed by the Italians.

Most companies took a narrow, purely rational approach. The typical company response was to take out ads, for example, stressing that customers should not confuse the company's position with that of the official government of Italy. These were cognitive reasons that the ordinary people of Turkey dismissed as silly.

Benetton-Turkey, faced with the destruction of its stores and its brand, did the unthinkable and responded with an emotional response that sided with the Turks. Its ads proclaimed, "First and foremost, we are Turks too! Our first allegiance and loyalty is to Turkey! We feel the same way that you do about the Italians!" Yet it went further. The company removed the United Colors of Benetton from its ads and it placed black wreaths of protest on the fronts of all its stores as a show of protest — from a multinational corporation. And before that it lowered financial quotas during these difficult times — garnering trust with its employees — and consulted local store heads about the new policies. As a result, there was a general outpouring of support for Benetton-Turkey by the Turks.

Benetton-Turkey came up with this novel strategy by thinking creatively and emotionally. Other companies, without Benetton-Turkey's imagination, were tone deaf emotionally, and painted themselves as the victims. They simply lacked the emotional intelligence to weigh, judge and appropriately respond to the feelings of the Turkish people.

In the end, it is the split between cognitive IQ and emotional, ethical and spiritual IQ that is responsible for most of the major crises we have experienced. There is no doubt that the people running Enron were intellectually smart, but they were woefully lacking in ethical smarts.

Proactive organizations restore meaning through their actions before, during and after a major crisis. For instance, they allow people to grieve over the loss of their basic assumptions about the world, about themselves and about the organization itself. In this way, they allow new assumptions to emerge. ■

When a Whole Society Is in Crisis, All of the Challenges Apply

Recent crises, but 9/11 in particular, have revealed the serious inadequacy of the myths — the critical stories that we tell ourselves over and over to reassure and reaffirm ourselves — that serve the American people. In effect, these myths are grand assumptions masquerading as myths about the nature of the world.

The 9/11 attack was terrible not only because of the horrible physical destruction that it wrought, but because it demolished some of our most sacred assumptions about the nature of America and the world. The destruction of these assumptions has exacted a terrible blow on the American psyche. Worse still, there is no prospect for replacing them with others that are better suited for a complex world. ■

To Pioneer or Not to Pioneer
Page 8

THE SUMMARY IN BRIEF

*For years, organizations have clung to the belief that the firm that pioneers a new market will become the market leader. Contrary to this widely held belief, the authors write that being first to market guarantees nothing — not name recognition, not market share, and not long-term market leadership. The examples are numerous: P&G did not pioneer the disposable diaper, Federal Express was not the first to offer a priority airfreight service, and Microsoft did not invent the first Web browser. In this summary you will learn what five key principles **do** drive market leadership and how to apply them to your company's efforts to dominate mass markets.*

What You'll Learn In This Summary

✓ **Why vision of the mass market is crucial.** Market leaders are firms that can envision the mass market for innovations and can assemble resources and inspire people to realize that vision.

✓ **Why persistence is the key.** Market leaders are those who persist despite technological blocks, legal constraints, consumer resistance and competitive threats. The road to success is rarely easy.

✓ **Why commitment is necessary.** The mass market cannot be tapped cheaply. Many innovations hinge on new technologies that require costly research and development. Others require large-scale production to achieve economies of scale. Market leaders are firms that commit their resources to a vision when sales are a trickle but costs loom large.

✓ **Why relentless innovation is essential.** Markets, consumers, competitors and technology change constantly. Stagnation can erode market leadership quickly, letting a later entrant take over. Market leadership belongs to firms that innovate relentlessly even at the risk of cannibalizing their own products.

✓ **How assets can be leveraged.** Leaders who dominate an industry must use their resources to enter new and related markets. Market leaders are firms that nurture strengths, like name recognition and product leadership, and extend their resources' influence into related fields.

Are Pioneers Really Blessed?

Gillette. Coke. Tide. These brands have dominated their categories for decades. Once brands capture leadership, they can hold it for decades. In one study, researchers discovered that 19 out of 25 market leaders had held that position for over 60 years. Enduring market leadership is a common phenomenon.

Managers understand the importance of that leadership. First, enduring brands are attractive to consumers, and their owners can charge premium prices without incurring heavy marketing costs. Second, economies of scale mean that market leaders can operate at efficient volume and earn higher profits than a niche product. Third, market leaders can extend their brand recognition into related products and dominate there, too. On the other hand, thousands of products and brands are introduced every year, and most vanish from the market.

Why is it that some brands remain strong and others wither away and are quickly forgotten? The conventional wisdom has been that a firm's probability of surviving and its share of the market depend on the order in which it enters the market. The firm that pioneers or enters a market first is believed to have enormous advantage. This theory is the pioneering or first mover advantage. So many managers believe it to be true that companies everywhere scramble to be the first to market, whether the product or service is ready or not.

The Problem With 'Empirical Studies'

Several studies have provided what appears to be empirical data to support the accepted wisdom that being first to market is the key to success. For example, at least six studies show that pioneers have large market shares and are leaders in their markets. These studies report no pioneers that failed and support the idea that the first immutable law of marketing is that "it's better to be first than it is to be better."

Unfortunately, all the casual observations about pioneers and most of the formal data suffer from three serious problems. These problems are: *the exclusion of failures, the self-anointing of pioneers*, and *the self-serving definitions of the market*. All three problems work to enhance the perceived rewards of being first.

Exclusion of Failures

Humans have a tendency to forget failures. When researchers exclude those who failed from their analysis, and include only pioneering winners, they exaggerate the rewards of being a pioneer. Economists refer to this as *survival bias*. In addition, they may run the risk of rejecting a competing hypothesis to the first mover

(continued on page 3)

The Six Tenets of First Mover Advantage and Their Theories

Those who believe that the first mover retains a long-term competitive advantage believe that:

- ✓ **Pioneers rarely if ever fail.**
- ✓ **Pioneers lose share slowly as new firms enter the market.**
- ✓ **Pioneers retain a high steady-state market share of about 30 percent.**
- ✓ **Pioneers are market leaders.**
- ✓ **Pioneer market leadership is very stable.**
- ✓ **Firms should rush to market to get the first mover advantage. It's better to be first with an inferior product than late with a superior one.**

Their beliefs are based on the theory that: pioneers shape consumer tastes; consumers hate to switch brands; patents protect technological innovation; pioneers have low costs; and pioneers mobilize the best supplies, suppliers, and distributors, and target the best customers.

Are Pioneers Really Blessed?

(continued from page 2)

theory — that pioneers fail. Research that relies on survey data that only covers successful pioneers suffers from the real danger of being circular: stating a hypothesis, excluding conditions that could disprove the hypothesis, and then confirming the hypothesis because the data that would disprove it isn't even considered.

Take, for example, the Gillette Company, which is believed by many to be the pioneer of the safety razor market. Indeed, the company has been around for over one hundred years and dominates the market. But Gillette did not invent the safety razor. In fact, several companies marketed safety razors long before Gillette, and were the real pioneers. They failed.

Self-Appointed Pioneers

Another problem with the study of pioneers is the tendency to survey only current firms in the market. The managers then self-report information. Sociologists have long recognized that those who self-report tend to claim to possess qualities they think the public considers desirable. Many self-report that their companies were the pioneers, when in fact the real pioneers may have failed.

For example, consider Proctor & Gamble and the disposable diaper market. In 1991, P&G celebrated the thirtieth anniversary of its entry into the disposable diaper market. The company claimed at the time that it "literally created the disposable diaper business in the U.S." Based on this pioneering self-report, many reporters credited the company with inventing the disposable diaper. In fact, there were many versions already on the market, but all of them failed. It wasn't P&G's position as a pioneer that assured its success (it wasn't the pioneer), but something else.

Self-Serving Market Definitions

The third problem with pioneer studies is their tendency to narrowly define the relevant market. By defining a market narrowly, a company's market share automatically looks larger. For example, if Motorola defines its market as microprocessors for Apple computers, its market share is 100 percent since it is Apple's only supplier of chips. If it defines its market as microprocessors for all personal computers, its share falls to under 10 percent of the chip market.

Since the performance of managers is often evaluated on the market share of the brands or company they manage, they tend to define that share narrowly. The problem, of course, is that narrowing the market this way may blind the company to real competition coming at it from the margins. For example, for a period of time Wang dominated the narrow "dedicated word processing machine" market. When software companies began producing software that ran on personal computers, Wang still looked like the leader in its market. Soon, its machines were obsolete. The company was blinded to the underlying consumer need (a way to type documents) and focused on the current technology for meeting that need (a dedicated word processing machine). Had it defined the market as document preparation, it might have seen the changes in consumer needs coming.

A narrowly defined market prompts a firm to think of itself as the leader. This can blind a company to competitors in the broader market who may enter with superior technology and win its customers.

In addition, many researchers define pioneers too broadly, as "one of the early entrants" or a "firm that entered in the early years." This, too, skews the results. A better definition of pioneer is "the firm that first commercialized a product." By properly defining the terms, researchers can avoid the bias that has led to the conclusion that a company must be first to market to dominate that market in the long-term. ■

Learning From History

As you can see, asking managers of surviving firms to identify and evaluate pioneers has many problems. What is needed is an alternative approach. This approach is the historical or archival method. The historical method consists of reconstructing the evolution of markets by evaluating multiple market reports, written as close in time as possible to the actual events.

Using contemporaneous reports is the most important feature of the historical method. Contemporaneous

(continued on page 4)

Apple Shows Why Using Contemporaneous Reports Is Crucial

Today, Apple Computers is widely reported as having been the pioneer in the personal computer market. Yet, before Apple, there was the Altair. In 1975, Micro Instrumentation and Telemetry Systems (MITS) introduced the first personal computer, the Altair. The Altair established the notion of a stand-alone personal computer that consumers could own. MITS, the pioneer, failed and has been forgotten. Apple, a later entry into the market, succeeded. Apple is now remembered (incorrectly) as the company that first introduced the personal computer. Studying only Apple won't reveal any truths about being a pioneer, since it wasn't one.

Learning From History

(continued from page 3)

reports use the definitions of the market that were in place at the time, not those currently in use. Contemporaneous reports also allow researchers to see who really entered the market first. The second important feature of the historical method is that it strives to obtain a neutral perspective on market evolution. The third important feature is that the historical method uncovers rich details. A fourth feature is that the method allows the comparison of similar firms at the same stage of market evolution.

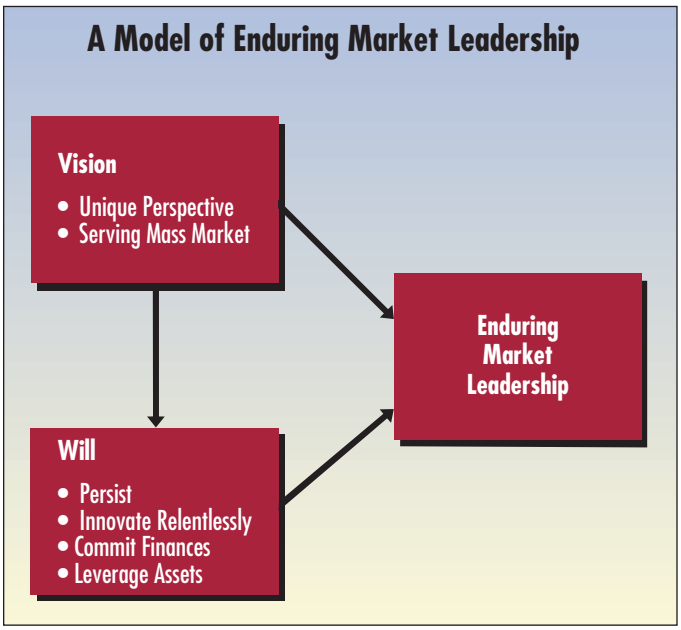
What sources can be used to determine if a historical source should be used in the analysis? The following four are the most important:

Competence. Is the informant able to report correct information?

Objectivity. Is the informant willing to report correct information?

Reliability. Is the informant a trusted source of accurate information.

Corroboration. Is there confirmatory evidence from other trusted sources?



To understand why and how a company comes to dominate a market, researchers need to look at the market as it existed when the product was introduced, and then at the behavior of the firm that ended up as the market winner, as well as the others who didn't. Take, for example, the Internet browser wars. The first entry into the market was CERN (now the European Laboratory for Particle Physics). The second entry was the National Center for Supercomputing Applications at the University of Illinois. Then came Netscape, followed by Microsoft. Each, in turn, was in control of the market and the technology. Yet today, Microsoft, the last entry, is the market leader. Why? That question is what we will explore in the rest of this summary.

Definitions are crucial for valid analysis. Loose definitions can lead to erroneous conclusions. Clear definitions are necessary for accuracy. Pioneer is defined as the "first firm to commercialize the product in a new market." Market is defined as "a competitive environment in which firms attempt to satisfy some distinct but enduring consumer need." ■

Pioneers and Real Causes Of Enduring Leadership

After extensive research, the answer is clear. Pioneers don't become long-term leaders.

Market pioneers rarely endure as leaders. Most of them have low market share or fail completely. Market pioneering is neither necessary nor sufficient for enduring success.

What does it take to become a market leader? The real characteristics of enduring market leadership are vision and will. Enduring market leaders have a revolutionary and inspiring vision of the mass market, and they exhibit an indomitable will to realize that vision. They persist through adversity, innovate relentlessly, commit financial resources, and leverage assets to realize their vision.

Will manifests itself through *persistence, relentless innovation, financial commitment,* and *asset leverage*.

Vision is the starting point. It motivates and directs will. Firms endure as market leaders because they have all or most of these attributes. Market pioneers often fail because they lack one or more of these factors. ■

Defining Will and Vision

What is **will** and what is **vision**? **Will** includes persistence, innovation, commitment, and asset leverage. These four factors all have to do with determination, and therefore define will.

Vision, as the term is used in this summary, is a company's unique perspective of serving the mass market. It isn't the broad statement designed for a press release. For example, when Microsoft founders Bill Gates and Paul Allen saw falling prices and improved technology, they concluded that there would be a huge market for personal computers. The vision of a computer "on every desk and in every home" fired their zeal to develop the software that would run those computers.

Envisioning the Mass Market

Focus on the mass market is an essential component of vision. Ray Kroc had a vision of an international mass market for cheap fast food. Bill Gates saw a mass market for personal computers. Yet, the mass market is something that marketers tend to shun. Strategists stress segmentation and differentiation instead. The result is that in a market of mature products, there are many brands. Each claims unique benefits for ever-smaller groups of consumers.

Marketers assume that mass marketing means cut-throat competition, low margins and low profits. This is far from true, especially when a product is new.

To reach out to the mass market, you must set a price that will appeal to the group you are targeting, and plan the entire research and production effort around achieving that price point. Remember that tapping the mass market allows economies of scale that lead to low unit costs. Low costs enable a firm to earn a positive margin on each unit. When multiplied over mass market sales, this strategy yields far greater profits than a higher margin in a niche market. Mass marketing has often propelled a late entrant to market leadership ahead of the pioneer that focused on a niche.

Also, the large-scale operation that goes into serving a mass market can easily support a big research effort, which can rapidly lead to price reductions and quality improvements. The scale and profits from tapping the mass market allow a later entrant to spring ahead of the pioneer with an early technological lead.

Exploiting the Economies of the Mass Market

Microprocessor sales reveal the dynamics of mass markets. Even at a low margin, a mass market can generate huge profits that can be invested to lower costs, improve quality, and further expand the market. Wisely exploiting these dynamics can give an organization a tremendous advantage over competitors and catapult it into market leadership.

Microprocessors are the brain of the personal computer. The wonder of the microprocessor lies in what it does and what it costs. It can perform millions of computations per second and it can be mass produced at relatively low cost. Intel developed the microprocessor in 1971. At the time, the company lived in the shadow of semiconductor giants IBM and Fairchild. How did Intel come to revolutionize technology? It did so because it saw mass market potential while its competition did not.

At the time, IBM concentrated on large, mainframe computers and wasn't interested in developing either personal computers or microprocessors for the mass market. To do so was seen as cannibalizing its highly lucrative niche business. Intel took up the challenge and developed a generic computer chip that could be used in countless applications from calculators to watches to personal computers. ■

How to Unleash Mass Market Potential

The lowly disposable diaper is a good example of vision. Disposable diapers were available to consumers in the 1950s, but weren't popular. The main reason was expense. They cost about 8.6 cents per change, compared to 1.5 cents per change for home-washed cloth diapers. Although consumers loved the convenience, the high cost meant they were used sparingly, primarily when traveling. Although 80 percent of diapering households used them, disposables only accounted for 1 percent of sales.

Proctor & Gamble realized the potential for mass market sales. They designed a better disposable diaper than was available at the time, and reduced the cost per change to 6 cents. It took five years to design the diaper and another five years to improve the design and reduce the cost enough to justify a national mass market roll out. In 1966, Pampers were launched with a cost of 5.5 cents per diaper. Demand was so high the company could barely keep up.

What happened to the pioneering competitor who was selling disposables ten years earlier? Chux diapers, produced by Johnson & Johnson, couldn't compete, and by 1981 had withdrawn from the market. The pioneer who had produced a successful high margin niche product (disposable diapers for traveling) yielded to newcomer Pampers after having dominated the market for 35 years.

For another example of the futility of concentrating on a niche market, go to: http://my.summary.com

Uniqueness of Vision

Consider McDonald's, Gillette and Federal Express. Contrary to popular belief, they were not pioneers of their markets. In fact, they entered established markets. At least two were given no chance of success. Yet, they endured and grew into great companies. Each had a unique vision and a novel idea for serving the mass market.

In the case of McDonald's, it was low-priced, fast food in a clean restaurant. For Gillette, it was a safe, convenient and disposable razor. For Federal Express, it was fast, reliable deliveries for consumers with urgent shipments. At the time, each vision was seen as radical,

(continued on page 6)

Uniqueness of Vision

(continued from page 5)

infeasible, and even foolish. The seeds of their vision were already present in products that were available at the time they formulated their vision. Other firms didn't leap at the opportunities because they were so immersed in their own narrow world view that they failed to realize the potential even when presented with the ideas.

Consider Federal Express. The founder, Fred Smith, formulated his idea for priority airfreight service as a term paper for a course at Yale in 1965. He earned a C on the paper, but turned his vision into a billion dollar success. By the time he started the business in 1971, his biggest competitor, Emery Air Freight, had been in the business for 25 years. Emery was a freight forwarder that picked up and delivered parcels, and shipped them via passenger planes. Smith's vision included flying the freight.

At the core of his vision was the belief that there was a huge market for priority mail — mail that was of high value and time sensitive, such as medicine, documents and electronics. The passenger plane system in use at the time was inefficient: Packages could take days to arrive as they were bounced around the country on available flights. His vision was of a hub and spoke system whereby mail would be flown from cities to a hub, sorted, and sent out on the same planes to their destinations.

Vision most often lies with individuals. By its very nature, vision is a perspective that is not held by a majority. Corporations tend to suppress individuality and encourage group thinking, which makes it much harder for visionaries to thrive and succeed. A corporation's ability to endure depends on its ability to attract, support and retain visionaries. ■

Persisting Against All Odds

Market leaders rarely achieve success through luck or sudden breakthroughs. Managers must have the will to persist through obstacles. The road to success is long, hard and trying. Luck has very little to do with it. Unfortunately, conventional business wisdom supports the theory that luck and accidental breakthroughs are the way to success. These beliefs may lead to unrealistic expectations and premature project terminations.

Persistence is the key to becoming a market leader. Consider this example: the advent of Beta and VHS video recorders. Although we often think of video recorders as a dramatic technological breakthrough, the truth is that we owe the ability to record television shows and view movies at home to persistence. As long ago as 1958, Sony started research. It took Sony four years to develop a two-head recorder, which it introduced to the market in 1962. Though it was a technological wonder, it wasn't advanced enough or affordable enough for either the business market or the mass market. By 1965, Sony had a model that was priced below $1,000, which was adopted in some schools, hospitals and businesses. By the 1970s, Sony was working on the Betamax. It first hit the market in 1975, nearly twenty years after work on it began.

As you can see, companies that persisted in following their vision have sometimes become market leaders. But how long should you persist before giving up? When should you enter or quit a market? The answer depends on good judgment and three factors. These factors are: vision, product takeoff and the dynamics of technological change. First, the vision has to be believed in passionately.

For a radical new product, three factors influence the likelihood that the product will take off. These are: the price, market penetration, and time since introduction. For example, most new product introductions will see low sales at first. This is because the new product is probably quite expensive when compared to the established product the consumer currently uses to satisfy the need the new product fills. But, as the product improves, the price usually begins to fall. When quality overtakes the older product, sales usually soar, and the product rapidly penetrates the market. As time goes on, the market matures and the cycle begins again. ■

For more examples of persistence, go to:
http://my.summary.com

Why and How Companies Must Innovate

Technology and consumer tastes are constantly changing, leaving markets in a state of constant flux. Old markets die out, new markets emerge, and multiple markets merge into a new one. Therefore, long-term leadership requires constant innovation. Firms must have the will to change their products, their attitudes, and their marketing to maintain leadership. Innovation remains important as competitors try to take market share from a company that dominates its category.

Market leaders must also avoid the fear that by innovating they risk cannibalizing existing products. Firms must be willing to innovate relentlessly. Constant innovation not only keeps competitors at bay, but generates profits for further innovation. This is the road to success taken by Intel and the microprocessor. Each time Intel introduced a new chip generation, sales of the older

(continued on page 7)

Why and How Companies Must Innovate

(continued from page 6)

generation level off and then decline. Each generation cannibalizes the last. Why would it do this? The success of each new product spurs competitors, and a firm must cannibalize its own products if it wants to maintain its leadership role. With each chip innovation, Intel creates a new market for updated computers, as those running earlier generations of the chips become obsolete.

Bureaucracy can be a formidable barrier to innovation; autonomy is the antidote. Companies can create small, independent units with their own mission, goals and budgets. These units should be populated with fresh talent, and they must be rewarded when they come up with innovations.

Unfortunately, many companies become bureaucratic entities that stifle innovation. They may not see the value of a breakthrough, especially if it offers competition to existing successful products. Without autonomy to pursue new ideas, no innovation will be exploited. Without talented individuals who are free to create, there will be no innovation. Both are crucial to reaching and retaining market leadership. ■

Xerox's Palo Alto Research Center Highlights Innovation

Xerox's Palo Alto Research Center (PARC) demonstrates the bureaucratic mold that hinders innovation and the organizational design that can break it. By the late 1960s, Xerox's success with copiers had transformed the firm into a giant, highly profitable corporation with a near monopoly in the copier industry. Having seen how the company's technology had rendered carbon copying obsolete, Xerox CEO Joseph Wilson feared that another technology, for example the new digital technology, could do the same for the company's copiers.

The company's bureaucracy did not share his fear but President Peter McColough did. Xerox thus established PARC as a research center to develop digital technologies and other leading edge technologies for the computer age. PARC produced an impressive range of innovative ideas, including the mouse, the laser printer, computer networks, color graphics, and the graphical user interface for personal computers. PARC was able to do this for four reasons: it located near top engineering schools to allow it to tap emerging talent; it was geographically removed from other Xerox labs, allowing it to develop its own culture; it had a generous research budget; and it had a policy of hiring the best talent in the country.

Raising and Committing Financial Resources

Financial commitment is critical if you want to refine new product ideas, create interest with consumers, and dominate a new market. You need both access to financial resources and willingness to use those resources. Without both, you will fail. Developing a great new venture almost always requires tremendous financial resources.

Adequate capital is essential if you are entering a market late because you will have to fund an attempt to gain a foothold against existing competition. If your aim is to target the mass market, you need money to produce your product on a mass scale. If you can't, you won't be taking advantage of economies of scale to lower the per unit cost. Marketing and distribution costs will also loom large. As a late entrant, you may find that it takes months or even years for products to generate enough revenues to cover costs. This, too, requires willingness to commit resources for the long haul.

Where do you find the necessary resources? Large established firms might have the money for a venture, but may be unwilling to spend it. Entrepreneurs starting out might be willing to commit all available resources, but that may not be enough. The organization with the clear vision of its place in the market has an advantage. If you can articulate that vision to those who have the resources, you will be able to finance the endeavor.

The influence of vision on financing is nowhere more apparent than in the Federal Express success story. You may recall that Fred Smith got a C from Yale on his business plan for package delivery services. After graduating, Smith enlisted in the Marines and fought in Vietnam, an experience that sharpened his will and turned him into an aggressive competitor. After his discharge, he used inherited money to start a business buying and selling corporate jets. When he experienced trouble getting shipments, he began thinking seriously about the Yale business plan.

Smith put up $250,000 of his own money and persuaded the board of the family's holding company to contribute a like amount. They agreed, and also guaranteed a $3.6 million loan to buy two jets. He then commissioned two studies on the feasibility of his idea and used the results to try to convince investors to fund the rest of the start-up costs. He also bought an option for more jets. The early years were rough, with Smith ending up pledging most of his personal wealth to keep the enterprise going. From 1973, when the company launched, until July 1975, when the company turned its first profit, only Smith's vision and relentless search for funding kept the company alive. ■

For another example of the quest for financing, go to: http://my.summary.com

Leveraging Assets Despite Uncertainty

Firms that dominate in one category can often become leaders in a related market, even if they enter late. For example, IBM's dominance in the mainframe computer market allowed it to quickly enter and lead the PC market, even if it entered late. Microsoft's dominance in operating systems let it capture large segments of the browser market, even as it entered late. In each case, once the late entrant entered, the pioneering brand lost its position.

Established latecomers can dominate because they have assets already accumulated from their established positions. These assets fall into two categories: generalized and specialized. A firm can easily transfer generalized assets from one category to another. These include brand name, reputation, customer base, and talent. Specialized assets may not transfer easily to another category, such as technology and manufacturing facilities.

If you want to dominate a new category, you must be willing to cannibalize specialized assets. If you don't, you may miss the opportunity in the new market. There are four major hindrances to leveraging assets. They are:

- **The new category appears to threaten the old category.** For example, does the new sale of computer printers threaten the old sale of copiers? The greater the threat, the harder it is for a firm to reallocate resources.
- **The company is focused too strictly on costs.** Market entry always involves risk, and that risk may seem greater for a firm that holds a dominant position in an established market since some of the assets it used to gain dominance may be sacrificed to enter the new market. Companies will need to focus on the expected future costs and benefits rather than just current costs.
- **The company has a myopic view of markets and is constrained by focus on current products and customers at the expense of new opportunities.**
- **The firm has a rigid bureaucracy in place.** Such a firm may be slow, cautious and indecisive.

How Microsoft Leveraged Operating System Dominance Into Browser Dominance

Overcoming resistance to leveraging assets is possible. Microsoft did it when it sought to leverage the assets developed in becoming the dominant operating system provider to take leadership in the browser wars. Microsoft adopted a strategy that involved leveraging the company's name, technology and distribution assets to take on early entrants into the Web browser market.

Microsoft was the clear leader in both the operating system market and the software market when it realized late in the game that the Internet would be the next revolution in personal computing. Microsoft became concerned chiefly because it saw the possibility that Internet technology could render software sold to individual computer users useless. By 1996, Netscape had captured 85 percent of the browser market. Microsoft's Bill Gates saw the writing on the wall, and told his people to embrace the Internet. Gates leveraged his assets with these four important moves:

- He sacrificed a new product, Microsoft Network, for the benefit of Internet Explorer. Microsoft Network would have taken on Internet service providers like America Online. Then the company offered America Online the opportunity to have its icon on the desktop of every computer with Windows in exchange for making Internet Explorer the company's exclusive browser.
- As soon as it decided it would concentrate on developing Internet Explorer, Microsoft invested people and money in the idea. Other projects were cancelled or modified to support the new vision of a future in which the Internet plays a larger and larger role.
- Microsoft freely distributed the browser and the server software needed by Web designers.
- Microsoft leveraged its most valuable asset, Windows 95 by bundling Internet Explorer with it. Because every new PC had Internet Explorer installed, it became much more likely that computer owners would use it rather than purchase a copy of Netscape.

The end result was that one year after announcing its strategy, Internet Explorer's market share had risen from 4 to 24 percent and Netscape's share had declined to 70 percent from 87 percent. ■

To Pioneer or Not to Pioneer

Casual observation of markets leads many people to conclude that the first firm to enter a market is the enduring market leader. But, later entrants often become the market leaders, and pioneers commonly fail.

What does this mean for managers today? In general, firms should not enter late simply for the sake of entering late. They should, however, think twice before claiming a pioneering or first-mover advantage and recognize the very real possibility that any advantage gained by that position could be challenged. Instead, companies should concentrate on the five factors identified as critical to achieving enduring leadership, regardless of when they entered the market.

The starting point is vision, which then drives the willingness to persist against great odds, the willingness to commit financial resources, to innovate relentlessly, and to leverage current assets. These qualities let a firm become a market leader whether it enters a market first or last. ■

WINNING

THE SUMMARY IN BRIEF

What does it take to win? According to Jack Welch, winning in business is great because when companies win, people thrive and grow. There are more jobs and more opportunities everywhere and for everyone.

People feel upbeat about the future, and winning affords them the opportunity to give back to society in hugely important ways beyond just paying more taxes — they can donate time and money to charities and mentor in inner-city schools, to name just two.

Winning companies and the people who work for them are the engine of a healthy economy, and, in providing the revenues for government, they are the foundation of a free and democratic society. Winning lifts everyone it touches — it makes the world a better place.

However, it goes without saying that you have to win the right way — cleanly and by the rules. That's a given. Companies and people that don't compete fairly don't deserve to win, and, thanks to well-honed internal company processes and government regulatory agencies, the bad guys are usually found and kicked out of the game.

Winning, however, isn't only important for top executives but for everyone — from the boardroom to the mailroom — who wants to get ahead and help his or her organization. The two are intertwined. For an individual, winning is personal. In the business world, winning is multidimensional. The successful salesperson, for example, helps not only himself but also his company and everyone connected with it.

Even the most talented businessperson with the best intentions will get nowhere unless he or she knows how to win in today's complex business world. Business is a game, and winning that game is a total blast!

In this summary you will learn:

- ✓ ***The importance of a mission statement and values for a company.***
- ✓ ***How a lack of candor is bad for business.***
- ✓ ***Differentiation isn't cruel and Darwinian, but fair and effective.***
- ✓ ***How to manage crises under the guidance of a plan of action.***
- ✓ ***The art of hiring winners, managing people and parting ways when the time comes.***
- ✓ ***How to find a job that you will love, get a promotion and manage a work-life balance.***

WINNING

By Jack Welch with Suzy Welch

— THE *COMPLETE* SPECIAL EDITION SUMMARY

PART 1-UNDERNEATH IT ALL

Mission and Values

Mission and values are two terms that are among the most abstract, overused and misunderstood words in business. By contrast, a good mission statement and a good set of values are real and concrete. The mission announces exactly where you are going, and the values describe the behaviors that will get you there.

First: About That Mission

An effective mission statement basically answers one question: *How do we intend to win in this business?* It requires companies to make choices about people, investments and other resources and prevents companies from falling into the common mission trap of asserting they will be all things to all people at all times.

Effective mission statements balance the possible and the impossible. They give people a clear sense of the direction to profitability and the inspiration to feel they are part of something big and important. You can get input from anywhere. However, a mission cannot, and must not, be delegated to anyone except the people ultimately held accountable for it.

... And Now About Those Values

In contrast to the creation of a mission, everyone in a company should have something to say about values. You can use company-wide meetings, training sessions and the like for immediate feedback and the intranet for broader input. The executive team has to go out of their way to be sure they've created an atmosphere where people feel it is their obligation to contribute.

It's in the Nitty Gritty Details

Act in a boundaryless fashion: Always search for and apply the best ideas regardless of their source; be tolerant of the bureaucracy; and see change for the growth opportunity that it brings.

Take the value "We treat customers the way we would want to be treated." That's pretty tangible, but Bank One had identified a number of behaviors that made that value come to life.

For a company's mission and values to truly work together as a winning proposition, they have to be mutually reinforcing. Examples of disconnections may appear minor or temporary, but, when left unattended, they can really hurt a company. In the worst-case scenario, they can literally destroy a business.

In its prior life, Enron was a simple, rather mundane pipeline and energy company. Then the company

(continued on page 3)

Bank One's Values

✓ Never let profit-center conflicts get in the way of doing what is right for the customer.

✓ Give customers a good, fair deal. Great customer relationships take time. Do not try to maximize short-term profits at the expense of building those enduring relationships.

✓ Always look for ways to make it easier to do business with us.

✓ Communicate daily with your customers. If they are talking to you, they can't be talking to a competitor.

✓ Don't forget to say thank you.

The authors: Jack Welch joined GE in 1960, and by 1981 he became the company's eighth chairman and CEO. Welch left GE in 2001, and is currently the head of Jack Welch LLC, where he is an advisor to Fortune 500 CEOs and holds public speaking engagements. He is also the author of *Jack: Straight from the Gut*, a *New York Times*' best seller.

Suzy Welch, Jack's wife, is the former editor of the *Harvard Business Review*, as well as an author of a number of articles on creativity, change, leadership and organizational behavior.

Mission and Values

(continued from page 2)

changed missions. Someone got the idea to turn Enron into a trading company. The goal was faster growth. It was in that context — of no context — that Enron's collapse occurred.

Your company will not reach anywhere near its full potential if all that is guiding it is a list of pleasant platitudes hanging on the lobby wall. ■

Candor: The Biggest Dirty Little Secret in Business

Lack of candor blocks smart ideas, fast action and good people contributing all the stuff they've got. It's a killer. When you've got candor, everything just operates faster and better.

The Candor Effect

First, candor gets more people in the conversation. Second, candor generates speed. Third, candor cuts costs. Given the advantages of candor, you have to wonder why we don't have more of it in business.

The make-or-break importance of candor in U.S. business is relatively new. Up until the early 1980s, big companies like GE and thousands of others operated largely without it. They had virtually no global competition.

Even though candor is vital to winning, it is hard and time-consuming to instill in any group, no matter what size. But it can be done. To get candor, you reward it, praise it and talk about it. You make public heroes out of people who demonstrate it. Most of all, you yourself demonstrate it in an exuberant and even exaggerated way — even when you're not the boss. ■

Differentiation: Cruel and Darwinian?

Companies win when their managers make a clear and meaningful distinction between top- and bottom-performing businesses and people. Companies suffer when every business and person is treated equally.

Differentiation is the most efficient and most effective way to run your company, and also happens to be the fairest and the kindest. Ultimately, it makes winners out of everyone. However, differentiation cannot — and must not — be implemented quickly. At GE, it took about a decade to install the kind of candor and trust that makes differentiation possible.

Every company has strong businesses or product lines and weak ones and some in between. Differentiation requires managers to know which is which and to invest accordingly. At GE, "strong" meant a business was No. 1 or No. 2 in its market. If it wasn't, the managers had to fix it, sell it or, as a last resort, close it.

Differentiation among your businesses or product lines requires a transparent framework that everyone in the company understands.

Differentiation and People

This process requires managers to assess their employees and separate them into three categories in terms of performance: top 20 percent, middle 70, and bottom 10. Then — and this is key — it requires managers to act on that distinction.

When people differentiation is real, the top 20 percent of employees are showered with bonuses, stock options, praise and a variety of rewards to their pocketbooks and souls.

The middle 70 percent are managed differently. This group is enormously valuable to any company; you simply cannot function without their skills, energy and commitment. After all, they are the majority of your employees. And that's the major challenge and risk in 20-70-10 — keeping the middle 70 engaged and motivated.

Managing the middle 70 is not about keeping people out of the bottom 10. It is not about saving poor performers. Rather, differentiation is about managers looking at the middle 70, identifying people with potential to move up and cultivating them.

As for the bottom 10 percent in differentiation, they have to go. If you have a candid organization with clear performance expectations and a performance evaluation process, then people in the bottom 10 percent generally know who they are. When you tell them, they usually leave before you ask them to. ■

Voice and Dignity

Every person in the world wants voice and dignity, and every person deserves them. When you run a unit or division, you rarely think that people aren't speaking up or that they're not respected. It feels like the people around you certainly are, and your days are filled with visits, calls and notes from people with strong opinions. But the majority of people in most organizations don't say anything because they feel they can't — and because they haven't been asked.

In an effort to create an environment where people could feel comfortable expressing opinions and asking questions, the Work-Out process was born and held at GE sites around the world. Patterned after New England town meetings, groups of 30 to 100 employees would come together with an outside facilitator to discuss better ways of doing things and how to eliminate some of the bureaucracy and roadblocks that were hindering

(continued on page 4)

Voice and Dignity

(continued from page 3)

them. The boss would be present at the beginning of each session, laying out the rationale for the Work-Out. He or she would also commit to two things: to give an on-the-spot yes or no to 75 percent of the recommendations that came out of the session and to resolve the remaining 25 percent within 30 days.

The boss would then disappear until the end of the session, so as not to stifle open discussion and return only at the end of the Work-Out to make good on his or her promise.

Tens of thousands of these sessions took place over several years, until they became a way of life in the company. They are no longer big events but part of how GE goes about solving problems. ■

PART TWO: YOUR COMPANY

Leadership: It's Not Just About You

When you become a leader, success is all about growing others. Without question, there are a variety of ways to be a leader.

What Leaders Do

1. Leaders relentlessly upgrade their team, using every encounter as an opportunity to evaluate, coach and build self-confidence. You need to invest the vast majority of your time and energy as a leader in three activities: evaluating, coaching and building the team's self-confidence. Too often, managers think that people development occurs once a year in performance reviews.

2. Leaders make sure people not only see the vision, they live and breathe it. As a leader, you have to make the vision come alive. Goals cannot sound noble yet be vague. One of the most common problems in organizations is that leaders communicate the vision to their closest colleagues and its implications never filter down to people in frontline positions.

3. Leaders get into everyone's skin, exuding positive energy and optimism. An upbeat manager ends up running a team or organization filled with upbeat people. A pessimistic sourpuss somehow ends up with an unhappy tribe all his own

4. Leaders establish trust with candor, transparency and credit. Trust happens when leaders are transparent, candid and keep their word.

5. Leaders have the courage to make unpopular decisions and gut calls. Some people long to be loved by everyone. Those behaviors can get you in the soup if you are a leader because there are times you have to make hard decisions — let people go, cut funding to a project or close a plant. A lot has been written about the mystery of gut, but it's really just pattern recognition. Leaders are faced with gut calls all the time, and sometimes the hardest gut calls involve hiring people. However, if you're left with that uh-oh feeling in your stomach, don't hire the guy.

6. Leaders probe and push with a curiosity that borders on skepticism, making sure their questions are answered with action. When you're a leader, your job is to have all the questions. You have to be incredibly comfortable looking like the dumbest person in the room.

7. Leaders inspire risk-taking and learning by setting the example. Winning companies embrace risk-taking and learning. But in reality, these two concepts often get little else than lip service. If you want your people to experiment and expand their minds, set the example yourself. Consider risk-taking.

8. Leaders celebrate. There is not enough celebrating at work — anywhere. Celebrating makes people feel like winners and creates an atmosphere of recognition and positive energy. ■

Hiring: What Winners Are Made Of

Hiring good people is hard. Hiring great people is brutally hard. Nothing matters more in winning than getting the right people on the field. However, before you think about assessing people for a job, they have to pass through three screens. The first test is for integrity. People with integrity tell the truth, and they keep their word. They take responsibility for past actions, admit mistakes and fix them.

The second test is for intelligence. The candidate has a strong dose of intellectual curiosity, with a breadth of knowledge to work with or lead other smart people in today's complex world.

The third ticket to the game is maturity. Mature individuals can withstand heat, handle stress and setbacks and alternatively — when those moments arise — enjoy success with equal parts of joy and humility. ■

People Management

Once you have the right players for the field, they need to be managed. People management comes down to six fundamental practices:

1. Elevate HR to a position of power and primacy in the organization and make sure HR people have

(continued on page 5)

People Management

(continued from page 4)

the special qualities to help managers build leaders and career.

2. Use a rigorous, nonbureaucratic evaluation system and intensely monitor its integrity.

3. Create effective mechanisms — such as money, recognition and training — to motivate and retain.

4. Face straight into charged relationships with unions, stars, sliders and disrupters. You can fight about issues, but your fighting will be more productive if you are always clear about what issues are negotiable and which are untouchable.

5. Fight gravity. Instead of taking the middle 70 percent for granted, treat them like the heart and soul of the organization.

6. Design the organizational chart to be as flat as possible, with clear reporting relationships and responsibilities. If you want to manage people effectively, help your people by making sure the organizational chart leaves as little as possible to the imagination. The trick is to have fewer rungs. Make your company 50 percent flatter than you'd normally feel comfortable with; managers should have 10 direct reports at the minimum, and 30 to 50 percent more if they're experienced. ■

Parting Ways

Sometimes people have to be let go due to integrity violations, layoffs due to economic downturns and firings for nonperformance. For integrity violations, you don't need to hesitate. Just do it and make sure the organization knows why, so the consequences of breaking the rules are not lost on anyone.

Layoffs due to the economy are more complicated. Every employee should know how the company is doing. That way, if layoffs occur, at least people will have some level of preparation.

The most complex and delicate firing is when an individual has to be let go because of poor performance. Usually, firings for nonperformance aren't black and white. Because of that, there are three main ways that managers get firing wrong — moving too fast, not using enough candor and taking too long.

How can you get it right? First, no surprises. A good performance evaluation process informs and prepares people in a fair and open way. Second, minimize humiliation; build up a person's self-confidence. Let the individual know there is a good job for him or her out there. Your goal for the fired employee is a soft landing wherever he or she goes. ■

Change: Mountains Do Move

Change is a critical part of business. You need to change, preferably before you have to. Most people hate it; they love familiarity and patterns and cling to them. But attributing a behavior to human nature doesn't mean you have to be controlled by it. Instead, it comes down to embracing four practices:

1. **Attach every change initiative to a clear purpose or goal. Change for change's sake is stupid and enervating.**
2. **Hire and promote only true believers and get-on-with-it types.**
3. **Remove the resisters, even if their performance is satisfactory.**
4. **Look at car wrecks.**

Most companies capitalize on obvious opportunities. But to be a real change organization, you also need the guts to look at bolder, scarier, more unpredictable events and to make the most of the opportunities. Bankruptcies, for example, are a calamity that provide all kinds of opportunities.

Most companies take advantage of obvious opportunities. But some also have the ability to make the most of regrettable circumstances — those "car wrecks" — and they should. These companies will benefit from realizing that change means seizing opportunity, even the ones wrought by adversity. ■

Crisis Management

As long as companies are made up of human beings, there will be mistakes, controversies and blowups. The cold truth is that some degree of unwanted and unacceptable behavior is inevitable. Crises demand from leaders a daunting balancing act. On one hand, you've got to throw everything you've got into understanding and solving the crisis. At the same time, you have to put that activity into a compartment and carry on as if nothing is actually wrong. That's what leaders usually neglect — to their regret.

You can be proactive in preventing some crises in three main ways. First, tight controls, such as disciplined financial and accounting systems with tough internal and external auditing processes, should be used; an organization's line managers should be required to review and act on every audit's findings.

Second, try to prevent crises with good internal processes, such as rigorous hiring procedures, candid performance reviews and comprehensive training programs, that make the company's policies crystal clear. Third, have a culture of integrity, meaning a culture of honesty, transparency, fairness and strict adherence to rules.

(continued on page 6)

Crisis Management

(continued from page 5)

Most of the time, crises blindside you because they don't detonate like bombs — they emerge in fits and starts.

Plan of Action

The following assumptions aren't a formula for managing a crisis, but hopefully they'll provide directional guidance while dealing with a crisis:

- **Assume the problem is worse than it appears.** Few crises start small and stay that way, so adjust your mind-set early on.
- **Assume there are no secrets in the world, and everyone will eventually find out everything.** The more openly you speak about the problem, the more trust you earn from everyone watching.
- **Assume you and your organization's handling of the crisis will be portrayed in the worst possible light.** Reporters are not in the business of telling your side of the story. Along with disclosing the full extent of your problem, you've got to stand up and define your position before someone else does.
- **Assume there will be changes in processes and people.** Crises require change. Sometimes a process fix is enough. That's because the people affected by the crisis — or sometimes those watching it — demand that someone be held responsible.
- **Assume the organization will survive, ultimately stronger for what happened.** After a crisis is over, there is always the tendency to want to put it away in a drawer. Don't — teach its lessons every chance you get. In doing so, you'll spread the immunity. ■

PART THREE: YOUR COMPETITION

Strategy: It's All in the Sauce

In real life, strategy is actually very straightforward. You pick a general direction and implement like hell.

The steps are:

- First, come up with a big idea for your business — a smart, realistic, relatively fast way to gain sustainable competitive advantage.
- Second, put the right people in the right jobs to drive the big idea forward.
- Third, relentlessly seek out the best practices to achieve your big idea, whether inside or out, adapt them and continually improve them.

Strategy means making clear-cut choices about how to compete. You cannot be everything to everybody. Corner stores have learned that survival depends on finding a strategic position where no one can beat them. Big companies have the same challenge. ■

Welch's Questions to Making Strategy Real

1. **What does the playing field looks like now?**
   - ✓ Who are the competitors?
   - ✓ Who has what share in each market?
2. **What has the competition been up to?**
   - ✓ What has each competitor done in the past year to change the playing field?
   - ✓ Are there any new entrants, and what have they been up to in the past year?
3. **What have you been up to?**
   - ✓ Have you bought another company, introduced a new product, stolen a competitor's key salesperson or licensed a new technology from a start-up?
   - ✓ Have you lost any competitive advantages that you once had — a great salesperson, special product, a proprietary technology?
4. **What's around the corner?**
   - ✓ What scares you the most in the year ahead?
   - ✓ What new products or technologies could your competitors launch that might change the game?
5. **What's your winning move?**
   - ✓ What can you do to change the playing field?
   - ✓ What can you do to make customers stick to you more than ever before and more than to anyone else?

Budgeting

The budgeting process at most companies has to be the most ineffective practice in management. It sucks the energy, time, fun and big dreams out of an organization. It also brings out the most unproductive behaviors in an organization, from sandbagging to settling for mediocrity.

In all their assumptions, the people in the field are operating with one simple goal, albeit unstated: to minimize their risk and maximize their bonus.

Senior managers are also preparing for the big budget meeting. Their agenda is the opposite of the field. They're rewarded for increased earnings, and so what they want from the budget review at every business is significant growth in sales and profits.

A Better Way

The problem is that companies often deliver only a fraction of what they could, and they take all the fun out of setting financial goals.

(continued on page 7)

Budgeting

(continued from page 6)

Imagine a budgeting system where both the field and headquarters have a shared goal: to use the budgeting process to ferret out every possible opportunity for growth, identify real obstacles in the environment and come up with a plan for stretching dreams to the sky. That system is linked to the strategic planning process in that it is focused on two questions:

- How can we beat last year's performance?
- What is our competition doing and how can we beat them?

If you focus on these two questions, the budgeting process becomes a wide-ranging, anything-goes dialogue between the field and headquarters about opportunities and obstacles in the real world.

Through these discussions, both sides of the table jointly come up with a growth scenario that is not negotiated or imposed and cannot really be called a budget at all. It is an operating plan for the next year, filled with aspiration, primarily directional and containing numbers that are mutually understood to be targets, or numbers that could be called "best efforts." ■

Organic Growth

Starting something new from within an established company requires managers to act against many of their reasonable instincts. But to give any new venture a fighting chance to succeed, you have to set it free and spend more money on it.

Managing a $50,000 new product line in its first year is harder than managing a $500 million business in its 20th year. That's why they need special treatment. Too often they don't get it.

There are three common mistakes companies make in launching something. First, they don't flood start-up ventures with adequate resources, especially on the people front. Second, they make too little fanfare about the promise and importance of the new venture. Instead of cheering about its potential, they tend to hide it under a bushel. Third, they limit the new venture's autonomy. ■

Mergers and Acquisitions: Deal Heat and Other Deadly Sins

Mergers and acquisitions give you a faster route to profitable growth. They quickly add geographical and technological scope and bring on board new products and customers.

Merging right is ultimately about avoiding seven pitfalls, meaning mistakes or errors in judgment. These are:

- **Believing** that a merger of equals can actually occur.
- **Focusing** so intently on strategic fit that you fail to assess cultural fit, which is just as important to a merger's success.
- **Entering into a "reverse hostage situation,"** in which the acquirer ends up making so many concessions during negotiations that the acquired ends up calling all the shots afterward.
- **Integrating too timidly.** With good leadership, a merger should be complete within 90 days.
- **The conqueror syndrome,** in which the acquiring company marches in and installs its own managers everywhere, undermining one of the reasons for any merger.
- **Paying too much** — so much that the premium can never be recouped in the integration.
- **Resistance.** In a merger, new owners will always select people with buy-in over resisters with brains. If you want to survive, get over your angst and learn to love the deal as much as they do. ■

Six Sigma: Better than a Trip to the Dentist

Nothing compares to the effectiveness of Six Sigma when it comes to improving a company's operational efficiency, raising its productivity and lowering its costs. It improves design processes, gets products to the market faster with fewer defects and builds customer loyalty. Perhaps the biggest benefit of Six Sigma is its capacity to develop a cadre of leaders.

Simple, Complex or Not at All

Six Sigma has two primary applications. First, it can be used to remove the variation in routine, relatively simple, repetitive tasks. And second, it can be used to make sure large, complex projects go right the first time.

For the first application, the level of training and education is certainly manageable. In order to discover the root causes of inconsistencies, people need to know what kind of information to gather and how to analyze it. The rigor of this type of training has a terrific side effect. It builds critical thinking and discipline. The second application involves a sophisticated level of training and statistical analysis.

Six Sigma is meant for and has its most meaningful impact on repetitive internal processes and complex product designs. Once you understand the simple maxim "variation is evil," you're 60 percent of the way to becoming an expert. The other 40 percent is getting the evil out. ■

PART FOUR: YOUR CAREER

The Right Job

How do you find the right job? You take one job, discover what you like and don't like about it and what you're good and bad at, and then you change jobs to get something closer to the right fit.

If you join a company where your sensibilities don't fit in, you'll find yourself putting on a persona just to get along. What a career killer — to fake who you are every day. You need to find "your people," and the earlier in your career you can do this the better. Even if a job seems ideal in every other way, without the presence of shared sensibilities, it's not ideal for you. In the best job scenario, you love the work. Sometimes it is the sheer challenge of the job that turns your crank. If a job doesn't excite you on some level, don't settle. Never be afraid to ask, "Just give me a chance." Someone will. ■

Getting Promoted

Basically, getting promoted takes one "do" and one "don't." Do deliver sensational performance and at every opportunity expand your job beyond its official boundaries. Don't make your boss use political capital in order to champion you.

An even more effective way to get promoted is to expand your job's horizons to include bold and unexpected activities. Come up with a new concept or process that doesn't improve just your results, but your unit's results and the company's overall performance.

Change your job in a way that makes the people around you work better and your boss look smarter. Don't just do the predictable. To get ahead, you have to want to get ahead. ■

Hard Spots: The Boss

Bad bosses come in every variety but, in any business situation, seeing yourself as a victim is completely self-defeating. And when it comes to your career, it's an attitude that kills all your options.

If your boss is being negative to you — and mainly you — you can feel pretty confident that he has his version of events, and his version concerns your attitude or performance.

You've got to find out what's going on. Start with a self-assessment. Then move on to a meeting with your boss. You have to talk. There is no way around it. Just remember, before you go into that meeting, be prepared and have options in the event that you come out of it unemployed. ■

Work-Life Balance

Without question, work-life balance as a concept has grown and expanded. It isn't just about how mothers can make time for all the demands in their lives. It's about how all of us manage our lives and allocate our time — it's about priorities and values.

But no matter what balance you choose, you'll have to make trade-offs. To make the choices and take the actions that ultimately make sense for you, you need to understand that:

1. Your boss's top priority is competitiveness.

2. Most bosses are willing to accommodate work-life balance challenges if you have earned it with performance.

3. Bosses know that the work-life policies in the company brochure are mainly for recruiting purposes and that real work-life arrangements are negotiated one-on-one.

4. People who publicly struggle with work-life balance problems and continually turn to the company for help get pigeonholed as ambivalent, entitled, uncommitted or incompetent — or all of the above.

5. Even the most accommodating bosses believe that work-life balance is your problem to solve.

Along the way you can help yourself with the following work-life balance techniques:

Best Practice 1: Be focused on where you are and whom you are with. No one wins when you routinely run your family's carpool logistics from your office phone or e-mail customers from the soccer field.

Best Practice 2: Have the mettle to say no to requests and demands outside your chosen work-life balance plan.

Best Practice 3: Make sure your work-life balance plan doesn't leave you out. Outside of work, clarify what you want from life. At work, clarify what your boss wants, and understand that, if you want to get ahead, what he or she wants comes first. ■

THE SUMMARY IN BRIEF

There is a new way of looking at business. After studying mergers in many industries through the 1990s, the authors of Winning the Merger Endgame *have discovered that all industries move through four stages of what they call the "Endgames Curve" toward inevitable consolidation.*

The path up the curve starts with the Opening *Stage where industries begin and companies proliferate. In the* Scale *Stage companies acquire other companies as they realize that organic growth will not push them to success. As industries move into the* Focus *Stage, mega-mergers become the norm. The industry consolidates and smaller companies disappear or are acquired. In the final* Balance and Alliance *Stage companies must find a way to reinvent themselves or die.*

How can companies succeed at each stage and move on to the next? And what are the short- and long-term implications of the Endgames curve for top management and investors? These are the questions answered in this summary.

What You'll Learn In This Summary

✓ **The rules that govern the Endgames Curve** and how they affect your business.

✓ **The qualities and hallmarks of each stage of the Curve and the skills and strategies to move through them successfully.**

✓ **Implications of the Endgames Curve for the CEO and Board of Directors.**

✓ **How investors can used the Endgames Curve** to make sound decisions and maximize returns.

✓ **The effect of the Endgames Curve on the future of the market** and how you can use it to predict the coming corporate landscape in your industry.

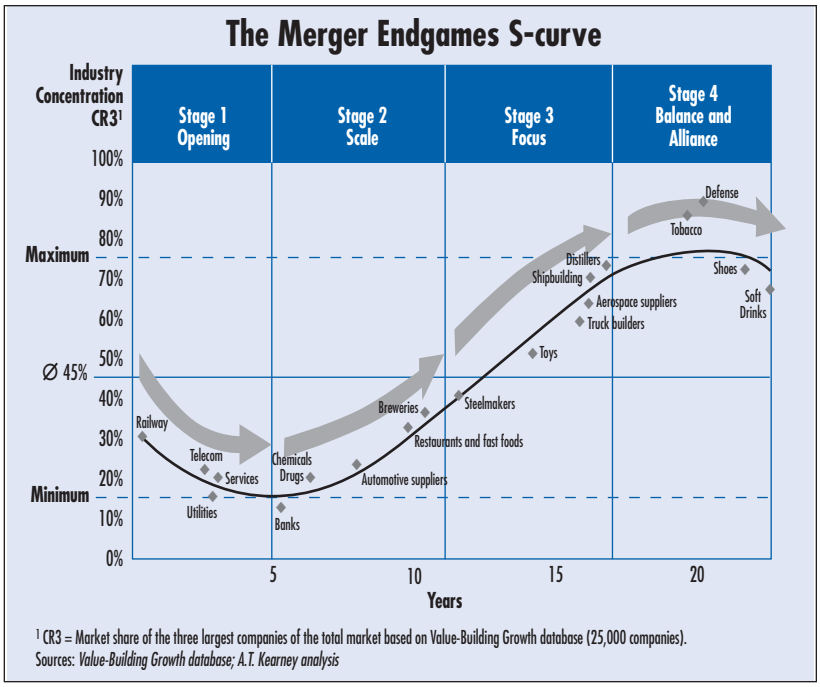
WINNING THE MERGER ENDGAME



by Graeme K. Deans, Fritz Kroeger and Stefan Zeisel

— THE *COMPLETE* SUMMARY

The Consolidation Landscape

Mergers and acquisitions activity has increased significantly over the last few decades, but it is a messy landscape strewn with successful conglomerates alongside contentious cultures and unrealized synergies. There are lessons to be learned, and this is a practical guide for managers and investors seeking success in the marketplace. The authors of *Winning the Merger Endgame* are executives from A.T. Kearney, who have tracked a natural history of mergers and acquisitions.

They studied 1,345 mergers of publicly traded companies that occurred from 1990 to 2000. To ensure a global context, all the mergers had transaction values greater than $500 million. They combined the information they gathered with information from A.T. Kearney's own Value-Building Growth database — companies that can maintain a specific balance between growth and profit to achieve long-term added shareholder value. They discovered certain business patterns emerged over time. By plotting major industries based on degree and speed of concentration, they built an S-curve along which every industry moves over an average of 25 years each. The authors found that mergers determine profitability, market share, and stock prices. Far from being a sideshow in business, they are the main event, "the Endgame."

[1] CR3 = Market share of the three largest companies of the total market based on Value-Building Growth database (25,000 companies).
Sources: *Value-Building Growth database; A.T. Kearney analysis*

Five Maxims of Endgames

- **All industries consolidate and follow a similar course.** Merger competence is the core competence of winners.
- **Merger actions and consolidation trends are predictable.** Industry consolidations will correlate nearly 80% with the rise in global stock markets.
- **The Endgames curve is a tool to strengthen consolidation strategies and facilitate merger integration.** All companies must keep the curve in mind from the beginning because all industries continue riding to the top no matter what.
- **Every major strategic and operational move should be evaluated with regard to its Endgames impact.** The value of a merger lies in the increased competitiveness of the combined entity, the resulting increase in shareholder value, and the move up the curve.
- **Endgames position offers a guide for portfolio optimization.** Companies should optimize their portfolio of subsidiaries and business units across different Endgames stages. ■

Rules and Logic of the Endgame

More important than the clear and logical order to the process of industry consolidation is that it can be a predictive tool. These fundamental truths set the foundation for an in-depth look at the individual stages.

Five Fundamental Endgame Truths

1. Consolidation is inevitable, unavoidable, and inescapable. In the past it took 40 to 60 years for an industry to consolidate. Now it takes 25 years, and in the future the time will shorten, but all industries will still go through these stages.

2. All industries are global. All companies are treated equally and in a global context the only optimal size is bigger. Acquire or be acquired.

3. Revenue is stable, but profitability changes in accordance with the stage. New industries have high profits, but as they begin to consolidate profitability decreases as the competitive climate leads to cost cutting. Once industries are established and settled they can set their own prices for healthy profits.

4. Long-term success depends on riding up the Endgames curve. There are no niche positions to hide in or avoid the curve. Slower companies will be acquired or disappear.

5. The future belongs to the maestros of external growth. Organic growth alone does not have enough force to propel a company up the curve, so mastering acquisitions quickly is key. ■

The Opening Stage

The Opening Stage is the frontier of industry consolidation. At the beginning of the stage, there are very few companies and even fewer with substantial revenue. Entry barriers are low, so no single company owns a measurable percentage of market share.

Competition becomes fierce in this stage as too many companies chase the same finite market share. Competition can only continue in one of two ways. The more efficient operators can drive less efficient rivals out of the market or acquire their competitors. The incentives for merging include the synergies achieved when the whole is greater than the sum of the parts; the increase in revenues, profits, and market share from the combination; and the lower combined cost of doing business.

The Industries of Stage 1

Examples of Stage 1 industries include new industries, such as biotechnology and online retailers; spin-off sub-industries, such as bottled water, which spun off of the Stage 4 soft-drink industry; and previously state-owned or state-regulated monopolies, such as energy, water and gas companies.

TMP Worldwide — Winning in Stage 1

TMP Worldwide started as a Yellow Pages advertising agency in 1967. In the early 1990s the company found that it owned an Internet-based resume posting board that was part of a recent acquisition. TMP relaunched it as Monster.com. In the middle of the Internet boom they realized they would need rapid acquisition, and they acquired and integrated 70 companies globally. The foresight to make the Internet an important part of its future business model, allowing TMP to avoid being an "also ran" in an industry that consolidated from 10 major players to three top-tier players — TMP, CareerBuilder, and Yahoo! — in two years. Now those three companies control 66% of online recruitment.

Strategic Lessons

Even as Stage 1 companies form in a new industry, their managers should be thinking ahead to the coming stages. They should:

- **Build entry barriers and defend territory at all costs.** Protect first-mover advantage.
- **Focus on growing revenue and market share instead of profit.**
- **Monitor the external political environment** to profit quickly from legal changes and capture mind share by being the first to adapt to the changing environment.
- **If you cannot dominate the entire industry, focus on the industry segment where your company has the ability to dominate.**
- **Master, and then accelerate, the acquisition process** to capture volume and increase chances for market leadership.
- **Form an open, integrated culture** to become the backbone for future growth
- **In a deregulating industry, look outside your borders for best practices** and clues to be prepared for anything. ■

If you cannot dominate the entire industry, focus on the industry segment where your company has the ability to dominate.

The Scale Stage

Having laid claim to as much territory as they can, it is time for companies to build scale. They must devise new strategies to grow, capture market share, and protect their turf so they can continue their climb up the Endgames curve. The industry leaders change frequently as the race for position and market share heats up. Increases in scale improve production, spread fixed costs, and earn profits — though the profits remain slim due to competitive pricing.

Companies must grow, but being careful not to take on more than they can handle, lest they become strained for working capital. Another danger is that excessive borrowing costs can become onerous if the acquisitions are not as valuable as hoped. Remember, size and scale do not automatically confer industry-leading market capitalization. You must make smart decisions.

The Industries of Stage 2

Examples of industries in Stage 2 include software, automotive parts, healthcare products, and brewing. Mergers have begun, but there is still no clear leader.

For example, the customer relationship management (CRM) market is part of the software industry, a high-growth industry where the successful companies have typically consolidated early gains by gobbling up the fingerlings to acquiring market share.

In 2001 CRM sales stood at $11.8 billion, and in 2002 they were projected to be $14.2 billion. Siebel, Peregrine, Oracle have 44% of the market share, while PeopleSoft, SAP, Trilogy, and Epiphany have another 12%. Seven companies hold 56% of the market share in the industry, and the rest is divided among struggling smaller players that make the market ripe for takeovers. The clear leader is currently Siebel with 28% market share, but battles will erupt in such a fast-growing area. Oracle and Peregrine have products serving other markets, and it is still possible that a new competitor, such as IBM, could diversify into the attractive market, scoop up several small players, and shift the entire landscape.

Healthy Growth

More than anything Stage 2 is about healthy growth, and the basics for that growth are immutable:

Mergers. Mergers do not always live up to expectations. To do so they need two kinds of benefits. There must be substantial rationalization and consolidation of economies. There must also be a well-conceived ability to capitalize on scale, size, and scope of the new, larger company. Consider carefully the competitive advantage that will be the base of the consolidated company's long-term profitability.

Globalization. A critical means of growing is to go global, particularly to the global triad of the Americas, Europe, and Asia Pacific. However, the complexities of conducting business abroad can be overwhelming, given cultural and economic differences. Acquiring foreign companies with resident knowledge is important.

Brand Consolidation. Frequently, companies in the Opening Stage become "roll-ups" as a series of acquisitions in a fragmented industry. In the Scale Stage branding is an important strategic tool to bind the various groups and position them for growth.

Market Extension. Companies with strategic vision anticipate when their industry will reach the saturation point and branch out or develop a new business model.

Strategic Lessons

To succeed in Stage 2 without being destroyed or acquired, consider the following strategies:

- **Reinforce core strengths,** such as culture and employees, as new acquisitions are brought into the fold.
- **Build momentum** by growing with maximum speed to consolidate the industry through acquisitions, not organic growth.
- **Become a consolidation leader** by building a merger integration model that clearly documents a proven methodology.

By the end of the Scale Stage, the major players have formed their empires and acquisition choices are limited. Much of the final Endgame blueprint has been drawn. Companies that have fallen behind or have not been acquired may have to choose niches as temporary hiding places until they can become attractive acquisition targets. ■

IT Platform as Linchpin

One of the most critical elements of the Scale Stage for an acquiring company is having an IT platform/system capable of serving the combined companies. A company cannot be successful with separate, incompatible systems. Depending on the business, the IT platform must include an enterprise resource planning (ERP) base system to handle all core transactions; and the acquired company must convert immediately. This will put accounting and financial controls in place, reveal process incompatibilities to be fixed, and define who is in control.

Underestimating the importance of physical integration with the parallel integration of information and systems can be fatal. Putting together two companies is hard enough. Doing it in the dark or speaking different systems languages is disastrous.

For Additional Information about integration strategy, go to:
http://my.summary.com

The Focus Stage

In the Focus Stage the strategic emphasis changes from speed to finesse. This stage is characterized by mega-deals and large-scale consolidation plays with the goal of emerging as one of the small number of global industry powerhouses. Now future Endgames winners acquire competitors with an eye toward economic return rather than market share. After integrating mega-mergers made in late Stage 2 and early Stage 3, companies turn their attention to maximizing shareholder value and satisfying equity markets. Unfortunately this means they often spend less time focusing on customers. The rules of the game have been established and the most important competitive levers that come into play are economies of scale, size and global reach, and cost position.

The Industries of Stage 3

Typical industries that are currently in this stage include steel producers, glass manufacturers, magazine publishers, and distillers.

Stumbling Blocks

There are some specific parts of the business to be aware of to avoid stumbling when navigating through the Focus Stage:

Harness People Power. The strain on all employees is enormous in the Focus Stage. They have been through many mergers, so they are tired. But the CEO must still focus them on important strategic, customer, supplier and internal goals.

Maintain Unwavering Focus. Focus on building the advantages of size, scale, scope, brands, organization, and information. Focusing resources on selected competitors allows the Stage 3 company to win without the pain of a full frontal assault. Recognize start-up competitors early and decide whether to crush, acquire or emulate them.

Beware Disruptive Technologies. Disruptive technologies can change the dynamics and economics of a Focus Stage industry quickly and result in an overhaul of the competitive landscape.

Constantly Redevelop Competitive Strategy. When companies are so big that mergers and acquisitions are no longer the most viable strategic option, use "blocking and tackling" as a primary growth strategy. Maximize the effectiveness of people and capital investments rather than directly encroaching on competitor's markets.

Strategies for Stage 3

- **Retool your competitive strategy** to define true strengths and either agree to ceasefire or avoid full frontal assaults with other major players.
- **Focus on financial affairs** by ridding your portfolio of low-growth or marginally profitable segments and keeping resources lean and fit, in part by employing fewer and better people.
- **Sharpen the marketing message** by unifying the brand identity that may be diffused in the eyes of customers after so many mergers. ■

Dramatic Turns in Retailing

The Focus Stage is characterized by harsh competition and dramatic maneuvers. The retailing industry is a prime example. The mega-retailers of the past such as Sears, Montgomery Ward, and J.C. Penney have been squeezed from all sides by a new breed of discount retailers and superstores that are choosing to do things differently. Meanwhile retailers such as Wal-Mart, Walgreen's, and Price Club came up with new ideas like eschewing expensive mall properties, cutting the frills to sell at deeply discounted prices, and specializing in one kind of merchandise. They took the old stalwarts by surprise. Ward filed for Chapter 11 in 2001, Sears is on its second "turn-around CEO" and hoping for a boost from buying Lands' End, and Penney is facing a full frontal attack from Kohl's. Size and scale do not insulate a company from the pressures of the Endgames curve.

Now that the industry is moving out of Stage 3, the two big winners, Wal-Mart and Target, are "choosing sides" by garnering the best suppliers, deals, merchandisers, and talent. Kmart, which is in Chapter 11, and the few regional niche competitors risk being too unattractive to play the game.

The Balance and Alliance Stage

The heavy-hitters are at the top of the Endgames Curve in the Balance and Alliance Stage. These are the few companies that are the winners, the unquestioned leaders in their field. Depending on how they protect their positions, they can be successful in this stage for a long time. Big mergers are no longer an option, so companies spend time maximizing cash flow, protecting market position, and reacting and adapting to changes in the industry, including market penetration and governmental scrutiny.

One of the biggest challenges for Stage 4 companies is how to spend the cash they generate. They can return profits to shareholders, break into pieces and redefine their market scope, or diversify into new or industries and new Endgames paths. The one option a Stage 4 company does not want to take is to maintain a business-as-usual mindset. This will lead to disaster in the

(continued on page 6)

The Balance and Alliance Stage

(continued from page 5)

face of breakthrough technologies from competitors and completely new industries.

Industries of Stage 4

Some industries in this stage at the moment are tobacco, aerospace and defense, shoe manufacturing and soft drinks. These leaders have shattered corporate boundaries, set new records and created global empires.

Strategies for Stage 4

Industries do not move through Stage 4 as they do with other stages. For this reason they must learn to remain and flourish. All Stage 4 companies "hit the wall" in one way or another and handling these five critical challenges is what separates the successful companies:

Manage growth. Find new ways to grow the core business internally, but also redefine your market externally. Expand your market scope by looking at "next door" markets. Zoom out until current market share is under 25% and opportunities for growth will materialize.

Address potential regulation. Be alert to governments, consumers, or competitors perceiving industry leaders as oligarchic or monopolistic and address these potential areas of concern or action.

Spin off businesses. Identify pockets of opportunity or niches to add value to the business. Create new industries or compete against new players in earlier Endgames stages.

Fight complacency. The biggest threat to Stage 4 companies is complacency, causing them to be blindsided by competitors or to wither away. The right reward and compensation systems, promotion and succession planning process, recruiting systems, and people development will encourage innovation and risk-taking, even in a Stage 4 behemoth.

Set a good example. Stage 4 companies are always in the spotlight, so they must hold themselves to higher standards. Trust in these companies is long and slow to build, but easy to lose. ■

Nike Settles into Stage 4

Financial success has been fleeting for many in the athletic shoe industry. With most products produced in low-wage labor markets in Asia, winning market share requires strong marketing, styling, endorsements, and brand management. The faddish popularity of LA Gear, the global empire of Fila, and the styling of Reebok have not led to long-term success.

Nike is at the head of the pack, but it will need to shift its strategy to stay successful long-term. While the company is strong in endorsements, it is weak in acquisitions.

Its best bet is to acquire companies in the Opening Stage that are poised for superior growth. Nike has made too few good acquisitions — Cole-Haan in business-casual shoes and Canstar in skates — and given up too many good opportunities, such as North Face for outdoor gear and Converse for mid-priced shoes. Strategic acquisitions like these could balance potential declining sales and market share.

CEO Strategies

CEOs and boards of directors must realize and accept the inevitability of the Endgames consolidation. Once they understand that every company in every industry will go through the four stages or disappear, they need to develop a vision to move through the stages. Different skills are necessary to lead a company through different parts of the Endgames curve.

Stages 1 through 2

CEOs in Stages 1 and 2 must drive aggressive growth and lead their industry in consolidation. Brute force, bold leadership, and vision are key success factors.

Develop an Endgames vision. In many industries like steel and chemicals the necessity of consolidation is apparent. In others, CEOs must have a rare talent to gain first-mover advantage by spotting an Endgames play before any other competitor.

Create a merger integration engine. Once a company's Board of Directors embraces an acquisition strategy and the first wave of deals is complete, the company's key differentiating success factor will be its ability to successfully integrate the high volume of acquisitions.

Prepare for Endgames Stages 3 and 4. Companies must undergo a major strategic transition when their industries move from Stage 2 to 3. The transition can wreak havoc with a company's business strategy and management processes.

Signs signaling the end of Stage 2 and the need for a new strategy:

- Mergers become the focal point of corporate strategy.
- Managers are overburdened with integration and neglect the core business.
- Company becomes "too big to manage."
- CEO achieves a certain degree of fame or notoriety and a significant bonus.
- CEO evolves into a "one-trick wonder."
- CEO makes one deal too many, or too big…or both.

(continued on page 7)

CEO Strategies

(continued from page 6)

Stages 3 through 4

Unlike the dealmaker skills and bold leadership traits required in Stages 1 and 2, the prototypical Stage 3 and 4 CEOs are shrewd chess players and portfolio managers. They must be able to navigate discreet issues such as Johnson & Johnson's strategy of focused acquisitions over time and PepsiCo's decision to pay a significant premium to acquire Gatorade for access into the sports drink market. There are few winners and many losers through Stages 3 and 4.

Implications for Endgame Survival

To lead a successful Endgames strategy, a CEO should look at three key implications of the tools and strategies available to him or her to manage in the Endgames environment.

1. Take a global view and adjust strategy to reflect the company's position on the Endgames curve. Endgames consolidation is a global phenomenon and ignoring that fact leaves you vulnerable to being surpassed or acquired.

2. Capitalize on cross-industry opportunities. All industries consolidate, so look beyond your own industry to see what you can learn.

3. Leverage the Board of Directors as a source for acquisition contacts, assessing the CEO's management of an Endgames Stage, and appropriately rewarding a CEO in each Endgames Stage.

The Board and the CEO must take ownership for the successful execution of an Endgames strategy through detailed, hands-on deliberation and decision-making. ■

For Additional Information on how CEOs can achieve successful mergers, go to: http://my.summary.com

McColl's Endgames Vision

In the early 1980s Hugh McColl became CEO of NCNB, a small North Carolina bank. Interstate banking was not yet legal in the United States, so the banking industry was clearly in the Opening Stage. McColl wanted to create a regional, multi-state bank, so he exploited a regulatory loophole and acquired a Florida bank. After lobbying regulators to change the laws in the southern U.S., he was able to acquire banks in South Carolina and Georgia as well, achieving a sizable lead over his competition.

In 1992, NCNB merged with C&S/Sovran to become NationsBank, the fourth-largest bank in the country. After completing more than 40 acquisitions, McColl grew the bank's assets to $120 billion. With a new federal interstate banking law, McColl was able to complete the biggest deal ever — the $60 billion merger with BankAmerica to create Bank of America. Due to a powerfully-developed Endgames vision, McColl turned a single state bank with less than $20 billion in assets into the largest depository bank in the United States, with $570 billion in assets, $10 billion in earnings, and operations in 22 states.

The Stock Market Connection

There is a connection between the Endgames curve and the performance of equities markets worldwide. First, companies can use it to build their strategies and find opportunities to outgrow their competitors.

Second, they can use it to predict what will happen in their industry as far as 20 years into the future. Though current merger activity is slow, as the economy recovers and consolidation resumes, there is a significant potential for stock prices to climb due to merger premiums and superior returns offered by successful implementation of the Endgames strategy.

Third, the Endgames analysis implicitly predicts and forecasts industrial deregulation in Stage 1, trade liberalization from Stage 1 to 2 or 3, and increased corporate governance. Companies will have new opportunities to increase profits and lead industries; the size and number of mergers will increase; and macroeconomic and regulatory factors will be more conducive to growth, leading to a rising stock market. If this trend stays intact long term, the entire global market capitalization in 2010 could be between $60 trillion and $80 trillion. Investors can profit at every stage. Identifying best practices of companies in each stage can lead to superior investments.

The key to using the Endgames analysis as an investment tool is the ability to identify companies that apply Endgames principles particularly well, and thus have the highest probability of becoming the ultimate winners. In each industry, regardless of position on the Endgames curve there are leaders and laggards. Identify the top performers on the basis of revenue growth and value creation growth. Companies that exhibit both of these are a starting point for good Endgames-based investments. Then consider the company with respect to the specific dynamics of each stage:

- **Opening Stage** — Choose companies with solid financial backing and a sound business model.
- **Scale and Focus Stages** — Look for potential mergers of near equals as the pace of consolidation increases. Also seek companies that stick to their core competencies.
- **Balance and Alliance Stage** — Look for compa-

(continued on page 8)

Index and Merger Correlation

From 1989 to 2001 there was a 93 percent correlation between the Dow Jones Index and acquisition activity in North America. To a certain degree rising stock prices form a currency for making M&A transactions possible. During the same period the Euro Stoxx index and merger activity were 80 percent correlated.

The same situation did not occur in Japan, where merger activity was flat during the Nikkei's dive in the early and mid-1990s. But as the Asian crisis continued in 1998, mergers skyrocketed. This was due to several Endgames-related factors. Some Stage 2 industries such as financial services and real estate had fallen so far that investors felt they were a good deal, and foreign banks swooped in to buy them as part of their global Endgames strategy. The Japanese government also encouraged several financial services institutions to merge as it began to deregulate the industry. And the market opened up and globalized, primarily in Japan's Stage 2 and 3 industries.

The Stock Market Connection

(continued from page 7)

nies that reinvent themselves and spin off new businesses into earlier Endgames stages.

Of course a solid Endgames Strategy depends on having the right information; there is no substitute for the due diligence companies must go through to get it. When researching an investment, research the regulatory environment, examine the company's merger success rate, anticipate future trends to discover future opportunities and strategic industry shifts, and follow the cycles of merger activity. ■

Endgame Visions of 2010

In mid-2002 the Dow stood at 10,000. Over the next decade the authors foresee it increasing fourfold. The companies in the Dow Index are in leading industry positions and are poised to finish among the winners in Stage 4. With Endgames consolidation trending to higher velocity and greater scale into the future, by 2010 the first $1 trillion merger will become a reality. The Dow increased about 3 percent per year from 1896 through the Depression. Since the 1950s it has risen by about 8 percent, and over the past 10 years about 12 percent, despite recent setbacks. Therefore a projection of 15 percent to 20 percent growth for the next several years doesn't seem so utopian. The authors' long-term perspective of stock valuation is that it will be driven by Endgames, as the value of merger and acquisitions transactions increases steadily in the future. The authors have other predictions for the next decade:

- In the mid- to late-1990s the spotlight shone on the Opening Stage with the technology industries. Companies that grew rapidly in the 1980s and 1990s will find consolidation as the best growth method, and **Stages 3 & 4 will be the battlegrounds for the next decade. Merger size will be unprecedented**.
- The exponential rise in stocks will affect the whole economy through speeding technology innovation, market roll-ups, and mergers. Industry insiders say the **Endgames cycle will no longer take 20 to 25 years to run its course, but may cycle at 16 or 17 years in the near future**.
- GE has the largest market capitalization, which recently stood at $332 billion. By 2005 we will certainly see **at least a dozen global companies with market capitalization of more than $1 trillion** as volume and scale barriers collapse, and by 2010 there may be hundreds of global industry leaders.
- Companies will face more cultural challenges with all of the mergers, complacency, the need to listen to customers and connect their employees. **Endgames masters will develop a truly global culture to integrate nations, races, and skill sets** to gain maximum productivity from stakeholders.
- **New industries for outsourcing and financial scorekeeping will proliferate and CEO strategy will change** to cope with managing these companies day-to-day and long-term. ■

National Economies and Endgames

Political leaders must provide the appropriate environmental and political infrastructure to nurture industries within their economies. They should:

1. Create a growth-oriented regulatory environment.
2. Establish an infrastructure that is positive for the local economy, industries, and companies.
3. Create an educational system that stimulates people to exploit their growth potential and induce younger industries to settle in the region to boost the economy.
4. Understand the importance of scale and size of companies that can compete at the global level.

A quick look at some countries reveal the following:

✓ France and Japan are strong in old industries and underrepresented in the Opening Stage.

✓ North America is equally balanced across all stages and well equipped for the future.

✓ Singapore and India are front-loaded which puts them in a strong position if their companies are strong enough to move up the Endgames curve.

THE SUMMARY IN BRIEF

The global pandemic ushered in a new reality of remote work—a trend that's likely here to stay. ***Work From Anywhere*** delivers practical strategies on developing a high-performing team and business in a remote, distributed environment. Accomplished authors, behavioral experts, and fast-growth business leaders Alison Hill and Darren Hill show you how to create these strategies to bring out the best in your hybrid and remote team members, by focusing on both performance and people.

You'll learn the unique psychology, methodology, and technology that make hybrid teams excel, and how to foster high performance across your team, no matter where they're located.

Working from anywhere is no longer just an HR conversation; it's an executive conversation. Perfect for business leaders working with hybrid teams, ***Work from Anywhere*** is also ideal for organizational development executives, cultural transition leaders, business leaders, and entrepreneurs who are responsible for ensuring that employees consistently perform at their best, regardless of location.

IN THIS SUMMARY, YOU WILL LEARN:

- Why working from anywhere (WFA) is not just necessary but desirable.
- The three pillars of performance, culture, and autonomy as the key to mastering WFA.
- Great strategies to change the way your team thinks, connects, and works.

Introduction

Having teams operate in a distributed or work from anywhere (WFA) fashion is not new, nor was it solely born from the global pandemic. A few rare companies with valuations now in the billions have been distributed for decades, or at least since the advent of the internet.

Yet, the sheer impact of COVID-19 and the overnight call to remote and distributed work practices reshaped workplace behaviour and standards so significantly that, in time, we may speak historically about the events of 2020 as being as disruptive for workforces as the invention of the printing press and the personal computer.

Jack Dorsey, CEO of Twitter and Square, announced in May 2020 a permanent remote work policy that allows individual employees to make the choice about where they work and how. Shopify CEO, Tobi Lütke, also announced in May 2020 they would embrace a remote workforce, claiming they were now "digital by default."

Put simply, the requirement of organisations to offer and adapt to WFA practices as a regular option is now here forever. Recent research suggests that to be competitive in the talent marketplace, you need to have options available beyond the co-located team.

Chief financial officers around the world have celebrated the shift to WFA more than anyone, because of their connection to the numbers that drive the business. The reduced costs are varied, but the two big reductions are reduced commercial rent and reduced travel and accommodation expenses.

The Best Way to Work?

But what if WFA is actually the best way to work? How comfortable has that question left you? What was your first intuitive response?

Embracing a WFA approach for your team could enrich the lives of your people and their work. You can lead and thrive as a team working from anywhere, whether in a distributed form or as a hybrid team. The gifts from this are not just a flexible work environment but also a deeply autonomous one, built on the kind of performance standards and cultural togetherness that create the work engagement we've quested for.

When we explore a new model and methodology, the very things we've been craving from work become possible.

The alternative is pretty ordinary; if your belief is that WFA is the poor cousin of the office-bound team, you'll likely create a self-fulfilling prophecy. Your energy will be reflected and radiated throughout your team, and you'll see problems instead of opportunities.

Let's not do that. Let's dare to create something special.

The World Has Shifted (shifting our world)

Making the shift to a WFA approach requires new tools and new processes. Change is possible, but it requires a change in perspective and a change in belief first.

Shifting Beliefs About Work

The following are the three key beliefs that will underpin your first step into exploring a WFA approach:

- **WFA is possible**. Sure, it's going to take work, and you'll learn many things along the way and turn corners only to realise that approach doesn't work. All of these are okay as long as you have the underlying belief that it is possible to WFA as a team.
- **We can do this**. The second key belief you'll need to embrace is that you can do this as a collective. Believing you will find a way with the people and the resources you have is critical to your long-term success.
- **It's worth it**. Finally, leaders who believe not only that it's possible but also that it's worth it are the leaders who'll find a way in the world of WFA.

Building Your WFA Philosophy

Let's face it. The new world of not being a co-located team is a radical change, and it requires some radical thinking. So rather than putting your efforts into a plan to build a hybrid or distributed team, sink your effort into creating a philosophy.

Start by asking the big questions: "What is our approach to working together?" "What is our approach towards finding success?"

For a long time, organisations have said, "It's culture first." The truth is that hybrid teams, without the data that comes with non-verbals in conversations, can create some real risks to the longer term success of the business unless they first focus heavily on performance. Performance can then strengthen culture and allow for autonomy.

In times of deep uncertainty, cultures need to focus on performance more than anything.

The three pillars of performance, culture, and autonomy provide a philosophy and framework that lays the foundation for a successful move to WFA.

In times of deep uncertainty, cultures need to focus on performance more than anything. You can have what would be perceived as an awesome culture, but your business (and its culture) can be one step away from falling over if there's not a care of, and measurement against, performance.

Performance provides a platform for culture within teams.

Culture and Autonomy

Shifting your team to WFA requires a different conversation about culture. It's a conversation about what you and your team value, and why you value it. What do you care about, and how can you care about that same thing in a different way?

With clarity around performance, and a drive towards a dynamic and evolving culture, successful organisations are those that believe work can be an extraordinary experience for the individual.

Autonomy is the ability to have a choice about how the work will be done. The expression of self within the role is key. Within workplaces, this means shifting away from a process-style of management and encouraging and supporting an output-style of direction. As a leader, you provide your team with the desired result and allow them to choose how to get there.

The expression of autonomy is dialled up in a WFA approach. Everything can truly come to life when the groundwork of clarity around performance is expressed (you're clear on what is of value) and this is connected to a culture that aligns (through the continual expression of values), allowing autonomy and personal growth to be developed (becoming valuable in the role).

Performance, culture, and autonomy are equally important. This WFA philosophy provides the framework for strong, important conversations inside your team and organisation. You can have conversations around what matters to you and your team, the key things you'll be measuring, how your people can belong and behave, and where the opportunities are for individualistic expression, growth, and mastery in the role.

The Call to Adventure

Let's unpack some of the early considerations and tools to get started on the pathway to WFA.

New ventures create energy—energy that is harnessed into motivation. Figuring out the new lay of the land can be engaging and intoxicating. Through increased action, we shift into the adrenaline phase of motivation. We see the results of our actions take effect, communication and feedback generally increase over this time as individuals are figuring out what they are doing, and we are open to innovating on the run.

Motivation can start to drop after this initial novelty and adrenaline period—and the higher the peak, the steeper the drop. As novelty and adrenaline drop, motivation starts to wane.

For leaders, it's important to recognise this phase and not see it as a sign that the shift to WFA is not working. Instead, this is the "bedding down" phase, providing an opportunity to redesign how work and connection are achieved.

Have normalising conversations with your people around how they are feeling and coping. Then double down on progress. Ask, "What are the things that we can make gains on today or this week that will move us forward?"

Navigating the Communication Quagmire

Working from anywhere requires different communication tools. Consider four tools you need to navigate this minefield and effectively engage a WFA workforce. The tools create a simple framework that can be applied to any organisation and help to bring structure and clarity to your hybrid and remote communications.

Say hello to your new favourite acronym: SOCS.

Social. Now more than ever, our people need social inter-

action and connection with their teammates to build rapport and strengthen their sense of belonging. Create time to engage not only with your own team but also cross-functionally with other teams. The preference here is to utilise a video conferencing tool (whichever is your software of choice) because it creates an opportunity to see people visually and pick up non-verbal cues.

Operational. The starting blocks for world-class WFA teams is to have a platform that can be easily accessed for operational communication and visual progress. Given the nature of hybrid work, this is most often a digital tool that is agnostic to location for accessibility. Consider how individuals, teams, and cross-functional teams can engage in these platforms, connect, help each other out if needed, and celebrate the wins along the way.

Conversational. Having a designated place where your team can have casual conversations back-and-forth, similar to how they would if they were all in the office together, is important. This includes team-centric conversations, company-wide conversations, one-to-one interactions, and everything from the quick business update, to the water-cooler chats, to recommendations about the latest Netflix series to binge on.

Speed. How do you cut through the noise when something urgent or important needs to be shared? Which platform do you use to get quick attention (knowing you don't want to use this platform all the time because it will be habitualised)? This is where the speed element of this framework swoops in to save the day. For many organisations, the best option for this is a quick text message.

Charting the Course

Any journey is founded in a combination of both embarking on a planned direction and the serendipity of stumbling across the unplanned along the way. When the unplanned happens and the unknown path is trodden, you have a chance to check back in and reorientate the pathway forward. Are you and your team way off base? Or is the new direction where you want to be? How do you reconnect with a sense of progress rather than meandering?

To keep progressing, you need a charted course of direction or a map to come back to. It is this touchstone that becomes a shared reference point for intrepid travellers to gather around, share stories, and plan for the next move.

Five Levels of Distributed Work

Matt Mullenweg, CEO of web-publishing and commerce firm Automattic, has a model, the five levels of remote work, which allows a team and organisation to plot where they sit on the continuum of remote or distributed work.

Level one: Non-deliberate action. At this stage, remote work is seen as a temporary fix or "holding pattern," and very few things have been done to improve or optimise the remote working experience. In this setting, employees may be putting off completing certain tasks out of necessity—essentially, until they're able to get back to the office.

Level two: Recreating the office. At this stage, they've made the commitment to work remotely but are still doing what they can to recreate the office environment and office routine in a remote setting. They'll (over) use tools such as Zoom or Microsoft Teams to gather as a team virtually, but there is still an expectation (assumed or otherwise) that emails and messages will be responded to as soon as possible.

Level three: Adapting to the medium. At the third level of remote work, you're likely to start seeing more of the benefits come to light. As employees have accepted that remote work is here to stay, they're much more likely to begin upgrading their space to accommodate their new working environment.

At this stage, asynchronous communication also becomes more common. Documentation and written communication will become more important at this stage, so that those who are unable to attend live are able to access critical information on their own timeline.

Level four: Asynchronous communication. Work no longer needs to happen at the same time for everyone. Instead, the work considers not only the tasks to be done but also how to hand over the baton to others who may arrive at the task at a different time. Employees have more control over how they structure their day, and your organisation will begin to focus performance expectations on outcomes and what is produced, rather than how or when work is produced.

Trust is heightened as employees gain more autonomy, and a new level of psychological safety is achieved.

Level five: Nirvana. This level should be considered "the dream" of all remote working organisations. At this stage, your organisation is able to consistently perform better than any co-located team. Everything is running

smoothly, and communication levels are high across the organisation. Everyone in the company has time for wellness and mental health.

Being strategic about where you are and where you are heading is the goal. And regardless of where you're aiming for in terms of your placement on these levels or on the distributed to co-located continuum, the question "Could this be done a different way?" is worth pondering.

Tackling the Toolbox

Work from anywhere is no longer a people policy touted by the rising technology companies or the early adopters; it is a permanent strategy and conversation inside organisations regardless of industry. This is indeed a new frontier, a new adventure, which requires new skills and new tools.

Research has uncovered three areas that individuals and leaders need to shift. As a leader, you need to

- Change the way your team thinks (psychology);
- Change the way your team connects (methodology);
- Change the way your team works (technology).

And you need to do this across two focus areas: performance and people.

For example, let's talk about psychology. If we start with the psychology of performance, the two areas to focus on are managing expectations and setting standards.

Managing expectations. For distributed and hybrid teams to work effectively, a conversation around expectations needs to happen. This includes setting expectations around response times, having a generosity of assumption, and recommitting to regular feedback. Through managing expectations, we provide our teams with the clarity, focus, and framework required to create psychological safety.

Consider the following ground rules: Leave nothing unanswered, tighten the feedback loop, and be a brag (encourage team members to share their successes).

Setting standards. To effectively create behaviour change and see a high adoption rate of the desired behaviours, you'll need to both set the standards and consistently role-model them as a virtual leader. This includes setting boundaries between "work" and "home" and encouraging others in your team to set and uphold their boundaries.

When stepping into the psychology of people, the two areas to focus on are managing people's mindsets and navigating roadblocks.

> With change being your only constant in the current environment, you need to adopt and encourage a growth mindset . . .

Mindset management. The mindset you hold drives the results you and your team are able to achieve. With change being your only constant in the current environment, you need to adopt and encourage a growth mindset within your team and organisation to see long-lasting success.

You can look to leverage many different tools and strategies to help manage mindset. A powerful example is cognitive reframing, which is the act of choosing to look at someone or something differently (the ole classic "Is there another way to look at this?").

Navigating roadblocks. Roadblocks are going to happen. It's inevitable, even more so when you are treading a path that is not well worn. You can divide any roadblock you encounter at work into two categories: external roadblocks or internal roadblocks.

For example, perfectionism. Do you find it a battle to let go of work until you feel it's been polished to the highest possible sheen? If this is you, try using cognitive reframing and shifting your language to coach yourself into realising that sometimes speed is more important than dotting every I and crossing every T.

Confronting the Challenges

Becoming a world-class work from anywhere team brings with it challenges—challenges that you won't have faced before on this new frontier; and when you overcome the initial challenges, others will be waiting around the corner.

Heroes confront the challenges that lie on their path. They

learn from the falls, strengthen their purpose and resolve, and navigate their way to the ultimate battles. It's through confronting the challenges that true mastery is achieved.

The Challenge of Losing Spontaneous Data

For example, how does leading a hybrid or distributed team differ from leading in a traditional office environment? The single biggest difference is the loss of spontaneous data through body language and non-verbal communication.

Research has indicated that approximately 70 percent of communication is picked up not from what we say but from how we say it—from body language.

When you're having distant conversations with your team, because you lack visual symbols and auditory cues, summarising throughout is often very helpful. This means, during distant conversations, webinars, or Skype calls, you summarise with each other what you think the other person's just said, and you do this far more regularly than you would during a face-to-face conversation.

This allows you to capture the value or the key concept that's just been shared and make sure that you're both actually in agreement that that's, in fact, what you're talking about. Invite people to share back what they've just taken from what you've just said, rather than just assuming that what they've taken is what you meant.

The Challenge of Performance Feedback

If performance is the bedrock of success in our WFA philosophy, world-class hybrid teams need to have the skills to be able to provide feedback around performance on a regular basis.

As we move further into a WFA dynamic, many leaders and team members are having to confront the challenge of facilitating an underperformance conversation within a virtual team setting. When approaching an underperformance conversation with a member of your team, keep the following in mind:

Start a conversation as soon as possible. The best place to start is to have the conversation rather than avoid it—the longer you leave it, the more assumptions can run amok and stories can grow.

Make the conversation visual. In order to effectively depersonalise the tough conversation, you need to make the conversation visual. It's useful to share your screen so that your points of discussion are clear, and misunderstandings can be talked through.

Sources of Strength

Let's explore some of the greatest sources of strength that can arise from the commitment to a hybrid, work from anywhere approach.

Rhythms and rituals have always been culturally significant, and in a WFA team they don't become less significant; in fact, you and your team's rhythms and rituals become a critical component in the long-term survival of team culture. They become the sources of strength on which WFA is built.

Working from anywhere is a shift in habits and behaviours. It can be a shift that increases energy and increases connection to work but only if you find the rhythms that work for you and your team.

Individual Rituals for Work

Despite the autonomy that comes with working from anywhere, having structure in your workday is still worthwhile for peak performance. Start with a set of WFA rituals that you can use to prepare for and wind down from your workday.

Different zones for different work. Given that our environment drives our behaviour, it could be worthwhile considering whether on different days, or for different portions of your day, you can work from a different location (such as the local park, a different local café, or even just a different room) in order to achieve an energetic shift.

Still have "work clothes." Wearing the same clothes all day can mean you find it more difficult to not only "switch on" for work but, potentially even worse, wind down from work at the end of the day. So even if your WFA clothes look nothing like your old office attire, separating what you'll wear when at work versus when you're not may be worthwhile.

Team Rituals for Work

When teams are distributed or hybrid, rhythms and rituals take on a new form. They shift from being unconscious (because we've done the in-office ones for a while) to becoming more conscious. They take greater cognitive load and planning although can be just as effective (if not more inclusive) than the office-only rituals.

Win the morning. The way your team starts their day inevitably has a flow-on effect to how energetic everyone feels throughout the rest of the day. Workers at Pragmatic Thinking often share what wins they've had during their daily kickstarter video meetings, with the beauty of this ritual coming to light in the variety of approaches they hear about.

While collaborating isn't a hard thing to do in theory, it's the habit and structures that surround collaboration that need to change in a WFA context.

Seize the midday. To perform at your best consistently, you've got to make space in your day for recovery rituals. Seize the midday is a daily reminder to get up from the desk and do something to reinvigorate our minds and reset for the afternoon sprint.

You can seize the midday by getting outside in the sunshine—at the beach, at a local park, or even by going out for a rollerskate. This daily exposure to sunlight (even on a cloudy day!) and a bit of aerobic exercise are important for many reasons, including the release of serotonin in the brain. Serotonin is a powerful neurochemical associated with a boost in mood and a sense of calm.

Slaying the Beasts

When it comes to a WFA or hybrid workforce, there are four big battles that you and your team will need to overcome:

- Collaboration (lack of);
- Stagnation (as opposed to ideation);
- Disconnection;
- Miscommunication.

Let's talk about the first of these.

Collaboration (lack of). Collaboration is the backbone of high performance. Collaboration starts with connection, but how do we achieve this genuinely in a WFA setting? The challenge for hybrid teams is that collaboration can diminish quickly, and this lack is like a famine.

While collaborating isn't a hard thing to do in theory, it's the habit and structures that surround collaboration that need to change in a WFA context. The true barriers to collaboration aren't the lack of walls and whiteboards; they're trust and ego.

Strategies to Slay the Beast

Here are the weapons to overcome those barriers and build true WFA collaboration:

Care about collaboration: Sounds simple, but it's an important first step. Your team's culture is about getting clear on the things that you care about. When you consciously care about collaborating with others, when you truly believe that the best outcomes are achieved through the input of experts and experience, you will find a way to successfully collaborate.

Review the resources and platforms you are using to collaborate: When it comes to collaboration, you risk a particular platform, tool or system becoming overused. One of the benefits of collaboration for WFA teams is that it reduces the pressure of having to think on the go. Instead, collaboration can be considered, allowing people to jump into the desired platforms pre-prepared. Get clear on when you use what platform, and allow space for people to find or use their own.

Create space to share and learn about other people's passions: Do you know the skill sets of your people and what lights them up? What about your team? Do they know that of others? Oh, yes, this is a doozy—but when you and your team get acquainted with the skill sets of others, you can cross-skill and learn from others, too.

Extend trust first: Lack of collaboration comes with a lack of trust and a growth of ego. ("What do they know? I've got this.") One of the ways to grow trust and reap the benefits of collaboration is to extend trust first. It will cost time, effort, and energy. Trust others to be able to comprehend what you are trying to achieve, trust others to provide their support, and trust others to ask if they don't know. When you make this investment of time, it can repay you and your team tenfold.

The Adventures That Await

If you've achieved a victory over any of these beasts, make sure you take the time to recognise the effort and courage required to succeed. A few quick tips for celebrating this with your team: Find a wider audience. Talk to your internal comms department, create a good news story, put in for

an award, or simply write an email to the CEO, cc'ing in your team, highlighting their victory.

Break bread. Whether the "feast" is face to face or virtual, you have the chance to tap into a well-worn ceremony of celebrating victory via a meal shared.

Level Up to the Next Adventures

Now that your dragons have been not only slain but also celebrated with gusto (or perhaps just a little fist pump), it's time to lift your gaze once again to what vistas sit before you in the new world of work. Four areas offer opportunity and exploration for any WFA or hybrid team to level up. These four areas are energetic state, gatherings, continuous productivity, and access for all. Let's discuss the last of these, access for all.

Building a work experience to WFA is one thing; but if you want to play a really big game, build a work experience to WFA for all, including people who would otherwise find access difficult because of pre-existing conditions.

Blind or visually impaired team members. When using visual technology, ask your team to support those who are blind or visually impaired by

- Communicating naturally and using ordinary language—using words such as "see," "sight," and "look" is okay;
- Being aware that gestures and facial expressions, such as nodding, pointing, and waving, may not be seen;
- Using precise words and instructions, such as right, left, forward, back;
- Giving directions from the person's perspective rather than your own—don't point or say "over there."
- Describing diagrams and pictures verbally.

The deaf or hard of hearing. When using visual technology, ask your team to support those who are deaf or hard of hearing by

- Utilising captions;
- Finding out the communication preferences of the individual;
- Ensuring background noise doesn't interfere with the conversation;
- Having someone available for the individual to reach out to at any point for help;
- Keeping the camera at a good angle to give lip-readers a good view of your face;
- Slowing down your talking speed to help improve the accuracy of devices being used.

If stepping into the adventure of becoming a world-class hybrid team is your pathway, be fairly warned: It's not for the faint-hearted. Diving into the beautiful questions around what it actually takes to deliver exceptional work, create a culture worth raving about, and carving out space for individual expression and growth is one heck of an adventure.

But you've got this. Truly you do.

Alison Hill is a registered psychologist and CEO of three-time AFR Fast 100 company Pragmatic Thinking. A culmination of her expertise across leadership, culture, and psychology, Pragmatic Thinking is a behaviour and motivation strategy company that helps organisations build better leaders by building better people. A behavioural scientist with postgraduate qualifications in management communications, Darren Hill is the co-founder of Pragmatic Thinking. He helps organisations and individual leaders to foster human skills in their places of work for outstanding results.

12 People Skills for Doing Business Across Borders

WORKING GLOBESMART

THE SUMMARY IN BRIEF

Global business is increasing dramatically and along with it, the cross-border friction that emerges when there are misunderstood or ignored cultural differences. Though every destination provides new hazards for mistakes, the challenges you will encounter are relatively predictable and easily anticipated.

The single greatest cause of difficulties in global business transactions is lack of appropriate people skills for relating to counterparts from other countries and cultures. In Working GlobeSmart, *Ernest Gundling, an expert in strategic global approaches to leadership development, organizational change and innovation, outlines the 12 fundamental skills managers need if they intend to move across borders and succeed. Not simply a list of culturally specific customs and behaviors, this summary presents a general set of behaviors spanning interpersonal, group and organizational skills.*

Managers, especially American managers, who can understand why these skills are important and incorporate them into their business dealings — whether in South America, Europe, or Asia — will find that partners across the globe are more likely to respond and work together to achieve mutually beneficial results.

What You'll Learn In This Summary

✓ Why people skills are the most frequently overlooked issue in cross-border business.

✓ How to interact with people from cultures that are more relationship-oriented, indirect, or hierarchical than the culture in the United States.

✓ How to listen to, look for, and understand what is not being said.

✓ How assumptions about the supremacy or "correctness" of our own culture holds us back.

✓ How to interact one-on-one with foreign partners as well as in team and group environments.

✓ How to implement your global strategy and vision on the ground, where it truly matters.

Global People Skills

Managers frequently underestimate the importance of global people skills to business. The model in this book includes 12 competencies that include interpersonal, group, and organizational skills. They must be well integrated throughout your organizational culture because the value of your products, either at home or abroad, will decrease without the people skills to back them up.

Failures in global business are more insidious than acute. They seem small, but as they build up, they become lethal. Expecting others to speak one's own language; assuming everyone is eager to adopt your ways; and not taking the time to establish effective relationships abroad can all undercut plans that have been carefully strategized at home.

Generalizations about a national culture can be helpful in anticipating how people will act in unfamiliar settings, but it is improper to apply stereotypes to an entire nationality that is most likely as varied culturally and ethnically as your own. By inquiring about another culture, identifying its contribution, learning its core values and attendant behavior, and understanding the gaps between you and the average profile of the other culture, you can predict areas of potential conflict both with business partners and your own personal limits. ■

Interpersonal Skills

Global skills are built on a foundation of strong personal relationships, but these relationships can take time and have many facets. Establishing credibility, handling feedback, obtaining information, and evaluating people are all critical interpersonal skills that international managers must develop when they work in another culture.

#1 Establishing Credibility

Experienced managers tend to take their own credibility for granted in the United States and they are more eager to get down to business. In other cultures there are vastly different codes for establishing the value of new clients and partners. They may find you boastful or arrogant as you rattle off your accomplishments. Instead, take local perspectives into account. In hierarchical cultures like Taiwan, Singapore and Malaysia modesty in top leaders is interpreted as confidence and sophistication. There is no need to blow your own horn because others will do it for you. It is more appropriate to demonstrate that you are receptive and aware of the appropriate behavior.

#2 Giving and Receiving Feedback

Giving feedback can be a great source of misunderstanding among different cultures. Those that favor direct and verbal forms of communication may misinterpret or miss entirely more inexplicit and nonverbal forms of feedback. Meanwhile very direct messages can easily cause unintended offense.

In parts of Europe and the United States, feedback is usually verbal, immediate and directed at a particular person. Consider different types of feedback when working abroad, such as nonverbal feedback, periodic feedback, feedback given in a different place, or offered to a group even if the target is a particular individual. By being aware of different styles, you can give feedback in a culturally appropriate manner and recognize it when you are on the receiving end.

Here are three ways to give indirect feedback:

Maintain frequent informal communication — It is easier to interject criticism in the ebb and flow of conversation instead of pointing out specific "areas for improvement."

Ask third parties to convey information — A trusted third party can open up a mutually acceptable solution that would have been impossible if both parties had

Interpersonal Skills

(continued from page 2)

burned bridges through more direct forms of feedback.

Anticipate problem areas and provide specific models — "Feedforward" by anticipating how local employees may make mistakes for which you will criticize them, and walk them through the process.

#3 Obtaining Information

Though gaining information can help managers understand organizational capabilities, project management issues, or market opportunities, its most important goal is to understand what employees have to contribute. Often issues such as status, motivation and previous experience with the United States or Americans colors whether or not an employee is willing to share information.

For instance in India, where people are taught to respect persons of age and authority and to keep a polite distance between people on different organizational levels, it is often difficult for subordinates to know how to bridge a status gap. If a U.S. manager asks an Indian subordinate for opinions or critiques on a specific project during a meeting or conference call that includes clients, it will be difficult for the subordinate to disagree with a superior in such a public forum.

Problems sharing information directly are more pronounced in hierarchical, group-oriented cultures where long-term relationships are a key asset. Putting your relationship with a senior member of the hierarchy in jeopardy can be too much of a risk.

Other obstacles to obtaining information that Americans may not consider are legacies of repressive political regimes that make people cautious about sharing information; an active mafia that preys on a country's business enterprises; equating subjective perceptions with objective "facts" when making decisions; or even poorly collected and organized information that is difficult to access.

Recommendations for obtaining information:

- **Ask via a third party**
- **Change the setting**
- **Explain background and context**
- **Show genuine interest**
- **Show precedent**
- **Probe politely but persistently**
- **Rephrase the request**
- **Clarify and confirm**

#4 Evaluating People

Navigating the pitfalls of evaluation in other parts of the organization without offending employees and causing significant rifts requires tact and understanding.

The Speech

A U.S. executive newly assigned to an Asian-Pacific sales operation made this speech based on his individualistic, direct, and task-focused background:

I'm very pleased to work with you in our Asian organization. I've worked with Asian companies before, and it is exciting to be part of the sales force with you. While I was director of Sales for the Western region in the U.S., we made a strong contribution to earnings. We now have a great opportunity to build a strong and profitable business together in Asia that will yield outstanding returns for the parent company and our shareholders. My wife and I look forward to living out here and getting to know you better.

The audience may be thinking the following things:

"He sounds very proud of his accomplishments."

"He doesn't seem to recognize all of the efforts we have been making here."

"Why is he talking about profit on a formal occasion like this?"

"He makes it sound like we are only concerned about stockholders."

"Does he think that Asia is one place?"

"Why did he mention his wife?

A more appropriate speech, playing to the audience's preferences for a team-based, indirect and relationship-oriented approach might have been:

It's a pleasure to meet with you today and have the chance to work together with you over the next several years. As you all know so well, this is an exciting and competitive part of the world, and we have many opportunities to become an even more vital contributor to our worldwide organization. There is much that I need to learn about doing business here and about each country and culture in the region. I look forward to getting to know each of you and the people in your sales organization much better.

Managers who do not speak the host-country language are vulnerable to receiving limited or distorted information about individual performance from people in key roles. When managers introduce the concept of accountability but still do not realize the unexpected effects of market circumstances, poor business results can be attributed to the wrong causes. Employees may feel divided motivation between evaluation criteria set by the foreign manager and that set by local managers. In addition, junior employees at immature subsidiary organiza-

(continued on page 4)

An Incorrect Evaluation

Ernest Gundling describes an incident that occurred a number of years ago when an Indian scientist joined his work group. Gundling was uncomfortable with the scientist from the start. The scientist wore expensive clothes and kept his carefully oiled hair tidy; Gundling preferred a natural look. The scientist was talkative and gregarious and would debate at great length on all topics; Gundling stayed quiet unless he had something important to say. The scientist spent hours in the cafeteria talking to acquaintances; Gundling spent his time in his cubicle working on his action items.

Eventually Gundling told an American colleague that he didn't feel the Indian scientist was adding value to the group. The American colleague told him he was wrong. The Indian scientist had made important contributions in generating new ideas and building support in the organization for the next implementation steps. The Indian scientist himself heard about Gundling's remarks, and told the author that there were many ways of getting things done. "I was embarrassed both for evaluating him incorrectly and for passing on that mistaken view without verifying it," Gundling writes.

Interpersonal Skills

(continued from page 3)

tions do not have the benefit of middle management mentors, or the middle managers may not have the skills or inclination to train and develop them.

Often those with good people skills at home make the wrong choices abroad. The most common trap is to evaluate people positively on the basis of language skills when they are deficient in managing subordinates or working with customers. Learn local standards so that you can discern when conduct that signals competence in your own environment has a different significance. ■

For Additional Information on comparative cultural orientations, go to: http://my.summary.com

Group Skills

Beyond working one-on-one, so much of business relies on team work. The problems of culture become magnified with each new person or culture that is added to the group. Working on global teams, training and development, selling and negotiating all need to be approached differently than they would be at home.

#5 Working on a Global Team

Teams play an increasingly vital role in accomplishing corporate business objectives, and teamwork is not easy for a diverse group whose members bring very different viewpoints. Globally dispersed teams that rely heavily on virtual forms of communication are common. This becomes difficult because of individual personalities; whether the team members trust each other; different communication styles; the tendency to defend national interests; and basic assumptions regarding the role of the team leader or meeting styles.

The more diverse a team the more information and perspectives it has to work with, but the diversity also makes it more difficult to work toward shared goals. Develop positive team chemistry by creating a shared context and building relationships of trust and rapport. Because the ability to contribute ideas or offer constructive criticism is influenced by cultural background, meeting facilitation techniques become important for drawing out opinions. For a team to work cohesively, it must decide on mutually acceptable styles for decision-making, a common team vision, problem solving methods, roles and responsibilities, and a set of core intercultural values that bind team members together.

The amount of "context" available through different types of interactions should be considered depending on the importance of the meeting. Person-to-person meetings afford a large number of contextual cues through informal contacts, direct physical exchanges, nonverbal messages. Each step on the way from personal meetings to e-mail involves a significant loss of context.

One caveat is that though humor is a key ingredient to building good intercultural teamwork, inappropriate humor can be offensive and can reflect poorly on the humorist. A safe form of humor in an intercultural context is directing it at one's own shortcomings.

#6 Training and Development

Training and development objectives are relatively universal despite the radical changes in recent decades. Training still remains a primary vehicle for enabling employees to meet corporate objectives. But learning styles and instruction methods, like everything else, are deeply influenced by culture. Trainers going abroad can make the mistake of presenting materials at a level that is either too advanced or simple for their foreign audience or has a lack of content fit, such as corporate mandated U.S.-based diversity training in India where the relevant diversity issues center on Muslims.

Overseas trainers should reconsider their attitudes and expectation in certain areas:

(continued on page 5)

Group Skills

(continued from page 4)

- **Credentials** — What credentials are important to the trainees and how will they probe for them?
- **Level of formality** — What level of formality do the trainees expect from the trainer?
- **Agenda** — How closely is the trainer expected to follow the agenda?
- **Discussion or debate** — Will audiences grill a presenter on factual claims? Is the presenter prepared to defend these claims with rigorous observations?
- **Small groups** — Are the trainees more comfortable discussing questions and concepts in small groups than in front of the whole audience?
- **Tests** — Do the trainees expect and want to be tested to prove the rigor of the training?

Cultural issues are equally important in employee development, whether it is formal or not. Western managers' approach to employee development involves setting parameters of a task and giving an employee room to complete it, assuming he or she will consult the manager if necessary, but only after trying to solve the problem first. Other cultures can view this hands-off style as "delegate and disappear." When dealing with subordinates who do not understand the Western style, managers should anticipate developmental needs of the employee; establish standards through personal example; expect employees to bring you problems; and expect to be approached about personal as well as business matters.

With respect to managing performance, it is important to work hard to integrate any new performance management systems into the foreign country's culture and make sure that everyone understands that judgments are going to be based objectively on performance rather than relationships. You will need comprehensive training for managers and employees; recognition for contributions to a team so employees do not see top performers as selfish and unjustly singled out for praise; clear quantitative measurements; frequent informal feedback; and a culture of openness where people can discuss how to improve their performance.

#7 Selling

Selling is likely the most resistant occupation to globalization, because buyers everywhere are literally and figuratively more comfortable with sellers who speaks their own language.

Initial Contacts — The task-focused methods of initiating contacts, such as cold calling, e-mail and ads, are less effective in foreign markets where an introduction from a mutually respected third party is far preferred.

Discovery — Keep culture in mind when learning about the organizational and transactional background. Develop effective responses to potentially incomprehensible behavior such as customers more interested in how you can fix the past than the future; customers who react better to personal questions than business questions; or those who expect to be treated like royalty instead of partners.

Relationship Selling — Relationships do not end with the sale in many cultures. They continue to grow over time and develop a web of mutual obligation. The progression from vendor to outsourcing solution to strategic partner is similar to the progression from acquaintance to friend to family, and each step comes with more serious obligations than you typically expect of business partners.

Handling Customer Concerns — The deepest objections and concerns held by customers may not be expressed directly, since broaching awkward subjects with foreign "guests" is uncomfortable. Learn to recognize the meaning behind common probes and give answers that respond to the underlying issues.

Persuasion — Western salespeople sell to an individual customer with a particular personality, but that is difficult when the buyer is a complex group that has dramatically different behaviors depending on the situation. While you may believe persuasion is a matter of verbal agility, elsewhere it may also involve nonverbal and contextual clues as well as lobbying through third parties

(continued on page 6)

Making Contacts in Italy

Dave Wong has spent the past few weeks meeting with Mr. Adamo from an Italian company that would help the expansion of his business in southern Europe. The meetings are friendly and open, if a little long, but the overall tone is positive and Adamo is interested in the leadership and reputation of Dave's company and its experience with other Italian customers.

Dave asks an Italian manager how to cement Adamo's interest, and the manager advises face-to-face meetings between Dave, Adamo, and selected contact people from other Italian customers. Their feedback and endorsement will show Adamo the company is well respected and connected in Italy. Dave thinks the request will be an imposition on his customers, but finds to his surprise and pleasure that they are happy to do it.

In the Italian relationship-oriented culture business people feel more comfortable dealing with people they know well, so this sales approach is appropriate. But a reciprocal obligation comes along with the privilege of making this kind of arrangement. The customers who have so cheerfully agreed to cooperate may soon ask Dave Wong to return the favor.

Group Skills

(continued from page 5)

and associating with high-status people or institutions.

Closing the Sale — Salespeople tend to misread signals from foreign buyers about when and how to "close." The classic mistake is believing you have an agreement when the mild "yes" from your host is nothing more than polite interest or a signature means little in the local legal environment. The close expands to stages such as listening to and incorporating customer ideas, not rushing the buyer when you want to close, and completing small projects in hope of getting larger ones later.

#8 Negotiating

With so many stakeholders and potentially conflicting interests, it is difficult for cross-border negotiators to overcome cultural and national differences. Because their consumer economies are based on fixed prices, businesspeople from the U.S. and Northern Europe are at a distinct disadvantage in countries where consumer prices are negotiated. Never be overconfident when negotiating abroad. It is extremely difficulty to outwit a foreign negotiating team when it is part of their heritage. For example, compare some elements of the Chinese negotiating style to your own expectations:

In China any knowledge is power and there is **no expectation that confidential negotiations will be kept secret.** The people you negotiate with today already know what price you agreed to with your previous customer.

The Chinese are charming and skilled at coaxing additional concessions in the spirit of friendship and mutual cooperation, especially from **starry-eyed companies intoxicated by the prospect of 1.2 billion new customers.** Be certain of and firm about your bottom line, and never give a concession without receiving one of equal or greater value in return.

Chinese negotiation **teams have a leader who consistently speaks on behalf of everyone.** If individual members of American teams express different opinions in the name of creative brainstorming, the other team will pick up on who is more sympathetic to them, develop a special friendship, and eventually call in their chips.

Relationship-based cultures with long histories are less hurried than their counterparts and are **unlikely to yield concessions because of time constraints.** Once they know your departure date or internal operating deadlines they will use that as leverage.

Unresolved issues from the day will often reappear during the course of a banquet or after-hours socializing. **Stay alert because lengthy toasts often signal negotiating demands,** and you will be at a disadvantage if half-drunk and unprepared to respond with your own toast.

In China the **contract signing is a symbolic mutual acceptance of a new relationship.** When unexpected problems arise people turn to the flexibility of the new relationship to solve the problems. What Americans see as postcontract negotiations in bad faith, the Chinese see a natural problem-solving method. ■

Organizational Skills

Once you have internalized these people skills and developed an awareness of the differences between your national culture and that of your overseas partners, you must determine how to adjust and accommodate your *corporate* culture to the business arena abroad as well.

#9 Strategic Planning

The most critical strategic act in a cross-border contest is "frame shifting" or moving from a plan of action that makes sense in one environment to another plan that makes more sense elsewhere. The key skills for strategic thinkers in the global environment are questioning assumptions and anticipating future global market changes.

Strategic planning involves examining the external business environment and internal capabilities of your organization, then formulating goals and an action plan to achieve your organization's vision. In your home country you may know how to do this, but abroad your success will depend on **what** information is examined, **who** is involved in creating strategy, and **how** the process is structured. Obviously international employees should be involved as much as possible.

Because relationships are so important abroad, create a deliberate relationship strategy linked to your business strategy. Relationships may be the best available source for gaining access to key customers, collecting market intelligence, protecting intellectual property, or winning government support. Cultivating and sharing personal networks is critical in grasping indigenous frames of reference and making the adjustments to develop a successful strategic plan.

You will also need to develop global leaders to regenerate strategic success. High potential employees must learn cross-border strategic planning, as well as combine the analytical skills and personal qualities needed to direct and engage with employees around the world. To create these new leaders, begin a deliberate global development plan involving varied job experience, international business travel, multicultural teamwork, contact with executive role models, and global business responsibility.

(continued on page 7)

Organizational Skills

(continued from page 6)

#10 Transferring Knowledge

Transferring knowledge smoothly and efficiently across borders has become an important competitive differentiator. A key skill required is creating "pull" or a demand for the knowledge that is to be transmitted. Some of the major drivers of global knowledge transfer are global product development strategies, relocation of production facilities to lower-cost labor sites, host government demands for a policy of proactive technology transfer, and the high cost of expatriate packages.

Gather the knowledge — Much knowledge is tacit rather than explicit. You must gain the trust and cooperation of the people who hold the accumulated experience and intuition.

Convey the knowledge — Look for ways to create a pull factor and ensure that information is shared horizontally and vertically.

Get the knowledge to stick — Expect problems in individual accountability, and look for ways to strengthen and reinforce accountability through personal relationships and concrete systems for data collection, evaluation and rewards.

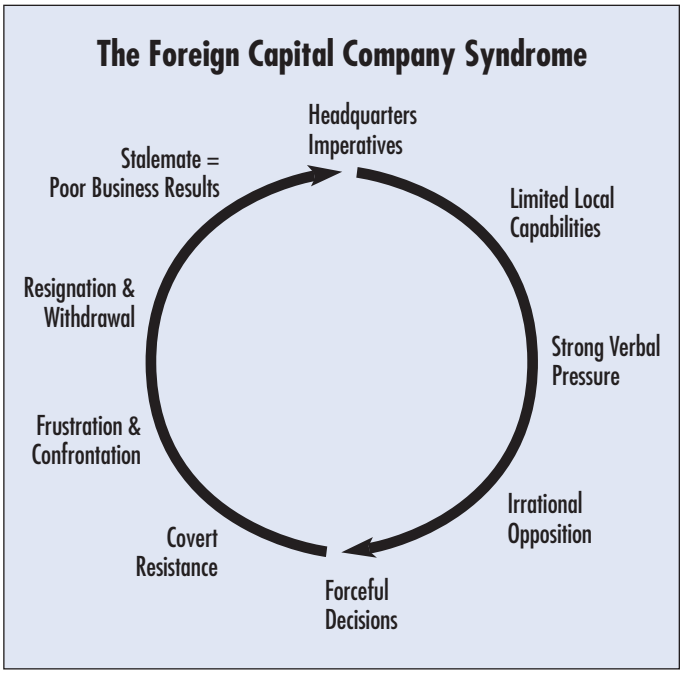
Generate new knowledge — Cultivate local leaders who fully buy into the new practices. Accommodate cultural differences but do not allow them to be used as a smokescreen to conceal poor performance.

Knowledge transfer can be affected by all sorts of other issues, including:

- **Organizational vision and strategy** and the commitment to boundaryless knowledge sharing.
- **Politics and community relations** between the organization and host country.
- **Definitions of knowledge** by people with different backgrounds.
- **Subsidiary capacity** to acquire new knowledge given education and experience level of local employees.
- **Personal trust and relationships** between parent company managers and subsidiary employees.
- **Information technology systems** and whether they are designed to enhance personal interaction or replace it.
- **Performance evaluation and reward systems** that are structured to support knowledge transfer.
- **Protecting intellectual property** from misuse and guarding against overly enthusiastic or illicit pull.

#11 Innovation

To succeed at innovation, managers and employees must generate ideas, turn them into substantive products and services, and implement them. When relying on sources from across the world, company leaders have an added challenge. The corporate strategy may espouse innovation, but a more traditional set of hierarchical values remain in place in subsidiaries. Without systems that provide incentives and minimize disincentives, employees will not push for promising but untested ideas.

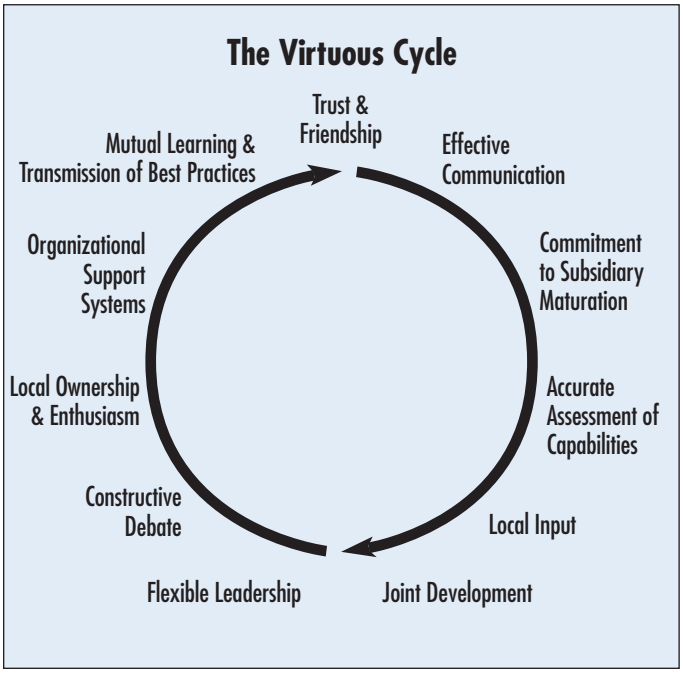


All areas of an organization including individual behaviors, teamwork, management practices, organizational systems and culture should be aligned to foster innovation and then convey the delicate balance to other environments. Improved communication throughout the company will help spread ideas as well as commitment to innovation. Focusing subsidiary energy to suit their competencies, such as invention, product development or commercialization, is another way to spread innovation.

State of the art innovation leverages globalization to make further innovation possible. The complete package for achieving global competitive advantage is to provide attractive products or service in the world's most profitable markets at the lowest possible cost in a socially responsible way.

#12 Managing Change

Even at home, tremendous momentum is required to move new changes forward in an organization, but to do it across borders you need a shared repertoire of global change management skills and a positive track record of past transformations to engender goodwill. This means building partnerships, but often change initiated by corporate headquarters meets with stiff local resistance abroad. Because subsidiaries are so far away, it is easy for them to ignore directives from the corporation or make their own changes.



Organizations often get trapped in the "Foreign

(continued on page 8)

Organizational Skills

(continued from page 7)

Capital Company Syndrome," a negative cycle of misunderstanding and misguided efforts (see chart on page 7). This negative spiral leads from fruitless discussion to imposed change to covert resistance and, finally, to poor business results.

Some of the most spectacular failures of cross-border change efforts can be traced to the failure of would-be change agents to establish credibility, obtain accurate information from distant locations, select the right people to drive the project, or lay the proper foundations for productive team interactions.

A better idea is to emulate the Virtuous Cycle, which generates positive momentum (see illustration above). In this case, effective communication, accurate assessment of capabilities, local input, joint development and other positive approaches leads to local ownership and enthusiasm, mutual learning and transmission of best practices and other positive results.

Often there is the desire to merge two cultures and their separate systems to create a "happy hybrid," but trying to make everybody happy is foolish. There is a broad menu of options beyond superficial hybrid solutions for those in charge of corporate makeovers. Systems can be standardized, selected, adapted, combined, integrated or adopted to come up with new ways of doing business. Think carefully about which approach or combination of approaches is most appropriate for every situation. ■

For Additional Information on western assumptions and possible alternative perspectives, go to: http://my.summary.com

Global Citizenship

As international managers head out to become global citizens they must consider how they will be changing the world. Does the foreign country want the changes you bring? Should it have them? As values around the world change, the best place to initiate change is where local customers and employees desire it or are open to it. Rather than national international managers, the world needs global citizens who can easily move from one culture to another. They encompass the core items of trust, respect and listening covered in these 12 skills, but also participating in meaningful work, profit, integrity, social justice, environmental sustainability, mutual learning and personal and professional growth. Global citizens transcend the dichotomies of parent and subsidiary and home and host country. As the ratio of overseas to domestic revenue shifts dramatically, companies will need employees who can recognize local customer needs, weight them against the organization's strategic priorities, and invest valuable resources in the best interest of the company. ■

For Additional Information comparing International Managers to true Global Citizens, go to: http://my.summary.com

Innovating by Globalizing

Infosys, headquartered in Bangalore, India, describes itself as an innovator in "solution definition and engagement delivery." It has prospered by finding innovative ways to enter and thrive in the global marketplace, thereby laying the foundation for further innovation. Its most compelling innovation is to package an irresistible business proposition for overseas customers:

- ✓ Well-trained English-speaking software talent
- ✓ The ability to manage large-scale software projects
- ✓ Supportive government policies
- ✓ Round-the-clock service provided by operations in different time zones
- ✓ Costs that are a fraction of those of in-house services or outsourcing operations based in the U.S. or Europe.

Infosys has been a pioneer in the outsourcing revolution that is changing the economy of Bangalore and India. Built on globalization, 70 percent of the company's business is from U.S.-based clients. The company has managed to convince the West it can provide high-quality reliable services and at the same time demonstrate to local residents that it is not just exploiting cheap labor.

WORLD OUT OF BALANCE

THE SUMMARY IN BRIEF

World Out of Balance *is a call to action to the corporate community to understand the external world in order to engage it. It explains why companies should develop their own structured, dynamic processes for reading the signs of change in a complex and often perplexing world, with at least one eye firmly directed toward the future. The objective is to sort false signals from meaningful developments so business leaders can anticipate and prepare for changes with the greatest potential impact on business operations down the road.*

In World Out of Balance*, Paul A. Laudicina, the managing director of A.T. Kearney's prestigious Business Policy Council, provides a practical framework for making sense of changes in the external environment and offers straightforward scenarios of how the future global business environment might evolve. His framework is based on what he has identified as five primary drivers of change — globalization, demographics, the new consumer, natural resources and the environment, and regulation and activism. Laudicina argues that today's earth-shattering events are fundamentally different from those of previous eras of history, as technologies are collapsing distance and spawning unprecedented global interdependence. Only a disciplined strategy will embolden corporate management to engage the world and seize the many opportunities it presents.*

What You'll Learn In This Summary

✓ How you and your company can stay ahead in a world of constant change.
✓ How you can prepare for the opportunities and threats that come along with burgeoning populations in unfamiliar markets.
✓ How changing demographic trends offer opportunities to businesses that can anticipate positive developments that affect populations of people.
✓ How five main drivers are shaping the ever-changing business world.
✓ How to better prepare for your company's future and realize the potential of new global realities.

WORLD OUT OF BALANCE

by Paul A. Laudicina

— THE *COMPLETE* SUMMARY

A Call to Action

Not long ago, most leading companies had possessed strong in-house capabilities for monitoring changes in the external environment. Companies like Royal Dutch/Shell pioneered increasingly sophisticated risk management and strategic planning functions to balance the considerable opportunities they saw overseas with the enhanced vulnerability to social and political unrest, economic upheaval, and natural disasters to which global expansion exposed them.

Rounds of cost cutting and corporate restructuring took their toll on strategic planning departments in the 1980s, and a decade of "benign globalization" in the 1990s shaped an exuberant worldview among a new generation of business leaders. Many believed that careful planning against external exigencies was largely unnecessary for success in global markets. As a result, most companies today lack the means to identify and manage external risks and find themselves without bearings in this increasingly complex world.

External Uncertainties and Shocks

Business leaders do not need to be paralyzed. Companies can — and should — undertake expansion strategies even when external uncertainties and shocks can have as much impact as traditional industry dynamics. With the most promising opportunities located outside home markets, hiding from risks is not an option. Instead, companies must bring insights about the external environment into the planning process in order to spot and act on new opportunities and avoid emerging threats. The key to this approach is plotting the five drivers that are most likely to shape the global business environment. The five drivers — globalization, demographics, consumer needs, natural resources and environment, and regulation and activism — are interdependent but not always mutually reinforcing.

The Gas Pedal: Technology

What makes this era of globalization truly unique is how inexpensive and powerful technology has become. New technologies create new opportunities, but if governments continue to fail to implement universal standards, corporations might find themselves confronted with an increasingly complex patchwork quilt of regional and national regulations. This complexity will curtail organizations' ability to expand markets and operations abroad, and limit the opportunities technologies offer to underserved populations. ■

Globalization: Two Steps Forward, One Step Back

The first modern multinational companies were born in the 19th century. The Singer Manufacturing Co. expanded the production of its sewing machines abroad in the 1860s. In 1863, a Singer sewing machine was presented as a gift to the King of Siam, whose acceptance helped establish the brand locally and provided the company with a successful model of celebrity endorsement and mass marketing that it would replicate across the globe. Before long, the company had a substantial presence in both Europe and Czarist Russia, and ultimately established a global market share of some 80 percent, with annual worldwide sales of 1.35 million machines in 1903.

For the most part, early multinationals remained companies with dispersed production and decentralized management. Long-distance shipping was difficult and communication was costly, so local managers enjoyed considerable autonomy in manufacturing and marketing products.

Modern Globalization

By contrast, contemporary globalization is a very different breed. Rapid transport, sophisticated logistics, and instantaneous communication have allowed for increasingly complex, dense forms of interaction. Executives can easily meet face to face. They can send sales and production data anywhere and at any time. Companies are able to disaggregate their production around the world, relying on just-in-time deliveries to keep manufacturing facilities running. By the end of the 20th century, nearly 63,000 multinational corporations were operating worldwide.

Deepening integration among financial markets further

Globalization: Two Steps Forward, One Step Back

(continued from page 2)

complicates how companies act internationally. As the Asian financial crisis revealed, malaise in one market can quickly evolve into a contagion that infects others. Even in relatively stable times, unexpected currency fluctuations can take a big bite out of corporate profits. German automaker Volkswagen reported losses of $1.5 billion as a result of the volatile dollar-euro exchange rate in 2003 alone.

Three Possibilities of Globalization's Evolution

The future path of globalization is uncertain. On one hand, countries may decide that the threats are too great and retreat to a more isolated position. On the other hand, globalization has proven itself time and again to be an adaptive phenomenon that takes more steps forward than back. The following three scenarios sketch different possibilities of how globalization may evolve between now and 2015:

Scenario 1. The Rise of Localization. Mounting security threats and economic uncertainty start to unravel the threads of globalization. Protectionism and nationalism proliferate. New security regulations restrict the cross-boarder movements of potentially harmful cargo, people and money. Consequently, international trade and investment slow substantially. Income inequality both between and among nations rises sharply. Caught in a cycle of worsening economic conditions, even traditionally free-market governments respond to intense public pressure to safeguard jobs.

Individuals are increasingly disdainful of global culture, global brands, and global norms, and seek refuge in the sanctuary of national identity. The antiglobalization movement, once the domain of nongovernmental organizations (NGOs) and street activists, finds growing resonance in white-collar suburbs. Unfettered global integration is believed to cause more harm than good. Confronted with these fears, the representative democracies of the industrialized world increasingly favor stability over efficiency.

Scenario 2. Bilateral Half-Measures. Countries take incremental and modest steps toward globalization, but the pace is more cautious than during the heady 1990s. As countries seek to maintain their competitive advantage in the global marketplace, it becomes increasingly tricky to paper over differences such as levels of agricultural subsidies and the scope of intellectual property laws. Multilateral trade and investment agreements are supplanted by regional treaties among nations whose interests most closely converge.

With no coherent global standards on issues such as the environment and biotechnology, companies that seek to expand globally must navigate a complex regulatory obstacle course. As a result, all but the largest corporations limit their expansion to a specific region, opting to dominate in one local standard while competing in other parts of the world on a more limited basis.

Scenario 3. Homo Economicus. The world returns to the path of ever-deepening global integration that began in the 1990s. Global trade is on a rebound. Offshoring and other capital flows continue, and their powerful development impact on Asia generates positive returns for Europe and the United States in the form of increased purchasing power abroad. All major economies are members of the World Trade Organization (WTO), which has eliminated the most onerous barriers to international trade. Still, in some areas, free trade negotiations have reached an impasse and governments find it difficult to reach consensus on several thorny issues. Trade in services is booming, and secure digital connections allow far-flung, global production and distribution networks to emerge.

Antiglobalization activists remain a small, but influential, group and focus their efforts on helping the least developed countries. Transnational problems, such as infectious diseases, computer crimes, terrorism, and financial instability, often foster international cooperation among governments and institutions, since no country can reasonably hope to completely isolate itself from such threats. Finally, although "global culture" remains a popular buzzword, it is countered by the increased exposure to an ever more diverse set of people — and all the creativity, ideas and perspectives they bring to the table. This return to benign globalization does not offer limitless opportunities — but they are vast, and they penetrate many levels of society. ■

How Preparation Saved Nokia

Mobile telephone maker Ericsson learned the hard way about the consequences of not being prepared after lightning struck a critical supplier's plant in New Mexico, starting a small fire. The Swedish company did not learn about disruptions in its supply chain for weeks, but its competitor Nokia, which also depended on the same supplier, had contingency plans in place within days. By the end of the year, Nokia had improved its market share, while Ericsson posted a $1.7 billion loss and outsourced its handset manufacturing to another firm.

Demographics: An Age of Extremes

The global community stands on the brink of new demographic challenges that come from the rapid aging of the world population. For most of human history, only 2 to 3 percent of the global population lived long enough to

(continued on page 4)

Demographics: An Age of Extremes

(continued from page 3)

become senior citizens. The World Bank now predicts that 16 percent of the global population — more than 1 billion people — will be over 60 years old by 2030.

As a result, the future of many countries may well resemble Florida, where pensioners and retirees represent nearly one-fifth of the population. The "Floridaization" of the world will be most acute in wealthy, industrialized countries, which will pass this same demographic benchmark in a matter of years: Germany in 2006, France and Britain in 2016, the United States in 2021, and Canada in 2023.

Unique Opportunities

Changing demographic trends offer unique opportunities to businesses that can anticipate positive developments that affect the population. For example, lower fertility rates and smaller families translate into more disposable income for women. While rapid urbanization will challenge developing countries, sprawling megacities offer a prepackaged infrastructure for marketing and selling products and services to those living at the bottom of the income pyramid.

Corporations that capitalize on the ebb and flow of the demographic tide will find themselves ahead of the game as they compete for human capital and consumers worldwide. The following three possible scenarios could play out between now and 2015:

Scenario 1. Restless Masses. The global population surges, mostly in developing countries. Government promises on improved social insurance programs fail to fully materialize. Fertility rates climb as families insure themselves against economic uncertainties by relying on additional children to bring in extra income and to care for parents and grandparents in their old age. In developed countries, pension and health care programs are under serious strain: Older workers exit the work force en masse as the costs of social programs skyrocket and retirement funds underperform.

Scenario 2. Immigration Queue. World population growth continues along a similar trajectory as today. In advanced economies, such as Italy and Japan, the economic burden of supporting the elderly falls heavily on an ever-shrinking pool of workers. Governments of advanced economies may open national borders to more immigrants to offset their shrinking work forces.

Scenario 3. Global Talent Flow. Population growth slows globally. As economic conditions improve and family planning programs become more widespread, fertility rates decline rapidly in developing countries. As the ratio of workers to retirees continues to shrink, countries increasingly utilize previously untapped demographic groups, such as women and younger people, to enter the work force. ■

What Causes Global Aging?

What explains the phenomenon of global aging? The first factor is rising longevity, thanks to improvements in health care and better standards of living. Since WWII, average world life expectancy at birth has jumped from 45 years to 65 years — a higher gain in the last half century than in the previous 5,000 years.

The second cause of global aging is declining birthrates. Instead of a population boom, there is actually a "baby bust" in countries and territories that today account for 44 percent of the world's population. Global birthrates have declined steadily since the early 1950s, when each woman had an average of five children. Today, the global fertility rate is 2.7. In developed countries, the average number of births per woman has fallen to 1.7 — far below the rate of 2.1 children per woman that maintains stable population size.

The New Consumer: Forging Bonds in a Fragmented World

Consumption patterns are greatly influenced by purchasing power, which has risen globally, but most acutely in emerging markets. Future global economic growth will significantly influence the levels of wealth and purchasing power among consumers in different countries, as well as the continued spread of technological use among consumers. Here are three possible scenarios for the consumption patterns of the new consumer between now and 2015:

Scenario 1. Rice and Beans. The first possibility would be weak economic growth worldwide — or worse yet, a prolonged global recession or a global economy disrupted by unpredictable events. Such a scenario would restrain the rise of the global middle class in emerging markets and elsewhere. Consumers in developing countries would be empowered and demanding, but possibly unable to afford the quality products they want.

If this scenario materializes, companies must find innovative ways to price quality goods at very low prices for mass consumption in order to get a piece of the shrinking consumer pie. Domestic companies in developing countries may be more agile and capable of supplying such products, and may also be viewed as less culturally intrusive. Global companies entering these markets may find themselves targets of a serious backlash, as they may be viewed as exploitative of poor consumers. Under this scenario, global corporations may increase their likelihood of survival by scaling back intrusive marketing efforts; toning down their brands; and operating as smaller, regionalized companies that partner with domestic brands.

Scenario 2. World Bazaar. If the global economy main-

(continued on page 5)

The New Consumer: Forging Bonds in a Fragmented World

(continued from page 4)

tains moderate and stable growth, allowing consumption patterns to remain similar to those today, consumer demand will continue to span a wide spectrum from customized, quality goods to subsistence basics. Increased fragmentation of consumer groups could confer a competitive advantage upon global companies that have already established themselves in emerging markets, as they can more easily command loyalty among existing customer groups.

Companies that wish to enter these markets must strive to quickly win the hearts of fragmented consumers and repackage products to reach masses of lower income customers. Companies that manage to be all things to all people through multiple, differentiated product lines that offer high-end to low-end merchandise may be more uniquely capable of reaching a broad consumer base.

Scenario 3. Hey, Big Spenders. The third scenario envisions savvy, technologically sophisticated, and affluent consumers worldwide, with new concentrations of middle-income consumers in developing countries. Global economic growth continues to surge, spreading wealth across different income groups in both advanced and emerging markets. As personal income levels continue rising, affluent consumers dominate consumer markets. Demand for premium products swells across the globe, with virtually all consumer segments seeking higher quality, more upscale products that they are now able to afford.

Global corporations must take the cue from their empowered consumers. Companies may find themselves fending off negative media and risking vandalism if they are too aggressive or intrusive in their marketing efforts. But they will watch market share slip away if they treat themselves as mere providers of goods and fail to tap into new demands and growing markets. ■

Natural Resources and the Environment: Stretching Limits

Fresh, drinkable water comprises only 2.5 percent of our total supply of water, and nearly 80 percent of that drinkable water is locked away in the polar ice caps and glaciers. Groundwater represents another 20 percent, which means that only 1 percent of fresh water is easily accessible.

Today, the majority of the world's population, approximately 90 percent, enjoys relative water sufficiency, as defined as an adequate amount of fresh water per person for all purposes. Five percent of the world experiences water scarcity, meaning there is insufficient water to satisfy normal requirements. Another 5 percent of the world is suffering from "water stress," a situation in which water supply problems are chronic and widespread, and there is mounting competition among water's various users. Among the countries expected to experience water stress or scarcity in the coming decades are India, Turkey, Nigeria, Poland, the United Kingdom, parts of China, and the western United States.

The New Energy Crisis

An estimated 1.6 billion people, or 25 percent of the global population, do not have access to electricity or gasoline. They depend on energy generated inefficiently by burning fuel, wood, and plant and animal wastes. A lack of energy perpetuates the cycle of poverty, while access to energy drives economic growth. Looking ahead to 2030, the International Energy Agency predicts that the global demand for energy will grow by two-thirds. This surge in demand will require an investment of up to $16 trillion.

When we consider all the variables that determine the availability of natural resources — political, technological, economic and regulatory — these three possible future scenarios emerge:

Scenario 1. Constrained Energy. This scenario envisions a world where there is little in the way of international cooperation and countries rely on their own unique assets. The world becomes increasingly polarized between those who have, or can afford, access to natural resources and those who cannot. Oil prices rise sharply due to increased demand, inadequate development of alternative energy sources, and an OPEC monopoly with renewed strength.

The United States and Europe reluctantly pay higher prices, but turn increasingly inward to protect their own economies. The United States seeks to safeguard its supply by providing significant military assistance to the resource-rich countries in the Middle East. The European Union imports oil and natural gas from neighboring Russia and cultivates relations with "rogue states" such as Iran. As Asia struggles to meet its energy needs, economic development slows throughout the region.

Despite warnings from scientists about rising greenhouse gas emissions, Western corporations successfully roll back environmental regulations, claiming they need to keep a lid on rising prices. At the same time, the higher oil prices lead to technological breakthroughs in alternate energy sources, including some clean energy solutions such as solar power and hydrogen fuel cells. The net effect on the environment, however, is still overwhelmingly negative.

Scenario 2. Necessary Invention. Countries strive to lessen their dependence on foreign energy. The oil and natural gas markets remain volatile, and when prices swing sharply upward, governments and companies seek alternate energy sources. The United States and Canada exploit oil reserves in the Arctic, construct a new generation of coal-fired power plants, and introduce legislation requiring more energy-efficient vehicles. European countries share declining

(continued on page 6)

Natural Resources and the Environment: Stretching Limits

(continued from page 5)

reserves of the North Sea and Scandinavian oil more efficiently, but they also develop more expansive, environmentally friendly renewable sources of energy.

As fossil fuels serve as the world's primary source of energy, global greenhouse gas emissions continue to rise. Water quality and availability worsen. Growing public concerns about environmental degradation — particularly in crowded urban centers — create a strong market niche for "green" products. Fuel cells emerge as a cost-effective option for large-scale applications, such as stationary power generators, but are still not able to compete with lower-cost hybrid systems in automobiles.

Scenario 3. Fuel for Growth. Surging economic expansion has made countries in emerging markets and industrialized countries more dependent on foreign supplies of oil and natural gas than ever before. Industrialized nations and key emerging markets form strategic alliances with resource-rich nations to meet their soaring energy needs.

As surging industrial growth takes its toll on the environment, water supplies deteriorate further. Governments provide incentives for corporations to reduce greenhouse gas emissions and conserve water. Companies recognize that protecting the environment means protecting their bottom line; they develop innovative ways to harness technology to ensure ample water resources, and reduce environmental damage. ■

Regulation and Activism: A New Breed of Challenges

"Government" may be among the most improved brands of the decade. Between 1994 and 2002, the share of Americans who said they trust government "most of the time" or "just about always" increased from 21 percent to 56 percent. Europeans place more confidence in the European Union (EU) and the United Nations than in their own national governments.

Growing security concerns have raised faith in governing institutions and given them a free hand to deal with national security issues. The United States and Europe have spent billions to implement new national counterterrorism measures, including enhanced airport security, passport control, and response teams for biological and chemical attacks. European nations have moved to create uniform banking standards and enhanced judicial cooperation within the EU.

The information technology industry has become an inviting target for new rounds of regulation. E-mail communication, electronic commerce, and digitized information have become so central to daily life that they need new "rules of the road," even if standards were not terribly important when the industry was still carving out its niche. With questions about privacy, intellectual property rights, and tax liabilities clamoring for answers, the authorities are likely to step in as traffic cops.

Frontiers of Science and Technology

Government intervention is being felt throughout the economy, from basic manufacturing to the most sophisticated telecommunications services. Nowhere is the effect stronger than at the frontiers of science and technology, where a host of new discoveries and developments is confounding existing regulations and rendering old ways of doing business irrelevant.

Perhaps the most intense ongoing debate surrounds the growing sophistication of biotechnology, where the ability of scientists to splice and manipulate genes has moved much faster than public acceptance for genetically modified (GM) organisms and "designer foods." Similarly, stem cell research and human cloning promise huge health advantages, but have also been subject to scrutiny from governments and citizens.

Against a backdrop of corporate scandals and declining faith in the private sector, corporate leaders face another kind of pressure: increasingly powerful activists bent on highlighting alleged abuses by multinational firms. These activists are part of a growing movement of people frustrated by the invasion of foreign influences and the perception that outside forces have taken control of their economic destinies and damaged the fabric of their societies.

New Dynamics of Regulation and Activism

How regulatory patterns unfold in the future will be determined by how corporations respond to the new dynamics of regulation and activism emerging today. Value-building companies that find creative ways to address broad social concerns and cooperate with interest groups may be better positioned for future success than those with a single-mind-

(continued on page 7)

The International Price of Spam

The United Nations Conference on Trade and Development estimated that, since the end of 2003, spam constituted 50 percent of all e-mail messages in circulation and cost as much as $20.5 billion in wasted technical resources. Even typically trustworthy corporations are under pressure to limit their use of e-mail to contact potential customers. Even a series of two e-mail newsletters from IBM asking subscribers to forward offers to their friends in exchange for free software was perceived as unwelcome spam by many recipients. As a result, governments worldwide are implementing an increasing amount of antispam legislation.

Regulation and Activism: A New Breed of Challenges

(continued from page 6)

ed pursuit of the bottom line. Business leaders must prepare for a wide range of possible scenarios, including:

Scenario 1. Big Brother Is Watching. This scenario envisions a hardening of the trend toward empowered governments and strident anticorporate activists around the world. Thousands of people see jobs disappear as their companies suffer market setbacks, and stockholders watch as their investments shrink. Governments expand their oversight and impose increasingly tight restrictions over the private sector, at the same time that taxes and fiscal spending are on the rise.

Compliance costs for most companies rise dramatically, and companies that survive find they are in a cost-cutting race to the bottom. Firms face intense pressure from regulators and activists, and only those that are able to cut back and make their organizations "lean and mean" survive.

Scenario 2. Partial Restraint. This scenario offers a more hospitable environment in which corporations, governments and activists find a middle ground. Occasional threats to national security continue to bubble up around the world, reinforcing the need for government oversight, while at the same time revealing its limitations. Tight budgets and a limited pool of talent help check government power, and most regulation remains moderate and rational. Large global companies become more attuned to volatile public opinion and do a better job of reacting to activist pressure, by strategically choosing times to fight and times to concede.

Scenario 3. Chicago Boys II. This scenario imagines a future in which global corporations experience a new boom and largely unfettered markets abound. As notions of corporate social responsibility spread throughout the ranks of business, corporations overcome the cynicism greeting them at the turn of the century. Big companies project increasingly transparent, responsible images, convincing larger segments of society that the private sector is aware of important issues and is ready to act responsibly. Having overreached in the past, once-powerful government regulatory agencies are cutting back. Activists remain powerful, but they more often work in partnership with corporations, who look to third parties to validate their sound business practices, adherence to emerging social and environmental norms, and socially responsible community initiatives.

Interacting Factors

Each of these outcomes depends upon multiple, interacting factors. Strict regulations and a reversal in globalization, for instance, could create an inhospitable climate for global business. Alternately, regulatory flexibility and strong consumer confidence could create powerful conditions for global business to reach new consumers in far-flung markets. ■

Activists and Technology

The infamous "Battle in Seattle," when antiglobalization activists effectively shut down a pivotal World Trade Organization summit, is widely acknowledged as the movement's coming-out party. Protests against national governments and multilateral institutions continue, but activists are increasingly focusing on corporations. International nongovernmental organizations (NGOs), whose numbers quadrupled in the 1990s from 6,000 to more than 26,000, have made important advancements in coordination. They are technologically savvy, using the Internet to transform local campaigns into international social movements with incredible speed. At the corporate level, firms are trumpeting their particular commitments to corporate social responsibility in an effort to pre-empt NGO wrath and appeal to consumers on an emotional level.

Visions of the Future

The scenarios that follow are designed to illustrate the kinds of global business environments that might emerge from a more complete scenario-planning assessment, and are based on the five drivers outlined in this summary. These three speculative scenarios are based on a certain combination of subscenarios that offer a view of the global business environment in the year 2015:

- **Scenario One: Patchwork World.** The state of the world and the business environment is characterized by a muddle-through mentality: Few governments show much leadership or vision, or even have enough high-quality talent to try to do so. The corporate sector responds in kind, seeking growth and profits by working their relationships and seeking advantage wherever they can find it in a fairly chaotic and turbulent world. Large patches of the globe are mired in poverty and violence, although the good news for North America, Europe and Australasia is that much of the trouble is localized and does not spill over excessively into the zones of affluence, though they would be getting even more affluent if global growth rates were higher.
- **Scenario Two: Castles and Moats.** This is not where the international community expected to end up. Security and survival preoccupy not only the world's poor, but also advanced countries, which have taken every possible means to insulate themselves from a world largely embroiled in vicious cycles of war, crime, terrorism, resource competition and disease. Citizens in affluent countries have willingly given up certain civil liberties and privacy in favor of broad and technically sophisticated defensive measures. This is a time of splitting the existing economic "pie" rather than expanding it, and companies operate as creatively as they can given the constrained access to markets, the risks that

(continued on page 8)

Visions of the Future

(continued from page 7)

abound, and a general mood of pessimism that prevails even among those still enjoying a good standard of living.

● **Scenario Three: Open Boarders, Lingering Fears.** The United States and China are the dominant economic, political and demographic players in the world — with large, robust markets that are highly intertwined, and muscular roles in the world that sometimes collide. Policy-making often moves in a different direction than it did in the late 20th century and isn't always in sync with business interests.

Governments are less concerned about directly supporting corporations and opening new markets than they are about ensuring security, responding to populist impulses, and providing a stronger regulatory counterweight to unfettered market forces. This is a time of intense business activity and technology innovation, and the rising tide of affluence continues to lift living standards in countries open to the global economy, even as further trade liberalization remains gradual. In the richest markets, companies tap into new consumption patterns emphasizing high-end, lifestyle-enhancing products and services.

Parsing Out the Implications

These three scenarios reflect measured judgments based on the best available insights at a given point in time. Circumstances and conditions undoubtedly will change, and with them the projected outcomes. For corporations operating in the real world, the process of discerning and calibrating these changes must be a continuous and dynamic one that allows corporate executives to seize the opportunities presented by change while understanding and managing the risks that accompany it. ■

Navigating Risks In Turbulent Times

Driven by an intensely competitive business environment, corporations have become increasingly dependent on global markets. Whether the drivers are revenue growth, cost reduction, or access to new knowledge, many of the most successful corporations already operate on a global basis. Even domestically focused companies are finding competitive pressures are increasingly forcing them to expand beyond their borders. The cost advantages of production in key developing markets combined with higher growth rates and demographic shifts moving greater consumer power to developing nations will compel corporations to move more and more of their value chain offshore. While offering new opportunities, such shifts will also present a new set of challenges.

As increasingly frequent, disruptive events have made painfully clear, companies are more vulnerable than ever to economic crises, security threats, supply chain disruption, and consumer backlash. The very innovations that have helped improve business efficiency and profitability increasingly are based on an integrated global business environment that also brings with it a series of interdependent risks. Consider these examples:

● **Just in Time.** Estimates suggest that the shift to just-in-time scheduling in the U.S. automotive industry alone has saved companies more than $1 billion a year in inventory carrying costs. The problem is that while costs have come down, risks have increased. If deliveries of critical components are delayed, the entire factory must shut down.

● **Extended Enterprise.** Increasingly, firms depend on a complicated network of customers, suppliers and partners that must all work together, and often no one person has oversight of the entire supply chain. In addition to day-to-day problems with forecasting, security, and information exchange, there is the increased risk of system failure if a key member of the network shuts down, even temporarily.

● **Outsourcing.** Although outsourcing can greatly reduce costs and often improve service levels, it can also compound risk as critical operations are managed outside the company and, increasingly, outside of the country.

Strategic Risk Management

Companies are turning to strategic risk management to improve outcomes while continuing to actively engage a volatile global business environment. More than just a checklist of safety measures, a strategic risk management approach identifies the core processes that drive a company's earnings and monitors both internal processes and external events to ensure that risk and reward are continually re-evaluated and rebalanced. The ultimate goal is, through an iterative process, to help companies evaluate their risk management process in the context of a structured "stages of excellence" approach.

As demonstrated in this summary, the dynamic drivers of the 21st century business conditions — imbued and turbocharged by extraordinary, ever-expansive technological innovation — underlie a world of continuous change and volatility. Those who fail to rigorously plan for and seize this future are abdicating their responsibility to their shareholders and stakeholders.

Stewards of the successful global corporation will not keep their corporate vessel docked at their home port waiting for calmer seas. Rather, with a constant eye on the telltale signs of changing conditions, and with all the expert input possible from a good crew and instrumentation alike, today's successful executive will ride the winds of change, meet the challenges they present, and realize the potential of these new global realities. ■

For additional information on the stages of excellence in risk management, go to http://my.summary.com
