THE SUMMARY IN BRIEF

When you're a project manager with a team of people who don't technically report to you, your challenge is to get Results Without Authority. This book delivers proven techniques for controlling projects and managing diverse teams in a wide variety of situations and bringing those projects to a successful closure. The concepts are essential for all project managers, with and without authority, because they offer a productive alternative to "command-and-control" management techniques that can easily backfire.

Tom Kendrick's system will help you get successful project results from diverse, cross-functional, virtual, outsourced and other types of project teams. Packed with invaluable guidance for projects of all scopes and in any field, Results Without Authority will help novice and experienced project leaders get the best from their project teams.

IN THIS SUMMARY, YOU WILL LEARN:

- The key project management processes, infrastructure and the role of the project office.
- Productive leadership styles that encourage reciprocity and collaboration.
- Tips for controlling a project through quantitative diagnostic metrics.
- How to create a collaborative planning process to provide a foundation for project control.

Control of Projects

Increasingly today, projects are undertaken in environments where the project leader has little formal authority. Even for projects managers with formal authority, significant portions of project work are done by contributors who work for other managers, often for a different company. Projects where no one is in charge are almost certain to fail. As the leader of your project, you must assume control, whether or not you possess organizational authority. Here is a list of things that project leaders can (and should) take control of, regardless of their position or power in an organization:

- Measurement
- Reporting cycles
- Milestones
- Communication
- Project reviews
- Change management
- Rewards and recognition
- Constructive criticism
- Reciprocity and exchange
- Risk monitoring

Project managers can use these means to enhance their control in any project.

Elements of Project Control

Every project leader has a number of levers available that increase project control. Three principal elements of control are

1. **Project processes** provide the structure necessary for control and can serve as an effective substitute for organizational authority.
2. **Influence**. Getting cooperation is much easier when you have a two-way relationship of trust and respect with your team members. The surest path to cooperation starts with establishing strong social relationships in which people don't want to disappoint each other. Another way to enlist willing cooperation is to involve your project staff in activities that they want to work on.
3. **Metrics (measurement).** Measuring a few key things on a project and publishing the results powerfully affect your project's progress. A small set of well-defined project metrics gives the project leader a powerful tool for managing project initiation, execution and closure.

Project control starts at project initiation, and it requires your full attention all the way to the end. Applying these concepts will carry you safely to your destination: project success.

Control Through Process

Successfully managing a project involves at least three separate activities: achieving project objectives, managing the project processes and leading the team. Project leaders who collaboratively fine-tune the project processes used by their teams gain control in two ways. Using processes that project contributors and stakeholders participate in defining augments the trust and collaborative environment that successful projects depend on. In addition, getting voluntary commitment to use well-defined processes encourages appropriate behavior.

Before doing a lot of work defining (or redefining) processes, assess where your organization stands on project management generally. It doesn't matter a great deal what specific processes you adopt as long as they make good business sense, have meaningful support from your team and stakeholders, and are actually used.

Life Cycles and Methodologies

Life cycles serve primarily to coordinate related projects and provide defined checkpoints, whereas methodologies drive to ensure consistency in how project work is done. Mandatory process aspects of either (or both) may be used to significantly enhance your project control.

Nearly all projects have at least an informal life cycle that provides an overall structure and consistency for major project milestones. There are two main families of project life cycles. One is the waterfall type, made up of a single arc through a series of sequential phases. The other is the agile type, in which projects are comprised of a succession of step-by-step, iterative cycles, each delivering an incremental result that approaches the final deliverable. The specific details must be customized to meet particular business, project and customer needs. For each requirement in a life cycle, ask two questions:

- Why is this necessary?
- How might I use or modify this particular requirement to enhance my control over my work?

Life-cycle requirements are also a powerful tool for managing potential conflicts among different functional groups with contradictory interests. If everyone commits to meeting well-defined project life-cycle requirements, there will be fewer conflicts over what is due and when.

In addition to specifying project milestone and review requirements, methodologies provide explicit guidance for how work is to be done. The process definitions generally include templates, checklists, forms and other materials that project leaders are either required or strongly encouraged to use.

Project Definition and Charter

Clear, unambiguous, high-level project documentation is essential for project control. Developing and communicating a thorough description of your project set the stage for all subsequent work. Get team buy-in for structured project management processes, and clearly document how you will use them. A project charter is a living document that may grow and evolve over the course of the project, but maintaining an unambiguous, easily accessed description of the project is a very powerful tool that you can use to keep your project under control.

Change Management

Change management processes that contribute to your ability as leader to keep things under control have several things in common:

- Specific requirements for submitting change requests
- A bias against accepting changes
- Standards for timely response on change requests
- A review process for changes
- Unambiguous authority for the owner of the process to make final decisions

Simply having a process that your team, sponsor and project stakeholders all accept is a powerful tool for overall project control. It puts people on notice that changes will be carefully examined before being accepted, and establishes the hurdle of adequate documentation of changes being proposed.

The project leader is best served by a process that clearly defines how the proposed scoping for future phases will be evaluated and prioritized, using objective standards and delegating unambiguous authority for final decision making.

Project Infrastructure

One way to begin establishing an infrastructure for your project is to list key questions that you would like to answer, working with your team. Review past projects for problems related to structure, and work with your team to make project infrastructure decisions to resolve them. Take advantage of organization expertise and project office capabilities, but resist surrendering control over your own project.

Control Through Influence

Project leaders need to determine what operating style works best for their project teams. Adopt a leadership style that works with your team members, and strive to deliver on what people care about the most. The leadership style that you adopt will determine how members of the team perceive you. Most of the time, this perception matters more than actual authority.

The fundamental basis for getting what you need relies, as it always does, on exchange: giving something in return for something requested. Build your awareness and skill for influencing others. A few things are common among successful influencers. They approach others one on one. Successful influencers also identify and use common ground and shared interests early. They are also generally well liked and seem to have a knack for closing the deal.

An overall process for influencing involves 10 steps:

1. Document your objective.
2. Identify who could do the work.
3. Evaluate your options, and select the best person.
4. Consider the other person's perspective.
5. List possibilities for exchange. These strongly correlate with motivating factors.
6. Meet with the other person.
7. Verify your assumptions, and determine what to exchange.
8. Request a commitment.
9. Document the agreement.
10. Deliver on your offer, and track the work to completion.

Negotiate credible commitments with contributors by discovering what they want that you can offer to them and by using exchanges.

To build influence in your team, lead by example, use random positive reinforcement, remove barriers, always provide positive reasons, coach, mentor, and assist, be inclusive, and practice credibility and integrity. Work to increase your influence through your actions and demeanor.

Building Influence with Your Manager, Project Sponsor and Stakeholders

To be successful, you also need to influence upward. You can improve your influence with your management by ask-

ing revealing questions and collaborating with your peers. Recommendations that come from a task force or a council of leaders carry a good deal more weight than those that originate from just one person.

Building influence with managers is largely about relationships; keeping your sponsor and stakeholders involved and supportive throughout your project is always a good investment of your time.

Control Through Project Metrics

Metrics can be used to better understand your project, to adjust the project's objectives, to improve your processes and working methods and to motivate team members. Project assessment metrics that use numerical data can show what you are getting into.

Measurement is also central to decision making. For the project leader with little real authority over team members, measurement is also an essential tactic for motivating project contributors. Used well, such metrics are a force for good that will significantly increase your ability to keep things under control and moving ahead.

Types and Uses of Project Metrics

Identify metrics that align with the project objectives and the desired behaviors. Of the three basic types of metrics, each plays a different role in project management:

- Predictive project metrics are based on definition and planning information and help set realistic expectations for the project.
- Diagnostic metrics are based on current status and serve as indicators of progress and as timely triggers for risk response, problem solving and decision making.
- Retrospective metrics assess how well the work you completed was done and provide insight into process issues and recurring problems.

Projects are complicated, and selecting the right measures for your project may be challenging. Defining the desired behaviors and objectives before considering the question of what to measure leads to more consistent, appropriate results.

Designing Individual Metrics

Methods for defining metrics include

- **Goal question metric.** A systematic process based on a three-tiered hierarchy. The first tier is at the top and defines the desired outputs and results. The second tier is composed of questions through which you can determine whether you have achieved those objectives. The third and lowest level contains measures that can be used in answering the questions.
- **Balanced scoreboard.** Robert Kaplan and David Norton devised a four-quadrant view that provides tension between the measures and helps to ensure that the metrics are less likely to result in dysfunctional behavior. Kaplan's four quadrants are customer, finance, internal process, and learning and growth.
- **Behavioral methods.** Metrics tied to rewards are nearly always defined starting with a behavior that is viewed as desirable and associating monetary payment, recognition or some potential for reward with specific behavior.

Select a small set of key measures, and obtain team support for them. Whatever process you use, the final steps of the process require you to evaluate your measures for appropriateness, consistency and potential dysfunction. Test the metrics, and establish a measurement baseline. Finally, use the metrics to monitor and control your project.

Control Begins With Project Initiation

Troubled projects frequently have tentative beginnings. You can avoid a lot of late project anguish by asserting control as soon as the project begins, ideally with a fully engaged project team ready to hit the ground running. To do this, you need the support of your sponsor, solid documentation and a project startup workshop.

Sponsorship

Your project sponsor has considerable organizational authority, at least enough to initiate your project. One of the first things you can do to ensure ongoing support and attention from your sponsor and other influential stakeholders is to set expectations right away and get specific commitments. Shortly after you assume responsibility for your project, use your influencing skills to extract commitments from your sponsor (and other key stakeholders) in exchange for your agreeing to lead the project.

Ask your sponsor to describe to you why, from his or her perspective, the project is being undertaken, and capture that rationale using your sponsor's words. However, avoid getting your sponsor too involved with the day-to-day execution of your project. You want your sponsor's support, not his or her detailed involvement; after all, it's your project.

Project Vision

Project vision is about why the project matters, and although this could be the same for everyone, some aspects may be personal and unique for each individual. For longer, more complicated projects, investing some time in the "vision thing" can be what differentiates a successful project that everyone cares about from a chaotic disaster.

An inspiring project vision increases your influence, particularly during project initiation. Work to understand your sponsor's expectations for the project. Your sponsor's motivations are the foundation for your overall project definition, and understanding the genesis for your project helps you uncover assumptions and constraints that you need to manage and control your project.

Develop a compelling project vision, and fine-tune it as needed to inspire and motivate your team.

Project Launch

With a sense of who wants the project and why, the project leaders can begin defining a foundation for project control by documenting and defining the project. Some of the documentation that you need to assemble for the initial project communication are

- **Project charter.** One way to collect initial high-level information. What matters most for project control is that you capture initial project expectations in writing.
- **Project priorities.** Documented priorities help you assess trade-offs and develop alternatives during project planning, minimize controversy over decisions throughout the project, negotiate project changes and support disciplined change control for your project. Setting priorities is equivalent to the old adage, "Fast, cheap, good — pick two."
- **ROI analysis.** Project ROI (return on investment) analysis requires two separate predictive metrics: monetary inflows and monetary outflows. Overall, focusing on the value of the project inherent in your vision is better than getting too wrapped up in financial ROI analysis.
- **Initial scoping.** One of your most important objectives in initiating a project that you can control is to get an early, solid fix on what "done" looks like. Changes, particularly late-project changes, are the enemy of control. You need to define deliverables, verify requirements, test the limits, validate initial scoping and get agreement on success criteria.
- **Project staffing requirements.** Following your analysis of preliminary scoping (or in parallel with it), confirm your project staffing. Particularly for leaders who do not directly manage the contributors on the project team, early identification and commitments for staffing are essential to project control.

Startup Workshops

Conduct an effective project startup workshop to get your project off to a healthy start. A project startup workshop serves to build teamwork and to establish a solid, shared understanding of what the project is about. Both the influence and control aspects of a well-run startup workshop are substantial.

Building Control Through Project Planning

Planning is a collaborative process that establishes buy-in and ownership of project work and motivates your whole team.

Plan Collaboratively

Plan your project thoroughly with your team, and integrate their inputs, suggestions and perspectives all through your planning documents. Collaborative project planning builds on the project charter, initial scoping and other documentation. Work for consensus, and document the decisions as you make them. Make your infrastructure decisions visible to your stakeholders and to others involved in your project.

Breaking Down the Work with Your Team

A project work breakdown schedule (WBS) is essentially the equivalent of a to-do list for your project. A project WBS is best developed by a team that includes a wide spectrum of perspectives — the more the better. Use planning data to set a realistic project baseline, negotiating required changes to initial objectives with your sponsor and stakeholders.

Defining the work is one challenge you face in controlling your project. Obtaining reliable commitments for every part of the work is the next. As your project's work takes shape, determine which member of your team is the most appropriate owner for the lowest-level activities in the structure. Develop a list of all project activities, noting the commitments that emerge during the development of your WBS. The commitments made by your team are only half the story. Also write down any commitments that you made to your team members, and schedule any work that you need to do to deliver on them. Commitments offered willingly are always much more reliable than those we try to force.

Collaborative Estimating

Estimating is one area where all the elements of control outlined in this book come together. Processes and metrics matter a great deal because estimates that aren't based on a good process and measured history are just wild guesses. Also, collaborative estimating provides excellent opportunities to build teamwork and influence.

Some ideas for developing estimates that help you understand and control your project include using your plan details, learning from history and approaching estimating as a team activity. Collaborative estimating is a well-established way to tap into the "wisdom of teams" and more deeply engage your team in the project. All collaborative estimating techniques create estimates based on team inputs. Because the estimates are produced by the same individuals who will do the work, they are motivating, and contributors generally do their best to deliver on them.

Constraints and Plan Optimization

As your project plan detail comes into view, much of what it reveals is not good news. The initial schedule is usually too long. The staffing, resources and budgets available are often far below what your cost analysis requires.

Spending at least a small amount of time exploring opportunities is both good business and one of your most potent levers for control. Consider opportunities for doing work in parallel (fast-tracking) to shorten the timeline. Determine whether a larger investment or staff will allow you to meet the timing and scoping goals. Once you have a plan, work to optimize it. Based on your project priorities, figure out how to meet the most important part of the scope-time triple constraint by relaxing the least important factors.

Throughout your project planning, maintain a list of risks that emerge. Keeping risks and their consequences visible is itself an effective mitigation strategy because people tend to work to avoid serious problems if they are aware of them. Collaborative risk planning also tends to build teamwork, enhances interpersonal relationships and can increase overall confidence in the project.

Measure Your Plan

You can use predictive metrics to assess your project as a whole, identify unrealistic assumptions, uncover significant potential problems and more clearly communicate what your project is up against. Because predictive measurements are primarily based on speculative rather than empirical data, they are generally less precise than diagnostic and retrospective metrics.

Useful metrics require a baseline, and baselines for predictive metrics are best set using retrospective information and metrics from recent comparable projects. Use these measures to further review your plans.

Use Your Plan

Once a credible plan is in place and agreed to, project control shifts to execution and tracking. Begin execution of your project with a credible, understandable plan that is available to all the members of your team. Once you set the project baseline, maintaining control now depends on keeping your plans up to date and visible.

Maintaining Control Through Project Execution

Initiation tells everyone what your project is doing, and planning shows how you intend to get it done. With everything clearly defined, project execution ought to be straightforward. Unfortunately, even the best-planned projects rarely run smoothly.

Define diagnostic project metrics that enhance control of your project; then get buy-in from your team. Diagnostic metrics in particular can show

- Critical activity slippage
- Adverse resource consumption and timing trends
- Chronic issues
- The need to modify project plans or execute contingency plans
- When to reset the baseline for the project

You need to select a small number of metrics that are likely to be useful enough to justify the effort it takes to collect them. All diagnostic metrics, even those you intend to collect only infrequently, have an ongoing cost. Select your metrics carefully, choosing ones that provide useful data that you can use to guide and control your project without inappropriate cost.

Status Collection

One of the most important and visible jobs of a project leader is communicating project status. This communication depends on a repeating cycle of information collections, analysis, response planning and outbound reporting. The tracking and reporting cycle repeats throughout your project, typically weekly.

If you are a project leader without a great deal of authority, you need to work to obtain meaningful commitments from your team to provide the information that you need. To do this, discuss with each individual on your team how the information will be used and what the benefits are.

Be dogmatic and disciplined in collecting project status. Whatever mechanism you select, do it the same way throughout your project. Email provides a simple, unambiguous way to collect status, and it leaves an audit trail for your records. Thank people for providing status, especially extended members of your team.

Informal Communication

Communication is arguably the most important job for any project leader. For project leaders who don't have a great deal of actual authority, informal communication can be substantially more critical to project control than formal communication. Informal communication — conversations, social exchanges, even nonproject interactions — forms the basis for the trust, teamwork and durable relationships that are essential for efficient project execution and the prompt resolution of difficulties. Use informal communication to collect soft data, and work to maintain relationships and trust within your team.

Maintaining Relationships and Keeping Your Team Focused

You can and should do a number of things to maintain good relationships with your team for the remainder of your project. Some methods include building on common interests, using team activities, tailoring your interactions, staying positive, interacting socially and using humor.

Use team-oriented activities throughout your project to encourage and sustain effective teamwork. One way to strengthen interpersonal connections right at the beginning of a project is to work as a team to name your project. Forging a project identity draws the team together by providing an easy, shorthand way to refer to the project as a whole.

Nonproject-related activities, such as going to a movie, a sporting event or some other type of outing, can be a significant boost to building team relationships. Likeable project leaders have more influence over their teams and more control over their projects. Cultivating an appropriate sense of humor is a good way to increase your likability.

For most project work, progress depends on people having substantial blocks of time to work without distraction. Do what you can to establish an environment where your contributors have protection from needless noise and interruptions. Getting results requires quiet, no matter how much we may believe otherwise.

Tracking and Monitoring for Project Control

Project scope depends heavily on scrupulously managing scope for your deliverables. Failure to control scope is about the most common reason projects fail to achieve their objectives. If you don't have a great deal of formal authority, a robust process for managing scope changes may be all that stands between you and complete chaos. If a good process exists in your organization, adopt it and use it. If not, write one, and get your team to provide feedback. Draft a process that has a default answer of reject for changes, with all changes treated as unnecessary until proven otherwise. Also include explicit criteria to be used in making a decision for each change.

Always answer two questions about every proposed change: **1.** What does it cost? **2.** What is it worth?

If the cost of a change appears to exceed its potential value, there's a good argument against the change. Finally, always consider four possible decisions for any change: rejected, approved, approved with modifications and deferred for future consideration.

When changes are approved, communicate them. Notify your team and others who need to know, and promptly update all affected project plans and documents. Use reports and other formal communication to keep people in sync with your project and aware of its progress.

Control Challenges

Projects of all types encounter barriers. To meet these challenges, you need to use your influence to establish relationships and trust with your team members, and maintain good team cohesion through your loyalty, personal interactions and good humor. Because most control problems are easiest to resolve face-to-face, meet one-on-one with your contributors as frequently as practical. Motivate your team using frequent thanks and recognition and rewards when appropriate.

Periodically review longer projects to validate objectives and plans and to revitalize the project vision. Deal with barriers to progress, and promptly resolve project conflicts. To remain in control, you need to manage barriers, resources challenges and conflicts.

Enhancing Overall Control Through Project Closure

Closing a project well involves some time and work, but it

is essential to the control of future projects. Getting agreement from your sponsor and from all your stakeholders that your work was satisfactorily completed is necessary before you can transition to new projects. Archiving your completed project documents provides information necessary for defining and planning similar future projects.

Employing Retrospective Project Metrics

In general, the role of retrospective metrics is to evaluate a process following execution. Retrospective metrics are especially useful for a project leader with limited power and authority. Whether your project ends successfully, with difficulty or even if it is cancelled, backward-looking project measurements reveal much about what you did well and what you need to improve.

Celebration and Team Rewards

One of the best (and certainly the easiest and least expensive) things that project leaders can do to motivate people and reinforce their influence is to thank team members for their contributions to the project. Thank people face-to-face if possible. Find at least one thing in particular to comment on for each individual as a way to reinforce your appreciation. Also, express your thanks in writing. Be generous in giving credit for project accomplishment to your team members in presentations, discussions with management and in other conversations.

As a project leader, you have another final task: arranging to commemorate the end of your project with some sort of event. Set up a small get-together to end your project on a positive note.

Capturing Lessons Learned

A post-project retrospective analysis provides you an opportunity to discuss all aspects of the project and allows you and your team to put it securely in the past and move on to whatever is next. The overall process is structurally very similar to a project review, except a retrospective analysis is, as the name suggests, primarily backward looking. Your tasks are to prepare for the retrospective, to meet to review project results and processes, and then to document and follow up on recommendations.

Document your retrospective meeting, and summarize the recommendations you and your team have made. Circulate your key findings to other project leaders. Follow up on your key recommendations. Capture and apply the lessons learned.

Conclusion

If you are asked to lead a project, someone believes that you are capable of doing it. If you believe it too, then you are both probably correct. Succeeding with any project is all about gaining the cooperation of the people involved. Controlling your projects when you have little authority comes down primarily to aligning your project activities and goals with those of your sponsor, your team and your stakeholders — getting by with a little help from your friends.

THE SUMMARY IN BRIEF

Imagine a company where everyone loves to work, where employees feel not just "satisfied" but truly cared for, respected and energized. Think of the impact this would have on recruitment, retention, customer satisfaction, innovation and overall performance.

Aron Ain, the award-winning CEO of Kronos, a global provider of workforce management and human-capital management cloud solutions, believes that anything is possible when people are inspired. By embracing employee development and engagement as a growth strategy, Ain transformed his company's culture and built a billion-dollar business. ***WorkInspired*** takes leaders and managers inside Kronos' highly admired WorkInspired culture, showing them the surprisingly simple rules they can follow to replicate that success.

Many executives talk about how "their people are their greatest asset." Ain challenges leaders to "walk the talk" and put people first, whether they oversee a team of five or an organization of 500,000. When they do, employees won't be the only ones who thank them. Customers and shareholders will, too. This is what it means to WorkInspired.

IN THIS SUMMARY, YOU WILL LEARN:

- How "un-leaders" inspire their people by adopting the right mindset.
- The importance of trust and over-communication.
- How to make work both fun and productive.
- How a culture of caring fosters innovation throughout the organization.

Introduction

I've spent my career working at Kronos® Incorporated, the Massachusetts-based, billion-dollar global software firm founded in 1977 by my brother Mark. You might not have heard of us, but chances are we're touching your daily life. Our initial product was the first microprocessor-based time clock, a device that recorded, totaled and reported employee hours.

Today, under the banner Workforce Innovation That Works™, approximately 5,500 Kronos employees — or "Kronites," as we call ourselves — around the world create, sell and service software that helps organizations track the time their employees work to ensure that everyone is paid properly; that employees are scheduled based on skills, preferences, seniority, availability and historic business data; and that organizations are better able to comply with complex labor regulations.

We believe that great businesses are powered by great people and that to be a great business you need to create and manage an engaged workforce. Lots of executives claim to put employees first, but when I became our company's CEO in 2005, I had a chance to put my philosophy to the test.

From "Like" to "Love"

Although people seemed to like working at Kronos, employees didn't ***love*** Kronos, and they didn't see our organization as a unique and extraordinary place to build a career. That's what we changed.

Our drive to institutionalize a great culture got a boost in 2010 when we hired a seasoned executive with a strong quantitative background as our chief people officer. We performed a quantitative and qualitative analysis of the main drivers of engagement, identifying development and innovation as the biggest factors — and after further refinement, we discovered that manager effectiveness and a feeling of connectedness to the company's mission and strategy were also critical.

Walking the Talk

Then we rolled out a slew of new programs, processes and benefits that our people wanted, branding them so employees around the world understood and valued them. We defined and branded our culture itself, calling it WorkInspired and linking it to three core competencies: character, competence and collaboration.

We've since tied these competencies to our business strategy, leadership, performance goals, competency assessments, selection practices, reward and recognition programs, and merit and incentive programs and processes. We called our culture WorkInspired because we think of our company as a partnership built on inspiration: We provide an inspiring place to work, and we ask that employees perform their work tasks in an inspired way as well.

Our embrace of a strong people-strategy has paid off. Employee engagement has soared, with 87 percent of employees now reporting strong engagement, far above the global IT industry norm of 68 percent. In 2014, the ***Boston Globe*** named us the top large employer in the state of Massachusetts.

Taking care of people first — so they can in turn delight our customers and boost our sales — isn't rocket science. ***Any*** company or team can do it.

We need to stop taking employees for granted. Engaged employees lead to more innovative products and happier customers, which leads to stronger performance. That holds no matter your industry, and whether you're a manager overseeing a team of five or a leader running an organization of 500,000.

Each of the following sections presents a principle that we've deployed to nurture engagement and help people become "work inspired."

Become an Un-Leader

There's a name for the kind of humble CEO I aspire to be. I'll call him or her the "Un-Leader." No matter where in an organization you reside, try regarding yourself as an "Un-Vice President," an "Un-General Manager," an "Un-Sales Supervisor" and so on.

Let's unpack the mentality that defines "Un-Leaders." First, such leaders appreciate that their team or organization's success doesn't owe all to their personal efforts. Some executives and managers like to think they're indispensable. But Un-Leaders harbor no illusions about the unique value of their own contributions. As CEO of Kronos, I think of myself as just another team member. As I see it, the reason we have thousands of people in our organization is because we need thousands of people. It isn't all about me, nor is it about other highly visible members of our leadership team.

A second feature of Un-Leaders' mentality is an ability to put their work and their title in perspective. Being a CEO doesn't define how I think about myself. As a result, I don't

When we are humble, and when we project that humility outwardly in our behavior, team members notice. They come to feel that their leaders respect them. . .

spend a lot of time obsessing over my title, my authority, my power. Instead, like every other Un-Leader out there, I have more time and energy to think about what really drives the business forward: employees and customers.

Humility Is Power

When we are humble, and when we project that humility outwardly in our behavior, team members notice. They come to feel that their leaders respect them, are dedicated to their welfare and are approachable.

Several years ago, when we were transforming ourselves into a company with cloud offerings, we set forth key desired behaviors for Kronites everywhere to focus on and embrace. One of these was humility. As we defined it, humility meant assuming "positive intent" and competence on the part of others, engaging others by asking questions and listening, and putting your own "agenda aside to operate in the best interests of the customer and company." We also clarified that humility and "bold" leadership were not opposites but, rather, went hand in hand.

Precisely how you define humility for your people is up to you. What's important is to

- Set a baseline standard with your own behavior.
- Lay out clear, formal expectations about how people throughout the organization are to behave.
- Infuse policies and processes with an ethic of humility.

Overcommunicate

I chat with everyone: employees, customers, prospective employees, vendors who happen to be visiting our offices. There's a Yiddish word for this behavior: "kibitzing."

At Kronos, I think of myself as the kibitzer-in-chief, and I recommend kibitzing to you as a powerful means of building a more engaged and inspired team or workforce.

CEOs of billion-dollar companies tend to converse primarily with their carefully chosen leadership team and nobody else. To inspire people and create a workplace they cherish, I believe you must build personal relationships with them and establish a culture throughout the company of open and honest communication. Communicating frequently with employees and other stakeholders, preferably face-to-face, can help you accomplish both objectives. In fact, don't just communicate — ***over*** communicate. You really can't do it enough!

For the best results, you have to ask plenty of questions and really listen to employees' responses. As I go about my day, I ask employees a variety of open-ended questions about their work and personal lives, simple queries like, "What are you working on?" "How was your weekend?" "How is your family?"

Questions Are Key

When chatting with employees, I gain new insights into our business that I never would have learned otherwise — details about struggles teams are having, new opportunities that are cropping up in various corners of our company, big victories that teams have notched and so on. Just as valuable, I gain an intuitive sense for the personalities, needs and desires of our employees.

Over time, I forge personal relationships, creating a general atmosphere of free-flowing communication. Employees feel more comfortable coming to me with their problems or concerns, which affords me new opportunities to help drive our business forward.

You can conduct these conversations virtually, using tools such as email and social media. I strive to overcommunicate using every digital medium at my disposal.

Frequently during the year, I send out company-wide emails with personal messages from me. I also create "aron@ work" videos, short, low-budget blogs that capture me speaking impromptu about company performance, year-end objectives, product launches — whatever is on my mind. Our employees in locales around the world tell me how much they appreciate these messages as a way to feel part of the Kronos family.

Trust Them (Again and Again)

For a more engaged, higher-performing workforce, start by assuming competence, and then demonstrate to people over and over again that you trust them. Toss micromanagement out the window!

In managing my own team, I don't just refrain from micromanaging — I trust enough to ***require*** independence. If you run an organization or team, you have the power to create broader, more formal mechanisms to instill trust. Here are several important techniques we use at Kronos:

Set expectations around trust. Instilling trust organizationally begins with clarifying the behavior you expect of all employees. Several years ago, we introduced under the framework of our three core competencies (character, competence and collaboration) a larger set of desired behaviors that apply to Kronites at all levels. One behavior we emphasized was "establishing trust," which we defined as "Gains the confidence and trust of others through principled leadership, sound business ethics, authenticity and follow-through on commitments. Establishes open, candid, trusting relationships; treats all individuals fairly and with respect; maintains high standards of integrity."

Deploy tools to help your people get to know one another better. Like many companies, we have prospective hires complete a behavioral assessment — in our case, a tool called Predictive Index (PI) — that reveals traits such as how detail-oriented a person is, how extroverted, how patient and so on. The results of this assessment allow us to increase the chances that personalities will mesh well within teams, which facilitates trust building as well as overall performance.

Infuse the principle of trust into your policies. At Kronos, employees can decide when and how much time off they wish to take, so long as they discuss their plans with their managers, get their work done, and coordinate with them to minimize any disruptions to our business and to the service we provide to our customers. By showing trust in this way (we also show it through our longstanding openness to flexible, work-at-home arrangements), we further cement its importance within our culture.

Teach managers to nourish trust in their teams. Manager training and accountability offer another important vehicle for trust building at the organizational level. First, we ask managers to be both "bold" and "humble." Don't jump to conclusions, and don't point fingers. Humbly accept that you don't have all the answers, boldly look to your people for insight and expertise, and ask questions that others dare not ask.

Hold Managers Accountable

Employees might join organizations because of the company and the compensation package, but they ***leave*** organizations because of their manager.

How do you improve the quality of your managers? The standard answer is training — lots of it. Most large companies offer some kind of training program for their managers, as do we. But training alone isn't cutting it.

What managers need, in addition to training, is accountability, including performance metrics and benchmarking. Otherwise, their efforts will diminish over time, and any formal training they receive will do little good.

In 2015, we launched Courage to Lead as a one-time training course, setting out a three-part behavioral model for all Kronos managers. This model sought to describe both the organization we were at the time and the organization we aspired to be even more fully going forward.

We asked managers to be bold yet humble, to challenge Kronites but also support them, and to disrupt existing practices but also make efforts to engage and connect with people.

How MEI Came to Be

Building off of our Courage to Lead model, we researched the behavior of outstanding managers, contacting other companies for their perspective, studying the specific practices employed by top Kronos managers, and querying a group of Kronites about actions they associated with excellent managers.

Compiling all of this research, we created a concise profile of a great Kronos manager, refining it in employee focus groups to build a new model focused on the manager-employee relationship.

Out of this work, we created the Manager Effectiveness Index, or MEI, a survey that captured employee judgments about managers' performance, specifically in the areas of communication, development, empowerment and support.

We didn't just throw MEI out there, leaving managers to make sense of it on their own. First, we only shared the initial batch of MEI scores with the manager being

evaluated, not his or her manager. This would give managers time to digest their scores and think about forming a personal action plan.

Second, to protect anonymity, we only shared employee MEI feedback with managers who had three or more direct reports respond to the questions. Third, since we expected these managers to use the feedback to create and implement development plans for themselves, we provided them with materials that helped them understand MEI's format and purpose, interpret the data and identify areas for improvement.

Fourth, we gave managers access to one-on-one coaching and a set of training materials to help them hone their skills. These training programs spelled out a range of possible actions managers could take to develop specific skills in which they might have shown weakness. The training also helped managers discuss their evaluation results with team members, giving them sample agendas for conversation and suggesting ways that they might frame key ideas.

Get Serious About Strategy

Many leaders and managers underestimate the links between strategy and creating a workplace that employees love. When I became CEO, I decided to make our corporate planning much more rigorous, data-driven and inclusive than ever before.

It takes us four to five months each year to "work the strategy" for the upcoming year. Starting in February, an external facilitator interviews me, other members of my leadership team, and five to 10 additional leaders within Kronos from areas such as product development, sales, services, marketing and strategy, to identify our strategic priorities and areas of interest.

On the basis of these interviews, we decide on a small number of key themes that we'll discuss during a three-day strategy off-site. We'll then spend a number of weeks collecting data relevant to the strategic questions and briefing all participants on the topics we plan to cover.

The strategy session typically takes place in May and results in a list of initiatives and guidelines for their implementation. A few months later, we meet again to refine this list before proceeding to the next phase, creating budgets around our strategic priorities.

My goal throughout our strategy process is to assure that we understand the truth of our business. If an existing strategy or tactic isn't working, we need to know that so we can change course.

Resource and Evangelize the Strategy

Once you have a smart, clear strategy in hand, you might think you're all set. You're all revved up, eager to execute — what else is there to do? Well, you have to actually follow up on the strategy. A couple months after our planning retreats, I'll review the budgets our leaders have drafted for the following year, comparing them to our strategies.

At Kronos, we also focus on communicating the strategy from its very inception. On the final day of our retreat, we typically spend time figuring out how best to summarize our decisions and communicate them to the rest of the company. From there, we mount a months-long internal campaign to communicate the strategy to every corner of the organization. I assume a lead role, talking about the strategy wherever I go as if it were my full-time job (which it is!).

To create an environment in which people love what they do, you don't need to embrace a strategy planning process that replicates the one I've outlined here. Simply focus on talking about strategy with others in your organization in a productive and inspiring way.

> If you truly want to build engagement, be yourself each day at work. Have fun.

Have Fun

To create a culture and a workplace that people love, it's important to humanize the organization and infuse it with levity and personality. So many companies seem gripped by excessive formality. Why does work have to be so serious?

Yes, we want employees to work hard and perform, and daily operations at Kronos and in most other organizations will involve a certain amount of drudgery and tedium. But why can't we make it ***fun*** to come to work?

If you truly want to build engagement, be yourself each day at work. Have fun. Let your hair down a little, even if it means sometimes breaking the rules. And always tell the truth. Your people will appreciate the authenticity of your words and actions. They'll believe in you because they'll feel they know you — the real you. Your personal brand and the company's brand will become humanized. Employee engagement and affection for the company will increase in turn.

The Many Faces of Fun

An obvious place to start is with your workplace and lifestyle amenities. When designing our new headquarters, we dedicated an entire floor to fun and collaboration — what we call "we" space. There's a gaming area, a park-like space complete with swings, a high-end coffee and smoothie bar, a library, a variety of food options, board games, walking workstations and fitness classes.

As Kronites are discovering, it's a lot easier to lighten up and let your personality out when you're sipping a mocha latte with your teammates or enjoying a game of air hockey.

Wellness programs provide another opportunity for the building of authentic work relationships. We offer an array of initiatives under our global LiveInspired wellness program, not just the usual options focused on diet, exercise and smoking cessation but seminars on the healing power of laughter, a "March Madness" exercise challenge (which I did not win), a "Virtual Torch Walk Around the Globe" walking competition, an obstacle course challenge, company-sponsored running races, a chance to play on our cricket team (at our locations in India) and numerous seasonal events.

Collectively, the stream of events, initiatives and programs convey that Kronos is a different kind of company — a place where each employee can be him- or herself and where work isn't always so serious. Kronos itself takes on a "personality," one of friendliness, authenticity and relaxed sociability.

Astonish Them With Kindness

In 2017, a Kronite named Adam used our internal collaboration platform to contact fellow Kronites with an important request. A month earlier, his 15-year-old-nephew Sullivan had been diagnosed with leukemia. To cheer up his nephew, Sullivan's mother thought that it might be nice if he received postcards from all 50 U.S. states. Adam wrote asking his fellow Kronites for help. Would his colleagues, located throughout the country and the world, be willing to send a postcard to Sullivan?

The answer was a resounding yes. Within minutes, Kronites in states such as California, Illinois, New Hampshire, North Carolina, Texas and Wisconsin wrote back promising to send postcards, as did employees in countries such as Canada, Germany and the United Kingdom.

Every organization has its share of good, caring people who help their colleagues. But you don't often find a strong, cohesive ***culture*** of caring. What's noteworthy about Adam's request and the response it elicited is precisely how ***unremarkable*** they are at Kronos.

How to Cultivate Caring

One of the most important steps you can take to cultivate norms of caring is to articulate firm expectations about behavior at every turn. We present "care for each other" to new employees as one of the signature values of the Kronos workspace.

Our emphasis on caring is reflected in numerous employee benefits the company offers. But mostly, we focus on creating a corporate environment where we simultaneously care for one another and produce great results. Our bonus program, for which all Kronites are eligible, rewards Kronites for behaving well toward their colleagues in the course of their daily work.

Specifically, in calculating a Kronite's job performance, we allocate 40 percent of the score to reflect how well a Kronite displayed our core values of character, competence and collaboration.

Leaders also have a strong role to play. If employees need help, and there's a way that Kronos can offer support, we're going to do that. And if there's a way that I personally can become involved, I'm going to do that, too. I take great satisfaction in lending a hand. But I also know that modeling such generosity through my personal conduct does a great deal to infuse a kind, giving ethos throughout the organization.

Give Employees Their Time Back

What would you do if your daughters were offered roles in a national touring theater production? Would you quit your job so you could spend months on the road with them? Would you have someone else accompany them? Or would you tell your daughters that they couldn't participate?

One of our employees, Kristen, might have faced this predicament had she worked at another company. In 2016, her two talented school-aged daughters were offered roles in the musical ***Annie***. The tour would take place over

If you want to maintain high engagement levels, then you must empower workers to prioritize their families and bring their whole selves to work.

eight months, stopping in over 90 cities throughout North America. The production company required that a parent or guardian accompany the girls.

Kristen wanted to accompany her kids, but she wasn't sure what that would mean for her job. Kristen didn't have to worry because Kronos was among the few U.S. companies to offer employees open time off. In 2016, we implemented an open time-off policy that featured no preset limit on how many days off employees can take.

myTime In Action

Called myTime, the program, along with our general commitment to flexibility, allowed Kristen to accompany her children on the ***Annie*** tour while still working full time. She handled her Kronos responsibilities while her daughters were performing, communicating closely with her team about her schedule.

Many companies seem to want employees to prioritize their jobs above all else. To maximize performance, they try to keep employees in the office for as long as possible, providing all kinds of perks to make that kind of lifestyle possible and even attractive.

We empower employees to put their families first, above the company. Our corporate values require this — and it's great for business. Productive employees are, first and foremost, ***engaged*** employees. If you want to maintain high engagement levels, then you must empower workers to prioritize their families and bring their whole selves to work. Because we enable Kronites to sustain their relationships at home, they come to work happier, treat their colleagues better and perform better.

Many employees today are used to working ridiculously hard and putting their families second. They might reasonably assume that their employers expect this level of commitment, even if companies move to open time off and affirm family's primacy. For this reason, leaders and managers need to make a company's family-first philosophy ***personal***, affirming and modeling it with their own words and actions.

Celebrate to Motivate

Many organizations and teams have programs in place to reward outstanding performance, offering trips, bonuses and the like. Yet these standard programs might not go far enough, especially when leaders don't become personally involved in extending recognition and gratitude.

To build engagement and enhance performance, managers have to make legends out of their most deserving employees, and organizations must create an array of formal mechanisms to recognize the greatness of individual employees and to mark turning points in their lives. It's about creating a ***culture*** of gratitude and acknowledgment.

Create forums for employees to thank one another. One Friday morning in 2017, shortly before her team relocated to our new headquarters in Lowell, Massachusetts, one of our employees, Melissa, stopped by the new offices to take a look. She was blown away by how beautiful and functional the space was, and felt moved to say thanks to the dozens of Kronites who in one way or another had helped design and outfit the new headquarters. For Melissa, it was easy: Just jump on our internal collaboration platform and write a post.

Kronites thank one another all the time on our collaboration tool, and they have also used 5HIFT Shout-Outs, a global peer-to-peer recognition program that allows employees to acknowledge the efforts of colleagues cross-functionally and in any region.

Provide public recognition, not just rewards. "Career Spotlight" is a special feature we produce that profiles Kronites and their career stories. Any Kronite at any level can nominate a fellow employee. Our communications team then interviews the person nominating the employee, the nominee, and the nominee's manager and writes an inspiring story. This recognition not only raises the profile of the featured Kronite within the organization but also promotes our culture of caring.

Practice mass gratitude. We hold events that allow us to express gratitude to large groups of Kronites all at once. Each summer, more than 1,500 Kronites at our cor-

porate headquarters take an afternoon off from work to attend an employee appreciation picnic. It's an enormous BBQ extravaganza, with music, carnival games, volleyball, corn hole toss and a basketball tournament. Departments often plan team meetings around the picnic, too, so Kronites from other regions can attend.

Put Yourself Out of Business

If you want to engage your workforce, you can't just nurture them, trust them, communicate with them, show respect for them and manage them in the ways discussed. You also have to give them the opportunity to put their ***own*** stamp on the business. You have to give them permission to take risks and innovate.

Further, you have to make innovation part of the culture, extending it to every part of your business, not just technology and products. In addition to investing more than $500 million over the past five years on product innovation, we've adopted an array of programs over the past decade designed to empower Kronites to take risks and think creatively.

In our products and technology group, for instance, employees until recently participated in "Kronovation Days" several times a year. At these designated times, they worked on projects that normally fall beyond the scope of their daily jobs. They had the time and freedom to explore new ideas and push their own boundaries. At the end of the Kronovation event, employees presented their ideas to their peers, and managers offered awards for the most promising ideas, some of which we incorporated into our products as features.

Another step to take to instill innovation in your culture is to support employee communication and collaboration. Although it took some adjustment on the part of Kronites, our internal collaboration platform has become a vibrant place for employees around the world to connect with one another and share new ideas.

Aside from implementing organizational policies and programs that encourage a culture of innovation, leaders and managers should also adopt a number of key behaviors: listen to and implement employee ideas; give employees the space to develop ideas on their own; model the reasonable risk-taking you wish to see in your people; and encourage innovation in every part of your business.

What if employees and former employees were going out of their way to rave about your culture? What if they loved your company so much that they couldn't imagine ever working anywhere else? What if they consistently pushed your company's performance to new heights?

Take care of your people, support them, inspire them — and they will.

THE SUMMARY IN BRIEF

Nice guys finish last. Do whatever it takes to win. These are all accepted business mantras. In some industries, this includes lying, leaving out details, and playing both sides of a contract to increase revenue.

In ***You Don't Have to Be Ruthless to Win,*** Jonathan Keyser begins by sharing his personal story and journey to selflessness. In part two, he introduces The Keyser Way and details his 15 Core Operating Principles that any business can incorporate and embody to create their own long-term success, while being happy and satisfied with the world—and their role in it.

Keyser teaches how any business can achieve extraordinary levels of success by selflessly helping others. "That's the best business strategy I have ever seen for creating long-term sustainable success," Keyser writes. "I don't have to sell. I don't have to persuade. I don't have to convince. I just serve, and more business comes my way than I can handle."

IN THIS SUMMARY, YOU WILL LEARN:

- A detailed strategy for sustainable success to act on today.
- How to plant seeds of service that produce future rewards.
- How to build a network of people who want to help you.
- How to use the 15 Core Operating Principles of The Keyser Way.

The Three Levels of Reinvention

Each of the core principles outlined in The Keyser Way are embodied on three specific levels: Self, Company, and Clients. All three levels must be addressed and incorporated into your overall strategy to achieve the level of success desired, without having to be cutthroat, brutal and selfish.

Reinventing Yourself

Recounting experiences while working in the competitive commercial real estate industry, Keyser explains how he became someone he did not want to be. In order to implement drastic changes in his personal and professional life, he found that first he needed to reinvent himself. He needed to strip away all of the negative, bad habits that he'd created in the conventional business world, in order to begin serving others.

Reinventing Your Company Culture

A second level of reinvention is needed for your company culture. In the commercial real estate industry, it was common for team members to treat each other as enemies and someone that needed to be beat. This creates an environment that does not attract top talent, nor contribute towards success. In order to foster the proper environment of encouragement, learning and growth, you must make changes within your company and your team.

Reinventing Your Approach to Clients and Collaborators

The final level of reinvention involves changing how you interact with and treat your clients and collaborators. By serving them selflessly, your clients trust and support you. This evolves into word of mouth advertising and strong networks of people who want to help you.

Each level of reinvention is highlighted in the 15 Core Principles, and Keyser shares many examples through his own stories and anecdotes.

Plant Seeds for Future Rewards

The Many Faces of Service

It's important to understand from the beginning that service does not necessarily equal charity. There are many ways to provide service with no actual money involved. Providing service on a variety of levels plants seeds that grow towards the success of your business.

When Keyser first launched his business, for instance, a client offered to let the company use spare space until they could afford their own offices. Other stories speckled throughout the book include introducing someone to a top-tier oncologist, helping people find jobs, and taking gasoline to someone stuck on the side of the road.

Leave Expectations Behind

When you provide service, it is imperative to do so without expectations of reciprocity. When you do something because you believe it will benefit you, that is not true selflessness and it can limit your progress. To truly benefit from The Keyser Way, you must provide service for the sake of helping and nothing else. If you have underlying motives, you are actually being manipulative and inauthentic, which hinders your overall progress.

Seeds Evolve into a Powerful Network

People Respond in Kind

By serving others without underlying motives, you plant seeds for the future. Over time, those seeds grow into a powerful network of people who want to help you in kind. By default, humans have the desire to return favors. This instinctual reaction is much more powerful when the favors are unsolicited and not manipulated.

Word of Mouth is Powerful

When you are a truly selfless person who helps others at every turn, that makes a deep impression on them that they want to share. They can't help but sing your praises to others, and consciously or unconsciously they will look for ways to help you in return.

15 Core Operating Procedures

Selflessly Serve

Becoming selfless starts with concerning yourself with the well-being of others without consideration for personal gain. Selfless service means doing things for others that add value to their lives, either personally or on a business level.

Outwork the Competition

You must be willing to outwork the competition in order to win. This requires personal commitment and drive because there is no instant gratification. Ten thousand hours of determined effort toward a singular cause, with-

> And don't be afraid to make mistakes. . . Fear of mistakes makes people timid instead of bold and you must be bold to win.

out quitting, is the key to mastery. The effort you put into serving your clients and prospects will quickly develop your reputation as someone who goes above and beyond the standard job performance in your industry. This reputation is priceless in acquiring future clientele.

Take Bold Action

And don't be afraid to make mistakes. Bold action is where successful people live. You want to live there. Fear of mistakes makes people timid instead of bold and you must be bold to win. Focus on learning from and seeing mistakes for what they really are—opportunities to grow.

Exceed Expectations

Analyze what customers expect from someone in your profession and brainstorm ways to exceed these expectations. Always set extraordinarily high standards for your service levels to your clients, work crazy hard, and commit to doing everything you do to the very best of your abilities. This commitment will create a solid reputation for your company that competitors will find very difficult to overcome.

Expect to Win

By being the best. When you can honestly say you're the best, you know without question that you will win. Being the best is a mindset that is intentionally created and perpetuated—don't waste your valuable time feeling insecure. Assume you already have a prospect's business, and show up committed to serving them to the best of your ability.

Truly One Team

Encourage your team to commit to helping every other team member become extraordinarily successful. Instead of working from a hierarchy and titles, consider creating a more collaborative environment that focuses on skills.

If you met a Navy SEAL, you would not ask, "What rank are you?" You would just say, "Wow, you are a SEAL!" The membership is all you need.

Give First

In order to put selfless giving in motion, you have to make the first move. When people realize that you truly care about them, with no thought for yourself, they feel a deep appreciation. Give something thoughtful and meaningful to them. Give your time; give someone the credit; give a relationship; give empathy.

Be Your Word

"Integrity means consistency between what comes out of my mouth and what my body does." It simply means doing what you say you will do. It is very tempting to say the things a client wants to hear, even if we don't know whether we can keep our promises. Be completely honest and do what you say you are going to do.

Have Fun

Choose to have fun personally, in your corporate environment, and with your clients. Being lighthearted and playful helps you respond more effectively to whatever you need to handle in that moment.

Succeed Through Self-Improvement

Self-improvement is the ultimate long-term success strategy. For those who truly want to be great, everything in your life is subject to change and open for improvement. Utilize books, coaching, feedback and courses. Be open to hearing hard truths and willing to make improvements.

Treat People Like Family

Treat everyone in your company like family. People crave camaraderie and want to be loved, accepted, and nurtured, and treating them like family creates an environment built on trust. Support interests, go on outings together, and create company traditions.

Be 100 Percent Coachable

Coachability is the key to becoming the best you can become. Keyser states that this is the hardest principle to

master yet also the most critical. Opening up to feedback from others helps us to identify blind spots and enables us to make changes. Have a coachable mindset, welcoming criticism in yourself and in your corporate culture.

Be 100 Percent Present

Commit all of your mental energy to what you're creating and do not allow yourself to be distracted by anything: technology, other people, or your own thoughts. If you want to be the best, you need to be fully present in what you do.

To be 100 percent present in whatever you are doing, you may need to change your environment. Leave the phone behind, put down your pen, close the door. Put your full attention and efforts into that moment and maximize each and every opportunity that comes your way to the fullest.

Care for Yourself

Without health, none of the other Principles contained within this book can be lived or experienced. Having a healthy body is essential to creating long-term, sustainable success in any industry. Much of your ability to get or remain healthy starts with your own personal commitment, and it can be motivated and encouraged at the corporate level in many different ways. Have competitions, schedule athletic activities with your team and clients, and stock healthy snacks in the lounge.

Be Disruptive

And embrace change. Never rest on your laurels. Continually seek out new technologies, methodologies, and ideas to stay relevant and keep ahead of market trends. Having a disruptive mindset is ongoing and never quits. It is constantly looking for different ways to see and do things. The pace of change has increased, and individuals and organizations that do not stay on the cutting edge of innovation will be swiftly left behind. Embracing new technologies and figuring out new strategies keeps an organization relevant and alive.

Use these Core Principles as the guiding force for your team. The process of developing the Principles that will be your compass is heavily dependent on you and your team, and they must embody the values you want to emulate. Your company principles will be the most critical piece of your successful transformation. They will need to be tailored to you and your industry.

Once you have created your own, do not let them degenerate into mere statements and become nothing more than lip service. Your entire leadership team must be completely aligned in both living and implementing your principles. Your principles should become so well known that they get buried in the subconscious of every team member—becoming second nature to each of you.

12: The Elements of Great Managing

by Rodd Wagner and James K. Harter, Ph.D.

THE SUMMARY IN BRIEF

How do great managers inspire their employees to achieve top performance? In *12: The Elements of Great Managing*, authors Rodd Wagner and James K. Harter, Ph.D., challenge conventional ideas about managing for corporate success and delve deep into the motivating factors behind a worker's productivity. Using data collected and analyzed by The Gallup Organization, the authors are able to show how employee responses to 12 simple statements about work life directly correlate to the most important aspects of a company's success.

Wagner and Harter convincingly demonstrate that to effectively manage a company's "human resources" requires more than hiring talented people to "do a job." Written for managers and employees of companies large and small, *12* explains what every company needs to know about creating and sustaining employee engagement. Ultimately, it is only through great management that a company can see measurable results in its productivity, profit, attrition rates, customer satisfaction, work-related absence and on-the-job accident rates.

More than a decade ago, The Gallup Organization combed through its database of more than 1 million employee and manager interviews to identify the elements most important in sustaining workplace excellence. These elements were revealed in the 1999 bestseller *First, Break All the Rules*. This summary covers the long-awaited sequel.

IN THIS SUMMARY, YOU WILL LEARN:

- What the 12 Elements of Great Managing are and how they relate to profitability.
- How having a friend at work can be extremely beneficial to corporate productivity.
- Why it's not just about having the right materials for the job but also about having a choice.
- Why it's crucial for employees to feel that someone cares about them.
- How productivity and financial success are correlated to employee engagement.
- What it takes to be a great manager.

THE COMPLETE SUMMARY: 12: THE ELEMENTS OF GREAT MANAGING

by Rodd Wagner and James K. Harter, Ph. D.

The authors: Rodd Wagner has worked for The Gallup Organization since 1999. As a principle of Gallup, he interprets employee engagement and business performance data for Fortune 500 companies. James K. Harter, Ph.D. is The Gallup Organization's chief scientist and has authored or co-authored more than 1000 research studies. Harter has been with Gallup since 1985 and his research was popularized in the book *First, Break All the Rules* and has been featured in such publications as *USA Today, The Wall Street Journal* and *The New York Times*.

The History of 12

More than a decade ago, The Gallup Organization assembled a select group of social scientists to examine the 1 million employee interviews in its database, the hundreds of questions that had been asked over the preceding decades, and every variable on business-unit performance that organizations had supplied with their employee rosters. This data was analyzed to find which survey questions — and therefore which aspects of work — were most powerful in explaining workers' productive motivations on the job.

Ultimately, 12 elements of work life emerged as the core of the unwritten social contract between employee and employer. Through their answers to the dozen most important questions and their daily actions that affected performance, the million workers were saying, "If you do these things for us, we will do what the company needs of us." These "things" are represented in the 12 Elements of Great Managing and are directly correlated to employee performance and company health. ●

The First Element: Knowing What's Expected

Because so much of an enterprise's efficiency depends on the seamless combination of personal responsibilities, the First Element of great managing is job clarity.

When Gallup researchers went in search of ("agree or disagree") statements most predictive of performance, one of the most straightforward turned out to be one of the most powerful: "I know what is expected of me at work." Groups that have high scores on this item are more productive, more profitable and even more creative. Substantial gains on the First Element alone often correlate with productivity gains of 5 percent to 10 percent, thousands more happy customers and 10 percent to 20 percent fewer on-the-job accidents.

"Knowing what's expected" is more than a job description. It's a detailed understanding of how what one person is supposed to do fits in with what everyone else is supposed to do, and how those expectations change when circumstances change. A good team, some say, is a lot like a great jazz band in which each player listens to the other instruments while playing their own. The better they pay attention to the rest of the band and work their way into the music, the better the result.

It's More Than Talent

Superior performance is dependent on more than individual talent and knowledge of the job alone, it is dependent on teamwork. Consider what can be learned from professional basketball: Viewed through a business statistician's eyes, the National Basketball Association (NBA) is a perfect laboratory to study not just teamwork in basketball, but teamwork itself.

Three management professors dove into NBA statistics to see whether, above and beyond individual talent, playing together improved a team's performance When they analyzed the data from 23 NBA teams from 1980-1994 they found that the greater the stability of a team's roster — fewer trades moving players on and off the team — the better they played.

More than each player knowing his or her job in isolation, a better team record also depends on the players learning hundreds of nuances and patterns in their teammates' play. This "tactic knowledge," wrote the professors, is a keen awareness of each others' styles and "must be learned

through experience," and "It is only through actually playing together that each member of the team accumulates the stock of tactic knowledge about the game play of other members of the team that enables such synchronicity."

The Second Element: Materials and Equipment

The importance of the Second Element of great managing, ensuring employees have the materials and equipment they need to do their work well, is best illustrated by its converse. When employees lack the means to do their work well, frustration with their inability quickly follows, as does anger with the company for placing them in such a difficult spot. From a purely functional perspective, having the right tools makes a job safer, easier and more productive. Equally important, the employees' perception that the company backs them up with the equipment they want and need serves as a powerful psychological motivator.

Workgroups for which materials and equipment are managed most effectively average higher customer engagement and higher productivity than their peers. They also have significantly better safety records and their employees are less likely to flee to other organizations. Those managers with bottom quartile Second Element scores average 20 percent to 40 percent higher employee attrition than top quartile managers, representing millions of dollars in direct and indirect turnover costs.

It's Not Just About the Materials

In the database, less than one-third of employees strongly agree that they have the materials and equipment they need to do their work well. There is a wide range on this item: the most engaged workgroups are nearly unanimous in their positive responses to the question, while the least engaged have no one who feels well equipped for the job. The most peculiar wrinkle in the data is that even in highly legislated environments where nearly identical workgroups are given the same machines, cash registers, office supplies and tools, the opinions of the employees vary.

The secret lies in the involvement, judgment and action of front-line managers. Less-engaged workgroups typically say that they were supplied with the standard toolkit in a standardized fashion: "Here's what you get. Make the best of it." The most engaged employees say their manager made what turned out to be relatively minor accommodations, aggressively petitioned for more expensive tools when the business case was strong and was generally vigilant in looking for new ways to make the team more effective.

Solving Second Element Issues

It's not unusual for a workgroup to have one or more Second Element issues that can be fixed only with the authority or money from corporate headquarters. In other circumstances, managers are able to manage Second Element concerns by making individual accommodations to employees. This allows employees to pick from a variety of choices: the cell phone that works best for them, for example; or a modification of the standard software in a laptop to meet an employee's working style, talents or work demands.

The Third Element: The Opportunity to Do What I Do Best

Matching a person to the right job, or a job to the right person, is one of the most complicated responsibilities any manager will face.

The Third Element emerged from the ability of a straightforward statement to predict the performance of a given worker and entire teams: "At work, I have the opportunity to do what I do best every day."

When employees talk about what they do best, they rarely frame the discussion in terms of a job description. Certainly people can form attachments to their professions to the point that being a salesperson, professor or nurse becomes part of their self-image. Their talents, however, being more an instinctive part of them than any specific job, are transferable from one position to another, even across industries.

Commonly, two people in ostensibly identical roles who, by virtue of "doing what they do best," perform in quite different fashions — one a banker who loves the business because he gets to work closely with people in his town; another a natural capitalist who can't imagine not being involved in the constant movement of stocks, interest rates and precious metals prices.

Maximizing Employee Talent

To get the most from a team, a manager must help each employee mold the job around the way he or she works most naturally, maximizing the frequency of optimal experiences in which the worker loses him- or herself in the work, is internally motivated and is naturally gifted. The manager must also realize that as long as the employee accomplishes the goals for which he or she is responsible, without any harm along the way, how it gets done does not matter. Acknowledging one's greatest

natural talents and weaknesses does not mean accepting a narrow set of career possibilities. Rather, it means each employee will succeed in a relatively unique way, applying his or her own style to the accomplishment.

Predicting Profitably

The Third Element is powerful in explaining not only productivity, but also the future profitability of teams within companies. Business units in the top quartile of Gallup's database on the "do what I do best" statement exceed the profits of those in the bottom quartile by an average of 10 percent to 15 percent. A recent analysis of multiple studies reveals that managers whose talents are aligned with their job demands achieve, on average:

- 15 percent more in sales
- 20 percent more in profit
- 24 percent fewer unscheduled absences
- 13 percent lower employee turnover.

But for all the evidence that this approach is good for business, only about one in three employees can strongly agree that they "have the opportunity to do what they do best every day." ●

The Fourth Element: Recognition and Praise

To reach their full potential, employees need recognition and praise, the Fourth Element of great managing. Generally, in the perception of employees, praise is painfully absent from most companies and the workgroups within them. Less than one in three employees can give a strongly positive answer to the statement, "In the last seven days, I have received recognition or praise for doing good work."

Employees who do not feel adequately recognized are twice as likely to say they will leave their company in the next year. Those who score the Fourth Element highest are two-and-a-half times more likely to agree that "from my most objective viewpoint, I am paid appropriately for the work I do" than those at the other end of the recognition scale. Variation in the Fourth Element is also responsible for 10 percent to 20 percent differences in productivity and revenue, and the acquisition and retention of thousands of loyal customers to most large organizations.

Positive Words and Dopamine

Dopamine is a neurotransmitter (a chemical that sends a signal from one part of the brain to another) that creates a feeling of enjoyment and satisfaction. Studies have implicated that dopamine is part of the mechanism behind enjoying good tastes and smells, receiving money and even seeing a pretty face. "At a purely chemical level," said *Time* magazine, "every experience humans find enjoyable — whether listening to music, embracing a lover or savoring chocolate — amounts to little more than an explosion of dopamine in the nucleus accumbens, as exhilarating and ephemeral as a firecracker."

People who alter their behavior to get those delightful bursts and positive words specifically have been found to activate the regions of the brain related to reward. This chemical release not only makes healthy employees feel good when they get praise, it is also crucial to memory and learning. It creates an internal reward system that makes employees want to repeat needed behaviors, if doing the right things earns recognition. ●

The Fifth Element: Someone Cares About Me as a Person

There are limits to how much can be accomplished through directives, financial incentives, fear of discipline and intense scrutiny of people's work. One of the crucial questions for a team leader trying to get the most from the team is whether they form a cohesive, cooperative, self-sacrificing, motivated crew. Such attributes are the essence of the Fifth Element of great managing and are measured by an employee's reaction to the statement, "My supervisor, or someone at work, seems to care about me as a person."

Social Capital

Team effort depends on the degree to which employees feel like a real part of a group, cohesiveness sometimes called "social capital." Authors Don Cohen and Laurence Prusak wrote, "Social capital bridges the space between people. Its characteristic elements and indicators include high levels of trust, robust personal networks and vibrant communities, shared understandings, and a sense of equitable participation in a joint enterprise — all things that draw individuals together in a group. This kind of connection supports collaboration, commitment, ready access to knowledge and talents, and coherent organizational behavior."

People treat each other differently when they form a personal connection, and they give more effort in a group when they feel that they are more than just a number. One of the best predictors of an employee's trustworthiness is his or her perception of whether the company "cares about my personal well-being." Compared with those who feel their company is looking

out for them, "a disproportionate number of the workers who view the employer as unfair and uncaring" will cheat when they think they can get away with it.

The correlation between not feeling someone cares about them and resigning has been observed repeatedly in studies of individual companies in the Gallup database and in analyses where data from many organizations are combined. In high-turnover companies, workgroups in the lowest quarter of the "someone at work cares about me" statement average 22 percent higher turnover than their top quartile counterparts. In organizations where resignations are less common, the difference rises to 37 percent.

The Sixth Element: Someone at Work Encourages My Development

The notion of a personal guide is an ancient idea that perpetually re-emerges in forms such as the relationships between master craftsman and apprentice, doctoral candidate and thesis supervisor, and resident physician and intern. There is something about working closely with someone who supervises the less experienced person's progress that cannot be accomplished as well in any other way. From this fact stems the Sixth Element of great managing, measured by the statement, "There is someone at work who encourages my development."

The Sixth Element requires a high degree of personal investment by the counselor in the education of his or her charge. Without a mentor, it is difficult for employees to achieve real engagement (less than 1 percent) with their employer. Conversely, two-thirds of employees who report having someone at work who encourages their development are classified as "engaged," while one-third are "not engaged" and less than 1 percent are "actively disengaged."

In its broadest usage, as captured by the Sixth Element, a mentor is anyone who, in the eyes of the employee, ensures he or she successfully navigates the course. The important aspect is not which term this protector goes by — friend, coach advisor, sponsor, counselor, supporter — but whether the employee feels supported inside the business.

The Seventh Element: My Opinions Seem to Count

Although there is always a need for expertly designed systems that help maximize production, nearly every system depends on the motivation of the people who run it. That motivation, it turns out, requires workers to strongly agree that "At work, my opinions seems to count." This is the Seventh Element of great managing.

The mechanism that connects this element with better business performance appears to be a greater sense of responsibility for or psychological ownership of those things over which one has a say. No matter how strong the external incentives, they never seem to measure up to the internal drive of advancing something that is at least partially one's own idea. Nearly half of employees who say their opinion counts at work also feel their current job brings out their most creative ideas. Among those who are neutral or negative on the Seventh Element, only 8 percent feel their creativity is well employed.

Benefits of Improving Scores

Improving the proportion of employees with high Seventh Element scores from one in five to one in three has a substantial impact on customer experience, productivity, employee retention and safety, all of which create, on average, a 6 percent gain in profitability.

Incorporating employee ideas pays back twice. First, the idea itself is often a good one. Second and equally powerful, that the idea comes from the employees themselves makes it much

The Twelve Elements of Great Managing

1. I know what is expected of me at work.
2. I have the right materials and equipment I need to do my work right.
3. At work, I have the opportunity to do what I do best every day.
4. In the last seven days, I have received recognition or praise for doing good work.
5. My supervisor, or someone at work, seems to care about me as a person.
6. There is someone at work who encourages my development.
7. At work, my opinions seem to count.
8. The mission or purpose of my company makes me feel my job is important.
9. My associates or fellow employees are committed to doing quality work.
10. I have a best friend at work.
11. In the last six months, someone at work has talked to me about my progress.
12. This last year, I have had opportunities at work to learn and grow.

more likely that they will be committed to its execution. Welcoming employee opinions also produces greater feelings of inclusion among workers. When the 12 elements are compared against a number of statements to test perceived racial or gender bias, the "opinions count" statement is most highly correlated with feelings that employees are always treated with respect and the company treats its workforce fairly. ●

The Eighth Element: A Connection With the Mission of the Company

The Eighth Element of great managing is captured by the statement, "The mission or purpose of my company makes me feel my job is important." Business units in the top quartile of Gallup's engagement database on this element average from 5 percent to 15 percent higher profitability than bottom-quartile units. Mission-driven workgroups suffer 30 percent to 50 percent fewer accidents, and have 15 percent to 30 percent lower turnover. Employees who feel connected to the mission of their company are also more likely to report that humor or laughter plays a positive role in their productivity.

The strange thing about the Eighth Element is how extraneous it is to the job itself and the employee's material well-being. The absence of many of the other elements — job clarity, the proper equipment, a match with one's talents, consistent feedback — become real obstacles to actual production. It's easy to see why they're required to get the job done. The same cannot be said for the Eighth Element, which is strictly an emotional need, and a higher-level one at that, as if the employee can't be energized without knowing how his or her job fits into the grand scheme of things.

More Than a Job

It's not uncommon for employees of highly engaged workgroups, from entry level to senior executives, to mention having turned down higher pay to join or remain with a company they believed would provide more meaningful work with a more enjoyable team. No matter how employees make sense of the world and their role in it, if they see a connection substantial enough to consider their work a calling, they get more out of work and the organization gets more out of them.

Because of this connection, workers more strongly identify with the team, have less conflict, trust management more, are more committed, work through things better and put in more time at work, whether compensated or not. Here, the job doesn't determine its meaning. For example, "A school teacher who views the work as a job and is simply interested in making a good income does not have a calling, while a garbage collector who sees the work as making the world a cleaner, healthier place could have a calling," wrote researcher Amy Wrzesniewski.

It Starts at the Top

The most highly motivated and productive employees push hard because they feel their work makes a difference to attaining those worthy goals. Despite the high correlation between senior leadership and front-line commitment to the mission, this element loses the most power along the way. While two-thirds of executives in a typical company strongly agree with the mission questions, less than one-third of street-level associates do. ●

The Ninth Element: Co-Workers Committed to Doing Quality Work

Phoning it in. Free-riders. Cheaters. Hitchhikers. Deadwood. Slugs. Drones. Asleep at the switch. Cowards. Barnacles. Slackers. Con artists. Deserters. They go by dozens of scornful labels. During a career, everyone encounters at least a few of the people who strive to do the least they can without getting reprimanded. The Ninth Element is measured by the statement: "My associates or fellow employees are committed to doing quality work," and few factors are more corrosive to teamwork than the employee who skates through life taking advantage of the much harder work of others.

The frustration is evident in a comment of an employee who gave a low score to the associates-committed-to-quality-work statement. "I dislike having to constantly tell people how to do their job. It becomes my job to fix what they neglected to do correctly in the first place." Another complained about "no one wanting to take responsibility for anything." If a team lacks a strong work ethic and a sense of responsibility to its members, the group becomes a convenient place to hide a little slothfulness, to push a little work to the other guy, or to point fingers when a project doesn't hit its deadlines.

In an average team, about one in three employees strongly agrees that her team members are committed to doing quality work. But the Ninth Element is highly sensitive to the presence or absence of one or more slackers. When a team perceives that one of its mem-

bers is dragging his or her feet, the proportion that rates the Ninth Element high drops to one in five. If a team is free of deadwood, the proportion that strongly agrees with the statement jumps to half of the team, with most of the rest giving positive, although slightly less emphatic responses. The many companies' performance data matched to Ninth Element scores show that people who feel part of a solidly committed team are routinely safer, better with customers, less likely to quit and more productive.

The Tenth Element: A Best Friend at Work

Responses to the Tenth Element, "I have a best friend at work," predict performance. Something about a deep sense of affiliation with the people in a team drives employees to do positive things for the business they otherwise would not do.

Early research revealed a very different social bond among employees in top performing teams. Subsequent large-scale, multi-company analyses confirmed that the Tenth Element is a scientifically salient ingredient in obtaining a number of business-relevant outcomes, including profitability, safety, inventory control and — most notably — the emotional connection and loyalty of customers to the organization serving them. A little less than one-third strongly agree that they have a best friend at work.

Friendship and Performance

Numerous qualitative studies of employee engagement suggest customers not only sense the level of camaraderie where they shop, but that it makes a large difference in their experience, if for no reason other than its natural contagiousness. In the service industries, the customer ratings of workgroups with strong Tenth Element levels are 5 percent to 10 percent higher than those of impersonal or acrimonious groups, explaining the difference between success and failure in many organizations.

Other connections between the "best friend" statement and business outcomes are less intuitive, at least at first blush. At one electric utility, friendships among team members proved to be responsible for lower accident rates. When the workers were asked for the reason, they said the answer is simple: People look out for their friends. A team that has two-thirds of its members strongly agreeing they have a best friend at work averages 20 percent fewer accidents than a team with only one in three strong on the Tenth Element.

Friendship is not without hazards for productivity, nor is it effective without the other elements, such as coworkers being committed to doing quality work or clear expectations for each member of a team. Without clear direction, tight-knit teams can lose themselves in socializing and ignore customer or business needs.

It's Easier to Work With Friends

Research on workers in various settings has shown that friends are more likely to invite and share candid information, suggestions and opinions, and to accept them without feeling threatened. Friends tolerate disagreements better than those who are not friends. The good feelings friends share make them more likely to cheer each other on. Friends are more committed to the goals of the group and work harder, regardless of the type of task. Group members who identify most closely with the team are more likely to monitor its performance against the goal.

Bunglers vs. Slackers

Gallup asked a random sample of U.S. workers which made them more frustrated: a colleague who tries hard but doesn't have much ability (a bungler), or a colleague who has the ability and doesn't try (a slacker). By a margin of six to one, workers are more upset with a slacker than a bungler.

The Eleventh Element: Talking About Progress

For all the complexity of performance appraisals — the balanced scorecards, the 360-degree feedback, the self-evaluations and forced grading systems — the statement that shows the best connection between perceptions of evaluations and actual employee performance is remarkably simple: "In the last six months, someone at work has talked to me about my progress." The statement does not specify that the discussion be an official review, but that the employee understands how he or she is doing and where his or her work is leading. In some ways, this statement is a long-term compliment to the Fourth Element of managing, which focuses on more immediate "recognition and praise."

Where a manager is regularly checking in with an employee, that employee is more likely to consider him- or herself properly compensated for the work, more likely to plan on staying with the company, and more than twice as likely to recommend the company to others as a great place to work. When compared with business results, the Eleventh Element turns out to be partic-

ularly powerful in driving productivity and safety.

Business units in the top quartile on this element realize 10 percent to 15 percent higher productivity and 20 percent to 40 percent fewer accidents than bottom-quartile business units. Yet less than half of employees in the global database strongly agree that someone talked with them about their progress in the last six months. Even among executives and senior managers, the proportion is only one-half.

Opinion Always Matters

On a purely functional level, an employee appraisal is quite simple. In practice, a good performance evaluation is a form of interpersonal art that requires managerial talent and careful preparation. A manager must maintain a delicate balance between giving candid, objective feedback and not crushing the employee's spirit and confidence. The research indicates that positive feedback charges up a worker, but negative comments sap the job of some of its intrinsic motivation. Comments from peers or subordinates must be interpreted carefully, and filtered of grudges, jealousy and erroneous observations. And, most of all, the discussion must be tailored to the personality, circumstances and potential of the employee. ●

The Twelfth Element: Opportunities to Learn and Grow

For many people, it is progress that distinguishes a career from employment that is "just a job." The Twelfth Element is measured by the response to the statement, "This last year, I have had opportunities at work to learn and grow." Employees who have an opportunity to learn and grow at work are twice as likely as those on the other end of the scale to say they will spend their career with their company.

When employees feel that they are learning and growing, they work harder and more efficiently. This element has a particularly strong connection to customer engagement and profitability. On average, business units in the top quartile on the Twelfth Element surpass their bottom-quartile counterparts by 9 percent on customer engagement and loyalty measures, and by 10 percent on profitability. These superior customer relationships and profits may occur because employees who are learning and are genuinely interested in their work have better ideas — which is another demonstrated correlation to the Twelfth Element.

Employees are Naturally Drawn to Progress

"Despite the fact that humans are liberally endowed with intrinsic motivational tendencies," wrote University of Rochester professors, "the evidence is now clear that the maintenance and enhancement of this inherent propensity requires supportive conditions, as it can be fairly readily disrupted by various nonsupportive conditions."

That's exactly what happens to many employees. Raised through a childhood in which each new year brought novel opportunities, playing at ever more difficult levels of sports, growing physically, educated in a system of cleanly delineated grades, many employees find themselves several years into their career wondering what happened to the momentum they used to enjoy.

Sitting in the same cubicle, doing the same job in much the same way without any meaningful new challenges causes employees to languish personally and professionally. A study of more than 3,000 adults between the ages of 25 and 74 found that 12 percent of the population is "languishing" and only 17 percent are "flourishing." "Languishing is associated with poor emotional health, with high limitations of daily living, and with a high likelihood of a severe number of lost days of work" and, when at work, lower productivity, wrote study author Corey Keyes.

What Great Managers Need

Some of what makes a great manager perform so well is pure talent — a natural ability to discern an employee's mind-set, a persistent optimism or a strategic acumen difficult to duplicate. Some of it is a deeply held personal mission to change the world for the better. Much of it requires that a front-line supervisor have the same experience with the 12 Elements as those he or she directs. One of the most fundamental needs of a great manager is … a great manager.

The level of engagement of managers ebbs and flows just as much as it does for anyone else. Moreover, the engagement level of managers correlates strongly with the attitudes of their team and before a person can deliver what they should as a manager, they must first receive what they need as an employee. ●

CORPORATE AGILITY

THE SUMMARY IN BRIEF

Early in 2002, a modest research project called the *Future of Work* gathered a small group of corporate thought leaders from such companies as Agilent Technologies, Cisco Systems, Intel, PeopleSoft, Capital One and Herman Miller to survey both labor and management in an attempt to discover how new technologies, the changing work force and economic globalization were changing how and where people worked, and what those changes meant to the future of work in the Information Economy.

In this summary, you will learn the results of the groundbreaking *Future of Work* research project and the forward-thinking strategies that have grown out of this new knowledge.

Filled with case studies of companies that have learned to stay ahead of the curve and advice from their top executives, this summary will help every company ensure that it stays profitable and sustainable for years to come. The stories, case studies, experiences and research results serve to make the future of work — where all of us will spend the rest of our professional lives — both more productive and more humane.

IN THIS SUMMARY, YOU WILL LEARN:

- How to reduce fixed operational costs to remain competitive in the global marketplace.
- How to institutionalize the innovation process to quickly react to a changing marketplace.
- How to confront the coming talent gap for creative and knowledge-based workers.
- How to pick and choose concepts that can assist you in reaching your current strategic goals.
- How to recognize changing marketplace conditions you may be forced to confront in the near future.
- How to deal with the increased mobility of the work force.

Introduction

The initial results of the *Future of Work* project confirmed that although the global economy had undergone a series of rapid, model-shattering changes, most businesses were unable or unwilling to adapt their traditional management styles to new conditions. Prisoners of their own outdated business practices and assumptions about how work gets done, businesses found themselves losing ground to competitors who had not even been on the map a decade before. They became victims, rather than beneficiaries, of advances in information technology. And at a time when the attraction and retention of qualified employees had become an even more critical factor in a business' success or failure, they found themselves out of touch with a work force that had undergone a dizzying transformation in attitudes, abilities and ambitions.

Together, these factors resulted in a crippling loss of corporate agility.

Dinosaurs and Jaguars

How does a business evolve from a slow and unwieldy dinosaur to a nimble jaguar? The process is a collaborative, strategic approach to management that acknowledges and leverages the growing interdependence of human resources (HR),information technology (IT) and corporate real estate (CRE), a process called *collaborative strategic management* (CSM).

Each of these three functional areas has its own disciplines, its own values and its own challenges. Yet no business can operate effectively unless HR, IT and CRE are in sync, aligned both with one another and with the organization's broader strategic goals. For all these reasons, businesses today desperately need a clearly defined methodology that allows them to align their HR, IT and CRE strategies, and thus achieve that all-too-elusive corporate agility. ■

More Corporate Agility, Less Corporate Real Estate

In the summer of 2006, senior managers from Hewlett-Packard and Sprint-Nextel sat down at a Global Workplace program workshop in Dallas, Texas, sponsored by Jones Lang LaSalle's Workplace Strategies (WS) team, a relatively new but fast-growing division of Jones Lang LaSalle's Strategic Consulting Group. At the time, Hewlett-Packard's Global Workplace team was overseeing the completion of the first phase of its Workplace Transformation program, aimed at supporting HP's increasingly mobile work force and significantly reducing its CRE holdings worldwide.

The growing mobility of the work force, due more to naturally evolving work styles than to company policy, had left the lights burning above thousands of unoccupied desks, and the company, as a result, was scrambling to *right-size* its real estate holdings. For an organization with approximately 150,000 employees and 65 million square feet of real estate, the logistics were daunting.

By the summer of 2006, with the program's first phase well under way, the Global Workplace team had come to Dallas to share its experiences, to learn what it could from other companies' best practices and to discuss the opportunities for outsourcing specific program responsibilities to service providers such as Jones Lang LaSalle.

Jones Lang LaSalle

Jones Lang LaSalle's own WS pilot program was motivated by the same primary goal that had caused HP

to reorganize its businesses — the reduction of fixed operating costs. Almost as important, however, was management's desire to increase agility and innovation by encouraging greater cooperation between its business units, which had been scattered throughout the four floors occupied by the company in its headquarters at Chicago's Aon Center.

Convinced that the lack of communication between these units was causing the company to miss opportunities to offer clients a greater variety of its services, management turned to the reorganization of its new space in the Aon Center. The new design, an Open Office Environment, was intended to increase cooperation by greatly reducing the number of offices and corridors, encouraging collaboration through random, spontaneous contact. The approach began to yield results almost immediately.

Workplace Transformation

Every effort to increase agility and/or reduce cost through workplace transformation necessarily involves significant effort in all three key support areas: HR, IT and CRE. You can't trim or enlarge one piece of the puzzle without affecting the others. The agile corporation is one whose senior executives know how to *collaborate* with their peers in order to achieve such strategies.

When a prominent business magazine named Jones Lang LaSalle as one of the best companies to work for, it noted that the near total absence of interior walls led to the increased availability of senior executives — and to greater employee satisfaction. ■

The Three Major Business Challenges

The workplace programs of today will age just as surely as the work force will. It is only by continually reviewing market conditions, re-examining corporate strategies and reallocating resources accordingly that businesses can prosper in a volatile and unpredictable global economy. The three major challenges facing business today are:

1. **Reducing fixed operating costs.**
2. **Confronting the coming talent shortage.**
3. **Institutionalizing innovation.**

Corporate agility can be achieved only through the continuous, collaborative management of HR, IT and CRE.

Collaborative Strategic Management

CSM means putting processes and practices in place that will allow HR, IT and CRE managers to create a unified approach to the organization's business imperatives, and to resolve them while respecting a core of shared corporate values.

CSM is *strategic* in the sense that it anticipates — in fact, even expects — continual change in the broader business environment. It is about management *over time*, because continuous environmental change demands continuous organizational and managerial change. CSM is the dynamic and ongoing process of internal decision making that is the essence of corporate agility. ■

Reducing Fixed Operating Costs

Reducing fixed operating costs in order to increase corporate agility is *the* central business challenge of the 21st century. In an ever-more dynamic global economy, businesses must move from a fixed-cost to a variable-cost business model in order to remain competitive and to increase their ability to react quickly to changing conditions.

The primary opportunities for reducing fixed operational costs include the following:

• **Reducing the corporate real estate footprint.** Given the increased mobility of the work force and the changed nature of its work styles, management has begun to realize that a great deal of its costly real estate is unused. Meaningful change in a corporate real estate portfolio must begin with the accurate assessment of conditions, behaviors and needs, and then must be followed by the right-sizing of the real estate portfolio.

• **Reconfiguring corporate real estate.** If the retained space is not configured to support recent shifts in employee attitudes and work styles, as well as technological advances, costs will remain higher than necessary.

• **Green building.** Green building, or sustainable design, is yet another method of reducing fixed operational costs, and one that bears on other issues of corporate agility as well.

• **Choosing a location.** No longer limited to the local labor pool, a more distributed work force and online recruiting allow companies to throw out a wider net for new hires, but these realities also force companies to accept more flexible work patterns.

The work environment is ultimately about connectivity, or how a company utilizes a network of places, both virtual and physical, to enable its employees to connect with one another, and with customers and suppliers, no

matter where they are. *Strategy of place* involves identifying the people who you need to hire, knowing where they are and predicting where they will want to be in the future as they move through their careers. ■

Attracting and Retaining Human Talent

Attracting and retaining qualified, engaged employees is the second of the three primary business challenges of the 21st century. There simply isn't enough human talent to meet the current needs of business, much less the constantly expanding global economy. The bottom line here is that in a few years — say, 2010 — the United States will have 10 million more jobs than it will have qualified people to fill them.

Where will companies go to get the talent? About one-third of the total will come from retirees remaining in the work force, though most likely not in a full-time capacity; one-third will come from outsourcing or moving work to interior population centers within the United States; and the remaining third will come from retraining workers displaced from lower-skilled and lower-paying jobs.

Meaningful Work

From the beginning, furniture manufacturer Herman Miller's founder made it clear to all those who worked for him that the quality of his employees' lives was as important a part of his company as the machinery that produced its furniture. Eighty years later, that spirit survives in Herman Miller's intentional Employee Experience.

Built on its founder's belief that *people are what companies are made o*f, and that demographic and cultural shifts are changing the face of the modern work force, Herman Miller began to build its Employee Experience program in 2004 to ensure that the company remained an employer of choice for the future.

In order to coordinate the program with the company's evolving business strategies, its designers first assembled a cross-functional core team composed of upper-level managers from HR, IT and CRE, all of whom reported to a chief administration officer. The team then defined key ideas and integrated these ideas into the following themes:

• **Meaning.** Most people want more from work than just a paycheck.

• **Choice.** Intelligent, qualified employees don't like being told what to do.

• **Opportunity.** Opportunity is necessary for employees to satisfy their need for growth.

• **Engagement.** When meaning, choice and opportunity combine to give employees the feeling that they are "owners" of the company, employees will be engaged.

• **Leadership.** Leadership makes employees feel trusted and encouraged.

As the relative supply of creative labor shrinks, the pressure to achieve agility will grow. ■

Innovation and Survival

Institutionalizing innovation is the last of the three major challenges facing businesses in the 21st century. To innovate means to make new, and most companies that fail, fail to develop not only new products and services, but also processes to promote agility.

What was missing from U.S. automakers' business plans, if not innovation? While Japanese, Korean and European carmakers saw that market forces favored smaller, more fuel-efficient vehicles, General Motors, Ford and Chrysler continued to manufacture automobiles whose fuel ratings came ever closer to being measured in gallons per mile.

Institutionalizing innovation means changing more than the minds of management or union leadership. It is rooted in the relationship between innovation and these other factors:

• **Technology.** IBM's On Demand Workplace (ODW) was built as a collaborative, personalized online workplace that delivered relevant content and tools to employees no matter where or when they were working. The program linked thousands of previously disparate resources into a single portal through which employees could access the information and services necessary to do their jobs. By 2003, the ODW programs had reduced IBM's annual costs by $683 million.

• **Company culture.** In 1991, Herman Miller launched its Supplier Diversity Program to increase opportunities for minority-owned and women-owned businesses. In 1993, the company became a founding member of the U.S. Green Building Council, the only office furniture manufacturer on the association's initial roster.

• **The workplace of the future.** Creative spaces are a product of a conscious and continuous design process that has a beginning, but no end.

• **The work force of the future.** Walk into a dim, hushed, compartmentalized space, and you feel creativity in retreat. Walk into an open, busy, naturally lighted

(continued on page 5)

(continued from page 4)

interior, and you feel a rise in your energy level and sense that you are once again in a community.

The lines between these areas of inquiry, just like those between HR, IT and CRE, are no longer drawn as clearly as they once were. They have a tendency to overlap, so it is important to have a companywide strategic approach to institutionalizing innovation. ■

The Virtual Work Force

In the past, labor was brought to the workplace and inserted into an existing, unquestioned framework. Then, the work defined the work force; now, the situation is changing. The work force of the future, by virtue of its skills, attitudes, ambitions and scruples, is now in the process of recreating the workplace of the future.

There are at least six solid reasons to establish distributed work programs, and each contributes to corporate agility:

1. **Reducing basic work force support costs**
2. **Increasing work force productivity**
3. **Attracting and retaining talent**
4. **Reducing the business risk of disruption from terrorism or a natural disaster, or defending business continuity**
5. **Reducing traffic congestion, air pollution, and more generally, the impact of business on the environment.**
6. **Moving work to where workers want to live.** ■

Offices Without Walls

It is the nature of the work itself — whether in sales, client services, work force support or facilities management — that ultimately dictates both *where* the work should be done and by *whom*. Or, in the words of Accenture's Corporate Real Estate Workplace team, "Work is not a place you go, it's something you do."

That is certainly the case with CorasWorks, a software company founded in 2003, with hundreds of customers spread across 24 major industries, in 20 countries whose software has more than 500,000 regular users — but that has only two employees reporting to the office on a daily basis.

It's a description that fits Agilent's Fieldscape program too, where supermobile employees rarely utilize company workspace, working instead out of their homes, in clients' facilities or in *third places*.

These examples are familiar to anyone responsible for corporate real estate planning or involved in workplace strategies today. They demonstrate once again the way real estate, human resources and information technology all come together in the future of work.

Third Places

One of the most striking findings of the original *Future of Work* research program was the discovery of the demand for "third-place" work locations for mobile knowledge workers. Within the next couple of years as many as 20 million people will be choosing to work one or more days a week in third-place facilities — that is, public or private spaces built specifically for the temporary, or semi-permanent, business purposes of companies and individuals.

Workplace Strategy

In reviewing the ways in which a number of very different organizations have created new work environments or adapted old ones to the requirements of today and tomorrow, several themes evolve. In every case where the transformation was reasonably successful, all three of the critical support functions — HR, IT and CRE — were actively and strategically involved in both the planning and the execution of the change. In addition, there was extensive end-user involvement.

Workplace strategy includes the active coordination of all resources required to enable work wherever and whenever it takes place. The workplace of the future will be highly agile, mobile and distributed across time and space. How do you develop a comprehensive corporate strategy to deal with this changing environment? From a project management point of view, five sequential steps must be undertaken to make this vision come alive:

1. **Assess business requirements, capabilities and audit processes.**
2. **Define a workplace strategy, complete with a vision of its business value and impact.**
3. **Make specific tactical and operational recommendations for change.**
4. **Implement a staged plan of action.**
5. **Evaluate outcomes and make additional changes as needed.** ■

The Well-Designed Workplace

The General Services Administration (GSA) has produced one of the finest, most comprehensive and codified approaches to workplace design, exemplified by its program *Leading by Example: A Demonstration Toolkit for Creating a GSA World-Class Marketplace*. This is a result not only of the organization's leadership and staff, but also of the lessons learned from the vast number and varied characteristics of the projects undertaken by the organization over the years.

The Seven Hallmarks of the Productive Workplace

The GSA toolkit is meant to help the GSA design, construct, occupy and maintain workplaces for its associates in a manner that is optimal for the nature of the organization's work; that fosters its business strategy; and that expresses the agency's mission, values and culture. Its guidelines and processes are drawn from the Seven Hallmarks of the Productive Workplace, first introduced in the GSA's Integrated Workplace. Its principle features are:

1. Spatial equity. Design the workplace to meet the functional needs of the users by accommodating the tasks to be undertaken without compromising individual access to privacy, daylight, outside views and aesthetics. Requirements include natural daylight, views, fairness and multiple work settings.

2. Healthfulness. Create workplaces with a clean, healthy building environment free of harmful contaminants and excessive noise, with access to clean air, light and water. Requirements are air, water, ventilation, ergonomics, restrooms and amenities that provide a greater level of healthfulness and community.

3. Flexibility. Choose workplace configuration components that can be easily adapted to organizational or work process changes, and that can be readily restructured to accommodate key functional changes with a minimum of time, effort and waste. Requirements include furniture strategy, workstations that allow user adjustment, fluid layouts based on function, technology with integrated cable management and remote work capabilities.

4. Comfort. Distribute workplace services, systems and components that allow occupants to adjust thermal, lighting, acoustic and furniture systems to meet personal and group comfort levels. Requirements include thermal control, lighting control, ergonomically sound workstations, multiple work settings, adequate space and security.

5. Technological connectivity. Enable full communication and simultaneous access to data among distributed co-workers for both on-site and off-site workplaces. Specific requirements include coordination, plug-and-play systems that allow occupants to easily make connections, data sharing, telephone services, network access, virtual meeting needs and wireless accommodations.

6. Reliability. Support the workplace with efficient, state-of-the-art heating/ventilating/air conditioning (HVAC), lighting, power, security, and telecommunication systems and equipment that require little maintenance and are designed with battery and/or greater back-up capabilities to ensure minimal loss of service or downtime. Requirements include clean air ventilation, proper lighting, effective HVAC, instructions on the use of systems, security, maintenance and confirmation of the systems' intended benefits.

7. Sense of place. Endow the workplace with a unique character, appropriate GSA image and strong business identity to instill a sense of pride, purpose and dedication among individuals and within the workplace community. Requirements include providing well-designed signage; ensuring connectivity; demonstrating brand, values and beliefs; providing a sense of ownership; using desirable color schemes and finishes; and preserving original design quality. ■

Collaborative Strategic Management

In ideal situations, we attempt to move communication from an impersonal level toward a level of intimacy, which means an *increasingly common understanding of values and respect for differences*. This occurs when groups move from simply coordinating their activities to acting in a truly collaborative fashion. In this sense, the structure of the communication network is the foundation upon which you can build task structures and therefore, organizational effectiveness.

The Workplace/Work Force Transformation Program

With the advent of truly global markets; the continuing revolution in information technology; the globally distributed work force; and the growing, worldwide human talent gap, senior managers are beginning to understand that they may no longer be able to hit their own targets without the strategic cooperation of the company's other business units. It seems increasingly clear that those corporate entities unable to adapt their management practices to the growing interdependence of HR, IT and CRE will soon find themselves marginalized by their more strategically coordinated competitors.

(continued on page 7)

Collaborative Strategic Management

(continued from page 6)

The first order of business is the creation of a task force made up of upper-level executives from the departments of real estate management, human resources and information technology. Without sufficient, well-advertised involvement from upper-level management, the momentum necessary to overcome a company's natural resistance to change cannot be achieved.

Align Goals

The first task is strategic alignment of goals. It is imperative that any workplace strategy be completely aligned with the core business mission and plan. That means knowing the product development strategy for both production and market channels; the work force staffing plans; the financial management strategy; an overview analysis of the branding program; and how the technology deployment plan will support all these.

The optimal method of doing this review is a short series of executive roundtables where the external team brings information on the state-of-the-practice and the resources that are present. Briefings center on key questions regarding such issues as business drivers, competitive threats, strategy development and decision processes.

The result of this first step is a *statement of the business problem* and specification of the results desired. This statement is then used for an internal return on investment (ROI) analysis prior to proceeding with the next steps. This allows for creation of a set of recommended tactical programs that, when executed, will lead to the results required.

A New Workplace Strategy

At this point, the leadership team should assemble a task force to lead the job of defining a new workplace strategy. Once assembled, the task force will follow four simple, quantifiable steps:

1. Assessment. Deconstruct departmental activities. Map work processes. Conduct a task/activity analysis. Assess organizational readiness. Conduct a work force survey of needs and expectations. Develop alternate scenarios.

2. Recommendation(s). The key here is a comprehensive analysis of where suboptimization is occurring, where money can be saved and where funds should be reinvested to reach a set of collaborative strategies. The task force's recommendations will almost certainly include a series of gradual reductions in total square footage under company management, taking into account each division's needs given the company's new work force/workplace strategies, and a geographic realignment of the company's real estate assets.

3. Implementation. During this critical stage, the focus turns to IT, without which the attempt to distribute the work force will fail. The task force must ensure that these steps have been taken: division of IT has been prepared well in advance of any changes in staffing and real estate, the company's internal communications have been reconfigured *before* organizational change occurs, and coming changes in technology and the infrastructures this will require have been thoroughly considered before the company's systems are revamped.

4. Evaluation. The task force will be required, in conjunction with upper-level management, to continually re-examine the company's core goals and strategies, in order to recommend adjustments in work force/workplace strategy.

Management must consider these factors: establishment of units within each division for prototype testing; a linked training and development plan for initial program participants; a mechanism by which customers and suppliers can respond to the changes; and making permanent a new business model team that continuously looks for more effective, and efficient, ways to organize the business. ■

Achieving Corporate Agility

Achieving agility requires executives and managers to adopt fundamentally new ways of thinking. They have to shift away from the old linear, industrial model toward a more collaborative, systemic and holistic view of the world and their role in it. There must be a significant shift in how decisions are made in agile corporations, as opposed to a more traditional organizing and governance style.

Preparing for the Next Wave of Change

There are eight major categories of questions that you should be asking — simultaneously and continuously. There is no magic or best way to sort these questions, and of course, there is always some overlap. But if you are devoting resources to continuously investigating these areas, you will be prepared for the next wave of change:

1. Meta forces of change. What are the global sociopolitical forces that impact how we work? What are the possible alternative futures, given those forces?

2. Public policy issues. What are the workplace/work force effects of trade policies, employee benefit requirements, environmental laws and labor laws? What will these public policy issues be in five years, and how will

(continued on page 8)

Achieving Corporate Agility

(continued from page 7)

they affect your business and your customers?

3. Demographic dynamics. What are the multigenerational dynamics of demography, especially in underdeveloped countries? What factors influence generational cultures and values? What are the long-term trends in educational funding, in the United States and elsewhere?

4. Geography or talent pools. Close on the heels of the demographic questions, where will the most desirable talent be living in five, 10, 20 and maybe even 50 years? Why? What is the psychology that underlies mobility?

5. Work process and collaboration styles. What motivates humans to collaborate? How do compensation and reward systems affect work behaviors? More research is needed, as we really don't yet understand these areas very well.

6. Social and intellectual capital metrics. How should work force performance in a distributed work environment be measured and audited? How do you capture increased social capital on your balance sheet? What is that social capital worth in the marketplace?

7. Challenges and difficulties of managing a distributed work force. What are the specific competencies required to manage distributed workers successfully? What do leaders of the future look like? How do they develop these competencies?

8. Deeper understanding of barriers and sources of resistance to the new models. What are the cultural barriers to the fundamental changes that the future of work will bring — and demand? What kind of change management processes must be put in place? How do we get senior management on board?

Disposing of Unneeded Real Estate Assets

A significant part of the cost savings associated with collaborative strategic management (CSM) comes from shedding that 30 to 50 percent of unnecessary real estate. The quicker you can get that fixed cost asset off your books, the sooner you realize bottom-line gains.

Firms that represent tenants looking for good deals — and therefore bypassing traditional brokers — are already emerging in the market. The traditional broker is losing his or her place as a mediator, a development that is already underway in the automotive, airline and banking industries with the advent of e-commerce.

There should be a special, identifiable group of people within the organization who are tasked with answering these questions, over and over again.

A New Way of Looking at Organizations

Organizations contain three levels — or, more appropriately, *spheres* — of work. In the *activity* level, products or services are produced and distributed. In the *administration* level, different activities are coordinated. In the *policy* level, general direction is set. The point here is to locate the forward-looking role, the "futures group," at the policy level.

The three spheres of work — activity, administration and policy — represent a minimum set of necessary levels of an organization in the traditional sense. Executives set policy, middle managers coordinate action and non-managers do the work of the enterprise. You have to know where you are in the organization to understand how you fit into the overall scheme of things as well as how and what you can do to increase the organization's agility.

Core Issues at Each Level

The core issue for the activity sphere is "What are we doing?" These people are concerned about efficiency, resources and getting things completed.

Administrators are concerned with "How will we get it done?" They are characterized by control issues, methods of work and maintaining the status quo. Administrators are interested in survival.

Policy makers look at the question "Why are we doing this?" Their concerns center on issues of direction, effectiveness, the creation of new abilities for the organization and renewal.

An agile organization is one that strategically integrates the management of its real estate, human resources and technology assets. It does that in a collaborative fashion that requires a change from the decision-making processes and styles that rely on today. Finally, an agile enterprise organizes itself into three (and only three) levels that center on completion, survival and renewal. ■

THE SUMMARY IN BRIEF

When Lou Gerstner took the helm of IBM as its CEO in 1993, the company was a shambles — hemorrhaging money, drained by an insular corporate culture, and rapidly falling prey to smaller companies that could make the same products better, faster and for less money. Wall Street was calling for its breakup into small, independent business units, but Gerstner had other things in mind — to keep the company together, change the way it (and, eventually, its entire industry) did business, and show it could keep up with and even surpass the startups and small businesses presenting its biggest challenges. Lou Gerstner thought the enormous corporate elephant could dance as gracefully as its much smaller competition. He was right.

What You'll Learn In This Summary

✓ **Always be ready to fight.** Analysts took one look at the disparate units that comprised IBM and how much they were costing the company and its shareholders, and demanded they be broken out into their own businesses. Gerstner said "No", engaging in his first battle with "The Street."

✓ **If it's broken, fix it.** IBM had an anemic economic model, a host of revenue-draining assets, and even problems with its own internal information technology tools (an oddity in the information technology industry). IBM was in serious trouble when Gerstner took over. Yet, with the right vision and strategy (not to mention the valued resources that followed them), he was able to breathe new life into the moribund organization.

✓ **If it's not broken, fix it anyway.** Some aspects of the business could have probably been safely ignored or set aside. Gerstner improved them anyway.

✓ **Make a personal commitment to leading.** True leadership — the kind that makes companies special, that can turn them around, that can make elephants dance — requires commitment, determination and passion for life, for business and for winning.

WHO SAYS ELEPHANTS CAN'T DANCE?

by Louis V. Gerstner, Jr.

— THE *COMPLETE* SUMMARY

Laying Down Expectations

Shortly after Lou Gerstner was introduced as IBM's CEO in the Spring of 1993, he met with the company's Corporate Management Board — roughly the top 50 people in the company. He laid out for them a number of troublesome areas in the company:

- Loss of customer trust, supported by low customer ratings on quality.
- The mindless rush for decentralization.
- Slow response to cross-unit issues.
- Tension over control of the marketing and sales processes.
- A confusing and contentious performance measurement system, resulting in serious problems when closing sales with customers.
- A bewildering array of questionable, even senseless, alliances.

Gerstner announced a program called "Operation Bear Hug." Each of the 50 members of senior management would, within three months, pay a personal visit to a minimum of five of IBM's biggest customers, find out first-hand what their needs and concerns were, and report back to Gerstner. The Bear Hug meetings became the first step in reducing the customer perception that dealing with IBM was difficult.

Gerstner also disbanded the Management Committee (MC), the small board of executives who okayed every major decision at IBM — a group that, in Gerstner's view, gave only rubber-stamp approval and was more of a figurehead panel than an actual decision-making body.

Within the first weeks on the job, Gerstner also met with various leaders in the computer and telecommunications industry, including Andy Grove of Intel, Bill Gates of Microsoft, and John Malone of TCI, many of whom encouraged Gerstner to get IBM out of the PC or chip business, hinting the company was too slow to compete. He even conducted individual interviews with major publications, like the *New York Times, Wall Street Journal* and *USA Today*, which, nonetheless, gave IBM and its new chairman mediocre grades for their initial performance after Gerstner came aboard. ■

Gerstner's Greatest Accomplishments

If you ask Lou Gerstner today what was his greatest accomplishment in all his years at IBM, he would say it is that his successor is a longtime IBMer, as are the heads of all the company's major business units. He didn't "clean house" of managers and executives when he came aboard; IBM was too big and complex for such a move, and there were too many talented people with unique expertise.

What he did do, shortly after disbanding the Management Committee, was create an 11-member Corporate Executive Committee (CEC) to help him make big-stakes decisions. The CEC would not accept delegation of problem solving, nor would it sit through presentations or make decisions for business units. Its focus was solely on policy issues that cut across multiple units.

Gerstner also reduced the size of IBM's board of directors, from 18 to 12 members, then rebuilt it with some of the best and brightest minds in all of the day's business communities. The board, as a result, has been a strong, involved, effective and important contributor to IBM's success.

Holding the Vision

After only 100 days on the job, and with major news outlets and analysts alike calling for some visible, tangible proof of a turnaround at IBM, Gerstner went public with four key strategic initiatives:

Holding the Vision

(continued from page 2)

1. Keep the Company Together

Gerstner decided very early on to keep IBM one unified enterprise, in the face of an increasingly diversified computer market. While IBM was slow to deliver distributed computing (delivering increased computing power to individual users), other companies moved in, supplementing IBM's basic systems with add-on applications and hardware that provided the powerful systems both business and home computer customers wanted and needed.

Gerstner recognized that no one company was positioned to be an integrator of all these disparate parts. Before the components reach the consumer, someone must sit at the end of the line and bring it all together in a manner that creates value for customers. Gerstner saw IBM as being uniquely positioned to be that company, the one that could apply complex technologies to solve business challenges. He knew the company had to be saved, had to remain together. What he didn't know was how exactly to deliver on the potential of the company as a unified enterprise.

2. Change the Company's Fundamental Economic Model

In simplest terms, if a company's revenue, gross profit, and expenses are all moving in the right relationship, the net effect is growing profits and positive cash flow — the makings of a successful business. In 1993, those relationships at IBM were all wrong — revenue was slowing (due to the company's reliance on declining mainframe sales); gross profit margin was sinking (due to the discounted prices it had resorted to in order to sell mainframes); the company's expenses were out of control.

Expenses were, however, the first issue tackled — $8.9 billion was slashed out of the budget. This required an employment reduction of 35,000 people (in addition to the 45,000 jobs cut in 1992 — the first such layoff in the company's history).

3. Reengineer How the Company Did Business

Gerstner saw IBM's business processes as cumbersome and highly expensive, requiring a reengineering program of gargantuan proportions, a top-to-bottom overhaul of its basic operations. Gerstner focused on six core initiatives: hardware development, software development, fulfillment, integrated supply chain, customer relationship management, and services. These were the processes most visible to external customers, and they were soon joined in reengineering efforts by several internal processes, including human resources, procurement, real estate, and, oddly enough, information technology. From 1994 to 1998, the total savings from these reengineering projects was $9.5 billion.

4. Sell Nonessential Assets to Raise Cash

Only a handful of people understand how close IBM came to bankruptcy in 1993. Gerstner noted then that there were a number of assets that could be sold to make the company solvent again, and, thus began a wholesale jettisoning of nonessential assets:

- Much of the corporate airplane fleet was sold.
- The corporate headquarters in New York City was put on the block.
- The bulk of the company's fine art collection was auctioned off.
- IBM's Federal Systems Company (which primarily handled government contracts) was sold to the Loral Corporation.

These sales went on for many years — even after the need to raise cash dwindled. As the years went by, Gerstner continued streamlining the company in an effort to achieve and maintain focus in essential operations. ■

IBM's Internal IT Woes

Gerstner's greatest shock upon starting at IBM was the state of the company's internal information technology (IT) infrastructure. He found the company spending $4 billion a year on IT alone, yet people still didn't have the basic information they needed to run the business. The systems were antiquated and couldn't communicate with one another. IBM had hundreds of data centers and networks scattered around the world, many of which were dormant or being used ineffectively.

The company saved $2 billion in IT expenses by the end of 1995, going from 155 data centers to 16, and consolidating 31 internal communications networks into a single one.

Reinventing Big Blue

To understand the extent of IBM's turnaround under Lou Gerstner, it is necessary to understand a bit about the company's history, particularly the company's success under Thomas Watson, Jr., who succeeded his father as CEO in 1956 and who was at the helm when the company introduced System/360, its wildly success-

(continued on page 4)

Reinventing Big Blue

(continued from page 3)

ful mainframe family. System/360 was the Microsoft Windows of its era — an era IBM led for three decades. Both IBM and Microsoft seized upon major technology shifts and brought to market entirely new capabilities for customers.

Standing on Top

In IBM's case, the big technology shift came with the advent of the integrated circuit, or semiconductor chip. Watson and his colleagues knew that those chips could handle massive amounts of work, placing the computing power that used to require a room full of machines into a box that sat in a corner (and, eventually, on one's desk). At great research and development cost, IBM fashioned a family of computers — from very small to very large processors — and peripheral devices that would enable customers to grow their systems as their business needs grew.

IBM built its entire business around mainframes — all hardware, software, sales and services were tied to System/360. Competitors reeled; many disappeared. The company appeared invincible, until the advent of the UNIX "open" operating environment in the early 1980s showed chinks in IBM's armor. Customers finally had a viable alternative to IBM's mainframe products and pricing, and the open, plug-and-play nature of the environment meant that other companies — many other companies — could gain entry into the once locked realm of information technology solutions.

The Faltering Foundation

After UNIX cracked the foundation, PC makers came along swinging wrecking balls. IBM barely put up a fight; because it didn't see PCs infringing on its enterprise computing franchise, it surrendered control of the two most valuable PC components — its operating system and microprocessor — to competitors (Microsoft and Intel, respectively). By the time Gerstner arrived, those two companies had ridden their successes to the very top of the computer industry.

Gerstner's strategy to get IBM back on top hinged on two risky bets: first, that the IT industry's disaggregation into thousands of niche players would make a *services-led* business model a huge growth segment of the industry; and, secondly, that standalone computing would give way to *networks*, allowing computing functions to be performed from a wide range of hardware — from cell phones to handheld devices, to household appliances. Gerstner then worked, over time, to align IBM's strategic efforts in four key areas: services, software, Original Equipment Manufacturer (OEM) business and e-business.

Services

The key to Gerstner's turnaround — to winning the bet and establishing his vision at IBM — was transforming IBM's service entity from one that dealt solely with IBM products, to one that was truly focused on serving customer needs. Along with Dennie Welsh — the head of IBM's service subsidiary — Gerstner transformed IBM's entire philosophy, from one that essentially sold IBM solutions to one that could, if the customer's needs were right, suggest competitive products as well, and help maintain the total solution after purchase.

Once he established the new service philosophy, Gerstner broke the service unit out as a separate company — IBM Global Services. Problems were myriad at first — IBM was essentially building a labor-based business inside an asset-intensive company. But Gerstner and Welsh built the unit into a solid success, because they were able to do the following:

- **Use its balance sheet.** Such a unit must be willing to carry the infrastructure and loss until long-term contracts become profitable.
- **Drive economies of scale.** One must consolidate a lot of customer data centers into smaller units, and use fewer resources to do so.
- **Build recruitment, training, compensation and HR processes.** The unit had to bring in a bulk of people (1,000 or more) every month — something it had never done before.
- **Be disciplined.** The unit's leadership had to learn how to negotiate profitable contracts, price their skills, assess risks, and walk away from bad contracts and bad deals.

Software

When Gerstner arrived at IBM, the company was locked in a pitched battle over operating system (OS) superiority — the company's OS/2 system versus Microsoft's Windows. It only took a short period of time for Gerstner to realize that in the networked world, desktop operating systems were yesterday's battle.

What IBM's software unit focused on was computer middleware — the largely invisible layer of databases, systems management software and transaction-management programs that connect front-end applications with the operating systems behind them (in other words, the tools a user sees and uses, and the stuff that makes the tools run). Gerstner instructed the unit to engage in a massive, multi-year effort to make IBM's middleware applications more open and network-enabled. That

(continued on page 5)

Reinventing Big Blue

(continued from page 4)

effort, combined with several strategic acquisitions, made IBM's Software Group one of the most powerful software companies in the world.

OEM

The announcement in April 1994 that IBM would mount a serious push to sell its technology components on the open merchant (or Original Equipment Manufacturer — OEM) market was equal parts pragmatism and risk. The reasons for the decision were compelling:

- The company had been underutilizing its Research Division, a fertile and creative asset.
- Dispersing its technology more broadly would drive the company's ability to influence the definition of the standards and protocols that underlie future industry development.
- Selling its technology would recoup some of the company's R&D expenditures, as well as open up a new income stream.
- In a post-PC world, there would be high demand for components to power network-accessible devices.

The company's Technology Group started out simply enough, selling simple memory chips (called DRAMs). This served as an entry point; once IBM proved its mettle in this segment, customers were less worried about their reliability as a supplier, a fact that has been an asset to the company as it moves into the emerging opportunity of providing chips to service the growing networked products industry.

E-business

The term *convergence* had been on the tongues and minds of technology professionals for years before Lou Gerstner came aboard IBM. Simply put, convergence is the melding of traditional analog technologies (like telecommunications or consumer electronics) with their digital kin.

In the early 1990s, inside IBM the concept took the form of "the cloud" — a graphic representation of a network that could enable and support incredible amounts of communications and transactions among people, businesses, and institutions. Gerstner recognized that if the cloud became the focus of all such interaction, it would cause a revolution in computing (moving emphasis away from the PC, toward larger enterprise systems inside the cloud) and one in business (interactions between individuals, groups, governments and other entities would be revolutionized by massive, global connectivity).

IBM was uniquely positioned to benefit and lead in this new, convergent environment, in part because it had embraced open, standards-based computing, including important Internet standards and protocols. To succeed, the company had to do the following:

- In software, recognize middleware applications would be the integrating glue of networked applications.
- In service, a new business was built around Web hosting, including consulting and implementation components.
- In component technology, it had to maintain and grow the foundry of specialized chips that were in high demand.
- Get the entire company on board and moving together.
- Deal with the confusion over what exactly made an e-business company. IBM's focus — middleware applications, service and chip technology — were not as visible to the online public at large as products such as browsers.
- Revamp all marketing communications, to communicate the real value inherent to the Internet, and how IBM did fit into that equation.

Lou Gerstner considers IBM's e-business campaign to be one of the finest jobs of brand positioning he has ever seen. ■

Mr. Watson Pays a Visit

A special moment occurred for Lou Gerstner in the first few weeks of his tenure at IBM:

"I walked out of my house one morning at my usual early hour," he explains. "However, when I opened my car door, I suddenly realized there was someone sitting in the back seat. It was Thomas Watson, Jr., former IBM CEO and son of IBM's founder. Tom literally lived across the street and had walked up my driveway to surprise me and ride to work with me. He was 79 years old.

"He was animated and, perhaps better stated, agitated. He said he was angry at what had happened 'to my company.' He said I needed to shake it up 'from top to bottom' and to take whatever steps were necessary to get it back on track.

"He offered support, urged me to move quickly, reflected on his own career, and, in particular, the need he had seen over and over again to take bold action. At the end of our ride together, I had the feeling he wished he could take on the assignment himself!"

Addressing Corporate Culture

Lou Gerstner came to see that culture isn't simply one aspect of the game — it is the game. An organization is nothing more than the collective capacity of its people to create value. Taken on their own, concepts like vision, strategy and financial management can only take a company so far; it is only when those elements are ingrained into the very fiber of an organization that that organization has the chance to be great. The values a company claims to have (teamwork, customer service, shareholder value and the like) do not necessarily translate into the day-to-day behavior of an organization's employees.

Successful institutions almost always develop strong cultures that reinforce the elements that make the institution great. They reflect the environment from which they emerged. When that environment shifts, the culture tends to impede the organization's ability to adapt.

Such was the case at IBM, which seemed to exist in the shadow of its founder, Thomas J. Watson, Sr., a self-made man who engendered a culture of respect, hard work, and ethical behavior at his company.

Watson deliberately and systematically institutionalized three Basic Beliefs that had made IBM successful under his stewardship:

- **Excellence in everything we do**
- **Superior customer service**
- **Respect for the individual**

These Beliefs were baked into the company's compensation and benefits systems, its management schools, its training programs, its marketing and customer support. They formed the doctrine of the company.

At the same time, companies need to change — as the world changes, the rules, guidelines and customs lose their connection to what the enterprise is all about. What the Beliefs had meant in 1962 (when Watson's son, Thomas J. Watson, Jr., introduced them) was not the same as what they meant in 1993, when Lou Gerstner took the helm.

When IBM was at the early height of its market share, "superior customer service" essentially meant "servicing our machines on the customer's premises." Over time, however, the idea of service became deeper, more layered — the needs of IBM's customer base had changed, and the company had no way of knowing what those needs were, because they didn't know how to ask. Customer service became more of an administrative task than a nuanced approach to individual clients.

Over the course of 30 years, as the Beliefs became further ingrained in the company culture, a sense of entitlement among employees made them feel immune to such external forces as competition, price wars, and the like. They believed that anything important started inside the company, and were essentially disinterested in customer needs. As this happened, employees shifted their attention away from external forces, toward insular, internal politics. There was general permission to stop projects dead in their tracks (the infamous "nonconcur" system), a bureaucratic infrastructure that defended turf instead of promoting collaboration, and a management class that presided, rather than acted. ■

The Culture of "No"

The aspect of IBM's culture that Lou Gerstner found most remarkable was the ability of any individual, and team, any division, to block agreement or action. The Belief "Respect for the individual" had dissolved into a pervasive institutional system for nonaction, one that supported something as extraordinarily restrictive as the nonconcur system, in which IBMers, when they disagreed with a position taken by their colleagues, could announce they were "nonconcurring."

The net effect was unconscionable delay in reaching key decisions, duplicate efforts (as units focused solely on their own pet approaches) and bitter personal contention, as hours of work would be jeopardized or foiled by lone dissenters. Years later, Gerstner heard it described as a culture in which no one *would* say yes, but everyone *could* say no.

Principled Leadership

In order to breathe some fresh air into the organization, Gerstner did away with the Basic Beliefs, pointing instead to eight principles:

1. The marketplace is the driving force behind everything we do. Gerstner recognized that IBM was guilty of producing confusing technology, then making it instantly obsolete. Under the first of Gerstner's principles, the company vowed to focus on serving customers and, in the process, beating the competition.

2. At our core, we are a technology company with an overriding commitment to quality. Technology was always IBM's greatest strength. Under Gerstner, the company needed to funnel that knowledge into developing products that served customer needs above all else.

3. Our primary measures of success are customer satisfaction and shareholder value. No company is a success, financially or otherwise, without satisfied customers.

4. We operate as an entrepreneurial organization with a minimum of bureaucracy and a never-ending

(continued on page 7)

Principled Leadership

(continued from page 6)

focus on productivity. The warp-speed marketplace demands that the company accept innovation, take risks, and pursue growth, both by expanding existing businesses and finding new ones.

5. We never lose sight of our strategic vision. Every business, if it is to succeed, must have a sense of direction and mission, so that it knows what is important, and how it fits into any given situation.

6. We think and act with a sense of urgency. Planning and analysis should never be carried out to the extent that the job that needs to be done now does not get done.

7. Outstanding, dedicated people make it all happen, particularly when they work together as a team. The best way to end turf wars is to cherish and reward teamwork, particularly teamwork that delivers customer value.

8. We are sensitive to the needs of all employees and to the communities in which we operate. People must have the room and resources to grow, and the communities in which we do business must become greater because of our presence.

Some questioned the need to do away with the Basic Beliefs, in favor of these new principles. For Lou Gerstner, the reasons were clear — the Basic Beliefs had morphed from wonderfully sound values to something virtually unrecognizable.

Lou Gerstner used these principles first to serve as a wake-up call to his leadership team — to motivate them to focus its talents and efforts outside the company, not on one another. Gerstner noticed almost immediately upon taking the CEO job that so few of those in his employ talked with passion about a competitor; on the contrary, many spoke with passion about other parts of IBM. He couldn't believe competitors and critics alike were saying IBM was through, that those competitors had taken so much market share from IBM, and yet, all the company's leaders could worry about was their own little internal turf.

Win, Execute, Team

Gerstner set company leaders on a new path, based on the eight principles and focused on three simple key concepts:

- **Win.** Business is a competitive activity — there are winners and losers. In the new IBM, there would be no place for anyone who lacked zeal for the contest. The opponent is out there; the marketplace must be the driving criterion for all actions and behaviors.
- **Execute.** Speed and discipline must supersede the obsessive perfectionism that caused IBM to miss market opportunities, allowing others to capitalize on the company's discoveries.
- **Team.** Everyone must commit to acting as one IBM, plain and simple.

"Win, Execute, Team" began as a mantra, and eventually took the form of a new performance management system, based around these three concepts (dubbed Personal Business Commitments, or PBCs), and the actions employees were going to take in the forthcoming year to fulfill those commitments.

The Moon Shot

Yet, even with this new focus, Gerstner knew he needed something more, something to shake his company out of its complacency. IBM had been averse to change for so long that its management and employees never saw the external challenges coming that wound up shaking the company to its core. Gerstner used the near-collapse of the company as a focal point for bringing about change, but he knew the memory of that would not last forever. There came a time when it was clear to all that the company's life-or-death crisis was over.

In order to maintain the momentum of change and keep the company focused on a singular goal, Gerstner decided to declare e-business as IBM's "moon shot," its galvanizing mission, the purpose that would be incorporated into everything the company did from that point forward, the new ground for its behaviors and operating practices — in other words, its culture. In moving focus from crisis to mission, Gerstner shifted the internal discussion from "What do we want to be?" to "What do we want to do?" ■

Lessons Learned

Lou Gerstner has often been asked what he has learned over the course of his three decades in business. Although he notes that each individual's circumstances are different, there are fundamentals that characterize successful enterprises and successful executives.

They Are Focused

Lack of focus is the most common cause of corporate mediocrity. Some companies stray too far outside their realm of expertise, taking a "grass is greener approach" — Xerox going into financial services; Coca-Cola into movies; Kodak into pharmaceuticals. Others determine acquisition is the best way to grow their business, rather than working hard to fix or build their base business. Quite often, such deals not only fail to work; they wind

(continued on page 8)

Lessons Learned

(continued from page 7)

up sinking the acquiring entity further into the morass of their growth problems.

At the end of the day, a successful, focused enterprise is one that has developed a deep understanding of its customers' needs, its competitive environment, and its economic realities. Vision statements might make a company's employees feel good or revved up, but they cannot turn a goal into reality. Vision is not the same as strategy.

Intelligence wins wars, whether on the battlefield or in the marketplace. Deep competitive insight is critical to success. A company might want to believe its products are the best available, but facts are facts — that company will never know how valuable or valued its products are without examining them for cost, features and functionality, and comparing those findings with those of the competition.

That analysis feeds directly into corporate strategy — insightful action plans built on clearheaded thinking and analysis, long on detail and short on vision, that are reviewed regularly, becoming, in a sense, the driving force behind everything a company does. From there, resources are applied to the most important elements of the strategy; this, on occasion, will require reprioritization of some resources, taking them away from one task or project to put them on a more important phase of a strategy. While this is rarely easy (and, often, not done very well), it is nonetheless necessary in some instances.

They Are Superb at Execution

Execution — getting the task done, making it happen — is the most unappreciated skill of an effective business leader. It is extremely difficult to develop a unique strategy for a company; if that strategy is truly different from what others in the industry are doing, it's probably highly risky. Industries are, after all, defined by economic models, explicit customer expectations, and competitive structures that are known to everyone and impossible to change in a short period of time.

Execution is really the critical part of a successful strategy. Getting it done, getting it done right, getting it done better than the next person is far more important than dreaming up new visions of the future. According to Lou Gerstner, effective execution is built on three attributes of an organization:

● **World-class processes.** Every industry has five or six key factors that drive leadership performance; the best companies build processes that enable them to outperform competitors vis-à-vis these success factors. If your company has antiquated, disconnected, slow moving processes — particularly those that drive success in your industry — you will end up a loser.

● **Strategic clarity.** Companies that out-execute their competitors have communicated crystal-clear messages to all their employees on mission and strategy, but this does not automatically lead to perfect execution. Superb execution is more about values and commitments, the reinforcement of communicated strategies in everything a company does.

● **High-performance culture.** Superb execution is not just about doing the right things, but doing the right things faster, better, more often and more productively than your competitors do. This type of high-performance culture is full of leadership-driven, self-starting executives and committed employees; it makes first-rate products; it also maintains a culture in which excellence is praised, cherished and rewarded.

> ***The best leaders don't hide behind staff; they don't simply preside over the work of others. They are visible every day with customers, suppliers and business partners.***

They Abound with Personal Leadership

In Lou Gerstner's mind and experience, personal leadership is the most important element of institutional transformation. Great institutions are not managed; they are led. The best leaders create high-performance cultures, with demanding goals, measured results and full accountability. They don't hide behind staff; they don't simply preside over the work of others. They are visible every day with customers, suppliers and business partners.

The finest CEOs of our time — the Sam Waltons and the Jack Welches, and the Andy Groves — are all passionate about winning. They urge their colleagues to win. They hate to lose, and when they do lose, they demand that what caused them to lose be corrected. Leadership is not cold or intellectual — it's personal. The passion exhibited by these leaders was not a substitute for good thinking or good people or good execution. Rather, it is the electricity that courses through a well-made machine that makes it run, makes it hum, makes it want to run harder and harder.

Leaders must also possess the highest level of integrity, of fairness and even-handedness. Playing favorites or excusing some while others hang for the same offense, destroys morale and the respect of colleagues. There are almost always good arguments to be made for bending the rules, but the executive that allows too many exceptions will find his leadership eroded, the trust of his colleagues evaporated. Leaders must demand uniform and fair adherence to good principles and policies in order to be effective. ■

Fruit Stands and Fortune 500 Companies

How Universal Laws of Business Apply to a Company of Any Size

by Chris Bachler

What the CEO Wants You to Know is a small, unpretentious-looking book that could easily be overlooked on the shelves by readers who look for big things in big packages. But this little book is compact because its message is equally compact — and purposefully so.

Author and management consultant, Ram Charan, sets out to accomplish a limited, yet important objective. That specific objective is to help business professionals — from the board room to the mail room — understand that underneath it all, business is basic, simple and adheres to universal fundamentals. To make this point, Charan draws upon his earliest memories of life in India.

What the CEO Wants You to Know
by Ram Charan
Published by Crown Business, Copyright 2001, 137 pages, $19.95

Fundamentals of Business

The book is autobiographical in some respects, with Charan reminiscing about his early years in India where he learned the basics of business firsthand by working in his family's simple shoe shop, along with 12 other members of his extended family.

Though business was a struggle (their nearest competitor was right next door), the shop prospered enough to subsidize Charan's engineering degree, then later his MBA and Ph.D. in business at Harvard Business School.

It was in India, as a child — long before Harvard Business School — that Charan learned the most important things about business. It would take many more years of formal education and working closely with the finest business leaders in the world before Charan would fully grasp how basic and fundamental business is at its foundation.

In other words, while some people clearly have a greater knack for business than others, there is nothing complicated about those fundamental principles that, if followed faithfully, can bring almost any businessperson success.

He strongly emphasizes this point, even touching on some of the mundane details of running a shoe shop or a fruit stand. However, it's clear that Charan's purpose is to immerse his readers in the world of the small business in order to reorient their perspective from the ivory tower to the nuts-and-bolts wisdom of the small entrepreneur.

But what is so special about the small entrepreneur? Perhaps just one thing: The small entrepreneur is able to see and understand the business in its entirety. He has a panoramic view of buying and selling, marketing, customer service, bookkeeping and every other aspect of the business.

In addition, he learns to peer deeply into all the minutiae. With little complexity and no bureaucratic layers to hack through, the small-business person is blessed with the ability to understand his business as well as he knows his own mind. According to Charan, this entrepreneurial perspective is needed at all levels of even the largest companies.

This panoramic view, however, is typically lacking within today's imperial corporations. With so much size, variety, complexity, bureaucracy and change, it is hard enough for someone to firmly grasp his own responsibilities in his own little niche, let alone to comprehend the inner nature of the entire mega-enterprise.

Rather than encouraging a comprehensive view of the company, today's business world tends to promote greater specialization. Henry Ford's assembly line lives on.

We are urged and rewarded to learn as much as we can about one very specific field. Aren't specialists generally prized more and paid better? Don't organi-

"Today's business leaders need both range and depth. They need to understand every dimension of the enterprise, and they need to understand every part right down to its essence."

zations usually prosper by pulling together a broad mix of specialists, each assigned to a very specific task in one isolated corner of the company?

What is the cost of specialization to enlightened leadership? According to Charan, the downside shows up in leaders who move up through their silos because of their brilliance in their own areas of specialty, then, reaching the top, fail because they cannot cover all the necessary bases.

Today's business leaders need both range and depth. They need to understand every dimension of the enterprise, and they need to understand every part right down to its essence. How else can they make the right decisions and make them quickly? How else can they keep their vast enterprises afloat in the age of industrial world war? How else can they keep investors interested and customers loyal?

Nevertheless, what opportunity does the typical corporate employee, raised and stuck in his special department, or "chimney," have to get even a marginal glimpse of the bigger picture? How much does the sales manager know about manufacturing, purchasing or any other division of the company when he's always been in sales and moved vertically in that division alone?

Imagine the problem he would have were he to become CEO or COO and suddenly need to run a whole company — most of which is strange to him. In this situation, that once-brilliant sales manager might wash out.

Here is where Charan's emphasis on "shoe shop" thinking comes into play.

The Best CEOs

The most interesting parts of the book are Charan's descriptions of the qualities of great leaders. These observations are offered throughout and include supporting examples of such business giants as Jack Welch, Sam Walton, Michael Dell, Jac Nasser and Larry Bossidy.

A great CEO, Charan maintains, must have good "business acumen." By this, he means someone who "has a way of bringing the most complex business down to the fundamentals. ... The most successful business leaders never lose sight of the basics ... [and have] an insatiable desire to cut through the complexity to the fundamental building blocks of money making."

A leader with true business acumen will focus on just a few realistic business priorities that are designed to retain customers and build income.

He or she will also look for ways to get up close and personal with customers. The late Sam Walton, founder of Wal-Mart, was known for mixing freely among employees and customers. Bob Nardelli, CEO of Home Depot, frequently visits stores, puts on the orange apron and waits on customers.

On leadership, Charan offers some good — sometimes even surprising — insights. Mastering both the business and people sides, he says, is crucial for CEOs to deliver results.

Charan writes, "Being a leader of people is not the same as being a people person. ... Personality alone is not what makes a company deliver. It takes insight into how the organization really works and how to link people's actions and decisions to the right priorities. It is this ability, in fact, that sets the superstar CEOs apart from the rest."

In short, the world's best CEOs possess "street smarts" or common-sense wisdom. They're plain thinkers; and if they're brilliant, they don't advertise it. Instead, they're quite willing — as Jack Welch was — to play the role of the student, thus encouraging others to pour out the bounty of their wisdom.

According to Charan, the main difference between running a fruit stand and a multinational corporation is one of size.

Of course, the big companies are more variegated and complex, but they can forget that the fundamentals are always the same.

Moreover, much of the complexity that seems inevitable for the modern enterprise is needlessly created by business leaders who are locked into a mindset that simplicity is for simpletons and complexity is a badge of distinction.

However, Charan thoroughly disagrees with this mindset.

Image, Income and Growth

Charan reminds readers that company image and perception are every bit as important as income generation. He points out the great importance of investor confidence in a company's performance and explains the formula used in their favorite yardstick, the Price-Earnings multiple.

"When a company misses expectations," he writes, "investors begin to question the company's discipline. Doubts arise about whether the company can deliver on its commitments going forward. ... They begin to panic when one of their investments misses the expected money-making target more than two times in a year."

Charan boils down the often overlooked or misunderstood basics of income generation, which depend not only on profit margin but also on "velocity," or product turnover. He expresses this in the following simple formula:

Return = Margin x Velocity

Products must move through a business as quickly as possible, he says.

Growth is another essential that should concern every employee. For the average employee, growth might mean a slightly greater opportunity for promotion. Yet real corporate growth is necessary for business survival and essential to avoid being overtaken by competitors. Charan offers Westinghouse, a company once comparable to GE, as an example.

Still, the author is quick to concede that sloppy growth can be dangerous. Size is not a measure of success, according to Charan. He asks, "Are you growing in a way that is generating or consuming cash?"

Personal Coaching

Charan identifies the single biggest problem that managers have to confront when coaching employees — their reluctance to be straightforward when tackling unpleasant matters.

This tendency toward avoidance goes back to an innate trait in human nature — a reluctance to stir up conflict. Most often, the instinct serves us well. But leaders must be able to see beyond short-term unpleasantries to head off long-term disasters.

Charan dismisses the value of performance reviews as a means of developing personnel.

"Coaching is not a performance review," he writes. "It's not about what someone did last year, and it's not about money. It's very personal. You're hitting the person between the eyes. You're helping him face his blind sides and learn to do things better. The feedback has to be honest and direct. No sugar coating."

A manager coach needs to think beyond an employee's short-term behavior — at least if he wants to groom the employee for advancement. "Most often, when leaders try to coach others, they focus only on behavior," Charan points out. "Don't forget the business side. Can the person cut through the complexity? Is the person selecting the right business priorities?"

When hiring, Charan also encourages managers to look beyond the resume and other routines and to probe for personal qualities that are of paramount importance.

Here Charan takes another page from Sam Walton. "Sam Walton defined the most important criterion for hiring in his business: common sense. He carefully selected people who met the criterion

"When hiring ... look beyond the resume and other routines, and probe for personal qualities that are of paramount importance."

and developed and trained them. Employees were taught to watch sales, price, inventories and customers like a hawk. And they had considerable autonomy to make decisions and take action."

Examples From Major Companies

To support each key point, Charan offers numerous real-life examples of how CEOs of major companies have applied good business acumen with remarkable success. These anecdotes are refreshingly brief and to the point. He recounts most of them from firsthand experience.

A few of these anecdotes include:

- How Dell found success through stunningly low inventories.
- How Ford bolstered lackluster sales by streamlining its product lines.
- How GE's Jack Welch turned to the Internet to reduce transaction costs from $1 to 2.5 cents.
- How Wal-Mart's Sam Walton kept his regional managers in tune with minute-by-minute developments in the business by requiring them to pay weekly visits to both company stores and competitors.

"None of these successes," Charan maintains, "could have been achieved without business acumen on the one hand, and leadership of people and the organization on the other. Business acumen provides the road map and clarity. But unless you want to be a one-person shop, you must learn how to link business priorities and people."

What Does the CEO Want You to Know?

It is not immediately clear why Charan titles his book *What the CEO Wants You to Know*, nor does he state his reasons. A safe assumption might be that CEOs want all their people to better understand the fundamentals of business.

Certainly the rationale is plain enough. Better-informed employees are better performers. Moreover, even lackluster employees will better appreciate the sometimes complex and always stressful challenges that their CEOs face every day.

Charan's reflections on his childhood in the family shoe shop are a bit overdone, though he leaves those behind after the first couple of chapters. The flaw is forgivable when viewed in the greater context of the book itself and its intention to cut through the barriers of 21st-century business thinking, reminding readers how simple business philosophy should be.

Charan's purpose is not to present revolutionary ideas. He wants readers to think beyond their day-to-day routines; he wants them to see their roles within the framework of a broader context and to awaken their dormant entrepreneurial instincts.

The result is analogous to the experience we have whenever we hear about a new idea that sounds so shockingly simple that we upbraid ourselves for having overlooked it.

Final Examination

Charan repeatedly urges his readers to "cut through the complexity." To do that, however, you must know something about it. Otherwise, you won't know what to cut through.

So Charan provides a laundry list of areas that he recommends should be examined, including such broad topics as underutilized capacity and competitive changes.

Imagine you are a street vendor looking at your business. Charan suggests that you answer questions such as these about your company:

- What were last year's sales?
- What is the growth picture?
- What is the profit margin? Is it growing?
- What is your inventory and asset velocity?
- What is your return on assets?
- Is your cash generation increasing or decreasing?

"If you can answer these questions for your company," he concludes, "you are speaking the universal language of business. You're getting a picture of your company's total business, the kind a shopkeeper would have." ■

CONFRONTING REALITY

THE SUMMARY IN BRIEF

Any plan for a business has to answer three questions: What's the nature of the game? Where's it going? How do you make money in it? Yet, in many organizations today, they rarely get asked — much less answered — adequately.

It takes unflinching realism to get such answers, but the established methodologies for defining the purpose of a business have drifted steadily away from realism. Many people today are boxed in by dysfunctional practices and habits that more often than not obscure reality, rather than expose it. Fewer companies will succeed in the future because the business environment is becoming far less forgiving of mistakes.

In their previous book, Execution, *the authors focused on the gap between strategic plans and outcomes, pinpointing execution as the missing element. In* Confronting Reality *they explain that the gap originates with the nature of how people conceive the purpose and direction of their businesses.*

This summary reveals how organizational processes are flawed. People don't fully understand the game they're playing because they don't look at it hard enough. Specifically, they don't analyze and link the three fundamental components that determine a business's success or failure: the environment it operates in, the financial targets it needs to meet and the internal activities and capabilities it depends on to meet those targets.

In addition, you will learn:

- ✓ ***How to implement the business model the authors developed to achieve a robust, reality-based process for thinking about the specifics of your business in a holistic way.***
- ✓ ***How to use a process called "iteration" to debate and harmonize your external environment and financial targets with your internal capabilities.***
- ✓ ***How companies like EMC, Cisco, 3M and The Thomson Corporation used this business model to decide what they needed to change.***
- ✓ ***How you can anticipate future events, condition your culture for the changes required and develop leaders who can succeed in this tumultuous environment.***

— THE *COMPLETE* SUMMARY

When Reality Bites

The most widespread unrealistic behavior when the game changes drastically is to violate the First Law of Holes (when you're in one, stop digging). They often achieve heroic results — which are, alas, almost as often pointless, because they fail to confront the new realities.

To lead successfully in today's environment, you need to employ a business model based on the world's new reality. Such a business model answers the following questions:

- Is the "how" of making money in my business and industry changing?
- Who is winning in my industry, who is not winning and why?
- How, specifically, are winners making money?
- If my business is a winner, what do I need to do to stay on top?
- If I change my game, what, specifically, should I be doing?
- Am I in a growth industry or not? If not, and I want to continue playing in the game, how do I change or play it better than the competition?
- Is my organization moving quickly to spot and take advantage of growth opportunities generated by these changes?

The Six Habits of Highly Unrealistic Leaders

1. Filtered Information — They may get information only from people with the same point of view. Or the information may be distorted by people because of their own biases or agendas.

2. Selective Hearing — Leaders practice selective hearing for several reasons. The most common reason for this is preconceived notions or past experience, e.g., looking into the rearview mirror, the arrogance of success and refusal to confront a problem because they can't see a solution.

3. Wishful Thinking — This is the root of much selective hearing and seeing, e.g., the acquisition will work because we need it to. Information to the contrary doesn't make it through the screen. Wishful thinking can take the form of rhetorical statements based on experiences, such as "The market will come back — it always does."

4. Fear — Fear may be embarrassment over saying the wrong thing at a meeting, or a necessity in a culture of fear. Some tyrants fire people for disagreeing with them. More common and pernicious in companies that force-rank executives, people who make superiors uncomfortable risk being downgraded to a lower performance percentile.

5. Emotional Overinvestment — People can accomplish great things with deep commitment. The downside is that emotional investment in a project may blind them to its weaknesses. Some of the most poignant victims of emotional overinvestment are companies with great histories of innovation. Nobody has the courage to say that the splendid history is just that — history.

6. Unrealistic Expectations of Capital Markets — It's vital to create value for shareholders. The downside: Many leaders become captive to unrealistic performance expectations, notably the pressure for steady, predictable quarterly improvements. They respond by making unrealistic promises, which often they can keep only by bending their businesses totally out of shape. ■

Upended: Why the World Is Changing

Virtually every business is now a player on the global stage. Understanding how the world business environment affects you starts with distinguishing between cyclical and structural change.

While cyclical changes are a part of business life's normal ups and downs, structural changes are fundamental, long-term alterations in the basics of making money. Structural changes are usually hard to differentiate from cyclical ones in their early stages — when you really need to see them. By the time they're obvious, your odds of adjusting well to them are sharply lower.

Three structural changes drive today's explosion of intensifying worldwide competition:

1. **Increasing integration of business activity across borders, accelerated by the Internet.**
2. **Worldwide overinvestment, fueled by a vast credit expansion and immense free flow of risk capital.**
3. **A global buyer's market that has shifted power from owners and managers of capital to consumers and giant retailers.**

Also, beware of the wild card: Government regulators around the world are getting more aggressive and coming at different issues without coordination or rationalization of their policies.

Why Don't Companies See These Things Coming?

Planners typically put their time into studying strengths and weaknesses of important rivals, which are usually traditional competitors in their home markets, and seeking ways to beat them. This is far too narrow a focus and may allow other players to set the direction of the game. You are dealing with something very close to the hypothetical butterfly of chaos theory, whose beating wings in China can ultimately generate a tornado in Iowa.

The challenges of a changing environment inferred by the butterfly beg the questions:

- Can you see growth in your industry?
- Is it profitable?
- Are supply and demand in balance?
- How far are the products of your industry from being commoditized?
- Is it structurally defective or heading that way?
- How do you stand in relation to your competitors?
- Where is the technology going? Can you foresee making breakthroughs with either one product or a series of products or a division?
- How does your talent compare with that of your competitor, and is it equal to what the customer needs?
- Do you have legacy costs that can sabotage your competitive advantage? ■

Redefining the Basics of Management

Rising competitive intensity forces a return to basics, but in a far more fundamental way than the operationally focused 1980s. Getting down to basics today means focusing on how you can create intrinsic or fundamental value for your business.

Fundamental value is a combination of real profit, real return on investment, appropriate cash generation and growth that is sustainable based on continuing differentiation of your products in the marketplace. Your ability to create fundamental value rests on how good you are at finding the right balance between your external and internal realities and your financial aspiration — how skillfully you develop and use your business model.

Leaders hoping to grow their way to success through mergers and acquisitions had better think again. Studies repeatedly show that companies that grow mainly through acquisitions are less successful than those that earn most of their growth organically. Consolidation cannot return an industry's dynamics to "normal" if the player's business models have been overtaken by structural change. The only good reason for an acquisition is to enhance the fundamental value of an enterprise. In other words, it must complement and strengthen the business model.

Another old practice ready for the scrap heap is that 1990s holdover, maximizing shareholder value in the short run. As the dot-com phenomenon made clear, market valuations aren't necessarily connected to the fundamental value of a company. ■

The New Model for Confronting Reality

The business model proposed in this book offers an organized, rigorous way of looking at the health and profitability of a business, now and in the future. It is a statement of your current reality and its probable — as opposed to hoped for — future direction. It is also an early warning system for real-world changes that pose threats or provide glimpses of opportunities. Finally, the model is a blueprint for taking action. By using it to test the actions you want to put in place, you gain a better understanding of what will and won't work.

How Does a Business Model Work?

The model starts with a logical breakdown of many elements that make up a business, from its markets to

(continued on page 4)

(continued from page 3)

income statement to leadership development programs. These group into three components: the environment you business lives in; your financial targets; and business activities.

The Financial Targets

As you search to determine the right relationship between each component of the model, you develop a basis for adjusting financial targets to reality. The purpose of these targets is not to strive for precision over, say, three years, but to recognize that the changes in the external environment, as well as most changes in internal activities, have consequences that must be recognized in the financials.

Strategies, Operating Activities, People and Organization

Only when you've crystallized the realities of the external environment and linked them with your chosen set of financial targets can you think about strategies, operating activities, selection and development of people and organizational processes and structure.

Questions to ask when thinking about strategy in the context of a business model:

- If your industry is delivering financially attractive results and you aren't, what are the reasons?
- If the industry is underperforming, is there something you can do to overcome the root causes?
- How can you develop flexible plans that provide directions rather than specifics? Many strategic plans are rigidly linked to fixed projected numbers for three to five years. Instead, you have to plan directionally: What mix of actions do you plan to take, and what's the range in which your resource allocation will take place? When any variable changes, you have the flexibility to respond.
- What productivity initiatives, such as enterprise resource planning (ERP) systems or outsourcing, will make you more competitive by lowering your costs?
- Do you have the resources to finance the strategies and initiatives you identified?
- How good are your operating activities? Do they ensure that your strategy provides distinctive experience to your customers and delivers one or more financial targets?
- Do you have the right people to pull off the introduction of new initiatives? Are they properly deployed?
- What obstacles in your business stand in the way of reaching your goals?
- Are you focusing on the right initiatives for growth? To grow at a faster rate than your industry, you need some edge — a cost advantage that enables you to sell at a lower price, new and better distribution channels, serving parts of the world not yet served, a breakthrough technology, better knowledge of the customer, a more effective organization.

Iterating the Model

As you work through the external environment and your internal activities, your financial targets will change according to the realities you've identified. Each iteration depends on understanding what you can and cannot reasonably expect to accomplish. You identify areas where you may be able to improve your performance — or ones you thought held promise but which, under scrutiny, do not after all. You learn whether of not all the moving parts of the plan mesh with each other. Each of these discoveries is a new iteration of the business model.

The iteration process is where you make tradeoffs. ■

Assessing External Realities

The four elements of making a realistic assessment are the following:

- ✓ **The broad business environment:** existing and potential competitors; economic, demographic and technological trends; regulatory issues; and structural and cyclical changes
- ✓ **Financial history of your industry and its players:** the attractiveness of your industry
- ✓ **Your customer base:** arguably your most precious asset
- ✓ **Root-cause analysis:** underlying causes of trends and issues you've identified.

Getting to Reality

When Michael Wisbrun was appointed head of KLM Air Cargo in 2000, its management team foresaw that companies would develop more and more worldwide networks and supply chains. The team wanted to position Air Cargo as a leader in this emerging trend. But Wisbrun had serious reservations about the business model he inherited.

When he examined financial targets, he saw that the division had flat revenues and was barely breaking even. Cash flow was negative and the return on investment was approaching zero — not a great foundation for a bold, unproven strategy.

Worse, his external analysis of the new model turned up a major flaw in the vision. Large integrators such as

(continued on page 5)

Getting to Reality

(continued from page 4)

FedEx and UPS were already serving the market; not many customers were looking for similar service from an airline, and those who were didn't seem willing to pay for it. "The business model clearly wasn't anchored in reality; its parts didn't mesh," says Wisbrun.

Modeling the Solution for KLM

External Realities: The marketplace was not ready for the logistic services the strategic planners hoped to offer. But there was opportunity in the core air cargo business, where some of KLM's competitors were making money.

Financial Targets: Cash flow was negative and return on capital close to zero, revenues were flat and the division was barely breaking even on margins.

Internal Activities: The idea people who were advancing the strategy lacked operating skills and didn't pay enough attention to their financial targets. Their huge, long-term logistics project was consuming resources without generating growth.

Iteration: Searching for the right mix of elements in the three components, Wisbrun pinpointed flaws in the existing strategy: It was out of step with current market realities and imposed a prolonged drain on financial resources.

In his first iteration he assessed prospects for a new strategy — return to the core business — and focused on people, creating a new management team to help him determine requisite changes in people and operations. He and his team then established realistic financial targets and revisited the model every six weeks.

Within a year, cash flow and margins improved. By early 2004, KLM Cargo was a leading player in the industry and gaining market share. Improved financial performance allowed it to acquire new and more efficient freighters to further increase market share and improve margins, asset utilization and cash flow. Because the management team practices the business model drill regularly, all of its members are not merely masters of their functional silos but well versed in the totality of the business. ■

What to Change and What Not to Change

There is no one-size-fits-all plan of action. The ability to zero in on precisely the parts of the business that need attention and leave the rest alone is just as much a sign of great leadership as is reinventing the business model when radical action is needed. The business model brings rationality to the issue of change. Use it to identify and anticipate external realities and make realistic, positive change.

Facing Crisis: What EMC and Cisco Did That Sun Didn't

All three companies were successful during the tech boom. Then EMC and Sun found themselves facing structural change in their external environment. While EMC chief Joseph Tucci faced facts and reinvented his business model, Sun's Scott McNealy struggled to keep his old course. Cisco's John Chambers realized that his problem was not structural but cyclical and operational. He put his company through profound change, but his business model remained intact.

Modeling the Solution for EMC

External Realities: After the tech crash, purchasers of storage systems cut back on expenditures and switched from EMC's high-cost products to cheaper ones. Competitors were also developing machines for the high end, at lower cost.

Financial Targets: Revenues, margins, profits, cash flow and ROI were all falling precipitously.

Internal Activities: EMC was geared toward producing premium-priced products with proprietary software and high margins. Its technologists strove to design and build highly sophisticated machines and its salespeople, operating as loners, were aggressive because they had the most desirable products on the market.

Iteration: Tucci's external analysis showed that the old strategy was obsolete because market changes were structural. Financial targets could not recover without a new business model. He started with a new strategy: Recapture and expand the customer base by selling lower-cost hardware, software — open, not proprietary — and solutions.

He and his management team met often to iterate in the search for solutions. The first iteration left too much high-end product to meet targets for costs, margins and products, leading to further efforts to produce for middle and lower markets. Subsequent iterations revealed the need to replace people who couldn't adapt to new conditions and to restructure the organization. Financial targets were revised upward as the action plan produced results.

Modeling the Solution for Cisco Systems

External Realities: Demand plunged as customers cut back on purchases and confronted mounting industry overcapacity. But Cisco's cutting-edge products were still desirable.

Financial Targets: Revenue growth stalled, margins shrank and cash generation slowed.

Internal Activities: Cisco's operations and organizational processes were designed for high growth. Product prolif-

(continued on page 6)

What to Change and What Not to Change

(continued from page 5)

eration and controlling costs were not a high priority.

Iteration: Chambers correctly analyzed the market downturn for Cisco; it was cyclical, not structural. He kept financial targets and strategy intact and modeled ways to align them with new and future marketplace realities.

After establishing the likely volume of sales, he searched repeatedly for ways to lower costs and get his desired margins. In subsequent iterations, Chambers saw opportunities to get into new markets and segments vacated by fallen competitors; with plenty of cash, he moved to exploit them.

Modeling the Solution for Sun Microsystems

External Realities: As with EMC, Sun's customers deserted its high-priced, high-performance products after the bubble burst, seeking cheaper alternatives.

Financial Targets: Revenues plunged and margins collapsed. Cash generation slowed drastically.

Internal Activities: Sun maintained its technological leadership with intense R&D efforts. Its people and organizational processes were geared to selling unique and demonstrably superior products.

Iteration: Judging the market change as cyclical, McNealy at first stuck to his original strategy and focused on cutting costs. As it became apparent that changes were structural, he went through many iterations to find other ways to meet the targets, including broadening his market with lower-priced models, pooling his resources with other technology suppliers and moving toward open architecture in some product lines.

Simultaneously, he continued his traditional course, spending heavily on R&D to develop dazzling new technologies.

While Tucci, Chambers and McNealy responded differently to the industry shakeup they faced, there are common lessons to be learned from their experience:

- In times of crisis, it's essential to understand the environment as it has become and is likely to be, rather than what it has been.
- Thoroughly refresh your understanding of your customer base before you decide what actions to take.
- Ruthlessly assess your organization.
- Be rigorous in measuring the progress of your turnaround, keeping an eye out for any sign of slippage from the chosen path.
- Approach any crisis without preconceptions. This is the time when relying on the past or on conventional wisdom can lead you rapidly to disaster. ■

Innovating for Growth: The New 3M

When Jim McNerney became CEO of 3M in 2000, the company had been ambling along with unremarkable earnings, little revenue growth and a lethargic stock price. As a transplant, he could have brought in a prepackaged solution, raising financial targets and driving people to meet them. But he was a master of business-model thinking, so he took a different course.

3M had a basically sound model. McNerney recognized it would be important not to damage a strong culture built on innovation that did many things well. Defining the situation as "a build rather than a teardown," he concentrated on the third component of the

(continued on page 7)

Rebuilding the Foundation: Home Depot

Home Depot roared its way through the 1990s, but then the rocket fizzled out. In 2000, same-store sales declined, the company issued a profit warning and the stock plunged. Robert Nardelli was brought in to straighten out the company.

Nardelli used the business model as his mental framework, scrutinizing each of the three components. The external environment didn't seem problematic, but the financial component was badly out of balance. Home Depot had relentlessly pursued top-line growth to make its earnings-per-share targets. But cash was getting soaked up by inventories and capital expenditures, and sales at stores open more than a year had begun to decline. Expanding beyond 200 store openings a year, he concluded, was not realistic unless cash and recruiting of qualified store managers could keep pace.

Connections between financial targets and internal activities gave Nardelli much to ponder. Home Depot was an operational free-for-all. The company needed leadership development. As Nardelli iterated the model, connections between internal activities and financial targets became clearer. He rapidly and massively accelerated investment in information technology. Once he had the right kind of people in place, he made bold moves in operations.

Changes were anything but smooth. Between May 2001 and early 2003 the stock price fell from $52 to $22. Acknowledging that he'd made some mistakes, Nardelli stuck to his business-model targets. By spring 2004, people were finally noticing his accomplishments. In three years, annual sales, net earnings and cash had grown. The stock price had climbed back to the $30s.

Innovating for Growth: The New 3M

(continued from page 6)

business model to uncover weaknesses in operations — the people and organization processes that kept the company from realizing its full potential.

Modeling the Solution for 3M

External Realities: Markets in general were growing well, and there were no dramatic threats on the horizon.

Financial Targets: 3M was meeting all of them, but they were modest and well below the company's potential.

Internal Activities: Talented people made the company an innovation machine. But new product development was disconnected from customers and took too long. Operations lacked discipline.

Iteration: During six months of meetings with senior management, McNerney searched for ways to improve financial results without damaging 3M's culture of innovation. He repeatedly iterated his approach to change until he was satisfied that he had the right mix and sequence of actions.

He then set higher financial targets, transparent both inside and outside the company, and began to change organizational processes, combining many businesses and centralizing things like purchasing. After conditioning his people for change by introducing a Six Sigma initiative, he overhauled the innovation processes to speed them up and connect them more closely with the marketplace.

The results have been clear: 3M shortened the new product introduction cycle by a year and a half. Revenues grew by $1.5 billion from 2000 to 2003, and operating margins rose several percentage points during that period, just shy of the goal McNerney originally set. The stock price has nearly doubled since he took over. McNerney is admired both inside and outside the company. ■

Seizing Opportunity: How the Thomson Corporation Transformed Itself

The Thomson Corporation didn't appear in need of transformation when Richard Harrington took over as CEO in 1997. The U.S. $8.8 billion business had enjoyed an almost legendary status for its empire of newspapers and professional publications. It also owned a travel and resort business in the U.K. Overall, revenues were growing about 8 percent a year, compounded.

But Harrington's central question was whether a model dependent on regional newspapers would run out of gas no matter what new strategy might be conceived and executed. His analysis exposed a simple but crucial question: If the model is not adequate for the future, what fundamentally needs to change? What arena can we play in where the business model will create long-term value?

Modeling the Solution for Thomson

External Realities: The newspaper and travel businesses were currently profitable, but the future looked less promising. By contrast, Thomson's smaller professional publishing business appeared to have enormous growth potential.

Financial Targets: Thomson was currently meeting its long-run targets. But with the newspaper business, that would not necessarily be the long-term case.

Internal Activities: People, operations and organizational processes were well harmonized for existing businesses.

Iteration: Harrington recognized that structural changes would erode the newspapers' profitability. He and his board agreed that Thomson should create an entirely new business model that would achieve desirable financial targets by publishing information for professionals such as financial services people and lawyers. Harrington first modeled the relationships between different sale prices for businesses to be sold and investment required to build professional publishing. Arriving at a balance that would not require heavy borrowing, he proceeded with the plan. Moving forward required continual changes in people and organizational processes, with results weighed constantly against the progress on financial targets.

Over its transformation period, Thomson grew its total revenues at a compounded annual rate of 7.4 percent and organic revenues at about 5 percent. Thomson was listed on the NYSE in 2002 with an initial market capitalization of $19.5 billion; in May 2004 it stood at $21 billion. It is widely recognized as the industry leader in transforming itself into a provider of value-added electronic solutions. ■

How to Prepare for Change

Succeeding in today's business world requires skills and abilities that haven't been given much weight in the past. Acute radar is one: You need to "look around corners" and discern parts of the external environment that will affect the future of your business.

In most businesses, people put most of their time into studying the strengths and weaknesses of major rivals. They look for ways to beat competitors.

But you constantly have to ask bigger questions:

(continued on page 8)

How to Prepare for Change

(continued from page 7)

- Can you see profitable growth in the industry?
- What could commoditize it?
- Can you foresee a technology change that could alter the rules of engagement?
- Who else might become a competitor?
- What government policies are brewing that could affect you for worse or better?
- Is the industry structurally defective, or heading that way?
- Most important, what do your customers think?

To know and anticipate these things, you must take information gathering to the next level. It must be a real-time process: a social mechanism with frequency and consistency.

If you do it just during the planning session, it's too late. It has to inform the business model and all the daily decisions people make about their direction and processes. Mostly you need to converse proactively by asking questions, listening and keeping your mind open about answers. You do it not just in routine meetings, but when you're meeting with people from different parts of the business or at a trade show or at lunch with a supplier. ■

Getting Ready: How to Condition Your Culture for Reality

The more change your organization can handle, the more freedom you have in adjusting your business model. The readily available tool for conditioning your organization to change is the initiative — a specific, high-impact project that requires cooperation across the entire organization, such as enterprise resource planning, Six Sigma or digitization.

How to Lead an Initiative

If an initiative is important enough to launch, it cannot be allowed to fail. The leader's follow-through keeps the initiative alive and encodes it into the organization's DNA. Before you start, ask yourself:

- Do you understand the initiative well enough to develop metrics to evaluate its implementation?
- Are you willing to commit necessary resources for education?
- Do you have the focus and discipline to drive it through the organization?
- Do you have the stamina to repeatedly convey the importance of the initiative through your actions as well as your words?
- Do you have the courage to confront those who are standing in the way?
- Is cynicism changing over to excitement? ■

Leading for Reality

Companies are full of talented, hardworking people whose time-honored leadership qualities have taken them to the top but aren't adequate for the task now at hand. Two leadership qualities have become absolutely indispensable:

Business savvy — People with business savvy know how to make money. They have business models in their minds and understand all three components and their relationships. They have a gut feel for the external environment.

A need to know — Leaders relentlessly pursue critical information that can make all the difference to their business prospects.

Identifying and Developing the Right Kind of Leaders

The processes most companies use to spot potential leaders aren't geared to finding those with the qualities needed most today. In addition to business savvy and intense curiosity, these include flexibility of mind, perpetual adaptability, willingness to change and courage to risk failure.

What does the person you're watching talk about in meetings? What sparks her curiosity? How broad is her scope? Does she have a natural tendency to search for root causes? Does she shape a set of options before doing anything? You can learn a lot about a person by watching how he solves problems. Does he diagnose a situation based on what's worked in the past, resorting to familiar solutions, or search for new and creative approaches?

Are the people you're looking at broad thinkers? Listen to the options they propose and notice whether they sit or act on them. ■

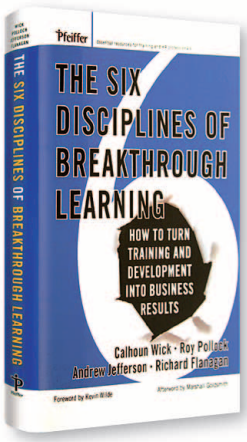
Developing a Competitive Advantage in Human Capital



How to turn training and development into business results

by Tom Moore

The Six Disciplines of Breakthrough Learning reminds its readers of the age-old management dilemma: "What if we train our employees and they leave?" To which noted leadership consultant and author Mark Sanborn replies, "What if we don't and they stay?"

Learning agility (the ability to learn, unlearn and relearn rapidly) has become one of the most critical survival skills for both individuals and companies. Yet all too often, companies pay lip service to training. Proclaiming "employees are our most important asset," these firms trot out misguided programs that fall into one of the following traps:

- **Poor planning.** Too often programs are assembled and rushed to the market to satisfy the whims of top management.
- **Poor intent.** Learning programs are often positioned on the moral high ground.
- **Poor measurement.** Too many corporate learning and development departments still report the number of people taught, the hours of instruction and the number of courses offered as though these were results.
- **Poor design.** Too often programs lack relevance. They are assembled entirely within the human resources or training departments and are implemented with little or no input from the line leaders that will be trained.
- **Poor accountability.** Too many training and development departments focus on the learning experience itself. Rarely are there the necessary follow-up systems to ensure the learning is put to constructive use on the job.

THE SIX DISCIPLINES OF BREAKTHROUGH LEARNING
by Calhoun Wick, Roy Pollock, Andrew Jefferson and Richard Flanagan
Published by Pfeiffer, an Imprint of Wiley, Copyright © 2006, 233 pages, $40.00.

Shining the Accountability Spotlight

The Six Disciplines of Breakthrough Learning sets out to avoid these pitfalls by holding the training and development function accountable for the transfer and application of corporate learning. It's a guide about bridging the "learning-doing" gap and keeping score; in fact, adopting these disciplines provides a road map to link training to business goals.

The authors comprise the leadership team of Fort Hill, a company that provides training tools and resources. They have condensed years of experience into six disciplines; these strategies constitute a breakthrough in training that converts a much higher proportion of learning into personal and professional transformation and leads to demonstrable business results.

Learning enterprises are willing to invest in programs provided they see results in measurable outcomes, such as greater effectiveness, improved productivity, enhanced customer satisfaction and other objectives. But the authors warn that "the reality of corporate life is that there are always more good ideas for investments — in research, training, marketing, sales or manufacturing — than even the most affluent company can afford." That stark admonishment provides further impetus to get training right from the start.

Keeping Score

While it would be easy to take issue with the number of disciplines embodied in the book, one cannot

"No corporate education should be conducted without first understanding the nature and drivers of the business, the business needs and the environment in which it operates."

deny the defining message: Breakthrough programs are the result of a disciplined and systematic approach to learning and development, executed with passion and excellence and held accountable for accomplishing specific business objectives.

Not surprisingly, the book reads more like a textbook than a novel, engaging the reader on multiple detours for reflection and planning. Following the formulaic approach of telling the audience what you're going to tell them, telling them and then telling them what you told them, the authors march through each of the six disciplines in a provocative fashion that compels our attention and consideration of change.

Each chapter begins with a broad philosophical overview, followed by a more granular treatment of each of the disciplines before ending with a bulleted summary — a practical implementation guide for learning leaders.

The authors take pains to include graphics, scorecards and templates divined from their practice and research that not only aid in digesting the material but also provide valuable take-aways for any organization.

In addition, the authors intersperse their treatment of the disciplines with relevant case studies from thought leaders such as Honeywell, AstraZeneca, the British Broadcasting Company and the University of Notre Dame, among others, providing a glimpse of what success looks like.

Sony's Talent Management Councils

One such case study details the investments that Sony, a global leader in electronic components and entertainment, makes in its workforce of more than 150,000 employees. Sony understands that in order to survive and thrive in the highly competitive and rapidly changing market in which it operates, it must continue to enhance its talent pool, introduce new leadership skills and increase its bench strength. The company has created "talent management councils" to ensure that training and development programs are transferred to the business.

"At the start of each cycle, we talk to the talent management council and we review the current business objectives and the direction in which we are trying to take the company," the authors quote Debby Swanson from Sony, national director, talent and organizational development.

The councils not only ensure linkage between business objectives and learning, but also serve as the faculty — creating a learning, teaching, and ultimately, profitable enterprise. Council members also review results reported by participants three months after the residential portion of the program.

The Sony example distills the essence of *The Six Disciplines*: While training initiatives traditionally have focused on what takes place in the classroom, what goes on before and after the actual training itself can be equally — if not more — important.

Begin With the End in Mind

No corporate education should be conducted without first understanding the nature and drivers of the business, the business needs and the environment in which it operates. This knowledge ensures complete congruence between the desired business outcomes and the planned learning experiences.

The essential goal should always emphasize improved performance. Ultimately, every program must produce a positive financial return, directly or indirectly.

According to the authors, training is essential in the areas of diversity, ethics and leadership; however, this training must also "pay dividends" when it

comes to decreasing operating costs, increasing productivity, improving consumer confidence and enhancing innovation. They write, "Programs that help participants improve their personal performance pay dividends in greater job satisfaction, motivation and retention."

In the initial stages of program design, learning leaders should also direct their efforts toward getting the right people in the room; they should gear the training around the attendees, their prior level of knowledge, belief structures, natural learning styles and emotional states.

"What participants take away from a learning and development program, what they are able to transfer and, therefore, ultimately the results they are able to achieve, are influenced by what happens during the preparatory period, long before the formal coursework begins," the authors say.

The way learning enterprises strengthen this initial phase is to ensure high expectations by creating programs perceived as integral to the business and essential to the participant's career. Strong management support also greatly increases the probability of success.

In the Classroom

During the traditional instructional phase of the program, the authors challenge the traditional "sausage stuffer" approach — transmitting as much information as possible and filling every waking moment of a program with activity and instruction. This "compromises the quality of learning and its transferability," they write. The organization as a whole will benefit more if its employees exit the program doing several things *well* instead of a number of things *poorly*.

They encourage instructors to ensure that learners know how to apply the new information and skills to their work roles. Learning activities must stimulate the kind of thinking and actions that will be required on the job. Thus, if the objective is to improve the ability of the participants to analyze business or personnel situations, they must be given the opportunity to practice their analytical skills. It is not sufficient for the instructor to simply talk about it.

They embrace action learning — a powerful learning component, provided it is planned with the same level of attention to detail as other forms of instruction. To make connections between actions and learning, the authors suggest allowing participants time to practice their new knowledge, reflect on lessons learned, and write down how they intend to apply their new knowledge.

"New insights and skills must be recalled before they can be adapted and applied," the authors explain. "We are able to remember new information when it is associated with or linked to existing ideas, patterns and knowledge already stored in long-term memory. To forge these links, participants must be given sufficient guidance and enough time to reflect on what they have learned."

"Learning creates value only when it is transferred and applied to the participant's work environment. Education is a process ..."

Beyond the Classroom

The real work begins when the course ends. Learning creates value only when it is transferred and applied to the participant's work environment. Education is a process, not an event like a performance or a concert. Unfortunately, in most conventional corporate education initiatives, little or no attention has been paid to what happened after the instruction was completed.

Understanding that corporate learning and development is now being judged by the business results it generates, the authors develop a new definition of the "finish line" from the last day of instruction to the documented delivery of business results. One golden nugget the authors convey is that the last item on most agendas reads "Program Ends" or "Adjourn." A better ending would be: "Begin Transfer and Application."

Indeed, the post-instructional transfer and application period is a particularly rich opportunity for a breakthrough that will ultimately benefit the organization.

Managers can support programs by encouraging their direct reports to apply what they have learned in the classroom in their day-to-day jobs.

In the nation's leading learning enterprises, the training and development department supplies information about course content and objectives and how managers can contribute to the process through coaching. In addition, senior management should create support for learning transfer as a part of every manager's job — one that is monitored, recognized and rewarded.

The authors' experience suggests that breakthrough learning and development programs that provide ongoing support for learners — especially during the first few crucial weeks of the transfer phase — "enjoy a greater return on their educational investments." The idea is that trainers should redefine their role from "strictly trainers/presenters to facilitators of behavioral change on the job."

You Can't Manage What You Don't Measure

All the work by designers, facilitators, participants, coaches and managers is for naught unless it manifests as demonstrable results of importance to the business. Credible, reliable measures are needed to determine whether the training investment is paying dividends and what refinements are needed to further improve the program's effectiveness.

According to the authors, "The only way to prove that the resources have been well used is to document relevant results." The other reason to assess outcomes is to drive continual improvement in learning and development. Effectiveness and efficiency are increased by rigorously assessing the quality of the current output, implementing ideas for improvement, measuring the impact and repeating the procedure.

From the outset of training through its delivery and, ultimately, utilization on the job, there must be clear agreement on what is expected and how success will be measured. Anything less puts the learning enterprise at risk, because the criteria for success or failure becomes a matter of opinion.

Producing a Rich Harvest

The value delivered by a corporate educational program is proportional to the extent to which new knowledge and skills are applied to the work of the organization. Nothing more. Nothing less.

The job of corporate learning and development is not merely to impart knowledge, but to be sure that it is put to work so that its benefits can be harvested.

Creating a fertile and receptive environment begins at the top. Senior executives can set the tone that learning and development is a strategic priority. Senior management support must be manifested in deed as well as in word. It needs to be backed up by systems of accountability to ensure that managers embrace the importance of their role in learning transfer, since a person's immediate supervisor has profound influence on whether learning is transferred and applied or abandoned.

The inherent beauty of the book is that the six disciplines provide an effective road map not just for training and development, but for any department within the organization — marketing, distribution, information technology — to follow to ensure transparency and alignment between the goals, objectives and needs of the business.

Fred Harburg, senior vice president of leadership and management development at Fidelity Investments, puts it this way: "We are not in the business of providing classes, learning tools or even learning itself. We are in the business of facilitating improved business results." ■

A Fast, Cost-Free "Secret Weapon" for Improving Any Business Process

BREAKTHROUGH BUSINESS RESULTS WITH MVT

THE SUMMARY IN BRIEF

Every executive wants the same thing — improved results: more profit, less cost, better quality and higher customer satisfaction. But what business improvement ideas will produce these results, and how can you be sure that plans that look good on paper will actually work in the real world?

Testing ideas one at a time is too slow and too expensive — and it doesn't always give managers the direction they need. *Breakthrough Business Results With MVT* describes and details the one revolutionary method that offers a powerful, fast and inexpensive way to prove with certainty that ideas will have the biggest impact on your bottom line. Multivariable Testing (MVT®) uses advanced statistics to test the real-world effects of dozens of business improvement ideas, discover the synergies between them, and identify those ideas that are the most powerful and profitable under real-world conditions.

IN THIS SUMMARY, YOU WILL LEARN:

- How MVT creates practical, fast, cost-free solutions to any business problem.
- How MVT uses data to take the guesswork, politics and emotions out of major business decisions.
- The proven methodology for implementing an MVT business improvement project in your company.
- How leading companies like Lowe's and DuPont have achieved breakthrough MVT successes.
- How MVT improves corporate culture.
- The four-phase process for implementing MVT on an organization-wide basis.

The Power of MVT

Let's start with an outlandish claim: Multivariable Testing (MVT) is the greatest business improvement methodology ever devised. A lot of evidence will be required to prove that statement, but a strong case can be made for it. Clients who have implemented MVT will provide much of the evidence.

QualPro has tested the real-world impact of over 150,000 business improvement ideas over the past three decades and discovered that most business ideas do not work. The experience of over 1,000 companies shows that no matter the source, 75 percent of their ideas will not improve results, and nobody can accurately predict which 25 percent are the most powerful ideas.

The only way to avoid making seat-of-the-pants guesses at which ideas and solutions will make the biggest impact on your organization's performance is to test them. The only way most professionals know to test ideas and solutions is to test one idea at a time, measure the results, and hold all other conditions constant. Unfortunately, this method has some severe shortcomings in the real world:

- It is highly inefficient.
- It cannot identify synergies.
- Test results often cannot be consistently repeated in the real world.

The alternative is MVT, which offers a powerful, inexpensive, efficient way to use statistics to test dozens of business improvement ideas, discover the synergies between them, and prove with certainty which ones are the most powerful and profitable under real-world conditions. Businesses that use MVT regularly generate millions of dollars in cost savings or new revenues as a direct result.

MVT basically entails testing a lot of different variables/solutions/business improvement ideas all at the same time. When applied to a business problem, it is a 12-step process that starts with dozens of practical, fast, cost-free ideas for improvement and uses advanced statistics to quickly sort out the ideas that will help from the ideas that will hurt or make no difference. The essence of an MVT improvement project is *rigorous, quantifiable, accelerated learning*.

Breakthrough Improvements

The MVT process begins with the idea that you can do better with the people, equipment and processes you already have; and you can do it quickly, without spending any money. In the MVT process, good ideas are just as likely to come from front-line employees as they are from experts, managers or senior managers.

The MVT process typically yields dramatic breakthrough improvements — often beyond what anyone imagines. In more than 13,000 projects involving more than 1,000 companies, MVT has never failed to identify actions that measurably improve results. MVT successes often can be generated in very short periods.

Twenty-two years of experience indicates that MVT does wonders for the morale of the organization. The fact that the process allows everyone who could possibly have worthwhile suggestions to make those suggestions is the key.

If everybody is allowed to make suggestions for

The authors: Charles Holland, Ph.D., developed the MVT process in a nuclear weapons plant to solve critical problems using advanced statistics. In 1982, at the urging of quality guru W. Edwards Deming, Holland founded QualPro, an MVT training and consulting firm. Over the last two decades, QualPro consultants have assisted clients in implementing MVT at more than 1,000 companies, including many of the Fortune 500. Many clients have improved business results directly linked to MVT valued in the hundreds of millions of dollars. QualPro conducts seminars on MVT throughout the U.S., and its work has been profiled in most major business publications.

The Power of MVT

improvement, results and the morale of the people in the organization always improve. Often surprising, counterintuitive suggestions provide the biggest sources of improved performance.

The MVT process has worked in every organization on every process encountered. Experience proves that the results of any process can be improved using MVT if two criteria are met: (1) the process has a measurable output and (2) the people in the organization have ideas about how to improve performance. ■

How MVT Works

QualPro — an MVT training and consulting firm — and its clients have tested over 150,000 ideas in over 13,000 MVT projects. Of all the business improvement ideas that were tested, only about 25 percent (one in four) actually produced improved results; 53 percent of the ideas tested made no difference; and 22 percent (that would have been implemented otherwise) actually hurt the results that they were intended to help.

The really amazing finding supported by QualPro's data is that there is no correlation between what people in the organization *think* will work and what actually *does* work. This does not mean that people in an organization are not knowledgeable about their processes or that they are unintelligent. It simply means that the business world is much more complicated than most people realize.

No one in a business can reliably predict which business ideas will work. MVT is powerful because it eliminates guesswork first. The outcome of an MVT project is an objective measure of the impact of each idea and combination of ideas on important business measures. Management can make key decisions based on statistically valid data and facts rather than on opinions, instincts and organizational clichés.

Just as important, MVT eliminates the emotions and politics often involved in decision making by measuring the impact of an idea, rather than its source. ■

Why MVT Is Much More Effective Than Other Methods

- MVT is fast.
- MVT makes the organization more efficient. MVT projects seek out improvements that the organization can make right away, using its same equipment and people.
- MVT eliminates wasted effort. Eliminating wasted effort improves business results with less energy and money expended.
- MVT is better science. The MVT method tests far more factors in a fraction of the time to obtain accurate, verifiable results.
- MVT boosts organizational morale. There is no better team-building event than a successful MVT project.
- MVT provides organizational focus. MVT provides focus for chaotic organizations by scientifically narrowing the range of business options to the few best ideas on which management needs to focus. Because of this, management can stop directing resources, organizational energy and time to other issues.

Using MVT to Increase Sales, Cut Costs and Improve Customer Satisfaction

Companies often become consumed by issues that are urgent and that need to be addressed in the short term. These issues may not, however, be truly high priorities from a financial or strategic standpoint. MVT should not be utilized to address such issues. MVT is a very powerful tool that works best when directed toward large, important business problems that have a significant financial impact.

MVT is able to improve the financial performance of an organization in three major ways:

1. Increased sales
2. Reduced costs
3. Improved customer satisfaction.

Increased Sales

MVT has a long history of helping companies increase sales by improving retail store sales or salesforce effectiveness.

Citibank used MVT to improve call center effectiveness. They had hoped MVT would help them achieve a stretch goal of a 50- to 75-basis-point increase in net sales. By using MVT they actually achieved a 205-basis-point increase that translated into millions of dollars per year.

Actions identified by the MVT process showed Citibank how they could significantly increase their net sales rate and at the same time reduce call-handling time and increase employee satisfaction.

Ten improvement ideas, generated in part by call cen-

ter representatives themselves, were tested across several sites. The MVT tests showed that the most powerful factors leading to increased sales were attributed to five of these ideas.

Reduced Costs

MVT frequently has been used to improve the efficiency of things ranging from advertising to chemical processes to paper machines to labor. It also has been used frequently to reduce waste, to decrease defects and to reduce rework.

Deluxe Corporation is one of the largest check printers in the world; using MVT, it was able to reduce waste by $11 million as a result of changes in its production scheduling, staffing strategies and the type of paper stock it used.

Improved Customer Satisfaction

MVT improves customer satisfaction by enhancing product design and improving the quality of products. Additionally, MVT frequently has been used to optimize service levels and even to improve the ability of companies to react to service failures.

American Express used MVT to improve its process for preventing customer attrition. Using MVT, American Express tested potential solutions to credit card cancellations. These included using different call scripting, applying sales goals, and changing the type of questioning during calls. The changes to the process resulted in an 18 percent reduction in customer attrition, a 7 percent increase in credit card spending, a 12 percent increase in transaction volume, and a 5 percent increase in loyalty program participation.

Improved Organizational Culture

MVT raises morale because it involves the entire work force in finding solutions to important problems, and the process improves corporate culture by promoting innovation. When MVT is used in an organization, employees learn that there is no such thing as a bad idea. MVT enhances corporate culture by helping to establish a can-do attitude. ■

MVT Compared to Six Sigma and Other Popular Improvement Approaches

• **Six Sigma** has helped many companies, yet most top managers are not overwhelmed by their Six Sigma results. Companies commonly use the MVT process as their primary improvement approach. However, there are also many situations in which MVT has been used in conjunction with a Six Sigma effort. MVT has demonstrated the ability to take Six Sigma results to a whole new level.

• **Data mining** has been used by many companies to analyze historical data, to try to determine conditions to incorporate into their activities to immediately improve results. Used in this manner, data mining is unlikely to yield the types of breakthrough improvements achieved by MVT because most of the improvement ideas that are investigated in an MVT experiment have never been in place in the company's history.

• The basic idea of **lean manufacturing methods** is to speed up the process, to turn out more, and to reduce waste. Many manufacturing companies have adopted such methods. In every case where the MVT process was used in "lean" companies, it reduced setup times and increased throughput over and above what the company had accomplished with its lean manufacturing efforts.

Other improvement approaches include Total Quality Control (TQC), Total Quality Management (TQM), Statistical Process Control (SPC), reengineering, ISO benchmarking, and organizational psychology-based approaches. However, none of them have demonstrated over the long term that they have the consistent improvement power of the MVT process.

Implementing an MVT Business Improvement Project in Your Company

The MVT process involves 12 steps, regardless of the business, industry or process being tested for improvement.

Step 1: Choose a high-payoff goal and create the environment. The following actions are important to take at the beginning of every project:

- Select an important, high-payoff project.
- Get the right people involved.
- Provide training to allow people to execute their roles.
- Ensure that project participants are motivated to succeed.

Step 2: Define how you will measure success and validate your measurement system. In this step, key measures of success are identified. Choosing correct measurements, defining them properly, and assuring that the numbers are precisely accurate are critically impor-

(continued on page 5)

Implementing an MVT Business Improvement Project in Your Company

(continued from page 4)

tant steps to improving results. Never underestimate their importance.

Step 3: Use control charts to hunt for good ideas to test. Statistical Process Control (SPC) charts identify instances in which a process goes out of control. MVT process improvement factors developed using SPC charts have a significantly higher probability of helping results than do test factors developed through brainstorming. Test factors that are identified using SPC charts are helpful about 50 percent of the time.

First, you must construct the appropriate SPC chart for each key measure of success. The charts are used to identify instances of uncontrolled variation in historical data. Once these are identified, investigate each special cause to identify its source. Use suspected special causes as a basis for MVT test factors.

Step 4: Use data mining and other statistical techniques to find good ideas to test. Analyzing historical data can be very useful in identifying high-potential improvement ideas for MVT experimentation. However, reliance on data mining or other forms of historical data analysis for immediate implementation will rarely, if ever, provide breakthrough results.

Step 5: Brainstorm for improvement ideas with everyone who could have worthwhile suggestions. Brainstorming is valuable because it can generate ideas that have not been implemented previously or that have been implemented, but do not show up in historical data analysis. Brainstorming should include the local, front-line work force, management, technical personnel, customers or those who interact with customers, suppliers or those who interact with suppliers, and naïve observers who are not too close to the problem.

Step 6: Select improvement ideas that are practical, fast and cost-free. After steps 3, 4, and 5 have resulted in many dozens of suggestions for improving results, the next step is to categorize the ideas as: (1) practical, fast and cost-free, or (2) impractical, slow or costly. MVT experiments are done only with those ideas that met all three aforementioned criteria.

Step 7: Design an MVT Screening Experiment to Test Many Ideas with Only a Few Tests. It is strongly recommended that you do not attempt to design an MVT screening experiment without the aid of an experienced MVT consultant. Designing an MVT screening experiment involves defining the MVT test matrix, choosing the experimental units, randomly assigning the experimental units to test recipes, determining the replication and reflection strategies, setting the size and duration, and playing the game (determining if each factor-pair combination can be tested).

Step 8: Execute the MVT screening experiment and measure test results. Two things should be expected while an MVT experiment is being executed: improved results and problems. Two types of execution problems commonly seen are: (1) lack of compliance (when factors or recipes are not executed as planned) and (2) situations in which it is not possible to execute a factor or combination of factors as those factors were defined.

Execution of an MVT experiment involves the following steps:

1. Develop an action plan.
2. Prepare factor materials and training.
3. Communicate the plans, roles, procedures, logistics and importance.
4. Create and execute a monitoring process to measure recipe compliance.
5. Act to remedy any execution flaws.
6. Collect data.

Step 9: Analyze screening test results to determine which ideas help, hurt or have no impact on performance. After executing the MVT screening experiment and gathering data for each recipe on the key measure(s), analyze the data to determine the impact of each test factor. Examine the measurements, calculate factor effects, calculate control limits and calculate effects on variability.

Step 10: Design and execute an MVT refining experiment to optimize results. One major purpose of a refining experiment is to increase confidence in the findings. Confidence increases 20-fold if a process change exceeds the control limit in a refining experiment as well as in a screening experiment.

Another major purpose of a refining experiment is to identify conditions even closer to the optimum. Approximately 70 percent of the improvement is revealed in the initial screening experiment, and another 30 percent of the possible improvement is revealed in the refining experiment.

A third purpose of the refining experiment is to determine useful synergies between factors. Refining estimates interaction effects with more confidence.

Step 11: Analyze the results and decide which ideas will make the biggest impact on your business. As the

(continued on page 6)

Implementing an MVT Business Improvement Project in Your Company

(continued from page 5)

MVT refining experiment progresses, it's necessary to examine the data to confirm they represent what they should. Once the results of the MVT refining experiment are assessed, they can be consolidated into a predictive equation. This allows for the prediction of key measure improvement results based on the factors that will be implemented.

The company's managers should be shown the improvement factor effects from the screening and refining experiments. Review the effect of each improvement factor and help the managers, process experts, process owners and decision makers to buy into and make sense of the results. Help management decide what to do, and which process changes to implement.

Step 12: Carefully implement the most powerful ideas, calculate the bottom-line impact, and take the money to the bank. The steps used in implementing findings from MVT experiments are virtually identical to those used in the process of executing MVT experiments. (See Step 8.) The difference is that, during implementation, there is only one recipe, with only one set of conditions to be executed. The recipe represents the best conditions to achieve the company's objectives.

Flawless execution is just as important during implementation as it was in testing MVT recipes. During implementation, however, every percentage point of noncompliance may directly cost the company thousands or even millions of dollars. Therefore, it is vitally important to create and execute an effective monitoring process to measure factor execution and to identify shortcomings in compliance. The target for factor compliance is 100 percent.

If the results achieved are below the expectations that were indicated by the MVT, lack of compliance in implementing the factors is almost always the cause.

Time and time again, experience shows that additional improvement is almost always possible. Your organization is likely to surface more ideas for the second and third rounds of MVT than it did for the first one. Additional MVT experiments often achieve larger results and gain momentum, making even larger gains than those of the first round.

What It All Adds Up To

Proper, dedicated application of the MVT process will yield staggering improvements. The typical result of using the MVT process is a little bit of improvement during the screening experiment, considerable improvement during the refining experiment, and dramatic improvement when the results are implemented.

Case Study: Implementing an MVT Project

A nationwide retailer with over a thousand locations had been experiencing falling sales. An MTV project was launched to identify actions which could turn around their sales decline. The plan was to test factors that included ideas from operations, advertising, merchandising and human resources.

After discussion, it became clear that there was actually another important objective — increasing profitability. To allow a valid comparison between large and small stores, "comp" sales and profits were used as the measures of success. Comp sales and profits were operationally defined as the difference between this year's sales or profit dollars and the sales or profit dollars for the same store for the same time period during the previous year.

More than 100 potential improvement ideas were narrowed to those that would be included in the MVT screening experiment. Only 23 ideas were then found to be practical, fast, and cost-free, so only these ideas were included.

A recipe matrix of 24 recipes was created. Each of the recipes would be executed in two different stores, so 48 of the company's 1,000 stores would be included in the MVT screening experiment. Specific stores and the specific recipe to be executed for each store were determined. Then an execution plan was created.

After analysis, six of the 23 factors had significant individual effects on sales. A predictive equation was constructed that would forecast the collective impact of the test factors on sales and profit. Management was extremely excited by the potential of a 10 percent comp sales impact.

Every one of the factors was implemented, but the rate of compliance was only 53 percent. When this was adjusted, improved comp sales increased revenue by more than $20 million per month, or about $250 million per year. The stock price doubled over the next quarter. ■

How Lowe's Reduced Advertising Expenses by $50 Million While Increasing Sales

Dale Pond, executive vice president of marketing at Lowe's, the home improvement retailer, was looking for ways to improve the business. Pond wanted a reliable

(continued on page 7)

How Lowe's Reduced Advertising Expenses by $50 Million While Increasing Sales

(continued from page 6)

method for measuring the impact of advertising on sales.

Pond was convinced that the MVT methodology could help him at Lowe's.

Lowe's decided to undertake two initial projects: the first involving the cover design and effectiveness of its newspaper circulars, and the second to determine the most effective media mix (television versus radio versus print ads) to fully exploit the $100 million annual media buy. The key measure was defined: sales at each store — pure, raw, simple sales.

Twenty-nine design or process ideas made the cut, based on the criteria of practical, fast, and cost-free. The mathematics in the screening MVT provided most of the knowledge of the effects of each of the factors — with just 36 versions of the cover. Testing 36 different covers in different markets with local pricing with different product patches with multiple vendors was not easy to pull off, but the Lowe's project participants made it happen. The paring of the list of ideas for the media-mix project resulted in 16 factors to be tested.

Using sales data collected from each of the markets executing an MVT recipe, the analysis of the experiment made it clear which changes improved sales results and which changes hurt results. Lowe's performed MVT refining experimentation that further clarified which ideas made an impact on sales.

A key discovery that ultimately saved both prep time and printing costs was that more product pages in the circular did not sell additional products. Cutting the size of the circular from 72 pages to no more than 48 pages saved millions of dollars annually in printing and postage expenses and did not hurt sales.

The results of the MVT projects led to dramatic changes. In the next year, Lowe's saved millions of dollars in advertising and marketing expenses, and improvement in sales directly related to the MVT-acquired knowledge added millions of dollars in new revenue. ■

How DuPont Achieved $26 Million in Increased Production With No Capital Investment

Dupont makes many different materials that consumers call "plastics" but which are actually far more specialized and differentiated than that term implies. One particular line of products is called *engineering polymers*; these are used primarily to replace metal in applications in which rigidity, stress tolerance and weight reduction are key goals.

In the mid-1950s, DuPont developed a material that was a tough, heat-resistant metal substitute and patented it as Delrin®. Today, Delrin is a mainstay of DuPont's engineering polymers line.

DuPont had a problem in the Delrin production process, however. Over a very short production time (often a few days), the buildup of particulates in the pipelines caused the polymer to begin forming within the pipes that fed the gas to the polymerizer, and the company was forced to take the machine offline to clean the pipes. With the resulting loss of production, minimizing the time for the cleaning process was critical. The downtime was costing DuPont an estimated $8 million annually.

DuPont had spent $1 million on having four teams conduct 22 different plant tests, based on the traditional one-factor-at-a-time experimental method. The tests were not successful, and the problem was considered, at least informally, to be unsolvable.

DuPont eventually could not make enough Delrin. They were anxious to find a solution and enthusiastic about the opportunity to try MVT. A cross-functional project team was formed and a key measure was defined. The conclusion was that "run life" — the amount of time that a polymerizer could operate continuously between cleanings — was the key measure that had to be extended. The goal of the MVT project was to increase the amount of time the polymerizer could operate.

The project team collected over 300 valid ideas. As in all MVT projects, the ideas were subjected to the practical, fast, and cost-free criteria review. This cut the list to 23 testable ideas. A 23-variable, 24-run experiment would take four months to complete. Because a 12-run experiment would meet the time requirements, the team leader asked for each operator's input on the 23-item list, and from the results, he identified 11 items to test.

Of the 11 test factors, three had significant impact. After testing, the team changed seven factors – the three that had significant impact and four where the changed level was easier for the operators to perform. A few months into the effort, the run life was extended from an average of 72 hours to an average of 139 hours, almost double the starting point and well above the 120-hour goal the team had set.

The changes produced a 15-percent increase in the amount of Delrin produced, which generated an additional $18 million annually in new revenue. With the additional revenue generated by this new level of production, the

annual (and recurring) benefit of this project to DuPont was $26 million — without any capital investment. ■

The Four Phases of Using MVT to Spread Breakthrough Results Throughout Your Company

Implementing the MVT process on a broad basis can transform an organization — competitively, financially and culturally. QualPro has constructed a standardized process to help clients implement MVT on an organization-wide basis.

Phase I: Complete two high-impact MVT projects with breakthrough results.

The purpose of Phase I is to prove to senior management and the rest of the organization that the MVT process will work in that particular organization. Phase I consists of the completion of two, high-priority MVT projects that will clearly demonstrate the benefits of the MVT process to the organization.

Project teams, guided by MVT consultants, apply the MVT process to financially significant opportunities. These initial successes pave the way for improvements on a broad scale. Often, the financial benefits from these Phase I projects more than fund the organization-wide MVT process efforts for the first several years.

Phase II: Commit to an organization-wide rollout — a senior management function.

The purpose of Phase II is to plan the organization-wide rollout of the MVT process. During Phase II, senior management creates and communicates an action plan that (1) prioritizes MVT projects to align with corporate objectives, (2) provides appropriate training, resources, and involvement to management, technical, and front-line personnel and (3) monitors process-improvement activities to ensure that success is rapid and quantifiable. MVT consultants support Phase II efforts through assessments and executive sessions.

Phase III: Execute MVT projects throughout the organization.

The purpose of Phase III is to expand the benefits of the MVT process across the entire organization. MVT projects are launched to address every major improvement opportunity. The objective is to produce results like those achieved in Phase I and to achieve dramatically improved results in all the organization's priority processes. Often, this broad application of MVT process-improvement techniques rapidly improves corporate financial performance.

Phase IV: Maintain the Gains, Prioritize MVT Opportunities, and Continuously Improve.

The purpose of Phase IV is to involve all personnel in maintaining the gains made in Phases I and III while also working to further improve results. As new challenges and opportunities are identified, additional projects are initiated. New hires and promoted personnel are involved appropriately in new or existing MVT efforts. ■

The Payoff

The MVT process is an amazingly powerful tool. The following breakdown shows a quick look at exactly the benefits of its use.

- It yields big results.
- It works every time.
- It improves any process.
- It provides counterintuitive learning.
- It translates to the real world.
- It accomplishes fast improvement.
- It has a great track record.

An organization-wide rollout can generate incredible accomplishments for business. The use of MVT creates a can-do culture as well as greater satisfaction. Higher revenue can be generated, while reducing costs and improving profitability. Lastly, the use of MVT can result in increased shareholder value.

The greatest impacts of the MVT process have yet to be realized. The process is an underutilized resource due to the fact that very few people know of its existence, much less its power. MVT is a process that should be used in every business, no matter what its product or service.

Finally, MVT is a process that should be used for the public good. Many of the problems that affect society could be solved using the MVT process. As with business processes, every public-interest process could be made more effective. The bottom line is that all of our lives could be better. ■

Beyond Performance

How Great Organizations Build Ultimate Competitive Advantage

by Scott Keller and Colin Price

THE SUMMARY IN BRIEF

The greatest invention of all time isn't the wheel, it's organization. By working together effectively, people can achieve feats far beyond anything they could accomplish individually. At a time of unprecedented economic, political and social change, organizations need more than ever to operate at peak levels of performance. In order to do so, they need leaders who understand both how to achieve organizational excellence and how to sustain it.

Evidence shows that only a third of organizations that achieve excellence are able to maintain it over decades. Even fewer manage to implement successful transformation programs. These statistics have devastating implications. In business, most of today's companies will falter within 20 years. In government, the majority of reform programs will fail. So will most efforts to create broader social change.

Co-authors Scott Keller and Colin Price wrote *Beyond Performance* for people who intend to beat these odds. Based on one of the most extensive research efforts ever undertaken in the field of management, *Beyond Performance* shows how leaders can deliver performance today while ensuring that their organizations stay fit for the future.

IN THIS SUMMARY, YOU WILL LEARN:

- The secret of achieving and sustaining organizational excellence.
- Everything you need to build an organization that can execute in the short term and prosper over the long term.
- Why the health of an organization is equally as important as its performance.
- How to determine the mutually reinforcing combination of management practices that best fits your organization's context.

Introduction

Almost three decades ago, McKinsey's Tom Peters and Robert Waterman published what was to become one of the best-selling and most influential business books of all time, *In Search of Excellence: Lessons from America's Best-Run Companies*. in which they examined 43 of the Fortune 500 list of top-performing companies in the United States.

Since *In Search of Excellence*, there has been a torrent of business titles providing accounts of organizational excellence and theories about what drives it. One of the best-known examples is Jim Collins and Jerry Porras' 1994 book *Built to Last*, which analyzed patterns among 18 successful companies.

Unfortunately, it seems that the recipes for excellence offered by these landmark publications provide no guarantee of staying power. It's revealing to look at what has become of the "excellent" companies lauded in the pages of *In Search of Excellence* and *Built to Last*. By 2006 — well before the recent financial crisis — 20 percent no longer existed, 46 percent were struggling and only 33 percent remained high performers. Why was this?

Changes in Fortune

Not all of these changes in fortune can be attributed to the companies themselves, of course. Performance is partly driven by macroeconomic forces, industry attractiveness and sheer luck. But it's also driven by the decisions leaders make, what they do and don't do, and the way they lead, which are things under every leader's control.

Our research suggests that many companies fall from grace because of an excessive bias toward a static view of managing performance instead of taking a more dynamic view that encompasses not only their company's performance, but also its health: its ability to align, execute and renew itself faster than the competition.

So if organizations need to take a more dynamic view of excellence, how can they achieve it? This takes us to the question of how leaders make rapid, large-scale change happen, and how they develop cultures of continuous improvement.

We don't claim to have all the answers, but at this point in our research efforts, we're confident that we do have insightful (beyond common sense) and pragmatic (readily applicable) advice that will help leaders beat these odds and achieve sustained organizational excellence. In fact, we've observed so many successes in so many industries and from so many different starting points using the approaches we describe that we regard successful transformation and sustained excellence as a real possibility for almost any organization. ●

PART I: WHY PERFORMANCE IS NOT ENOUGH

Perhaps surprisingly, we have found that leaders of successful and enduring companies make substantial investments not just in near-term performance-related initiatives, but in things that have no clear immediate

benefit, nor any cast-iron guarantee that they will pay off at a later date. At IT and consultancy services company Infosys Technologies, for instance, chairman and chief mentor N.R. Narayana Murthy talks of the need to "make people confident about the future of the organization" and "create organizational DNA for long-term success."

So why is it that focusing on performance is not enough — and can even be counterproductive? To find out, let's first look at what we mean by performance and health.

Performance is what an enterprise delivers to its stakeholders in financial and operational terms, evaluated through such measures as net operating profit, return on capital employed, total returns to shareholders, net operating costs and stock turn.

Health is the ability of an organization to align, execute and renew itself faster than the competition so that it can sustain exceptional performance over time.

For companies to achieve sustainable excellence, they must be healthy. This means they must actively manage both their *performance* and their *health*. Our 2010 survey of companies undergoing transformations revealed that organizations that focused on performance and health simultaneously were nearly twice as successful as those that focused on health alone and nearly three times as successful as those that focused on performance alone.

The Five Frames of Performance and Health

Leaders can bring about significant and mutually reinforcing improvements on both of these fronts at the same time by following a structured process.

We've chosen to describe this process in terms of five basic questions that must be answered in order to make change happen. Here they are:

- *Aspire:* Where do we want to go?
- *Assess:* How ready are we to go there?
- *Architect:* What do we need to do to get there?
- *Act:* How do we manage the journey?
- *Advance:* How do we keep moving forward?

Our goal is to provide rigorous and proven methods that enable leaders to answer each of these questions as they relate to both performance and health. While both aspects are critical, we go into much more depth on health. Why? Because that's where the greatest need exists. When surveyed as to which areas they wish they had better information to help them design and lead transformation programs, only 16 percent of leaders chose "determining what needs to be done to generate near term performance." On the other hand, more than 65 percent chose "determining what needs to be done to strengthen the company's health for the longer term." ●

The Science: Hard Facts Behind the Soft Stuff

You'll remember that we identified three key attributes of good health: internal alignment, quality of execution and capacity for renewal. Working from these attributes, we've determined that organizational health can be broken down further into nine elements that combine in different ways to support and sustain them:

1. **Direction** is a clear sense of where the organization is heading and how it will get there that is meaningful to all employees.
2. **Leadership** is the extent to which leaders inspire actions by others.
3. **Culture and climate** is the shared beliefs and quality of interactions within and across organizational units.
4. **Accountability** is the extent to which individuals understand what is expected of them, have sufficient authority to carry it out and take responsibility for delivering results.
5. **Coordination and control** is the ability to evaluate organizational performance and risk, and to address issues and opportunities when they arise.
6. **Capabilities** is the presence of the institutional skills and talent required to execute strategy and create competitive advantage.
7. **Motivation** is the presence of enthusiasm that drives employees to put in extraordinary effort to deliver results.
8. **External orientation** is the quality of engagement with customers, suppliers, partners and other external stakeholders to drive value.
9. **Innovation and learning** is the quality and flow of new ideas and the organization's ability to adapt and shape itself as needed. ●

PART II: THE FIVE FRAMES ASPIRE: WHERE DO WE WANT TO GO?

The first step towards organizational excellence is setting clear objectives for performance and health.

Performance: Setting strategic objectives

The performance aspirations your organization chooses will depend, to a great extent, on your starting point. They will also depend on your industry or sector. A

bank's performance aspirations will be quite different from those of a mining company, a hospital or a government department.

All the same, there are three lessons that almost any organization can apply when setting its performance targets: focus on your medium-term future, balance facts and intuition, and set tough but achievable goals.

Health: The Four Archetypes

On the health side, organizations will do best by starting with the knowledge that 37 specific management practices make up the nine elements of health.

Our research shows that healthy organizations need to excel at no more than six, if they're the right six. We've been able to determine how these practices complement, or impede, one another, and defined four archetypes that around four-fifths of healthy organizations fit into.

The Four Archetypes

How do we find those six? When we analyzed the complementarities among the practices underpinning organizational health, we found there are *four* recipes that can be used as a foundation on which to build. For simplicity, we've labeled each recipe as an "archetype" of a healthy organization. They are:

- **Leadership Driven.** Companies that fit this archetype believe that leaders are the catalysts for performance, setting high expectations and supporting the organization in achieving them.
- **Execution Edge.** Companies that fit this archetype believe that discipline, sound execution and continuous improvement are the foundation for great performance.
- **Market Focus.** Companies that fit this archetype believe that shaping market trends and building a portfolio of strong and innovative brands keep them ahead of the pack.
- **Knowledge Core.** Companies that fit this archetype believe that their pool of talent and knowledge represents their most important asset, and that their success depends on developing it effectively.

It's important to note that these four recipes are not a mere analytical construct, but a deeply ingrained fact of organizational life. Further, the knowledge that there are four reinforcing recipes should make it clear to leaders that they need to think systemically about health rather than adopting individual "best practices" from other organizations. What works in one recipe may spoil another.

Assess: How Ready Are We to Go There?

For most leaders, once they've set their performance and health goals, it's tempting to move straight into action. That is a mistake. Organizations that succeed take the extra time to assess whether they have the capabilities and mindsets to fulfill their aspirations.

Performance: Determining the Capabilities That Matter

Assessing the capability platform of your organization takes place in a two-step process: determining the capabilities that matter most in terms of your performance aspirations and then evaluating the state of these capabilities in your organization today.

This is a vital part of the transformation process: Our survey indicates that organizations that explicitly assess their current capabilities against those required to fulfill their performance aspirations are 6.6 times more likely to succeed in their transformation.

Consider an organization that needs to do something to stop its margins being squeezed. Its natural response will be to cut costs. But what capabilities will it need to implement this strategy? The answer will depend on where it intends to achieve the savings. Will it look to lean manufacturing? Better procurement? Supply-chain redesign? A review of overhead costs? Having targeted one or more areas, the organization faces another question: How good does it need to be at these areas to capture the savings? And looking further ahead, which of them is worth investing in strategically? In other words, which might yield competitive advantage in the future?

Answering questions like these will give you a clear view of the institutional capabilities you'll need.

In our experience, genuinely institutional capabilities are supported by three systems within an organization: technical, management and behavioral.

Health: Discovery Process

If we find symptoms of ill health, how can we trace them back to root causes? The place to look is at underlying mindsets. Mindsets drive behaviors and behaviors support (or obstruct) the management practices that lead to good (or bad) organizational health.

Bringing these mindsets to the surface and working with them explicitly is the only way to make sustainable change happen. Missing this step will doom any transformation to failure. In our 2010 survey, none of the companies that did no work on diagnosing mindsets rated their transformation programs as "extremely successful."

Moreover, companies that did go below the surface to identify deep-seated mindsets were four times more likely than those that didn't to rate their transformations as "successful."

Architect: What Do We Need to Do to Get There?

By this stage, you know your aspirations and the facts about your capability platform and vital shifts in mindsets, so it's time to work out exactly what you need to do to get from where you are now to where you want to be.

To make the transformation manageable, you'll need to break it down into a portfolio of change initiatives.

Performance: Identify the Right Set of Initiatives

Identifying the right set of initiatives is not always straightforward. Again, there's a close analogy with human health. When you feel ill and visit your doctor, he or she will ask about your symptoms, conduct an examination, eliminate possibilities and, if necessary, use tests to form a judgment on your disease or condition, the course it will take and the treatment most likely to prove effective.

Translated into a business context, this might sound something like: "This is where we are heading if we carry on as we are. Unless we address X and build on Y, we won't be able to get to where we want to go."

To help companies devise a holistic set of actions to meet their performance goals, we've developed an approach that we call the "portfolio of initiatives." To follow it, organizations develop a list of potential initiatives to take and then plot them on a grid with two axes: time and familiarity. The grid they produce will reveal at a glance whether the initiatives are balanced or unbalanced.

A portfolio of initiatives should embody all the actions your organization needs to take to meet your medium-term performance aspirations.

Health: The Influence Model

In the "Assess" phase, you decided on the vital few shifts in mindset that you need to make to achieve your performance and health aspirations, so your next priority in this, the "Architect" phase is to devise a set of interventions to influence those mindsets. The key to influencing mindsets lies in making meaningful changes to the context in which people work.

Through years of research and practical application, we have developed what we call the "influence model." It identifies four major levers that leaders can use to shift employee mindsets on a wide scale:

- **A compelling story.** The key elements in a compelling story are its content, the way it is communicated and the embedding of its message through rituals.
- **Reinforcement mechanisms.** Organizations need to link performance and health with rewards and consequences, leverage non-financial incentives and adjust their management processes, structures and systems.
- **Skills required for change.** The right skills can be developed by adopting a "field and forum" approach, working on the required relational and technical skills, and refreshing the talent pool.
- **Role modeling.** Effective approaches to role modeling include having the top team undergo a visible transformation, taking symbolic actions and selecting and nurturing influence leaders.

Using these levers to influence mindsets doesn't mean adding further initiatives to the slate of things to do. Instead, it means ensuring everything already on the slate is done in a way that maximizes their impact on the desired shifts in mindsets.

Act: How Do We Manage the Journey?

As with any journey, lessons are learned along the way, unforeseen events call for the plan to be adapted and energy levels must be managed to make it over the long haul. Having the right delivery model and change engine enables this to happen during transformational change.

Performance: Choosing the Right Delivery Model

Too often, organizations are impatient to get a pilot under their belt so they can press on with the rest of the implementation. However, driving it too fast or without sufficient care and attention can quickly lead to unintended consequences.

The first pilot is a *proof of concept* designed to establish whether the idea you are testing truly creates value. Conducted properly, this pilot will make considerable demands on your attention and resources. After all, if an initiative has made it into your portfolio, that must mean you expect it to deliver significant value, so investing in a field trial will be very important.

Let's say the first pilot goes well. What's to stop you

jumping straight from proof of concept to scaling up? We'd strongly advise against it. Instead, we recommend you complete a second pilot — a *proof of feasibility* — to work out how you can capture the bulk of the desired impact in such a way that it is fully replicable.

This pilot needs resources on par with those you'd dedicate to the real scale-up effort, plus a sustainable level of senior management attention (not an initial surge of interest that fades as time goes on).

Health: Creating the Change Engine

To help leaders generate and manage energy in their organization during the hectic execution stage, we've developed a tool called the change engine. It applies equally to performance and health initiatives, and consists of three linked elements:

- **Structure.** Bringing order and clarity to transformation activities by structuring the program at three levels: the transformation headline, performance and health themes, and specific initiatives. Programs are more than six times more likely to be considered successful if they are well structured according to our 2010 *McKinsey Quarterly* survey.
- **Ownership.** Building broad ownership for the transformation by combining formal governance and accountability with viral tactics to unleash self directed change. The same survey found that programs that energize employees through communications and personal involvement are twice as likely to be considered extremely successful.
- **Evaluation.** Regularly collecting robust data on progress in order to correct course quickly when necessary and celebrating achievements. Programs that rigorously track progress and impact through clear metrics and milestones are more than seven times more likely to be considered extremely successful.

Advance: How Do We Keep Moving Forward?

Building the capacity for continuous improvement requires as much energy and focus as any other stage in a transformation. The key to embedding a capacity for continuous performance improvement in your organization is to hardwire it into the infrastructure.

According to our 2010 survey, companies that build the capacity for continuous improvement into their organization are 2.6 times more likely to consider their transformation program a success over the long term.

Performance: Continuous Improvement Infrastructure

The transformation program will already have helped develop many of the mindsets and competencies that are needed to support continuous improvement: stronger functional and problem-solving skills, confidence that improvement can be achieved, the breakdown of silo thinking and so on. But the organization will also need to take specific steps to put a continuous improvement infrastructure in place. This comprises four main elements:

- Systems for sharing knowledge and best practice to ensure that improvements in one area are quickly adopted in relevant areas across the organization.
- Processes to identify and capture opportunities for improvement that enable employees at any level to change things for the better.
- Methods to facilitate continuous learning that give an organization a chance to pause and take stock of what's working, what isn't and what to do about it.
- Dedicated expertise to ensure continuous improvement activities get the attention they deserve.

Health: Centered Leadership

The core requirement on the health side is the right kind of leadership. The centered leadership model comprises five elements, which, when combined, give leaders the resilience and emotional capacity to continuously improve themselves as they continuously improve their organization. These elements are:

- **Meaning:** finding and communicating personal meaning in work, and enabling others to tap into their own sources of motivation and purpose.
- **Framing:** discovering opportunities in adversity by viewing even the most difficult problems in a way that opens up constructive and creative solutions.
- **Connecting:** taking active steps to build a web of internal and external relationships.
- **Engaging:** generating the confidence to step up and act, involving themselves and others in the face of uncertainty and risk.
- **Energizing:** investing systematically in one's own physical, mental and emotional energy, and creating the practices and norms needed to energize others.

A *McKinsey Quarterly* survey of 1,147 executives found that the five elements of centered leadership are mutually reinforcing. Respondents who reported that they frequently practiced four or all five gave high ratings to their passion for their work, their effectiveness as leaders and their satisfaction with life.

We discuss centered leadership last because it is a destination. By the end of any transformation you should have a broad base of centered leaders to take the organization forward. The journey to centered leadership, however, should start from day one.

PART III: PUTTING IT ALL TOGETHER

The senior leader's role is unique. The person at the top of the pyramid provides cues for everyone else in the organization as to what really matters. Furthermore, by learning what the senior leader's role in a transformation should be, readers at lower levels of an organization — and would-be leaders, too — can help their own senior leader fulfill it.

What Only the Senior Leader Can Do

There are four roles the most senior leaders should play during transformational change: making the transformation meaningful, role-modeling, building the team and relentlessly pursuing impact.

- **Make the transformation meaningful.** The impact of the change story depends on the extent to which the senior leader makes it personal, openly engages others and spotlights successes as they emerge. Senior leaders should consider themselves the "Chief story teller" in the organization.
- **Role model desired mindsets and behaviors.** Successful senior leaders typically embark on a personal transformation journey of their own. Through their actions, they not only show what the new behavior looks like, but also role model the ability to change.
- **Build a strong and committed top team.** To harness the transformative power of the top team, senior leaders must make tough decisions about who has the capability and motivation to make the journey, and spend real time ensuring alignment at the most senior levels.
- **Relentlessly pursue impact.** Where significant customer impact, or financial or symbolic value is at stake, there's no substitute for senior leaders rolling up their sleeves and getting personally involved. "I was an outrageous champion of everything we did," Jack Welch said of his involvement in numerous GE transformation initiatives including Six Sigma, the Workout program, reinventing Crotonville and the A-Class leadership initiative.

While playing each of these roles, the senior leader must also ensure that the organization strikes the right balance between performance and health, and doesn't allow one to overshadow the other. Daniel Vasella, CEO of Novartis, warns that, "Once you become dominated by the pressure of making the quarter, even unwittingly … you'll begin to sacrifice things that are vital for your company over the long term."

The Five Frames in Action: One Company's Story

On becoming president of the US financial services company Wells Fargo, John Stumpf inherited an organization with a strong culture that already led the industry in many products and customer segments. With no burning platform to drive change, he wondered how he could define his era of leadership, so he commissioned a review of current performance and future trends. This exposed worrying developments on the horizon: opportunities for acquisition were few, regulation was getting tighter, credit quality was deteriorating and customer preferences were changing.

Further analysis revealed that the bank had a healthy execution-edge archetype. It committed itself to pursuing historic growth rates despite the adverse trends, and decided to focus on capturing value by "mining the seams" between its traditional silos to boost cross-selling and customer loyalty. This would involve shifting to a market-focus archetype, but without losing the strengths and disciplines of the execution-edge archetype.

The bank followed the five-phase approach to make these aspirations a reality. Two years later, thanks to the equal emphasis on a portfolio of performance initiatives and a health-oriented spirit and way of thinking — on top of continuing efforts within lines of business to outexecute the competition — Wells Fargo's cross-sell rate was up by 18 percent to an extraordinary 5.2 products per customer. Customer loyalty measures in the community bank, where the bulk of the initial efforts were targeted, had jumped from 34 percent to 45 percent, and customer attrition had dropped from roughly 20 percent to less than 10 percent. Total returns to shareholders grew by 5.5 percent compared with 2.6 percent for industry peers, and net revenue grew by 31 percent compared with 11 percent for industry peers.

On the health side, the number of team members who felt that their way of working helped make things easy for customers had increased by 23 percent, and those feeling that collaboration across businesses was benefiting customers had increased by 16 percent. Moreover, the ratio of engaged to disengaged employees in the community bank had leaped from an already high 4:1 to a truly distinctive 7:1.

'One Wells Fargo'

Wells Fargo's merger with Wachovia has made the rallying cry of One Wells Fargo all the more important. The work on integrating the two companies continues and is expected to take until the end of 2012. What then? The organization is already gearing up for the next round of One Wells Fargo performance and health initiatives that will equip it to stay ahead of the competition long into the future. For now, though, the bank's experience over the period of 2005-2008 stands as a vivid illustration of how to make change happen at scale in an organization.

When asked to look back and identify the key ingredient in the effort, Stumpf — now chairman, CEO and president — nominates "getting the right balance between the initiatives we were driving from the top of the house with creating the right spirit, ways of thinking and ways of working throughout the organization." In the end, what mattered was "our 150,000 team members making the right One Wells Fargo decisions day in and day out." Ever true to his company heritage, however, Stumpf adds, "And having a time-tested set of vision and values to build upon and a great team to make it happen didn't hurt either!"

That brings us back to our central theme. The "vision and values" and "great team" that Stumpf credits as key factors in Wells' success are hallmarks of an organization that places as much weight on sustaining its health as on delivering performance and financial results. Getting that "and" into performance and health is what gives organizations ultimate competitive advantage. Not only does it enable them to make a successful transformation, it enables them to stay on top from then on.

Making It Happen: Do You Have What It Takes?

As we come to the end, we'd like to reiterate three of the principles that sit behind everything you've read. They are right at the heart of our findings and we'd encourage you to keep them in mind so that you stay grounded in the fundamentals of performance and health as you embark on and progress through your own journey.

Performance and Health Matter Equally

The first principle is that *performance and health matter as much as one another — and can be measured and managed with equal rigor.* The most important word in performance and health is "and." In all the decisions you make and actions you take as a leader, we encourage you to address both dimensions at once whenever you can. But bearing in mind that it's the health aspects that are most often neglected, we suggest you put extra emphasis on that side of the equation.

For most leaders, doing what we recommend will mean stepping outside their comfort zone. When we leave our comfort zone, we enter a learning zone.

Manage Performance and Health Today

The second principle is that *performance and health are both things you should be managing today.* Just as performance requires a quarter-by-quarter, month-by-month, day-by-day focus from leaders, so does health. Sometimes people equate health with the long term (something to manage tomorrow). This thinking couldn't be more flawed. Our research shows that the way you manage your health today is responsible for at least 50 percent of your ability to continue to perform in the future. And we'd add a word of warning: the higher an organization is riding in its performance, the more likely it is to be complacent about its health. Leaders of today's high-performing organizations would be well advised to watch out for this tendency and deal with it quickly should it arise.

It All Comes Down to Behavior Change

The third principle is that nothing changes unless behavior does. In the end, improving an organization's performance and health comes down to getting people to do things in a different way. That requires us to understand why we behave the way we do, and to be aware of the things that can stop us from achieving the impact we're striving for. We need to accept the predictable inherent biases that make us human, no matter how irrational they may seem in the cold light of logic. The approaches and tools we use should always be viewed through the lens of "How does this help us to understand and influence the behaviors we need to achieve our aspirations?"

A Proven, Rigorous Approach

Our research and experience indicate that by putting the three principles above into practice through the five frames approach, your organization will be well on its way to sustaining high performance and company health no matter what its industry or field may be.

Breaking the Fear Barrier

How Fear Destroys Companies From the Inside Out and What to Do About It

by Tom Rieger

THE SUMMARY IN BRIEF

In companies, fear can take many forms: fear of not meeting a goal, of not getting a bonus, of losing decision rights and respect. Fear compels employees and managers to protect themselves by creating seemingly impenetrable barriers fortified by rules and practices that benefit one group while harming others.

If this sounds familiar, then you know that, left unchecked, fear-driven barriers can spread at an alarming rate in a company. Workgroups start to define success not by reaching the company's overall goal, but by fulfilling their part of the process. Restrictive policies pile up until managers start to exert extreme control over headcount and resources. Other managers feel compelled to build empires — taking over other departments' functions to regain or enhance their self-sufficiency. In the midst of these counterproductive activities, employees suffer, success deteriorates and efficiency dies.

While these barriers might seem insurmountable, they are not. By learning from the real-world lessons in Tom Rieger's book, *Breaking the Fear Barrier*, leaders, managers and employees can overcome the barriers that plague their company. It takes courageous leadership and can be difficult, but the result will be nothing less than transformational.

IN THIS SUMMARY, YOU WILL LEARN:

- How your worst enemy is not always your competition.
- Why so many organizations plague themselves with cumbersome, lumbering bureaucracies that can't quickly respond to market changes.
- How some of your rules could be hurting your company's overall success.
- How to find the courage to fix what's wrong in your organization.

Introduction

In the aftermath of the Great Recession, while organizations are dealing with widespread loss and fear, it's easy for them to give up hope that they can get back that edge, that swagger and that fierce pride that drove success in the past. But it's still out there. That hope still lives inside every employee, manager and leader. To unleash that hope, organizations must utterly destroy the fear barrier. The first step is to understand how fear works, and how barriers are constructed and sustained so that the underlying root causes can be destroyed one by one. The second step is to create an environment where courageous behavior can flourish and thrive.

This is a difficult journey, but one that can mean the difference between success and utter failure; between dreams realized and hopes dashed. It is a journey we can't afford *not* to take. ●

Fear of Loss

Why do so many organizations plague themselves with barrier after barrier and create cumbersome, lumbering bureaucracies that can't quickly respond to market changes or new conditions? By creating internal barriers, countless organizations damage themselves with red tape, interdepartmental conflict, inefficient processes, restrictive policies, or too much or too little information.

My colleagues at Gallup and I worked with several companies that had "stalled." No matter what they tried, no matter what they did, they just could not stop a slow downward slide. To determine the root cause of this problem, we conducted extensive background material reviews of policies and procedures, and conducted several thousand in-depth interviews with people at different organizational levels, from CEOs to front-line employees in different industries, functions and job types in both the public and private sectors, across a dozen countries spanning six continents.

The focus of this research was to identify policies, practices and procedures that hindered success — often without an apparent good reason — and then to trace the origin of the problem. In every case, the problem was a barrier: something put in place internally that was intended to help one group, but harmed another. When we examined the data, we found that one root cause for those barriers far overshadowed all others. It existed in every organization that we studied and was generally the driving force behind the most damaging and most severe barriers. It was fear — fear of loss.

An Endemic Sense of Entitlement

What largely drove that fear of loss, we discovered, was an endemic sense of entitlement. Whether the issue was pay, a bonus, a promotion, decision rights, a big office, headcount or a budget, people would go to great lengths to protect something they felt they were entitled to — even if doing so was not in the best interest of the organization as a whole. The victims of these protective decisions often knew how harmful these behaviors were, but they were powerless to do anything about them.

People often face a basic dilemma between what is best for them personally versus what is best for the organization. Barriers inevitably spring up when these two dynamics are in conflict, but when they are in perfect alignment, organizations can avoid these barriers.

If these two forces are not managed properly, fear of loss can become a self-fulfilling prophecy. ●

Parochialism

When functional silos create protective policies and rules, defining success by focusing on only what happens in their own little world, and losing sight of the ultimate outcome, a company has reached the first level of bureaucracy: Parochialism.

Sustaining parochialism isn't easy. It takes a lot of effort. So to deal with incessant interruptions, exceptions and problems, parochial departments (and often whole companies) make new rules to protect themselves: rules that control actions, rules that restrict the flow of information, rules that limit and define how others will deal with that department, rules about the rules for changing the rules — all to serve the parochial needs of a local "ruler."

Rules tend to enforce parochialism when they are absolute. General Motors (GM) used to have a rule that senior executives had to review presentations three times: They'd read the presentation before the meeting, sit through the presentation and read the minutes of the presentation afterward. This is part of the reason why GM executives routinely read 600-700 pages of documents a day, ranging from divisional performance results to lease agreements, leaving them with little time for selling cars.

Managers and leaders who are acting in a parochial manner don't think they're doing anything wrong. Often it is the contrary: They strongly believe that they are taking a courageous stand for what is best. They may even have been rewarded for their actions even though those actions are clearly harming the organization.

Doing Something Wrong But Thinking It Is Right

Behavioral economist George Loewenstein's study on behavioral decision theory and business ethics helps to explain this phenomenon of doing something that is clearly wrong but thinking it is right. He found that "whenever individuals face tradeoffs between what is best for themselves and what is morally correct, their perceptions of moral correctness are likely to be biased in the direction of what is best for themselves." In other words, if your self-interests are in conflict with those of the greater good, it is simply human nature for you to adjust your view of the greater good to match the context of what is best for you.

If organizations do not aggressively work to prevent situations in which one individual or group succeeds at the expense of others, the leaders of those groups may feel compelled to act in a parochial manner. If an organization is holding leaders accountable to hit certain goals, and others appear to be getting in the way, then it is logical for leaders to feel justified putting up walls and barriers to prevent those interruptions or distractions from having any effect — even if doing so ultimately hurts the broader organization. ●

Territorialism

Often, managers feel that they have no choice but to maintain the tightest level of control possible over people and budgets to ensure that no penny is wasted and no assets are lost, especially to other departments. They may pressure front-line workers to meet short-term goals at the expense of meeting their specific departmental goals. By doing so, these managers create even thicker barriers to protect their turf.

These barriers institutionalize the problem of fear. If managers are worried enough, they may feel forced to start controlling resources, projects and people just to maintain control. They believe this is a solution to a temporary problem, but it rarely is. What starts out as a fear-based reaction can soon become standard operating procedure. Tight control becomes more and more prevalent, and it inevitably affects interdepartmental behavior. The whole scenario creates a low-grade siege mentality.

The Second Level of the Pyramid of Bureaucracy

This condition is the second level of the pyramid of bureaucracy: territorialism.

To be clear about terms, parochialism and territorialism differ in various ways. They are the result of different dynamics and they have different manifestations: While parochialism is about protection from *outside*, territorialism is about control over what is *inside*, regardless of the impact on front-line staff or other departments. While parochialism and territorialism are not the same thing, they are not mutually exclusive. A parochial manager can also be territorial, and vice versa.

Territorial Managers

Here are some of the many ways territorial managers exercise control:

- **Taking away freedom.** Low empowerment, despite high levels of accountability, is a serious barrier that exists to some degree in virtually all organizations.
- **Taking away extra time.** Every job requires a certain amount of time to perform. Territorialism systematically fills every minute with bare-minimum tasks,

leaving no time for outstanding performance and certainly none for personal empowerment.

• **Eliminating opportunities to gain knowledge or skills.** In times of scarcity, training is often the first thing to go, even though that training may help prepare employees for transfers, advancement or new ways of doing things.

• **Restricting information flow.** By keeping employees in the dark — about issues as major as strategy or as minor as office supply entitlements — managers limit employee participation and effectiveness.

• **Withholding support.** Perhaps the most insidious way for a territorial manager to limit empowerment is to implicitly or explicitly express that employees are empowered at their own risk and that they will not be supported if things go wrong. ●

Empire Building

Territorial managers and leaders can control their fiefdoms unchecked as long as they don't have to deal with other departments. But when they do, fear of loss of their ability to maintain control can drive them to spread their sphere of power over others. Fear reaches its apex in an organization when individual departments start building empires. Empire building is the pinnacle and most extreme level of the pyramid of bureaucracy.

Empire building occurs when one group attempts to regain or enhance its self-sufficiency by encroachment or by expanding its span of control even when that is not in the best interest of the organization. There are several signs that empire building has begun: Departments compete for IT initiatives. Recruiting may become backlogged. Leaders either directly or indirectly control other independent groups by "speaking for them"; by claiming the right to prioritize time or resources for different departments; or, in empire building's most severe form, by creating duplicate functions of their own.

Empire building cannot exist without parochialism and territorialism. The preconditions for empire building are endemic fear, different views of success, tight control over resources and lack of shared accountabilities — the bricks and mortar of parochialism and territorialism. When faced with parochial and territorial colleagues and the barriers they build, managers might feel that they have no other choice *but* to build empires.

Empire Building Is About Acquisition and Expansion

But empire building is not the same as parochialism and territorialism. Parochial managers do not necessarily want to take control over other departments. Instead, they build walls against others' empire building attempts to keep outsiders from interfering with their own local focus and viewpoint. Territorialism is about keeping things just the way they are. Empire building is about changing the balance of power. While territorialism seeks to impose limits on what people can do inside the silo, empire building seeks to change the focus of what those in *other* departments do. Territorialism is about defending the current span of control, but empire building is about expanding it.

Empire building can take many forms, but it's fundamentally about acquisition and expansion. Empire builders are driven to take over headcount, information, budgets, decision rights and other resources. When they do, it increases inefficiency, conflict and disengagement, and wastes resources. Instead of worrying about a competitor taking over a segment of the market, empire builders worry about asserting control within their own companies. Time and money end up being directed at internal turf wars rather than at the competition. Empire building is not the valid consolidation of oversight, but rather the deliberate attempt to improve one group's self-sufficiency at the expense of another group's success. The costs to an organization can be enormous. ●

The Cost of Fear

When a manager behaves in a territorial manner — controlling staff through low empowerment or misguided accountability — employees have trouble assisting with or even seeing what's happening in the organization as a whole.

To discover how prevalent territorial behavior is in American workplaces, Gallup conducted a nationally representative study of 2,634 U.S. working adults. We asked respondents about various aspects of empowerment and accountability in their workplace as an indication of how much they were controlled versus how they were judged.

Four Groups of Workers

From the resulting data set, we categorized workers into four groups based on their levels of empowerment and accountability: Top Performers, Loose Cannons, Broken Spirits and Prisoners.

Top Performers are the kinds of employees who approach a customer problem by saying, "I am here to help," who are *able* to help and who expect their manager to know about it and approve. Top Performers represent about one-fourth of the U.S. working population.

Loose Cannons have great power but very little responsibility. They have no objective metrics, don't receive feedback on their performance and/or face no consequences for their actions. Loose Cannons make up 21 percent of the U.S. working population.

Broken Spirits are held highly accountable but have little, if any, empowerment. Members of this group have firm metrics and face consequences for falling short of performance targets. However, they are unable to make decisions or adapt to new situations. Broken Spirits represent the smallest proportion, accounting for 5 percent of the U.S. working population.

Prisoners lack any empowerment and live in a world of shifting rules and subjective accountability. Prisoners are the ones most likely to be found in a parochial or territorial environment. Shockingly, *one out of every two* American workers is a Prisoner.

So what does all that imply for business performance? The average engagement level for Top Performers is at the 87th percentile, making that group among the most engaged employees Gallup has studied. They are also the most productive. The average level of engagement for Prisoners is at the 8th percentile, making them among the least engaged and least productive employees.

Ultimately, parochialism, territorialism and empire building make a company less successful, less able to innovate and more prone to high levels of internal distrust. While the barriers that Prisoners and Broken Spirits face may seem insurmountable, it is important to keep in mind that others did not impose these internal barriers. Because people inside companies build barriers, they can be the ones to destroy them, clearing the way for success. To effectively combat fear-based bureaucratic barriers, a company must be ready and willing to attack the problem on all fronts. ●

Overcoming Parochialism

There are two steps to addressing parochialism: treating the symptoms and curing the disease. The symptoms of parochialism are rules that prevent more than they protect, making life easier for those within the silo at the expense of the broader organization's success.

Conducting an audit of these rules is a critical part of addressing the symptoms of parochialism.

To identify the rules that you need to audit, start by asking which rules sometimes get in the way and are not mandated by law. Different people from different parts of the organization will have different views about whether a rule is good or bad. Those who benefit from the rule will like it. But those who have to live with its negative repercussions may have several examples of how the rule hurts the overall success of the organization more than it protects it against loss or liability.

Once the organization has identified the debatable rules, the audit can begin.

Six Steps of a Rule Audit

A rule audit follows six sequential steps:

1. Identify the need that the rule is supposed to fulfill, and evaluate the validity of that need. Every rule should have a clear, established and valid need that it fulfills.

2. Assess ownership of the rule. Assessing rule ownership should be easy, and in many cases, it is. Accounting owns accounting rules, customer service owns customer service rules and so on. When no one owns a rule, no one is accountable for deciding whether it's good or bad.

3. Determine how effective the rule is in meeting its intended need. If the rule doesn't demonstrate that it improves performance, then the rule needs to be scrapped in favor of a different one to meet the intended need.

4. Find unintended consequences of the rule. To determine if a rule has unintended consequences, auditors need input from a wide range of employees, inside and outside the department that owns the rule, as well as from internal and external customers.

5. Establish the type of rule it is and the type it should be. Rules that make up the bricks and mortar of parochialism are usually *gospels*, or rules that must always be followed without exception. Some rules are *guidelines*. Some rules establish a boundary that should not and cannot be crossed. These are *ground rules*. The most elusive rules are *ghosts*. Ghosts are rules that are not really rules. Most ghosts start off as a practice to cope with a specific situation. But over time, those situations change or simply cease to exist. And yet the rule survives because old habits can be hard to break.

6. Adjust and communicate. Leaders must clearly communicate changes and adjustments to rule types, owners, needs and other pertinent information to the entire organization. ●

Overcoming Territorialism

Territorialism is about maintaining control over people and resources inside a silo. So overcoming territorialism involves addressing what the people within that silo

are — or, more importantly, are not — empowered to do and how they are held accountable.

The first step to creating appropriate levels of empowerment is to determine the factors that are limiting it. To find out, companies can conduct an employee survey in which workers indicate how much they agree or disagree with empowerment issues. Once organizations establish which aspects of empowerment are a problem, they can take appropriate corrective action.

Freedom to make decisions. If employees lack the freedom to make decisions, it's probably because of their workgroup's territorial manager. Determining the appropriate level of employee's decision-making freedom comes down to establishing a shared, unifying, mission-oriented company goal and a reasonable set of ground rules. That goal should then become the ultimate barometer of good and bad decisions.

Time. The most common empowerment killer is lack of time. To address this problem, organizations must determine what the administrative task capacity (time left over after mission-critical work) for a particular function actually is. Once you know that time capacity, prioritize tasks based on the overall business.

Training opportunities. Training criteria should be as objective as possible. And companies should expect and encourage managers to ensure that their staff continues to learn and grow.

Access to information or resources. A culture of information sharing should be a deliberate strategy, along with rewards for sharing and penalties for hoarding.

Employee participation and innovation. Mapping the communication flow in an organization can shed light on where information is flowing well, where it is blocked, where it is vulnerable and where it is too many layers removed.

Managerial support. Holding employees accountable for the overall success of the organization and empowering them to succeed in furthering these objectives, including placing them with a talented manager, can help prevent territorial behavior from reaching a critical mass.

Overcoming Empire Building

Decisions that foster empire building are typically a result of short-term thinking. One type of short-term thinking is a *sin of omission*, when decisions are made for short-term benefit without a full realization of the ultimate effect. A sin of omission is a barrier created by a hasty decision or a badly planned move, such as pulling resources off one project to save another, thus making it impossible for the first project to succeed. This becomes a problem when there is collateral damage to the broader organization.

Another type of short-term thinking is a *sin of commission*, when people realize that there will be long-term consequences, but they sweep those concerns under the rug. When unpleasant consequences are well-known but brushed aside, dismissed or minimized until it's too late, organizations are creating a sin of commission.

Companies Cannot Ignore the Short-Term Impact of Decisions

To avoid these types of problems, organizations should evaluate the guiding principles based on long-term *and* short-term impact on business success. Companies can't ignore the short term; doing so could put them out of business. But ultimately, the most important thing is the long term. Organizations will be better off making decisions that carefully consider long-term outcomes.

Courage Enablers

Removing barriers is only the first step. Leaders must give employees the encouragement, energy, commitment from above and support to try new things and to focus on the greater good of the overall organization. Leaders need to give special attention to courage enablers to ensure that new barriers aren't built. Once rules, empowerment, accountability, information flow and resources have all been addressed, managers need to foster courageous behavior through four types of actions:

- **Aligning vital courage and moral courage.** Shane Lopez and the late C.R. Snyder are perhaps the foremost experts in research regarding hope and courage. They defined vital courage as the "inspiration for actions that improve one's lot in life or that ultimately promote survival." Moral courage is "the authentic expression of one's beliefs or values in pursuit of justice or the common good despite power differentials, dissent, disapproval or rejection." While vital courage is inwardly focused (survival), moral courage is outwardly focused (ideology). Vital courage is about what's best for the employee. Moral courage is about what's best for the organization.

- **Matching responsibilities with strengths.** Organizations that effectively create individualized career paths for talented employees have seen dramatic benefits. One heavy equipment manufacturer began to use a strengths-based approach to determine eligibility for a fast-track manager training program. The failure rate for

those going through the program dropped from an unacceptably high level to virtually zero within six months.

• **Engaging employees.** Engaged employees are good for business. In a financial services company, higher levels of engagement meant stronger productivity. In a manufacturing firm, greater engagement resulted in fewer accidents. In a hospital, increased engagement led to improvements in patient outcomes and safety rates. Other businesses saw increased sales, lower turnover, better customer relationships and higher market share. What all of these organizations found is that engaged employees are a prerequisite for courage and success.

• **Rewarding courageous behavior.** The reward doesn't have to be a trophy or a bonus; it could be a note from a manager, a pat on the back or a story told at a department meeting. Whatever the vehicle, leaders should reinforce and celebrate courageous behavior. And the reward should be meaningful to the person you are rewarding and clearly linked to the types of new behaviors you are seeking. ●

Beware of Courage Killers

Managers who lack the talent to do their job effectively are at the source of many courage killers. There are many ways for these managers to discourage courageous behavior in an organization. Some of the more common courage killers are:

• **Inconsistency.** To reduce inconsistency and create courageous behavior, organizations must have clear and objective rules that they communicate well and that everyone in the organization fully understands. They should enforce those rules as consistently as possible, based on hard outcome metrics rather than opinion.

• **Playing the blame game.** This courage killer tells workers that they are empowered *at their own risk*. But failure results in recriminations, regardless of whether the employee has the support and blessing of his or her manager.

Managers who are not willing to support employees who are acting within the rules or with the manager's consent send a message that they cannot be trusted. But managers who publicly stand behind their employees and encourage intellectual energy and initiative are tremendously beneficial to their companies.

• **Hoarding information.** To be empowered, employees must have access to the information and resources they need to do their jobs properly.

Ultimately, unless there is a compelling legal or regulatory reason to keep information from employees, companies should not tolerate information hoarding.

• **Public floggings.** A technical analyst in an industrial products company joined the organization with high hopes and expectations. However, her optimism was quickly dashed. When the manager of her workgroup was disappointed in an employee's performance, that manager would get an inch from the offending employee's face and scream at him or her in front of the entire group during meetings. After witnessing a few of these episodes, the new employee quit and took another job, even though the pay was lower.

• **Subjectivity/rewarding subservience over service.** When organizations base performance metrics on clearly communicated and achievable targets that pertain to objective outcomes, then everyone knows exactly what they need to do.

• **Excessive control.** Organizations must set ground rules for the types of decisions employees can make. As long as employees stay within those parameters and there is some accountability for results, they should be free to make decisions. ●

The Leadership Imperative

There are no fearless leaders, but there are courageous ones. Everyone has fears they need to face. The key is to learn to overcome those fears. Mark Twain said, "Courage is resistance to fear, mastery of fear — not absence of fear." To create a fearless company, leaders must master fear — their own and others'. They have to have the courage to fix what's wrong.

Mission success must be the ultimate barometer of everything that happens in the organization. Anything that contributes to it should be encouraged; anything that detracts from or has an unknown relationship to it should be discouraged or eliminated. However, the mission is unlikely to succeed unless the entire leadership team aligns itself with the shared goal, and achieving that degree of unanimity takes work. The leader needs to present the vision and discuss it with each member of the senior team one by one. Members should have the opportunity to voice their concerns and objections. Some objections will be valid; some will not. The final judge and arbiter must *always* be mission success. The leader should embrace suggestions that further the mission; suggestions that don't are irrelevant background noise.

Once leadership has achieved agreement and alignment with the mission, the next step is to determine how each department and function companywide will

contribute to mission success. Recognition, budgets, advancement, hiring strategies and other decisions should start and end with mission. Every department must consider its role in these decisions as well as how it will support other departments.

Goals, Budget Allocation and Resource Distribution

Specific goals, budget allocation and distribution of resources should be based on these guiding principles:

- Improving financial performance
- Improving the workplace
- Strengthening customer relationships
- Limiting liability
- Avoiding catastrophic failure

These issues are best decided locally. The overall *direction* of the strategy, however, should be driven by leadership and based on mission. ●

The Fearless Company

Parochialism, territorialism and empire building may seem like iron-clad barriers that cannot be torn down. But it is critical to remember that these walls were built internally, one brick at a time, out of fear. They weren't there when the company was started. They don't have to be there now.

If leaders are bold enough to see through the fear and dissect the root causes that make up this destructive pyramid of bureaucracy, they will see that these barriers can be overcome. Barriers that were built internally can be destroyed internally.

Barrier Busting Takes Courage

Barrier busting takes a great deal of courage. Executives and managers need to look in the mirror and say that absolutely everything is on the table. This will create tension and may cause some to leave. It can also mean the difference between success and failure. Removing barriers starts with understanding what people are trying to protect and shifting their reference points toward the greater good rather than local processes. Leaders should structure rules and policies to prevent walls from forming, instead of using them as the bricks and mortar that parochial managers need to build their dream castles.

As competition over resources increases, companies must take great care to manage the territorialism that will inevitably follow. Aggressively protecting empowerment, focusing on outcomes and holding people accountable for the right things are absolutely critical to maintaining an open and collaborative environment. Organizations can limit empire building through better management of information, focusing on the long term and having an outcomes-based resource prioritization process.

Company leaders must also properly manage information flow across departments to help ensure that they are enabling courageous behavior and that empowerment levels remain high. Information flow should be relevant and balanced: not enough information and people can't do their jobs; too much and mission-critical work will suffer as people become buried in e-mails, meetings and memos.

Focus on Total Company Success

Organizations can optimize resources by allocating them based on guiding principles that are focused on total company success rather than on one group's parochial or territorial attempts to trump another group. At the same time, leaders must beware of fear-based decisions that are focused on short-term needs rather than a long-term vision.

This journey can be difficult, challenging, exhilarating and cathartic. It is a fundamentally emotional experience for the employees who finally have the chains of bureaucracy removed. Completing the journey is nothing less than a celebration of freedom and the first step on a path toward greater success. ●

How Mistakes Help Employees Learn and Grow

One progressive manager told an employee who was terribly upset after making a mistake, "I don't expect you to never make mistakes. If you never make mistakes, you never learn. If your intentions are good and you act within the rules, I will back you up. I do, however, expect you to not make the same mistake over and over again."

Capturing New Markets

How Smart Companies Create Opportunities Others Don't

by Stephen Wunker

THE SUMMARY IN BRIEF

New markets have powered the greatest business successes in history, from Standard Oil to Facebook. How can you discover and pursue new markets to make your business thrive?

In *Capturing New Markets*, world-renowned business strategist Stephen Wunker argues that the first step is to stop applying traditional formulas of success and understand the unique dynamics in fast-changing new markets. He guides you through the process of creating counterintuitive strategies, such as treating competitors as collaborators, timing market entry and targeting narrow niches before big customer segments.

Whether you work for a huge corporation or for yourself, *Capturing New Markets* helps you find new sources of growth. Based on Wunker's groundbreaking work with Clayton Christensen — the Harvard Business School legend who coined the term "disruptive innovation" — plus Wunker's extensive experience in the trenches, this practical and fascinating guide shows you how to turn new markets into the drivers of growth — propelling you and your company into a whole new world of opportunity.

Capturing New Markets upends traditional thinking about business strategy, showing what will work in a new economy marked by turbulence and change.

IN THIS SUMMARY, YOU WILL LEARN:

- How to identify, create and dominate new markets.
- How to find new ways to grow.
- How to sustain new sources of growth into the future.
- How to anticipate customer demands and meet emerging needs before anyone else does.
- How to lead new markets while your competitors are just waking up to the opportunity.

THE COMPLETE SUMMARY: **CAPTURING NEW MARKETS**

by Stephen Wunker

The author: Stephen Wunker's accomplishments include developing dozens of new growth platforms for clients in a decade of consulting for both start-up and large firms across six continents, establishing new growth businesses for Africa's largest cellular network and creating the first mobile Internet device marketed outside Japan. Wunker has been published frequently in journals such as *Forbes, BusinessWeek, Managed Care* and *U.S. Banker.*

Preface

The rise of Apple to become one of the world's most valuable firms is often credited to the elegant simplicity of the products envisioned by its co-founder and CEO, Steve Jobs. But the roots of Apple's accomplishments lie deeper. Apple visualizes how technology can lead to new markets. As Apple has shown, new markets are potent sources of growth. Not only do they generate new revenues, but they often create opportunities for firms to lead new industries, earning a price premium for their offerings while building up strengths that limit their competitors' ability to make inroads.

Credit cards, air travel, video games and television — all giant industries today — were once new markets. Big companies often get their start this way. In fact, 42 of America's 50 largest firms are based on exploiting markets that once were new.

New markets can be deceiving. While they can create vast new growth, they may seem small and irrelevant today. Winning in new markets requires taking a disciplined, dispassionate view of where opportunity lies. It may necessitate embracing new ways of engaging with customers, channel partners and other stakeholders. Frequently, it entails adopting an unfamiliar way of making decisions. Yet the payoffs can be immense.

Why New Markets Matter

A new market might cannibalize some of the old, but it also expands overall consumption — cars significantly hurt the makers of buggy whips, but they greatly expanded the use of transportation. If fighting competitors for share is a zero-sum game, new markets are about positive sums that create economic growth. There are two general ways in which new markets create growth:

• *New customers.* A new market often will lead to people or institutions buying products or services that they had not purchased before. Sometimes these products may be new-to-the-world, such as Apple's iPad, whereas in other circumstances they might be newly affordable or accessible, like cell phones have become in developing countries.

• *New consumption occasions.* A new market also may result from new consumption occasions. Colgate created a new market with its Wisp toothbrush, an ultra-portable single-use brush meant to be used on the go. E*Trade enabled consumers to trade stocks far more frequently than they could with traditional brokers. New products, services or technologies do not necessarily lead to new markets. The key distinction is whether they ultimately lead to new consumption.

Why New Markets Matter Now

New markets are particularly relevant in today's economy. As firms emerge from the "great recession," they are seeking new ways to grow. The [2008] downturn has left little appetite to take on the high costs of competing head-on against entrenched competitors, and so it is compelling to pioneer businesses with low costs of entry but high potential rewards. Aside from the short-term economic climate, several long-term trends are also converging to force new markets onto companies' strategic agendas:

• *Globalization.* For many firms, emerging markets are new territory. If firms do not play offense in emerging markets now, they soon may be playing defense against globalization's winners.

• *Information*. Thanks to innovations such as the Internet, e-mail, social networks and cheap telecommunications, information flows far more rapidly today than ever before. The easy availability of information enables markets to form quickly.

• *Virtual sales channels*. As well as enhancing information flows, the Internet has created virtual channels that link pioneers with target customers, bypassing the middlemen who often neglect new markets because of their focus on short-term sales quotas.

• *Open platforms*. Many new markets build on innovations that originally had an entirely different purpose. Global Positioning System (GPS) technology underlies industries such as car navigation devices, vehicle tracking and location-based advertising.

• *Discontinuities*. While change can shut down growth prospects for some firms, such as Blockbuster, it can open up potential for others willing to embrace new markets, such as Netflix.

The economic history of the 20th century frequently was the story of new markets. Industry after industry arose to expand consumption, from household cleaning products to information technology services. If this was the case over the past century, what will happen in this one? The trends that made new markets a powerful engine of growth are even stronger today. Businesses that seize the opportunity of new markets may grow enormously. They also can stay vibrant as the economy changes around them. ●

Finding New Markets

The precursors for any market will depend greatly on the idiosyncrasies of that industry. Generally, there are six categories to monitor, which are quite distinct from the factors to monitor in established markets:

1. Platform Technology. Given the accelerating rate of technological advancement, platforms are constantly emerging to enable new markets. These platforms can build on each other to create expanding frontiers of potential. New platforms build on previous ones, and they enable a cascade of future platforms and associated new markets. As a result, the number of new markets keeps expanding.

2. New Business Systems. George Eastman was a skilled amateur chemist, but his invention of celluloid film was not sufficient to make photography mainstream. Consumers were worried about how to handle the film — the original Kodak camera, while relatively inexpensive, still cost consumers more than $5 in today's money to develop a single exposure. Eastman's coup was inventing a business system in which consumers never had to touch the film. The camera was sent back to Rochester, NY for the film to be removed, developed and reloaded. Eastman also depended on the mass marketing enabled by the rapid growth of newspaper and periodical publishing during this time; the business model of a relatively cheap camera sent to Rochester for developing may not have provided local dealers with big motivations to create the market on their own.

How One Platform Technology Continues to Build New Markets

The integrated circuit made the cell phone possible. Integrated circuits gradually took on more computing functions until they became microprocessors. As microprocessors gained increasing power and cellular standards made fast transmission speeds feasible, the smartphone was born. As smartphone operating systems, such as Google's Android, took root, software developers could develop hundreds of thousands of applications for these machines. As these applications enable smartphone users to interact in new ways, still more new markets will bloom.

3. Changing Customer Capabilities. Almost 11 percent of the world's population, or 740 million people, live in India's countryside. Collectively, they spend about $148 billion on consumable products each year, including both food and nonfood items. Their per-capita consumption is growing at about 2.2 percent per year. While this translates into a little more than $16 per person per month, the sums add up to significant amounts. Moreover, consumer spending in urban India is growing by 5.4 percent per annum. These are already large markets and they are quickly getting bigger. As Indian consumers grow wealthier, new markets form.

4. Changing Customer Behaviors. One of the most difficult market triggers to scout for is a change in customer behavior. The challenge lies not in finding new behaviors — they can be readily observed — but in resisting the urge to proclaim optimistically that the tipping point is at hand. Behavior change takes a while and it is hard to rush.

5. Changing Business Partner Incentives. Sometimes the incentives within an industry's ecosystem of firms can change to make companies more receptive to buying a new category of products. For example,

doctors have long had the ability to buy health care IT systems that computerize their medical records and enable them to download data from other physicians and even patients' home monitoring equipment. These systems have the potential to improve care, yet the U.S. market has emerged slowly. Recently, the market has changed. Medicare — by far the nation's largest health insurer — will now pay physicians bonuses if they meaningfully use electronic records in their practices. As a result, this industry is expected to grow at more than 10 percent per annum for the next several years.

6. Changing Regulations. Regulations can change quickly and affect the fortunes of new markets overnight. While lobbyists sometimes focus on the costs of regulations to existing businesses, this money can go into the coffers of firms prepared to lead the newly formed markets that result due to these changes.

Assessing What Doesn't Exist

How can you evaluate something that doesn't exist? Borrowing techniques used in established markets is often folly. Past trends cannot be extrapolated, growth estimates are wild guesses and competitors are unknown. Additionally, potential customers may think new business ideas to be a bit weird. While some firms can move fast to launch experiments in a market, others require more intensive cost-benefit assessment.

Gauging a Market's Value

To get to the stage of detailed assessment, a new market should seem significant. It may provide either a modest value to a large number of customers (social networks) or a large value to a modest number of customers (biotech drugs). Ideally, it will do both.

To determine the number of target customers, the value created by a new offering and the extent to which a firm can capture that value, companies should take traditional approaches as far as they can. For instance, the medical device manufacturer Becton, Dickinson and Co. (BD) was able to estimate the potential market for health care worker safety at more than $500 million based on the number of workers using needles, as well as the cost and consequences of infection through accidental needle sticks. This estimate helped to justify a hugely successful product-development program to make the company the new market's leader.

Signs That an Industry Can Quickly Grow

Why is it that some great ideas take forever to take root, whereas others flourish fast?

Eight factors explain the difference. Lacking any of these variables can be enough to slow down a market. In combination, their absence can be devastating.

1. Physical Infrastructure. If an innovation relies on others laying groundwork, a firm might wait a long time for change to happen.

2. Business Infrastructure. Groundwork can be economic as well as physical. Sushi needed no building projects to become popular, but it did require (at least initially) a restaurant with highly trained sushi masters, almost all of them Japanese.

3. Few Decision Makers. The growth of indoor plumbing required an army of decision makers to agree on a need and a solution. Urban planners, architects, builders and families all had to align. Trying to coordinate diffuse decision makers is very difficult.

4. Depth of Need and Relative Performance. To get noticed, a new offering has to excel over competitors on at least some important criteria.

5. Behavior Change. Customers often start using a new offering by applying current behaviors and subsequently discover that it enables new behaviors as well.

6. Speedy Sales and Use Cycle. An innovation's penetration into the market is directly related to how fast prospective customers can understand whether it is really useful for people like themselves.

7. Low Switching Cost. Switching costs make it more difficult for potential adopters of an innovation to sign on.

8. Low Risk of Failure. Customers also will proceed slowly if the result of an innovation's failure would be far worse than its potential benefit, no matter how slight the risk of that event might be. Risks make potential customers want to see others adopting the innovation first, lengthening the overall penetration process.

The First Customers

Launching into a new market is different from pumping out offerings in the core of an established company. Usually, people who are being honest with themselves will recognize that there is a tremendous amount they do not know. Do people really want our product? Will they use it as intended? Will they pay what we require? Did we plan our costs correctly? How will the competition evolve in a year's time?

Only the very brave will rush confidently into such murky waters. They may be under substantial pressure from senior management and investors to get big fast. Or, in other contexts, they may have grown

used to creating detailed project plans and executing them ruthlessly.

The Power of Footholds

Staging growth is an element of a foothold strategy, but it is not the same thing. Firms could limit their investment in a business while spreading small bets across diffuse market segments. They could focus solely on research and development (R&D) up front and defer actual product launch. By contrast, a foothold approach focuses investment on creating an offering for a very small number of market niches, and it seeks to get out into the marketplace early to obtain the sort of real-world feedback that countless hours at a whiteboard never can achieve.

- **Speed.** While getting big fast is a hazardous proposition, new businesses do need to move quickly. The return on investment earned by a venture is a direct function of how fast profits are realized. Footholds accelerate action. By focusing money and people on a small, well-defined target, footholds enable rapid decision making.
- **Gaining "Scale."** One of the iron laws of business is that firms are more profitable the larger they are relative to their competition in a given marketplace. Scale allows companies to save through purchasing more cheaply. It spreads costs, such as technology, marketing and management, across a larger sales base. Scale also can enable firms to price higher because customers like to buy from a leader in the industry and the leader can afford to create product features that followers lack.
- **The Sociology of Innovation.** Sociologists have long studied how innovations diffuse within a population. Starting with a 1943 landmark examination of how Iowa farmers adopted novel seed corn from 1928 to 1941, they have traced how innovations tend to take root in a small sliver of a population that is prone to consider new approaches because they are desperate for a solution, have processes to assess these offerings or are simply intrigued by new things.

In a foothold market, customers often will know each other, even if they compete. They may hire people from rival firms, meet at industry events or golf at the same country club. Even if they do not know each other personally, they will be keenly interested in what their competitors are doing.

- **Competitive Signaling.** While it is illegal in many countries for companies to collude on price, it is well-established practice to signal intent to lead a particular market. In this way, firms can limit their head-to-head, price-based competition and instead dominate particular market segments based on their unique offerings for that customer set. ●

Paths to Market Penetration

The emergence of the mobile marketing industry shows how new markets often start through early movers integrating a set of offerings and selling directly to customers, only to have the industry disaggregate into specialists and sales channels as the market matures. Sales channels often dislike new markets, yet eventually they can be critical to making the market big. The process of moving from direct to channel sales holds many perils.

A company's choice of commercialization strategy can be likened to deciding between driving on a superhighway or country road, and a firm's circumstances can point the way to the best route.

Both the superhighway and the country road contain many dangers for early movers in a market, but the risks can be mitigated on either path.

Switching to the Country Road from the Superhighway

It is a courageous and sometimes foolish move to exit a traffic jam on the superhighway and instead try your luck on the country road. A company will lose its channel sales quickly and may have to create a whole new set of competencies. Yet this is precisely how Vanguard Group became one of the world's largest asset managers. In 1977, the company disposed of its traditional broker-dealer distribution network and established the mutual fund industry's first "no load" funds, where there was no sales charge for customers moving into the funds — and therefore no money to pay sales commissions. Direct sales also were the best way to market low-cost index funds, a category that Vanguard pioneered in 1976. The company escaped the highly competitive structure of a fund industry selling through brokers who pocketed big fees and instead raced through open space, growing quickly as a result. Vanguard was able to make the switch because it had little choice; it was losing money otherwise. It also had an idea that catered to a readily identifiable market segment and an easy means of reaching those customers through advertisements in publications targeted at them. ●

Entering at the Right Time

"The pioneers are the ones with arrows in their backs." This business saying captures the feeling of many toward new markets: They generate immense value, but

not for the people who create them. Building a market can take more money and time than pioneers bargain for. Once these firms have laid the groundwork for an industry's growth, well-funded companies can swoop in to scale up and capture most of the profits. Yet there are endless counterexamples to this hard-bitten sentiment, including more than 450 startups that have grown to the point of becoming publicly traded companies in the past decade in the United States alone.

We can learn from a huge range of case studies. VisiCalc, Friendster and Diners Club each helped to create their respective industries yet faded away, sometimes swiftly, as their industries matured. Yet, in many instances, businesses that were early entrants became long-term winners; Zipcar today looks unassailable as the leader in car-sharing services. What explains the difference in outcomes? What do those findings imply about timing when a company should enter a particular market?

While *first-mover advantage* has become a common business term, it can be hard to define who is actually first; there is ample debate, for instance, about who can claim to have invented the automobile. Companies also may not know in advance if they will be first to market because competitors' initiatives are often opaque to the outside world until they are nearly ready to launch. Usually what matters is not being first, but being early.

Timing the Market

Companies that have a basic thesis about the advantages and disadvantages of their market timing should be able to avoid many missteps. The thesis is straightforward — it is better to be early when a company can:

- Preserve an early market lead stemming from barriers that later entrants will face
- Build resources and competencies that larger firms eventually could imitate, but which they will prefer to acquire
- Avoid becoming locked in to inappropriate technologies or business models before the market is deeply understood
- Avoid incurring large upfront costs because it is early to market.

If a company cannot meet at least two or three of these conditions, then it may be better off as a fast follower that learns from others' mistakes.

The Challenges for Fast Followers

Followers need the discipline to hold back and then to move quickly before an industry's competitive order becomes set in stone. But there is a critical caveat: *For many companies, it is impossible to be a fast follower. By the time they get to market in a significant way, they will be late.* Because of factors such as decision-making time frames, product-development cycles and the length of the sales process, a company's eventual entry into a quickly moving market may be so delayed as to be irrelevant.

There are some circumstances, however, in which being a fast follower makes sense. If a company has strong local market power, such as a grocery or newspaper, it can learn from experiments happening in other territories and then copy the winning formulas. ●

Fulfilling the Potential of Emerging Markets

Developing countries contain some of the most enticing new markets. With 80 percent of the world's population, they already account for 48 percent of the world's economy. The International Monetary Fund predicts that they will generate two-thirds of global economic growth from 2011 to 2016. Companies seeking growth would be foolish to ignore the opportunity.

The potential of emerging markets is widespread. Many people would think first of the $4.4 trillion expansion of China's gross domestic product over the past 30 years — a sum that constitutes more than 7 percent of today's global economy. The nation's tremendous growth has led it to become the world's largest consumer of construction equipment, automobiles and more. As impressive as China's growth has been, it presents just one facet of the story. Look at sub-Saharan Africa. More often associated with development aid than high-growth industry, the region nevertheless has seen an explosion in the field of cellular technology. Mobile communications is now a huge multi-billion dollar business throughout the continent.

Despite all this opportunity, emerging markets are still a sideshow for most large companies. A big impediment to aggressively targeting these countries has been the pesky issue of profits. For many companies, emerging markets historically have been a black hole of investment. Customers can be keenly sensitive to price and local competitors may be ferocious. Given the big money that some firms spend to begin operations in these countries, the prospect of enduring bleak returns makes many companies remarkably consistent about when they will consider a serious move — next year.

Yet an alternative scenario is quite plausible. When Celtel started in 1998 with a vision of becoming the

AT&T of Africa, it had to turn to government-backed financial institutions to raise much of its capital. Despite investors' initial hesitations, the company grew very quickly, with 98 percent of subscribers being lower-income prepaid customers. It was sold seven years later for $3.4 billion, creating enormous returns for those courageous first backers and making the company founder a billionaire. Along the way, the firm made major contributions to economic growth in the countries it served.

Advantages That Can Transfer Across Countries

With developing countries being so diverse, firms need to map out what advantages translate effectively between national markets. After all, customers in Uruguay are not going to care all that much about a company's leading position in Bangladesh. Advantages that can transfer across countries may include:

- *Brand*. The allure of global brands is somewhat overstated, given that in consumer products they tend to concentrate in sexy industries, such as sport and fashion, that have worldwide stars. However, in business-to-business markets, there can be more potential. Software companies, for example, make good use of implementation case studies to illustrate their impact.
- *Specialized skills*. For Celtel, a key competitive advantage lay in a small cadre of technical specialists who could support the rollout of new telecom infrastructure, billing systems and other critical but arcane elements of the business.
- *Economies in research and development (R&D) and production*. Nokia and other global manufacturers have exploited their scale economies to provide relatively advanced handsets to even the bottom tiers of the market.
- *Technology pipeline*. When company leadership pushes staff to stay customer-centric in their thinking, technology pipelines from developed nations can convey real advantages.

Enabling the Corporation

Sony Corp. became a titan of the consumer electronics industry through pioneering new markets: the transistor radio, the Walkman, the camcorder and much else. The company's co-founder and long-time chairman, Akio Morita, was legendary for his close observation of consumer habits and brilliant insights about potential new-product categories. His retirement in 1994 was a tragedy for the company — since then, Sony's stock price has been essentially unchanged. How can firms create a corporate competency around finding and exploiting new markets?

One decision to make early on is how widespread these new competencies need to be. While innovation programs can be broadly based, targeting both new ventures and better execution of existing businesses, new-market programs may be more focused. They may be walled-off efforts that draw minimally on the organization's core but nonetheless derive some advantage from that legacy.

The Great Challenge of New Markets

The great challenge of new markets is often not the idea — exciting and sometimes even obvious. Instead, companies struggle with creating the new while executing faithfully on the old. There are no magic tactics to make this happen seamlessly. Instead, sophisticated managers use disciplined techniques, balance between competing objectives and think carefully about how their goals mesh with corporate and business-unit strategies. While ventures must be highly adaptable, a program to create these businesses needs upfront planning about its mission, portfolio, governance and a host of other factors. It is all too easy to succumb to expediency, making small but continuous compromises that lead to where so many have gone before — failure.

How Companies Should Attack New Markets

Venture capitalists are role models for how companies should attack new markets. They combine blank-slate strategy with portfolio planning, a tailored approach to financial analysis and a deliberate sequencing of risks.

VC firms (VCs) succeed because they are strategic opportunists. They follow a strategy suited to the moment, not to yesteryear when an established company first entered a market. They focus resources on what has high growth potential today, not on sustaining businesses that already may have passed their peak. Because the canvas for VCs is so broad and open, they have to be very clear about what they are seeking.

In some environments it is possible for companies to enter new markets by creating dedicated business units, but in other industries this makes little strategic sense. Balancing separation and integration is a delicate act requiring substantial forethought.

Although companies need to be flexible in how they address the external world, internally they need to lay out clear rules of the road for internal audiences about how they will organize their efforts around new markets.

A Catalytic Role for Government

Democratic institutions hobble the potential of government as a venture capitalist, but their legitimacy and transparency create opportunity to lay essential groundwork for the growth of new markets.

Nascent industries are an obvious way to create economic growth and good jobs, and they can be a long-term antidote to underlying ills in health care, energy and many other fields. Yet government has a very mixed track record in supporting new industries. The political process can favor trendy, inflexible and inconsistent programs that spread cash broadly. New markets need just the opposite approach.

Public policy should have an important role in ensuring openness in four key areas. This role costs little and involves no political ideology.

- **Open Information.** Information undergirds a huge number of new markets ranging from geophysical analysis to hedge funds. The availability of data allows specialists to emerge in assessing and acting on that information. The result is better decision making, more efficient resource allocation and higher-quality products.
- **Open Platforms.** Open platforms create a basis for new markets. These platforms might stack on top of each other — integrated circuit, cell phone, Android Operating System and so forth — to enable uses that the originators of the underlying platforms scarcely could imagine. Many of these platforms are commercially attractive and need no government support. However, some initiatives are not viable as businesses but are important and well handled by a trusted intermediary, such as government.
- **Open Experimentation.** The barriers to new markets' success frequently lie not so much in creating new solutions as in getting them broadly adopted. To take perhaps the most dramatic example, during the 18th century, the British Navy lost more men to scurvy than to the enemy. It was a tremendous boon to the Navy once ships started including citrus in sailors' diets in the 1790s. Alas, the solution had first been published — by no less than the surgeon general of the East India Company — in 1614.
- **Openness to People.** People are utterly fundamental to shaping new markets. Individuals have played essential roles in new markets from the days of Andrew Carnegie and Levi Strauss through to Max Factor and Andrew Grove.The history of mobile communications shows how government can catalyze open systems with multiple vendors that surmount barriers to initial adoption and enable rapid upgrading of solutions. ●

Afterword

New Markets can be huge, amorphous and rapidly moving. Where do you start? Your strategy should depend on your circumstances. Top executives have the authority to set a strategy and portfolio plan for the corporation. They should be wary of dictating a new-market concept in too much detail because it is tough for frontline staff to rapidly adjust approaches on a dictate that comes from the pinnacle of a company. Rather, executives can articulate how much growth they expect from what types of new markets (new geographies, customer types, product types and so on). They can also kick off an effort to bolster the firm's capabilities in these endeavors through rigorous methods.

Lower-level managers in big companies can make a general argument upward about the power of new markets, but that thesis becomes more compelling if it is linked to a specific opportunity. Perhaps a project has languished because it has been wrongly directed toward established rather than new markets. Possibly there is a promising customer group that the company has not cracked. A new technology might be emerging that could affect the industry in poorly understood ways. These questions help to make the urgency of new markets clear and their potential concrete.

Entrepreneurs target new markets because they have to — this is where they stand a fighting chance against big incumbents. Their priority is usually around how to focus very limited time and money. Startups need a thorough profile of the latent need they are targeting, a clear idea of their foothold market and a sequenced plan of risk mitigation.

Whatever your circumstance, you may think that this is a poor time to tackle new markets. Business is too good, too weak, too concentrated, too diffuse — delay is easy to justify. But the world is not waiting. New platforms, emerging consumers and proliferating discontinuities are opening up countless new markets even as they threaten more established ones. The pace of change will not slow down. This is the time to act. ●

Escape Velocity

Free Your Company's Future from the Pull of the Past

by Geoffrey A. Moore

THE SUMMARY IN BRIEF

From the world's leading high-tech strategist comes the definitive road map to help established companies create next-generation growth. Based on 20 years' experience advising the top leaders of many of the world's most successful enterprises, Geoffrey Moore's *Escape Velocity* offers a pragmatic plan to engage the most critical challenge that established enterprises face in the 21st-century economy: how to move beyond past success and drive next-generation growth from new lines of business.

As he worked with senior management teams, Moore repeatedly found that executives were trapped by short-term, performance-based compensation schemes. The result was critical decision-makers overweighting their legacy commitments, an embarrassingly low success rate in new-product launches and a widespread failure to sustain any kind of next-generation business at scale.

In *Escape Velocity*, Moore presents a cogent strategy for generating future growth within an established enterprise. Organized around a hierarchy of powers — category power, company power, market power, offer power and execution power — this insightful work shows how each level of power can be orchestrated to achieve overall success.

IN THIS SUMMARY, YOU WILL LEARN:

- How to use organic innovation as a complement to M&A to systematically migrate an enterprise's portfolio out of lower-growth and into higher-growth categories.
- How to leverage asymmetrical resource allocation to create a powerful and sustainable foundation for a long-term competitive advantage.
- How to leverage target-market initiatives as accelerants to growth.
- How to manage your innovation resources to create maximal returns.
- How to fundamentally change the execution cadence of an organization, creating an irreversible tipping point along the way.

Introduction

This is a book about freeing your company's future from the pull of the past, but we should ask ourselves right from the start, why should one believe it is in need of liberation? What change is so dramatic that it calls into question the working assumptions that have sustained successful business performance for the past half century? In a word: *globalization*.

One way or another, for everyone involved, globalization means a whole new ball game. And that means back to the drawing board for vision, strategy and execution. What, to begin with, do we think this new world will actually want from developed-economy companies? And what will it want from *your* company?

Which markets will create your best returns, and how will you realign your management and resources to capitalize on them? Who will design your next generation of offers and for whom will they be designed? How will your legacy business models stand up in an increasingly digitized, globalized and virtualized economy?

There is still plenty of opportunity to read and react, to listen and evolve. If you can make reasonable and steady progress toward staking out positions in next-generation markets, while at the same time leveraging your positions in current markets, you can be optimistic about your chances. Or can you?

What if there is some hidden force working against your best efforts? What if this force is operating inside your own company with the full support of your executive team, your board of directors, your investors and, indeed, yourself? What if this force is able to mysteriously redirect resource allocation so that it never quite gets deployed against the new agendas?

That force is the pull of the past, most concretely embodied in your prior year's operating plan. That plan exerts a gravitational force that pulls inexorably at any investments that seek to depart from its inertial path. The larger and more successful the enterprise, the greater the inertial mass, the harder it is to alter course and speed.

There is a path that can achieve the escape velocity required to engineer a genuine change in course. This path accommodates both the sustaining demands of cyclical market positions and the disruptive ones of new secular change. Like the one we are currently bound to, it ends with an annual operating plan and a resource negotiation that can have zero-sum or even minus-sum characteristics. But it does not start there.

Instead it begins with a highly structured set of dialogues around vision, strategy and execution that tee up future opportunities and risks in a way that allows them to compete more effectively for resources against our existing franchises. ●

Escape Velocity and the Hierarchy of Powers

To free your company's future from the pull of the past, to escape the gravitational field of your prior year's operating plan and to complete the round-trip by returning with next year's operating plan, you need to apply a force that is greater than the inertial momentum of current operations. No experienced executive is likely to underestimate the amount of force required. It is, as they say in Silicon Valley, ginormous.

In his first law of motion, the one that covers inertia, Issac Newton taught us that an object at rest tends to stay at rest and an object in motion tends to continue in the direction in which it is currently moving. The same goes for resource allocation.

When organizations begin their strategic planning effort by circulating last year's operating plan, they reinforce the inertial properties of the resources as currently allocated. This is not a good outcome, but, to be frank, there is no help for it. You cannot really zero-base the budget every year, not in an enterprise of any size. So you have to assume this inertial force will be introduced into the process at some point.

What you *can* do, however, is get yourself and your colleagues out in front of it, Specifically, you can take the time to develop and bring to the table an *outside-in, market-centric perspective* that is so compelling and so well informed that it can counterbalance the inside-out company-centric orientation of last year's operating plan. And if you do this the quarter *before* you start your annual planning, you can earmark the resources and hive off the commitments to ensure they do not get lost in the subsequent shuffle.

To do so you need a framework to guide the process — or rather, as presented below, a *framework of frameworks*, because there is a lot of ground to cover.

A Framework of Frameworks

The Hierarchy of Powers is a framework of frameworks. It sizes up all economic competitions in relation to five types of economic power, each a driver of growth, organized in descending order from most general to most specific, as follows:

1. **Category power.** Category power is a function of the demand for a given class of products or services relative to all other classes. It creates the generic growth dynamics within which your company operates.
2. **Company power.** Within a given category, company power reflects the status and prospects of a specific vendor typically signaled by that company's market share. Growth here is at the expense of your competitive set.
3. **Market power.** Market power is company power within the confines of a single market segment. Market segments are sets of customers who share a common and unique set of needs and who reference each other, directly or indirectly, when making their purchase decisions. Growth here is signaled by dominant market share within segment.
4. **Offer power.** Offer power is a function of the demand for a given product or service relative to its reference competitors. Growth here is signaled by net change in revenue.
5. **Execution power.** Execution power is the ability to outperform your competitive set under conditions that favor no vendor in particular. Growth here is signaled by driving programs to tipping points, after which they become self-sustaining.

Within this framework, think of each type of power as being made up of a set of vectors, each of which can align with one another to reinforce the sum total of power or cancel each other out to reduce power to near zero. Thus you can be in a hot category and fail to execute, producing a near-zero result. Similarly, you can execute like crazy in a dying category and have an equally disappointing outcome. But when you get the powers aligned, when each is reinforcing the others, then the magic they call *synergy* appears and very good things can happen indeed. ●

Category Power: Reengineering Portfolio Management

By the fall of 2010, two iconic brands in the world of print media, *Businessweek* and *Newsweek*, had been sold at an extraordinary price — rumored to be $1 apiece! Meanwhile 3Par, a not particularly distinguished storage company, had been acquired for $2.3 billion, 10 times last year's trailing revenues.

Welcome to the world of category power. Print media are falling off the end of the category maturity life cycle, being displaced everywhere by digital media. When this happens, it doesn't matter how good your brand is — just ask Kodak what happened to its brand when film got displaced by digital photography. Meanwhile that same shift to digital media has thrust the storage category into a massive secular growth curve.

Category power is the No.1 predictor of future economic performance. So if you are going to free your future from the pull of the past, begin here. This exercise goes by the name of portfolio management and it begins with the category maturity life cycle.

The Category Maturity Life Cycle

The fundamental model for understanding the dynamics of category power is the category maturity life cycle. This model is used to focus on the *changes in state* categories pass through during their life cycle, and the implications of these state changes for the future of your fran-

chise. Category power manifests itself in five different states. The significance of these states is as follows:

A. Emerging Categories. These are the maelstroms in which new wealth-creating engines are born. For established enterprises, emerging categories are a real challenge. They entail high risks combined with highly variable rewards, demand a lot of attention from top-flight resources, but do not provide material returns in the near term. For start-tups, on the other hand, emerging categories are a godsend. They put the incumbents in their weakest possible position and create openings for no-name disrupters.

B. Growth Categories. These are the great wealth-creation vehicles for public enterprises. Growth is secular, often lasting the better part of a decade. In Stage B category competitions, established enterprises have powerful competitive advantages over new entrants, not the least of which are an established brand and a global go-to-market footprint. Nonetheless, if the incumbents deny the new paradigm and persist in their loyalty to the status quo, or if that new paradigm becomes global overnight (as is now possible in digital media businesses, for example), then the trumpets blow, the world order is destabilized and the walls come tumbling down.

C. Mature Categories. This is where the overwhelming bulk of the world's economic returns are generated year after year. It is also where the vast majority of jobs and tax returns are generated. Mature categories offer stability and predictability. Growth is cyclical. Market leadership positions change very slowly and established enterprises dominate.

D. Declining Categories. These are categories that have transitioned from cyclical growth rates to persistently negative ones. This is also a secular change, meaning it is only going to get worst. That said, like many things in life, it may take a long time to get a lot worse.
Established enterprises are the only players of merit at this stage. The market is not looking for new vendors; rather it is deciding whether to bite the bullet on changing out infrastructure now or to stretch its current position for a little longer.
The key point for us to take away is that in Stage D, for the first time, category power is a negative force. We are swimming against the tide.

E. End of Life. This phase is the end of a category's commercial viability, as in telegrams, telexes, rotary phones, movie projectors, slide rules, typewriters, carbon paper, jukeboxes, transistor radios, rabbit-ear antennae, carburetors and the like. A category reaching end of life has been known to cripple an entire enterprise's viability, which is nothing short of tragic. This happens when a company stays too long at the fair.

The great challenge in portfolio management is onboarding a nascent business with good prospects for Stage B growth at a time when its current revenues are not yet of material size. This demands you allocate premium resources for an extended period of time, particularly on the go-to-market side of the house. These resources are under enormous pressure to meet short-term revenue commitments, and the contention for them too often results in short-changing the emergent opportunity. Thus portfolios fail most often not for lack of R&D innovation but rather inadequate go-to-market representation. ●

Company Power: Making Asymmetrical Bets

Company power is the sum of all the bargaining power you can bring to bear relative to your customers, your suppliers, your sales-channel partners and your whole-offer partners. In its most spectacular from, it is the sort of thing that IBM demonstrated in the 1980s, Microsoft in the 1990s, Google in the first decade of this century, and Apple at the present time. But one need not achieve such dramatic positions of power to create superior returns for your shareholders. You just have to make yourself different enough to matter.

Achieving this kind of escape velocity from your competitive set, freeing yourself from power-deflating bake-offs with competing companies, means you must field one or more unmatchable offers. Such offers, in turn, are born from an unmatchable set of capabilities — what we call your "core" — which is unique to your company, hard to replicate by competitors, and in great demand by customers.

The idea of *core* evolved from the concept of value disciplines introduced in the 1990s — companies can generate escape velocity in one of three ways: *product leadership*, *customer intimacy*, or *operational excellence*. The theory was further refined by the introduction of *innovation types*, which made the choice of a vector of differentiation more granular. But the key in all cases is to develop or acquire "crown jewels" — unique assets that are proprietary to you, hard for competitors to replicate,

and highly valued by customers. Crown jewels come in many forms — technology patents, brand loyalty, domain expertise, a massive installed base, a disruptive business model, and the like. The key to realizing company power is to overweight resource allocation to intensify the impact of these assets in the marketplace.

By contrast, the failure mode is to peanut butter resources evenly across all requests, such that no one area ever gets beyond the boundaries of the competitive set's generic capabilities.

Being laser-focused about the specific direction of your core innovation investments and being Star-Trek-bold about skewing resource allocation to their specific ends together let you achieve escape velocity from your category norms.

Market Power: Capitalizing on Markets in Transition

Market power is simply company power specific to a particular market segment. Within the segment, you are the top dog, the big fish in your pond. Indeed, market power is always best measured in terms of a fish-to-pond ratio, where a 50 percent share of new sales into the target market segment is the entry stake and 80 percent is more likely to be the sustainable steady state. In your pea patch, you are quite simply the vendor of choice.

Thus it is that Google is the worldwide category leader in search, but not in China, where the market leader is Baidu. Facebook is the worldwide category leader in social networks, but in Spanish-speaking countries it is hi5 and in Brazil it is Orkut. In each of these market segments, the worldwide leader doesn't have a little *less* power — it has a *lot* less, as in *none to speak of.* Customers in each of these markets have built a fence around their local vendor of choice and that has fundamentally altered the dynamics in the marketplace.

Market power of this kind *guarantees* competitive separation from your category set. When you dominate a market segment to the point that customers and partners self-organize to marginalize your competition, you have truly achieved escape velocity.

And why would market segments do this? Why would they confer on your company's exceptional bargaining power, allowing you to earn margins well above the industry standard in the global market? The primary reason is that they want and need you to give very special attention to their particular details.

Global standard products go a long way toward meeting most of the specifications for any given category, but they never go all the way to meeting all the needs. That is left either to the customer or to some intermediary. This works fine for most cases, but in some segments, some of the time, the needs are high, the specifications are demanding and the global value chain is simply not up to the task. This creates an opening for a company to develop special products and services, often augmented by a specialized value chain, and take the segment by storm. This is the reward of niche markets.

Thus Silicon Graphics and subsequently Sun workstations took the first decade or two of business from visualization-intensive segments like oil-and-gas seismic pro-

When a Segment Strategy Works

There are at least eight situations in which a segment strategy is likely to pay for itself many times:

1. **Gaining market adoption for a disruptive technology.** The goal is to accelerate mainstream acceptance of a disruptive next-generation technology by first winning over a beachhead segment.
2. **Penetrating a new geography.** Targeting an underserved segment and meeting its end-to-end needs all the way is a great way to get market insiders to pull you in.
3. **Getting out from behind the market leader.** Underserved market segments provide the opportunity.
4. **Anchoring a turnaround.** There is nothing like a niche market segment for solving this.
5. **Solving for the "stuck in neutral" problem.** A management team can retake control by targeting a niche market segment in need.
6. **Capitalizing on a great niche opportunity.** In niche markets where a handful of companies spend lots of capital on next-generation facilities and tools, you can build high-value sustainable franchises without leaving the niche.
7. **Exploiting the "granularity of growth."** When markets mature and commodotize, value migrates from the core offer to the secondary elements surrounding it.
8. **Capitalizing on a market in transition.** When every company in a segment is looking for a safe haven that is compatible with the new world order, the first whole-offer teams to arrive with true end-to-end solutions to their problems will delight them.

cessing, computer-aided design for semiconductors, technical publications for user manuals, industrial design for consumer products and special-effects cinema.

Thus Lecroy's digital oscilloscope became the instrument of choice for nuclear physicists, HP's 12C became the calculator of choice for real estate agents and Tandem computers became the engine behind all the ATM machines that retail banking could deploy.

As these examples illustrate, while niche market segments may be lucrative, they are not particularly large. ●

Offer Power: Breaking the Ties That Bind

Thus far in our discussion of escape velocity, we have imagined the pull of the past as a gravitational field holding our rocket ships prisoner to a home planet. That is how categories, competitive sets and even market ecosystems exert their claims on companies and keep them in their place. When it comes to offer power, however, it's a different story.

To achieve escape velocity, your next-generation offers must free themselves from the entanglements of the myriad of legacy commitments, a long tail of products, promises and one-off customizations, each with its own trickle of revenue, each nattering for some share of the sales force's attention, each tugging at the sleeve of enterprise marketing to get some murmur of the total corporate voice. This is not gravity at work.

This reminds us more of Gulliver in the first of his travels, waking up in the land of Lilliputians, the six-inch-tall citizens who render him powerless to move; his giant limbs held captive by an infinitude of tiny, threadlike ropes. Thus does the long tail of your legacy offer set exert its power over your next-generation giants.

How can it be that the mighty is so subordinated to the minuscule? In the world of business, it is easy. In any given quarter, you are doing your best to meet your revenue commitments and, not uncommonly, you find yourself a bit underpowered to do so and very much at risk of falling short of plan. Indeed, you are much in need of a next-generation giant that could replenish your power. But instead, under the pressure of events and the compulsion to make the quarter, you find yourself taking revenue from wherever you can get it, grasping at any and all straws, fearful of cutting off any source of funds, however small.

So how are you going to break out of this tangle? Well, like Gulliver, you are going to have to innovate, not just to create your future but also to coexist in your present and to release yourself from your past. All this entails a much broader model of innovation than most people have in mind.

The model consists of three different types of innovation, each pursuing a return that is unique to it and contrary to the goals of the other two types. The types are:

1. **Differentiation.** The goal here is to be unmatchable, to create the escape velocity that will define your future.
2. **Neutralization.** The goal here is to keep up with or catch up to new market expectations, typically reset by some competitor's latest differentiation. You don't have to outperform, you just have to show you are good enough. But you have to do this *quickly* because a failure to respond here could have a big impact on your present results.
3. **Optimization.** The goal here is to do what you were doing before but faster and cheaper, thereby freeing up resources for use elsewhere or to be taken to the bottom line. This is all about productivity. It is also how you free yourself from the pull of the past.

All three forms of innovation are valuable, and all are required for an enterprise to sustain a strong market position. But here is the rub: Each type is incompatible with the other two.

- *Differentiation* is not readily managed to budget or schedule — you cannot say when you are going to become unmatchable, nor can you predict accurately how much it is going to cost. You just have to commit to get there, no matter what.
- *Neutralization* must be managed both to budget and schedule, with the latter being critical because you cannot afford to keep on disappointing the market with sub-par features. At the same time, you do not want to spend heavily here because all you really need is to be good enough soon enough.
- *Optimization* runs perpendicular to the other two — it is not about creating output, but rather about improving process. What it must do is respect the other two types and not impose on them constraints that will violate their prime objectives.

The key lesson here is that you must not bind any one type of innovation too closely to another type. Instead, use neutralization to set your project calendars, layer in differentiation whenever it is ready, and conduct optimization in the background as a continuous quality improvement effort. ●

Execution Power: Engineering the Escape

Everything we have discussed, all the various types of power we have labored to put in place, are for nought if we cannot actually execute our escape-velocity initiative. The challenge is to deploy a next-generation initiative at scale, overcoming the inertial resistance of our current go-to-market system to do so. To fully appreciate the dimensions of that challenge and address it successfully we need to:

- Model enterprise execution dynamics in general as they evolve over the life cycle of a given generation of offers from their invention to their deployment to their optimization
- Dig specifically into the dynamics of the transition between invention and deployment at scale, with particular attention to the criticality of achieving a tipping point and the catalytic role of programs in that regard
- Map these requirements to organizational development frameworks that call out the leadership attributes and organizational structures best aligned with meeting the escape-velocity challenge.

Transitioning to Escape Velocity

When you organize and staff around the life cycle of innovation, you get great traction in each of three execution zones: invent, deploy, optimize. For the complex-systems model this means invent via great *projects* to drive entry into new categories and markets, deploy via great *playbooks* to scale up to capture market share during secular growth and optimize via great *products* to extract maximum returns from cyclical growth.

On the volume-operations side, this same arc of execution from invention to deployment to optimization translates into great *product* R&D to enter new categories and markets, great *partner relationships* to scale out to deploy new offers during secular growth and great *processes* to capitalize on established market positions during cyclical growth. What's not to like?

Well there is one thing not to like: *transitions*! Each transition program, be it from invention to deployment or from deployment to optimization, must drive the organization to a tipping point so that what began under the purview of one set of managers is now taken up fully by another. Inventors do not relate easily to deployers, nor do deployers relate easily to optimizers, so these hand-offs are somewhat unnatural acts. But they must succeed, else the whole initiative is lost.

The Six Levers Model

The framework that underlies the playbook for product innovation is the Six Levers model:

1. Centralize. Bring operations under a single authority.

2. Standardize. Reduce the variety and variability of processes delivering similar outputs.

3. Modularize. Deconstruct the system into its component subsystems and standardize interfaces for future cost reductions.

4. Optimize. Eliminate redundant steps, automate standard sequences, streamline remaining operations, substitute lower-cost components or otherwise cost- and resource-reduce.

5. Instrument. Characterize the remaining processes in terms of the variability of key parameters and develop monitor-and-control systems to manage their performance.

6. Outsource. Drive processes out of the enterprise entirely to further reduce overhead, variabilize costs and minimize future investment.

Transition programs, in other words, must in effect catalyze conversions, bringing on the next set of leaders, getting them committed to carry the effort through the next phase. This is not the normal way to think about programs, so let us take just a minute to underscore what is required.

Most programs are level-of-effort affairs. Think training programs, lead generation programs or quality improvement programs. The program teams are assembled and as long as they are working on the issue, improvement in results is expected. But when the teams stop working, those results taper off. It is a pay-as-you-go model, if you will.

We're not talking about pay-as-you-go here. A transition program is a one-time intervention that changes the state of its object of focus. It is catalytic. By driving the organization to a tipping point, the center of gravity shifts and control migrates from one locus to another: behavior changes, the culture changes, the way things get done changes, all in fundamental and nonreversible ways. In other words, this is *big* change. ●

Conclusion

Let's look at one last major case example in which bringing together a number of levels of the Hierarchy of Powers created a major break from the past.

By the end of the 1980s, IBM had lost its way. In the early 1990s, it turned in such a catastrophic performance that even its most loyal supporters questioned its reason to be and were calling for its breakup. Instead Lou Gerstner and his team were able to engineer a now-famous turnaround, restoring a commitment and then a capability to be *the end-to-end solution provider for information technology to global enterprises*. That was what they decided the world wanted IBM to be and subsequent events have proved them right. This was their core, the foundation upon which they would restore the company's power.

In choosing this escape trajectory, they capitalized on several of IBM's crown jewels: its long-standing customer relationships anchored in the original mainframe business, its deep service capabilities and its brand reputation for end-to-end delivery. The team took these to a new level by refocusing the company on whole new classes of offers. That is, they transformed the decaying offer power of their legacy, prioritizing service offers over products and software offers over hardware. Then they doubled down in both areas with major crown-jewel acquisitions, including PricewaterhouseCoopers in services and Lotus Notes, Tivoli, Rational, Filenet and the like in software.

On the execution-power front, they redeployed executives from corporate-facing to field-facing jobs, letting them either sink or swim in their new customer-intimate assignments. They encouraged the services teams to support competitors' products, not just IBM's, because that is inherent in keeping an end-to-end commitment. They leveraged broad system-maintenance pricing agreements to help middle-of-the-road products compete against best-of-breed point solutions. In short, they tilted the whole company toward a services-oriented core. And everywhere they leveraged the complex-systems execution paradigm of projects-to-playbooks, eventually extracting themselves altogether from volume-operations businesses like printers (spun off to Lexmark) and PCs (sold to Lenovo).

Hitting the market in the middle of the 1990s, this dramatic repositioning caught HP and Sun off guard and set them back on their heels. This let IBM exploit a major category-power transition to Internet-enabled business-process reengineering at a time when everyone thought that was Silicon Valley's private pea patch. But what the Valley's engineers did not understand fully enough was that IBM's core was rooted in its abiding passion to help customers derive business value through technology investments, in part by sticking around long past the product sale just to make sure it paid off.

The other companies in their competitive set just wanted to drop off their products and move on. That's not what a large portion of the world wanted, however, and so IBM was able to win the nod. In other words, their *services-led* offer model trumped their competitors' *product-led* approach.

Closing Remarks

The reengineering of the global economy from a universe of vertically integrated corporations run by command-and-control management systems to one of highly specialized and disaggregated enterprises interoperating collaboratively to create global value chains has been an impactful change. In this new environment, change happens much faster than ever before because the whole no longer has any way to hold back the part. And that means that market transitions and technology disruptions are much more frequent.

Two things are critical to note here. First, in an era of change, it is critical to focus more attention than normal on power and less on performance. That is because the very foundations of your current performance are being eroded, and your No. 1 priority is to establish a next-generation foundation. If your company does not have an authentic dialog around power, if it is unable to reallocate resources to capture new power, if it instead remains bound to the performance obligations and expectations set by your legacy power, then it will become increasingly marginalized and eventually extinct.

Second, it also means that responses to these changes must be negotiated across a broader set of constituencies, many of which you have no command or control over. Collaboration has never been more at a premium.

In a collaborative network, the advantage goes to whoever can call the tune first, identify the relevant changes under way, find the pivotal role to play and communicate the vision in actionable frameworks. The purpose of the frameworks introduced here is to help you achieve that advantage and free your company to participate in its rewards. ●

Sensing the Future to Compete in the Present

GET THERE EARLY

THE SUMMARY IN BRIEF

A forecast is a plausible, internally consistent view of what might happen. It is designed to be provocative. At the Institute for the Future (IFTF), the word prediction isn't used because it is a statement that something *will* happen, and a *prediction* is almost always wrong. Fortunetellers predict the future; forecasters don't. A forecast doesn't need to "come true" to be worthwhile. It should provoke new thought: new insights, new possible actions or new ways of thinking about the present. You don't need to agree with a forecast to find it useful.

The ultimate paradox for business leaders today is the inability to forecast the future, yet the necessity to make sense of it in order to thrive. To be successful, leaders must devise strategies rooted in their own point of view and then get there ahead of the crowd. However, many leaders are content with getting there in time, and some are even willing to settle for getting there fashionably late. Those behind the curve focus on quick-fix problems, avoiding the kind of long-term dilemmas that will characterize the future. But as the IFTF's 10-Year Forecast delineates, today's corporate chieftains face more and more dilemmas; recurring, complex, messy and puzzling situations.

In this summary, Bob Johansen — former president and CEO of the IFTF — shares techniques refined by the Institute to help you navigate your organization's road to the future. Employing fascinating case studies like that of the Apple iPod, he shows how getting there early means finding new markets, new customers and new products ahead of your competitors. Through these stories, Johansen shows how getting there early helps you see beyond today's problems and recognize possible futures before others do.

IN THIS SUMMARY, YOU WILL LEARN:

- Seven directions of change in the next decade.
- Core dilemmas of the five driving forces in IFTF's 10-Year Forecast.
- The difference between a problem and a dilemma.
- Why smart networking is critical to marketing.
- How to conduct an effective After Action Review.

Thinking 10 Years Ahead to Benefit Today

Forecasting is a kind of mental fitness practice, comparable to physical fitness. Here are the core methodologies used at IFTF to develop forecasts:

• **Expert Opinion Aggregation** — defines who is most proficient in understanding a possible future.

• **Expert Workshops** — are usually composed of groups of about 12 to 25 diverse experts.

• **Content Synthesis** — draws together the forecasts of others.

• **Historical Analog** — draws lessons from the past.

• **Scenarios** — bring forecasts to life through stories to bring people into the daily life of future worlds.

• **Survey Research** — uses questionnaires or interviews to elicit attitudes about the future.

• **Ethnography** — is derived from anthropology to explore underlying culture and values.

• **Visualization** — brings a forecast to life through pictures, human and digital art, and other means.

• **Artifacts from the Future** — are hybrids of archaeology and design that use imagined objects to bring a forecast to life.

Although forecasting methodology is important and useful, it is wise not to take any methodology too seriously. Each leader needs to decide what approach he or she will take toward the future. ■

Institute for the Future's 10-Year Forecast

Before discussing the 10-Year Forecast, it is important to highlight the underlying directions of change behind it. Think of these as historical contexts for the future that is to follow. The following statements indicate direction, not destination; we are moving in the direction indicated, but may never actually get to the end point toward which we are moving. We are moving toward:

• **Everyday awareness of vulnerability and risk** — both in the developed and undeveloped worlds.

• **An hourglass population distribution** where old age is the new frontier, but kids will be heard.

• **Deep diversity** that is "beyond ethnicity," in the workplace and society.

• **Bottom-up everything** in which people interact with the products and services they consume.

• **Continuous connectivity** in which network connections are always on.

• **A booming health economy** in which health is an important filter for many purchasing decisions — and health risks are on everyone's mind.

• **Mainstream business strategy** that includes environmental stewardship combined with profitability — doing good while doing well.

Within the 10-Year Forecast, there are five driving forces, or "storylines": personal empowerment, grassroots economics, smart networking, polarizing extremes and health insecurity. These storylines help to expand on the external forces that will shape the next 10 years.

Storyline 1: Personal Empowerment

The word *consumer* is obsolete, but there is no better word to replace it yet. The word *consume* means to destroy. But consumers are not just destroyers or passive recipients of mass messages, and increasingly, people resent being treated as such. Consumers are empowered people whose powers are amplified by the interactive media they are rapidly learning how to use.

For very large organizations, this personal empower-

ment creates a dilemma: How can they engage constructively with the increasingly powerful individual and networks of people who buy their products and services?

IFTF's research suggests that engaged consumers are characterized by three bellwether behaviors:

1. **Self-agency:** acting with independence, on one's own behalf, but with closely networked links to others, so that individual decisions are magnified but influenced by others.

2. **Self-customization:** adapting and applying core products or services to their own individual needs, with expectation that products will be customizable to their needs.

3. **Self-organization:** organizing responses and initiatives in ways that are difficult to anticipate.

Engaged consumers are a force to be reckoned with. They can inject a brand with incredible buzz, as did early iPod users. Apple got there early with a well-designed and compelling product promoted mostly by word of mouth, although Apple fueled the fire. Engaged employees have the same kinds of power, but it is applied to work. Many work practices (e.g., time and task management) are being brought home, but influence goes back and forth as the line between home and work become blurred.

People are shifting their identities from consumption to creation — including customization and do-it-yourself (DIY). The shift implies a move toward more open economic exchange, with an emphasis on external innovation.

Personal empowerment will be shaped by the aging baby boomers. The word *retirement* will probably be replaced by a boomer-type term like *redirection, regeneration* or *refinement*. Boomers will rethink and re-form the notion of careers for the 50-plus in several ways:

• **Working older:** Don't expect them to stop working, unless they get bored.

• **More health expenses and investments in health:** Chronic disease meets longer life.

• **Lower levels of government support:** Social Security will not be enough.

• **Expanding, not narrowing horizons:** Empowered boomers have a big-picture view, so they will continue to reach out and grow.

The next generation of workers is *really* different, with skills and perspectives their elders do not share — or in some cases even understand. They will likely be more comfortable improvising their way out of dilemmas. Many have learned their skills in video gaming worlds that are not as different from business as some may think.

Storyline 2: Grassroots Economics

Economies of scale — where bigger is almost always better — are giving way to economies of organization, where you are what you can organize. Think of it as eBay on steroids. Everyone can be a seller and everyone can be a buyer. All organizations have the potential to take on a grassroots character. Think personal media, personalized products and services, and mass customization.

The grassroots economics dilemma facing very large corporations is how to grow financial performance in an economic environment in which scale is a mixed blessing, and you must give the feeling of being both large and small simultaneously.

Storyline 3: Smart Networking

We are moving toward a global fishnet of connectivity, where smart networkers live at the leading edge of market trends, making distinctive and influential choices about entertainment, health, home, policy issues and elections. Increasingly, brands are selling not just to an individual, but to a social network.

The smart networking dilemma to be considered is how to engage in positive ways with smart networks and networkers that cannot be controlled and only rarely can be influenced in straightforward ways.

IFTF has identified these six factors as being most important to networking IQ:

1. **Group participation:** how you use networks to engage with others in effective ways.

2. **Referral behavior:** how you use networks to link to other resources available through the network.

3. **Online lifestyle:** how the network fits the context of the rest of your life.

4. **Personal mobile commuting:** how you use the network as you move about.

5. **Locative activity:** how you use the network to draw links to specific geographic locations.

6. **Computer connectivity:** how you use your skills to link to computer-based resources.

If leaders are not skilled or at least conversant with blogs, wikis and other networked media, it will be hard for them to lead. Younger workers are learning to create and share knowledge in a mixed physical and virtual landscape. The explosion of social software will challenge traditional notions of focus, workflow and productivity.

Storyline 4: Polarizing Extremes

Everything, and especially the proliferation of extreme views, is amplified on the Internet. Extreme

(continued on page 4)

Institute for the Future's 10-Year Forecast

(continued from page 3)

groups seem more sophisticated at networking than do more moderate ones. A dilemma of polarizing extremes is figuring out how to engage extreme groups when you cannot please all of them.

Worldwide, it appears that fundamentalist perspectives (religious, political and social) are increasing in popularity. Strong opinions will become more mobile. For the first time in history, during the course of this decade more than half the world's population will live in cities. The shift will be greatest in developing countries. Megacities (over 10 million people) will constitute a new kind of wilderness, resembling the most extreme ecologies in nature and eliciting adaptive survival strategies. At the same time, small cities with populations of 50,000 or less will be among the fastest growing in both developing and developed worlds.

Storyline 5: Health Insecurity

Boomers will fund and fuel what health researchers at IFTF call the "health economy." The health insecurity dilemma is how to grow a culture-of-health marketplace in the shadow of looming global health crises. How many will be able to afford to be healthy?

Essentially, the next 10 years will see new approaches to extending what the body can do in ways that were difficult to imagine before. IFTF has identified these styles of creating an extended self:

• **Identity switchers:** those who strive to change their identity through mental and social disciplines.

• **Medical modifiers:** those who use medical or surgical methods to change their bodies in ways they find positive.

• **Body builders:** those who use exercise and other disciplines to alter their physique.

• **Death defiers:** those who stretch the limits of what is possible and what is safe.

• **Super connectors:** those who use networks to amplify their sense of self and essentially develop a more connective definition of "self." ■

The VUCA World

There are both nasty challenges and intriguing opportunities in the VUCA World. These dangers are characterized by *volatility*, *uncertainty*, *complexity* and *ambiguity*. But these same dangers create leadership opportunities in terms of *vision*, *understanding*, *clarity* and *agility*.

The VUCA world is sparking new ways of thinking and acting. The most successful leadership strategy is to flip the danger, like an aikido move in martial arts where you absorb the attack but redirect the energy of the attack in a positive direction. The negative VUCA world can be turned around with a combination of vision, understanding, clarity and agility. The challenge is finding a way to engage honestly and create a winning strategy within the chaos that you encounter. Here are some emerging principles:

• **Volatility Yields to Vision** —Vision means having a clear intent, a clear direction for your actions. Vision is much more important than foresight since it seeks to create a future, not just study the future. With clear vision, creative space opens for innovation within the parameters you specify. A bold vision sees beyond volatility, with a calm perspective not trapped by assumptions of the present.

• **Uncertainty Yields to Understanding** — Listening leads to understanding, which is the basis for trust. You must learn to listen carefully without judging too soon. The VUCA world creates an urgency to act quickly, but sometimes it is a false sense of urgency. The best leaders have the presence and calm to listen before talking.

• **Complexity Yields to Clarity** — Leaders must help others make sense of complexity. The VUCA world rewards clarity because people are so confused they grasp at anything that helps them make sense out of the chaos. The thoughtful leader's quest is to be both clear and accurate, simple but not simplistic.

• **Ambiguity Yields to Agility** — Leaders can't surrender to ambiguity; that would lead to paralysis and confusion. Rather, they must learn how to be agile and respond to attack. The VUCA world rewards networks because they are agile, while it punishes the rigidity and brittleness of hierarchies. ■

What's Different About Dilemmas?

The biggest challenge for leaders is learning to live with — even embrace — the tensions inherent in dilemmas. How can you prepare your mind to win when faced with dilemmas, to win what appear to be no-win games? Dilemmas disguised as problems are particularly dangerous. If you engage a dilemma as if it were a problem, you may get there early, but you are not likely to win.

Most of today's leaders were taught to solve problems, and problem solvers have specifically been taught to move fast. Winning when faced with dilemmas, however, requires an ability to hold complexity in your mind

(continued on page 5)

What's Different About Dilemmas?

(continued from page 4)

without knowing too soon and without taking words or data too seriously. If you get there early, you've got time to sort out a situation. Some leaders shoot from the hip because they get there late and don't have time to do anything else.

Can You Tell a Dilemma From a Problem?

Modern dilemmas have evolved beyond the traditional definition of *dilemma*, which focused on an either/or choice between two bad options. In today's complex world, choices are many (we face *tri*lemmas and *multi*-lemmas) — even as the context within which dilemmas are arising is becoming more intractable. Consider the following characteristics of modern strategic dilemmas:

- Unsolvable
- Recurrent
- Complex and often messy
- Threatening
- Enigmatic and confusing
- Puzzling, with two or more choices — and decisions are still required
- Possibly positive (dilemmas with attractive but competing options are possible).

A problem is "a question or puzzle that needs to be solved." Typically, in current thinking, a problem has a binary (either/or) solution or at least a clear solution. In a world of dilemmas, we still have many options for response, but usually the options aren't simple and usually they don't come in pairs. Yes/no will not be enough. What might be a third way, or fourth or fifth? Expecting a binary solution can get you in big trouble in the world of dilemmas.

Dilemmas as a Source of Inspiration

The first discipline is to resist jumping to premature conclusions. Unless you're in an extreme situation where you absolutely have to respond immediately, reflection is usually more useful than reaction.

There are still many problems with binary solutions and it is very important that someone solve them. Looking ahead, however, it can be seen that most problems with binary solutions will tend to be tactical, important for successful execution but more appropriate for the operational people within a firm. Strategic thinking will be dominated by dilemmas. ■

It Takes a Story to Understand a Dilemma

Storytelling is only part of the leader's challenge. Listening for stories is just as important, to untangle dilemmas, reach some kind of "Aha!" and develop winning strategies. Sometimes the best stories about a dilemma will arise where you least expect them.

A Story About Silicon Valley

Silicon Valley works as a hotbed of innovation based on the dilemma between the "culture of ideas" and "culture of money" in the valley. The "culture-of-ideas" people love ideas and love to exchange them to see ideas mix and grow. They are willing to give away ideas, trusting they will get back even better ideas in return. Subgroups of the culture-of-ideas people are intent on changing the world, and convinced their ideas can have an impact.

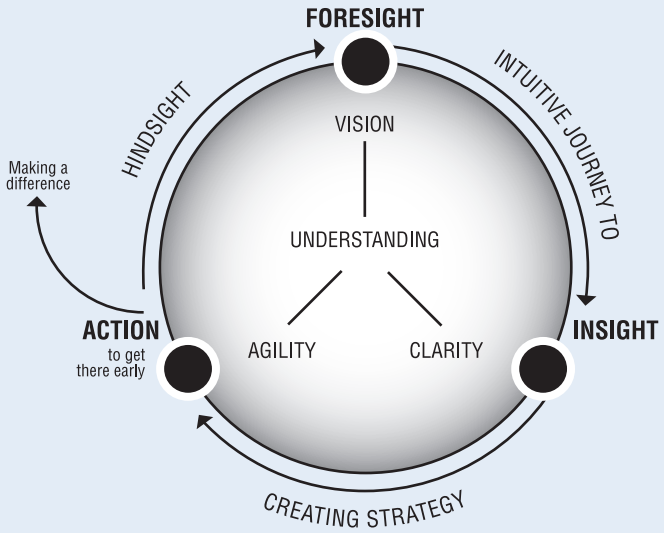
Meanwhile, the culture-of-money people in Silicon Valley are focused on making as much money as possible, through commercialization of technology and ideas. Subsets of this group are driven by greed.

However, these social networks need each other. The culture-of-ideas people need money to bring their ideas to life. The culture-of-money people need ideas and innovation to inspire new businesses and attract investors. Neither of these two dominant cultures likes the other — even though they recognize that they need each other. The tension between the poles of this dilemma — ideas and money — provides energy for Silicon Valley innovation. If this dilemma were "solved" the creative energy of the Valley would dwindle. ■

Immersion

Immersion is the best way to learn in a VUCA world. Immersion experiences allow leaders to learn rapidly and viscerally, and help at every stage of the Foresight to Insight to Action Cycle (see diagram on page 6) by providing a way to get there early before committing to go there at all. Immersion can help leaders experience a possible world of the future to get a feeling for what it might be like, to see things from different points of view to provoke insight. Immersion helps you try out different ways of being so you can develop your own agility.

Consider a spectrum of immersion experiences, in order from most to least involvement for the learners:



- **Simulations of reality:** where some aspect of the real world is being modeled so it can be experienced.
- **Alternate-reality games:** where individuals, small

(continued on page 6)

Immersion

(continued from page 5)

Foresight to Insight to Action Cycle

groups or huge numbers of players engage in hypothetical worlds, either digital or real.

• **3-D immersive environments:** where people role-play an alternative identity in an online setting. There is no story or "game" other than what the players create.

• **Role-play simulation games:** where learners play a role in an interactive simulation that draws from real-world experience.

• **Scenarios:** where a story is brought to life, through text or physically via artifacts.

• **Mentoring, reverse mentoring or shadowing:** where learners are immersed for a period of time in the life of another person from whom they want to learn.

• **Ad hoc immersive experiences:** where the goal is helping someone see the world from another point of view.

• **Theatrical improvisation:** where actors bring a future possibility to life in a vivid way while learners watch.

• **Case studies:** where a real-world situation is described in a third-person but engaging way so that learners can become involved with the case. ■

Sensing and Sensemaking

To get there early and compete, both sense and sensemaking skills are needed. First, you sense what's going on around you and what might be possible in the future. Being able to identify what's most important or influential requires an ability to sense and make sense of both concrete information and qualitative experience. Think of sensing as listening: to the world around you, to the signals you think are important for your organization and to your inner voice of innovation. Sensing is listening for the future, hearing something that others don't yet hear.

Foresight to Insight to Action Workshops

Moving from foresight to insight is an intuitive search for "Aha!" It is a nonlinear creative process best done in a small-workshop setting. Small groups are good at listening for the future in creative ways to generate insights and seed innovation. In an interactive workshop setting, seven to 25 people can be amazingly productive — if they can learn to engage constructively with each other. In planning one of these workshops you need to assess where you'd like to focus. A typical workshop will have the following emphasis:

• 40 percent on foresight that is provocative for the organization

• 40 percent on insight provoked by the foresight

• 20 percent on possible actions. ■

From Insight to Action

The transition from insight to action is more straightforward than the transition from foresight to insight. Action is aimed at results, at making a difference. But action doesn't necessarily mean final action. Action unfolds. The ultimate basis for evaluation of a forecast is not what you got right in the forecast but whether the forecast helped leaders make better decisions that led to action that made a difference.

Beware of the Operational Problem Solver

Action is great, unless it is the wrong action. Those who are problem solvers also want to get there early, but are more likely to get there early with an answer that is wrong — even if it is right in the short run. Action is the home court of the problem solver.

Modern strategic dilemmas require new kinds of leadership and new kinds of leadership development. Even solvable problems can be embedded in dilemmas, and dilemmas can be nonlinear — like global warming — with real potential for large-scale sudden or long-term impacts that can rearrange entire systems.

The key here — in the midst of action — is to recognize the difference between a problem and a dilemma as

(continued on page 7)

Components for a Foresight to Insight to Action Workshop

Foresight to Insight to Action workshops work best when they have the following ingredients:

1. **A meeting owner.** This person may need to make real-time decisions during the workshop regarding next steps.
2. **A target outcome.** Having a clear outcome, a mantra for the meeting, gives everyone focus.
3. **A diverse group.** You need diverse people who will play well together. Generational mixes and mixes of thought styles are particularly helpful.
4. **A content facilitator.** He or she must possess both content and group process skills to assist participants in drawing links between foresights, insights and possible actions.
5. **A chunk of provocative foresight.** A big picture forecast can be a wonderful stimulant, but it's also important to think through the message track you want to use to stimulate the discussion.

early in the process as possible. If in doubt, assume you are dealing with a dilemma. If, as the situation unfolds, it turns out that you are dealing with a solvable problem, all you need to do is solve it and move on. On the other hand, if you mistake a dilemma for a problem, you can dig yourself in deeply before you realize what's going on — and before you figure out that no solution is possible. By this time, there may be no way out, or at least no face-saving way out.

Wal-Mart's Sustainability Strategy

Foresight: Long-term financial performance won't be possible without changes in environmental practices.

Insight: Wal-Mart needed a new approach.

Action: Create the Wal-Mart Sustainability Strategy.

Wal-Mart has always been about growth and "everyday low prices." But in 2005, CEO Lee Scott entered into new territory with his focus on "business sustainability," which he defined as including the goals of environmental sustainability and robust business performance. This strategy has three core elements, each of which involve dilemmas that Wal-Mart will try to overcome:

1. Climate and renewable energy
2. Zero waste
3. Sustainable products.

Wal-Mart is aiming to do good while doing well, that is, without compromising its financial goals. Perhaps Wal-Mart's years of bad press — a dilemma — influenced its decision to deal with the environmental dilemma. ■

Flexing and Flexibility

The organizational form of the future will be more like a network than a hierarchy, although hierarchies won't disappear. There is no single center in network organizations; there are as many possible centers as there are network nodes. The action is at the intersections and edges. Such a structure is just right for dealing with dilemmas. Nobody controls organizations that function like networks, but the organizations can be woven into varied patterns and flexed without losing strength.

Leaders must have the ability to flex, the wherewithal to maintain a clear direction and the vision to decide where, when and how to work. Fortunately, the next generation of workers wants even more flexibility and more choice — and they are ready to navigate the work/private life dilemmas implied by this increasingly networked world.

Developing Your Ability to Flex

Flexing is like the freedom that a musician has to improvise within the rhythmic structure of a song. However, in most organizations, there are distinct values and legal requirements that must be met. Organizational structures and responsibilities are both explicit and implicit. The outside world, however, is not necessarily governed by the same principles. Organizations cannot assume that their ways of working will be followed by others. Flexing skills need to be tempered by an organization's sense of direction.

The IFTF has identified seven "tuning levers" to design and evaluate organizational structures:

1. **Structure** — Like the cord on a fishnet, network structures are strong but flexible. The number and pattern of the nodes on the net are critical to its strength and flexibility.

2. **Rules** — Flexible firms work best with only a few rules, but those must be followed religiously; principles, rather than rules, work best in the context of network organizations.

3. **Resources** — The key resource need in network organizational structures is to make communication possible across the network.

(continued on page 8)

Flexing and Flexibility

(continued from page 7)

4. **Thresholds** — Scale thresholds are critical in the life of network organizations, since small groups are typically more cohesive than large ones.

5. **Feedback** — This often comes informally by word of mouth.

6. **Memory** — Memory in network organizations is often decentralized and formal methods of organizational memory (like databases) often do not capture the vitality of the knowledge being stored.

7. **Identity** — Network members may or may not have shared collective identities; some are formal while others are informal with dispersed identities. ■

Flexible Firms

Firms that have incorporated flexibility have begun to emerge, but there is still room for more flexible firms to come to the forefront.

An Open Source Flexing Story

While IBM still supports hardware and software businesses, it makes money off of services. Open source for IBM includes:

- Co-production of value between competitors and users
- Celebration and incorporation of user-generated innovation
- Discovery of communities of interest and efficiencies among users, producers, distributors, partners and employees.

IBM has been able to create or participate in open source or free zones where it gives away software in order to create a higher-value competitive zone where it can offer services. It is cooperative and open in hardware and software, but competitive in services.

A Geoweb Flexibility Story

The geoweb is the mixing of virtual and physical media to extend both our experience of the physical world and our access to online resources. Walt Disney is already mixing the physical experience of the park with virtual links and is focusing attention on both the technology and human efforts to work with technology to provide great experiences for guests. Consider Pal Mickey — a small Mickey Mouse stuffed animal with a radio frequency reader in its nose and an ability to "talk" to the person holding him. As a guest goes around Walt Disney World, Pal Mickey gives updates on where lines are shortest and points out interesting attractions. ■

Foresight From Hindsight

On the Foresight to Insight to Action Cycle, the activities between action and foresight are observation, measurement, induction and learning from experience. What can we learn from our actions to identify new approaches for the future? Thoughtful foresight should include hindsight: At IFTF it is said that you should look at least twice as far back as you are looking forward. For example, the Institute's 10-year forecasts usually include a 20-year look back.

After Action Reviews

One of the most effective disciplines for learning from experience is the After Action Review (AAR). The army and other military services and the fire and police agencies use AARs as a regular discipline for debriefing and documenting lessons from every significant event. The army keeps a database of AAR lessons, but the primary value is not in the database but in the personal discipline of learning that is ingrained in daily life. Lessons from AARs are fleeting and best understood in real-life context.

A big challenge for business is to distinguish performance evaluation from learning. At many companies, managers talk boldly about "learning from failure," but common wisdom among employees is that there is a strong, usually unspoken, pressure to produce and not admit failure.

After Action Reviews are an example of content synthesis, which is a tool for foresight. The key to AAR, as well as any other form of experience synthesis, is to learn from what has happened and apply that learning to one's understanding of future possibilities.

Often, the best foresight happens in real time, in the midst of the action. The best leaders develop an instinct for response, a discipline of readiness, not just a plan. The best strategy emerges from the flow of experience and events. The deepest insights arise in the field, and often an initial insight suggests a first action; but as the action unfolds, the insight gets deeper. That's what prototyping is all about, a kind of learn-as-you-go style for strategic action. ■

Management: Strategies

Getting Naked

A Business Fable About Shedding the Three Fears That Sabotage Client Loyalty

by Patrick Lencioni

THE SUMMARY IN BRIEF

Most of us still struggle with vulnerability because we are human beings who don't like to be weak, which means we are subject to the completely natural but irrational fears that make us uncomfortable being naked.

In *Getting Naked*, acclaimed management expert, consultant, speaker and *New York Times* best-selling author Patrick Lencioni tells the remarkable story of a management consultant who is trying desperately to merge two firms with very different approaches to serving clients. One relies on vulnerability and complete transparency; the other focuses on proving its competence and protecting its reputation for intellectual prowess. In the process of managing the merger, the consultant is forced to learn life-changing lessons that prove to be as relevant as they are painful.

Getting Naked provides readers with concepts that are accessible and compelling. In it, Lencioni explains the three fears that provoke service providers — whether they are internal consultants, salespeople, financial advisers or anyone else serving long-term clients — to unknowingly sabotage their ability to build trust and loyalty. He also provides a practical approach for overcoming those fears.

IN THIS SUMMARY, YOU WILL LEARN:

- How to build deeper and longer-lasting relationships with your customers and clients.
- How to make your relationships in business and in life more authentic and fruitful.
- How to develop higher levels of client loyalty and intimacy than your competitors ever imagined.
- How to benefit from becoming more vulnerable.

Introduction

Vulnerability. It is one of the most undervalued and misunderstood of all human qualities.

Without the willingness to be vulnerable, we will not build deep and lasting relationships in life. That's because there is no better way to earn a person's trust than by putting ourselves in a position of unprotected weakness and demonstrating that we believe they will support us.

Yet society encourages us to avoid vulnerability, to always project strength, confidence and poise. Although this is certainly advisable in some situations in life, when it comes to important, ongoing relationships, it stifles our ability to build trust.

For those who provide service to clients, vulnerability is particularly powerful. Those who get comfortable being vulnerable — or as some people call it, naked — are rewarded with levels of client loyalty and intimacy that other service providers can only dream of.

Can you be too vulnerable? No. Of course, if you come to your clients every day admitting that you've made yet another mistake or that you don't know how to do yet another required element of your job, that would be a serious problem. However, it would not be an issue of vulnerability, but rather of competence: The problem would not lie in the *admitting* of so many weaknesses, but in the *having* of them!

Naked Service

Why do we resist being naked with our clients?

For one, we think it will hurt our chances for success. We fail to realize that, even though clients require us to be competent enough to meet their needs, it is ultimately our honesty, humility and selflessness that will endear us to them and allow them to trust and depend on us.

Naked service is rare, which means it provides an opportunity for a powerful and tangible competitive advantage for those who embrace it. They will build stronger, stickier relationships with their clients; they'll have an easier time getting those clients to actively and enthusiastically recommend and endorse them, even without being asked; they'll have more comfortable and collaborative discussions about pricing and fees; and they'll enjoy their work much more.

But more than any of that, what makes naked service worthwhile is that it puts us in a position to more effectively help our clients, which, of course, is what providing service is all about. ●

THE FABLE

Part One: Theory

I'm not going to lie; Michael Casey was one of my least favorite people in the world. Even the mention of his name could put me in a moderately bad mood.

And so, if you had told me a year earlier that I would spend four solid months of my professional life learning about him and his annoying little consulting firm, I would have told you it was time for me to change careers.

But that's exactly what happened, and I've lived to tell about it.

Me

I'm Jack Bauer, and yes, I share a name with that guy on TV who saved the world every year. Unlike him,

though, I'm not a superhero. I'm just a consultant.

For five years I'd been working within the strategy practice at Kendrick and Black, a prestigious, international full-service management consulting firm headquartered in San Francisco.

In addition to being one of the senior consultants in our division, I headed up sales for the strategy practice of our firm. This meant I sometimes competed for clients with Michael Casey and his firm, Lighthouse Partners.

Now, Lighthouse was a much smaller firm than ours, and they focused most of their work in the Bay Area, so we didn't run up against them in more than 5 to 10 percent of the projects that we pursued. But when we did, we lost every single time.

That's not exactly true. We won once. But a year later the client threw us out and hired Lighthouse, which was more painful than losing to them in the first place. This only exacerbated our bitterness toward Michael Casey.

Keep in mind that when you compete against a consulting firm you almost never actually see your competitors. But you hear about them. And after listening to story after story about Michael Casey and his team, I would have liked nothing more than to hear they were going out of business. Or so I thought.

Horrible Promotion

When I was first told by a colleague that Michael Casey was leaving Lighthouse and that his firm was for sale, I was ecstatic. We had finally worn him down, I decided.

Lighthouse was up for sale and we wouldn't have to compete with and be humiliated by them ever again.

My glee at hearing about the demise of my enemy came to an abrupt end five days later when the founder of our firm, Jim Kendrick, pulled the rug out from under me.

"Here's the deal, Jack. You probably know about a little consulting firm over in Half Moon Bay called Lighthouse Partners. Well, they were desperate to be sold in a hurry, and Marty said they were probably worth the risk. So we bought them before anyone else could. We are going to have you manage it for a while. We want you to spend five or six months overseeing the firm. As soon as you get your hands around what's going on over there, we can integrate whatever parts of it we decide to keep into our strategy division, and figure out what to do with the rest. And if all goes well, you should be heading the strategy division by then, given that Marty will be retiring next summer." And he left.

Just like that, my world had been turned upside down, and for the rest of the day I couldn't decide how to digest it all. As I explained to my wife that night, I should have been happy. But there was something about the situation that made me uncomfortable.

Part of it was certainly the realization that if this went poorly, my career would be considerably damaged — and that I'd have Lighthouse Partners to thank for it. Michael Casey just might continue to haunt me even after his departure.

Acceleration

Casey's departure from Lighthouse turned out to be more abrupt than anyone expected. As soon as the ink was dry on the deal, he was gone.

When I asked my boss, Marty, about the circumstances, he shrugged. "I really have no idea. But you'll probably find out on Wednesday. You're meeting with the partners over at Lighthouse Wednesday morning."

So, 48 hours after the contract had been signed, I found myself driving west along the crooked highway connecting the San Francisco Bay Area to the coastal town of Half Moon Bay. That's where the 25 employees of Lighthouse Partners were waiting to hear what I had to say about their future.

Walking the corridor, I found a door with a Lighthouse sign on it and went inside. ●

Doing Whatever It Takes

Naked service providers not only overcome their need to feel important in the eyes of their clients, but also purposefully put themselves in a lower position. They do whatever a client needs them to do to help them improve, even if that calls for the service provider to be overlooked or temporarily looked down on. Ironically, clients come to trust and respect service providers who do this and ultimately come to think more highly of them. That's because there is nothing more attractive and admirable than people who willingly and cheerfully set their egos aside and make the needs of others more important than their own.

Part Two: Practice

I was greeted by a petite, 40ish blonde woman in blue jeans who was sitting at the front desk. "Can I help you?"

Before I could answer, she continued, "Are you Jack?"

"I'm here for a meeting with Amy Stirling and Dick Janice." I'm pretty sure that I didn't smile, because I felt a sudden surge of self-consciousness and inferiority. I wondered if she noticed.

Without a trace of anxiety, she responded, "I'm Amy Stirling."

Seeming to sense my discomfort, Amy continued, "Why don't you go on into the conference room, and I'll see if I can't find Dick and Matt."

A minute later I was sitting alone at the oak table in the fishbowl room.

I couldn't decide whether I was more afraid of confronting the little monster I had been loathing for these past few years, or of discovering that it wasn't as ugly as I had imagined. Whatever the case, it was too late to consider, because at that moment Amy and two of her colleagues walked into the room.

Dick Janice, the oldest of the partners and someone whose name I had heard a few times in the course of my sales adventures, greeted me first. Dick seemed as friendly and calm as Amy, which I found disturbing. Do these people even know who I am and why I'm here?

Fortunately, the last and youngest of the partners, Matt O'Connor, gave me a nervous vibe that reconnected me with reality. A freckle-faced redhead, Matt didn't manage to smile when he shook my hand, and he looked away as soon as he could.

Re-Entry

"So, why did Michael Casey sell the company? Why didn't he just let you guys run it, or sell it to you?" I asked.

"Selling it to Kendrick was the right thing to do," Dick explained.

"Why?"

"Well," Matt said, "for one, Michael's never coming back. Six weeks ago his daughter and her husband were sideswiped by a semi truck. Her husband died, and she sustained very serious injuries. Michael was adamant that taking care of her two young girls was his new full-time job."

I had to respect Michael Casey.

Matt went on. "Selling it to us would have put a huge, risky burden on us. If Michael's departure hurt the business, the value of the firm could have disappeared. Michael wanted us to share in some financial upside, and this was the right time to do it."

"Besides," Amy explained, "if things don't work out with K&B, we can always take a year off and go start another firm."

Perspective

I couldn't argue with the logic I was hearing. "So why do you think K&B did the deal?" I wanted to get their perspective.

"Well, we think that you — not you personally, but someone over there — didn't like us and wanted to get rid of us.

"And then there's the deep pockets." Matt explained. "Kendrick and Black can afford to take a flyer on us, but that's a lot of money to our little firm. We received a nice little payout, and we get to keep our jobs."

I didn't want to tell them that there was a good chance some of them wouldn't. As it turns out, I didn't have to.

"And if some people don't get to keep their jobs," Dick explained, "then they'd get a severance package to add to their payout, which would be more than enough to bridge them through to their next job."

It was at that moment that I was about to embrace these people and become part of the team. But then it dawned on me. They were actually in a better position than I was! If things didn't go well with the merger, they'd be fine. Probably better off. But my career would be in serious trouble.

The more I learned about Lighthouse Partners, the worse I felt about myself and about the state of my career. And that put me in a horrible situation. I had to make this merger work with a bunch of people who constantly reminded me that I was sometimes a complete ass. ●

Part Three: Research

The next day was the beginning of my personal crash course in Lighthouse Partners and Michael Casey, the man.

During my first three days in Half Moon Bay I met with at least a dozen consultants and most of the other staff members.

It wasn't until my fourth day that I saw my first glimpse of the secret behind the success of this strange little firm.

Give Away

Dick Janice and I went into the prospective client's building, and the receptionist gave us security badges and had us wait for someone to get us. Within minutes we were escorted to the elevators and to a conference room.

When the CEO and head of ops arrived, we did our typical meet and greet and sat down to talk. The CEO went first.

"So, I was telling my friend, John Sullivan — he's the COO over at Frigidata — that we needed some help figuring out how to do better planning, and he said I should call you. And that's why we're here."

Dick nodded. "OK. Tell me why you think you need to do better planning."

The CEO looked to his operating guy. "Well, it's getting harder and harder to make revenue forecasts. Our costs are rising faster than they should be, and we're not sure why. And we're starting to lose market share, which hasn't happened in 10 years."

Pulling out his pad of paper, Dick began asking a series of questions. Revenue. Number of employees. Competitive landscape. Cost structure.

Primary Research

After he had exhausted his initial questions, Dick went to the whiteboard. "OK, let me explain what a strategically healthy company looks like, and figure out whether any of this is helpful to you."

And for the next 45 minutes we just talked. Or better yet, Dick asked questions and the CEO and his sidekick talked.

Finally, the CEO looked up at the clock and said, "OK, we're running out of time here. I'd like to continue this conversation with the rest of my team, because we're going to need input from marketing and finance to figure this out."

Dick nodded. "OK. Should we shoot for next week?" He scrolled through his PDA. "I'm good for Tuesday afternoon."

The CEO said, "Done. We'll be in the boardroom on the fourth floor. I'll have Nancy set you up."

And we were gone. It was all too easy.

Consistency

"So, I'm curious," I said afterward, still trying to play it cool. "Why didn't you try to wrap up the deal today? I think they'd have agreed to just about anything."

Dick explained, "You know, I'm pretty sure they're going to want to be a client. So I don't really want them thinking about what we're trying to get out of the arrangement. At this point, all I want to focus on is figuring out their issues." He paused.

"And we need to make sure that they'd be the right kind of client. We'll have a better sense of that next week. For all I know the real problem is the CEO. If that's the case, and he's not willing to deal with that, then we don't want to be in there wasting our time and energy, and their money, rearranging deck chairs on the Titanic. We've learned over the years that having a bad client is worse than having none."

"How could that be if they're paying you?"

Dick said, "Well, for one, it prevents you from finding other good clients. And you're unlikely to get a good reference." He paused. "And, as Michael used to say, it just makes you feel bad about coming to work. It destroys the culture."

Endurance

As I approached the 12th week of my integration project, my boss Marty decided it was time to evaluate our progress and begin the process of more formal integration.

With less than a week to prepare, I began assembling my notes and asking more pointed questions than ever about Michael Casey and his various rules of thumb that, more than anything, defined his approach to client service and business. I was also starting to see a few patterns connecting many of those points. ●

Part Four: Testimony

As I nervously rode the same elevator to the 20th floor where I had been going to work uneventfully for the past five years, I decided that I had probably overdramatized the magnitude of this meeting and the situation in general.

Jim Kendrick's opening comments at the meeting made it clear that I had not. "We paid real money for this firm. What I want to understand today is what kind of return we're going to get."

"Well, I think this could be an extraordinary opportunity for Kendrick and Black, much bigger than I would have imagined a few months ago when the deal was announced. But I'm not going to lie to you. We're going to have to work hard to learn how to do what they do."

It took more than a few seconds for my words to sink in.

"Did you say that we're going to have to learn how to do what they do?"

I nodded my head. "That's right. From a financial standpoint, Lighthouse has slightly better profit margins than we do, and slightly higher revenue per client. Most of their business comes from referrals and warm leads. When they meet with a client they spend their time asking questions and doing primary research right there. It's like they skip the entire sales process. And they're remarkably successful."

Making the Case

"More than anything else, the power of what Lighthouse

does can be explained by one word: *vulnerability*."

Larry Dewitt asked, "Did you say vulnerability?" He smiled and didn't wait for me to respond. "Is this some kind of new-age hippy thing where we're going to get naked and hold hands?"

The room chuckled collectively and I forced myself to laugh along with them.

"It's interesting that you used the word *naked*," directing my comment at Larry, "because that's not a bad way to describe the way Lighthouse presents themselves to clients."

I had their attention again. After writing "vulnerable" and "naked" on the board, I continued.

"What I'm talking about here is a certain kind of fearlessness they have. Whether they're selling or consulting, they don't seem afraid of anything."

"What would they be afraid of?"

"Three things. The first one is the fear of losing the business, either during the sales cycle or in the process of doing consulting." I wrote it on the board.

"The second fear that Lighthouse doesn't have — and one that most consultants, including myself, struggle with — is the fear of being embarrassed or looking stupid in front of their clients.

"The third and final fear that the Lighthouse consultants seem to have overcome is the fear of feeling inferior to their clients."

Deception

After my presentation, Jim Kendrick stood and went to the middle of the conference table near the speakerphone.

"Gentlemen, I guess you've heard enough. Is there anything else you need from us right now?"

Finally, after a few seconds' delay, a voice came over the phone.

"No, I'm good. We'll finalize the details on Monday. Thanks, everyone."

Jim then addressed someone else on the line. "What about you, Michael? What did you think?"

"I thought he nailed it, probably better than I could have. Great job, Jack."

I said "Thank you" half-heartedly, not knowing who I was talking to and why there were people on the line.

Jim ended the phone conversation. He went back to his chair. "The two gentlemen on the phone were Tom Paulson from Strategic Insights, and Michael Casey, the founder of Lighthouse. I thought they should hear today's meeting. See, we're selling Lighthouse to Strategic Insights, and I wanted Michael to confirm that your description of his company was accurate, and I wanted Tom Paulson to hear it directly from someone with no vested interest in selling the firm. Evidently, Paulson liked what he heard, and Michael affirmed that it was true, and so we have a deal."

Onward

I arrived at Lighthouse the next day. When I entered the conference room, I saw only two men. They introduced themselves.

"Hi Jack, I'm Tom Paulson." He was a nicely dressed, professional-looking man, the kind you would think would run a high-end consulting firm.

The other man, the one who looked just slightly familiar to me, was older but wore jeans and a polo shirt.

"I'm Michael Casey. I've heard a lot about you, Jack. I want to thank you for doing such a nice job explaining my firm the other day."

Then he changed the subject. "Jack, I'm here to ask you to stay on and run this office."

I turned to Tom Paulson, who smiled and made his pitch. "We want to maintain this culture and see if we can't infect the rest of our firm with it."

Michael went on. "Listen, I don't want to see this place disintegrate, and I don't want to see people over here lose their jobs. When I left, I knew that it might not be perfect and that there was a possibility things would unravel, but when I heard you on the phone this week, I decided that there was a chance to keep it going. And that's why I got on a plane for the first time in months."

"Of course I'll take the job."

Tom shook my hand enthusiastically, which was nice. Michael just smiled at me like a parent who had known all along what I was going to do. ●

THE MODEL

The Origins of Getting Naked

A management consulting firm called The Table Group was started in the late 1990s that provided a variety of services to a wide range of clients in just about every respectable industry imaginable. From the beginning they adopted a simple and informal approach to serving clients that provoked surprising levels of loyalty and trust. They call that approach *naked consulting*.

One of the keys to the naked service model is humility.

Naked service has allowed The Table Group to build extraordinary trust among its clients over the years, beyond anything they could have imagined.

In essence, their clients have treated them more like real partners and team members than as vendors or outsiders. Or as they like to say, they treat The Table Group like members of their family. The naked approach to consulting has allowed The Table Group to more effectively serve and help those clients in meaningful ways.

The naked approach is certainly not limited to the management consulting field. It applies to anyone who provides ongoing, relationship-based advice, counsel or expertise to a customer, inside or outside of a company. Or better yet, it applies to anyone whose success is tied to building loyalty and sticky relationships with the people they serve.

Naked Service Defined

At its core, naked service boils down to the ability of a service provider to be vulnerable — to embrace uncommon levels of humility, selflessness and transparency for the good of a client.

As obvious as that may sound, it is more difficult than it seems, because humility and selflessness and transparency often entail suffering. And suffering is not something most human beings, especially in our modern culture, understand or welcome. Most of us live our lives trying to avoid awkward and painful situations, which is why it is no surprise that we are susceptible to the three fears that prevent us from building trust and loyalty with our clients:

The Three Fears

#1: Fear of Losing the Business. No service provider wants to lose clients, business opportunities or revenue. Ironically, though, this fear of losing the business actually hurts our ability to keep and increase business, because it causes us to avoid doing the difficult things that engender greater loyalty and trust with the people we're trying to serve.

What clients want more than anything is to know that we're more interested in helping them than we are in maintaining our revenue source. And when we do something, or fail to do something, in order to protect our business, they eventually lose respect for us and understandably question whether they should trust us.

#2: Fear of Being Embarrassed. No one likes making mistakes in public and having to endure the scrutiny of spectators, especially when those spectators are paying us for our advice or counsel. This fear is rooted in pride, and it is ultimately about avoiding the appearance of ignorance, wanting to be seen instead as smart and competent.

Naked service providers are so concerned about helping a client that they are willing to ask questions and make suggestions even if those questions and suggestions could turn out to be laughably wrong. They readily admit what they don't know and are quick to point out — even celebrate — their errors because protecting their intellectual ego is not important to them.

#3: Fear of Feeling Inferior. This fear is about preserving our sense of importance and social standing relative to a client.

It is completely natural for service providers to yearn for respect and admiration, and to have a disdain for being overlooked, condescended to or treated as though we are inferior. Sometimes we forget that the word "service" shares the same root meaning as "servant" and even "subservience."

Shedding the Three Fears

Vulnerable service providers demonstrate nakedness by engaging in a variety of simple but powerful practices, all of which correspond to one or more of the three primary fears. And as important as it is to understand the fears that underlie these principles, the specific actions that demonstrate naked service are what is required to achieve client loyalty.

The principles of naked service are as follows:

Shedding the Fear of Losing the Business

- **Always consult instead of sell.** Naked service providers transform every sales situation into an opportunity to demonstrate the value of what they do. They avoid, as much as possible, telling clients what they would do if they were to be hired; instead, they just start serving them as though they were already a client.
- **Give away the business.** This principle has two applications. On the one hand, it is related to the "always consult instead of sell" principle because it is about giving a prospective client advice and service even before they agree to become a paying client.
- **Tell the kind truth.** Naked service providers will confront a client with a difficult message, even when the client might not like hearing it. As a result, they put the relationship with the client at risk, knowing that it is more important to serve the client's

needs than it is to protect the service provider's own business.

- **Enter the danger.** Naked service providers don't shy away from uncomfortable situations; they step right into the middle of them. Entering the danger has to do with having the courage to fearlessly deal with an issue that everyone else is afraid to address.

Shedding the Fear of Being Embarrassed

- **Ask dumb questions.** Naked service providers are the ones who ask the questions that others in the room are afraid to ask out of fear that they would embarrass themselves.
- **Make dumb suggestions.** Naked service providers go beyond merely asking questions that others shy away from; they make suggestions that they aren't sure of, knowing that they are putting themselves in a position to be even more embarrassed. A client is going to remember that one great idea a consultant proposes far more than the not-so-great ones.
- **Celebrate your mistakes.** Naked service providers don't enjoy being wrong; they just realize that it is an inevitability. And rather than attempting to hide or downplay their errors, they readily call them out and take responsibility for them.

Shedding the Fear of Feeling Inferior

- **Take a bullet for the client.** This is about finding those moments when we can humble ourselves and sacrificially take some of the burden off of a client in a difficult situation, and then confront them with the kind truth.
- **Make everything about the client.** Naked service providers throw their full attention into the world of the client. They make it clear that their focus is on understanding, honoring and supporting the business of the client.
- **Honor the client's work.** Naked service providers honor the client by taking an active interest in his or her business and by appreciating the importance of that business to the client and the client's customers.
- **Do the dirty work.** Naked service providers are willing to take on whatever a client needs them to do within the context of their services. Because we are humble and more concerned about our clients than we are about ourselves, we'll do what they need. In doing so, we'll earn their loyalty and gratitude.
- **Admit your weaknesses and limitations.** We all have weaknesses, and if we try to cover them up we'll probably put ourselves in a situation of having to do more and more of what we aren't good at. Trying to be something we're not is not only exhausting, it also prevents us from doing our best in the areas in which we can thrive. ●

Another Reason to Give Away the Business

Another part of giving away the business is more financial. It entails always erring on the side of the client when it comes to fees. Because you're interested in a long-term relationship with a client, it is in your best interest to show them that you are more focused on helping them than you are in maximizing your short-term revenue.

Broader Applications of Nakedness

The principles of naked service apply most directly and comprehensively to businesses like management consulting, financial advising, public relations, technical services and internal corporate support services. However, they can be applied to a variety of other service businesses involving ongoing relationships with clients.

This could certainly include family practice doctors, retained lawyers, sales account managers, life coaches, building contractors, insurance agents and even personal trainers. And although every principle of naked service may not apply to each of these fields, most of them do, and they can help any service provider inspire loyalty and trust with clients.

Even beyond the world of clients, being naked has its benefits and advantages. When we can demonstrate vulnerability to the people we live and work with, we build stronger relationships, affirm our trust in them and inspire them to become more vulnerable themselves. And that is certainly worth getting naked for. ●

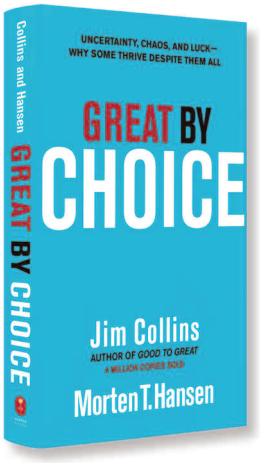
How to Control Your Company's Destiny



Review by Chris Murray

GREAT BY CHOICE

by Jim Collins and Morten T. Hansen

2011, Harper Business, 304 pages, $29.99
ISBN 978-0-06-212099-1

A new title by Jim Collins is always cause for excitement and anticipation for business readers who have been informed and guided by the insights of his previous best-sellers, notably *Built to Last* and *Good to Great*. In many ways, his new book, *Great by Choice,* does not disappoint. Collins offers new metaphors with compelling imagery, such as "fire bullets, then cannonballs." He presents revealing comparative stories of companies that succeeded and those that failed — describing, for example, how Southwest Airlines copied the revolutionary business plan of Pacific Southwest Airlines (PSA), then somehow used that business plan to become the only consistently successful airline of the past two decades while PSA declined and eventually disappeared. And he explodes common myths, such as the importance of innovation in the success of a company.

Collins also stays true to his groundbreaking methodology: develop an ambitious research question, translate the question into a set of statistical criteria, then use the criteria to identify two sets of companies: one set of companies that meets the criteria, and one set of comparative companies — companies operating under the same constraints and advantages as the first set of companies but that have clearly failed to meet the criteria of success. An in-depth study of the histories of the two sets of companies then reveals what the successful companies did right and what the unsuccessful companies did wrong.

In *Great by Choice*, the core question is: Why do some companies thrive in uncertainty, even chaos, and others do not? Collins and his co-author Morten T. Hansen note that the companies featured in the book were not chosen simply for their performance, but for their performance in "unstable environments." They call these companies "10X" companies because they performed at least 10 times better than the industry average in the stock market.

The Race to the Pole

The authors set up the comparison between success and failure with a description of the race to the South Pole between Roald Amundsen and Robert Falcon Scott. Amundsen succeeded brilliantly, not only reaching the South Pole first, but also getting his men back to safety after doing so. In contrast, Scott struggled painfully to reach the South Pole. He arrived after Amundsen had come and gone, and then tried unsuccessfully to get home. He and his four companions died on the return journey.

As the authors point out, the two men faced similar conditions and similar hardships. Neither was "luckier" than the other. Likewise, the unsuccessful set of companies in the book faced the same conditions and same constraints with which the successful companies had to battle; yet the unsuccessful comparative companies were as doomed to failure as Scott.

How does one survive and thrive in the Antarctic business world of the 21st century? Collins and Hansen

offer three 10X behaviors — fanatic discipline, empirical creativity and productive paranoia — to which companies and their leaders must adhere if they are to survive.

Fanatic Discipline

According to Collins and Hansen, discipline refers not to the hierarchical discipline of rigidly following orders or staying in line, but to the self-discipline of being unwaveringly consistent. As the authors explain: "Discipline, in essence, is *consistency of action* — consistency with values, consistency with long-term goals, consistency with performance standards, consistency of method, consistency over time."

Collins' analogy for discipline is the 20-mile march — marching forward every day without fail 20 miles toward your destination. If the conditions are bad, your goal should still be to march 20 miles. If the conditions are good, you should *not* increase your goal. Even if the weather is nice, the roads are clear, you're well rested or whatever else might improve the conditions, you should still only aim to march 20 miles.

"According to Collins and Hansen, discipline refers not to the hierarchical discipline of rigidly following orders or staying in line, but to the self-discipline of being unwaveringly consistent."

In business, the 20-mile goal is translated into a performance measure. It doesn't matter what that measure might be, only that there is a consistent, unchanging goal. For Southwest Airlines, for example, the goal was simply to make a profit — every year, no matter what the conditions of the airline industry that year. But just as important to Southwest's success, according to the authors, was the company's refusal to overreach. In 1996, when 100 cities clamored for Southwest Airlines' service, the airline restrained its expansion to four cities.

Empirical Creativity

Collins and Hansen use the analogy of bullets and cannonballs to explain empirical creativity, the second of the three 10X behaviors. Imagine that you're on an 18th century warship about to be attacked, and you only have a limited amount of gunpowder. You have two choices. The first choice is to use all your gunpowder to shoot a cannonball into the side of the enemy ship. You take the shot … and miss. Now you're out of gunpowder. The second option is to use some of the gunpowder to make bullets. You shoot the bullet and miss. You recalibrate, shoot the bullet, miss again, but this time you were closer. After two more bullet shots, you have the gun calibrated correctly to make a direct hit. Now, you put the rest of the gunpowder into the cannonball and blow a hole in the side of the ship.

Translated to the world of business, "Fire bullets, then cannonballs" means that you try out something on a small scale first, make adjustments (recalibrate) and then, when you're sure you're going to have a hit, spend significant resources and time on that initiative.

It's generally at this point in a business book that some readers will question whether or not the principle described is applicable to their own companies. While Collins and Hansen provide case studies featuring companies from a number of industries, they do an excellent job of keeping the core of their message applicable to any business.

In reference to empirical creativity, the authors write about the 10X company Amgen. The firm was launched to create a product around the latest recombinant-DNA technology. According to Collins and Hansen, Amgen fired 12 bullets — experimenting with 12 applications for recombinant-DNA technology. The applications included everything from a Hepatitis-B vaccine to an epidermal growth factor for wound healing to bioengineered indigo for dyeing denim jeans.

Out of the dozen bullets fired, the protein called erythropoietin (EPO) showed the most promise. After clinical trials and securing a patent, Amgen, in the terms of the authors, "fired a cannonball" by building a testing facility and allocating capital to manufacturing and assembly. "EPO became the first super-blockbuster bioengineered product in history," the authors write.

For companies that aren't trying to build a better blue jean, the principle of taking measured steps before pouring resources into a potential growth opportunity is still a necessary concept to successfully navigate today's economy.

Productive Paranoia

Productive paranoia is the last of the three 10X behaviors. Under the umbrella concept of productive paranoia, Collins and Hansen offer three different "core sets of practices." The first two are to prepare for the worst, and to manage risk carefully. One of the best ways to prepare for the worst is to maintain significant cash reserves, according to the authors. "Compared to the median cash-to-assets ration for 87,117 companies analyzed in *The Journal of Financial Economics*, the 10X companies carried three to 10 times the ratio of cash to assets."

In their discussion on risk, the authors introduce three types of risks: death line risk, which is the type of risk

that can kill an enterprise; asymmetric risk, in which the downside is larger than the upside; and uncontrollable risk, in which the action taken exposes the company to threats or conditions outside of their control. A statistical analysis of the actions of the 10X companies and comparison companies showed that comparison companies took a greater number of each type of risks.

The third set of practices is to be vigilant about changing conditions, and when change is on the horizon, to take action in response. The authors refer to this as "zoom out then zoom in" — zoom out to see what is happening or about to happen in the environment of your business, then zoom in and respond with a specific action.

Surprising Insights and Familiar Themes

Readers of Collins' earlier books will find *Great by Choice* to be a combination of surprising insights and familiar themes. Two of the more surprising insights involve innovation and luck. According to Collins and Hansen, companies in any industry must meet an innovation threshold — their products or services must offer a certain level of innovation for the company to even be "in the game." The threshold can be low or high depending on the industry. For example biotechnology has a high innovation threshold — innovations in this industry take the form of highly expensive-to-develop new drugs and scientific breakthroughs. By contrast, new insurance products have a low innovation threshold — they are rather easy to create.

"According to Collins and Hansen, companies in any industry must meet an innovation threshold — their products or services must offer a certain level of innovation for the company to even be in the game."

Once the threshold is met, however, further innovation is not the key to success, write Collins and Hansen. Discipline and consistency are key. For example, American Memory Systems was the first to break the 1,000-bit memory chip barrier in 1970. A small competitor, Intel, was able to come back from the overwhelming disadvantage of being second to market because, according to the authors, it focused obsessively on manufacturing, delivery and scale. Within three years, Intel chips were the best-selling semiconductor components in the world.

Luck Is Overrated

Another important insight, and one to which the authors dedicate an entire chapter, is to debunk the role that luck plays in success. Here, the rigorous methodology of the authors is particularly valuable since they are able to prove statistically that successful companies do not have any better luck than companies that fail and vice-versa. The difference is what the authors call "return on luck" — how companies handle the luck and turn it into sustainable success. That IBM asked Microsoft to develop an operating system for its personal computer may seem to be extremely lucky. The fact that IBM went to *another* company first is all but forgotten — yet it was that other company, Digital Research, which had been "luckier" than Microsoft.

While *Great by Choice* offers some interesting insights, there are also familiar themes that are starting to represent a common thread between the various works of Collins. Discipline and will are emphasized over and over again: the discipline to march forward every day 20 miles, no more, no less; the discipline to try out ideas on a small scale before launching the "cannonballs"; or the discipline to prepare for the worst before the worst happens and to take manageable risks. The authors also dedicate an entire chapter to the SMaC (Specific, Methodical and Consistent) recipe concept. In short, a SMaC recipe is a set of practices and strategies — what to do and what not to do — from which companies never waver. The authors found that 10X companies never abandoned any of the elements in their SMaC recipe. The less successful comparison companies, on the other hand, would make wholesale changes to the recipe. They were less disciplined.

Collins placed an equal amount of emphasis on discipline and consistency in his previous books. A "culture of discipline" was one of the key components of Good to Great companies, for instance, but discipline was also an important element in other concepts in *Good to Great*, from the Hedgehog concept to Level 5 Leadership.

The authors do not ignore the overlap of concepts and ideas between *Great by Choice* and previous Collins books. In a "Frequently Asked Questions" chapter, they answer such questions as why "fire bullets, then cannonballs" is different from the *Built to Last* concept of "try a lot of stuff and keep what works" (the answer: Keeping what works is not the same thing as making a big bet). Another question: How are the SMaC recipe and the Hedgehog Concept different? (The answer: The SMaC recipe translates the Hedgehog Concept into specific actions.)

The authors' explanations notwithstanding, readers will get a sense that there is a vaguely familiar current to the ideas in this book. There is a good reason: *Great by Choice* is essentially addressing the same issue as the previous Collins books. The differentiating factor in this book

— companies that survive and thrive in chaos — is not totally convincing. The advice in this book should be followed whether or not a company is trying to operate in the business equivalent of the frozen Antarctica. You shouldn't prepare for the worst because the worst is on the horizon. You should prepare for the worst, period. Also, the advice in previous books, such as get the right people on the bus, should be equally followed, irrespective of the environment. And finally, it can be argued (and in fact, the authors themselves allude to this issue at times) that the world of business is *always* a threatening, turbulent and dangerous environment.

In sum, while the parameters of the turbulent environment might have led to a new set of companies, the prescriptions in *Great by Choice* essentially apply at all times to all companies, including the companies featured in *Good to Great* and *Built to Last*. Had *Great by Choice* presented a set of radically different prescriptions for success, the credibility of the previous books would be questionable.

In truth, there are bound to be a limited list of factors for sustainable success in business. In his books, Collins and his co-authors have created a set of memorable metaphors and guidelines backed by in-depth research that should stay on the bookshelves of all business leaders, regardless of the size of their company, type of industry and even the state of the environment in which they operate.

Moving forward, however, Collins may want to dive deeper into some of the specifics of his success strategies, rather than try to create an entirely new set of strategies. He did this to some extent with his previous book, *How the Mighty Fall* (some critics questioned the lack of breadth to the book, missing the point entirely). For example, risk is a subject that needs to be further developed. A quantitative analysis featuring the number of risks taken or not taken does not adequately explain *how* to avoid taking risks, how to recognize the various types of risk, or how to rebound from a risk that backfires. The "how" is missing in a number of the concepts introduced in this book — for example, how do you know what bullets to fire? Is there a methodology to identify the "next big thing" as Steve Jobs was able to do with the Napster revolution (understanding that once the next big thing is identified, don't bet the house).

Answering the Critics

Noting the joy with which some commentators highlight the *Built to Last* companies that have fallen, a *Fast Company* writer perceptively argued that it's easy to criticize Collins because his books are so specific with their examples and recommendations. It's true that one can hardly criticize the specifics of *Who Moved My Cheese?*

Collins is a superstar business writer and deserves to be. His books are consistently insightful, readable and memorable, and will contribute to the success of his readers. Putting some of the unanswered "how" questions aside, this is a book not to be missed. As the authors write in the epilogue: "This book and the three that precede it … are looks into the question of what it takes to build an enduring great organization." For that mission, Collins, in partnership with a new co-author and the support of a tried-and-tested methodology, delivers once again. ●

"In sum, while the parameters of the turbulent environment might have led to a new set of companies, the prescriptions in *Great by Choice* essentially apply at all times to all companies, including the companies featured in *Good to Great* and *Built to Last*."

The authors: Jim Collins is the author or co-author of six books that have sold more than 10 million copies worldwide, including the bestsellers *Good to Great*, *Built to Last* and *How the Mighty Fall*. He operates a management laboratory in Boulder, Colo., where he conducts research, teaches and consults with executives from the corporate and social sectors.

Morten T. Hansen is a management professor at the University of California, Berkeley. He is the author of *Collaboration* and the winner of the Administrate Science Quarterly Award for exceptional contributions to the field of organization studies.

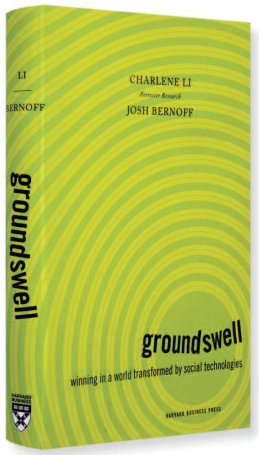
Ride the Tide of the Groundswell

Ways to Turn Social Technologies Into Success Stories



Review by Andrew B. Clancy

GROUNDSWELL

by Charlene Li and Josh Bernoff

Published by Harvard Business Press
Copyright ©2008
286 pages, $29.95

"Water, water everywhere, nor any drop to drink," writes Samuel Taylor Coleridge in his epic poem "The Rime of the Ancient Mariner." It is a line that is all too applicable to hundreds of companies thirsting desperately to capture consumer interest. These organizations, much like Coleridge's cursed sea captain, sit idly in an ocean — in this case the Internet — and are unable to bring a breath to their sails (or sales, as the case may be). This is despite the constant current from their customers that surrounds them in the form of blogs, postings on social networking sites and customer reviews.

There is no longer a need for businesses to wonder if their customers are out in the abyss paying attention. Instead, authors Charlene Li and Josh Bernoff want businesses to scan the seemingly endless online seascape, identify the most critical people and relate to them in their preferred method of communication. Their new book *Groundswell: Winning in a World Transformed by Social Technologies* intends to provide some much needed navigational tools to the frightening number of corporate ships currently lost in the e-commerce sea.

As vice presidents and principal analysts at technology and market research giant Forrester Research, Li and Bernoff have spent the past several years immersed in research surrounding the ever-evolving consumer use of technology. *Groundswell* is as much a product of this research as it is an attempt to answer the hundreds of questions the pair have received since their organization published a report titled "Social Computing" in 2006.

In that report, and in subsequent studies, they observed that consumers were no longer relying solely on companies for information and interaction concerning various products. Buyers took it upon themselves to link up with other buyers, bypassing the manufacturer entirely, and gleefully in many cases. The decentralization of the traditional buyer/seller silo would be cause enough for concern, but as *Groundswell* indicates, the methods consumers used presented their own set of focal points.

It can be a dizzying prospect for any marketing professional or IT executive. The volume of feedback provided by customers is multiplied by the variety of formats in which that feedback can be provided. *Groundswell* makes no secret of the fact that many business leaders are not well-informed about the vast array of technologies that constitute what Li and Bernoff refer to as Web 2.0. Just when a company feels comfortable with the appreciative reviews posted by a consumer on a personal blog, along comes another customer seeking to provide tech support services to the masses via an interactive message board. Less than a week later, someone who knows nothing about the company's manufacturing integrity puts a post on YouTube that accuses the company of using sweatshop labor. No matter which direction the company and its executives turn, someone has something to say about them. Can they capitalize on the positive while short-circuiting the negative?

Li and Bernoff offer a dose of reality chased with a bit of comfort. They are clear in their message that businesses cannot afford to ignore the groundswell that surges from Web 2.0, but it would be impossible to commit to the mastery of all forms of social technology. Fighting the fight on all fronts will only deplete a company's financial resources and exhaust its employees. *Groundswell* helps businesses pinpoint their focus by dividing the mission into three parts: understanding social technology, interacting with these technologies and handling the impact of Web 2.0 on one's own organization. As the authors point out, running blindly into the world of consumer-driven content is the equivalent of trying to explore a vast wilderness with no map. Succeeding in this marketplace requires a company to double and redouble its focus.

Cracking the Code

While the Internet has been a blessing to any number of businesses, there are certain mass-appeal industries that have occasionally trembled in the face of the Web's might. The entertainment industry in particular has suffered during a series of showdowns with the online community, and *Groundswell* offers a particularly intriguing tale at the outset of the book to illustrate the impact of social technologies. A single post on a solitary blog was picked up by a Web site that uses a reader-driven rating system to prioritize news items. Within the span of a single day, the post had made its way onto more than 3,000 Web sites. This may seem like an incidental occurrence until the authors reveal that the post contained the processing key that allowed people to illegally copy HD-DVDs. The technology had barely been on the market and someone had already devised a way to steal it.

"While the Internet has been a blessing to any number of businesses, there are certain mass-appeal industries that have occasionally trembled in the face of the Web's might."

The film industry made attempts to bottle the piracy genie that had been unleashed, but this only led to the code being spread farther and with increased enthusiasm. As Li and Bernoff note, the online world had completely overpowered the real world. Continuing on with additional examples, it becomes rapidly apparent that the exponential growth and near-instant connections between people are at the heart of the groundswell, and the ramifications for businesses are not always positive.

Groundswell forces executives to accept that the size and market dominance of their companies do not excuse them from becoming part of the Web 2.0 movement. Instead, the authors point out the skill most needed to handle social technologies is equivalent to jujitsu, the martial art where an opponent's energy is redirected to your advantage. If consumers have discovered methods to remove corporations from their interactions, it is the company's job to reinsert and reintroduce itself, creating the same relationships the customer has with other customers.

The book's first section ("Understanding the Groundswell") is an absolute must-read for executives attempting to understand technologies that probably dominate the daily existence of their children (or grandchildren). Li and Bernoff are methodical in walking readers through each type of Web 2.0 technology, how it works and how businesses can make use of it. It's a primer with a punch, as the authors feature statistics for the percentage of online consumers in each of six major countries that use the technology. While there's no guarantee that it will lead an executive to set up his or her own MySpace or Facebook profile, readers need to become comfortable with a basic understanding of the social technologies at their companies' disposal.

One of the most useful concepts introduced by the authors is the social technographics profile. This method of grouping your customers according to their groundswell activities and ways of participation lies at the core of Li and Bernoff's research. Readers have the benefit of the pair's years of effort and can now put consumers into one (or several) of six groups. The characteristics of each group are indicators of trends in online behavior and are a marketer's dream. As mentioned earlier, *Groundswell* places the criteria for an organization's success on its ability to focus its marketing strategy down to the right message delivered to the right consumers in their preferred method of communication. The social technographics profile is integral to this effort.

The authors cite a director at a media company who nearly made a critical error when developing content for its Web site. Prior to understanding the groundswell, the director fell prey to the idea with the highest amount of buzz around it at the time: blogging. Despite the director's client base being driven, successful, college-educated mothers with a middle-class household income, she felt they would somehow have time to write their own blogs. Fortunately, Li and Bernoff's organization stepped in and provided some valuable data about the social technographics profile of the "Alpha Moms," as the client group is known. The fact that the company completely reversed its plan for the Web site should indicate just how critical it is to understand consumers' preferred online interaction methods.

Learn to Listen Before You Speak

If there is one crime of which many organizations are guilty, it is not *truly* listening to their customers. Li and Bernoff give a measure of forgiveness to yesterday's organizations because the main method of gathering information was previously limited to rudimentary market research. However, *Groundswell* provides readers with a picture of the variety of ways in which businesses can now listen to their customers loud and clear. These efforts are helped to a large extent by the customers themselves, who are now, more than at any previous point, willing to freely offer their opinions. As the authors note, tapping the groundswell for customer feedback often provides answers to questions an organization never thought to ask.

The good news for executives is that there are plenty of people willing to share. It's the method of navigating the outpouring of comments that becomes the challenge. Even the most dedicated analyst can be overwhelmed by the volume of information, and *Groundswell* rightfully states that marketers must be careful not to assume that those who choose to comment are representative of the entire audience. This is why the authors recommend working with a vendor that is dedicated to monitoring the stream of Internet traffic surrounding a company. While some may view this as smacking of self-promotion, Li and Bernoff do mention other research firms besides Forrester Research. It is a credit to the authors that they maintain a razor-sharp academic edge and allow their work to be the promotional vehicle for their company.

Listening is only one half of the act of engaging the groundswell, and it is rendered useless without an equal amount of effort devoted to talking. The two follow a very natural order, and a company needs to have a confident team with competence in the former before it can approach the latter. The authors write that companies should not waste the effort they've put into gathering information via Web 2.0 by using traditional media to contact consumers. This is a key point for readers to grasp. The consumers who answered a company through online methods are expecting a response through the same channel.

Fortunately, it is at this juncture in *Groundswell* that the authors provide some of the most interesting case studies featured in the book. Li and Bernoff wisely integrate the names readers know, such as Procter & Gamble Co., with stories from other organizations, including the National Comprehensive Cancer Network. The Procter & Gamble case study, in particular, provides an example of the way in which listening translates to talking and talking translates to results. The consumer goods juggernaut discovered a way to reach a previously difficult section of its buying population through building an online community. It's a story that must be read to be truly appreciated, and it is important to note that a business does not need P&G's multibillion-dollar advertising budget to follow a similar path.

Let the Swell Speak for You and to You

There is little doubt of the immense effort required for a company to learn about the groundswell, much less take the time to research its audience, create a strategy and enter the stream of social technologies. However, the reward for doing so can lead to marketing opportunities an executive may have previously thought impossible. A closer look reveals that the company that took its time in finding the right audience and communicating to them in the right way has made a powerful impression. The organization finds that the consumers that previously wanted to talk to the company now want to talk *about* it. This is a process that Li and Bernoff refer to as "energizing," and it can deliver word-of-mouth promotion with incredible return on investment.

Readers should know that energizing your consumers partly depends on whether or not they fit the social technographics profile required to do so. Word-of-mouth marketing needs an amount of give-and-take between corporation and consumer. Many customers are latent marketers, the authors state; they just require the right motivation to tap their potential. Fortunately, once a motivated customer begins spreading the benefits of a product or service, he or she is providing the company with a source of promotion that is far more credible than conventional advertising.

Once the online community rallies around a company and its brand, it becomes the responsibility of the organization to partner with consumers to keep the channel alive and kicking. The authors make no secret of the fact that this requires a level of dedication. Sites need new content, close monitoring and, most importantly, frequent communication from the company as continued proof that it is listening to its audience. The level of creativity to which a company is willing to extend itself can produce interesting results. The case study of Del Monte Foods proves to be particularly insightful about demonstrating the cycle of listening, talking and responding to consumers.

The open channel that results from creating a community around one's customers can even fuel a company's approach to its own products. *Groundswell* gives examples of organizations that made modifications to existing products based on suggestions gathered from the online community, the aforementioned Del Monte being one such company. Li and Bernoff make the point that executives need to remember that the advice provided by customers is simply that: advice. The purpose of accepting feedback from one's

clients is to spur on the process of innovation and provide the raw materials that the company's talented employees mold into the next big success. It shows a depth of understanding that the authors want to bring producer and consumer closer together while not neglecting the individuals who do the legwork for everything in between.

Catching Workers in the Groundswell

Li and Bernoff use the discussion of employees to segue nicely into the final third of *Groundswell*. Executives who look to tap the power of consumer feedback and creativity may find the tide returning to flood them. It may seem obvious to some readers, but the people behind the scenes of a company's foray into social technologies are generally participants in the groundswell outside the workplace as well. With a little bit of urging, the same creative types can help create an internal groundswell within a company.

One of the keys to the groundswell culture is that it requires an organic method of growth. Li and Bernoff cite an example of a company that tried for eight months to launch a blog to no avail. The problem was the result of trying to force the idea from a top-down perspective. Executives who lacked a sophisticated knowledge of Web 2.0 were not about to sign off on an idea that seemed to arrive from out of left field. The authors write that the marketing team's saving grace was its enthusiasm for the blog project. The group simply needed to partner with someone in the organization who shared their enthusiasm and degree of knowledge about social technologies. The marketing team found its match in the company's founder, who, as Li and Bernoff write, "was removed from day-to-day operations and had the time and bandwidth to devote to a blog." It was a perfect match, and in less than two months, the company's blog was online.

Just as with the social technographics profile method, creating and supporting an internal groundswell requires companies to tap the right individuals to find the right method for reaching employees. Internal groundswell may appear outwardly to be the exclusive domain of companies that are large enough to merit a private information resource in the Wikipedia vein. However, one of Li and Bernoff's most important recommendations is for firms to start small. Internal organization of a groundswell takes as much care and strategic planning as it does to create an effort directed at consumers. This tip appears as part of a list of five steps to effectively generate groundswell within an organization, and it is an essential set of insights for any executive looking to put many of *Groundswell*'s philosophies into practice. It may lead some readers to feel that the order of the chapters should have started with organizational change, then moved on to reaching customers.

"... companies cannot afford to ignore the technologies that are transforming the Web on a daily basis. Strangely, the root of many corporations' hesitance at embracing new technologies is a fear of not being able to control the content."

Li and Bernoff point out time and again in *Groundswell* that companies cannot afford to ignore the technologies that are transforming the Web on a daily basis. Strangely, the root of many corporations' hesitance at embracing new technologies is a fear of not being able to control the content. What these firms fail to realize is that by not making their presence felt, they have essentially given complete control to consumers, and in many cases, customers with a bad attitude are the ones most willing to share. The authors do a fantastic job of reinforcing this point, and their insightful suggestions should help to change the mindset of executives who overly rely on traditional marketing methods. If nothing else, readers should not be afraid to set sail into the oncoming groundswell and with precision and planning, return like the mariner to tell their tale.

The authors: Charlene Li has become an expert on social computing and Web 2.0 through her work with Forrester Research, a technology and market research company, where she is a vice president and principal analyst. Josh Bernoff is a widely quoted technology analyst and a vice president at Forrester Research. He has consulted on strategy with senior executives from global companies including ABC, Best Buy, Cisco, Comcast, L'Oreal, Microsoft, Sony, TiVo and Viacom. The authors share a blog at www.forrester.com/groundswell.

Management: Hands-On

Human Sigma

Managing the Employee-Customer Encounter

by John H. Fleming, Ph.D., and Jim Asplund

THE SUMMARY IN BRIEF

Six Sigma changed the face of manufacturing quality, creating excellence by reducing variance in finished goods, revolutionizing businesses and boosting profits. Now, HumanSigma is poised to do the same for sales and service organizations.

Human Sigma offers an innovative, research-based approach to one of the toughest challenges businesses face today: how to drive success by effectively managing the moments when employees interact with customers. Based on research spanning 10 million employees and 10 million customers around the globe, the HumanSigma approach combines a proven method for assessing the health of the employee-customer encounter with a disciplined process for improving it.

Offering essential ideas for today's global business leaders, the authors show how sales and service companies can flourish in the new global economy. They reveal a profoundly different method for managing human systems for growth. Blending strategic analysis with hands-on, practical steps and advice, this summary will change how you view your work, your employees and your customers forever.

IN THIS SUMMARY, YOU WILL LEARN:

- Why employee and customer experiences must be managed together — not as separate entities.
- How emotions drive and shape the employee-customer encounter.
- Why the employee-customer encounter must be measured and managed at the local level.
- How employee and customer engagement interact to drive enhanced financial performance.
- Why sustainable improvement in the employee-customer encounter requires disciplined local action coupled with a companywide commitment to changing how employees are recruited, positioned in roles, rewarded and recognized, and how they are managed.

The Terminator School of Management

Arnold Schwarzenegger fans will recall the harrowing image from the apocalyptic opening scene of *The Terminator.* It's the Year of Darkness, 2029.

The machines — created by an advanced form of artificial intelligence called Skynet that accidentally becomes self-aware — have concluded that they must erase humans from the face of the planet, replacing them with predictable but unfeeling, efficient, and relentless copies of themselves. The machines have decided that humans are not only unnecessary, but they are expendable. They add no value in the vision of the future the machines seek to create.

Terminator Management

Terminator Management is an institutionalized mindset that views people — customers *and* employees — as a necessary evil; a nuisance; or, in extreme cases, as adversaries in doing business. Rather than viewing people as the reason a business exists, the Terminator School of Management views them as impediments to business that breed inefficiency, cost and errors.

Terminator Management sees employees as little more than a cost it needs to reduce or a mistake just waiting to happen.

New Rules

Experts offer a new set of rules and a different way of thinking about managing your company's complex human systems, which can serve as an antidote to Terminator Management. It's about a model and an approach called HumanSigma.

HumanSigma offers a disciplined approach to measuring, managing and improving the performance of your most volatile and valuable assets — your customers and employees — to drive financial performance.

Quality Control

The accounting and financial reporting systems modern businesses use have failed to keep up with the changing nature of value creation. By focusing on tangible assets, current accounting systems implicitly undervalue human contributions to the enterprise, which are primarily intangible things such as creative branding strategies, research and development, and labor productivity.

A recent study revealed that an estimated 80 percent of the market value of the average S&P 500 company is made up of its intangible assets — the company's brand, its customer base and levels of engagement, the talent of employees, and innovation and R&D, just to name a few of the most crucial elements. Though most executives recognize the importance of these intangible assets, it's much more difficult to justify investing in them without an accepted means of accounting for the success or failure of these investments.

Toward an Alternate Approach: HumanSigma

HumanSigma, like its namesake Six Sigma, builds on the best principles of that methodology, offering a strategy for optimizing business performance by reducing variability and improving performance on key indicators.

The beauty and simplicity of Six Sigma is that it integrates a universal and consistent method to count quality

defects with a disciplined process to eliminate them. The HumanSigma model overlays these same basic process elements onto the human systems of your business by providing a consistent method to assess and monitor the effectiveness of the employee-customer encounter and a disciplined process to manage and improve it.

Human Systems and Vital Signs

Just like your regular visits to the physician, an organization requires a feedback system to evaluate, regulate and maintain its overall health. And, just like you, organizations have vital signs that need to be regularly monitored. An organization's vital signs serve as diagnostic indicators of how effectively it's addressing its key constituencies, executing its strategies, maintaining its economic viability, and how likely it is to grow.

If heart rate, respiration and blood pressure are the vital signs of the human organism, then in sales and service organizations, the corresponding vital signs of the employee-customer encounter are the health of its human systems: its customer relationships (heart rate), employee relationships (respiration) and overall financial viability (blood pressure).

Separately, these vital signs provide important but incomplete diagnostic information about the effectiveness of the organization's employee-customer encounter.

The employee perspective usually lies within the domain of the human resources department. Though the encounter between an employee and a customer represents the touchstone of value creation in sales and service companies, human resources departments are rarely involved in strategic decision making, marketing campaigns or advertising efforts, outside of providing input about staffing levels and costs. This is unfortunate. Employees who interact with customers are the face and the soul of the brand and are intimately involved in the front-line execution of the brand promise, yet they play little role in its formulation and development.

This brings us to the first new rule of HumanSigma management:

Rule 1: You can't measure and manage employee and customer experiences as separate entities; they must be managed together under a single organizational entity.

Only when these organizational systems and their vital signs are brought together and empirically linked can a true picture of the health of the employee-customer encounter be understood and managed. What this means in practice is that the responsibility for measuring and monitoring the health of a company's employee and customer constituencies should reside within a single organizational structure. This structure should have a clearly identified champion who has the authority to manage change across the broad range of organizational activities that affect the employee-customer encounter.

Measure What Counts

Although it is appealing to simplify how you think about the health of your employee and customer relationships, remember that "not everything that can be counted counts." You need to be careful, deliberate and informed, because what you measure is a crucial component of your future success. What you measure must be more comprehensive than mere satisfaction and broader than simple advocacy.

Feelings Are Facts

More than 75 years ago, William I. Thomas, a sociologist at the University of Chicago, wrote, "If men define situations as real, they are real in their consequences." In other words, a person's definition of the situation — that is, how they perceive that situation and what they define to be true about it — determines how he or she will react to it. Thomas was saying that though the objective elements of a situation are important, the subjective experience of those objective elements — what the situation feels like — is what truly matters to people. Perception *is* reality.

Too often business leaders get caught up in the facts of their businesses and fail to appreciate what matters to employees and customers. For them, reality is not only the objective experience they have with companies but also how they perceive and interpret that experience — their feelings about it.

In the employee-customer encounter, one of the most intriguing factors that can significantly affect customers' and employees' perceptions of the world around them is their emotions.

We can sum this all up with the second new rule of HumanSigma Management:

Rule 2: Feelings are facts, and emotions frame the employee-customer encounter.

Customer Engagement and Emotional Attachment

Studies reveal that engaging customers on an

emotional level has a significant financial benefit.

There are four key dimensions to a customer's emotional attachment to a company. Each dimension represents a specific set of activities that meet customers' emotional needs.

The Emotional Attachment Hierarchy

The first and foundational dimension of emotional attachment is *confidence*. Is the company trustworthy? But confidence alone is not enough to build long-term, sustainable and emotionally connected customer relationships.

Beyond confidence lies *integrity*, the essential dimension of fair play. Does this company treat me the way I deserve to be treated? If something goes awry, can I count on this company to fix it quickly?

The next emotional requirement is *pride*, a sense of positive association and identification with the company. Pride goes beyond simplistic notions of self-presentational, status or "badge" qualities of association to deeper levels of shared values between the customer and the company. Customers who feel pride are proud to be a customer not because of what their association with a company says to others, but because of what it says to them about themselves. Customers' associations with companies not only convey information about them to others, but they also help define and sharpen their own self-concepts.

The fourth dimension, and the ultimate expression of emotional attachment, is *passion*. A passionate customer describes his or her relationship with the company as irreplaceable and a perfect fit for him or her. Passionate customers are rare, but they represent the epitome of customer connectedness. They are customers for life and are worth their weight in gold. ●

Emotional Attachment: Confidence and Integrity

The foundational dimension of emotional attachment — confidence — is also the most basic. Will this company deliver on its promises, day in and day out?

Confidence is the bedrock upon which higher levels of emotional attachment are built. But confidence alone is not enough to build long-term, sustainable and emotionally connected customer relationships. It's only the starting point for an emotional connection.

A company's ability to engender confidence in its customers begins with its ability to consistently deliver a customer's basic requirements for that industry and the more specific elements of the company's brand promise. Gallup's research has shown that companies that fail to build confidence have a much tougher time engaging customers than companies in which customer confidence is solid. For customers, the consistency between what a company promises and what it actually delivers is key to building confidence.

Integrity

Social psychological literature identifies at least three different types of fairness or justice: *distributive* fairness, which addresses how resources are distributed; *procedural* fairness, which covers the processes and systems that are used to determine how resources are allocated; and *interactional* fairness, which encompasses how people are treated at an individual level. All three types of fairness come into play at different times, and all are important. However, from a customer's perspective, distributive and procedural fairness carry the greatest weight because they represent chronic — or structural — issues. Customers' perceptions of transactional fairness, in contrast, can vary from interaction to interaction and therefore represent transient — or acute — issues.

Three Types of Fairness

Distributive fairness deals with how companies allocate resources among individuals. With distributive fairness, three rules are possible, relating to equity, equality and need.

Fair treatment under the equity rule means that the company should reciprocate and distribute resources based on what the individual has invested in the relationship. In contrast, fair treatment under the equality rule means that a company should distribute resources equally among all customers, or "Treat me the way you treat *all* other customers." Finally, fair treatment under the need rule means that the company should distribute resources based on individual needs, or, "Treat me like *no other* customer."

Procedural fairness covers whether customers feel that your company's policies and procedures are fair and equitable.

The search for customer centricity is really a search for procedural fairness. If customers perceive that a company is taking advantage of them or designing policies and procedures inequitably, their engagement will quickly erode.

Interactional fairness encompasses how a company treats people at an individual level. At issue is whether your employees make interacting with the company enjoyable. ●

Emotional Attachment: Pride and Passion

Pride functions on multiple levels. The power of the pride dimension is not just what doing business with a particular company tells others about me — it's what being a customer tells me about *me*.

People embrace the brands they buy and the companies they do business with as symbols that help them define their own sense of who they are. Because all of us feel less than complete in some aspect of our lives, there are limitless opportunities for customers to connect with brands and companies as a means to building their desired self-identity. The relationships we build with the companies we choose to patronize profoundly affect how we construct and sharpen our self-concepts.

Passion

Passion represents the ultimate expression of emotional attachment. A passionate customer uses expressions like "It's irreplaceable" and "It's a perfect fit for me!" to describe his or her relationship with your company. For these customers, the number of potential alternatives they'd consider using is zero.

Passionate customers look to your company to set the standard for other companies to follow. These customers are relatively rare — they make up only 18 percent of all customers in Gallup's customer database — but they represent the zenith of customer connectedness. They are customers for life and are a significant financial resource and annuity for companies.

Not only are passionate customers truly committed "ambassadors" for your brand, but they hold the keys to building greater levels of passion throughout your customer population. ●

Win Their Brains and Their Hearts Will Follow

A functional magnetic resonance imaging (fMRI) machine measures the flow of oxygenated blood to various parts of the brain on the assumption that greater activity in a particular brain area increases the need for oxygen in that area. Because they tend to show up as bright colors on the resulting brain scan images, the areas with enhanced blood flow are often described as "lighting up." Areas that light up are experiencing intense neural activity.

So imagine that you could peek inside the heads of your customers as they think about your company or your products, services or brands. What would they see? Would the brain activity of customers with a strong emotional connection to your company vary from that of customers who are indifferent? To find an answer, researchers recently used fMRI to examine real-time brain activity in customers of a Japanese luxury retailer.

When they analyzed the results of the brain scans, they found the brains of customers who were highly engaged with the retailer were more active while they were thinking about the company than were the brains of customers with lower levels of engagement.

They also found that the brains of customers who were most passionate about the retailer were considerably more active while thinking about the luxury retailer than were the brains of customers with lower levels of passion.

When they think about a company, customers who are highly engaged and the subset of those customers who are strongly passionate about the company engage a specific set of brain regions associated with emotional processing and storing emotional memories, as well as areas related to facial recognition and facial memory. This provides strong evidence that the emotional centers of the brain — as evidenced by neural activity — play a crucial role in building and sustaining customer engagement. ●

Employee Engagement

New York University professor Baruch Lev has written extensively about intangible assets and how to account for their contributions to company market value. His research has found that intangible assets contribute much of the value in most firms and that the earnings generated by intangible assets are a better predictor of stock market returns than either accounting earnings or cash flows.

Researchers have found that *engaged* employees are the main source of much of these intangible assets. When employees are engaged — or emotionally and psychologically committed to the firm — businesses perform more efficiently, and when businesses perform more efficiently, employees become even more engaged.

A recent study of 2,178 business units from 10 companies in six industries found that engagement predicts performance in key areas — including customer engagement, employee retention, sales and profit — better than performance predicts engagement. In the search for a good measure of the source of Lev's intangible assets, one needs to look no further than the engagement of the firm's employees.

Just as engaged customers are among a company's most profitable patrons and passionate advocates,

engaged employees are a company's most productive and efficient workers.

Among the variables that discriminate between highly productive workplaces and those that are unproductive is the quality of the local workplace manager and his or her ability to meet a core set of employees' emotional requirements.

Primary within these conditions are emotional elements that reveal our basic human needs: to be recognized as individuals and to contribute. At a local level, managers can influence employees' most basic needs by setting clear expectations and providing needed resources. More than this, they can energize their employees by showing them that they care personally and professionally.

Engaging Your Employees

Companies can change and focus employees' behavior in more positive directions by engaging employees' hearts and minds. A careful look at more than 10 million interviews with employees have led researchers to four core principles of employee engagement that when combined with the key principles of customer engagement, begin to sketch out a road map for navigating the terrain of HumanSigma:

- **Manage by outcomes, not behaviors.** Great organizations and managers view excellence within a role as achieving the right outcomes, not just conforming and executing the steps of the job the right way.
- **Liberate, don't legislate.** The most dramatic increases in productivity occur when companies allow workgroups to choose their own initiatives and focus on them.
- **Engagement is for everyone.** Almost every employee can become more engaged.
- **All politics is local.** Everyone from the boardroom to the mailroom is responsible for the quality of his or her workplace.

Employee engagement provides a starting point for improving organizational performance. Like politics, "all performance is local," and it varies from location to location and team to team within the same organization. Addressing that variation and its impact on overall organizational health is the key to managing your organization's HumanSigma.

The Scourge of Local Variation

The successful implementation of standardized processes, policies and other drivers of customer engagement that should be more or less constant across the enterprise brings us to the consideration of exactly who is doing the implementing and how that implementation is being managed. For this reason, businesses must focus on reducing variability in local "people" processes (the "who" and "how" of implementation).

The power of an approach focusing on reducing local performance variability lies in its simplicity and flexibility, allowing each unit to identify and correct its own causes for disengagement. Any location can optimize its performance, regardless of its starting point. The lesson from research is not that a business in a "C" market can necessarily be as profitable as one in an "A" market, but rather that the "C" *and* "A" locations can improve considerably if they adapt to meeting the requirements of their customers and employees. No research suggests that the local conditions can be so bad that a given business unit cannot improve — or so good that a local unit cannot fail.

This brings us to the third new rule of HumanSigma management:

Rule 3: Think globally, measure and act locally: You must measure and manage the employee-customer encounter locally.

Do your current performance metrics go deep enough into your organization to provide local managers with the information they need to manage effectively?

HumanSigma

Employee engagement has a direct and measurable relationship to and impact on customer engagement. This brings us to the next rule of HumanSigma management:

Rule 4: There is one number you need to know. We can quantify and summarize the effectiveness of the employee-customer encounter in a single performance metric — the HumanSigma metric — that is powerfully related to financial performance.

The Strategy and Tactics of Human Sigma: Evaluate, Intervene and Encourage

HumanSigma's strategic objective is to optimize the vital signs of your company's human systems.

HumanSigma optimizes these vital signs by focusing on performance and change on two levels within the company: the enterprise level ("think globally") and the local level ("act locally"). This two-pronged approach requires a *system owner* for each of the critical human systems — employees and customers — paired with an effective change mechanism that can be driven down to

the team level where the employee-customer encounter occurs and where real, sustainable change actually happens. These system owners should be coordinated by and partnered with a corporate HumanSigma champion charged with ensuring that these two dynamic systems are energized and optimized.

Consolidate responsibility for managing your company's human systems under an executive champion — a "chief HumanSigma officer" — who has corporate support for broad-based change initiatives to improve HumanSigma performance. This individual must have a span of control that, at a minimum, extends to the customer and employee domains.

The Tactics of HumanSigma

Achieving and maintaining excellence in human systems performance demands regular attention to three interrelated activities: evaluation, intervention and encouragement.

Meeting all of these demands, but particularly the demand for intervention, requires attention to a combination of *transactional* and *transformational* activities.

Transactional activities are those that recur regularly, but they tend to be more topical and short term in focus. Typical transactional interventions include activities such as periodic measurement, internal assessments and audits, education and training, brainstorming sessions, and action planning.

Transformational activities, in contrast, result in fundamental changes in the company's human ecosystem. They address questions such as, Do we have the right people in the right roles? Are our compensation and reward systems properly aligned with our strategic objectives?

With that, we arrive at the fifth and final new rule of HumanSigma management:

Rule 5: If you pray for potatoes, you had better grab the right hoe. Improvement in local HumanSigma performance requires deliberate and active intervention through attention to a combination of transactional and transformational intervention activities. ●

The Demand for Evaluation

Engaging employees and customers — and driving HumanSigma performance — requires a year-round focus on changing behaviors, processes and systems to meet and anticipate these constituencies' needs. This requires a total commitment from the leadership team down to frontline units and employees. To implement the right changes, a rigorous process of monitoring engagement and defining appropriate support and activities is needed. Local units must be held accountable for their engagement levels, their successes should be celebrated and they should receive the support they need to increase engagement.

Measurement Logistics. Once you've established the overall goals of your HumanSigma program, it's time to identify how often you should measure, how to build a measurement plan and how to conduct the measurement.

Analysis. Analysis helps leaders identify enterprise-level opportunities and prioritize actions at a macro level. Second, it encourages managers and workgroups to identify specific opportunities to respond to unique local issues.

Identifying Performance Zones. By identifying performance zones and tailoring interventions to current performance — a process called *adaptive intervention* — organizations can apply solution strategies that best fit a team's current performance level.

The Way Forward. Once organizations have received baseline performance data, it's important for them to develop a road map spanning a three-year period. ●

The Demand for Intervention

The intervention stage is where the organization's commitment to HumanSigma principles is tested, and it's arguably the most difficult. But the intervention stage is also where the seeds of dramatic organizational change are planted. An effective HumanSigma intervention process begins with orienting employees toward the need for and benefits of change, as well as the reasons for selecting a particular intervention activity instead of others.

Transactional Activities in Intervention

Here are four transactional activities in intervention:

Brand Promise Alignment. If you believe that your front-line employees play a crucial role as brand ambassadors and are truly the face of your brand in the marketplace, then an obvious place to begin an intervention process is with the brand promise itself. What is your company's brand promise? How well-known is it throughout the company?

Action Planning. For action planning to be effective, it must be completed in a timely manner, usually within one month of receiving local HumanSigma performance feedback. The specific elements of local unit-level action planning are often best left to the local units.

Action Planning Review. Carefully reviewing, critiquing and modifying a unit's action plans can increase its likelihood of success and reduce the likelihood that the process will frustrate the team. The review should be regular and thorough.

Customer Advisory Boards. How can local units regularly engage in deep conversations with customers and customer-facing employees in a cost-effective way? A simple solution is for each unit to form a customer advisory board that meets on a regular basis.

Transformational Activities in Intervention

Just as seeds planted in rich, fertile soil and nourished with sunshine and water will grow faster, stronger and healthier than seeds sown on barren land and left to languish on their own, so too will your improvement efforts gain greater traction if you plant them in a more "fertile" organizational soil. The goal of transformational interventions is to create this kind of environment within your company.

Creating a culture of accountability is one of the most important transformational interventions any company can implement.

A second transformational activity is to supplement your existing work force by selecting new associates who have an increased likelihood of success and performance at excellence. ●

The Demand for Encouragement

In the helter-skelter pace of our day-to-day business lives, it's all too easy to forget the adage that you can attract more bees with honey than vinegar. But we should all strive to remember that success must be encouraged, celebrated and rewarded. To that end, high-performing HumanSigma units should be recognized — and not just the managers or executives who run the units, but the entire team. And because the financial payoff of HumanSigma management accrues to those units that improve their HumanSigma position as well as those that consistently perform at very high levels, it's also important to recognize those that improve the most.

Celebrating successes helps institutionalize improvement by establishing the language and culture of engagement. Consistent enterprisewide support is necessary to maintain positive momentum, and cheerleading and emphasizing initiative are important means of sustaining enthusiasm for the change process.

Transactional and Transformational Activities in Encouragement

Transactional activities include preferred recognition, performance communication and celebration, local celebrations, and recognition and formalized rewards.

Transformational activities include peer group mentors; summits and retreats for top managers; performance linked to advancement and promotion; and case studies, such as a featured article in a company publication highlighting specific success stories. ●

Conclusion

HumanSigma focuses on accepting our human nature and capitalizing on it to manage employees, motivate them, accelerate their development, and unleash innovation and productivity, all to ultimately engage the emotions of your most valuable asset — your customers.

The most important thing is to get started and keep working at it. Improvement takes time and mindful attention to the everyday facts of our lives. Each team needs to sketch out a vision for its future and work hard to build toward that vision. You will make mistakes, so your system needs to be tolerant of missteps if your organization hopes to optimize its performance for the long haul. Managing the employee-customer encounter is just plain hard work. It involves measuring the right things in the right ways, taking deliberate and disciplined action to improve each local team's performance, and celebrating your successes.

What works best for your organization must ultimately be determined by the employees who work there. The answers are not easy. But researchers have noticed how the need to own your own improvement makes people more innovative, productive and confident. There is not a better set of characteristics for companies facing an unknown future. ●

The Tough New Realities That Could Make or Break Your Business

INTELLECTUAL PROPERTY

THE SUMMARY IN BRIEF

Intellectual property is a product of the mind. It's a song, a book, a business secret or almost any other kind of creation. These products have value — often tremendous value — in the business world. The question is how to protect these assets.

In the United States, the four main types of intellectual property (patents, copyrights, trademarks and trade secrets) each have their own body of law pertaining to creation, ownership and use. These laws have evolved over centuries, but the advent of new technologies and social and economic shifts make it difficult for them to keep up with the times. Change is coming, and how and when it comes will affect nearly every owner, creator and user of intellectual property.

The "intellectual property paradox" — the notion that giving property rights to owners of intellectual assets harms those who are unable to pay for access to the assets while helping those who are able to pay — often explains intellectual property laws differing among countries. Although treaties and agreements have somewhat homogenized the areas of intellectual property law, intellectual asset owners still must navigate the laws of each country in which they do business. Given the scalability of intellectual assets, dealing with the inconsistencies and the sometimes doubtful options for recourse can still be worthwhile.

Paul Goldstein covers these topics and more as he explains intellectual property law's history as well as some important legal cases that brought American intellectual property law to where it is today.

IN THIS SUMMARY, YOU WILL LEARN:

- The characteristics of the four major areas of intellectual property law.
- How intellectual property law protects a business's intangible assets.
- The significance of major laws and legal precedents related to intellectual property.
- What changes you should anticipate in intellectual property law.

THE COMPLETE SUMMARY: **INTELLECTUAL PROPERTY**

by Paul Goldstein

Introduction

No idea is entirely original; every innovative business borrows, sometimes extensively, from its competitors and others. Many of the best-known and most valuable brand names — Burger King, McDonald's — are little more than descriptive words and common names. How can a company appropriate such names for its own exclusive use? When a departing employee takes a company's trade secrets and know-how with him, what part of this information belongs to the company and what part, derived from his own skill and training, belongs to him? Elusive as intellectual property boundaries are, the business value they secure is enormous. ■

The Intellectual Property Paradox

The name Polaroid is synonymous with instant photography, but without patents Polaroid could not have dominated the market as it did for the entire history of this once-popular medium. In the course of the *Polaroid v. Kodak* trial, in which Polaroid sued Kodak for infringing on 12 patents related to its instant photography films and cameras, one Polaroid official described the company's founder, chairman and chief investor, Edwin Land, as "fierce" about patents.

The views of innovators like Land and Kodak's George Eastman rarely change: More patents are preferable to fewer, and the broader the reach of these patents, the better. But views of lawmakers do change. Patent standards and remedies can shift even over the span of a single trial, particularly when, as in the case of *Polaroid v. Kodak*, the trial stretches over 15 years.

The Risks and Rewards of Legal Uncertainty and Change

One legal standard that changed over the course of the Polaroid trial was the statutory requirement that, in order for the U.S. Patent and Trademark Office (PTO) to grant a patent, the applicant must show not only that the invention was new at the time he invented it, but also that it was "nonobvious" — not readily apparent — to workers reasonably skilled in the art.

Even if the applicant convinces a patent examiner of the invention's novelty and nonobviousness, and the PTO issues a patent, another company, if sued by the patent owner, can ask the court to invalidate the patent on the grounds that the PTO erred in its findings of novelty or nonobviousness. And even if the patent is valid, the company can ask for a finding that its own product did not infringe upon that patent.

The Paradox of Public Goods

Economists classify goods whose use by one person will not diminish use by others as "public goods and services" — the classic examples (in addition to information) are lighthouses, public education and national defense. They also observe that to grant property rights in information will necessarily violate a basic tenet of contemporary economic policy by decreasing the welfare of one class of users — those unable or unwilling to pay for access to information — without increasing the welfare of another class of users — those who are willing and able to pay the intellectual property owner's asking price.

A standard solution to the problem of public goods is for government to pay for the production and maintenance of these goods out of the public treasury and to make their benefits available "free" to everyone. But few Americans would be willing to trade private for public choice over the selection of products available on the supermarket shelf or hardware counter any more than they would want government to choose the films they watch or the books they read.

The Unique Scalability of Intellectual Assets

Where economists view intellectual assets as inexhaustible, businesses view them as scalable. Through license agreements with well-placed licensees, a company can exploit its intellectual assets in product, service and geographic markets that it lacks the resources to enter itself; it can also delegate enforcement of rights to licensees. ■

Patents

The U.S. Patent Act's description of the five classes of protectible inventions is straightforward enough: "any new and useful process, machine, manufacture or composition of matter, or any new and useful improvement thereof." At the threshold of the next great cycle in patent protection, the hard question is not whether, or even when, patent law will begin to scale back, but *how*.

Cycles of Protection

The origins of contemporary patent law lie in the English Crown's grants of privileges to foreign tradesmen and craftsmen in the 14th and 15th centuries to spur the adoption of modern manufacturing methods.

The first U.S. patent law was a general rather than a private act, and authorized patents for "any useful art, manufacture, engine, machine or device, or any improvement therein not before known or used." In 1836, Congress reinstated the examination system and fixed the patent term at 14 years with a seven-year renewal period. To the chagrin of many observers, the U.S. Patent Act in force today strays little from the structure and principles of the 1836 act.

The High Protectionists Take Charge

In 1982, Congress created the Court of Appeals for the Federal Circuit to hear appeals from trial court patent infringement decisions across the country. It was also created to replace, with a single national standard, the patchwork of patentability standards previously applied by the regional courts of appeal.

Congress also undertook major new initiatives to use patents to spur industrial growth, among them the 1980 Bayh-Dole Act that fostered university-industry collaborations by making it possible for universities to patent the results of federally funded research. Finally, two U.S. Supreme Court decisions in the early 1980s, one opening the door to patents for computer programs and the other holding that a live, man-made organism could qualify for patent protection, established new high-water marks for an already ascendant patent system.

Software Patents

Until March 3, 1981, when the U.S. Supreme Court in *Diamond v. Diehr* for the first time upheld a patent on a computer program, the patent status of computer software had been in doubt.

In 1994, the Court of Appeals for the Federal Circuit ruled that a patent applicant could effectively bring its software within the traditional category of "machine" simply by describing his invention to include the software running on a general-purpose computer. Finally, in 1995, the Patent Office retreated from its stern antisoftware position and announced that it would treat computer programs as patentable subject matter as long as they were embodied in a tangible medium, such as floppy diskettes.

Patenting Life

The Supreme Court's 5-4 decision in *Diamond v. Chakrabarty* endorsed patents for living organisms in the most ringing terms, underlining the importance of an openhanded patent system for business investment in new technologies. In 1985, the Patent Office Board of Appeals ruled that plant varieties were patentable, and in 1987, that a genetically engineered species of oyster was patentable subject matter.

The Patent Office was met with objections when it announced that it would consider patent applications for vertebrates, but it issued its first such patent in 1988, on the "Harvard Mouse," or OncoMouse. The mouse was genetically engineered by a Harvard researcher for enhanced susceptibility to cancer, and consequently of particular use in cancer research.

Everyone Holds a Patent

The Court of Appeals for the Federal Circuit made it easier to enforce patents and to obtain monetary and permanent injunctive relief against infringers, and also to obtain preliminary injunctive relief against alleged infringers. Books such as *Rembrandts in the Attic* and *Edison in the Boardroom* encouraged companies to search through their portfolios for patents that could be licensed and, if not licensed, litigated. Because patent owners can file infringement cases in any U.S. judicial district where allegedly infringing products are sold, "rocket dockets" sprang up, offering patent claimants speedy discovery, early trial dates and fast trials.

Pharmaceuticals Versus Electronics: The Battle for Patent Law's Next Phase

The great upsurge in patent scope and enforcement over the past quarter century has divided patent industries into two warring camps. On the one side are the high protectionists, led by the pharmaceutical compa-

nies. On the other side are the low protectionists, led by the electronics and software companies.

Probably the most consequential division between high and low protectionists centers on American patent law's "all-or-nothing principle," which empowers a patent owner to shut down a later inventor's business even if the inventor offers to pay a reasonable license fee. One solution to the standoff between the pharmaceutical and electronics industries is for Congress to tailor its reforms along industry lines.

eBay v. MercExchange

The Court of Appeals for the Federal Circuit consistently ruled that, once infringement is shown, injunctive relief is virtually automatic, and this appeared to be settled law in the United States until November 2005, when the U.S. Supreme Court agreed to review the Federal Circuit court's decision in *eBay v. MercExchange*, applying the automatic injunction standard.

In September 2001, MercExchange, a Great Falls, Va. company founded by a patent lawyer-engineer, filed suit in the federal district court for the Eastern District of Virginia, alleging that eBay's "Buy It Now" feature, enabling prospective bidders to purchase an item immediately at a fixed price instead of waiting for the outcome of the auction, infringed on three electronic commerce patents owned by MercExchange's founder.

In May 2003, the jury found that eBay and its subsidiary Half.com had willfully infringed two of the three patents, and in August the judge ordered eBay to pay $29.5 million in damages but declined to order an injunction shutting down the online auction's use of the feature.

In March 2005, the Federal Circuit court affirmed the trial court's finding of patent validity and infringement. But the court reversed the trial court's decision denying injunctive relief.

On May 15, 2006, the U.S. Supreme Court announced its decision in *eBay v. MercExchange*, unanimously holding that the Federal Circuit court erred in enforcing a virtually categorical preference for permanent injunctions in patent cases and directing it in the future to require the plaintiff to pass, as it must in other fields of law, a four-factor test: "(1) that it has suffered an irreparable injury; (2) that remedies available at law, such as monetary damages, are inadequate to compensate for that injury; (3) that, considering the balance of hardships between the plaintiff and defendant, a remedy in equity is warranted; and (4) that the public interest would not be disserved by a permanent injunction." ■

Copyrights

For all its undeniable cultural impact, copyright is essentially about commerce. It protects not only writers, composers and artists, but also mapmakers, data compilers and software designers. The U.S. Copyright Act captures all this value by granting five exclusive rights to copyright owners: the rights to reproduce their works, to adapt them, and to publicly perform, display and distribute them.

How the Movie Studios Used Copyright to Tame Their Distribution Partners

The history of the motion picture industry's encounters with new technologies, from television in the 1940s and 1950s to TiVo at the turn of the 21st century, teaches two important lessons about the use of copyright to navigate relationships with future distribution partners. One is that because copyright fosters production of competing works, no copyright owner can hope to control the spigot that releases content to distributors. The second lesson is that in law, as in life, *timing is everything.*

How the Computer Industry Used Copyright to Fight for Market Share

Three central copyright rules — the rule that copyright protects expression but not ideas, the rule that a work must be original to be copyrightable, and the fair use doctrine — proved decisive in resolving conflicts between companies like IBM, Apple and Sega. These companies sought through copyright to control access to their established operating system platforms, and, on the other side, producers of competing and complementary equipment, such as Fujitsu Limited, Franklin Computer and Accolade, Inc., that sought access for their equipment to those platforms.

Why did copyright become the principal vehicle for software protection through the 1980s and 1990s? One reason is that, ill-fitting as copyright was, other intellectual properties — patents and trade secrets — were even more deficient. And although proposals abounded for laws tailor-made to the specific characteristics of software, they lacked the pedigrees of historical validation and international acceptance.

The greatest casualty of the software battles — dubbed "softwars" — was copyright itself, and not because the judicial decisions in any way injured copyright principle (they did not) but because the debate ignited a new and still enduring skepticism about the value of copyright that was unprecedented. Any business — whether it is a producer or user of copyrights — that produces or distributes copyrighted content should attend to this new direction in the law. ■

Trademarks

Although trademark law's origins and legitimacy lie in its protection of consumers, the law has always and inescapably protected producers as well, giving them an incentive to invest in differentiating their products and brands from those of competitors. The great revolution in trademark law has been to elevate this incidental protection for producers into a full-fledged property right — much like a patent or copyright — that has only the most attenuated connection to consumer confusion, and sometimes no connection at all.

The Use Requirement

Trademark rights in the United States require trademark use, and the company that is first to use its brand in connection with goods or services in the marketplace is the company that gets to own it. The use requirement effectively penalizes first adopters who lack the resources or business motive to immediately enter all of the natural markets for their brands.

However, the use requirement also rewards predators that wait for goodwill to develop around another company's brand in one market and then trade on the brand's value by introducing it on a new product in a different market. This is possible for the predators as long as consumers are not confused as to source of the brand.

Use and Abandonment: The McDonald's Dilemma

Under the trademark doctrine of abandonment, a brand-name owner that fails to proceed promptly against a second user, even one in a distant product or service line, faces the risk that it will lose rights to its brand not only in the distant market, but also in the market where it first acquired goodwill.

McDonald's successful lawsuit against Quality Inns International's "McSleep" economy hotels illustrates the legal dimension of attempts to protect against trademark abandonment. Quality Inns made four arguments to support the use of the "Mc" prefix for its new chain, but the court rejected each one. Against Quality Inn's argument that the name "McSleep" would not confuse consumers into thinking McDonald's was operating or franchising the new chain, the court relied on survey results in which more than 20 percent of respondents gave "McDonald's" as their answer to the question, "Who or what company do you believe owns or operates the hotel called McSleep Inn?"

The court observed that McDonald's had obtained registrations for a range of uses wider than just food services — including "McStop" for interstate travel plazas and "McShuttle" for ground transportation — and had named its own headquarters hotel "McLodge." This effectively gave the company a "family" of marks under the "Mc" prefix and consequently a first claim on other such uses.

Avoiding abandonment requires more of brand owners than just monitoring uses and registrations of their marks in markets where they may someday want to use the marks themselves. Yet suing to enjoin an unauthorized use of a brand name can have adverse consequences for the company's public relations.

Trademark owners also suffer another comparative disadvantage in their dealings with unauthorized users. While a patent or copyright owner will frequently enter into a license with an infringer and thus expand its market, a trademark owner, like McDonald's in the McSleep case, will be concerned that such a license might bring its brand into the wrong market at the wrong time.

The Distinctiveness Requirement

Trademark law protects a brand only if and to the extent that the brand distinguishes, or at least is capable of distinguishing, the goods or services of one company from those of another. Yet to give one company exclusive rights in even a partially suggestive term may deprive a competitor of words that it needs to describe its own product accurately. The U.S. Trademark Act reconciles the competing interests of the two companies by barring registration for marks that, when used in connection with the applicant's goods or services, are "merely descriptive" of them, unless the mark "has become distinctive of the applicant's goods in commerce."

Distinctiveness and Genericide

The great trademark risk for a consumer brand company today is not that its chosen trademark will be insufficiently distinctive to qualify for protection. Instead, the risk is that in promoting its mark and acquiring distinctiveness, the company may also succeed in identifying the market with the class of goods generally — "Thermos," say, becoming the generic term for a vacuum-insulated bottle — thereby forfeiting any trademark rights in the term. Trademark lawyers call this "genericide."

Trademarks Without Confusion

Trademark law moves slowly, and for decades the law's use requirement, confining a brand owner's exclusive rights to the goods or services that the company actually marketed, stood as an obstacle to protection for broader-reaching corporate brands. Finally, in 1995, Congress amended the federal Trademark Act to provide a remedy for the dilution of "famous" marks.

For additional information on the McDonald's suit against Quality Inns, go to: http://my.summary.com

Where trademark law traditionally requires a brand owner to prove that a competitor's use of its mark confused consumers into purchasing the competitor's product rather than its own, the Initial Interest Confusion Doctrine today holds that it is enough for the brand owner to show that consumers were initially confused as to the source, even though their confusion was dispelled by the time they made their purchase.

Mapping Trademark Change

At the end of a century of doctrinal expansion, brand-name protection in the United States today consists of two separate but intertwined strands. One, rooted in the economics of information, seeks no more than to secure consumers' expectations about the source of goods and services. The other, aligned with the economics of public goods, seeks to protect brands for their own sake, much as patent law protects inventions and copyright law protects entertainment and information. ■

Trade Secrets

At least three contemporary forces, none of them likely to be reversed, promise to test trade secret law's boundaries over the coming years. One is the increased pace of employee mobility, not only in high-technology industries, and not only in the United States. Second, the use of licenses to profit from the scalability of intellectual assets — a long-standing practice among patent, copyright, and trademark owners — will require crisp boundary lines to replace the behaviorally blurred edges of trade secret assets if these assets are to support fluently administered licenses. Third, where trade secret law presently draws for its content on regional as well as industry norms — and in the United States, on the rules applied by the 50 states — globalization will require harmonized definitions of rights that can be easily licensed across borders.

Trade Secrets as Competitive Strategy

No case better illustrates the use of civil and criminal trade secret litigation as a harsh competitive tool than a 1995 lawsuit filed by Silicon Valley software producer Cadence Design Systems against start-up rival Avant!. In November 1995, ArcSys, which had gone public in June 1995, merged with Integrated Silicon Systems Inc. to become Avant!. Two months later, local police and FBI agents searched Avant!'s headquarters, where they seized an electronic log indicating that one of the four executives who had left Cadence in 1991 had taken with him a copy of a basic place-and-route program. Within 24 hours, Cadence filed a civil suit against Avant! alleging misappropriation of trade secrets as well as copyright infringement, unfair competition, conspiracy, breach of contract and false advertising.

The criminal case came to an end on May 22, 2001, four years after the district attorney's office first filed charges, with all of the defendants entering into plea bargains with the prosecutor, including a dismissal against one of the defendants, jail sentences for four and a prison term of up to six years for another. In addition to Avant!'s agreement to pay $27 million in fines and $190.4 million in restitution to Cadence, one executive agreed to a $2.7 million fine, but received no jail time. In return for the parties' agreement to dismiss all pending civil claims against each other, Cadence received $265 million. Adding in $47 million for settlement of a shareholder suit, Avant!'s total liability amounted to more than half a billion dollars.

The Evolving Contours of Trade Secret Law

Shorter job tenure and higher employee mobility in the United States and elsewhere will not only weaken historic norms of secrecy and bonds of loyalty, it will also increase the inclination of courts to overturn non-compete covenants that they might have tolerated in times of long-term employment. Global markets will also place new, possibly unsustainable demands on a trade secret law that depends so heavily on the peculiarities of regional norms and the relations between employers and employees.

Business method patents, which have flourished more vigorously in the United States than elsewhere, can best be understood as a legal response to frustrations over the limitations of trade secret law in supporting the exploitation of such valuable business methods as stock hedging strategies and tax-reduction techniques. Copyright, too, has moved into trade secret territory.

Secrets and Crimes

The federal Economic Espionage Act closely tracks the definition of trade secrets employed by the Uniform Trade Secrets Act, encompassing all forms of secret financial, business, scientific, technical, economic and engineering information, and imposes penalties for trade secret theft that include a fine up to $500,000 and 10 years' imprisonment for individuals, and a fine up to $5 million for organizations.

Companies are reluctant to have their secrets disclosed in civil or criminal proceedings. Although U.S. courts will issue protective orders in order to guard a company's secrets, the realities of wide-ranging discovery will often make leakage all but inevitable.

Secrecy Law and Secrecy Norms

The Uniform Trade Secrets Act defines a "trade secret" as "information, including a formula, pattern, compilation, program, device, method, technique or process, that derives independent economic value, actual or potential, from not being generally known to, and not being readily ascertainable by proper means by, other persons who can obtain economic value from its disclosure or use."

Mapping Trade Secret Change

Best practice for company trade secrets is to watch out for the breach of security norms and to act quickly when they occur. Smart trade secret practice also means paying close attention to evolving legal regimes in an attempt to exploit traditional secret information without the requirements of secrecy — for example, using patents and patent licenses to exploit business methods and practices formerly protected by trade secret law, and being alert to other legal doctrines that over the coming years will inject propertylike rights into what has long been the domain of norms and relationships. ■

Intellectual Assets on the Internet

If the defining attribute of intellectual assets is that they can be used by countless numbers of consumers across national borders and never be exhausted, then the Internet may be the first distribution technology to fully capture this unique quality. It is, of course, this unfettered use that represents the Internet's greatest challenge to intellectual assets.

Patents on the Internet

The enforcement history of U.S. Patent No. 5,960,411, for a system of "1-Click" online purchases, granted on September 28, 1999 to Amazon.com founder Jeff Bezos and a number of co-inventors, illustrates how potent an Internet patent can be as a competitive weapon. The Internet not only suffers from overbroad, low-quality patents, but also offers an unparalleled vehicle for challenging them.

Copyrights on the Internet

In 1998, Congress struck a copyright balance by insulating Internet service providers, by carving out "safe harbors" to protect the providers from monetary liability so long as they comply with prescribed conditions. One condition is that they implement a policy to terminate any users who are repeat copyright infringers. Another is prompt removal of copyrighted material as soon as the service provider received notice that it is infringing.

Few copyright owners or Internet service providers today object to the safe harbor provisions, for they have so far effectively balanced the relative needs and abilities or each to patrol and control online infringement. But if copyright owners have accepted the practical desirability of these safe harbors, they have grown increasingly concerned over the logic of the expedience they embody, a logic that could entirely transform copyright law — and, for that matter, patent and trademark law — from a property system that requires individuals to seek permission to use a particular intellectual asset, to a system that effectively casts this asset into the public domain, free for use by all, unless the asset's owner specifically requests that they be excluded.

Trademarks on the Internet

Trademark law at the end of the 20th century consisted of two strands: one studded with age-old doctrines to protect consumers against confusion as to the source of goods and services, the other advancing new doctrines to protect brand-name owners against the unauthorized use of their marks, whether or not consumers are confused.

Domain names were the first battlefield. Search devices such as metatags and keywords offer more varied opportunities for diversionary use. The next big question for brand-name companies and their competitors is whether these expansionary rules crafted for the Internet will migrate from this setting into trademark law's mainstream and contribute to the broadening of trademark law generally.

Mapping Intellectual Asset Change on the Internet

Any intellectual asset company that does business on the Internet will, over the coming years encounter two irreversible facts: The Internet has changed intellectual property law, and intellectual property law has changed the Internet. Companies need to monitor such changes not only on the Internet — the setting where they arose — but in the bricks-and-mortar world as well, for precedents established in one setting inescapably migrate to cases decided in other settings. ■

Intellectual Assets in International Markets

Even the most sophisticated companies encounter legal surprises in their foreign ventures, particularly if a company is habituated to sometimes idiosyncratic U.S. intel-

lectual property rules. Careful drafting of intellectual property licenses can inject some degree of certainty into transborder commerce. Of course, contract clauses govern only the conduct of the contracting parties, not infringers, whose conduct will instead be controlled by the law of the country where the alleged infringement occurred.

Territoriality and the Trade Economics of Intellectual Assets

A centuries-old principle — territoriality — drives not only the law, but also the economics of international protection of intellectual property. For protection abroad, American intellectual asset owners must look to the law of the country in which the asset is being exploited.

Instead of challenging the territoriality principle, a country that is a net intellectual property exporter could enter into a bilateral treaty with a net importer, obligating it to extend strong protection to foreign intellectual assets.

Multilateral Treaties

In the case of copyright, dissatisfaction with these bilateral treaties ultimately led to the adoption in 1886 of the Berne Convention for the Protection of Literary and Artistic Works, a multilateral treaty with Belgium, France, Germany and the United Kingdom, but not the United States, among the initial signatories.

The Berne Convention follows on the heels of the Paris Convention for the Protection of Industrial Property, adopted in 1883 as the multilateral convention for patents, trademarks and unfair competition, follows the principle of national treatment.

The World Trade Organization's Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPs), adopted in April 1994 as part of an agreement amending the General Agreement on Tariffs and Trade, expressly incorporates the minimum standards of the Berne and Paris conventions and adds substantial minimum standards of its own, including standards for enforcement.

Harmonizing and Diverging Tendencies in National Laws

The American tilt toward formalities and limited rights stems from the utilitarian tradition that underlies U.S. copyright law, while the inclination elsewhere toward rigorous, formality-free rights traces to the European precept that an author has a natural right to protection for the products of his mind. Indeed, Europeans commonly refer to these rights not only as copyright, but as "author's right." Doubtless the most powerful harmonizing force — and, not coincidentally, a force that is responsible for increasing levels of copyright protection worldwide — is that the community of copyright owners crosses national boundaries.

All national trademark systems follow the principle that a brand should be registered if it signifies, or has come to signify, a single source. However, where American trademark law accepts as registerable everything from the shape of a package to a handful of musical notes to a fragrance applied to sewing thread, other countries have been slow to allow newer forms of marks in their registers.

Before TRIPs, few countries enforced trade secret protection as robustly as the United States; most other nations generally relied on such broad rubrics as unfair competitive practices and the Paris Convention standards of "honest practices in industrial or commercial matters" to protect confidential information.

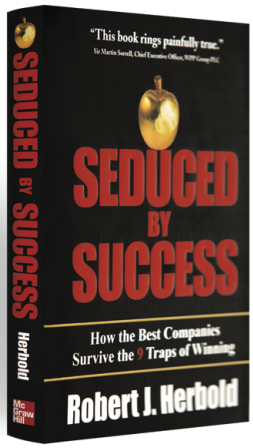
Mapping Change in the International Arena

Evolving global compliance with TRIPs standards holds out three prospects to American companies that seek to exploit their intellectual assets abroad. First, because TRIPs generally embodies the high standards of U.S., European and Japanese intellectual property laws, an American company can increasingly expect the same high level of protection abroad as it does at home.



Second, because the new standards will be not only high but roughly uniform, a company will encounter fewer legal surprises than in the past. Third, as the legal playing field between developed and developing economies levels off, intellectual property protection will disappear as a source of comparative advantage for developed countries, and companies will begin to weigh other comparative advantages when deciding where to exploit and develop their intellectual assets.

Whatever its implications may be for the American economy, this newly "flat" world offers significant investment opportunities for American and other intellectual asset companies, not only in recently developed economies like that of Singapore — which has become an important world center for stem cell research — but also in developing economies like China's. ■

How the Best Companies Survive the 9 Traps of Winning

SEDUCED BY SUCCESS

THE SUMMARY IN BRIEF

Don't let success put your company on the road to ruin. When leaders of organizations experience meaningful levels of success or periods of stability, they tend to believe that they are entitled to continued success into the future. In many cases, managers become complacent, comfortable and mediocre, when in fact they should be building on all the things they have done well in the past.

It is important to realize that people and businesses fall into this success trap. It happens to entire companies and departments, to small groups within organizations and to individuals. All are susceptible to the perils of success.

Robert Herbold wrote *Seduced by Success* in an effort to help individuals and organizations become successful and *stay successful*. This summary will show you how to look past your current success or stability and constantly probe for new and better ideas and ways to do things. Herbold shows companies how to avoid the nine traps of success — the legacy practices that almost felled giants such as General Motors, IBM and Apple.

The issue of how to put past successes in perspective is also addressed, showing readers that they should not rely too heavily on what worked yesterday or what's working today. It's too easy to be trapped in the exhilaration of the present and to believe you've found the true and everlasting formula for sustained success.

IN THIS SUMMARY, YOU WILL LEARN:

- How GM's success gradually led to its downfall.
- What steps DaimlerChrysler took to become a manufacturer of unique automobiles.
- How a focus on details and execution helps organizations avoid the trap of boredom.
- How Southwest Airlines rose to the top of one of the toughest industries.
- Which three guidelines are necessary to clearly communicate expectations.
- How Apple managed to make a comeback with iTunes and the iPod.

Success Is a Serious Business Vulnerability

The vulnerabilities resulting from success can bring down individuals and organizations of all sizes. For example, look at what has happened to General Motors, or GM, a 98-year-old company that took the leadership of the automobile business away from Ford in the 1920s. In the 1950s it became the largest employer in the free world and the first firm to make $1 billion in a year. In the mid-1970s, GM had almost a 50 percent market share in the United States, as well as the best-selling model in America, the Oldsmobile Cutlass.

However, for the next 30 years, it was downhill for GM. By early 2006, its financial problems were staggering. It had lost $8.6 billion in the prior year, and its market value was down to $11 billion. How could such an incredibly successful company experience a three-decade-long decline?

For 30 years, GM watched Japanese car companies come to America and build nonunion plants that turned out distinctive-looking cars with world-class quality and industry-leading efficiencies. The car manufacturer never came to grips with the enormous constraints that were put on the company by its rigid legacy practices. Besides having models described as "too timid to excite consumers," the company's inaction on the labor front was killing it.

By 2005, it had almost 700,000 retirees and their dependents who relied on GM for pensions and health care; spending on this came to roughly $2,200 for every vehicle that GM built and was the key reason that the company lost $1,227 on each vehicle it sold in North America. Year after year, GM went blindly along, producing unexciting cars and signing union contracts that were clearly economic suicide in the long run. It had been clearly captured by its legacy practices.

Why Does This Happen?

When you step back from all this General Motors history, it is absolutely shocking to see America's premier corporation of the 1970s spiral downward for three straight decades. What's ironic is that the former head of GM, Alfred P. Sloan, is famous for saying, "Any rigidity by an automobile manufacturer, no matter how large or well established, is severely penalized in the market." Sloan was actually referring to Henry Ford, who in the 1920s refused to change his business model to build different cars that would suit different tastes in America. Little did Sloan know that the comment would be applicable to GM decades later.

The story of GM is a classic lesson of how companies can be captured by legacy practices from periods of success, causing very serious problems. There are three destructive behaviors that are created and nurtured by success. They are the following:

1. Lack of urgency. Success seems to lead to the avoidance of any kind of stress in favor of basking in the glory of prior times. Individuals, companies, government agencies, nonprofits and education groups are all vulnerable to this behavior.

2. Protective and proud. Success and stability seem to breed a loss of curiosity and a defensive attitude toward any kind of new thinking that would suggest that what is currently being done might not be the best approach. This is sometimes called the "not invented here" problem.

3. Entitlement mentality. Once you achieve some degree of success or stability, the world does not owe you lifelong success. Many individuals and organizations are so impressed with themselves and their achievements that they can no longer imagine a world where they are in decline. ■

Trap No. 1: Neglect

Neglect is sticking with yesterday's business model. It's been seen time and again. Individuals and organizations experience the euphoria of winning. But seldom do these same talented people and organizations step back, review all the elements of their business model and confront the question of whether or not they are improving.

When you consider how businesses in a particular industry operate, the thing that is so striking is the wealth of opportunities that exist to dive into a particular area and create unique advantages over the competition. We've seen such companies emerge as unusually successful because of a unique logistics approach or a superior customer services model or by adding significant new capabilities to the products and services that had been defined narrowly in a particular industry. What's important is to be constantly challenging your organization to imagine a different world from the one you are dealing with today. And you must really probe your potential to create real advantages.

Face Reality, Then Tackle Your Vulnerabilities

One of the most important things an individual can do is to develop a mindset that constantly assumes that things can be improved and aggressively pursue alternatives. Here are some steps to follow to figure out where things stand:

• **Review all aspects of your business model.** This is the kind of exercise that typically never happens. People get so busy executing day-to-day activities that they rarely step back and look at the big picture.

• **Be objective.** This is the hard part. People who have experienced success and are experts in their legacy practices see things through biased eyes.

Turning IBM Around

In the early 1990s, IBM was an example of a previously successful company whose top managers were not realistic. They were clinging to the ways in which IBM had operated for years, and they could not imagine any viable alternatives. Then Lou Gerstner became CEO in 1993. Gerstner ran into some incredibly entrenched legacy practices — the first thing that infuriated him was the company's process of strategic decision making, which consisted of groups within IBM forwarding proposals to the Management Committee. The committee was made up of six members who met once or twice a week and held lengthy and formal meetings.

The second thing that bothered Gerstner about IBM was its complex financial management process. It was extremely difficult to pull together consolidated financial statements for all of IBM, making it hard to find out the status of projects. The final problem that Gerstner uncovered in the company's business model was how confusing IBM was from a customer perspective. Customers were disappointed by IBM's lack of responsiveness, undoubtedly because of its organizational complexity.

Given these problems, Gerstner had to make some very fundamental changes in the company. Within six months of his arrival, he announced to all employees that their new role would be to solve the customer's information technology-related business needs. His vision was to transform IBM from a computer company into a much broader technology and services company. Facing reality and fighting the urge to stick with your old business model can be difficult, but with great leadership, as in the case of IBM and Gerstner, it can be done. ■

Trap No. 2: Pride

Pride is the trap that allows your products to become outdated. Great products are all about unique, distinctive capabilities that are constantly updated and kept fresh. Unfortunately, there are plenty of examples of successful products that have been left alone and allowed to drift into mediocrity because their companies became frozen in the practices they believed were the secret to their success.

Uniqueness: An Absolute Essential

Back in 1996, Chrysler was at the top of its game. It had achieved that status by bringing out some very distinctive and successful automobile lines. It invented the minivan and took Jeep and generated a new version of the Grand Cherokee, which basically created the sport utility vehicle. At the time, these vehicles were unusual and unique automobiles. Chrysler was also riding on the success of some of its other vehicles, but the 1998 merger with Daimler-Benz would prove difficult. The next three years were very tough for Chrysler as part of DaimlerChrysler AG. After several years of strong car and truck sales, demand for the company's high-margin minivans and SUVs was cooling off, primarily because the competition was catching up.

During this period, Chrysler hired large numbers of people. All of the excess, coupled with the absence of distinctive new vehicles, led to financial trauma. When Dieter Zetsche took over as CEO, he found a lot of complicated financial projections but no thorough analysis of the company's strengths and weaknesses. He

Chrysler's Comeback Car

Zetsche's comeback plan began to take hold in the spring of 2004, with the introduction of the Chrysler 300 sedan. Its hulking look, small side windows and massive egg-crate grille caused *Car and Driver* magazine to describe it as: "This mobster in a pin-stripe may just save the franchise." It was named *Motor Trend*'s Car of the Year.

The secret to Chrysler's turnaround, driven by CEO Zetsche, was summarized well in the *Wall Street Journal* when it said, "Mr. Zetsche pushed engineers working on new cars to give each model features customers can't get elsewhere, additions for which they might pay extra."

quickly moved into action, cutting 20 percent of the work force and reducing the cost of parts by 15 percent. Zetsche also took it upon himself to get the excitement back into Chrysler's vehicles. ■

Trap No. 3: Boredom

Clinging to your once-successful branding after it becomes stale and boring is a dangerous hole to fall into. American fast-food giant McDonald's fell into this trap in 2002 as customers complained about slow service, rude employees and cardboard-tasting food. Because the food chain had become so accustomed to being on top, it had let all the elements of its marketing slide into disarray: ineffective strategy/theme, lack of acknowledgment of current trends and poor execution at the store level.

The business world is full of examples like this: once-exciting brands that became dull, old and stale. This often happens because less focus is placed on the brand once it is successful. The folks running those brands assume that they have found the magic formula and now it's time to sit back and reap the benefits.

Be Clear and Concise

It is startling to see how many products in the marketplace are struggling as a result of a severe case of lack of identity. A great example of understanding distinctiveness and freshness is Harley-Davidson. In 1985, the company was in trouble. Its motorcycles were of poor quality, but the most severe problem was constant oil leaks in the bikes.

Fortunately, Jeff Bleustein stepped in as the engineering vice president during this decline and finally conquered the quality issues. From that point on, Harley-Davidson became an incredible success story, primarily because of fantastic branding — it essentially built a motorcycle cult. It tackled the building of this brand from many angles, but the core element in all its products and marketing was the distinctive Harley attitude of individualism, freedom and rebellion.

Focus Relentlessly on Details and Execution

Starbucks is an excellent example of superb brand execution. The company has a very clear picture of what it wants to be in the consumer's mind, and it works endlessly to have every aspect of the consumer experience line up with that objective.

So how do Howard Schultz and his team keep that consistent Starbucks experience while constantly refreshing the product line? Their success comes from the way the company connects with customers, communities and each other. As Schultz has said, Starbucks is not in the coffee business serving people, it's in the people business serving coffee. A typical customer stops by his or her favorite Starbucks an average of 18 times a month. No American retailer has a higher frequency of visits. Starbucks exemplifies the essence of keeping the core of a brand strong. ■

Trap No. 4: Complexity

As successful organizations grow, they often fall into the trap of hiring too many people, which makes the organization more complicated. Organizations then reorganize into smaller groups to get as much clarity as possible, but this often leads to unproductive fragmentation of processes that should be carried out organizationwide.

Don't Wait for the Crisis

Why is it so hard to constantly push for improvement in the processes that help run the organization? The reason is that change is very hard for individuals to accept. The price you pay for waiting and allowing that process to become out of date can be enormous. Eventually, you end up in crisis mode, trying to fix things just to catch up, without any notion of actually trying to get ahead of your competition. In addition, by tackling these things when they are running fairly well, you have more of an opportunity to experiment with different approaches, since you are not under the gun to fix the problem now.

Schneider National is a trucking company that serves customers such as Wal-Mart and Lowe's. During the 1980s and 1990s, when Schneider was growing quickly, its services were in high demand because the trucking

(continued on page 5)

Trap No. 4: Complexity

(continued from page 4)

industry wasn't very well-developed. However, in 2000, the company's growth began to sag due to the increased overcapacity in the industry and the slowing economy.

In order to deal with this impending crisis, Schneider National put some operational principles in place to ensure that this didn't happen again. Here are the six steps Schneider took to put a set of procedures in place on an ongoing basis:

1. Process focus. Schneider developed an enterprise model that described how the business works. It then dissected that model into its component processes and committed itself to constantly perfecting each one.

2. Process owners. Each of the processes outlined in the enterprise process model was assigned a particular process owner, who was a senior executive empowered to make whatever changes were needed to keep that process superior to the competition.

3. Managerial engagement. The management of an organization has to provide strong leadership by setting an expectation that things will constantly be improving.

4. Full-time design teams. When potential improvements in a process are spotted, people need to be assigned to the task of achieving those improvements, and they need to be working on them full time.

5. Building buy-in. The design team needs to get people's ideas and work to enroll people in the cause to make significant improvement.

6. Bias for action. Both the design team and the process owner need to operate with the mindset that says that 80 percent is good enough. At Schneider, the design team adopted a principle of "70 percent and go." This means that when the team developed an improvement, even though it hadn't achieved perfection, it implemented what it had and modified it on the fly.

The six steps should enable an organization to avoid crisis, but a strong focus on continually achieving simplicity, efficiency and standards is required. ■

Trap No. 5: Bloat

Successful organizations that were once agile typically tend to reward themselves with more manpower. These additional employees tend to make the business more fragmented, which complicates and slows down decision making. It also leads to slow reaction times when there are changes in the marketplace and to a defensive attitude.

Assign Top Talent to the Tough Issues

Volumes have been written on the importance of getting the right people in the right jobs. Different organizations go about this in a myriad of ways, but once these people are on board, you need to get them excited about what they can achieve, and then delegate responsibilities to them and see what they can do.

At Microsoft, they tend to look for individuals who have a passion for the computer industry and, most important, are super-intelligent. The company trains its current employees to interview candidates for passion and intelligence, seeking people from top schools and other companies. Microsoft's emphasis is on IQ, and recruiters are taught a variety of questions to use in probing for the desired intelligence and problem-solving skills.

For example, a candidate might be asked to estimate the number of gas stations in the United States. What's important is to see what kind of steps this candidate will come up with on the spot to make a reasonable estimate. The recruiter isn't after a "correct" answer; he or she is interested in the speed and creativity with which the candidate could put together a reasonable process for making a logical estimate. One of Microsoft's core competencies is recruiting top talent. The company recruits for incredible enthusiasm and raw intelligence, which has largely helped its successes over the years. ■

Trap No. 6: Mediocrity

Many organizations fall into the trap of sloppy personnel management. This is dangerous, since people are your most important asset. These companies treat all their employees well, but they also treat all their employees the same.

While many companies take pride in this approach, the problem is that the superstars don't get challenged to their full potential and the poor performers don't get confronted. Typically the performance appraisal system atrophies to the point where it is nearly nonexistent. The organization evolves from a meritocracy to one that is attempting to create a team spirit centered on a successful past.

There are four steps that you need to take to revitalize your talent pool and to create that lean, mean fighting machine. These steps seem to come right out of a human resources textbook, but it's shocking how seldom they are done well.

1. Institute a performance appraisal process that is actually used for each and every employee at least

(continued on page 6)

Trap No. 6: Mediocrity

(continued from page 5)

annually. Make sure that there are checks and balances to ensure that everyone gets a high-quality appraisal and that the ratings for people are adequately spread out. Roughly 10 percent of your people should be classified as excellent, and there should be 10 percent who are clearly classified as doing unsatisfactory work. The middle 80 percent need to be managed according to how they are doing.

2. Compensation plans as well as emotional rewards need to vary significantly by performance rating. Your strong performers should get significant rewards, and your poor performers should get virtually nothing.

3. Get rid of deadwood. You need to deal with those weak performers. Everyone in the organization knows who they are and is watching how you are going to deal with them. If you put up a weak performance, it sends a signal that people really don't have to work hard to do just fine.

4. Fast track your superstars and rotate your average performers. Leaving people in a job too long is bad. The superstars need to be stretched, and the average performers will become the protectors of the legacy practices they are familiar with. This hurts the organization, and even more dangerous, the organization begins to believe that those individuals are critical and must be left in their current jobs because they represent a scarce resource that has deep accumulated knowledge.

Organizations need to be anxious to take on the next challenge. Even if a business is in the midst of a raging success, it needs to create an atmosphere that clearly states that it is after the next level of excellence. ■

Trap No. 7: Lethargy

Success can often cause businesses to become lulled into a culture of comfort, casualness and confidence, where negative characteristics are consensus-oriented decision making, ambiguity and a lack of aggressive behavior in general. This leads to the following four traits, which can cause things to get worse.

1. Your company always adds projects and never eliminates any. This kind of behavior comes about because the view is that this is a successful company, and successful companies dabble in a lot of projects. Nonetheless, you need a process for regularly inspecting the list of things happening in a group and cutting out the marginal things or those that have dragged on too long and never contributed to the business.

Clarity, Simplicity and Repetition

In order to fight the trap of lethargy in an organization, the following three guidelines should be followed in order to ensure success:

- **Everyone should describe the culture in the same clear way.** If employees hear confusing messages from various leaders or if they notice that some of their leaders' behaviors don't match company values, the culture will weaken and fragment quickly.
- **The message should be simple.** Everyone in the organization should be able to immediately state the organization's key values.
- **The values need to be repeated.** There is no substitute for employees hearing management refer to the values on a regular basis and observing behavior that is consistent with those values.

2. Your company hires excessively. Often the thinking is: If we are successful, we need more people so that we can do even better in the future. Headcount needs to be carefully managed, and new ideas should be staffed by killing old, stale projects.

3. Your company lacks intensity about the competition. Your company culture needs intensity, focused on the fact that business momentum is always created by distinctiveness and uniqueness that has an appeal to customers. You should always be rallying the troops around your latest distinctive product to continually create excitement.

4. Your company fears change. Managers need to be constantly reorganizing employees around big opportunities — this helps create an agile and aggressive culture.

Southwest Airlines

In 34 years, Southwest has grown to be a company with about 35,000 employees, its plane fly to more than 60 cities and it has a fleet of almost 400 Boeing 737s. The first three years after 9/11 were brutal for the airline industry. During that period, the major carriers laid off thousands of people and collectively lost $22 billion. However, Southwest did not lay off a single employee during that three-year period, and it remained profitable each quarter. In May 2004, Southwest became the leader in the number of domestic customers it carried per year, surpassing all other airlines in the United States.

There's no doubt that Southwest wins the clarity, simplicity and repetition award in keeping its values and its culture absolutely constant. Keeping with these guide-

(continued on page 7)

Trap No. 7: Lethargy

(continued from page 6)

lines is at the heart of the company, and it's amazing how much success it has generated in one of the toughest industries. ■

Trap No. 8: Timidity

Organizations tend to fragment into fiefdoms. Management falls into the trap of ignoring the typical buildup of divisive turf wars and infighting. This can occur at many different levels. It can involve warring individuals within a group or a department, or it can involve warring groups. In the worst case, the whole organization, with its various divisions, groups and individuals, is working to protect various turfs.

Once you have information about where the silo and fiefdom problems are, the tough part is doing something about them. That requires nerves of steel and strong leadership skills. However, the situation has to be confronted. There are two tools for breaking up fiefdoms:

1. Place strong performers from outside the fiefdom in key jobs within the fiefdom. This will not only provide some fresh new direction, but signal that "the party is over."

2. Dismantle the fiefdoms by reorganizing. This forces people to get back to basics and realize that changes are what will be required.

Assemble a Team You Believe In

Too often in business, we think that certain people have deep expertise and experience and we are afraid to move them out. This is usually a gigantic mistake. Naturally there are exceptions to this rule, but even in those cases, beware.

The automobile business provides a rich example. In the 1950s and 1960s, Porsche established itself as the thoroughbred luxury sports car brand. Starting in the early 1970s, however, it had a very difficult time, and by the early 1990s, Porsche was a company in deep distress. It had an antiquated, legacy production system that was very inefficient, and it had experienced two decades of failure to broaden the appeal of its product line.

One of the first steps that the company took was to create a fresh leadership team. In 1993, the Porsche board of directors set out to assemble a new executive team. It named Wendeline Wiedeking as the new CEO. One of Wiedeking's primary strengths was his ability to make principled but unpopular decisions.

Next, Porsche tackled its poor-performing legacy manufacturing process. It took three years to generate significant improvement, but by 1997, Porsche workers took only 45 hours to build a 911 model vehicles, compared with 120 hours in 1991.

Once production problems were dealt with, management turned its attention to modernizing the product line. It updated the 911 model to make it more luxurious. In addition, Porsche created a mid-engine roadster, the Boxster. This was a smaller, less expensive version of the 911, with a very sporty look and great performance. By 2003, the Boxster accounted for 40 percent of Porsche's unit sales worldwide and 50 percent of its sales in the United States, Porsche's largest market.

By the end of 2004, the automobile manufacturer was in high gear. The 911 model was as healthy as ever, the Boxster was a raging success and so was the Cayenne SUV. Looking back to 1993, this is a clear example of the value of getting new talent and letting these people build a unified team to achieve great things. ■

Trap No. 9: Confusion

Many leaders of successful organizations fall into the trap of confusion and schizophrenic communications. They will describe a direction one day, then change their position the next day; or they will say one thing, but their actions won't support it.

These kinds of communication issues happen at all levels of the organization. The problem can be a first-level group manager who constantly confuses his six direct reports about the direction of their efforts. The reason is that he has not internalized the need to change anything. It can be a division vice president who doesn't have a clear direction for the people of his organization, even though the problems are mounting, a competitor is thriving or an opportunity is being mismanaged.

Wal-Mart's Communication Process

Back in the early days of Wal-Mart, Sam Walton personally designed a process that was used every week to continually collect information on the company and its competitors. It was done to find out what was and wasn't working, as a basis for modifying plans accordingly. After all, Walton would point out, the customers and employees in the stores know best what it will take to keep Wal-Mart on top. The whole communications process was focused on tackling missed opportunities promptly and getting them fixed within days. The repetition of this process week after week sent a clear signal that store execution was absolutely king at Wal-Mart.

(continued on page 8)

Trap No. 9: Confusion

(continued from page 7)

Make Expectations Clear

When driving change, the leader needs to describe specifically what the goal is and how progress will be judged. Here are three guidelines that will help in the communication of clear expectations.

• **Simplicity.** You need to tell employees what you are asking for and why you are asking for it. Your message needs to be succinct, understandable and sensible.

• **Standardized measures.** It's ideal if you can develop an exhibit or two showing the data or charts that you are using to determine whether you've achieved the goal or not.

• **Continual inspection.** People need to know that management cares and that it is using specific measures to determine whether success is being achieved.

Employees get very confused and nervous when a leader is ambiguous and confusing about what the group is trying to achieve. It touches off debates and defensive attitudes as the confusing messages accumulate.

It sounds very simple to always have in front of employees a description of the desired outcome, the current status of things and clear expectations of what should take place in the immediate and long-term futures. However, this can often be harder than you think, but it has big payoffs in achieving and sustaining success. ■

The Key to Continual Success

A key lesson is that no matter what the history of an organization is, once a degree of success is achieved, it breeds a culture of a lack of urgency, complacency, excessive pride and a protective attitude toward the way things have been done in the past. Success also encourages an entitlement mentality that assumes since you've done well in the past, that will always be the case.

The humbling part of business is that just as soon as you have achieved some degree of success, word gets out. Your competitors are observing you, and they are hungry and anxious. They are plotting aggressively to move ahead of where you are.

However, there are two guidelines that are exceptionally important once you reach the point of success and stability. Practice them at all times.

1. When you are a winner, be as aggressive as you were when you were lagging behind. Remember the high sense of urgency when the competition was ahead of you and you were hustling with the bright idea that you believed you could put your company out in front. In any organization, that same degree of urgency needs to exist at all times.

2. Develop a culture that constantly questions all practices at all times. You need to become a student of your areas of responsibility and the areas around you. You also should constantly be probing for new and better ways to do things, while continuing to execute your current responsibility with excellence.

Resting on Your Laurels Is Never an Option

There is one company whose ups and downs over the years provide a great example of an organization that has lost momentum because of all the success-induced traps previously discussed. That company is Apple.

In the early 1980s, Apple was truly on top of the new and exciting personal computer industry. Steve Jobs, Apple's cofounder, was heaped with lavish praise. But by 1983, Apple's business was softening and Jobs took the very unusual step of hiring someone from outside of the computer industry to join the company. He chose John Sculley, former president of Pepsi-Cola USA, the beverage subsidiary of PepsiCo. Sculley got off to a slow start, and it was clear that Jobs and Sculley were having difficulty figuring who should do what — the classic case of two people trying to do one job.

More than 20 years later, in March 2006, Apple sold its billionth song from its iTunes Store. Stepping back, the difference between Steve Jobs' behavior in the mid-1980s and his incredible energy and innovation in the late 1990s and early 2000s is amazing. In the early 1980s, Apple and Jobs were flying high, and then they tanked because Sculley and Jobs did not rally around a focused plan and because of Jobs' proud and protective attitude toward the Macintosh.

Apple's volatile history is an extremely rich reminder of the need to constantly be vigilant in your efforts to improve. You must remember, no matter how many times you have been up or down, watch out for the wicked traps that success creates. ■

How Old-Fashioned Values Drive a Twenty-First-Century Corporation: Lessons from Lincoln Electric's Unique Guaranteed Employment Program

by Frank Koller

THE SUMMARY IN BRIEF

The Cleveland-based arc welder manufacturer Lincoln Electric has survived two World Wars, the Great Depression, globalization, the decline of industrial America and the recent credit crash — and yielded impressive profits throughout.

In *Spark*, journalist Frank Koller investigates Lincoln Electric's inner workings and reveals surprising lessons about what happens when managers view their employees as valued assets rather than costs.

Lincoln Electric operates on a solid foundation of loyalty, trust, flexibility and a fair reward for a job well done. At Lincoln, any of the 3,300 employees can approach the CEO with a problem — or an idea. There are no designated parking spots; everyone enters and exits through the same front doors and eats in the same cafeteria. Any employee with more than three years of tenure, and who meets the firm's performance benchmarks, is part of Lincoln's "Guaranteed Continuous Employment" policy, a promise that the company will do everything it can to avoid layoffs.

Lincoln Electric draws strength from its most valuable resource: its employees. And the employees know that as long as they work hard for Lincoln Electric, their employer will work hard for them.

IN THIS SUMMARY, YOU WILL LEARN:

- How to succeed by treating employees the right way.
- How more equitable practices can rebuild trust in management.
- How compensation can grow in tandem with productivity and profits.
- How unusual policies can add value to your people, customers and society.

Preface

Lincoln Electric was founded in Cleveland in 1895, at a time when the city was one of the most important industrial centers in the United States. But starting at the end of World War II, Cleveland's big manufacturing companies deserted this quintessential Rust Belt hub in a steady stream. Yet, Lincoln Electric stayed put, expanding its footprint in the community year after year by buying up the neighboring deserted properties of those who fled, as well as investing heavily in a new research center for robotic welding and expanding operations abroad.

At the end of 2008, none of the 3,300 American employees preparing to listen to the annual bonus announcement had any illusions that their company was immune from the economic chaos affecting the global economy. The global welding market was in trouble just like virtually every other part of the economy. But unlike millions of other American workers, those at Lincoln Electric could look back over their company's long history for reassurance that they could survive the hard times ahead. Two indisputable facts provided comfort. First, for more than 60 years, no permanent employee of the Lincoln Electric Co. in Cleveland who meets the firm's performance standards had ever been laid off due to lack of work. It's a promise, a company policy enshrined in the *Employee's Handbook*. Second, for 74 uninterrupted years starting in 1934, the company had paid out a profit-sharing bonus just before Christmas. Based on an annual merit-rating program, the bonus had almost always exceeded 60 percent of an employee's basic earnings. In a number of those years, it had exceeded 100 percent.

John Stropki

When John Stropki, the chairman, president and CEO of the company, took the stage at 3 p.m., the cafeteria was completely packed. Toward the end of the 30-minute presentation in which he reviewed the year just ending and then looked ahead to 2009, Stropki said, "No one is certain as to how long the current recession will last or how severe it will be. In anticipation of a long, deep recession, we will continue to look for ways to reduce our overall costs and do it in a way that protects our long-term financial viability and preserves our long-standing and very successful Guaranteed Employment Policy."

Then, before every employee in the cafeteria — and across the United States — was handed a personalized white envelope, Stropki announced that the check inside represented roughly 61 percent of each employee's base earnings: The average bonus being handed out was $28,873. Furthermore, no permanent Lincoln Electric employees in the United States were laid off for economic reasons in 2008.

Good Business

The day before the 2008 bonus was announced, Stropki was asked why his firm had stuck for so long with a promise to place the interests of its employees on par with those of its customers and its shareholders.

"I don't think of this as a social responsibility," Stropki answered. "I think my philosophy and that of my predecessors is that we can perform in an economically challenging environment, and we can spread that pain in a way that long term will better represent our shareholders' interests without crucifying our employee base, and

we think it is good business, not bad business, to do that."

For nearly a century, through thick and thin, Stropki, his predecessors and the company's employees have been able to sustain their unusual and beneficial relationship. The company's perennially robust profit margins (driven by consistently innovative technology), the dramatically heightened job security and quality of life enjoyed by its employees and the benefits that accrue to the local Cleveland economy should give the rest of the American business world pause.

The Lincoln Brothers

John C. Lincoln

In the summer of 1895, John C. Lincoln, a 29-year-old family man with a wife and two young children, was laid off from his job at a small Cleveland, Ohio, manufacturing company that made electric motors.

Rather than scramble to take the first job he could find by working for somebody else, John decided to gamble by striking out on his own: He opened up the Lincoln Electric Co., a business dedicated to designing and manufacturing electric motors.

Like any small-scale entrepreneur, John did everything and anything to grow his new business. He designed small custom-order electric motors, wrote and sold an instruction manual on the principles of electricity and even began experimenting with electric automobiles.

Well before World War I began in 1914, the electric car in the United States was already losing its battle against the gasoline engine. But as the electric automobile market withered away, John realized he was still holding a winning hand in a promising new field: The powerful electrical current produced by his motor-generator unit could do much more than charge a car battery — it could also create an arc of electricity hot enough to melt steel.

James F. Lincoln

John's growing company, which, by 1907, had more than 30 paid employees, clearly needed a firm hand in the front office. John found the answer to his dilemma in his younger brother, James, who had agreed to join the company after dropping out of engineering at Ohio State. Almost instantly, it became clear to both men that James was much better suited to the day-to-day challenges of the business world.

Within two years, they had designed, built and sold their first welding machine, a behemoth that weighed more than 1,500 pounds. Over the next few years, John was granted several groundbreaking patents that ensured Lincoln Electric's early technological lead in the new industry.

In 1914, he appointed James, then 31, as general manager. The younger Lincoln brother was a natural in the business world, an inspiring and charismatic leader who, from the start, was determined to earn the loyalty of every employee. Under James' leadership, Lincoln Electric commenced its steady ascent over the next few decades to its prominent position in the global welding industry.

A Four-Part Management System

James Lincoln recalled the challenge he faced when he took over the day-to-day management of Lincoln Electric: "I knew that if I could get the people in the company to want the company to succeed as badly as I did, there would be no problems we could not solve together."

Within a few years of taking the helm of Lincoln Electric, James had introduced three of the four major components of the management system that has proved enduringly successful:

1. **A company-wide "open-door" policy of internal communications.**
2. **The use of piece rates to pay workers in the factory.**
3. **An annual merit-based bonus system.**
4. **The promise of guaranteed employment.**

The fourth took longer to become reality, but was part of his plan from the early days.

At his core, James believed every company had to earn the right to expect hard work from its employees, but at the same time he was absolutely convinced that no employer could expect to motivate its employees to work hard just by paying money. He would argue, passionately, that first and foremost employees wanted to be respected as human beings who were engaged in a process of creating a worthwhile product.

Once employees came to believe that they were truly valued as individuals — in other words, that respect was the everyday currency of the workplace — James was convinced working hard would become the norm, not a rarity. Respect also required employees to shoulder a sense of responsibility for the well-being of each employee in the firm, particularly to allay what James believed was the worst fear of every working man: "He has learned from bitter experience [that] when business was slack, he was tossed out on the street, often with no

more thought for his future than was given to any other worthless scrap." ●

The Merit-Based Bonus

The dollar amount of Lincoln's annual bonus — an average of $28,873 in 2008 — has been an object of amazement and a subject for controversy from the day it was first paid out in 1934. Over the decades, the bonus has ranged from more than 120 percent of base pay to (exceedingly rare) as low as 25 percent; since 1955, it has averaged 77 percent.

Given that the company has paid its annual bonus for 75 years without interruption, Lincoln employees have become accustomed to receiving a large financial reward for working hard, although most try hard to guard against becoming complacent about it. Yet while the amazingly large dollar value of the publicly announced average bonus receives the bulk of attention outside the company, the merit rating is what drives intense interest inside the firm, because it is the merit rating that determines whether each individual employee receives a larger, or smaller, bonus than the average.

How the Merit Rating Works

A small example: In 2008, an *average* Lincoln employee (one who earned 100 merit points) received a bonus worth 61 percent of his or her base wage. For someone on the assembly line, a welding-lab technician or a junior engineer earning $50,000 in basic wages last year, that meant a bonus of $30,500, for a total pay of $80,500. An employee who earned the same $50,000 in base wages but received a higher merit rating of 120 points (perhaps because he or she was rated as more of a team player in the factory) would see his or her bonus increased by a further 20 percent: The bonus would be worth $36,600, resulting in total pay of almost $87,000. In similar fashion, a merit rating of just 80 points would result in lower overall earnings of just $74,000.

The merit rating also identifies employees who are failing to meet the company's demanding performance standards. Persistent merit ratings below 80 lead, first of all, to discussions between management and an employee about his or her future with Lincoln Electric and, ultimately, may be used in an evaluation process leading to dismissal.

In the early days of the bonus, Lincoln Electric was small enough and James was confident enough about his managerial judgment that he personally reviewed and compared the performance of every worker in the company. But after World War II, merit rating evolved into a much more sophisticated process. Yet, as with so much at Lincoln, the merit-rating system of 2008 is remarkably similar to that in place a half-century ago.

Performance Attributes Ratings

Several times during a year, every employee on piecework is rated by his or her supervisors on five different performance attributes, each measured on a 20-point scale: overall *productivity;* overall *quality* of the work performed; the extent to which the worker demonstrates *adaptability* and *flexibility* on the job; his or her *dependability* and sense of *teamwork;* and, finally, the employee's awareness and compliance with the company's *environmental, health and safety* priorities. An employee can be awarded more than 20 points on a particular scale for clearly superior performance, but only if someone else in the same work group being evaluated by that supervisor receives less. In other words, there is a limited number of points to be distributed among any group of workers.

Lincoln Electric's hourly and salaried employees are rated on a slightly different set of metrics. Obviously, the *quantity* or *quality* of work performed by a factory worker winding transformer coils is easier to measure than the work performed by a design engineer or an accounting technician. The "Performance Development System" used for these employees draws on a more modern management lexicon of *goals* and *core competencies,* designed to measure and rank attributes such as decision-making ability and judgment, customer focus and innovation. In the end, however, the overall evaluation structure and its financial implications for individuals are similar for every employee in the company. ●

Understanding What the End Game Is All About

As director of manufacturing for Lincoln Electric, Lee Seufer is responsible for overseeing production of the machines that have kept the company at the forefront of the global welding industry for more than 75 years. After nearly three decades, exercising caution and care with employees is as much a part of Seufer's job as it is to ensure the quality of the company's latest welding machines.

Seufer said, "I know we always have lots of good work under this roof for people to do, and my goal is always to take people and put them working on something more interesting that we can't mechanize." And in tough times? "We are not going to lay you off because things are slow, and you are not going to lose your job!"

But there is one absolute prerequisite for employees looking to benefit from Lincoln Electric's guaranteed

employment program, stresses Seufer: "The guaranteed employment promise depends on everyone — from management to the employees — understanding what the end game is all about."

Lincoln's End Game

The "end game" is to ensure the continuous profitability of a technologically savvy manufacturing firm in an exceedingly competitive global marketplace. That was John's goal in 1895, James' goal when he took over in 1914 and it has remained the goal of every CEO ever since. It is also the game plan for every other private business in the country. But what sets Lincoln Electric apart is that the company has shown that it can achieve its goals while demonstrating a degree of respect for its workers that is exceedingly rare in the United States.

James Lincoln always said that only the firm's satisfied customers, not its management, could really guarantee employment for its workers. But during the 1950s, once the idea of formalizing the guarantee had been raised at an Advisory Board meeting and James had agreed to make it a priority, senior executives began to analyze how a formal promise could survive the regular ups and downs of normal business cycles. (By that point in the company's history, there had apparently been no layoffs for several decades, which must have been encouraging for everyone involved.)

Two recessions, in 1954 and again in 1957, tested management's evolving strategies to keep people at work without threatening long-term growth. Gradually, James grew confident that a no-layoff policy could work, and in 1958, the board voted to adopt the Guaranteed Continuous Employment Plan. It remains in place, essentially unchanged, to this day.

Guaranteed employment, as people inside the company call it, is not about jobs for life. It is a contract that describes, in precise detail, the obligations of workers and management on a day-to-day basis and the penalties that ensue when the obligations aren't met. New employees are introduced to the policy as soon as they are hired, and everyone understands the terms of the plan and what it means for them.

From its earliest days, Lincoln Electric has always relied on the flexibility of its workforce — in pay, hours and assignments — to act as a buffer against the unpredictable ups and downs of the business cycle. Being thinly staffed is almost a corporate virtue, said Gretchen Farrell, vice president of human relations, and essential to maintain the commitment to guaranteed employment.

Lincoln Electric's Guaranteed Continuous Employment

- It is seen as a competitive advantage for the company.
- It provides covered workers with security against layoffs due to lack of work when the economy slows down.
- The plan covers permanent employees in Cleveland (95 percent of the company's U.S. workforce) who have completed three years of service.
- Employees are guaranteed at least 30 hours of work per week.
- Employees are required to work overtime whenever scheduled.
- Workers are not guaranteed a particular job or rate of pay.
- Every employee must be willing to accept transfer from one job to another.
- The plan only covers workers who uphold Lincoln Electric's well-defined performance standards.
- If the company's survival is threatened by conditions beyond its control — from recessions to natural disasters — the guarantee does not hold.

The Proper Step Forward

Why did James ultimately offer his employees a guarantee of steady work? Why wasn't he threatened, like so many employers at the time, by the idea of giving up one of the most powerful tools available to any CEO, the right to cut his workforce whenever it seemed necessary? In part, he was motivated by the religious values he was imbued with while growing up as the son of a deeply pious Congregationalist minister. He genuinely wanted to treat people well.

James was convinced that workers who feared for their jobs would never demonstrate much enthusiasm for their work, let alone any creativity. "There may even be no conscious effort to hold back progress," he cautioned, but a worker will never try to put his mind to creatively solving a problem if in doing so "he is threatened with the loss of his job by a better way of producing."

To some observers, a guaranteed employment promise sounds like charity, not sound business management. Not to James: "It is no part of management responsibility to be merely kind to workers," he stressed in his

writings. "Managers are responsible for efficiency in their industry … efficiency depends on human cooperation … cooperation [demands that] the fear of losing income will be eliminated. … This can only be done by guaranteeing continuous employment."

A Formal Guarantee of Steady Work

Sometime around 1950, the idea of a formal guarantee of steady work was first raised at a meeting of the Advisory Board, and in January 1951, James began sharing his thoughts on the proposal with employees. Several memos speak of his conviction that a program that had already been in operation for roughly 25 years was probably worth taking to its logical conclusion, but he cautioned his employees that it could also bring hardships. James was trying to ensure that everyone would understand that while great shared gains were possible with guaranteed work, so too was shared pain in tough times.

"It is an experiment that poses many problems," James wrote on Jan. 16, 1951. "Some of these must be answered, of course, by management, but some of them also must be answered by the producing worker. While continuous employment … would undoubtedly increase the total income to all people, yet there is little doubt that in extreme conditions it would reduce the bonus. … It is my belief that it is the proper step forward, but there are many problems which must be acknowledged if we are to succeed."

James' biggest challenge in implementing guaranteed employment — and it remains the biggest challenge for any employer — was to ensure that his employees trusted him to keep the promise. There would be many sacrifices required of employees in the short run to make the system work for everyone in the long term, and employees would never be willing to make those short-term sacrifices if they didn't believe James would deliver in the long term.

The Challenge of Employee Trust

Trust is generally missing in a reading of the history of guaranteed employment over the past century or indeed of the history of many other issues involving management in the American economy. Over and over, senior managers seem to have started down the road to a no-layoff policy, only to quickly resort to layoffs when they were faced with a serious financial crisis. Lincoln Electric approached a guaranteed employment promise extremely cautiously, however. The idea had been part and parcel of the day-to-day management system for several decades before James suggested that it could formally become company policy.

Once implemented, the promise could never be broken; there would be no second chances for guaranteed employment. James was convinced it was a risk worth taking.

The Importance of Flexibility

If trust is the first overarching principle necessary in any workplace that hopes to thrive with a guaranteed employment promise such as Lincoln Electric's, the second is surely flexibility. Everyone — from the bottom to the top of the company — must be willing to be flexible about virtually everything involved with doing a job and being paid for it.

Layoffs Aren't a Big Deal Anymore

Lincoln Electric has always operated under the assumption that an energetic pursuit of corporate profits is not inhibited by an equally determined commitment to raise the fortunes of its employees; in fact, the two are interdependent. As proof that Lincoln Electric's business model can survive the rough-and-tumble of Wall Street, consider the company's financial track record: an average growth rate of 19 percent per year from 2005 through 2009, an average annual return on investment of 16 percent during those years, a long-term debt-to-equity ratio of only 9 percent, a bank balance of $406 million in cash and a larger global market share than any of its competitors.

The final verdict among researchers on layoffs is uniformly negative: In other words, layoffs consistently fail to achieve what executives who call for them expect and that, in fact, layoffs hurt everyone involved, from the workers who are let go to those who remain at the firms themselves.

Layoffs are sometimes unavoidable in the real world. Those researchers have no illusions about how our market economy operates. They understand that a corporation's future must be precisely plotted out with detailed strategies to ensure its survival, growth, the effective use of scarce resources (including employees, physical materials and finances), higher share prices and, ultimately, greater and greater profits.

Lincoln Electric is no different in that regard: Every employee knows that if abandoning guaranteed employment is the only option left to avoid a bankruptcy brought on by cataclysmic economic conditions, senior management will make that decision, albeit reluctantly.

Yet the latest research on layoffs and their aftereffects seems to raise serious doubts about the corporate and social wisdom of regarding this strategy as anything but an absolute last-ditch survival option. The decision to order a layoff seems to be a choice that is, on one hand, very risky for the firm and, on the other hand, almost always very costly in human terms for the workers let go and for society at large, which finds itself forced to deal with the aftereffects.

Layoffs Are Deadly

For example, in December 2007, economists Daniel Sullivan from the Federal Reserve Bank of Chicago and Till von Wachter of Columbia University published the astonishing result of their research into mass layoffs and mortality. Their verdict: Layoffs are deadly.

Their research revealed a disturbing fact: "Male workers who suffer a permanent layoff in the middle of their working lives suffer an increase of 15 to 20 percent in their probability of dying in the following 20 years. If you summarize what that means over a lifetime, it turns into a loss in life expectancy of one to two years." The impact of the financial damage was so great that "it changed their whole lives … and workers with the greatest losses have the greatest reduction in their life spans," said von Wachter. "Losing your livelihood speeds up your mortality." ●

A Terribly Nonoptimal and Inefficient Policy

Wharton's Peter Cappelli argues that the majority of executives who order layoffs operate by "rules of thumb, and the most important one is 'What is everyone else doing?'" The resulting herd behavior creates a perfect feedback loop of reinforcing causality, where everyone comes to believe that there is only one way to reach the destination of sustaining profitability and growth: Keep the layoff lever close at hand.

Economists actually have a name for this phenomenon — path dependency — which is often described as the problem where "you can't get there from here because the road has been dug up."

When distinguished economist George Baker was asked why so many of his intellectual colleagues share his skepticism about a guaranteed employment policy such as Lincoln Electric's, even as they teach the case study that profiles what is arguably its most famous exemplar, he said, "Lincoln Electric is a special case, and by the way, it is not a panacea for them. When they go into tough times, it's really expensive for the company, and unless there is some other good reason for having it, as part of an incentive system like Lincoln's, in my view, you would be wrong to recommend it. The reason that people are so in-their-guts opposed is that, most of the time, it is really a terribly nonoptimal and inefficient policy."

Lincoln Electric's embrace of a guaranteed employment policy grew out of the desire of its founders to build a successful commercial enterprise. The ultimate goal was to ensure long-term growth and a steady stream of profits. In order to do that, the founders believed it was necessary to run a financially solid company that avoided taking undue risks or going into debt, to provide their employees with steady work and to share a significant portion of the profits with them.

An Egalitarian Work Environment

Lincoln Electric — the company and its employees — benefits significantly from a much more egalitarian work environment, in terms of pay and working conditions, than is found in the vast proportion of other American corporations. While the current economic crisis has certainly re-energized a debate about the growing financial inequality of American society, the value system that has produced the bloated executive salaries in so many sectors of the economy will not be transformed quickly. In the meantime, it's understandable that the vast majority of working Americans generally do not feel as if they are part of the same team as their company's CEO.

The Institute for Policy Studies reports every year on the exorbitant annual compensation paid to corporate leaders in America. Its latest estimate, for 2008, is that the average CEO in the S&P 500 makes 344 times more than the average American worker ($10.5 million versus $30,617). According to Lincoln Electric's annual report to the Security and Exchange Commission, CEO John Stropki made $4.6 million in 2008; that's just 150 times more than the average U.S. worker.

But consider this as well: At Lincoln Electric, the average worker made approximately $70,000 in 2008, more than twice the national average. Using that as a basis of comparison, Stropki makes just 65 times more than the average worker in his company. In addition, Lincoln Electric's executive ranks are relatively small for a company of its size, and in 2008 only four other senior executives earned more than $1 million (and none more than $2 million) in total compensation.

It's not just the relatively low salaries of Lincoln's senior executives that serve to dissuade others who might otherwise be interested in emulating the company's management system in their own companies.

"People do make different amounts of money at Lincoln, but the company tries hard to make you feel like you are part of a team," said Harvard's management and strategy expert Norman Berg. "The differential in symbols is enormous in most corporations, but Lincoln has always tried to minimize that — no preferred parking lots, no measurement of someone's status by windows — and those things appeal to most people."

No Status Symbols

Status symbols are almost nonexistent at Lincoln Electric. All of the employees at its Cleveland headquarters, from the CEO to the cleaners, enter the factory through one main door. There are no personalized executive parking spots. Only the CEO and a few vice presidents have offices with windows, while other senior executives work in windowless rooms that can best be described as bland, olive-green cells filled with a hodgepodge of mismatched office furniture. There is no executive dining room: Everyone eats in the basement-level cafeteria, where vice presidents line up with welders and engineers to receive trays of the hearty daily lunch specials.

This Is Not About Altruism

The business model that Lincoln Electric has built over the past 114 years has proven phenomenally successful, by any measure used to gauge success in the American economy.

Since the 1930s, the company has retained its position as the largest manufacturer of welding equipment in the world. The company now has production facilities in 20 countries and has been expanding its global footprint even during this punishing recession. Since becoming a publicly traded corporation in 1995, the company has earned an excellent reputation on Wall Street for consistently solid performance due to the skill of its senior management team.

It has kept open, and even expanded, its main production base in Cleveland while dozens of other large local employers have closed up shop and moved away, with devastating consequences.

And finally, for at least six decades, the company has honored a promise to its American employees never to lay them off for economic reasons.

Dismissing Lincoln Electric as an anomaly is nothing but an easy rationalization for continuing business — and layoffs — as usual. If Lincoln Electric can make guaranteed employment work, while achieving steady profits for the company and its shareholders and sustaining the otherwise decimated local community tax base, don't other employers have a social responsibility at least to try to understand how the policy operates and then to try in their own fashion to travel the same road?

After 100 years as a private business, Lincoln Electric was able to make the transition to become a public corporation, issuing shares and coping with all the complexities of external scrutiny while, to this point in time, still largely living up to the principles of its founders and its employees.

A Symbol of Hope

Lincoln Electric's success can serve as a symbol of hope at a time when the American economy doesn't seem to be working well for many citizens and their communities.

CEOs chanting "I have no option" as they announce layoff after layoff is really an admission of failure. With millions of Americans forced out of their jobs over the past several years, there is no excuse for continuing to accept failure as normal. It doesn't have to be that way.

Lincoln Electric offers proof that if a company truly values its employees, works to instill trust in the workplace and commits itself to ensuring the long-term financial stability of those workers, then that company can still thrive, innovate and survive the perpetual boom and bust cycles of a capitalist economy. It may even do so better than its competitors.

Embracing flexibility and trust in the workplace is difficult work, not only for management but also for employees, and the way toward a brighter, more secure economic future is not easy. The long and particular road that Lincoln Electric has traveled is not for everyone. But it is one that must be considered.

This country desperately needs more businesses to decisively set foot on a similar journey if it is ever to aspire to rebuild the social stability and widespread prosperity that have made America great.

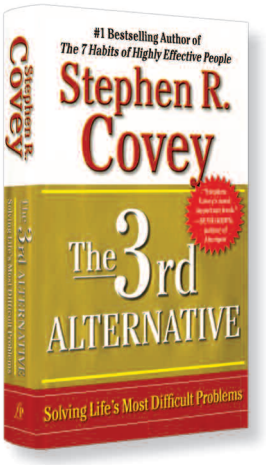
Stephen R. Covey Guides You to a Win-Win



Review by Chris Murray

THE 3RD ALTERNATIVE: SOLVING LIFE'S MOST DIFFICULT PROBLEMS

by Stephen R. Covey

© 2011, Free Press, 480 pages, $28.00
ISBN-13: 978-1-45-162626-1

In an age of contention and intransigence, when so many people, or certainly their leaders at the political level, seem to be deeply divided and unwilling to work together, the idea that there is a radical new win-win approach to conflict and collaboration is enticing. Knowing that this approach springs from the mind and work of Stephen Covey is even more intriguing, for with his first book, *The 7 Habits of Highly Effective People*, the then-unheralded Covey fundamentally changed the way many people approach life and success.

As with many of Covey's ideas, the titular concept in the book — the 3rd Alternative — is deceptively simple. In most conflicts, there are two alternatives: my way and your way. The key to resolving conflicts in a win-win way is to find a 3rd Alternative — "our way."

At first glance, this may hardly seem new. Aren't conflicts always resolved by finding a solution that, through negotiation, embraces a bit of my way and your way? As Covey emphasizes throughout the book, the 3rd Alternative is not a compromise that opposing sides can live with. Compromise is a lose-lose solution because each side must reluctantly give up — lose — something it wants. The 3rd Alternative is a win-win solution in which each side gets everything it wants.

Finding Harmony with an Alternative

Covey tells the story of how a government in an unidentified country decreed that all classroom time should be spent on core academic topics, such as reading and mathematics. There would be no time for music. This distressed one student's mother, who was a professional musician and thought that music was a key subject area that needed to be taught at school. It also distressed the girl's teacher, who agreed with the mother. But what could they do? The teacher's paradigm, forced on her by the government, was that all class time had to be spent on non-music classes. The mother's paradigm was that some class time should be devoted to music. Who would win?

They both did, Covey writes. The solution was for the teacher and the musical parent to teach the core academics subjects using music. Music was used to teach fractions (one eighth note plus a second eighth note equals one quarter note). Poems were sung. History was learned through the study of great composers and their times. Foreign languages were taught by singing folk songs of other countries.

Covey tells this story to illustrate the key ingredient to creating or discovering a 3rd Alternative: synergy. Synergy, of course, is based on the idea that the sum of the parts is greater than the whole. Music, in fact, is a great example of synergy. A beautiful harmony is impossible if you play one note and then another and then another. Adding single notes together might get you a melody (and a rather spare one at that), but no harmony.

The only time you will hear a harmony is if all the notes are played together. "Like musical notes, synergistic people do not lose their identity," Covey writes. "They combine their strengths with the strengths of others to produce a result far greater than anything either could achieve alone."

To resolve the dilemma of music vs. academics, the musical parent and the teacher combined their strengths to create a 3rd Alternative.

Readers will see in Covey's story the difference between what he calls traditional 2-Alternative thinking and a 3rd Alternative solution. The 3rd Alternative solution avoids the typical win-lose outcome that results from conflict. Covey's choice of education as one of the areas to illustrate his concept demonstrates two of his strengths as a writer. First, Covey grounds his argument in a simple scenario to which virtually every reader can relate. Second, he selects areas of society that would be considered hot-buttons for debate. This enables readers to actively engage with The 3rd Alternative on both a professional and personal level.

> ... Covey lays out a clear, step-by-step method for achieving a 3rd Alternative that is at once specific enough to be applicable, but general enough to be realistic.

Of course, not all problems are as easily resolved as the example of the music class. As expected, however, Covey lays out a clear, step-by-step method for achieving a 3rd Alternative that is at once specific enough to be applicable, but general enough to be realistic.

The Four Paradigms

The 3rd Alternative method is based on four paradigms — ways of thinking — that are completely different from the paradigms involved in 2-Alternative conflict and compromise.

The first paradigm is "I see my self." In other words, writes Covey, the path to the 3rd Alternative begins with self-awareness. It requires you to search deep inside yourself to clearly be aware of your motives, uncertainties and biases. Those who practice 3rd Alternative thinking, writes Covey, say: "I have examined my own assumptions. I am ready to be authentic with you." While 2-Alternative thinking begins with "I see my side," 3rd Alternative switches to "I see my self — independent of my side."

The second paradigm, according to Covey, is to accept and care for the other person in the conflict. In the traditional approach to conflict, people don't see another "person," they see the other "side." They don't see the opponent as a unique individual, but as a label of whatever the other side might be. In other words, the paradigm "I stereotype you" describes what most people are doing when they look at opponents in a conflict.

Covey makes an important distinction in the second paradigm that is particularly applicable to business. His ideas appear to reinforce the shift to collaborative, or solutions-based, sales. Salespeople in many organizations have transitioned from a hunter/prey approach to accumulating business to learning to care for the sales prospect and to understand his or her unique needs. The switch from combat to collaboration resembles Covey's paradigm to remove labels from the person on the other side of the bargaining table. This demonstrates one of several instances where, in lieu of a direct corollary, executives will need to interpret and apply Covey's ideas to the business world.

The third paradigm takes a new approach to the engagement of one party by the other. In the traditional 2-Alternative thinking, the opposing parties either refuse to listen to the other side or focus completely on defending themselves against that side. Third alternative thinkers, Covey writes, have a different approach: They actively want to engage the other person. In Covey's words, "the best response to someone who does not see things your way is to say, 'You disagree? I need to listen to you!'"

The fourth paradigm is where the synergy between the two parties occurs. By this point, each party has a more honest perspective of who they are themselves — someone with biases and perceptions, not someone with all the right answers. Each side also has a realistic and complete appraisal of the other person as an unique individual and not just a representative of the other side. Finally, both parties have successfully sought out and understood the viewpoint of the other person. The stage is now set for finding a completely new solution, using the strengths of both sides, that neither of them had imagined before.

Start With the Question

Covey acknowledges that synergizing effectually is a challenge and he offers four steps to synergy. The first step is to ask, "Are you willing to go for a solution that is better than any of us have come up with yet?"

The next step is to define the criteria. In other words, Covey writes, the next question is: What would *better* look like? Specifically, what would a solution that delights both of us look like?

The third step is creating the 3rd Alternative. The criteria is set and now comes the hard work of finding this

3rd Alternative that meets the defined criteria and, therefore, leaves both sides delighted with the outcome. Creating the 3rd Alternative is not easy. It requires brainstorming new frameworks, thinking completely differently from the past and suspending judgment, at least for a while.

As an example of how a 3rd Alternative can be created, Covey describes a long-standing battle over the pesticide DDT. DDT was once used effectively in the fight against the deadly disease malaria, caused by the bite of a mosquito. Because of this pesticide, deaths from malaria plunged. However, environmentalists led by Rachel Carson revealed that DDT and other pesticides were causing significant long-term damage to the environment, and the pesticide was banned. The result was an immediate and disturbing increase in malaria deaths. Pro-DDT and anti-DDT forces passionately argued for their position: the pro-DDT side argued that the benefits of DDT outweighed the consequences. Anti-DDT forces argued that the pesticide was too dangerous and that the breed of mosquito that carried malaria was becoming immune to the pesticide anyway. As the conflict raged on, the Bill and Melinda Gates Foundation quietly brought together a diverse group of experts from many fields to find a 3rd Alternative for reducing malaria. The combined forces of the Gates team developed a number of radical solutions to the problem. In one case, a rocket scientist suggested using lasers to shoot the mosquitos down, optical engineers experimented with blue lasers from ordinary DVD players, programmers created software to guide the lasers and an inventor put it all together with parts acquired from eBay. "Harmless to humans and wildlife, the laser is so finely calibrated that it can spot a mosquito by its wing vibrations and bring it down with a tiny burst of light," Covey writes. "Perimeter fences equipped with such lasers are capable of defending entire villages from malaria."

The fourth step is the arrival at synergy. The solution is found. Excitement has replaced conflict. "How do we recognize the 3rd Alternative?" Covey asks. "It's the one that meets our criteria of success. It does the job that needs to be done. It embodies the outcome we all want. It changes the game. It enables everyone to win."

The 3rd Alternative at School

The template for achieving the 3rd Alternative that Covey offers can seem a bit optimistic. It's one thing to write: "recognize your own biases," "listen empathically" or even "create a 3rd Alternative." It's another to achieve these kinds of positives in situations of conflict wrought with tension, emotions, high stakes and perhaps even a visceral dislike of people on the opposing side.

Covey, however, did not become one of the world's great thinkers on achievement and success by offering impractical pie-in-the-sky prescriptions that wouldn't work in real life. The 3rd Alternative is packed with examples. The description of the 3rd Alternative and the detailed step-by-step implementation guide only occupy one chapter of the book. The bulk of the book is contained in the seven chapters that illustrate, with myriad real life examples, how the 3rd Alternative applies to work, home, school, law, society, world and life.

The bulk of the book is contained in the seven chapters that illustrate, with myriad real life examples, how the 3rd Alternative applies to work, home, school, law, society, world and life.

The school chapter, for example, describes the familiar 2-Alternative debate over education in many countries. On one side of the debate are educators who believe that inequity — poverty, racism, dysfunctional families, low resources — are the cause of the problems in education. On the other side of the debate are what Covey labels generally as "business," that is, those who believe that if education were run more as a business, the problems would be solved. The business side of what Covey calls "the great debate" sees the educators themselves as a major problem.

Third alternative thinkers in this field, whether they are educators or business, work synergistically with others to find unique, never-before-seen solutions, Covey writes. Wendy Kopp, for example, founded an organization called Teach for America that recruits the best students from the best schools to spend two years teaching in disadvantaged schools before they start their careers.

Another example is A.R. Combs Elementary School, a magnet school in Raleigh, N.C. that was about to be shut down. It didn't have many students, the facilities were in poor condition, the teachers were demoralized, the parents were unhappy, the students came from very disadvantaged socio-economic conditions — all the factors pointed to failure. Covey describes how principal Muriel Summers pleaded with the superintendent not to close the school. The superintendent relented but asked for a specific proposal from Summers on how she was going to attract more students. He gave her a week. Summers tells Covey, "We decided to send up a proposal to make a school like no other in the U.S.A. — the ideal school — and we had one week."

Summers met with all of the stakeholders involved in the school, including parents and teachers, as well as

community and business leaders, and she asked them the 3rd Alternative question: What would our ideal school look like? Together, the stakeholders developed a new unifying mission for the school: to develop global leaders. Every decision and every action in the school would be driven by this mission to instill leadership skills in every student. Covey details the incredible results achieved by the school, including national awards. Today, the school is a model for what Covey calls "Leader in Me" schools across the country.

The Blackbird Mine Case

The chapter on the legal application of the 3rd Alternative is co-written by Larry Boyle, a former Justice of the Idaho Supreme Court, who offers his own experiences to help explain how Covey's ideas can work in an arena that is designed to be adversarial. Boyle describes, for example, how he was called to mediate the Blackbird Mine case, a complex environmental case involving a cobalt mine that operated in the 1950s and 1960s. The mine was abandoned in the 1970s, but it left behind, in Boyle's words, "a terrible stream of acid and metallic poison that was devastating to the land, water, and wildlife of the beautiful Salmon River wilderness." He goes on to explain that "like a series of tipping dominoes, the state, private environmental groups, and a dozen federal agencies sued the mine owners and each other to force cleanup. A blizzard of claims and counterclaims flew."

Boyle tried something new: He shut down the courtroom, sent all the interested parties to separate conference rooms and asked each of them to come up with a plan to settle the case. In two hours Boyle would receive the plans and, with the help of a leading scholar of environmental law named John Nagle, try to synergize the plans. In the weeks and months that followed, the process was repeated several times. Within several months, the 10-year-old Blackbird Mine case was resolved without trial to the satisfaction of all.

The 3rd Alternative is not a beautiful starry-eyed theory on how the world could find solutions to problems if people would only "get along." Covey uses his renowned communication skills built on illustrative metaphors and clean, step-by-step frameworks, combined with his years of experience working with 3rd Alternative leaders around the world, to write a book that offers a path to solutions in the future. Just as importantly, the 3rd Alternative reveals why certain people are breaking through today with innovative solutions while others remain mired in contentious, never-ending battles.

Attempting to attack new problems using the same tired methods is certain to end in disappointment.

Arianna Huffington, herself no stranger to conflict resolution in her role as president and editor-in-chief of the AOL Huffington Post Media Group, praised Covey for his commitment to exploring an alternative path to solutions. She writes that Covey is urging readers to look beyond "suboptimal solutions." This is perhaps the best endorsement for readers to pick up Covey's book. Attempting to attack new problems using the same tired methods is certain to end in disappointment. Covey's repeated description of people and organizations that found a better way will undoubtedly inspire readers to emulate the examples in this book and seek out their own 3rd Alternatives.

While it's unlikely that *The 3rd Alternative* will achieve the game-changing significance of Covey's book *The Seven Habits of Highly Effective People*, his new release will play its part in adding to Covey's legacy of positive change in business and beyond.

The Invisible Spotlight

Why Managers Can't Hide

by Craig Wasserman and Doug Katz

THE SUMMARY IN BRIEF

In *The Invisible Spotlight*, management experts Craig Wasserman and Doug Katz make a compelling argument that all managers work in the heat of an invisible spotlight where their every word and deed are scrutinized by employees. Remarkably, most managers are unaware of this reality. As a result, they underestimate the impact of the passing moments that are at the heart of their management relationships.

Wasserman and Katz tell illuminating stories from their nearly 40 years in the trenches about management successes and misadventures in the unseen spotlight. Each story acts like a mirror, reflecting the reader's own management challenges. The authors' realistic observations and insights gained as consultants enrich the lessons that are offered.

The Invisible Spotlight presents a fresh, practical perspective on building sound management relationships. Whether you're a brand new, first-line supervisor, an experienced middle manager or a seasoned senior executive, you'll find something here worth your time and contemplation.

The Invisible Spotlight: Why Managers Can't Hide offers readers a hard look at the soft side of managing.

IN THIS SUMMARY, YOU WILL LEARN:

- Why the management role does not come naturally.
- How instincts and reflexes alone can be as self-defeating as they are useful.
- How management requires practice, discipline and self-reflection.
- How managers are architects of the relationships they form with their employees.
- How people don't change when they're comfortable; they change when they're uncomfortable.
- Why no paint-by-numbers approach to managing will protect managers from missteps.

Introduction

Whether managers appreciate it or not, they are a central and dominant influence in their employees' lives. Employees spend countless hours watching, listening, thinking about, talking about and trying to please their bosses. This is what is meant by the invisible spotlight. Being in that constant spotlight comes with the territory.

Because of the management position you hold — because of its status and authority — your words and deeds carry enormous weight. They can heighten your employees' commitment in a profound and lasting way. They can help your employees perform — and want to perform — at exceptional levels. By the same token, your words and deeds can cause your employees hours of uncertainty and distress — even the off-handed remarks you make without malice. What you say and do can erode your employee's spirit and contribute to all manner of performance problems. It's important, therefore, to take stock of what you do, how you do it and how you want to do it.

PART I: THE MANAGEMENT RELATIONSHIP

So much of your relationship with employees is forged in brief, unscripted moments. Sometimes the moments are dramatic, sometimes quiet and fleeting. A passing conversation with an employee, a glance of approval or disapproval, a gesture of encouragement when an employee's confidence flags — these are the moments that can make or break your relationship with anyone who works for you.

Unfortunately, the popular management literature of the day encourages you to develop "reliable management systems" and a "consistent management style" as if the secret to success were in your everyday, predictable management routines. The fugitive moments I'm referring to here barely get a mention. Let me assure you that you can raise or lower the spirits of an employee, eliminate or perpetuate confusion, make important things happen or stall … all in a matter of seconds. And yet you might barely notice what you've done.

Once you pay attention though, you can create these pivotal moments rather than relying on your reflexes. The trick is to consciously control the influence you have and to act with intention. This control — this self-control really — makes it possible to turn a glancing moment into a lasting result. *These moments form the foundation of the management relationship.*

Inspiring Your Staff to Deliver and Innovate to Their Potential

If you're in a management role — whether out of desire, duty or fate — you must understand that at the core of your work are your management relationships. No amount of inspired business savvy, motivational energy, administrative skill, marketing expertise or technological genius will compensate for an unhealthy relationship. None of these talents will bear the best possible fruit unless your management relationship is well watered.

An employee doesn't set the tone, standards or direction for the way the two of you work. The foundation

of this relationship always falls to you. You're the *architect*. You're the one responsible to create the conditions that promote your employees' best work. It all boils down to an inescapable truth: If the foundation of the management relationship is solid, it's because you're doing something right. If the foundation falters or fails, it's because you're doing something wrong. It's that simple and that difficult. ●

The Invisible Spotlight

A new vice president joined a large company where I was consulting. A vacant corner office was assigned to him and was scheduled for repainting in advance of his start date. But a miscommunication between the facilities department and the contractor delayed the job by a few weeks.

When he arrived for his first day, there was some confusion about where he should park himself. The VP noticed an unoccupied office on his department's floor and insisted that he set up there for the interim. The office was sterile and cramped, with barely enough space for a visitor's chair. Not an office befitting a corporate officer. Yet the VP insisted.

He used that office for two weeks as his home base. He met his staff and colleagues there and spent hours at the desk, acquainting himself with the organization he'd just joined.

When I stopped in to meet him days later, he made no reference to his undersized quarters; never reached for a polished explanation nor an assurance that he would soon move to a more suitable space. He allowed his decision to speak for itself. He knew his behavior was making a statement about his values and his leadership. He knew those around him were noticing and hearing through the grapevine about his choices. He was yet another manager who understood that his people were talking about him at dinner — that he was front and center in an invisible spotlight.

He made a deliberate decision. He regarded the logistical delay not as an inconvenience, but as an opportunity rich with symbolism. ●

Management Is Work

It was apparent to those with whom I spoke that Phil had brought significant improvements to the business. But one other theme ran through every conversation I had with his supervisors and staff. Just about everyone told some version of the same story: a supervisor demeaned in mid-sentence for a scheduling procedure that Phil thought was misguided; a newer supervisor's safety improvement recommendation harshly dismissed because Phil declared it too costly for the presumed benefits; a department head's carefully conceived plans for the layout of the truck bays summarily overridden. The word in the hallways was that Phil had no patience, his ideas were the only viable ones, he was callous, thoughtless and intimidating. He was like the cow that gives good milk but then knocks the bucket over.

Working in Phil's world was hard on his work force. It was beyond just stretching to do their level best as professionals. It had become personal. The relentless pressure had become demoralizing. Each supervisor described the same journey: from initial skepticism soon after Phil arrived, to full throttle enthusiasm and an eagerness to please, to a sense of tentativeness and cowering — both at work and after hours — as the atmosphere became abusive. Several supervisors were actively seeking other jobs.

The Risk of Self-Acceptance

This should have been a pretty tough message for Phil to digest. But as I held up the proverbial mirror, Phil simply looked at me, occasionally nodding in agreement. When I was finished, he reflected a moment. Then, "You're not telling me anything I don't already know. My family has been telling me these things for years. I don't suffer fools well. That's just the way I am."

I had to respect the guy for his candor. But his self-acceptance was self-destructive. "Phil, we've just come to the reason your VP sent me here. He didn't give you this job so you could be a bastard. He gave it to you with the expectation that you would be a professional leader. Those are far from the same thing."

Phil sat calmly and considered my response. So I continued, "At this company, working as a manager, you're expected to work at *being* a manager. You can't simply rely on your 'natural ways.' You're the guy responsible for making these workplace relationships work, not driving them into the turf. You're the guy who has to develop these supervisors into confident captains, not shadows of themselves, limping away for safe harbor. You're the guy who has to establish an atmosphere that encourages best efforts, not one that exposes vulnerabilities and insecurities. Being an effective manager is your job. It's a set of skills that needs to be mastered. In this regard, you're failing."

Phil worked hard at catching himself. He began to allow others to succeed and err more on their own and to learn from both. He began to insist on the critical things, recognizing that not everything is critical. He

learned that his natural impatience was a virtue so long as it served to energize, not humiliate. And most important for Phil, he came to appreciate that his employees wanted to please him; he needed to master the art of making that possible for them. ●

PART II: MANAGEMENT MOMENTS

The idea that you can discuss unwanted news or provide a critical assessment and at the same time keep an employee smiling is silly. There's just no way around the fact that speaking the truth about a failure, an oversight or an inconvenient development is thorny for all parties.

And yet, over the past half century, we've clung to the idea that managers should manage conflict without anyone feeling ill at ease. We ask managers to read books, watch instructional DVDs and attend training classes on how to achieve a mutually satisfying, "win-win solution" through "open, empathic dialogue" with their employees. We've somehow convinced ourselves that if only managers polish their communication skills, change can be comfortable.

How to Discuss Serious Problems and Deficiencies

Unfortunately, managers too often come away from these "lessons" believing they can discuss serious problems and deficiencies without causing any pain and suffering. How "comfortably" the conversation goes becomes their measure of success. But here's the thing: *Contrary to popular belief, people don't change and improve when they're comfortable. They change when they're uncomfortable.*

When managers varnish the truth, they may avoid tension and conflict, but they'll fix nothing. They'll improve nothing. And this is because they create no incentive, opportunity or direction for change.

Watch deliberate managers handle difficult conversations. Their objective is to speak clearly and frankly enough to carve a path to change while protecting the relationship. The truth is, some degree of discomfort sets the stage for change. The trick is not to avoid it, but to manage it head on and with respect. ●

The Internal Dialogue

You can't rely on your reflexes alone when you need to walk a tightrope; managing important moments requires anticipation and rehearsal.

To the untrained eye, it may appear that capable managers are endowed with a knack for thinking on their feet. They seem to know just what to say, just how to act. What's uncanny is how spontaneous their reactions seem. Unscripted. Off the cuff. Capable managers seem to respond in the moment, to the moment, without time or need for planning.

Don't be fooled.

Sure, all of us have had the good fortune of a sudden insight in the midst of turbulence. But managers with staying power don't count on their reflexes alone when they walk a tightrope. Nor do they expect the tightrope itself to somehow reveal how to balance on it.

Being *naturally* quick on your feet is a management myth. Quickness requires years of practice, lots of mistakes and recoveries, and careful preparation. The reality is that conscientious managers spend hours anticipating the rough roads they expect to travel. They score their important interactions the way a composer scores a symphony. This is the *internal dialogue.*

How to Prepare for Pivotal Conversations With Employees

When managers prepare for pivotal conversations with their employees, they don't do it with a broad brush. In fact, what they do resembles the vivid, private rehearsals of a stage actor or the pre-visualizations of an Olympic athlete. They don't imagine their challenges in general terms; they engineer them down to the particulars.

You've seen these managers as you commute to work. They're talking to themselves in their cars. Sometimes they'll turn their rearview mirrors toward themselves so they can speak into their own eyes. You see their lips moving, but they're not singing with the radio or having a Bluetooth chat. They're talking out loud to themselves. What you're catching a glimpse of are diligent managers in an internal dialogue — anticipating how they'll navigate the ebbs and flows of a tough conversation with an employee. ●

Moments of Recognition

More thought than you ever imagined goes into the art of recognition and encouragement.

To effectively recognize and encourage employees, you need to know what you're looking for. You need patience as the employee moves toward success in small, uneven steps. You need a sense of timing. And you need to use language that not only conveys that you're pleased but what you're pleased with. None of these skills comes naturally to most of us.

Clarity Makes It More Instructive

"Well done, Peggy." "Good work, Janice." "I'm real-

ly proud of you, Herb." These are always encouraging words, but they're not always as useful as they can be.

Words this general will make an employee feel good. But too often they don't communicate *what he or she should feel good about.* They're too broad to convey what the employee did to earn them.

Recognition can instill more than a positive feeling. It can be instructive. It can help an employee develop specific abilities and perspectives. To make it useful, you need to speak in words that your employee can "see." Being specific is powerful, whether you're catching an employee doing something right or wrong. You have to clear your head, formulate your thoughts and know exactly what you saw, heard or read that you want to recognize and encourage.

"Paul, I realize it's not easy for you to pose those challenging questions about this project to your own colleagues, but I'm glad you did it in today's meeting. It makes us all sharper."

"Diane, I know you would have liked more time to review the proposal, but I appreciate your decision to release it now so we have a shot at making our deadline."

Your employees will learn most from vivid words of recognition and encouragement.

As for taking the time to get good at this management skill, there's one more thing to consider: Your employees will be able to digest more forthright criticisms if you've conveyed both a readiness and an ability to recognize what they do well. Praise is not just "nice." Nor is it just "motivating." It actually positions a manager to critique more candidly if and when a moment of instructive discomfort is called for. ●

Credible Moments

Your management relationships are defined more by the disconnects your employees see than by the declarations they hear.

No matter how artfully you orchestrate a given interaction, it alone won't ensure the success of your management relationships. You're in the invisible spotlight between interactions, too. During these periods, your employees are looking for signs of your credibility. They're judging if you mean what you say. They're comparing word and deed.

A lot goes on in the passing moments. And a lot goes on between them, too, when employees get a glimpse of how closely what you say aligns with what you do. You can rest assured that your management relationships will be defined far more by the disconnects your employees see than by the declarations they hear.

Employees Watch You Like a Hawk

Your employees watch you like a hawk, keenly observing what you say, how you say it, what you do and how you do it. You cannot escape the invisible spotlight. And as childlike as you might think it is, they will imitate you, too. That's right: Full-grown, level-headed, self-respecting adults will imitate you. It's not childlike really. It's human. Keep your jacket on during meetings and others will follow your lead. Take that jacket off and observe how your employees interpret your action as permission to remove their own jackets. Wear a tie or scarf to work each day and watch them begin to appear on others.

In a more substantive and important way, your employees adopt your point of view; they mimic your approach to people and problems. If you're open to ideas and give the benefit of the doubt to others, your employees will do likewise. By the same token, if you're intolerant, accept nothing short of perfection, question the trustworthiness or speak ill of your colleagues, you'll hear echoes of these same attitudes in your employees' words and actions.

Employees act on the unspoken and near universal assumption that to be like you is to be liked by you. The enlightened manager with honorable intentions understands this dynamic and uses it to encourage the highest levels of pride and commitment. ●

Moments of Recovery

Managing is a sloppy game with too many unknowns to calculate the right moves every time. Recovering from a mistake is one of the hardest challenges to address with grace.

You can dedicate yourself to honoring every principle and prescription, and still you will stumble. More than once in your career, you'll look dumb, give the wrong impression, bruise someone's feelings, have a meltdown. Everyone takes his or her eye off the ball once in a while. Everyone is blind to some persistent idiosyncrasy or other that spells management trouble.

If these eventualities are not what you bargained for as a manager, go to your room and hide under your bed. You'll make fewer blunders there.

You're in that invisible spotlight. Your employees are talking about you at the dinner table, listening to what you say, measuring how closely your words square with your deeds. So a management mistake is always under a more high-powered microscope than a private or personal one.

Skillful managers have learned that ignoring a misstep

or denying a destructive behavior pattern is itself destructive. They've come to appreciate that a blown opportunity or brainless act creates one more opportunity to strengthen the management relationship. Clearly, recovering from a mistake is one of the hardest challenges to address with grace. It takes more soul searching and intestinal fortitude than carrying out a routine management duty. But therein lies the chance to excel.

There Is No Undo Command

So what do you do once you've fallen off the ladder, injuring yourself and maybe someone below? If you're smart, you step up to your obligation to apologize and make reparations to your victims. You resolve to climb ladders in the future with more care. And if the injury leaves your body permanently compromised, you stay off ladders.

It's the same when you try to recover from management injuries; those you inflict and those you sustain. You apologize and begin rebuilding the foundation of your relationship with care. You do this is by compensating for the damage you've done in a compelling way. Though you can't take back a slap in the face, you can stop slapping — and offer enough evidence of regret, respect and reform to dilute the impact. ●

PART III: MANAGEMENT PASSAGES

Progressing through your management career is all about adapting to changing situations.

Every competent manager learns how to make this transition eventually, but it's not without an internal struggle. As you would expect, the struggle is most acute in times of crisis. Dan, a favorite client, is a case in point. He's yet another example of how sustained, conscious effort is indispensable to mastering the management role.

Like many fast-track managers, Dan's greatest assets in some situations played out as liabilities in others. He fought his natural tendency to run over people in meetings, to grab control from those he thought were dawdling or just idling. He had the answers well before others knew what the questions were; a source of unending frustration for him. He had competitive fire in his eyes and a desire to surpass whatever goals were set, no matter how demanding.

Our earliest consultations were about the basic challenge of managing versus doing — accomplishing things through his management relationships instead of doing it all himself.

I stopped by unannounced to see Dan one morning.

"You're going to be mad at me," he said.

"Why will I be mad at you?"

"Because next week, I'm going on vacation with my wife. We're going to Europe."

"Nothing to be mad at so far."

"And I plan to call in every morning at 7:30 local time to run a staff meeting."

Alarm bell. This would be a setback … a vestige of Dan's need to be in the fray. The truth of it was, Dan just didn't want to be left out of the action. Were he on hand in a crisis, he knew he'd be able to dive into a phone booth at a moment's notice and change into his Superman costume. But a distance of 6,000 miles would make heroic acts impossible.

A Substantial Challenge

Dan was at a crossroads. He knew time was limited, and the challenge would be substantial. He thoroughly dreaded the consequences should his staff misstep while he was vacationing. I assured him that the supervisors who report to him were as prone to errors as he dreaded. And I reminded him that he had for some time been resolved to confront the challenges of his transition from doing to leading. This would be a pivotal one.

Dan was beginning to see the vacation not as a missed opportunity to prove his individual worthiness, but as a chance to demonstrate his *management* worthiness. The trip would allow him to test — and showcase — the leadership talents he had been working so hard to nurture in his staff. He also knew that engineering this moment capably would impress those whose opinions he cared about and respected.

The Rewards of Self-Restraint

When he returned, he found that his employees had performed admirably in his absence, some more adroitly than others. Several had war stories to tell and some bragged about their successes.

In the days after he got back, he sensed an increased level of enthusiasm and commitment within the team as they handled day-to-day details that he had previously kept for himself. He also noted that a number of the issues being brought to his attention by his supervisors were more sophisticated because the staff was beginning to dispose of the more routine matters themselves. He responded by delegating broader responsibilities to those on the team who had demonstrated a capacity to take them on and who had earned the trust of his fellow managers. ●

When the Magic Doesn't Seem to Work

Sometimes your plate gets full with unwanted developments, imperfect choices and unexpected outcomes.

Over the years, Andy counseled Kevin, established standards of conduct, tried to hide him behind intermediaries and sent him to charm school. All to no avail.

Andy faced two management imperatives. He was expected to find and support the talent that would make his company as profitable as possible; and he was expected to maintain an environment in which a team of professionals could cooperate to keep the company profitable over the long haul. But Andy reached a different conclusion:

"Enough is enough," Andy thought. "No one person — no matter his talents — is worth the disruption to our company's culture and to my credibility as a manager. As much as the organization may suffer in the short run by losing Kevin, and as much as I may have to pick up the slack until I replace him, we'll be better off in the long run. We'll be healthier."

After giving Kevin one final opportunity to rein himself in — an ultimatum he just couldn't bring himself to yield to — Andy and he agreed on a separation package.

And then, like clockwork, Andy spoke the words I've learned to expect in such complicated situations, having heard them over and over again for decades:

"I should have done it sooner."

Andy had more to say some weeks later, and every word of it is instructive:

"The dark mood in the organization has lifted, our staff is more collaborative than ever and I feel better. But make no mistake: We lost value and lots of talent when I let Kevin go. If you've never been in a job like this, you can't possibly understand what a sacrifice that is. Many close to this situation saw him only as a monster and a brute. They made him a one-dimensional caricature just so they could ignore the ambiguity of it all. But Kevin was a brilliant contributor. A money machine. He did exactly what the company is set up to do. He made our Big Guns very, very happy. And he forced us to do our best.

"Having said all this, *I should have done it sooner.*"

No Easy Way Out

So many organizations have a Kevin. These talented, yet flawed folks offer you no easy out.

They always bring something invaluable: highly developed skills and savvy; a large black book of contacts and relationships; gravitas in the industry; a rare expertise; a strategic view of the company's future. And, at the same time, in some other way, they are poisonous.

In these situations, when there's no handbook to consult, you are left with your own assessment of the options, your own calculation of what your organization can tolerate and your own conscience. You've done your best when you've thought these things through with care, seeking the help of those who have fought similar battles and you're prepared to manage the consequences — both the favorable and the unfavorable ones.

Management is work. And that's in no small part because you practice it in a real and flawed world, not a world of formulas and fairy tales.

Idiosyncrasies and Imperfections

As a manager, you bring three things to work each day:

- You bring your mental map of the management role — everything you've learned from role models, training programs, the reading you've done and your own experience in leadership positions.
- You bring whatever planning and scripting you've done in preparation for the interactions you expect to have — the lines and behaviors you've worked out in your internal dialogues to make specific moments meaningful and productive.
- Finally, you bring you — you bring your battery of personal passions and preoccupations, preferences and prejudices, private anxieties and apprehensions, and even physical and social quirks. Sometimes these are natural gifts that will enhance your management impact; sometimes they're baggage that will burden it.

The Knotty Thing About Your Idiosyncrasies

Your management relationships are profoundly affected by your virtues and idiosyncrasies. They find their way into every interaction with everyone you come in contact with: employees, colleagues, customers, vendors and bosses. And because they do, your personal watermarks not only affect the outcome of specific interactions, but they also define the complexion and the tempo of your entire workplace environment.

The knotty thing about your idiosyncrasies is that they're, hands down, the hardest realities for you to recognize as a problem. Idiosyncrasies are personal; so much a part of us that we've grown blind to them.

It's no surprise then, that you assume these parts of your character have no impact on your management

relationships. But make no mistake. In the same way your employees benefit from your personal virtues and healthy management behaviors, they're held hostage by your foibles. And, for the most part, they suffer in silence.

Managing Managers

Learning the complexities and subtleties of management is akin to learning a new language.

Classrooms can only drill on the fundamentals; they provide ideals and abstractions. Real fluency with an unfamiliar tongue is achieved when it's practiced every day in an environment that requires it. This is where you come in. You have to do what you want your people to do.

You must be willing to inquire about your managers' relationships with their employees — discuss them in some detail; critique them as if they are as central to the work as anything else; offer strategies for creating constructive moments and handling uncomfortable moments with employees; recognize improvements when your managers make them. If need be, you must even be willing to assign tasks to your managers that are specifically designed to test and improve their skills.

Sensitize Your Managers to the Invisible Spotlight

It falls to you to sensitize your managers to the invisible spotlight. In other words, you must create a culture in which management excellence is valued and publicly rewarded in the same way other business achievements are. This establishes management effectiveness as an organizational priority.

Most important, you must demonstrate every day what you're asking your managers to strive for. This is the *sine qua non* of management development — the single most important condition for promoting management excellence.

When these conditions are met, classroom training can make a contribution to your managers' development. If this sounds a lot like what you would do with your children when you send them to an expensive tutor, you're right, it is. We are all children, employees and managers.

Your managers learn when you place a premium on what they're supposed to learn. You have the greatest effect when you take an interest in it and have the courage to tell them when they're not measuring up and when they are. This principle may never be so important as when you're in a position to manage managers.

Closing Thoughts

Once you see how closely your words and deeds are scrutinized by your employees and how significant your impact is on their lives, you'll begin to manage your important moments of interaction with them more wisely and deliberately. You'll also avoid many of the hazards of working in the dark.

What you say and don't say, what you do and don't do *in the moment* determine how firm the foundation of your management relationships will be.

Your behavior in the moment can cause your employees hours of uncertainty and distress, or it can heighten their commitment and contribution in a profound and lasting way.

An Honorable Profession

The magical thing about managing in an unseen spotlight is that your employees — your audience — very much *want* you to be good. They *want* you to be effective. They're rooting for you to be successful. This is because their lives are made immeasurably easier, more predictable and more rewarding if you manage your relationships deliberately and honorably. Your employees can be energized, even inspired by how well you perform. This is how powerful your impact can be. This is how much you matter.

The success of your relationships requires that you relentlessly assess how your important moments have gone, why they went the way they did, what needs to happen next and how they can be better handled next time. The point is *you are the architect* of these moments of interaction.

Remember: If the foundation of the management relationship is solid, you're doing something right. If it falters or fails, you're doing something wrong. It's that simple and that difficult.

Management is hard work. It involves complexities that can't be simplified. It is an honorable profession that demands thoughtfulness, wisdom and ethical considerations beyond step-by-step recipes.

Topgrading

How Leading Companies Win by Hiring, Coaching, and Keeping the Best People

by Bradford D. Smart, Ph.D.

THE SUMMARY IN BRIEF

Great companies are made by A-Players. The secret is to hire, promote and retain only these individuals, but this is easier said than done. Research shows that typically only one-fourth of those hired or promoted turn out to be A-Players. The other three-fourths (the B- and C-Players) become mis-hires and mispromotions. And with the cost of a staffing mistake estimated at 15 times base salary, the financial drain on the average company is huge.

Compare that with the 90 percent and higher success rate enjoyed by companies that use management psychologist and consultant Bradford D. Smart's topgrading practices for hiring, training and promoting. Case studies of topgraded companies — including General Electric, Hillenbrand and the American Heart Association — prove that it's possible to vastly improve how people are hired and promoted at companies large or small. By rewarding A-Players, improving B-Players and weeding out C-Players, topgraded companies are much more successful.

Topgrading can enable your company to gain a sizeable advantage over your competition.

IN THIS SUMMARY, YOU WILL LEARN:

- How leading companies have embraced topgrading.
- A practical approach to the Topgrading Interview, the proven best practice for assessing talent.
- How to turn some B-Players and C-Players into A-Players.
- Successful techniques for developing and coaching A-Players.
- How to gain a strong advantage over your competition.
- What management competencies to look for when hiring a potential A-Player.

Topgrading: Every Manager's First Priority

How dramatically can topgrading improve talent? The average company today hires only 25 percent A-Players, promotes only 25 percent A-Players and has 25 to 40 percent A-Players in management. Topgraded companies hire 90 percent A-Players, promote 90 percent A-Players and eventually have 90 percent A-Players in management.

What Is Topgrading?

Topgrading is filling every position in the organization with an A-Player, at the appropriate compensation level. Topgrading involves replacing underperformers until the entire team of 10 consists of 10 A-Players, or at least those who clearly exhibit A-potential. When you are topgrading, you are not accepting a mixture of A-, B- and C-Players. You are proactively doing whatever it takes to pack your team with *all* A-Players. Topgraders are not cheap. Circumstances might justify paying above the *entire* accepted salary range. The topgrader is more rigorous than the "upgrader," more thorough in assessment and more likely to get what he or she pays for.

Proactively seeking out and employing the most talented people can have a major effect on the creation of other competitive advantages. High performers contribute more, innovate more, work smarter, earn more trust, display more resourcefulness, take more initiative, develop better business strategies, articulate their vision more passionately, implement change more effectively, deliver higher-quality work, demonstrate greater teamwork and find ways to get the job done in less time with less cost. It's no coincidence that A-Player managers attract and retain A-Players, who want to be part of organizations that succeed.

Who Is Topgrading?

McKinsey & Co., a premier global consultancy, is known for its commitment to seeking out and employing the best people available at every level. Intel, Dell, Goldman Sachs and 3M attract and retain A-Players and quickly redeploy C-Players. Lincoln Financial, Hillenbrand Industries, General Electric, MarineMax, Hayes Lemmerz, the American Heart Association and UBS increase their percentage of A-Players yearly and redeploy not just C-Players but B-Players too.

What Is an A-Player?

An A-Player is someone who qualifies among the top 10 percent of those available for a position. An A-Player is the best of class. Most fine companies use these definitions:

- **A-Player:** top 10 percent of talent available
- **B-Player:** next 25 percent
- **C-Player:** below the top 35 percent.

The Topgrading Calculator

The Topgrading Calculator helps to overcome talent self-delusion. If you are a perfect topgrader, you don't need a Topgrading Calculator to estimate the number of replacements necessary to achieve 100 percent A-Players. If your success rate is 100 percent, you need only hire one person (who will be an A) as a replacement. If your likely success rate is 25 percent, you need to hire four people to get an A — three mis-hires and your good hire. Topgrading promises to improve your success rate from 25 to 90 percent. In the meantime, to learn how many people you will have to hire to finally have 90 percent A-Players:

Topgrading Calculator

Total Number of Replacements to Achieve 90 Percent A-Players

Number of Underperformers to Be Replaced	25%	50%	75%	100%
10	31	17	11	10
20	67	35	24	20
40	141	72	48	40
100	357	179	120	100

1. Estimate your current number of A-Players, including those with A-potential.
2. Estimate your hiring success rate (your percentage of A-Players and A-potentials after hiring and promoting people).
3. Use the Topgrading Calculator (see above). It will show the total number of people you must hire or promote in order to end up with *at least* 90 percent A-Players, after replacing all those who turn out not to be A-Players. For example, if you wish to replace 10 underperformers, you hire or promote 10 using topgrading, and end up with nine or more A-Players on your team.

The Financial and Career Costs of Not Topgrading

Integrating topgrading into your interview process minimizes the firings and measurable costs of mis-hires, making your course of action relatively quick, seamless and inexpensive.

Topgrading case studies for years have shown how to achieve a 90 percent success rate in hiring. The CEOs of the following organizations estimated the percentage of upper management hires who turned out to be A-Players as follows: Lincoln Financial, 90 percent; Hayes Lemmerz, 94 percent; ghSMART, 92 percent; MarineMax, 94 percent; and the American Heart Association, 95 percent.

Prior to topgrading, most of these organizations experienced a hiring success rate of about 35 percent; Topgrading Interviews took them to 90 percent and higher. Their typical topgrading discipline is for a group of managers to scrutinize each hire one year after the person was hired. B-Players without A potential are deemed mis-hired.

In some companies that evaluation of the hiree is so tough that if the hiree turns out to be a B or C without A potential, the bonuses of the hiring manager and HR professionals are reduced. So there is great confidence that those deemed A-Players truly are.

The Cost of Mistakes

It doesn't make any difference if a person is "hired" from outside or inside the company. Mispromoting internally is about as costly as mis-hiring an external candidate.

At the worker level there are plenty of published statistics on turnover and even a few studies of the costs associated with mis-hires. A computer search of more than 200 studies and articles produced a hodgepodge of single-company results, with costs of mis-hiring factory workers to be $1,500 in one company and salespeople $6,000 in another. Government studies have placed the costs of mis-hiring programmers at two to three times their annual compensation. At the managerial and professional levels, the data are even more sparse.

The single biggest *estimated* cost of mis-hiring is the wasted or missed business opportunity. In recent years there have been many multimillion-dollar fiascos that clearly could have been avoided had an A-Player been hired instead of a B/C-Player.

One of the most insidious elements of wasted or missed business opportunity goes to the heart of topgrading. B/C-Players hire B/C-Players and drive away A-Players.

CEO mis-hires are the most serious. The media, if not behavioral scientists, cite at least some of the costs. Have you read enough about Ken Lay and Dennis Kozlowski? Their companies suffered because of their failures as CEOs. Michael Ovitz was hired and fired by his buddy Michael Eisner at Disney, and Ovitz walked away with $140 million in severance (challenged in later lawsuits). Not only are the stockholders hurt, but all business suffers a black eye when executives reap great financial rewards despite destroying companies and jobs.

The Career Setbacks

There is no clearer truth to a topgrading professional than this: The most powerful lever for career success in management is topgrading.

Its corollary is: There is no more certain career derailer in management than failing to topgrade.

More than 6,000 senior managers have answered exhaustive topgrading questions about every job they held, an average of 10 jobs. Successful careers all have a common pattern: Creating more talented teams accounts for better results, earning managers more promotions.

Sometimes the managers admitted they were lucky — they inherited an A-Team because a boss assigned them the "best and brightest," or they went to work for a topgrading company that taught them how to do it. Most were motivated and resourceful, figuring out how to develop or replace non-A-Players.

The vast majority of managers interviewed in a recent study experienced a stutter step — a failure to topgrade and a resulting failure to perform — that led to career stagnation for a while or, in some cases, getting fired. The most successful leaders figure out the importance of topgrading, do it, get better results and earn promotions. ●

Hiring and Promoting Talent: The Topgrading Platinum Standard

The main responsibility for hiring good people rests on your — the manager's or CEO's — shoulders.

The CEO's job is to achieve results by getting the strategy, talent and organizational culture right. Topgrading must be thought of as a function permeating the entire company, supported by HR but driven by the CEO. When delegated to HR, topgrading fails, even when HR is a fully topgraded function.

HR cannot drive topgrading, because it lacks the line authority and political clout and because many HR systems (compensation, performance management, hiring, succession planning) require CEO intervention to maintain the A-Player standard.

Anyone can topgrade — *any* department manager can topgrade a department; *any* division manager can topgrade a division. But from a corporate topgrading perspective, the CEO cannot assume that A-Player subordinates are doing it. That's why Jeffrey Immelt (CEO) and Bill Conaty (HR) literally spend months in the famous Session C talent meetings at GE.

The same principle holds for you if you are a function head or operating division head. As a division president you can topgrade, but it is foolish to assume that all your A-Player plant managers will topgrade (even though they would not be considered A-Players without being topgraders). In your talent meetings as well as daily discussions, you must be sure that no one is gaming the system or eroding your A-Player standard for political reasons.

Topgrading Assessments

In topgrading companies it is typical for everyone in management to be topgrading-assessed, to create an overall talent picture of A's, A-potentials and non-A's. Managers are developed and become A's or are redeployed, and eventually there are 90 percent A-Players. Companies relying on a current performance review and a three-year-old topgrading assessment fail to achieve 90 percent success in promotions. To achieve a 90 percent success in promotions, you must supplement performance appraisals with a fresh, current topgrading-based assessment. ●

Redeploying Chronic B- and C-Players: A Moral Approach

If topgrading means packing teams, even the entire company, with A-Players, then it usually involves removing chronic B- and C-Players. *Chronic* means they don't even try to become A-Players or else they have embraced their Individual Development Plan, or IDP, (a performance plan to maximize strengths and minimize weak points) but simply aren't improving sufficiently to qualify as A-Players in a reasonable amount of time.

Some B/C-Players can be redeployed internally into jobs where they can be A-Players. If this isn't feasible, they are redeployed externally. They're let go or "changed out," though typically with an appropriate severance and outplacement counseling. Having worked on their IDPs, they also have good insights into themselves and a clear understanding of what sort of job would enable them to be happy and … A-Players!

Unfortunately, topgrading requires some firing or asking people to resign. It's painful, but it's not immoral if companies:

- Use the best selection techniques, which lead to hiring 90 percent A-Players.
- Use the best assessment techniques, which identify as many people with A potential as possible.
- Use the best coaching techniques, which give A-potentials the best chance of becoming A-Players.
- Look for other internal jobs where the person would be an A-Player.
- Fire people only if they fail to achieve agreed-upon standards for performance. ●

Topgrading Case Study: Lincoln Financial

In 1998 Jon Boscia was named chairman and CEO of Lincoln Financial, and he continued to execute the new business strategy, transforming Lincoln from a traditional life insurance company to a diversified financial services

powerhouse. Topgrading was key to the success.

Today Lincoln, with $5.3 billion in revenues and $131 billion in assets, is a different company, one of the nation's leading providers of wealth accumulation and protection, financial planning and investment advisory services for the fast-growing segments of affluent and retirement markets.

Topgrading required dramatic changes in management, not because the company had weak talent, but because some of the managers in the traditional insurance company lacked necessary competencies to drive the strategy.

Boscia said, "About half of the top 100 managers were A-Players in the old Lincoln and became A's in the new Lincoln, but others simply did not have the necessary skills for the new strategy."

Simple Topgrading Model

To qualify as a company that topgrades, the A-Player standard has to be embraced, but that alone is insufficient. The A-Player standard is not achieved without superb methods to assess and deploy internal talent and assess candidates for selection.

The simplest model for topgrading includes these five essential components:

1. Topgrade from the top down.
2. Assess internal talent using Topgrading Interviews, a process that involves an indepth review of an individual's education and work history, his or her core competencies, as well as a thorough background check (*see page 6 for more information*).
3. Coach people using Topgrading-based Individual Development Plans.
4. Hire and promote people using Topgrading Interviews.
5. Redeploy (fire, demote, transfer) people who fail to achieve the A-Player standard. ●

Obstacles to Topgrading and How A-Players Overcome Them

Ratcheting up an organization's talent involves many obstacles. Here are the top 10 major obstacles to topgrading and the best practices to overcome them:

1. "I can't get my B/C-Players to hire A-Players." Topgrade from the top down, or require your A-Players to make the topgrading judgments for their B/C's.

2. "We think we're hiring A-Players, but they turn out to be B/C-Players in disguise." Perform more accurate assessments using the Topgrading Interview.

3. "Our human resources people are overworked and understaffed, so we don't exactly have a pipeline of A-Players going through the office." Constantly recruit your "virtual bench," your network of A-Players in your Rolodex, who are ever available to join you. And require all your managers to constantly build their virtual bench.

4. "Search firms just don't produce enough A-Player candidates." Manage the search process, including search firms, much more thoroughly.

5. "I want to raise the performance bar, but almost every talented person I bring in from the outside is rejected by the current organization culture and ends up quitting." Provide new A-Players protection from undermining by existing personnel.

6. "We can't afford to hire A-Players." A-Players are available at *all* compensation levels.

7. "I do not want to fire loyal B/C-Players." Redeploy chronic B/C-Players because painful as it is to fire someone, failing to do so is almost always more painful — to the company, your career and the underperformer.

8. "Our problems will soon clear up because we engaged a management consulting firm and their report looks great, so topgrading isn't necessary." Topgrade first. Organizations that topgrade are able to drive improvements in strategy, productivity, innovation, quality, customer service and speed to market.

9. "We could never attract A-Players because of our location, industry, current financial problems and so on." Pay more in compensation to attract the level of talent necessary to beat the competition.

10. "My subordinates tend to give 'thumbs-down' on A-Players." Don't let them have a vote. Make the hiring decision yourself. ●

Coaching 101: The Topgrading-Based Model

Coaching is a one-to-one dialogue in which a coach helps a person understand his or her strengths and weak points and build commitment to improve performance. Coaching helps unlock someone's potential. This involves:

- **Counseling** — to help someone improve self-awareness and change points of view.
- **Mentoring** — sharing sage advice to help someone become more savvy in matters of organizational culture, networking and career planning.
- **Teaching** — instructing someone in order to improve expertise.

• **Confronting** — addressing non-performance to help someone either achieve performance goals or accept the necessity of redeployment.

Ordinary solid human qualities blended with topgrading best practices frequently result in leaders being rated "very high" on coaching scales. This becomes clear during assimilation coaching, a disciplined process to help your new hire adjust and to begin a comprehensive developmental process.

Assimilation Coaching

First-time topgrading interviewers have fun in assimilation coaching, a high-powered, positive coaching session. You feel empowered, so it is relatively easy to empower your new hire. There are fewer problems to fix with A-Players than with C-Players, so there is little inclination to push, cajole or demand certain changes.

With an initial coaching meeting a success, you become positively reinforced to polish your skills, to extend coaching to other subordinates. Hiring an A-Player using topgrading interviewing and thorough reference checking automatically endows you with super-coach characteristics.

A topgrading-based coaching meeting, whether for assimilation or another purpose, is not always warm and fuzzy. Even A-Players have weak points — plenty of them. Coaching need not be acrimonious, but to be effective, it must be hard-hitting.

The nicest thing you can do for high-potential managers is tell the truth and hold them accountable for growth. That means saying, "Improve, and only then will you get promoted." People change the most when they sense pain in not changing and benefits in changing, and fully embrace developmental activities to achieve their goals.

Whether coaching a new hire, addressing a newly observed problem, or facilitating change in any performance-management or career-development system, the steps are the same: awareness, rational acceptance, emotional commitment, individual development plan, reinforcement, monitoring progress and conclusion. Implied in all seven steps is who's in charge — not the coach, but the person receiving the coaching.

Coaching to Fix Weaknesses

Having conducted a Topgrading Interview gives you instant coaching advantages. Having hired an A-Player, you automatically are 20 percent better as a coach.

The four essential steps in coaching a new hire to succeed are:

50 Management Competencies

A-Players need not be excellent in all competencies, but they must meet the minimum standard for a particular job on all of them. The following are 50 management competencies:

• **Intellectual Competencies:** Intelligence, analysis skills, judgment/decision making, conceptual ability, creativity, strategic skills, pragmatism, risk taking, leading edge, education, experience, track record.

• **Personal Competencies:** Integrity, resourcefulness, organization/planning, excellence, independence, stress management, self-awareness, adaptability.

• **Interpersonal Competencies:** First impression, likability, listening, customer focus, team player, assertiveness, oral communication, written communication, political savvy, negotiation, persuasion.

• **Management Competencies:** Selecting A-Players, coaching, goal setting, empowerment, accountability, redeploying B/C-Players, team building, diversity, running meetings.

• **Additional Leadership Competencies:** Vision, change leadership, inspiring "followership," conflict management.

• **Motivational Competencies:** Energy, passion, ambition, compatibility of needs, balance in life, tenacity.

1. Hire an A-Player with a tandem Topgrading Interview, reference checks with all bosses in past 10 years, a co-worker competency interview (one hour each), and conclusions stated in a Candidate Assessment Scorecard (CAS), a simple form used to assess the candidate on all competencies.

2. Conduct oral interviews or e-mail 360 survey two to four weeks after hire, with the purpose of measuring first impressions.

3. Have a coaching interview two to six weeks after hire; state conclusions, strengths, weak points; and create an Individual Development Plan together.

4. Hold a mid-year career review in which you discuss follow-up e-mail 360 survey results and include feedback to you.

This rather typical assimilation-coaching session should progress through the seven psychological stages of change: awareness, rational acceptance, emotional commitment, program for development, reinforcement, monitoring progress and conclusion.

Constructive Criticism

The business world is too fast-paced and too demanding for quiet, gentle little hints, except with a rare subordinate requiring your most flexible and sensitive care. This world requires hard-hitting constructive criticism.

You want the straight scoop if your boss is dissatisfied. You want to be treated with respect, and you respond best when you are presented positively with an opportunity to improve. Your subordinates want and deserve the same thing. ●

The Topgrading Interview Guide

The Topgrading Interview Guide provides you with the most accurate and valid insights when assessing internal talent and candidates for selection or promotion. Companies can achieve a record of 90 percent A-Players hired when a tandem interview (two interviewers) is conducted and the interviewers have been trained in Topgrading Interview techniques.

The Topgrading Interview Guide features comprehensive questions that cover college, work history, self-appraisal of strengths and weaknesses, leadership/management, topgrading and competencies. It produces more valid results than so-called targeted, or competency-based, interviews that ignore dozens of important competencies as well as the chronology, the crucial patterns of how the interviewee developed throughout his or her career.

Interview Questions to Facilitate Topgrading

During the interview process, it's important to ask thorough questions about the interviewee's education and prior work history. Beginning with college, incorporate some of the following questions into your Topgrading Interview:

- What people or events during college might have had an influence on your career?
- What were the high points during your college years? (Look for leadership, resourcefulness and particularly what competencies the interviewee exhibits *now* while discussing those years.)
- What were your career thoughts toward the end of college?

Following the questions about education, move into a discussion about the interviewee's work history. Based on his or her resume, you will already have an overview, but the following questions will allow you to delve deeper:

- What were *your* expectations for the job? What did you find when you arrived to the position? What major challenges did you face?
- What results were achieved in terms of successes and accomplishments? How were they achieved?
- As a manager, what sort of talent did you inherit? What changes did you make, how did you make them, and how many A-, B- and C-Players did you end up with?

It is also necessary to have the interviewee give a self-appraisal. This involves listing all of his or her strengths and assets, as well as any shortcomings and areas for improvement. After obtaining the list, go back through and have the interviewee elaborate upon each point. Finally, ask the interviewee to go over his or her competencies with you. These include intellectual, personal, interpersonal, management, leadership and motivational competencies. A general question such as "Please describe _____ and what specific examples can you cite?" should be asked. This information will allow you to assess a number of the interviewee's competencies.

Interpreting All the Data

Here are some of the most important principles for valid interpretation of data:

1. Observe patterns. Patterns in many statements give multiple vantage points from which to find out what makes a person tick and what the person's strengths and weak points are.

2. Assume that strengths can become shortcomings. Under pressure, we all tend to overuse our strengths, and they can become shortcomings. During interviews, entertain this hypothesis frequently.

3. Assume recent past behavior is the best predictor of near-future behavior. As you review an individual's chronological history, weigh the most recent behaviors most heavily.

4. Spot red flags and look for explanations. Red flags are warning signals to the interviewer that something has gone wrong. Use follow-up questions to get additional information.

5. Weigh negatives more heavily than positives. Good-fit factors do not ensure success, but poor-fit factors can ensure failure.

6. Watch out for strong feelings and beliefs. Naturally, strong beliefs can be an asset for any candidate. It's when the beliefs are accompanied by rigidity, intolerance and extreme emotionality that you begin to wonder if there might be accompanying shortcomings. ●

Avoiding Legal Problems

Topgrading can embrace the spirit and letter of employment law or it can be abused. An effort to remove chronic B- and C-Players can incur big risks if

care is not taken to avoid a charge of discrimination — age discrimination, for example.

Developing future A-Players can trigger litigation if disabled people protected by the Americans with Disabilities Act are overlooked. The Equal Employment Opportunity Commission will be knocking on your door if your infusion of new A-Players systematically excludes minorities. Employees and managers have discovered not only their civil rights, but also their contract and tort rights. Unless your company protects itself, it could face serious employment-related claims, including claims of wrongful discharge, breach of contract, discrimination, negligent hiring or harassment.

Topgrading will help you meet legal requirements during the hiring process. The leading-edge practices in recruitment and selection — job analyses, behaviorally anchored competencies, structured interviews, note taking and so forth — must be coupled with working hand in hand with your partner in HR and your legal counsel to avoid legal problems. State laws vary and your company might be vulnerable. So check with your attorney before acting or failing to act.

Safe Hiring and Firing Practices

Despite the complexities of employment law, the answer is to focus on the fundamentals: (1) perform thorough job analysis; (2) write job descriptions with behavioral competencies; (3) use nondiscriminatory language in employment applications, topgrading forms and guides, job advertisements and interviews; (4) use legally sound job offer letters; (5) avoid negligent hiring and retention claims; (6) use safe managing and firing practices; and (7) follow guidelines on how to topgrade outside the United States. ●

Topgrading in the Future

It's hard to imagine an organization that cannot benefit from topgrading. From hot dog stands to the United Nations, A-Players get results, C-Players don't. What organization cannot benefit from a 90 percent success in hiring versus 25 percent?

Consider just a few future venues for topgrading:

1. Community Service. Community-service organizations can attract more money in the future by topgrading them and advertising, "We have a team of A-Players who will spend your donations for maximum results."

2. Government. Why not screen political candidates for financial support by submitting them to Topgrading Interviews?

3. Finance. Half of all mergers and acquisitions fail, and the biggest reason is inadequate talent. The most successful venture capitalists are very rigorous in assessing management in organizations in which they invest; they qualify as topgraders. Topgrading offers the world of finance accurate insight into people.

4. Governance. To hire a CEO, boards have historically trusted the search firm's interviews and report, with directors performing perfunctory interviews. With directors taking more (deserved) heat and incurring more legal risk, it would seem prudent to select a CEO by topgrading.

5. Legally Mandated Topgrading. With race norming and quotas illegal, yet the pressure for affirmative action continuing, valid approaches for hiring truly talented protected groups is the solution.

6. Education. Are 90 percent of teachers in your school system A-Players? European high schools surpass U.S. schools on standardized tests, yet our per-pupil cost is sky-high (six times what French students are allocated, for example).

7. Career Planning. Topgraded companies rarely promote people over their heads or leave a super-talent languishing and underutilized. Educational institutions could assess students' career talents much better if they would incorporate a Topgrading Interview.

8. Future Research on Topgrading. Talent as an issue, or opportunity, is as old as the human race. Many companies could contribute to the body of scientific literature, and hundreds of master's theses and Ph.D. dissertation could refine and connect individual corporate studies.

In the meantime, you can conduct your own research on talent maximization every day. Topgrading is not easy. There are lessons to be learned, by you and me, about what topgrading approaches work best. Your personal "case study" is an art form, a work in progress. ●

How to Mentor People and Allow Them to Be Successful

THE HANDS-OFF MANAGER

THE SUMMARY IN BRIEF

The No. 1 reason for quitting that employees cite in exit interviews is "my manager." Most managers and executives not only aren't aware of this obvious problem, but also probably wouldn't know what to do about it if they did.

Today's employees do not respond well to the old hands-on, militaristic management styles. They are highly independent, individual professionals with their own fully developed ideas.

Fortunately, there is a new management style on the horizon: hands-off managing. Managers who practice this style are devoted to rekindling the human spirit within their companies by keeping their hands off their employees' happiness and allowing success to happen. These leaders recognize that real power comes from partnering, not criticizing.

In *The Hands-Off Manager*, Steve Chandler and Duane Black offer this new management vision, showing how any manager — new or seasoned — can coach and mentor employees rather than hover over their shoulders and goad them into action.

In this system, each employee's strengths are honored and honed in a climate of partnership and goal-setting. *The Hands-Off Manager* finally provides the solution to the age-old problem of getting the best performance out of people without frustrating them or you.

IN THIS SUMMARY, YOU WILL LEARN:

- How to improve your management skills by finding a style that fits who you are and what you love to do.
- What it means to be in alignment with life, your team and yourself.
- How to hire people and place them in roles suited to their talents.
- What steps you can take to unlock the powers that live naturally inside others.
- How to improve the attitude of your team and the success of your company.

Taking Your Power Back

Much management activity today is brought to life by Peter Drucker's comment, "So much of what we call management consists in making it difficult for people to work." Managers make it hard for their people. They unknowingly kill the human spirit by their old-school micromanaging and critical judgments.

But there is a new kind of manager emerging in companies today, known as the "hands-off manager."

All managers have two communication styles from which to choose:

- **Hands-on:** They can criticize and judge their people.
- **Hands-off:** They can mentor and coach their people.

This choice presents itself many times throughout every day. Every communication with one of your people is going to be a version of this choice. If you choose judgment and criticism (implied or otherwise), you will provoke defensiveness and withdrawal — not creativity and productivity.

When we judge people and find them coming up short, we then start to criticize and micromanage them. In this age of the sensitive, knowledge-based worker, that's a self-destructive cycle. It engenders nothing but resentment and push-back.

Also, when we judge, we are giving our power away. When we resent a team member, we are giving power to that individual — we are giving power to the person we are angry with by allowing him or her to occupy and dominate our thinking. Real power in leadership comes from partnering, not criticizing.

Hands-off managers set themselves apart by retaining their power. They make the effort to understand everyone they meet, in order to reduce their stress levels at work. These managers are completely aware that every time they judge someone, they alter their own well being.

The hands-off approach allows you to learn to take your power back and live in a world of quiet action and nonjudgment. If you do this, you'll soon be living with an open mind, forgiving effortlessly and taking back control of your energy and enthusiasm for doing great work. ■

Redefining Success for Yourself

Your first job as a hands-off manager is to manage your inner life. It is impossible to mentor others toward success if you haven't done it within yourself. Hands-off management begins in the mind of the mentor.

So how do we make sure we become successful? Most people never succeed because their definition of success always includes some change in the outer world, and the outer world is so hard to change. So you might begin by redefining success for yourself, and you might find that the definition is already inside you.

Once you wake up to this inner resonance, you will know when things have meaning for you and how you can use them in ways that will benefit your life. This inner tuning and intuition is at the heart of hands-off management. You don't need to get your hands on the world to shape and manipulate what's already perfect inside you.

That's the key to the hands-off life: Find a way to let what's in you naturally come through. Rather than racing around learning all kinds of new managerial systems,

Redefining Success for Yourself

(continued from page 2)

Great Ideas in the Shower

Many surveys show that managers get their best ideas in the shower, when doing easy yard work or while on vacation. Why is that? It's because you've stopped trying to control your thinking. You've taken your hands off your mind and allowed the wisdom within to emerge.

At a mental level, this is similar to the difference between talking and listening. People have taught for years that if you listen, you will learn more than if you're talking. But people have always assumed that "listening" only means listening to another person, an all-too-narrow interpretation of listening.

Hands-off management starts with listening to yourself; tuning in to your own heart and mind, because if you learn to listen to your inner being, you will learn more than if you're always trying to talk to yourself about how things should be.

procedures and trendy formulae, just get better at knowing yourself and the person you are managing. ■

Using the Power of Neutral

Organizational life is a constant process of negotiation and sales. It's an ongoing opportunity to promote a particular perspective in order to accomplish a purpose you are working toward. But not everyone sells the same way or from the same position. In fact, what really sets a hands-off manager apart is taking the neutral position. Managerial mastery is simply an unusual ability to achieve the neutral position.

Neutral observation is the ultimate vision. As a true and artful observer, one must be without judgment and without a position. A true observer gains power from seeing all valid positions from a neutral position.

Managers deal every day with opposites. We deal with up and down, success and failure, hard and easy. What we don't understand is that those opposites go together and need each other. We can only experience easy because hard exists. Yet we're always anxious to remove the opposite of the experience we seek — and in reality that's not possible.

So, a micromanager's resistance to opposition, and to the opposite of what he seeks, blocks him from getting to where he's trying to go. He gets good critical feedback, and instead of being open to it, he's immediately defensive. ■

Using Focus and Intention

Hands-off management means hands off the past and hands off the future. Your focus is the present moment because you understand that productivity always happens *now*. As your people learn to create freely in the present moment, success comes to them. When we are in that creating mode, we are advancing upward, evolving and expanding toward higher levels of success. Creating always occurs in the moment, never in the future.

Attaching to Your Thoughts Like Velcro

Sit down with an unsuccessful, unhappy or struggling manager and you will hear him describe where his focus goes: "I get too many phone calls. I have too many personal problems to deal with. My health is not ideal right now. I have too many visitors. I'll never be able to answer all my e-mails. My reports are overdue. I have too many meetings to attend."

Notice all those stressful thoughts crowding in on this manager. The hands-off manager learns to take just one of those thoughts and work with it. "I get too many phone calls" turns into "I'm putting my calls direct to message. I look forward to hearing them later when I'm ready and focused on them."

Hands-off managers are creators. They take one stressful situation at a time and create something good from it. Hands-on managers, on the other hand, are reactors. They react to all thoughts, all day, full alarm. For them, life itself is an emergency.

Management by Worrying

Old-school managers believe that if they don't get worried enough about something, they won't solve the problem. So their internal motivation system is fear. They think they have to *scare themselves* into doing the right thing. However, when you are a manager focused in the moment, you are moving your team forward again. You are paying attention to what's being communicated to you. You are honoring every experience. You are finding value in everything that has ever happened to you. You have respect and caring for others.

Many people think this neutral and accepting focus would make them passive and directionless managers. Quite the opposite! Pure action emerges from an undistracted mind. Because that is where *intention* enters the picture, rises up and takes over.

It's important to have intention. But an intention is different from a goal, and knowing the difference is vital to your success. Goals in companies and with indi-

Using Focus and Intention

(continued from page 3)

viduals striving for success are expressed this way: "The goal is where I want to get to, and I'm going to be really unhappy and disappointed if I don't arrive there."

Obviously this kind of thinking only introduces stress into the human system. It builds discomfort and unwanted pressure. Stress is not optimal for performance. That's why it's more effective to use peaceful inner intention.

One can more easily think, "Well, that's where I intended to go to, but oh well, I didn't get there." It may sound weak, but it's actually stronger, because from that non-stressed mood you are more likely to keep trying. You are able to say, "It was just an intention. It's okay that I didn't get there. I'm going to keep working on it."

With an intention, there's no place to get to — no hill to climb. The intention is in you already. You just flow with it and use it as a direction monitor. ■

Questions Leading to Success

The hands-off manager doesn't spend a lot of time giving advice. Instead, he or she perfects the ability to ask questions that allow success and fulfillment to happen, questions such as "What things come naturally to you?" or "How easy is the workflow for you right now?"

We have been trained by the media, our families, our traditions and our culture to focus on the negative and try to fix it. We obsess over sins and shortcomings, trials and tribulations. We try to go outside ourselves to change the negative. Then we try in vain to create an external situation that's positive.

But none of that works, because the positive solution is on the inside. What we were seeking was already in us. How do you find these solutions inside you? Start asking questions, and then listen. Take a moment after you do something and question how it feels to you. Listen to that feeling — with a little practice and discipline, it's not hard to find a way to test all your actions against this inner knowing. ■

Inspired Ideas Lead to Success

The best ideas come when you stop forcing your thinking. The straining involved with forced thinking actually pushes away ideas. You are repelling that great idea that wants to float up and announce itself. But how do we get into that relaxed, hands-off state of mind?

The answer is to learn to listen and recognize, to learn to be available for the ideas that are in us instead of trying to find them in a manual or guideline.

That's the secret discipline involved with success. It's in *allowing* yourself to step back and let it happen. It's a tough discipline to learn at the outset, but it's a rewarding one. It rewards you in large ways by helping a great career to unfold. But it also rewards you in smaller, more immediate ways: For example, you can actually finish your workday with a low level of stress. You can learn what it means to do less and achieve more.

Not a Soft or Passive Approach

When a hands-off approach is used, energy and productivity increase. The approach holds people *more* accountable for high performance, not less. It is not patient with people whining and playing victim. It has no room for self-pitying complaint.

Sometimes, a hands-off manager can be "hard" on team players to wake them up to their power. You want to get their attention, so you might say, "Look, this is ridiculous. You're some of the most talented guys I've ever worked with. I've watched you perform at a level that was truly exceptional. And now you're stumbling over this? This is not acceptable. It shouldn't be acceptable to you, either. Tell me what I can do to assist you right now."

Disappointment and Mismatches

The "common sense" world has laid out a false map for us of what it means to be "successful." Most definitions of success associate it with becoming an admired leader, becoming financially abundant, finding an ideal love mate or living for a long time. But those pursuits are all comparison-based in their definition of success. They focus as much on one-upping or excluding others as they do on inner peace and happiness. ■

Practice Finding an Inner Vision

Learning to make decisions based on inner listening — paying attention to gut instinct — is different from trying to judge what the "right" or "wrong" thing to do would be. That's the old school of management — to take right and wrong, make them absolutes and try to impose them in the workplace.

Instead, find what you are aligned with and what feels natural to you with every decision you think you have to "make." Actually, for the hands-off manager, decisions

(continued on page 5)

Practice Finding an Inner Vision

(continued from page 4)

have a way of making themselves, of becoming such obvious choices that no real decision is necessary. You just know what to do next.

As you bring people onto your team, you'll become skillful at choosing the people with whom you feel a sense of alignment. You'll know them and feel a sense of well being when you're around them.

A Different Kind of Vision

Some top leaders say a great leader is a visionary. And we know they are referring to market trends, product and service development and all the things business magazines tell them to think about.

The hands-off manager is a different kind of visionary. The hands-off manager's vision is not a vision for what the company will be in 10 years. It's a vision that sees into the potential of people right here and now. Your success as a hands-off manager will be directly related to your ever-increasing ability to see more in your people than they're seeing in themselves.

This vision goes other places too. For example, you acquire a new vision of the customer. You realize that if you don't observe your customers and why they're buying, as well as why they're not buying, you will lose your ability to help them. Vision, again, becomes observation. It's not a fantasy trip to an island in the future. Your customers are waiting to tell you how to relate to them.

The Rewards of Hands-Off Decision Making

The hands-off approach carries this key insight: Allowing success is the opposite of forcing success. It is learning what it means to be in alignment with life and with yourself. Many people think this is theoretical, spiritual or something that hasn't ever been used. The opposite is true. This is an applied system that works in the real-world workplace.

You'll consistently find the strengths in your people instead of trying to add what's missing. You'll be able to teach them to use what's inside them instead of trying to fix them and doing the things most managers try in vain to do.

Most businesses operate through wild attempts at control. They focus on their own rules, policies, detailed supervision, inspections and quality control as if their people were trained animals. The hands-off manager is the solution to that dysfunction. When you find people who love to do what you're asking them to do, you don't have to control or motivate them. You don't have to force them to work harder. They're already doing it.

What Is the Manager's Job?

Your job as a hands-off manager will be a job of learning. You'll be learning to be aware of what your people love to do. You'll be learning what powers live naturally inside them. You'll then be more skilled at placing people in roles suited to their talents. You will see into them, see what they love to do and listen to what they tell you.

It can get interesting and challenging when you embark on this journey, because people don't always tell the truth. They tell you what they think you want to hear or what they think will get them a higher salary. That's the curse of approval-seeking in action. You'll detoxify that situation every time you show them that winning your approval is not a productive pursuit. Approval-seeking is our society's most futile and dysfunctional pursuit. If your people can learn to drop it from their workplace endeavors, they may even learn to drop it at home and improve their personal relationships. ■

Tuning Your Instrument

Your highest purpose is to become the fulfillment of your potential — to learn to manifest and bring into the world the gifts that are contained within you. It is simply the most fundamental, the most profound and the most important reason for living. It's to become who you already are.

Purpose is letting the best of what's in you come through and then giving it to the world. That's your life's purpose. And everyone has the same purpose. Within that purpose, they have their individual outer manifestation: to entertain, to organize, to teach, to create. ■

The Hands-Off Football Coach

When the University of Texas football team won the national championship in the 2006 Rose Bowl, it was largely due to their star quarterback, Vince Young. Young had become a well-rounded, complete player in his junior year, and many were calling him the best quarterback of all time.

When his coach, Mack Brown, was asked how all those improvements in Vince Young's game occurred from one year to the next, Coach Brown said, "We just stopped coaching him. We just got out of his way. We saw what was emerging in him, and we decided to let it come forward without a lot of old coaches messing with it."

Becoming Available

If we are the old-school micromanagers, then we've been in hiding. We've been unavailable. We've been hiding behind a disguise made up of problems, and excuses for having those problems. However, it's time to turn and go another way, to calmly choose another path to take. This path will make you available to yourself and to others. Old-school micromanagers try hard to learn how to succeed. They seek out teachers and success gurus. They want to think and grow rich. But it's that very thinking that's in the way.

Galileo knew that the answer was not in outside knowledge. "You cannot teach a person anything," he said. "You can only help him discover it within himself." Galileo's words are the heart and soul of hands-off management.

Let's say you've cleared your mind and learned to disarm all the negative thoughts in your life as they arise. Now you're free to discover who you are. You're free to realize the best that's in you.

What's really happened? You've become available to yourself. And in this freedom from all those burdens you've been carrying, you're able to follow your instincts. Because you listen to your instincts and you're not worried about what other people might have said about you. You're available for inner ideas. You're available for insights. You're available for inspiration.

You've erased that wall you have built up in yourself though a lifetime of criticism, self-judgment, anger and disappointment — all the thoughts that have blocked your potential from coming through. ■

Letting Go of Judgment

The common theme of most managers is that they are always mildly upset about what's happening. But what's happening is not upsetting them — their judgment about it is.

Anything that bothers us only bothers us because we have a judgment about it. We cling to passing thoughts that say, "This is wrong! This shouldn't be happening to me!" But we don't stop to realize that the upset we're experiencing is caused by our judgment.

If we could be open to all things and see them as the flow of the marketplace and get away from what should not be, we would release ourselves from a monumental amount of dissatisfaction, stress and blame. This ability to dismiss judgment when it pops up is a critical skill for the hands-off manager to cultivate.

If you try this dropping of negative judgment for long enough, it will produce peace at your center and a gentle surge of relaxed intelligence to allow you to deal well with any issue. We aren't saying you should be in denial. You can be an expert evaluator of performance without being emotionally "disappointed" or "upset" with a person's actions. Knowing the difference is vital.

Living in the Moment

As a hands-off manager, you can be different. You can start your day centered in the peaceful, present-moment awareness of infinite possibility. That's because you no longer imagine all the things that are going to go wrong. There is no "wrong" way things can go. They're just going to go where they're going to go. There's no more judgment about what's going to occur.

We are not saying to take a passive attitude. This is the opposite of passive. It's an active embrace of what is. It frees up energy that had previously been trapped in internal conflict and distress. You are ready to act sooner.

Life is not so much about what's going on, but how we choose to interpret it. Soon you alter all your thinking to be about you and your interpretations instead of the "bad" and "wrong" and "unfair" things that have happened. Practical benefits arise from this managerial approach. Your people will be more comfortable with you when you accept them the way they are. They will be more trusting of you, and their interest will turn to doing great work for you.

Once employees find out that you aren't judging them, they'll share almost anything with you. That's when you can make real progress in helping them improve their skills. The hands-off manager has the rare ability to enter into a true partnership devoted to the success of the employee. Employees who aren't being judged are far more open to coaching and mentoring, and allowing their managers to help them improve. ■

Waking Up the Whole System

Feeling your connection to everything enhances hands-off success. It comes from feeling all the support you are already getting. You don't need to put your hands on anything to wring out that support. It's already everywhere. Most people live completely unaware of how supported they are. They think they are relying on themselves. In their offices, they have signs that say, "If it's to be, it's up to me."

(continued on page 7)

Waking up the Whole System

(continued from page 6)

They also think they can make money only if they take it from someone else. In their contracted view of life, it's a zero-sum game. But the universe's evolution outward toward infinite expansion is not a zero-sum game. Any time you try to create a system around the finite zero-sum premise, the system collapses, because it isn't in agreement with nature. ■

Deepening Your Desires

The hands-off manager always wants to go deeper, to find what lies beneath a co-worker's desire. You don't just want to know what he or she wants, you want to know why. That allows you to put your mentoring and coaching into that context. You are helping people get what they want, not what you want.

And when you take their "wish list" deeper than the first blush, you can show them how to live the life they dreamed of right now, with your full support. Otherwise your people are seeking the end without the means.

You will help them go right to the means. So instead of having goals about how many millions they're going to have, they now have intentions about how effective a person they're going to be. They now have intentions about what's inside them that would create the wealth. Under your mentoring, they can reformat their approach to what they want. ■

The Ultimate Zero-Sum System

Marxism — a zero-sum system — was created on the paranoid concept of the finite limitation of wealth; in other words, there's only so much wealth in the world. It was the ultimate hands-on system of micromanagement taken to the extreme.

Marxism said there are limited, finite resources and we must take these limited resources from the rich and redistribute them. What destroyed Marxism was the recognition in the free market system that wealth is infinite and unlimited.

Similarly, this limitation and finite thinking can also destroy an organization from within. For example, a lot of people think that if they deliver extraordinary customer service they'll have to give up profit. They don't have the imagination to see how huge a contribution great service is to their long-term bottom line.

To make certain you never fall into this zero-sum black hole, focus on what you're giving. Trust the system and know that it will work. By doing this, you will get results.

Living in Three Worlds

Allowing success requires that we create an understanding within ourselves of the existence of three worlds that we live in every moment of every day, simultaneously.

These worlds are spirit, mind and body (or the physical world). Most of what happens in those three worlds you can't actually see.

We spend most of our time focused on the physical world. But the physical world is just the manifestation of outcome. By the time you see it, it's too late to change anything. The real change happens internally, not externally. Change becomes *visible* only in the external world.

So our ability to make a difference and change the results we're seeing does not happen by focusing on and fixing external events. Our access to destiny occurs earlier in the process than that. It occurs when we focus on spirit (our intuition and inspiration) and mind (our thinking and planning). Those are the only domains where we can exercise free will and free choice.

You don't get to choose whether the sun's going to come up tomorrow or how other people are going to behave or react to a given circumstance. But you do get to choose *who you are being*.

Focus on Process, Not Results

The Iceberg Principle would say that what you see above the surface in the ocean when you look at an iceberg is only about 10 percent of what actually exists. The other 90 percent of the ice floats below the surface and is not visible to the eye. That's exactly what's occurring in our own world. What we see coming through in physical form is a very tiny portion of all that's actually happening.

The hands-off manager will focus on the process, not the results. The process is the mind and the spirit inside the machine. It's the heart of your organization. If you focus on the process, the results will unfold naturally. So if you have an inner process that guarantees a quality sales force, good customer service, a reliable product and a good marketing plan, you don't have to worry about how to be successful. It flows easily from there.

If you want to make a change, it starts in the worlds of the mind and the spirit. Your spiritual world becomes the world from which you receive ideas, inspirations and insights. And the mental world is where you create plans; it's the world where you use thought, analysis, focus and attention to bring into being that which you desire to contribute to the world. The physical world is

(continued on page 8)

Living in Three Worlds

(continued from page 7)

just the world of events, of information. It's where results occur, where data is collected, where objects are manifest, where the outcomes happen and where actions take place. It's the last stage of the process. ■

The Hands-Off Manager as Coach

Hands-off managers become excellent coaches. They create an atmosphere where their people receive coaching gratefully. So the hands-off manager becomes quietly masterful at the coaching process. It's a perfect replacement for the old-school micromanager's habit of criticism, judgment and correction.

Hands-off managers coach their people so that their people's talents are allowed to emerge, allowing them to do better work in the workplace and become more harmonious with their own inner intentions.

You can help your team by first creating a clear concept of coaching itself. You'll want a definition that's easy for your people to understand and is personal to them, so that when you coach somebody, both parties know what they are doing.

The term "coaching" came from the world of sports — a world of performance and numbers. Sports provide a beautiful metaphor for what good coaching is in an organization. In sports, coaching is what happens when a coach or a manager works with an athlete to increase that athlete's ability to contribute to the team.

Unsolicited Advice

A lot of people think that coaching means giving advice, but in a nice way so that you're giving advice but you can call it "coaching." That's still advising. Coaching is a more complete package, because coaching embraces a bigger picture. When you are coaching, the first thing you do is seek to understand the other person. You do not first seek to be understood.

Therefore, the first stage of the coaching session is the intake: You ask questions and you get in touch with the intentions and the inner motivations of the person. It's important for you to see what they want to achieve, what they're trying to do and how they see the situation. So first of all, you want to listen, ask more questions and let them talk. Keep your hands off their answers. They don't need fixing.

An important skill of effective coaching is knowing to ask some good, open-ended questions that reassure the person you're coaching that you're really interested in how they feel and how they see things. That's what you're going to work with. You're not going to work with some preconceived notion of how things should be. That's just a subtle form of advising and is condescending.

Coaching Is About What's Possible

Coaching is moving people from being stuck in a mind-set in which they think they are limited to opening a new possibility. The hands-off manager has what the Zen masters call "beginner's mind": Nothing is impossible. If you are that manager, you are always looking to move people from rigid limitation to possibility.

Lasting behavioral change is always the ironic specialty of the hands-off manager. By not micromanaging, more things change. By keeping your hands off the process, the process improves faster. Would you pull a flower up with your hands from the ground to help it grow? Why try to do similar things to an employee?

A Quest for Understanding

What does coaching lead to? Better behavior? More productivity? Something you, as a manager, want? No. What good coaching leads to is that the person you're coaching will achieve his or her objectives faster. Not yours. That's really vital in coaching: focusing on the wants and needs of the person being coached, not your own.

When you're coaching someone, you are coaching them so that they realize their objectives faster; you're not coaching them so they become better for what you want, or so they serve the company better after the coaching session. They will, but that's a side effect.

When you are doing your hands-off coaching, you're helping people align with their own intentions and noticing how their intentions are in alignment with yours. You *can* coach. Just be yourself and be committed to the higher good. As a hands-off manager, you enjoy creative freedom, because you are not burdened with doing things right and making others wrong. That's why the hands-off manager is such a success. ■

THE SUMMARY IN BRIEF

American business has entered the Age of Transcendence, with an increasingly older population searching for the higher meaning in their lives, not just more possessions. According to the authors, a *historic social transformation of capitalism is under way*. In this book they provide a measure of the scale of change by profiling companies that have broadened their purpose beyond the creation of shareholder wealth to act as agents for the larger good.

They call these companies firms of endearment (FoEs) because they strive through their words and deeds to endear themselves to all their primary stakeholder groups — customers, employees, partners, communities and shareholders — by aligning the interests of all in such a way that no single stakeholder group gains at the expense of other groups. They're driven as much by what they feel is right (subjectively grounded morality) as by what others might more objectively claim to be right.

FoEs are run by executives who reflect in their managerial philosophies the changes in culture they are talking about and who are champions of a new, humanistic vision of capitalism's role in society. Firms of endearment are companies people love doing business with, love partnering with, love working for, love investing in.

This summary reveals how FoEs are blowing away the S&P 500 averages and increasing "share of heart" by delivering the emotional, experiential and social value stakeholders are demanding.

IN THIS SUMMARY, YOU WILL LEARN:

- The distinctive set of core values, policies and attributes of FoEs.
- How FoEs outperform *Good to Great* companies.
- Why the best way to serve shareholders in the long term is to embrace a Stakeholder Relationship Model (SRM), as Costco does.
- How companies such as Patagonia, Whole Foods and Google attract and retain employees who see their jobs as a calling.
- The unspoken contract that FoEs honor.

It's Not Share of Wallet Anymore; It's Share of Heart

The meaning of life — and of one's own life in particular — is a perennial issue in midlife and beyond, but the search for meaning has a major influence on the ethos of society and this plays a big role in reshaping corporate culture. The search for meaning is changing expectations in the marketplace and in the workplace, and therefore is *changing the very soul of capitalism*.

Humanistic companies or firms of endearment (FoEs) seek to maximize their value to society as a whole, not just their shareholders. They create emotional, experiential, social and financial value. Some call the emotive dimension the "soul of a company." Companies without a soul face a doubtful future.

What Is a Firm of Endearment?

Consider the words love, joy, authenticity, empathy, soulfulness and other terms of endearment. Until recently, such words had no place in business. Today, a growing number of FoEs embrace such terms. They endear themselves to stakeholders by bringing the interests of all stakeholder groups into strategic alignment. These companies meet the tangible and intangible needs of their stakeholders in ways that engender affection and loyalty to the company.

Firms of Endearment That Made the Final Cut

Most studies of corporate exceptionalism or "greatness," to use Jim Collins' term, start with financial performance and work backward. In *Firms of Endearment*, we instead used humanistic performance — meeting the needs of stakeholders rather than shareholders — and worked forward. In the book is an *illustrative* list of FoEs. None of these firms is perfect; each has areas in which it is relatively weak or somewhat vulnerable. It is important to note we do not claim that a company will forevermore be a great investment once it adopts the Stakeholder Relationship Model (SRM) that characterizes FoEs.

The 30 companies we believe best exemplify a high standard of humanistic performance are Amazon, BMW, CarMax, Caterpillar, Commerce Bank, The Container Store, Costco, eBay, Google, Harley-Davidson, Honda, IDEO, IKEA, JetBlue, Johnson & Johnson, Jordan's Furniture, L.L.Bean, New Balance, Patagonia, REI, Southwest, Starbucks, Timberland, Toyota, Trader Joe's, UPS, Wegmans and Whole Foods.

In terms of how these companies perform, the publicly held FoEs returned 1,026 percent for investors over the 10 years ending June 30, 2006, compared with 122 percent for the S&P 500; that's more than an 8-1 ratio. Over five years, the ratio is even higher, because the FoEs returned 128 percent while the S&P 500 only gained 13 percent. Over three years, FoEs returned 73 percent versus 38 percent for the S&P 500. ■

New Age, New Rules, New Capitalism

For a century, the consumer economy has been grounded in a materialistic *having* focus. That focus is now being diffused by rising desires for a sense of meaning that cannot be drawn from material things. Consumers may still want a given product, but along with that product, many want a high-road experience

that connects with their more mature *being* focus. For example, shoppers at pricey FoE Whole Foods pay substantially more than they would pay for eggs at Kroger just for the good feeling that they are doing right by purchasing eggs from free-range hens. As more consumers make purchases based on self-actualization — the need to make the most of their abilities and strive to be the best they can — the way business is done is being reshaped gradually.

Shareholders Versus Stakeholders

The best way to serve shareholders in the long term is to embrace a Stakeholder Relationship Model, as Costco does. On average, Costco pays its employees 65 percent more than Wal-Mart and 40 percent more than Sam's Club. Its benefits are also more generous. *Yet, Costco generates significantly more profit per employee than Sam's Club does.* It achieves this seeming alchemy by being far more efficient (spending only 9.8 percent of earnings on SG&A — sales, general and administrative expenses) and having a very low employee turnover (only 6 percent in the first year, compared with 21 percent at Sam's Club and 50 percent at Wal-Mart).

Finding the Will to Change

No doubt some will argue that the idea of capitalism undergoing a social transformation is nonsense. Nevertheless, the remaking of capitalism into an instrument of broader purpose appears unstoppable. Stakeholders are demanding more socially aware management from companies and consumers will push for this by closing their wallets to companies that don't comply.

In May 2005, *Fast Company* published an article by Alan Deutschman about the myths that motivate a change in behavior. The following list takes a look at four of the myths:

1. Fear is a powerful impetus for change. More often, it is a powerful impetus for denial. According to a famous survey by Royal Dutch Shell, most companies do not reach the 40th anniversary.

2. Giving people objectively provable facts is an effective technique for stimulating change in behavior. If this were true, 65 percent of Americans would not be overweight.

3. Slow change is more effective than sudden change. Incrementalism works no better in companies than it does with the people who run them.

4. Past a certain age, people can't change. The issue is not whether people (and companies) can change after decades of following the same patterns, but whether they can muster the will to change.

Change can be massively challenging for companies that have been around long enough to form entrenched bureaucracies; however, if a company does not make an attempt to change, it will become a company that fails to reach its 40th anniversary.

Changing to Become an FoE

Einstein famously said, "A problem cannot be solved by the same consciousness in which it arose." The consciousness that has ruled business enterprise over the past two centuries is rooted in classical notions that reason is superior to emotions in the affairs of people. This has reduced stakeholders (including shareholders) to largely bloodless statistical entities.

Reflecting on Einstein's dictum, the new consciousness that will lift a company successfully into the loftier realms of new capitalism recognizes that all reality is personal and infused with affect. Objectivity has proven to be an overreaching effect of science, and subjectivity currently rules in terms of garnering stakeholder loyalty and affection. ■

Firms of Endearment Versus Good to Great Companies

Jim Collins' best-selling book *Good to Great* identified 11 companies as going from "good" to "great" by delivering superior returns to investors over an extended period of time. (The companies had each delivered cumulative returns at least three times greater than the market over a 15-year period.) We compared our set of publicly traded FoEs with these 11 companies and discovered:

- Over a 10-year horizon, FoEs outperformed the *Good to Great* companies by 1,026 percent to 331 percent (a 3.1-1 ratio).
- Over five years, FoEs outperformed the *Good to Great* companies by 128 percent to 77 percent (a 1.7-1 ratio).
- Over three years, FoEs performed on par with the *Good to Great* companies: 73 percent to 75 percent.

Note that none of the *Good to Great* companies made our cut, though one (Gillette) did come close.

The Chaotic Interregnum

The globally iconic Coca-Cola brand is wallowing in disorder. Its maker is trying to regain its footing under CEO Neville Isdell, who replaced Doug Daft in May

(continued on page 4)

The Chaotic Interregnum

(continued from page 3)

2004, who replaced Doug Ivestor in 2000, who followed the legendary Roberto Goizuetta, whose death in 1997 ended an era of plenty for the world's most recognizable brand.

Shortly after taking the position, Isdell vowed to double the value of the company's trademark within a decade by focusing on advertising with a youthful point of view. However, he seemed unaware that the population growth among the young has slowed to a crawl in the United States. This and the fact that soft drink consumption generally falls off around the mid-30s means demographics are working against Coke's growth prospects. Companies like Coca-Cola are riding through the greatest storm of change and disorder since the beginning of the Industrial Revolution.

A Solution to Disorder: Natural Capitalism

FoEs reject the hierarchical control-minded templates inspired by Newtonian science long central to organizational theory. FoEs transcend that tradition by tapping natural laws governing *complex adaptive systems* — self-organizing networks of entities that continuously form and reform in response to evolving needs and environmental changes.

Leadership at the top is more catalytic and inspirational than directive. The General Electric jet engine factory in Durham, N.C., is such a place. It has no factory leader. Rank-and-file workers manage everything from process improvement and work schedules to the overtime budget. Managers who have never held an engine-making tool in their hands no longer shape the happenings on the factory floor.

The Communications Challenge in the "Era of Disorder"

The balance of information power is now in the hands of the masses. This has changed the rules of communication between companies and their stakeholders, especially customers. What the Internet has done is make conversations (a.k.a dialogues) less optional and more of an essential part of everyone's day. Here are the four crucial principles of effective dialogue:

1. Establish a positive relationship (or reinforce an existing one) before getting down to business.

2. Show willingness to be vulnerable. Honda ritualizes managerial vulnerability through the practice of *waigaya*, a protocol whereby rank is put aside to facilitate problem solving.

3. Foster reciprocal empathy, whereby stakeholders reciprocate the company's empathy. Every customer wants to be understood. The same goes for every employee, supplier and business partner. After the first Gulf War, the insurance giant USAA, which serves military personnel and their families, sent refunds to policyholders who had gone to the Gulf, covering the period they were not driving at home. Some 2,500 policyholders mailed the refunds back with a note of appreciation saying they wanted to keep USAA financially sound.

4. Conduct conversations with genuine reciprocity. This makes for good and lasting relationships. The Body Shop's Anita Roddick gathered ideas from customers in suggestion boxes, and the staff wrote a personal reply to the author of every message. ■

Employees — The Decline and Fall of Human Resources

In the Age of Transcendence, people are looking for more than a paycheck from their work; they want "psychic income" as well as monetary income. People want work that engages the whole person, work that fulfills social needs, work that is meaningful — psychologically rewarding. People want to view their work as a calling.

FoEs can afford to be highly selective in employee recruitment because they are attractive places to work and generally rank well above average in their categories for wages and benefits. Progressive Insurance goes far beyond the norm in benefits, extending medical benefits to employees' grandchildren, parents and kids over 23.

Executive leadership in FoEs generally comes up through the ranks. This turns into a big motivator for new employees. At CarMax, employees choose one of four career tracks: Sales, Purchasing, Operations or Business Office.

FoE Leaders Understand the Fine Art of Building Trust

A distinguishing mark of FoEs is the high degree of trust that pervades them. They draw on four key elements to build trust with employees:

1. Respect for individuals: FoEs view each individual employee as a "whole person" rather than an impersonal factor of production. Management encourages employees to participate in company decision making, regardless of their rank.

2. Transparency: FoEs are free of the paranoia many companies have about sharing information with all employees as well as other stakeholders. New Balance

(continued on page 5)

Employees — The Decline and Fall of Human Resources

(continued from page 4)

opens up its books, building trust *and* helping employees understand what it costs the company to produce shoes in the United States versus in China. Management considers this an important factor in improving efficiency and remaining competitive.

3. Team building: FoEs cultivate an uncommonly strong sense of team participation. At JetBlue, new employees spend an hour each with the president and the CEO, as well as the vice president of people (a warmer, more humanistic term than *human resources*).

4. Empowerment: FoE employees generally have the authority (and obligation) to spend company resources necessary to make a customer happy or fix a production problem. In its early years, Southwest was forced to sell one of its four planes. Rather than operate on a reduced schedule (which would require fewer people), employees devised a plan to maintain the existing four-plane schedule. They reduced turnaround time at the gate by having everyone pitch in: pilots and management helped with baggage handling, flight attendants streamlined cabin cleanup and ground crews revamped the beverage stocking process.

FoEs Put Fun Into the Work Environment

FoEs stress a fun, collegial, productive and meaningful work environment, which is a key factor in attracting, motivating and retaining employees. These companies create an atmosphere that drives people to give their best without feeling pressured. FoE work environments are distinguished by three characteristics:

1. Fun. Jordan's Furniture once surprised everyone by closing down its stores and chartering four jumbo jets to fly all 1,200 employees to Bermuda for the day, treating them to a 90-degree day of beach, BBQ, music, water games and dancing.

2. Balance and flexibility. FoEs are disposed toward accommodating their employees' unique scheduling needs. Google grants each employee the right to spend 20 percent of his or her time at work on independent projects, several of which have developed into important new offerings for the company, including AdSense for Content, Google News and Orkut (for social networking).

3. Creative quality-of-life benefits. Google provides employees with an on-site physician, free massages, a game room, showers, subsidized child care, free gourmet lunch five days a week, dry cleaning, counseling on IRS matters, personal and family services and business legal services.

Training and Development Are High Priorities

FoEs are exemplary in their focus on helping employees maximize their potential through training, development and mentoring. They constantly celebrate their employee's achievements and successes, large and small. The Container Store has a long-standing reputation as one of the best employers in the country. A major reason for its success is its extraordinary commitment to training — 235 hours per year for new employees, compared with seven at the average company in the U.S. retailing sector.

Many FoEs have their own corporate "universities" to train employees, including Southwest, Commerce Bank, Toyota and UPS. In its initial two years, the UPS "Earn and Learn" program helped more than 20,000 part-time employees attend college.

The HR Department of the Future

The innovative and humanistic practices that FoEs follow in dealing with employees reflect a deep understanding of what people are looking for in their work lives today. In the past the HR function was something of a corporate backwater, a primarily administrative function dealing with payroll and staffing. This is fast changing as companies outsource the basic functions of administering benefits plans and payrolls. This frees HR to focus on more strategic issues such as employee performance and retention, which can directly affect the bottom line.

Essentially, it comes down to treating employees as customers. The ultimate goal of Jordan's Furniture's management team is to create "raving fans" out of its employees by providing internal growth opportunities, offering extensive benefits and considering them as another form of Jordan's customers.

(continued on page 6)

How FoEs View Part-Time Employees

Relatively few companies offer meaningful benefits to part-time workers. FoEs are distinct exceptions to this norm. Nearly all offer generous benefits, in some cases to those working as few as 15 hours a week.

Wegmans' employees become eligible for free health coverage and profit-sharing retirement plan contributions if they work 17.5 hours per week. The company tries to hire single moms as part-time workers. It views their employment as a win-win: The company gets staffing during difficult hours, and single moms get what they most need: health coverage. Unionized part-time employees at UPS get free health insurance and college tuition assistance.

Employees — The Decline and Fall of Human Resources

(continued from page 5)

Benefits That Flow to Shareholders From Doing It Right

The two main indicators of strong employee equity are low turnover and high productivity. Without exception, every FoE has an employee turnover rate much lower than its industry norm. FoE employees are also highly productive. Costco employees earn more than twice as much as Wal-Mart employees but generate three times the revenue.

Low turnover and high productivity are related to one another, because low turnover leads to more experienced employees, which translates to higher productivity. As a result, companies can have relatively low overall costs and be competitive while paying good wages and generous benefits.

FoEs have proven that the mother lode of wealth creation runs not through the executive corridors but through the vocational landscape of frontline employees. ■

Endearment as a Business Model

Heart is not a word often heard in B-school. But heart — a symbol of empathy, nurturing, caring, giving — has recently made a quantum leap and landed in the middle of mainstream business consciousness.

The problem is that many Wall Street analysts have not caught on to the idea that there is much profit to be gained by bringing love into business operations. Most business leaders think in terms of *numbers* and *profit*. *Love* and *profit* is an alien conjunction of words that is quantitatively murky. It is attention to the immeasurable qualitative dimensions of life that gives FoE companies their crucial competitive differences from their competitors.

The New Marketing Paradigm

The main trait of the 20th-century marketing paradigm was hucksterism — aggressive promotion and selling that put sellers' objectives ahead of the *real* needs of consumers. Consumers became prey. Marketers and salespeople became predators. Love is the antidote for this dehumanization. The former head of Meredith Publishing Magazine Group, the former chief solutions officer of Yahoo! and the CEO of one of the world's largest advertising agencies talk about love in the marketplace without being concerned about raising eyebrows.

New Balance is a FoE with a holistic-based market strategy, founded on the principles of healing that Jim Davis and his wife and business partner, Anne, continue to uphold a century after the company's founding.

The Unspoken Contract That FoEs Honor

From customers and employees to suppliers, partners, shareholders and the community, the full spectrum of a company's stakeholders is bound up with a company via these two contracts:

• A legal contract (mostly explicit) based on quantitative performance criteria established by jurisprudence as well as representations by a company and its agents in writing, oral communications and actions.

• An emotional contract (mostly implicit or unspoken) based on qualitative performance criteria established by stakeholders in the form of expectations that reflect their moral and ethical values and their experiential desires — what they want to experience and what they want to avoid experiencing.

FoEs understand that their business operations are shaped by both spoken and unspoken contacts. Like partners in a successful marriage, they know that failure to honor the emotional contract with a customer means the end of customer loyalty.

FoEs Are Soulful

People do not go to Wal-Mart for soulful experiences. However, they do go to Whole Foods with that in mind. They also go in mobs to the service-rich, family-owned Wegmans Food Markets for a soulful experience. They shop at Jordan's Furniture with its shoppertainment bonanza for a fun-filled, soulful experience.

Soulfulness is a hallmark of FoE companies. It is a distinctive component of culture in the Age of Transcendence that is reflected by an upsurge of interest in spirituality — in turn, a reflection of the aging of society. ■

Investors — Reaping What FoEs Sow

FoE Whole Foods is an extraordinarily vivid exemplar for the SRM business model. Over the past 10 years, Whole Foods has proven a better bet for investors than

(continued on page 7)

Investors — Reaping What FoEs Sow

(continued from page 6)

any of the five biggest grocers: Wal-Mart, Kroger, Albertsons, Safeway and Costco. In second place for shareholder enrichment by percentage gain is Costco, another FoE.

Whole Foods stands out even among the stellar performers that make up the FoE universe. It has returned 185 percent over the past three years, 400 percent over the past five years (when the S&P 500 rose by only 13 percent) and 921 percent over the past 10 years! In fact, between December 31, 1995, and June 30, 2006, Whole Foods returned more than 1,800 percent. ■

Partners — Elegant Harmonies

Concinnity is an ancient English noun, little used today. It means "a skillful blending of the parts achieving an elegant harmony." It is found in poetic descriptions of finely crafted artifacts. It is also used to describe elegantly constructed thoughts. However, organizations can achieve this state of concinnity as well.

A good example of concinnity among competitors is IKEA, Costco and Jordan's Furniture. When IKEA opened its first Boston store, its next-door neighbors Costco and Jordan's Furniture agreed to let IKEA use their adjacent parking lots for the grand opening. Jordan's even lined the street with signs saying "Jordan's Welcomes IKEA." FoEs expend goodwill to everybody, even their competitors.

Making the World Better Can Make Shareholders Richer

FoEs frequently take actions that produce results quite different from what conventional management logic would indicate. For example:

• FoEs decentralize decision making, but do so in ways that increase rather than decrease top executive influence at all levels of a company.

• FoEs typically pay frontline staff above norms in their categories. Rather than increasing cost of sales, this often reduces the percentage of a revenue dollar that goes to wages.

• FoEs typically depend little or not at all on conventional marketing practices, yet often experience explosive growth due to the affectionate regard that stakeholders have for them and the word-of-mouth promotion that results.

• Publicly traded FoEs tend to be less influenced by expectations of Wall Street analysts but typically achieve higher price/earnings ratios.

• FoEs operate with greater transparency than most companies but are involved in less litigation. ■

Society — The Ultimate Stakeholder

It is a given that no company likes to pay taxes. However, FoEs are generally sticklers for following not just the letter, but also the spirit of the law, and the area of taxation is no exception. None of the 17 public FoE firms we identified exempted themselves from paying taxes. As surprising as it seems, FoEs commonly view tax levies as fair pay obligations.

FoEs and Society

FoEs view the well-being of each stakeholder as an end in itself rather than merely a way to maximize shareholder wealth. These are some of the ways in which FoEs fulfill their keenly felt societal obligations:

• **Encouraging employee involvement.** FoEs encourage and reward employees for volunteering time and talents to support initiatives that benefit the local community. Patagonia has an environmental internship program that gives employees up to two months a year of paid leave to volunteer with an environmental organization of their choice.

• **Nurturing local communities.** FoEs strive to make themselves welcome in local communities and endear themselves by responding quickly to local exigencies. Progressive made job offers to 300 Zurich Personal Insurance employees who lost their jobs when the company moved its operations from Colorado Springs to Baltimore.

• **Cultivating global community.** FoEs strive to be exemplary global citizens, going well beyond local requirements. IKEA uses uniformly high environmental and safety standards worldwide, even when local regulations are less demanding.

• **Improving competitive context.** FoEs are adept at aligning social and economic goals. IDEO has a history of incorporating ecological and societal concerns into its product design.

• **Focusing on sustainability.** FoEs strive to operate in environmentally friendly ways. BMW turned a German law requiring firms to be responsible for their products over their lifetime into a profit opportunity. It has learned how to disassemble cars in an economical and environmentally sound way that gives it a sizable advantage over other automakers subject to the same law.

(continued on page 8)

Society — the Ultimate Stakeholder

(continued from page 7)

• **Cooperating with governments.** FoEs view governments as important partners in facilitating their ability to achieve their broad purposes and creating a better world for everyone. ■

Culture — The Secret Ingredient

FoE's strongest competitive difference is their corporate cultures. The passion, dedication, generous spirit and expansive creativity found in every FoE are products of their culture. It exerts a transformational influence on those who experience it, especially employees. Employees pumped up about their companies infect customers with their enthusiasm. Customers reciprocate with their own enthusiasm to round out a symbiotic relationship whose significance is lost on those who gauge companies strictly by the numbers. The three primary elements to organizational culture are:

1. Organizational vision. This is about creating and implementing a winning game plan. A common element found in every FoE is dedication to maximizing the creation of value for all stakeholders.

2. Organizational values. This is the aligning force that keeps an organization centered and balanced.

3. Organizational energy. This is the force that propels the organization forward at a steady speed. All FoEs are high-energy organizations.

Setting Organizational Vision

Firms of endearment share five primary elements in their corporate visions for seeing the bigger picture:

• A broader purpose than wealth generation
• Dedication to servant leadership
• Emotionally intelligent leadership
• Commitment to exemplary citizenship
• Recognition that they are part of an economic ecosystem with many interdependent participants. ■

Lessons Learned

Seven traits distinguish FoEs. Many companies can lay claim to some of the same traits. However, it is how the FoEs express these traits and weave them through their culture and operations that give them unique standing.

1. FoEs freely challenge industry dogma. This willingness means that they do not fit into the norms that Wall Street is comfortable with and leads analysts to criticize FoEs that pay wages and benefits above industry standards.

2. FoEs create value by aligning stakeholder interests. FoEs regard all their stakeholders as assets. FoEs have an uncanny ability to transmute stakeholder groups from separate, sometimes competing groups into a cohesive system in which the value of the whole is greater than the sum of the parts.

3. FoEs are willing to break traditional tradeoffs. Instead of "if/then" or "either/or," the alternative style of thinking — "both/and" — opens the mind to accommodate seemingly contradictory conditions.

4. FoEs operate with a long-term perspective. Although a number of FoEs presented here are privately owned and thus shielded from Wall Street pressure, publicly traded FoEs tend to be relatively impervious to such short-term pressures. In their IPO filing for the SEC, Google's founders warned potential investors they would not make operational decisions based on projected or actual quarterly earnings.

5. FoEs favor organic growth to growing by mergers and acquisitions. Most FoEs could probably grow at a faster rate than they have chosen. JetBlue's growth mode focuses primarily on continuing increases in flight frequency on existing routes as opposed to taking the costlier route of cultivating target market segments in numerous new locations.

6. FoEs blend work and play. Rule breaking regularly occurs in FoEs, with management's enthusiastic encouragement. It's all part of having fun.

7. FoEs reject traditional marketing models. One of the more important bonuses of being an FoE is lower marketing costs. FoEs are sustained by direct experience and great word of mouth. They do not rely on frequent sales and other dramatic promotions. This is a huge cost saver.

FoEs offer a cornucopia of valuable lessons for the rest of the business world and represent the architectural template for a new genre of business models that most midsized and larger companies will need to adopt to survive in the long run. Leading companies of the future will almost always be those that have crossed over to the other side of complexity to transform their organizations into firms of endearment. ■

THE SUMMARY IN BRIEF

UPS has earned a reputation as one of the top companies in the United States, known as much for its innovative practices as its skill in creating satisfied customers and employees. *Driving Change* tells the UPS story in a way that provides clear-cut lessons from which any business can benefit. Authors Mike Brewster and Frederick Dalzell demonstrate how UPS became a global commerce leader and why "Big Brown" is a company to emulate.

If you really want to find out what makes the world's leading package delivery and logistics company tick, if there is anything valuable for today's managers to learn from UPS, it all starts with the drivers. Mention UPS to anyone, anywhere, and you'll hear immediately about *their* driver: Rudy, Murph, Patrick or Sue.

Go to Mahwah, N.J., to UPS's World Technology Headquarters. Each day, data on some 15 million packages wends its way through the UPS global network. It doesn't matter where in the world a UPS package is, all package information is maintained on the global UPS system, enabling the company to act as one worldwide company.

Nonetheless, technology, too, has its limits, and UPS must get creative in order to serve its customers in every corner of the planet. In Zambia, for example, UPS uses canoes to make deliveries across the Zambezi River. At the other end of Africa, mules deliver UPS packages into villages in the Abu Simbel region of Egypt.

Go back — 100 years to be exact — to 1907 Seattle, where a tiny company called the American Messenger Company was started by a teenager named Jim Casey. And this is what you find about UPS and the nature of change.

IN THIS SUMMARY, YOU WILL LEARN:

- How UPS uses culture as a competitive advantage.
- Why "constructive dissatisfaction" is encouraged at UPS.
- The way UPS changed its business from retail package delivery to wholesale carrier.
- About the technology challenges the global carrier has had to face.
- Why UPS's employee ownership philosophy keeps morale high and turnover low.

Culture as a Competitive Advantage

Jim Casey was born on March 29, 1888, in Nevada and moved to Seattle with his family when he was eight. He quit school at age 11 and worked as a messenger before partnering at age 15 with two other messengers to launch their own business.

After trying the business in Goldfield, Nev., Casey returned to Seattle, and he and his new partner, Claude Ryan, started the American Messenger Company in 1907. They resolved to employ only clean-cut boys from good families whom they knew personally. In a roundabout way, the buttoned-up, Eagle Scout earnestness that UPS is so well-known for today developed in part as a reaction against the turbulent times in which Casey first did business.

The Origins of Culture at UPS

Much of the company's early business came from delivering Western Union telegrams. In 1913, Casey and Ryan merged their venture with another small Seattle delivery business run by Evert McCabe. McCabe brought an expansive sense of optimism and strategic vision that would make him one of the most important figures at UPS for many years. McCabe and Casey soon became the two guiding forces behind the company: Casey, the cautious and reflective businessman, McCabe, the visionary.

Once McCabe came on board, the firm adopted the name Merchants Parcel Delivery and began to focus on deliveries for small retail businesses in downtown Seattle. In 1912, a domestic parcel-post service was created by Congress. Large department stores and mail order houses in the big cities became interested in using parcel post for local deliveries, replacing local express companies.

By 1917, Merchants Parcel Delivery had persuaded three of Seattle's largest department stores to turn over their entire delivery operations. Early on, the company realized they could win a lot of business if they had a reputation for quick delivery. By 1919, they were looking to expand into other cities farther down the West Coast. From this expansion the partners renamed their company United Parcel Service (UPS) and began using brown-and-gold delivery cars. UPS began courting major department stores that prided themselves on the high-end nature of the retail environments. UPS had to persuade them that the delivery company would both provide excellent service to customers and reflect well on the merchants.

An Identifiable Corporate Culture

In the firm's early years, the work of forging a culture was relatively straightforward. A collective commitment to ways of doing business, and in particular an appreciation for maintaining impeccable standards of service, could be conveyed by example.

In 1927, the founding partners invited employees to become part owners of the company, one of the first stock-offering plans in American business. What was distinctive about UPS's plan was that it went beyond basic profit-sharing to actual voting shares. From then on, the company's owners would include not just executives but front-line employees too.

The Mark of the Founder

During the first 25 years of the company, UPS share prices never decreased in value — not even by a penny. In the very midst of the Depression, in 1932, UPS was moving 10 million packages each year, and the formerly

The Policy of Spic and Span: Becoming 'Brown'

UPS adopted a dress code and a code of etiquette. Success hinged on appearance and trust — on a *brand*. For UPS drivers, that meant fresh shaves, pristine uniforms, no smoking on the job and scrupulous politeness. As department store deliveries became the core business, this attention to detail and concern for professional appearance became a defining aspect of UPS.

In 1925, the company began issuing its drivers standardized brown uniforms in all cities where the company operated. Brown worked in part because it was more conservative, yes, but also because brown package cars looked cleaner on the roads, and UPS needed its cars looking as "spic and span" as its drivers.

dominant express companies had been waylaid by their inability to adapt.

UPS was thriving, and it all started with Casey and the management techniques he espoused, such as promoting from within, the stock ownership plan and the real interest executives showed in employees' progress. Every CEO since Casey has found reasons to invoke his spirit.

A dynamic founder can be an invaluable asset for a young company, but a problematic legacy as well. Every company has to eventually outgrow its origins and move beyond the vision, energy, ethos and outlook that set it in motion. Casey saw this test coming and worked doubly hard to instill UPS with the cultural outlook, leadership talent and management tools to survive as his legacy. ■

Constructive Dissatisfaction and the Quest for Continuous Improvement

Around 11 p.m. the last passenger flights disappear into the evening sky at Louisville International Airport; oddly enough, that's when things begin to get interesting. UPS, in close cooperation with Louisville, Ky., has carved out a large piece of the airport's cargo facilities, called Worldport, for its global air express hub. On a typical night, more than 100 UPS planes from all around the world converge on Worldport. Between 11:30 p.m. and 5 a.m., UPS unloads, sorts and reloads onto the outgoing Browntails (UPS lingo for its air fleet) somewhere between 800,000 and 1 million domestic and international air packages at Worldport.

Worldport, occupying 4 million square feet, four floors, three concourses bristling with 44 aircraft docks and staffed by more than 5,000 UPS night owls, dramatically displays UPS's operational and engineering genius. Worldport is also a study in how UPS achieves its stated mission of synchronizing commerce. The company handles more than 15 million packages around the world each day, and every one must be scanned and routed through the company's global network.

Contingency Teams in the Wings

Not all 5,000-plus employees who work the night shift at Worldport are involved in the sorting of packages; some prepare for potential snafus. Every Monday to Friday night at 7 p.m., a dozen or so UPS managers file into a conference room at the Air Service Center for the evening's "hot crew" conference call. Hot crews are standby crews waiting to be deployed on a contingency basis wherever glitches erupt in the company's air network.

Passenger airlines are prone to setbacks, as any frequent traveler discovers. A grounded passenger flight might frustrate anywhere from 50 to 300 customers. But the delays that constitute business as usual for a passenger airline are unacceptable to UPS. A grounded Browntail with full cargo delays 12,000 packages, and because those parcels involve customers on both the sending and receiving ends, that translates into 24,000 affected customers.

Keeping a dozen or so crew members and maybe 20 aircraft on call every weekday is an expensive necessity, particularly for an enterprise as focused on the bottom line as UPS. But if there is one thing to understand about the company, it's that every plan has a backup plan, and that backup plan has a backup plan. It is simply the cost of doing business.

The Birth of Constructive Dissatisfaction

Jim Casey coined a term to describe this compulsive habit of tinkering with the status quo: "constructive dissatisfaction." His memorable phrase makes the point that continuous improvement is never easy, that it stems from pushing people out of their comfort zones even when things are going great for a business.

Many great companies have come together around a breakthrough product or service or idea. Kodak comes to mind, with the Kodak camera in 1888, and Xerox

with its plain paper copier in 1959. UPS, by contrast, represents a different kind of company. It has rarely grown by bursts of pure invention. It has built itself not by inventing so much as by engineering and then re-engineering — its equipment, its systems, itself. ■

A Common and Uncommon Carrier

Rudy Taylor, a driver who currently works in New York City, has been with UPS for 30 years. Five years ago, Taylor was inducted into the Circle of Honor, reserved for UPS drivers with 25 years of service without an accident.

Taylor is certainly not alone at UPS as a superb professional driver. Nearly all longtime UPS drivers are exceptional, including the tractor trailer drivers. Taylor and his 70,000 fellow drivers make a lot of deliveries to businesses. It's hard to believe that for almost the first half-century of its existence, UPS did hardly any business-to-business deliveries but grew only through its consolidated retail delivery business, bringing packages from department stores to people's homes. The UPS of today only emerged after a transformation sparked by fundamental socioeconomic trends.

A Seismic Change in the Market

By midcentury, UPS had built a consolidated retail delivery business in metropolitan markets across the United States. With the outbreak of World War II and the imposition of wartime rationing, UPS's retail customers sharply curtailed deliveries. Prospects brightened with the return of peace in 1945, but business at UPS did not fully revive, as department stores started to push back on the cost of deliveries. UPS now faced a moment of truth. It could adopt a new business model, or it could stay the course.

The most intriguing opportunity was wholesale deliveries. Having spent decades mastering consolidated delivery, UPS confined itself to carrying commerce out of retail businesses to consumers. Wholesale deliveries meant bringing goods *into* those stores from other businesses. As the country's new highway infrastructure took shape, long-haul trucking emerged as a viable alternative to railroad freight.

Naturally, early wholesale coverage tended to dovetail with areas where UPS served retail customers. In the suburbs, the company commingled retail deliveries with wholesale pickups, but in cities, it initially handled the new business with a separate set of vehicles and routes. Either way, UPS drivers retained the brown uniforms and professional demeanor.

By 1956, wholesale business was beginning to supplant retail deliveries at the center of the company's thinking. Casey set a goal of achieving comprehensive coverage in U.S. wholesale delivery within 10 years. However, it took UPS more than three decades to achieve this milestone. What started in 1952 as an effort to add wholesale traffic became a campaign to forge what UPS began calling the Golden Link, meaning contiguous states through which UPS could deliver packages from one coast to another.

In 1980, the Federal Interstate Commerce Commission authorized UPS to serve retailers on an interstate basis in common carrier operations throughout the United States. Through 28 years of slow building, UPS had transformed itself from a retail deliverer operating in scattered metropolitan markets into a common carrier capable of picking up and delivering packages anywhere in the United States. UPS achieved transformation by working slowly and methodically, from the inside out. ■

Rising to the FedEx Challenge

UPS is defined mainly by its drivers and brown package cars. But it also runs the eighth-largest airline in the world, serving more than 800 airports in more than 200 countries and territories around the world. By the time it committed to building this airline, UPS had been in business for more than 75 years and had forged world-class ground operations.

The company's first attempt at an air service was called United Air Express. It failed, but more than 20 years later, in 1953, the company tried again with United Parcel Service-Air. Rechristened "Blue Label" in 1967, the air business remained small and, strategically speaking, something of a sideline.

The FedEx Challenge

Unlike its common carrier business, UPS's Blue Label air service contended with experienced and effective competitors. By the late 1970s, Emery, Airborne and Purolator were all jockeying Blue Label for elbow room in the skies. The sharpest elbows, though, belonged to a hungry new company that burst onto the scene in 1972 — Federal Express.

FedEx's hub-and-spoke system — with Memphis,

(continued on page 5)

Rising to the FedEx Challenge

(continued from page 4)

Tenn., as the sorting hub — created the most efficient next-day-air operation in the industry. By the early 1980s, FedEx had revolutionized the airfreight business and established itself as the leading overnight delivery provider. All of which UPS watched with some concern but, at first, not with any real sense of urgency, since FedEx did not put itself in direct competition with UPS's ground dominance but instead focused early efforts on building its own premium overnight business.

The surprise for UPS came when the size of the market that FedEx had tapped into started to become clear. Customers were beginning to ask UPS drivers and sales professionals why UPS wasn't offering next-day delivery. UPS, a company that had built its reputation and name on high standards of its service, had been outplayed at its own game.

Taking to the Skies

In 1981, UPS decided to buy airplanes, but would rely on a group of independent carriers to handle the operations. The company debuted overnight service in August 1982 between West Coast cities. The planes were even painted with UPS brown, thus the term *Browntails*.

Expectations ran high in September 1982 as the company prepared its nationwide launch of Next Day Air, serving 24 cities. UPS delivered 1,800 packages the first day, a number that was nothing less than humiliating. The company realized that the UPS brand didn't attract air volume the way it attracted ground volume. But UPS persevered, stepping up marketing efforts. Coverage, along with the size of the fleet, expanded in several phases over the next years. By 1985, UPS was offering Next Day Air across the continental United States and preparing to launch its air service to European destinations.

In August 1987, UPS announced it would take control of its fleet and maintenance operations and apply to become an official airline. Both the pilots and UPS management had adjustments to make, as the company absorbed the dynamics of air operations. UPS's gateway staff eventually had to accept the reality that they had far less control over air operations than ground operations. ■

Beyond the Golden Link

In 1975, with the Golden Link between the east and the west coast finally completed, UPS had the authority to link its service within the 48 contiguous states. Hawaii, thanks to a UPS acquisition, was also linked, and Alaska soon would be, meaning that UPS served all 50 states. It was time to take the business and duplicate it in an international market.

The thinking back then was that UPS's non-United States revenue opportunities were primarily intra-country. The question was which country offered the best intra-country market? Now that UPS served the entire United States, Canada seemed like the most logical and low-risk choice for expansion. On February 28, 1975, UPS began its Canadian service in Toronto, the company's first operation based outside of the United States.

Farther Afield

West Germany was next. A West German operation was not to be "international" in the sense of transporting packages between the United States and Germany or between Germany and any European neighbors. Rather, this was to remain a domestic operation within Germany.

The German post office, or *Bundespost*, UPS's would-be main competitor, didn't care much about service. It paid little heed to the needs of its customers and delivered packages on its terms, not its customers'. Fortunately for UPS, an opening in German law didn't automatically give the parcel monopoly to the Bundespost, as the U.S. Post Office enjoyed for first-class mail. German customers clearly wanted an alternative, and no other American delivery company was yet on the scene. In August 1976, packages were slated to start flowing as UPS launched its domestic ground business in West Germany.

Despite problems with employees and weak service in some areas, UPS had clearly hit upon a huge need in West Germany. For one thing, volume kept increasing. For another, in those instances when competent drivers actually completed their routes, customers loved the service. But the Bundespost was delivering as many packages as UPS was and certainly wasn't going to sit by as the newcomer poached its customers.

UPS increased salaries, retrained West German employees and implemented local accountability to help UPS Germany stop hemorrhaging money, although it would be many more years before it entered the black. After more than 30 years, it's one of UPS's strongest areas of the world. ■

Creating a Truly Global Business

In 1985, UPS was anything but a global company. The full extent of its international operations 10 years after obtaining full interstate rights in the United States was a domestic ground operation in Canada, as well as one in West Germany. A package could not be sent from New

(continued on page 6)

Creating a Truly Global Business

(continued from page 5)

York to London via UPS.

The problems launching the domestic operation in West Germany would inform how UPS would operate on a global stage for the next three decades. There was to be a critical difference, however, in how UPS would go about applying the hard-won lessons from West Germany to its operations in Europe and Asia.

When UPS decided to expand beyond West Germany in Europe in 1985, the first step was to choose where to expand. The management committee decided on the United Kingdom, as well as France, the Netherlands, Belgium and Luxembourg — four countries whose proximity to West Germany would allow them to quickly get packages to a yet-to-be-determined West German hub.

From Three to 180 Countries Served

Over the next four years, UPS made 16 major European acquisitions, as well as two major acquisitions that brought service to many parts of Asia, the Middle East and Africa. Important joint venture relationships were forged in China, Japan and Korea, and agent relationships were set up in Turkey and several other countries. Throughout this period, UPS tried to shore up its European operations by acquiring companies with the capabilities to solve some of the problems it was having.

By late 1989, UPS served more than 175 countries and territories. The company received some good news in 1996, when the European Union passed legislation that effectively removed borders between EU members, meaning that UPS trucks, package cars and vans could move from country to country without having to clear packages through customs. For UPS, this meant that its hard-won pan-European ground network, developed while its competitors emphasized air express, could operate far more efficiently. The globalization embodied in the opening of European borders was followed by an even larger-scale removal of barriers: the explosion of online retail.

In 2005, UPS International did $8 billion worth of business in a company with $42 billion in revenues. But the company must work to keep together a network of joint ventures, alliances and contractors to create delivery operations in "non-Brown" countries. ■

The Technology Company That Delivers Packages

About a week or so before Christmas Day, a trio of UPS Browntails lands at a tiny nondescript airport in Medford, Ore., home of the high-end food distributor Harry & David. In the span of about four hours, thousands of orders of Harry & David fruit, candy, truffles, cheesecake and other delectables are loaded onto the three aircraft to begin their journey to several strategically located UPS-operated Harry & David distribution centers. Then it's on to customers all over the world.

More than 90 percent of Harry & David orders made during the holidays reach customers within 24 hours, a percentage fairly unheard of in holiday shipping circles. Since using UPS, Harry & David has experienced far fewer customer service calls, product returns and holiday revenue adjustments. Because of UPS, Harry & David has been able to use technology as a strategic weapon to serve customers better.

Miracle in Mahwah

In Mahwah, N.J., UPS's World Technology Headquarters keeps the company's global systems running 24/7, every day of the year. The IBM mainframes (located in Mahwah and remotely in Atlanta, Ga.) process 27 million instructions a second, track 15 million packages each day, coordinate the operations of an entire airline, collect and distribute package data from 96,000 DIADs (Delivery Information Acquisition Devices) and connect 149,000 workstations through 8,700 servers.

From the Stone Age to the Digital Age

Nothing captures the UPS way of hanging back until the very last moment — and then going full tilt once it decides on the correct path — like its technology transformation. Today, convinced that exploiting new technologies is the key to any future growth of the package delivery business, UPS routinely invests about $1 billion annually in customer-facing technology tools and internal technology processes.

In 1993, UPS introduced TotalTrack, the first nationwide cellular mobile data system, which instantly provided customers with tracking information for all air and ground packages. Now UPS provides WorldShip, a software application, free to UPS corporate clients, who then use it to track their shipments to customers.

One of UPS's strategies in the late 1990s was to become the preferred vendor for major Internet retailers like Amazon.com. UPS.com was set up in the Innoplex, a 230,000-square-foot dot.com-ish tech facility. By 2001, it was estimated that UPS was delivering more than half of all items ordered online in the United States. ■

The Ownership Company

The UPS emphasis on teamwork, a willingness to readily switch jobs or even career goals, an acceptance that being in management means picking up and moving every few years, the taboo against openly politicking to get one's way, the ability to think long term and not be consumed by immediate needs — these core values didn't blossom by accident.

The chain of imparting "ownership" means supervisors must hand it down to their teams, in the same way that generations of UPS drivers and package loaders have been entrusted with that sense of ownership.

A Culture of Ownership

Not all of UPS's 427,000 worldwide employees are technically "owners," and since the company became publicly traded in November 1999, about two-thirds of stock ownership resides outside the company.

The idea of employee ownership, however, goes well beyond possession of UPS stock. It's the singular UPS cultural brew of stick-to-itiveness, self-interest and shared identity that leads such an incredibly diverse group of individuals to seek common cause. The company has built an incredibly positive culture by emphasizing a highly democratic human resources recipe, one that virtually no other major global company has attempted.

Another key to the ownership company is that most UPS middle managers and senior managers started as drivers or part-time package handlers. When even the top managers of a company start at the bottom, it not only enables them to understand where the real work gets done, but it gives every employee the incentive to, as Jim Casey would have put it, "saw wood." From the very birth of the company, Casey nurtured an expansive, inclusive sense of ownership.

The Biggest IPO in History

On November 10, 1999, the fuselage of a Boeing 727 Browntail was parked outside the New York Stock Exchange and a huge UPS banner draped the entrance of the Exchange. Almost as soon as UPS CEO Jim Kelley rang the bell, the company's shares — which Morgan Stanley offered to the public at $50 a share — started shooting up in value. The market was obviously excited by a company that had 92 years of financial performance behind it and experienced owner-managers running it.

On its first day as a public company, UPS shares went up to as high as $70.31 before settling at $68.25 at the end of the trading day. The IPO raised $5.5 billion, a new record.

So, in the end, what is the definition of an ownership company? One might say it's a place where a hard worker of integrity can build an impressive nest egg. Another answer would be a highly disparate group of people of different backgrounds, educations and aspirations drawn to a culture of success. A third response would be that it's a place where many people just love to come to work. ■

Better Than a Baseball Scholarship

Jeff Wafford, a high school baseball star, attended Maryville College in Knoxville, Tenn., on a sports scholarship. He didn't like the program and decided to transfer to the Metro-College program, which allowed him to take night classes at the University of Louisville (paid for by Metro-College) before heading over to Worldport to work the four-hour overnight shift.

Metro-College was created to attract students to UPS as part-time employees but also help them receive an education. Wafford was able to work nights, go to classes and receive full health benefits and credit toward a future pension.

Before long, he was managing other part-timers at UPS. Wafford currently works for UPS as a technical writer in Louisville and is one modern-day example of how UPS is a great place for people to become owners of both equity and their own futures.

Synchronizing Global Commerce, One Supply Chain at a Time

The ability of UPS to manage the transportation element of its customers' supply chain stems directly from the "stretching" of its core package delivery product and a century of transportation know-how. For UPS, integrating the transportation aspects with inventory has been a focus.

Building its supply chain business would turn out to be perhaps the most dramatic new strategic direction for the company since shifting from retail service to common carrier service in 1952. By 1999, UPS had revised its charter to change the company's mission for the first time in history, from serving customers' small package needs to enabling global commerce.

Enabling Global Commerce

Providing configurable solutions is the most natural of evolutions at UPS. After all, nearly a century ago, the placement of messenger boxes in Seattle taverns to save patrons a walk to the Western Union station certainly subtracted a step out of sending a message and was a way of moving "information" more efficiently.

Maybe it's the business world that is finally inventing

(continued on page 8)

Synchronizing Global Commerce, One Supply Chain at a Time

(continued from page 7)

terms for what UPS has been perfecting for a century. And perhaps another century from now, the business world will play catch up again and coin more phrases for what UPS is doing today: serving customers one-to-one. ■

One Company, One-to-One

Building an airline, developing a comprehensive global presence, transforming itself into a technology company, ramping up its logistics business — all these achievements over the past two decades have put UPS in an excellent position in 2007 to meet the many challenges of succeeding in other markets, especially in China. The question is whether the company can harness and organize all its services to treat the Chinese customer as if it's UPS's only one — the heart of the one-to-one vision.

A Bridge to Globalization

UPS, not surprisingly, plans on being a big part of the spread of goods to China's interior. Much in the same way that UPS spent much of the 20th century fighting regulatory battles in the United States to procure the rights to serve all 48 contiguous states, the company is primed for a similar challenge in China. To really create the kind of one-to-one customer intimacy in China that it enjoys in the United States, though, UPS needs to concentrate on four factors: increase its presence, improve its service quality and internal processes, keep improving training for all UPS employees in China and expand its sales force.

UPS is convinced that its strategy of combining its transportation services with a defined, configured set of supply chain solutions is the "sweet spot" for the company moving forward. Three factors allow UPS to successfully maintain its balance at the nexus of global trade: the ability to stay ahead of the prevailing wisdom about which markets will grow, the discipline to be prudent about investing precious resources and the responsibility to be a positive social force in those areas it does invest in.

The Future Evolution of the UPS Brand

The now iconic "What Can Brown Do for You?" advertising campaign was a very successful method of communicating a new UPS message to the public and, in a sense, was a way to articulate the one-to-one vision for a mass audience. Like most companies, UPS today thinks about how it will continue to grow in the future and how that growth will affect its brand. But unlike most companies, UPS's broad capabilities and global reach means that it is able to consider a wide array of business opportunities.

In 2001, UPS acquired franchisor Mail Boxes Etc. Inc. and on April 7, 2003, more than 3,000 Mail Boxes Etc. locations in the United States chose to rebrand as The UPS Store. In 2004, the year after the branding change, Mail Boxes Etc. opened more than 500 new locations of The UPS Store in the United States — a record for the company, and particularly impressive for a nearly quarter-century franchise. The UPS Store, while used primarily by small businesses and individual consumers, offers another avenue for creative ways for UPS to serve its customers.

The next chapter of the UPS story remains unwritten, but if the past holds any clues for what is to come, a transformation will result in not only a changed company, but a stronger company — one that will retain the best of what has worked in the past and adapt to meet a changing business world. That resilience is a testament to its homegrown leadership and ability to execute, certainly, but also to the singular culture planted by founder Jim Casey so long ago. ■

Revealing the 'Secret Sauce' at UPS

You wonder to yourself if you've really figured out how UPS collectively achieves the miracle of delivering 15 million packages every day. There is not one key ingredient to UPS's success, but three. And these three values certainly aren't secrets.

It will come as no surprise to anyone who has ever received a UPS package that culture is the glue that holds the center at UPS. Customers also seek the results of UPS's ability to execute on such a massive scale every day. Perhaps the biggest surprise in the search for the "secret sauce" at UPS is the company's unlikely knack for transformation, particularly when most of us believe UPS has been doing essentially the same thing for a century. Simply put, transformation is in the company's DNA. And it keeps getting better at it. ■

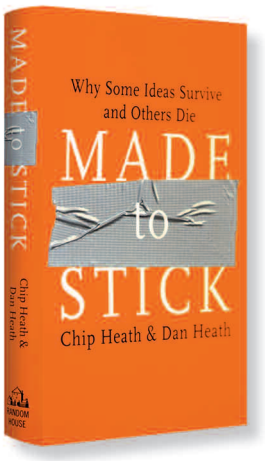
How to Get People to Care About Your Ideas



Featured Book Review by Chris Lauer

MADE TO STICK

by Chip Heath and Dan Heath

Copyright © 2007, Random House, 291 pages, $24.95, ISBN 978-1-4000-6428-1

A few years ago, the Heath brothers, Chip and Dan, set out on a marvelous mission. After being wrapped up in their own individual careers — Chip's in business; Dan's in education — for many years, they found themselves both asking the same simple yet perplexing question: What makes one story reverberate around the world while another story soon disappears? In other words, why do some ideas stick and others fail?

Many years of academic research and story gathering followed. Finally, the Heath brothers developed a framework that provides a compelling answer to their initial query. In 2007, they published *Made to Stick*, which presents their findings, theories and thoughts on sticky ideas. Their book also offers readers a formula for supercharging their own ideas and getting them to stick in the minds of others.

What does a sticky idea look like? Well, as an example, think of the most recent urban legend that you've been told. The urban legend is probably one that you received in a forwarded e-mail message, whether about politics, a celebrity or a new Internet virus or threat. Chances are you read this message one time, but you will remember the story and be able to repeat it again and again. A great joke is the same way. Some ideas, true or not, just stick.

No Sibling Rivalry

The Heaths have both learned valuable lessons about sticky ideas in their professional work. Chip Heath, for instance, has a Ph.D. in psychology and is a professor at Stanford University. His role as a professor has allowed him to turn his students into a powerful research machine that collects data on sticky ideas, codes it and analyzes it. Results from that research have been featured in *Scientific American*, the *Financial Times*, *The Washington Post*, *BusinessWeek*, *Psychology Today* and *Vanity Fair*. You may have even heard Chip Heath talking about his research on NPR or seen him in a National Geographic special.

Dan Heath has also made a name for himself as a powerful thinker who has his own very sticky ideas. With an MBA from Harvard Business School and years of experience in the world of education as a consultant at Duke Corporate Education, Dan is the co-founder of a new-media textbook company. His ideas mesh well with Chip's credentials and experience. Together, the two brothers discovered that their combined voices are even more powerful than either one alone. Through their blogs, books and magazine articles, the Heaths have established themselves as popular experts in the field of great ideas.

Recipe for Success

Made to Stick quickly became a *New York Times*, *Wall Street Journal* and *BusinessWeek* bestseller. The success of the book was not simply because Chip and Dan are columnists for *Fast Company* magazine. Their popularity

spread around the world beyond the business book community because they offer useful insights into a very important concept: developing sticky ideas.

Because the Heaths are smart and effective teachers, people are naturally compelled to hear what they have to say about the ways we can improve our communication skills. The Heath brothers know how to identify the small stories that tell much larger ones, and they know how to apply what they have learned to some of the biggest challenges in life and work.

Deeper Impressions

In *Made to Stick*, the Heath brothers offer a short list of clever tactics for creating messages that leave deeper impressions. This list covers business and personal issues simultaneously. Many of the topics they approach involve organizational issues, but they are also deeply personal, since they apply to many of the subtlest ways we connect with other people.

A sticky idea doesn't require press releases or public relations people to spread the word. In fact, sticky ideas stick with much less effort than a poorly constructed message. Whether it is a political idea or an algebra lesson, the stickier the message, the more of an impact it can have. When Malcolm Gladwell wrote his best-selling book *The Tipping Point*, he wrote about the "stickiness" of ideas. Both his terms "stickiness" and "the tipping point" stuck in the minds of those in the business world. Those ideas stuck because of their own stickiness.

The Heaths made several crucial discoveries while they were researching and studying how the stickiest ideas are put together. At the root of those discoveries is a valuable set of stickiness principles that anyone can put into use when trying to make an idea stick.

Keep It Simple and Surprising

The first of these principles involves keeping it simple. The essence of your idea should be simple and profound, the Heaths write. If you can sum up your point in a single sentence or phrase that compels you to follow it, you have mastered this aspect of stickiness. One great example of this principle is the Golden Rule: Treat others like you want to be treated. This message is so sticky that it has appeared around the world throughout history.

One great example of this principle is the Golden Rule: Treat others like you want to be treated. This message is so sticky that it has appeared around the world throughout history.

The next principle that the Heaths and their researchers found was that the unexpectedness of an idea gets audience members to pay attention to it.

Surprises stick to our brains. Most compelling ad campaigns and unusual newspaper stories catch our attention and stick in our heads because they are able to challenge one or more of our expectations. Engaging somebody's curiosity and interest with an attention-grabbing bit of new knowledge can be a very effective way to get started. The Heaths write that the short-term attention of audience members is easier to gain than their long-term attention. This is why "systematically 'opening gaps' in their knowledge — and then filling those gaps" can help you engage your audience members longer than a mere flash in the pan.

Concrete and Credible

Creating "concreteness" is the next step in the stickiness equation. This means that an idea is sticky if we can understand and remember it with ease. If a message is too abstract or ambiguous, it can get lost in the shuffle.

When an idea is firm and clear, people remember it. That's why the Heaths write, "Concreteness is an indispensable component of sticky ideas."

The next stickiness principle presented by the coauthors is credibility. If you have the authority, your ideas have much more stickiness than those of someone without it. The right level of credibility will encourage people to listen to you when you share an idea. It will also help them agree with your idea. When a person we trust shares an idea, we are much more likely to care about it than a message from a stranger.

Experts and celebrities work wonders in advertising to get a message to stick because many people recognize them as credible spokespeople. If we don't have access to a famous person, the Heaths write, an anti-authority can also work wonders when spreading a message. For example, Pam Laffin was neither an expert nor a celebrity. She was a smoker whose message was very sticky. Her experiences with emphysema and the effects of the disease provided her with the crucial credibility that helped to create an effective anti-smoking ad campaign that focused on her battle to live with failing lungs.

Laffin provides a great example of how credibility can go beyond celebrity and social status, the Heaths write. Credibility is also built on such important attributes as honesty and trustworthiness, which provide a strong backbone for a sticky idea.

The Power of Emotional Appeal

The next stickiness principle says an idea must be emotional if you want it to stick. The Heaths write that

tapping into people's emotions and getting them to feel something is a powerful way to get them to care about your idea.

Bland, emotionless appeals don't touch us, but messages that engage our emotions are much more effective. For example, one public service campaign that still sticks for many people is the 1970s anti-littering advertisements that featured a Native American shedding a lone tear when the garbage thrown from a speeding car lands at his feet. This advertisement from the organization Keep America Beautiful and the Ad Council included the tagline "People start pollution. People can stop it." The ad campaign touched such an emotional chord that the image of the "Crying Indian" has become a national icon.

> When a story connects to its audience through links to real experiences, it will be recalled, retold and used to spread an idea.

The Heaths point out that, although it was very effective at influencing behavior for years, the power of the Keep America Beautiful ad campaign had diminished by the 1980s, especially in Texas where litter had become a huge problem. The Heaths write that the emotions summoned by the crying Native American only appeal to a limited set of feelings, such as guilt and shame.

Researcher Dan Syrek found that the average person who litters in Texas is an 18- to 35-year-old man who drives a pickup truck and likes country music. The people in charge of a new anti-littering campaign in Texas realized that previous approaches to thwarting littering were not going to be as effective with this group because of its predisposition to antiauthoritarian behavior and lack of receptiveness to cute and cuddly "Give a hoot, don't pollute" messages.

'Don't Mess with Texas'

The Institute for Applied Research was hired by leaders in Texas to help the state fight a serious litter problem that was costing more than $25 million in cleanup costs each year. A new, stickier message was needed, so Syrek developed a campaign that addressed a different and more effective set of emotions. Taking a cue from the tremendous pride that Texans feel for their home state, the new campaign aimed to convince Texan litterbugs to change their behavior. It accomplished this goal by showing them that the people the average Texan admired did not litter. The result was the very effective "Don't Mess with Texas" ad campaign. Television commercials were produced that featured famous Texans from sports and music all stating that they did not litter. In the ads, they each reiterated the tagline "Don't mess with Texas." Celebrities from Texas, including boxer George Foreman, Houston Oilers quarterback Warren Moon and musician Willie Nelson, all chimed in to spread the message.

The Heath brothers explain that the ad campaign was an instant success. It reduced littering by 29 percent in its first year. Roadside litter went down 72 percent during the first five years. The emotions tapped by the advertisements, the Heaths explain, appeal to the litterbugs' sense of identity. This is the emotion that got them to care, and caring is what the emotional principle of stickiness is all about.

By showing readers how to inject more complex emotions into their ideas, the Heaths help them find the stickiness that will help their own ideas stick in the minds of others so they can be applied when the moment requires.

The final stickiness principle that the Heaths explore in *Made to Stick* is the idea that stories help people act on an idea. According to psychologist Gary Klein, author of *Sources of Power*, stories stick inside people's minds because they contain wisdom. Powerful stories are told and retold so people will learn to do things that will help them or others. Great stories also demonstrate unexpected causes and effects, point to better solutions and illustrate ways smart actions or decisions can be repeated.

Mental Simulation

One reason why great stories make people act is because the human brain is highly susceptible to mental simulation, the Heaths write. When we imagine events or sequences of events, we trigger the same parts of our brain that are triggered when we experience a real physical activity. When scientists look at the brain scans of people who are told to imagine a flashing light, the same areas of the brain are activated as the ones that are activated by a real flashing light. When we imagine words that begin with the letter *p* or the letter *b*, our lips subtly move to form the letter. Researchers have even found that if we imagine we are drinking lemon juice when we are drinking water, we salivate more.

This all leads to the conclusion that mental simulations through storytelling can help us do many types of things. The Heaths write that mental simulation can improve our ability to solve problems because it can help us anticipate the right response to a future situation. For example, picturing a difficult situation, such as an argument with the boss, and imagining a better way to respond, such as avoiding a usual reaction, can be an

effective way to prepare for the situation before it occurs. Studies also show that mental simulation can help us build our skills. One study even showed that mental practice produces about two-thirds of the benefits of actual physical practice.

The Heaths point out that these findings are important because they show us that mental simulation can be a very powerful tool when creating sticky stories. Remember, a sticky story is really just a mental simulation that guides people through a lifelike framework to a nugget of wisdom that we want them to remember. When a story connects to its audience through links to real experiences, it will be recalled, retold and used to spread an idea.

Great Stories Inspire

The Heaths point out that great stories stimulate as well as inspire. The great thing about stories, they add, is that they really don't take too much creativity to use. Great stories are all around us, we just need to learn to recognize the best ones that pass in and out of our daily lives and catch them so we can apply them when we need them most. The Heath brothers' book offers practical advice to help executives develop their filters and sift the story gold from the silt.

Beyond its stickiness principles, *Made to Stick* also helps readers understand stickiness by summarizing many of its points into "Clinics." These sections address a specific problem with some of the learning the authors have revealed. For example, while discussing the role of stories in creating a sticky idea, the Heaths present a clinic for "Dealing with Problem Students."

First, they present the situation, which involves the issues of professors having to deal with challenging students in their classrooms. Next, they offer messages from two different sources that are dissected and analyzed using the stickiness principles. Finally, they present their "Punch Line." This is where they compare the effectiveness of the messages and reach a conclusion about the best way to respond to a similar situation. These clinics transform the lessons presented throughout *Made to Stick* into useful actions that anyone in a similar situation can use to cope with a difficult situation. They also show how real people have successfully applied stickiness principles to their work.

The 'Made to Stick' Phenomenon

Made to Stick has become a phenomenon because it embodies all of the six principles it describes. For instance, it breaks down the ideas it contains into extremely memorable lessons that are simple and straightforward. The absence of industry-specific jargon or complicated metaphors help the authors quickly and smoothly get to their points. Additionally, many of those points are counterintuitive and unexpected. They offer surprises that keep readers tuned in for more ideas they can share with others.

The ideas presented throughout *Made to Stick* are also rock solid. There is very little speculation going on, other than the important reflections on the future and questions for readers that bring them into the lessons presented. Also, the Heaths have the academic credentials and the public exposure from their popular writing gigs to make them very credible sources of the information they present. They have also picked wonderful stories to illustrate their points. These stories contain a variety of emotional topics and situations to draw in all types of readers.

This insightful combination of the stickiness principles turn *Made to Stick* into a clear example of the lessons it contains. The book's popularity and best-selling success demonstrate that Dan and Chip Heath have captured valuable information in their book that is as applicable to our modern world as it is appealing to our desire to find sticky ideas that we can use to improve our work and our lives.

Management: Strategies

Change the Culture, Change the Game

The Breakthrough Strategy for Energizing Your Organization and Creating Accountability for Results

by Roger Connors and Tom Smith

THE SUMMARY IN BRIEF

In *Change the Culture, Change the Game*, Roger Connors and Tom Smith, the recognized experts on creating a culture of enterprise-wide accountability, apply their practical and powerful strategy to helping leaders accelerate culture change, energize their organizations and create greater accountability for results.

In this landmark guide to organizational culture change, the authors introduce the Results Pyramid model, a simple and memorable methodology for efficiently and effectively changing the way people think and act throughout an organization to ensure that they achieve their desired results.

Mastering the ability to accelerate culture change is an essential core competency for every leader who wants to keep his or her organization competitive and focused. *Change the Culture, Change the Game* offers the definitive guide for developing this leadership competency and is based upon a methodology that is used by some of the most successful and admired companies in the world.

Tapping into more than two decades of expertise in assisting clients in creating a Culture of Accountability, the authors present a refreshingly clear and simple methodology that leads to rapid, results-oriented culture change.

IN THIS SUMMARY, YOU WILL LEARN:

- How to accelerate the change in culture you need to achieve your goals.
- How to generate the potent impact that greater accountability has on accelerating change in people and teams.
- How some of the most successful organizations in the world have applied these proven best practices.
- How to transform your entire organization through each level of the Results Pyramid: Experiences, Beliefs, Actions and Results.

Introduction

Creating an organizational culture where people embrace their accountability toward one another and toward the organization should occupy center stage in any effort to create successful organizational change. Without accountability, the change process breaks down quickly. When it does, people externalize the need to change, resist initiatives designed to move them forward and even sabotage efforts to transform the organization. With accountability, people at every level of the organization embrace their role in facilitating the change and demonstrate the ownership needed for making true progress, both for themselves and their organization.

Accountability, done the right way, produces greater transparency and openness, enhanced teamwork and trust, effective communication and dialogue, thorough execution and follow-through, sharper clarity and a tighter focus on results. Accountability should be the strongest thread that runs through the complex fabric of any organization. It is the single biggest issue confronting organizations today, particularly those engaged in enterprise-wide change efforts. At the end of the day, greater accountability produces greater results. And when you build a Culture of Accountability, you create an organization filled with people who can and will get game-changing results.

Culture has an impact on results, and the right approach to culture change accelerates that impact in a way that brings *game-changing* results.

When you base culture change on accountability and adopt a process designed to produce your desired results, you not only create a competitive advantage, you gain the tools you need to sustain that advantage far into the future.

Let the journey begin!

PART ONE: IMPLEMENT THE RESULTS PYRAMID TO CHANGE THE CULTURE

Either you will manage your culture, or it will manage you. Simply stated, organizational culture is the way people think and act. Every organization has a culture, which either works for you or against you — and it can make the difference between success and failure. Managing the organizational culture so that leaders, managers, team members and employees think and act in the manner necessary to achieve desired results has never mattered more. Doing it well is not an option; it's a necessity. Optimizing the culture should command your attention every bit as much as your effort to achieve performance improvements in manufacturing, R&D, sales and every other organizational discipline.

Experienced leaders know that changing the culture can mean changing the game by growing faster than your rivals, beating a bad economy, revolutionizing the value proposition of your organization or a host of other competition-beating achievements. Managing the culture so that it produces the results you are looking for has become an essential role of leadership and a core management competency. Neglect it at your peril.

The Results Pyramid

The Results Pyramid presents how the three essential components of organizational culture — experiences, beliefs and actions — work in harmony with each other to achieve results. Experiences foster beliefs, beliefs influence actions and actions produce results.

A clear line separates accountable and non-accountable behavior and thinking. Above the line are the Steps to Accountability, to See It, Own It, Solve It and Do It.

The Results Pyramid

Organizational Chart

Below the line is the all-too-familiar blame game and victim cycle. The Steps to Accountability lead to Above the Line actions and thinking. The blame game, however, results in Below the Line actions and thinking. As you might imagine, when individuals consistently engage in these two very different modes of thinking and acting, they create different organizational cultures, which perform at strikingly different levels.

The Steps to Accountability

A Culture of Accountability exists when people in every corner of the organization make the personal choice to take the Steps to Accountability:

- **See It.** When you See It, you relentlessly obtain the perspectives of others, communicate openly and candidly, ask for and offer feedback and hear the hard things that allow you to see reality.
- **Own It.** When you Own It, you align yourself with the mission and priorities of the organization and accept them as your own.
- **Solve It.** When you take this step, you constantly ask the question "What else can I do?" to achieve results, overcome obstacles and make progress.
- **Do It.** This means doing what you say you will do, focusing on top priorities, staying Above the Line by not blaming others and sustaining an environment of trust.

Defining the Results that Guide the Change

Building a Culture of Accountability begins at the top of the Results Pyramid. That's why the first step involves clearly stating the R^2 results you want to achieve. Frankly, it makes no sense to initiate any culture building activity or process unless you intend to increase the capability of the organization to deliver results.

The most compelling reason to work on your culture? Culture produces results.

"Opthometrics," a respected optical retailer, provides convincing evidence that this assertion is true. Following several years of solid business results, a serious downturn in the economy posed a challenge to Opthometrics. Although the company had put initiatives in place to improve results, the numbers were not where Opthometrics wanted them to be. Early in the process, Opthometrics brought in two leaders known for their outstanding field management, both of whom believed that in order to improve the results, they needed to go to work on the culture.

That effort started with the Brand Leadership Team getting aligned around R^2 in several areas of operational performance. The current business model, R^1, was not delivering the desired business results needed to change. Testing the premise that culture produces results, Opthometrics conducted a pilot in 5 percent of its stores.

There were plenty of skeptics whom the team needed to convince that changing culture would indeed change results. Everyone agreed to a pilot test with a clear definition of success that would make the conclusions perfectly clear. Bottom line, the pilot would need to show a significant impact on the business before the company could make a go-forward decision to launch the culture change effort worldwide in all of its retail stores.

The team agreed that anything less than a 2 percent improvement in the pilot stores would trigger a no-go decision. Improvement that fell in the 2-to-5 point range would indicate the need for further evaluation. But improvement of 5 percent or more would support an automatic go and full-scale launch of the change effort. With the success criteria firmly established, they spelled out precisely how they would evaluate any performance improvements. They were not going to take any chance on investing their time and resources on culture unless the pilot met these standards of success.

After the first two months, results were well above 5 percent. The outcome was unequivocal: Changing the culture significantly increased the retail brand's ability to get the desired R^2 results. At Opthometrics, the culture began to change quickly as people began thinking and acting differently about how to do their daily work in the pilot stores. Not surprisingly, based on the results of

the pilot, the client launched a company-wide effort to change the culture. ●

Taking Action that Produces Results

When it comes to changing your culture, you must determine to get everyone in the organization acting differently and taking A^2 actions each and every day. Clearly, you need to do more than just get people acting differently; you need to get them doing the right thing at the right time in a way that produces R^2 results. You cannot accomplish a successful cultural transition without that sort of targeted, directed and focused change.

The single most important change in actions that needs to occur during a time of cultural transition is the shift to greater accountability.

Accountability, done effectively, is a skill you can develop just like any other skill, and while it is not a difficult skill to acquire and hone, it does require a high degree of conscious effort. When you do it right, you'll also find it the fastest way to improve morale.

Building the Pyramid

Understanding what needs to shift in the actions people take is an important first step toward accelerating culture change. Once you determine the shifts in behavior from A^1 to A^2, you can begin traveling a clear path to where your organization needs to go. Creating a clear picture of what C^2 looks like in terms of what people need to do differently is a key to accelerating change. Doing this collaboratively in an environment of heightened personal accountability speeds up the process and provides the foundation that will ensure a successful journey. Abandoning the sole reliance on traditional and ineffective change practices, focusing instead on approaches that truly engage the work force in embracing personal change, greatly enhances the prospects for success.

But we need to make one point perfectly clear: Nothing, absolutely nothing, gets people to change the way they act faster than getting them to change the way they think. When you work only with the top of the pyramid, Results and Actions, you limit your ability to accelerate the shift to C^2 and minimize the chances that A^2 will become part of the way people do things in the organization. Beliefs, more than anything else, will motivate necessary behavioral shifts, so you must help people adopt the beliefs that will yield the actions needed to produce R^2. ●

Identifying the Beliefs that Generate the Right Actions

During times of change, managers and leaders often focus their efforts exclusively on the top two levels of the Results Pyramid. Our clients quickly learn, however, that they can greatly enhance their success at accelerating a change in culture when they expand their focus to work with the seemingly less tangible Beliefs level at the bottom of the pyramid. There is a simple yet powerful relationship between the beliefs people within the organization hold and the actions they take. Their beliefs about how work should get done directly affects what they do. If you change people's beliefs about how they should do their daily work (B^1) and help them adopt the new beliefs (B^2) you want them to hold, you will produce the actions (A^2) you want them to take. When leaders work with this deeper, more lasting aspect of behavior, they tap into the most fundamental accelerator of effective culture change.

The need to change culture often arises whether we are ready for it or not. Consider the profound change that occurred in the wireless communications industry when the business model changed almost overnight with the introduction of the innovative iPhone by Apple. Apple founder Steve Jobs had tasked 200 top Apple engineers to create the iPhone. Stressful deadlines resulted in screaming matches between co-workers and among exhausted engineers, who, according to a *Wired* magazine article, "frazzled from all-night coding sessions, quit, only to rejoin days later after catching up on their sleep." In one case, "a product manager slammed the door to her office so hard that the handle bent and locked her in; it took colleagues more than an hour and some well-placed whacks with an aluminum bat to free her."

The new product required a monumental effort, but a little over a year after its introduction, the iPhone accounted for 39 percent of Apple's revenues and was the single largest contributor to Apple's bottom line. Steve Jobs changed the game by getting the big players in the staid wireless industry to agree to a new business model, one that shifted beliefs about handsets. Until then, the industry had defined them as "cheap, disposable lures, massively subsidized to snare subscribers and lock them into using the carriers' proprietary services," as *Wired* put it. After making this strategic shift in beliefs, major players began using smartphones to differentiate their offerings and win customers. As this new business model moves forward and continues to morph, wireless providers will need to help the people in their organizations make corresponding shifts in their beliefs about

how they conduct their daily business. Those who make these operational shifts happen quickly and effectively will create competitive advantage.

Building the Pyramid

Effective leaders understand that beliefs drive people's actions. Culture change involves getting people to adopt B^2 beliefs about "how things are done around here." An organization's Cultural Beliefs statement describes its Culture of Accountability. A Culture of Accountability is a culture (C^2) in which people take accountability to think and act (B^2 and A^2) in the manner necessary to achieve the needed result (R^2). Creating clarity around the key Cultural Beliefs that need to shift will help accelerate the transition to a new culture and increase the likelihood of delivering desired results.

Providing Experiences that Instill the Right Beliefs

The Experiences that form the foundation of the Results Pyramid drive accelerated culture change. Whether you realize it or not, you provide experiences for everyone around you every day. Each interaction you have with others in the organization creates an experience that either fosters or undermines desired B^2 beliefs. Quite simply, the experiences you provide create the beliefs people hold.

Many leaders find that early in their change efforts, the experiences they create fail to influence prevailing beliefs in the way they had hoped they would. To avoid that happening to you, take these four principles to heart:

Principle 1: People work to validate rather than invalidate their current beliefs by filtering new experiences through the lens of their current beliefs. We call this selective interpretation.

Principle 2: People often cling to old beliefs and only reluctantly surrender them, falling prey to what we refer to as belief bias. As with selective interpretation, people are generally unaware that they are doing this.

Principle 3: People frequently fail to take accountability for the beliefs they form, choosing instead to see those beliefs as natural and logical conclusions based upon their experiences.

Principle 4: Because the beliefs people hold do not readily change, the best indicator of future behavior is past behavior.

In some cases, experiences can actually backfire, inspiring beliefs exactly opposite of those you sought to instill. Accelerating the transition to a Culture of Accountability will occur only when you learn the importance of interpreting the experiences you create. In fact, everything depends on it.

The Four Steps to Providing E^2 Experiences

There are four important steps you can take to ensure that you provide experiences that will create B^2 beliefs. Skip a step, and you will likely find yourself, at some point, creating experiences that reinforce the old C^1 culture you want to change. These steps will help you create the right experience the first time and help you correct your approach whenever you discover that your effort is not influencing people's thinking the way you hoped it would.

Step One: *Plan It.* While you will find plenty of opportunities to create experiences spontaneously, you must also, and more importantly, learn to plan E^2 experiences in advance, both as a team and by yourself.

Step Two: *Provide It.* Follow your plan and provide the experience. Your efforts must be sincere attempts to provide genuine experiences that signal real change.

Step Three: *Ask About It.* If you don't check in, you will not know if you have hit the mark. Don't get defensive. Be curious and listen to what people really think. Get as much input as you can from as many people as you can. Don't ask leading questions that bias what people say.

Step Four: *Interpret It.* Act on the feedback that you received and take the extra steps necessary to interpret the experience you provided in such a way that people form the desired B^2 beliefs.

Building the Pyramid

Taking accountability to live the Cultural Beliefs and creating the E^2 experiences needed to foster and promote them does more than anything else to accelerate culture change.

PART TWO: INTEGRATE THE C^2 BEST PRACTICES TO ACCELERATE THE CULTURE CHANGE

Success in speeding up the culture change will only come when everyone's actions, beliefs and experiences are aligned from person to person and across the various functions of the company. The more completely aligned the culture, the more everyone will concentrate on achieving R^2 results. Effective leaders of culture change manage in ways that get a culture aligned with results, and then they work to keep it aligned.

Getting Aligned Around Alignment

Using the Results Pyramid as a reference point, here is

a definition of alignment that applies to every effort to change culture: ***Alignment is common beliefs and concerted action in collective pursuit of a clear result.***

This definition refers to lining up the parts of the Results Pyramid (Results, Actions, Beliefs, Experiences) so that all of the parts are positioned in relation to the R^2 results you want to achieve. When all the parts are aligned and everyone is moving in the same direction, you get accelerated culture change; everyone stays on the same page, people feel less stressed, decision making occurs more efficiently and almost everything speeds up.

During the Culture of Accountability Process, the speed of the culture change will directly correspond to the level of alignment you create and maintain around R^2 and the Cultural Beliefs.

The Case for Change

A critical mass of people who take ownership for the change process will produce enough alignment and positive momentum to keep the change effort energized and moving forward. Because the early adopters are important to the success of the overall effort, you should concentrate on cultivating and nurturing them.

To initiate this cultural chain reaction, you must make a compelling Case for Change. Everyone wants to understand the basic rationale for R^2. The Case for Change addresses the why behind R^2, providing the context for *why* we need to change the culture and why we need to do it *now*. The more compelling the Case for Change, the more likely you will forge the ownership and buy-in you need. The most compelling Case for Change always incorporates these best practices:

1. Make it real.
2. Make it applicable to your audience.
3. Make it simple and repeatable.
4. Make it convincing.
5. Make it a dialogue.

The Leadership Alignment Process

The Leadership Alignment Process consists of six key elements that help ensure that real alignment is achieved:

Step One: *Participation* — Get the appropriate people involved.

Step Two: *Accountability* — Identify who will make the decision.

Step Three: *Discussion* — Ensure that people speak up and are heard.

Step Four: *Ownership* — Promote the decision as your own.

Step Five: *Communication* — Be consistent with the message.

Step Six: *Follow-Up* — Check in and test for alignment.

Alignment is a process, not an event. It is something you must constantly work to achieve. ●

Applying the Three Culture Management Tools

Now that you understand how to create alignment for using the Results Pyramid to build a game-changing culture, you can start applying the three essential Culture Management Tools that will accelerate the change effort: Focused Feedback, Focused Storytelling and Focused Recognition. These tools will help you integrate the Cultural Beliefs into your organization's culture and speed it toward C^2 and your desired R^2 results. These tools are designed to help you deal with a C^1 culture's strong resistance to change.

• **The Focused Feedback Tool.** Constructive Focused Feedback offers positive and candid suggestions and guidance on what else people can do to demonstrate the B^2 beliefs more fully. This type of feedback is critical to helping people succeed in the new C^2 culture because it helps them know what they can improve in a timely way. A lack of constructive Focused Feedback will cause every culture-change effort to stall and eventually die out.

• **The Focused Storytelling Tool.** While Focused Feedback accelerates change, organizations can pick up the pace of the transition even more when they add Focused Storytelling to the mix of Culture Management Tools. People tell stories every day throughout the organization. These stories simply describe people's experiences and convey their beliefs about what is important and how work should be done in the organization.

Do you know what stories people in your organization tell each other? What beliefs do those stories drive? What stories do you tell to others?

These stories move the organization either toward C^2 or back to C^1. If you want to speed up the journey to a C^2 culture, then you must identify and tell C^2 stories.

• **The Focused Recognition Tool.** We all know that people sometimes "fall down" while learning to live the Cultural Beliefs. Acknowledging the step forward with recognition, in spite of the fall, will speed up the culture change effort. Focused Recognition, like storytelling and feedback, must center on the Cultural Beliefs. ●

Mastering the Three Culture Change Leadership Skills

Culture change always requires leaders to become proficient in the skills needed to lead the transition effort. Without a concerted effort at the top of the organization to develop greater proficiency with the skills needed to lead the culture change, leaders frequently slow down the process and make the change effort less efficient and less successful. Developing these skills will accelerate the cultural transition while enhancing leadership capability in every other endeavor. The three culture change leadership skills every leader will need if they want to move the culture from C^1 to C^2 are: the skill to Lead the Change, the skill to Respond to Feedback and the skill to Be Facilitative.

These three leadership skills are essential to ensuring that the culture change effort stays on track and achieves R^2.

1. The Skill to Lead the Change. Culture change must be led. You cannot delegate the initiative to Human Resources, Organizational Development or anyone else. While these and other organizational functions play important roles, the senior leadership team simply must maintain ownership of the process and lead the culture change at every level of the organization, ensuring that the change effort is prioritized correctly at the top of every management team agenda.

To bring about the C^2 culture and R^2 results, leaders must take personal ownership of the implementation of cultural transition best practices throughout the organization.

2. The Skill to Respond to Feedback. When people see leaders reinforcing B^2 beliefs, everyone gets the message that "I ought to be doing that too."

When you receive feedback that you have created an experience that is inconsistent with the Cultural Beliefs, you can use the Methodology for Changing Beliefs to get people looking for evidence of your true alignment and your deep desire to embody the new culture. Here are the methodology's five steps:

Step One: Identify the belief you need to change.

Step Two: Tell them the belief you want them to hold.

Step Three: Describe the experience you're going to create for them.

Step Four: Ask them for feedback on the planned experience.

Step Five: Enroll them in giving you feedback on your progress.

3. The Skill to Be Facilitative. It usually takes some effort to become thoroughly facilitative in your communication style — an important culture change leadership skill. Getting everyone to engage in a meaningful dialogue about what needs to change and making sure that conversation occurs at every level of the organization is essential to accelerating culture change.

Lasting culture change always requires collaboration, teamwork and dialogue. Your ability as an organizational leader to ask questions, seek input, create dialogue and get people talking about the right topics will speed up the adoption of C^2 beliefs.

Integrating the Culture Change

Leading culture change means working ceaselessly to implement and integrate. Each activity enhances and then mutually reinforces the other. Implementation sets up integration and integration sustains implementation. They go hand in hand.

Integration is not about convening additional meetings, creating a longer list of things to do or lengthening the workday. On the contrary, when you integrate the Culture Management Tools into the organization, you insert them into carefully selected, already existing meetings and activities. It bears repeating: Integration means integrating the tools into the current organizational processes, procedures and systems. When done correctly, integration weaves the Cultural Transition Process seamlessly into the way things are done in the organization. If you do it poorly, people end up feeling that you have just added another burdensome program to the many they already need to implement.

The Three Steps to Effective Integration

Successful integration of the C^2 best practices into the culture change process depends on effectively applying each of the following three distinct steps.

Taking these steps sequentially will allow you to spot the best opportunities for making integration happen in a way that optimizes your effort and minimizes distractions.

Step One: *Identify the Opportunities for Integration into Meetings.* Integration is most effectively accomplished within intact teams. While the opportunities for integration will differ from team to team, your initial list of opportunities should include all of the different meetings the team currently holds, including one-on-ones.

Step Two: *Identify Opportunities for Integration into Systems.* Integrating change into the organizational systems includes evaluating the policies and procedures of the organization, as well as both the formal and informal application of those systems.

Step Three: *Make Your Integration Plan.* This plan

should specifically capture what you are going to do to integrate the best practices into the activities you have selected.

A good example of how to do this comes from "Eastside HealthPlans." After the Eastside management team evaluated steps one and two in the integration process, they arrived at a plan. The team took early steps to align the organizational systems as well. As a result, they unleashed organizational thinking and began to make changes on a variety of fronts. Lean process teams were formed to address the waste, inefficiencies and administrative costs within the organization. For the first time in 25 years, leaders began to create significant experiences that suggested the company would not tolerate waste. These teams ultimately achieved line-item cost savings of over $200 million.

Enrolling the Entire Organization in the Change

In order to achieve transformational change, you will need to adopt the right process for enrolling everyone in the organization in the change effort. Five principles should guide you as you engineer and build full employee engagement in the change:

Principle 1: Start with *accountability*. Accountability for R^2 should always begin with clearly defined results. Without it you will not move the organization forward and enroll people in providing the effort needed to change your culture.

Principle 2: Get people ready for the change. Your culture will not change unless you get everyone in the organization enrolled in making the change happen. You should expend every effort to get people ready for the change by persuading and convincing them of the merits of the change and by getting them involved in the process.

Principle 3: Begin with the relative top and intact teams. Relative top means that regardless of where you initiate the culture change process — in a team, a division, a function, a subsidiary, a country affiliate or the entire organization — you must begin the process at the top of that organization to be most effective.

Culture change begins in the context of intact teams. Establishing peer-to-peer accountability within these teams is essential to building the right foundation for the culture change effort.

Principle 4: Establish a process control and keep it honest. To be most effective, you should adopt agreed-upon process controls at both the individual and team level. Common process controls include: embedding the language of the tools and models, tracking progress toward R^2 results and establishing milestones for process implementation and integration.

The enrollment process must be designed to help everyone avoid the trap of just "going through the motions." It should keep everyone honest in the way they apply the Culture Management Tools and C^2 best practices.

Principle 5: Design for maximum involvement and creativity. Cultural change is a highly collaborative effort and requires the engagement of everyone at every level as co-creators of the culture.

Final Thoughts

Culture change can provide the differentiator that brings competitive advantage and game changing results to any business. In today's competitive environment and challenging economy, performance improvements grow ever harder to achieve and game changers become more important every day.

True game changers don't come easily. No matter how much time you spend optimizing performance with incremental improvements, they will take you only so far.

When the business model demands R^2 results, the game is no longer just about optimizing current performance; it's about transforming organizational results. Game changing, transformational results can and do come from well-executed culture changing initiatives. When you change the culture, you change the game, and with that new game comes the desired results that shape and define success for your organization.

When you approach culture in the manner described here, culture change raises the spirit of the entire organization and energizes everyone involved to make the change successful. With the combination of accountability and the application of the C^2 best practices, you will accelerate the change in your culture and achieve the results you seek.

Bury My Heart at Conference Room B

The Unbeatable Impact of Truly Committed Managers

by Stan Slap

THE SUMMARY IN BRIEF

Ever have the feeling that no matter how rewarding your job is, there's an entirely different level of success and fulfillment available to you?

There is, and performance expert Stan Slap is going to help you get it.

Bury My Heart at Conference Room B entirely redraws the potential of being a manager. It will put an entirely new level of meaning into your job description.

You will never really work for your company until your company really works for you.

Bury My Heart at Conference Room B is about igniting the massive power of any manager's emotional commitment to his or her company — worth more than financial, intellectual and physical commitment combined. Sometimes, companies get emotional commitment in their early garage days or in times of tremendous gain, but it's almost unheard of to get it on a sustained, self-reinforced basis.

Of course, your company is only going to get it if you're willing to give it. In *Bury My Heart at Conference Room B*, Slap proves that emotional commitment comes from the ability to live your deepest personal values at work and then provides a remarkable process that allows you to use your own values to achieve tremendous success.

IN THIS SUMMARY, YOU WILL LEARN:

- The highest-rated management solution at many of the world's highest-rated companies.
- How to revolutionize performance in your organization.
- Where to find the urgency and energy to change the world.
- How to transform your career and life.

Introduction

When Mark Hurd, the CEO of Hewlett-Packard, taps you, you're going to feel it. Three years ago, he appointed Adrian Jones to be the channel chief for the Americas — 25,000 companies that represent a major revenue source for HP. Jones aggressively set about to create what is now recognized as the successful model of an enterprise-partner relationship. So, Mr. Opportunity just tapped him again, this time as an SVP, to turn around the company's Japan-APAC region, which many believe is the area of its greatest future growth.

Jones explains: "My first exposure to *Bury My Heart at Conference Room B* was years ago, as a regional manager for Quantum. I thought I knew everything. Had plenty of energy even if I wasn't sure what to use it for — was a cheeky, unguided missile. I know I should have been more skeptical about the process because it seems like it makes you vulnerable. In the end, it makes you so much stronger and I think I must have sensed that.

"It instantly changed my whole philosophy of managing. It showed me that you could transform people's lives in a business environment in a way they thought was impossible. Since then I've seen the metrics impact of *Bury My Heart at Conference Room B* — numbers up, better productivity, people more motivated, my team rated the best in the company and the best results in the channel space we've ever had at Hewlett-Packard.

"I'm a very passionate guy and what this showed me is that it really is OK to be passionate, to put your true heart into what you do. I've learned that the rest doesn't matter — who you are when you get up every morning is what matters. This is what I know now that I can pass on to you: Let the walls come down. Don't lead from your head. Lead from what you believe in." ●

PART 1: IT TAKES A VALUE PROPOSITION

What Lies Underneath

Emotional commitment is a tricky thing, a delicate process that's buried far below the level of conscious choice. It will happen only when your brain believes it's safe to give it and is uniquely rewarded for giving it. The critical signal for both is if you're able to live your deepest personal values at work. As a manager, can you say that's the case — no hesitation or qualification? Careful now: Even a financially rewarding, intellectually stimulating work environment isn't the same as living your own values.

The default position for emotional commitment is emotional detachment, which manifests itself in all sorts of ways. Could you possibly be emotionally detached at work without even realizing it? It would be hard to realize if you're detached. There's a party in your head and you're not invited.

Whenever a deep divide exists between who someone is as a human being, who they want to be as a manager and who they have to be as management, all hope for emotional commitment is lost. Lost for managers and lost for the companies that depend on them.

What Are We Talking About Here?

We are talking about nothing less than redrawing the potential for organizational success. The great plains of corporate possibility are a wasteland unless deep-seeded by a wholly different level of manager commitment.

Little is grown and nothing is sustainable. Companies will never change this until they change who managers can be within the company.

We are talking about nothing less than redrawing the potential for manager fulfillment. Providing the ultimate solution to work/life balance: not escaping from work, but living the way you want to at work.

This is all still very new thinking. New thinking requires smart connection of seemingly unrelated empirical data points, accurate interpretation of anecdotal evidence and the occasional leap of faith.

Most of all, it requires a deep desire to live in the new rather than continue to suffer in the old. ●

The Mystery Achievement

You must live your personal values at work. This isn't some woo-woo new paradigm management rhetoric. This is, flat out, the quality of your life.

Profitability. Growth. Quality. Exceeding customer expectations. These are not examples of values. These are examples of corporate strategies being sold to you as values. They may be good, important strategies, but they're strategies all the same. Values are different; values are deeply held personal beliefs.

Family. Integrity. Health. Freedom. These are examples of values. If these are some of your own biggest values and you feel that you have to compromise them in any way to do your job, you may not be fully living your values at work.

This isn't a matter of your intelligence, maturity or skill; there are relentlessly seductive forces being aimed at you as companies attempt to replicate a sense of personal-values fulfillment for managers but insert corporate priorities in its place.

It takes far more energy to be emotionally detached than emotionally committed, to maintain a wall between your inner and outer selves. This is energy that's no longer available to put into realizing the rest of your life.

The How and Why of What Matters

The best corporate revenues will be achieved as a result of managers' commitment to themselves, made before any commitment to the company. Sometimes companies get emotional commitment from their managers in the early garage days. Sometimes they get it in times of tremendous gain or pain. Sometimes they get it on a sustained, self-reinforced basis. The heart of a company's performance is hardwired to the hearts of its managers. ●

Time Waits for No Manager

On average, how many hours a week do you spend working — meetings, e-mail, people problems, crazed customers, not to mention any actual work that accidentally occurs in-between. Let's say, like most managers, it's about 50.

On average, how many hours a week do you spend traveling to and from and for work? Some managers are dazed road warriors, but for most it's about 10. Now you're at 60 hours a week: You're working 50 and traveling 10.

On average, how many hours a week do you spend thinking about work? Not actually engaged in doing the job but obsessing about the job, talking to someone outside the job about the job, daydreaming about the job and waking up screaming about the job? If you're like most managers, it's about 15 hours a week. Now you're at 75 hours a week: You're working 50, traveling for work 10 and thinking about work 15.

Welcome to Your Personal Life

At 75 hours a week, you're spending more than double your waking hours working than not working.

These are the irretrievable hours of your personal life — you do not get this time back. Every day. Every week. Every month. Every quarter. Every project. Every year.

To not live your deepest personal values for over half your waking hours is a crime. Worse, it's an unnecessary crime. Your company might actually *insist* you live them at work. You just have to know how to make this happen. ●

PART 2: WALLET. HEART. KEYS.

The Company Dream

What does a company want from its managers? It wants you to be fanatically loyal, ferociously energized, protective of the organization and its assets, willing to represent the company as immaculate in its offerings and innocent in its intentions, flexible but consistent, innovative but obedient, bold but conservative, diverse but similar, self-sufficient but a team player, firm and sharp but soft and pliable, dependably motivated by money but independently wealthy to the point where company compensation is a personal accounting bother and not worth collecting.

A company mostly wants homeostasis — it wants to be a stable and self-structuring organization. A homeostatic system adapts itself to its environment to preserve

stability. The system is constantly energized and will rapidly respond not only to manual changes, but also to any unexpected conditions. All critical variables are held at a desirable level by a self-regulatory mechanism.

But wait: A company doesn't just want its managers to be hordes of Zegna-clad thermostats, reactive to any change in the business climate that could adversely affect the enterprise. It dreams big. It wants you to be proactive, anticipating those changes and transforming them into opportunities. It wants you to pursue growing the business like a holy crusade. It wants you to *care*.

It wants you to be emotionally committed.

And no wonder: The results of emotional commitment are drool-inspiring. You know them all: the groovy Internet company, the feisty regional airline, the high-minded clothing manufacturer, the zany retailer. These are places where the weird stuff happens all the time — the remarkable acts of manager dedication that compel success against the market, against the competition and sometimes against all odds.

Emotionally committed managers in these companies don't always make the most money, but they don't leave. They champion their companies and they protect them at all costs. ●

A Tale of Two Companies

PRIDE Industries recently nailed annual revenues of more than $150 million. An outsourcing solutions company, PRIDE serves manufacturing and service industries across 11 states.

PRIDE is one of the largest employers of people with disabilities in the United States.

"We're damn well not a charitable act for our customers," bristles CEO Michael Ziegler. "We're in a regular cutthroat, hypercompetitive business. We'd never make the mistake of thinking it's anything else and neither would they."

Those customers include the likes of Hewlett-Packard. PRIDE handles all ink-jet printer supply fulfillment for HP in North and Central America and is the worldwide supplier of their repair kits. The business is regularly audited and awarded on competitive co-factors of cost and competency.

One of PRIDE's employees is an operations manager who says, "I don't think about my handicap much. 'Handicapped' would mean not being allowed to be who I want to be at work. I never feel handicapped here."

Rhino Records

Born in the back of a Los Angeles record store, spunky, funky Rhino Records grew up amidst a record industry that had become increasingly moribund in its prioritization of money over the meaning of music. Yet, Rhino refused to surrender its unique lunatic spirit and still ended up setting the enduring standard for the archiving of rock recordings in scope, sound quality and packaging.

Gary Stewart was one of Rhino's first employees and rose to the critical post of senior vice president of A&R. "The Rhino product was about protecting the music. The Rhino business was about protecting the lifestyle. I believe we are all one people, that people are equal and that they deserve freedom to do their own thing. People will rise to the cause if the cause is worth getting up for. That's what happened at Rhino."

Let It Happen

If your company wants the rest of its managers to perform like its best managers perform, then the company has to respect what makes those best managers willing to give emotional commitment. Enforcing or reinforcing it isn't as important as getting out of the way and *letting it happen*. The only way to generate dependable emotional commitment is to allow it to be self-generated. That's where it comes from. ●

The Dream Denied

Without emotional commitment from managers, a company can't ever realize the dream of being a self-structuring, self-protective system.

Companies can't get emotional commitment from their managers because the company believes it needs to be the dominant organism in the relationship, which causes managers to have to repress their own values — and so causes them to detach emotionally from their jobs. In order to really get that emotional commitment, a company would have to reattach managers to their own deep drivers — allow them to live their own values and act according to their own personal codes.

Even if they can't put the organizational finger on it, companies can sense the difference between emotional commitment and lesser kinds. They understand that something big is being left off the table — the gap between what their managers are giving and what they could be giving — and they attempt to close the gap.

The first attempt is to repurpose values by swapping individual definitions for corporate ones. You have Family as a value? That's beautiful. This is your family

right here. Now protect it by making your numbers.

The second attempt is the selling of the emotional company store: plenty of support for a common point of view; clearly defined enemies; ever-changing rewards and punishment; constant drama and numbingly urgent pace; *über* support rallies where cold business logic is sold as burning passion; free company clothing and low-cost company food; and company "values" made available in a dazzling display of collateral damage, including wallet cards, T-shirts, posters, mouse pads, coffee cups and a company laptop bag to stuff it all into.

OK, the *third* attempt is to trot out the carrots — money and the stuff money buys.

All of this is carefully calculated to work. It should work. Sometimes it seems like it works. It doesn't work. Not logically. Not neurobiologically. ●

How a Manager's Brain Works. And Doesn't.

In the worst corporate cultures, managers are expected to form stable, selfless, giving and forgiving relationships with companies that are ever-changing, selfish, greedy and unforgiving.

In these harshest of environments, managers make the conscious choice to fade back. They deliberately leave the best of who they are at home when they suit up every day for the detachment factory.

But in most corporate cultures, managers are there because they want to be there. They like their company. They want to help make things better. They want to take some sense of self from the might and magnificence of their organization. In many cases, managers don't even want to work less. They just want it to mean more.

Yet the same problem exists in these better environments and it's more dangerous because it's harder to see. Neurochemical markers in the brain identify options considered healthy and safe; these are the biological versions of "values." If they can't be met, health and safety must be in jeopardy and the brain immediately shifts into threat containment mode. One of the protective processes it deploys is emotional detachment. ●

Pinch Me; I'm Dreamin'

Companies know what they want most: emotional commitment from managers. But they're nervous about the potential risk of gaining it and frustrated by sustained efforts that haven't produced sustained results.

Managers know what they want most: to be allowed to achieve success by leveraging who they are, not by compromising it. But managers are detached and distracted by the constant effort of maintaining a personal center of gravity amidst a whirling corporate universe.

Your dreams and the dreams of your company may be different, but they are in no way incompatible.

The Solution. Cleverly Disguised as the Problem

What's needed is a model that will reliably allow managers to live their values at work without the company having to constantly facilitate the process. A self-sustaining model that is a safe and healthy choice for both the company and its managers. Brace yourself: The model is called leadership.

The purpose of leadership is to change the world around you in the name of your values so you can live those values more fully. The process of leadership is to turn your values into a compelling cause for others so you gain resources to help you do that.

The irreducible essence of leadership is that leaders are people who live their deepest personal values without compromise, and they use those values to make life better for others — this is why people become leaders and why people follow leaders.

The company must allow itself to be the best possible place for managers to practice true fulfillment, to live their values and to realize deep connectivity and purpose.

This is the system managers will protect. This is the system managers dream about. ●

The Limbic System

The limbic system is the part of the brain that evaluates the reward potential of judgment calls.

The limbic system is about serious business and won't be lured by the promise of *shiny things*! It can't be fooled by cheap substitutes, even if they're materially pretty valuable. To reliably trigger the desired limbic response in its manager population, a company would have to align the causes of oxytocin, serotonin and dopamine release with impeccable accuracy for each manager. The way to do that would be to connect life and work with health and safety: Allow each manager to work according to his or her individual values.

PART 3: YOU MUST. YOU CAN.

How to Decide What's Truly Most Important to You

Values are deeply held personal beliefs that form your own priority code for living. They're the individual biases that allow you to decide which actions are true for you alone. They're the personal standards that give you the most and that you care about the most. They're the definition of what life looks like when you live it exactly the way you want to. Values are your very own source of safety, hope and renewal.

Where Are Your Values?

Being a leader means being able to sell your values to others:

Step One: Identify the 10 values that mean the most to you personally. Define the meaning of each of the 10 values you've chosen. Cut your list of 10 values to five. Cut your list of five to three.

Step Two: Consider the considerable influences. There's an intimate connection between your emotions and your strong opinions about the way things ought to be. It's impossible to separate your emotions from your values because one keeps influencing the other. The big question is, *what influences both of them?*

Step Three: Confirm your choice. You could conceivably change your choice of top values at any time. It is much better to know that those values are not easily open to revision but are, instead, a true representation of your deepest beliefs.

Step Four: Connect the moments of truth. One of the best ways to confirm your values is to understand where those values came from — understand the moment, or moments, of truth that caused those values to become personal priorities.

Step Five: Talk to yourself, then talk to others. Ask questions to identify patterns of choices made, directions taken and options refused in favor of others. Ask these same questions of those who know you best. ●

How to Sell It to Yourself

Here are three big myths that prevent a manager's natural transition to leadership:

1. **"I don't have what it takes."** The problem with having great leaders as role models for your own development is that by the time they come to your attention they've already got their act together. You don't see them when they're starting out, desperately recruiting the first followers, stumbling through the initial construction of their vision, facing overwhelming odds and a power structure that is well resourced, dug in and disinclined to cede any territory.

Leaders do great things for the world, but the initial motivator is that they want to meet their own deepest values.

2. **"It seems like a lot of sacrifice without a lot of payoff."** No one could deny, for example, Nelson Mandela's remarkable sacrifice for his deep beliefs. But at least he knew his deep beliefs and was focused on realizing them. Leadership taps into energy and conviction that is simply unavailable to most people.

What's important is that you learn to do those things that leaders do so you can get the benefits that only leaders get. Leadership will connect you to your most important personal values and turn your cause into the common cause, but there are plenty of other benefits, and they'll all be yours when you apply leadership in an organizational environment.

3. **"I'm confusing management and leadership."** Authentic leadership is hard to find in the two environments where it's most often self-proclaimed: politics and business. It is followers who keep a leader in place. When the primary purpose of leadership isn't to serve that true constituency, the leadership is fundamentally corrupt.

In real leadership, mistakes are a healthy part of the process. And while real leaders may be tactically wily, they don't compromise their values. ●

How to Sell It to Your People

Living your values at work requires the support of others. If the people around you care, you've got a chance of achieving this for more than half your waking hours. If they don't, you won't.

The process starts with getting people's attention in a way that makes them believe your values are even worth considering.

The first way is bribery. One problem: It doesn't work. The carrot may achieve short-term results, but it won't inspire the honest, sustained effort a leader needs. The successful leadership battle is fought for your people's hearts, not their pockets.

The second way is fear. One problem: It doesn't work. The stick may achieve short-term results, but it's the longer-term result you have to be concerned about

since anger is the natural psychological reaction to fear. Inspiring a constant level of hostility among your people is a seriously flawed strategy.

The third way to get your people's attention (Hint: *This works*.) is with your hand, in which you symbolically reach out to your people. "Grab hold," you are saying, "and I'll take you to a Better Place."

Step One: Define the Better Place. In leader-speak, the Better Place is called "vision." Because their vision is driven by true belief, leaders really can see that Better Place.

Step Two: Back the better with the bitter. To encourage your people to dream of a Better Place, you muat be very clear about the nightmare of their current reality.

Step Three: Give them something for the trip. You can't just promise them a spectacular conclusion; You've got to give them something spectacular along the way to keep them moving. Link your Better Place with their significance, their belonging and their self-worth.

Step Four: Connect it up. What does it look like when all the steps are put together? It looks like you've got something that's different, sensible and compelling.

How to Sell It to Your Company

You can gain enterprise support for the prioritization of your personal values when you can translate it into business impact. To do that, you've first got to translate it into skill. Here is how to do both:

Step One: Solve old problems in a new way. The principles of *Bury My Heart at Conference Room B* need to be integrated into your regular management job in a way that helps you become more successful. That way you'll have a reason to use the principles regularly until they become reliable tools.

Step Two: Bench the metrics that matter. The key to protecting your individual implementation of *Bury My Heart at Conference Room B* is also using it to positively impact the performance measurements your company considers most important.

You're in good shape if doing that requires your own emotional commitment and discretionary effort; performance reinforcement for your people when traditional methods are unavailable or devalued; their increased unity of purpose, tolerance for change and faith in you when the circumstances of the company are in doubt. These are the metrics enhancement tools that have now been placed in your hands.

The Whole Point

Can one manager really change the world? Considering the state of the world today, that's the only way it can change — one person influencing one group of people at a time.

For all of these reasons, … **Be human first. A manager second.**

Step Three: Talk it up. Sooner or later you'll need to perform a miracle in the name of your leadership to reach a goal your own way, stop or slow a change, grant someone on the team special recognition. That decision won't be made by you but by someone a level or two above. You don't want to wait until that moment to explain that your leadership credibility hangs in the balance. If you'll need their support sooner or later, best to get it sooner.

PART 4: GET ON WITH IT

Personal Implementation

The typical manager receives more than 100 e-mails every day, works more than 50 hours every week and is responsible for more productivity and revenue every year. What you don't need is more to do in order to implement *Bury My Heart at Conference Room B*. You need a fast and simple guide that translates your willingness to embrace the solution into the skill to use it.

Step One: Take it home. *There is no greater good* for you and your partner or your family than encouraging each other's deepest values.

Step Two: Declare it. If you want your people to seriously commit to making your own Better Place happen, you're not only going to have to announce what you stand for, you're going to have to do it in an entirely new way.

Step Three: Prove it. You're going to have to earn trust like leaders do, through consistency and passion, and by how you make mistakes and cause others to. Your people will forgive a lot of mistakes in the interest of your attempting to get them to a Better Place.

Step Four: Now, first, next and later. Commit to a few steps over a few weeks. Confirm your values. Start getting the support at home for what you're trying to do at work, and start getting the benefits, too. Make sure you're ready. Prepare your initial declaration. This isn't about you; it's about you and your people, working together for something of mutual benefit. You don't

have to do it all and you don't have to have all the answers.

Step Five: Who's next? *Bury My Heart at Conference Room B* is about living your values at work by translating them into improved working conditions, thus generating your emotional commitment to the success of the company. There's not much in that sentence that wouldn't be good for your people to do too. You can help them do it. ●

Organizational Implementation

Bury My Heart at Conference Room B is designed to work individually and produce individual manager results for the organization. The more managers who apply the process, the more the organization benefits.

To ensure enterprise-wide results, it has to be implemented enterprise-wide. The process works just as well, uses all of the same tactics, but requires additional processes and resources to institutionalize behavior on this scale. When senior teams contemplate it, this is the part that usually seems most burdensome. That they have to model the behaviors themselves is the part that usually seems the most worrisome.

It's not simple to do, but it's certainly achievable, as are the results and the personal fulfillment opportunity for every manager, at every level. Here are all of the essential considerations:

1. **Embrace the business case.** This process can't be started, then defaulted on, so it should be initiated only after a deep commitment has been made to make it part of the way the business operates.
2. **Reinforce the right.** Whatever systems provide financial reinforcement for performance should include the application of individual values as one of the criteria. Rewards should be linked not only to what was achieved; but to how it was achieved using values and demonstrating emotional commitment.
3. **React to the wrong.** As you prepare for implementation, prepare for where the pressure will fall and prepare an unwavering response to anyone who might doubt that their disregard would trigger consequences.
4. **Don't overpromise.** Fortunately, you don't have to have all the answers and you don't have to solve all the problems yourself. This is about real leadership.
5. **Announce the organizational demand.** If your company is willing to make the investment in creating this opportunity for your managers, it should be made clear that it's an opportunity, but it's not optional. ●

You Must Remember This

Here is the closing argument, delivered on behalf of your personal fulfillment, your success and the success of your company:

- **A company must let managers live their values.** People are hesitant to embrace any world that is barren of what feeds them.
- **Living your values is the key to work/life balance.** If you're not living your values at work, you're not living them in life.
- **Your leadership is important.** Your company is not a passive environment. It has its own purpose, priorities and life force. Living your values in such an environment cannot be a passive process.
- **You should live your values at work.** Your values are your essence: an undistorted mirror showing you at your pure, attractive best.

The Path

There is a road.

It is the road that every renowned leader in history has walked down to achieve success. When you strip the mystery and mythology out of leadership, it is a specific series of tactical steps, often performed in a specific order and always for a specific reason.

When you implement what you now know about leadership — exactly how and exactly why — you'll move all the rest of the way down that road, to the fulfillment, impact and legacy that await you. ●

Management: Strategies

Flash Foresight

How to See the Invisible and Do the Impossible

by Daniel Burrus with John David Mann

THE SUMMARY IN BRIEF

Author and business consultant Daniel Burrus is one of the world's leading forecasters, corporate strategists and visionaries. Over the past quarter century, he has established a reputation worldwide for his exceptional record of accurately predicting the future of technological change and its direct impact on the business world.

"Wouldn't it be amazing if you could predict the future — and be right?" writes Burrus. "You can: All you have to do is leave out the parts you could be wrong about! And the amazing thing is, when you know where to look, there's more than enough you can be right about to make all the difference."

From small businesses to multinationals, individual careers to entire industries, *Flash Foresight* looks at how seven radical flash foresight "triggers" have transformed careers, fortunes and lives. Both engaging and enlightening, *Flash Foresight* provides an easy-to-implement blueprint for applying the same strategies to your own business, enabling you to see the invisible and do the impossible.

In the past, flash foresight was useful. Today, as the pace of technological change accelerates almost beyond the point of comprehension, it's an imperative.

IN THIS SUMMARY, YOU WILL LEARN:

- How seven valuable principles can help you find deep business insights.
- How to change the way you think about your current obstacles and open your mind to limitless new opportunities.
- How to stimulate innovation and positive change.
- What you need to do to survive and thrive in the challenging times that lie ahead.

Introduction

Dale Morgen is an accomplished inventor with more than 30 wildly successful patents under his belt. In the course of his work he has honed a certain skill, and that skill is *flash foresight*.

Flash foresight uses the data of your five senses, as well as that intuitive sixth sense we all have that some call a *gut feeling* or *hunch*. But flash foresight goes further, because in using it, you synthesize those sensory and intuitive faculties and project them forward through the dimension of *time*. A *flash foresight* is a blinding flash of the future obvious. It is an intuitive grasp of the foreseeable future that, once you see it, reveals hidden opportunities and allows you to solve your biggest problems — *before* they happen. Flash foresight allows *anyone* to both see and shape his or her future.

You've had flash foresights; we all have. They are those fleeting glimpses we sometimes have of where things might be heading. Flash foresight is a sensibility, a skill you can develop, refine and strengthen.

Let's start with how Dale Morgen used this powerful principle to arrive at his great idea.

Dale Morgen's Flash Foresight

Morgen knew that there is another approach to our worsening energy crisis that does *not* use fossil fuels, does *not* produce greenhouse gases or any other pollution, and does *not* create radioactive waste or pose any other environmental dangers. It's called *nuclear fusion*, and many scientists believe it could become the energy source of the 21st century and beyond.

Understandably, this prospect has a lot of major international players hot on the fusion trail. A consortium of 20 countries is building a massive, multi-billion-dollar facility in Southern France. At California's famous Lawrence Livermore lab, a fusion facility is under construction that will span three football fields to blast its millimeter-sized hydrogen-fuel pellets with massive lasers.

However, there's a problem. So far, even with these massive and astronomically costly facilities, the fusion reaction requires more energy going in than it yields in output. Like an investment that keeps losing money, today's fusion reactors produce a net energy *loss*.

And that's where Morgen's idea comes into the picture. His flash foresight was this: *Instead of making these facilities bigger and bigger, why not make them radically smaller?* In fact, why not make a fusion reactor so small you can't even see it — so small it would be built out of single molecules? In a word: *nanofusion*.

Morgen is one of a handful of early innovators who are exploring the emerging field of nanofusion. Morgen's model is similar to the Lawrence Livermore reactor in concept, only instead of firing mile-long lasers at small glass pellets, his reactor would fire a nanolaser made from a single carbon molecule — called a *nanotube* — at hydrogen isotopes wrapped inside another type of carbon molecule called a *buckyball*. This material has a much higher purity and density — and lo and behold, it produces a *net positive yield*: more energy coming out than it takes to make the reaction. Potentially, says Morgen, *vastly* more.

Imagine the impact such a technology would have on the world. We would have enough energy to fuel our

global economy for centuries — conceivably, forever — without producing any greenhouse gases or radioactive waste.

The *Go Opposite* Flash Foresight Trigger

The flash foresight principle underlying Morgen's nanofusion is this: Go opposite. While everyone else in fusion was focusing on building gigantic reactors that filled football fields, Morgen and his colleagues went in the opposite direction, designing one so small it would easily fit on the point of a pin.

The reason this principle works is as simple as the principle itself: When you look in the opposite direction from where everyone else is looking, you see things nobody else is seeing. It opens up hidden opportunities, unnoticed resources and overlooked possibilities, acting as a spark that ignites a flash foresight.

Besides the go opposite trigger, there are six other flash foresight triggers: *start with certainty*, *anticipate*, *transform*, *take your biggest problem and skip it*, *redefine and reinvent*, and *direct your future*.

Seven Flash Foresight Triggers

There are seven flash foresight triggers:

1. *Start with certainty* (use hard trends to see what's coming).
2. *Anticipate* (base your strategies on what you know about the future).
3. *Transform* (use technology-driven change to your advantage).
4. *Take your biggest problem and skip it* (it's not the real problem anyway).
5. *Go opposite* (look where no one else is looking to see what no one else is seeing and do what no one else is doing).
6. *Redefine and reinvent* (identify and leverage your uniqueness in new and powerful ways).
7. *Direct your future* (or someone else will direct it for you).

Start with Certainty

There are two distinct kinds of trends: *soft trends* and *hard trends*.

A hard trend is a projection based on measurable, tangible and fully predictable facts, events or objects. A soft trend is a projection based on statistics that have the *appearance* of being tangible, fully predictable facts. A hard trend is something that *will* happen: a future *fact*. A soft trend is something that *might* happen: a future *maybe*.

Understanding the difference between hard and soft trends allows us to know *which parts of the future we can be right about*. It gives us the insight we need to start with certainty because it shows us where we are dealing with future fact and where we are dealing with hypothetical outcomes — future *maybes*. The reason we typically don't trust trends is that we haven't learned how to make the distinction between hard trends and soft trends. Once we know the difference, we know where to find certainty — and the future suddenly becomes visible.

That trillion-dollar surplus the government predicted at the end of the 1990s was a soft trend, only we treated it like a hard trend. We were not only expecting it to happen, we were acting on it as if it had already happened: We were spending like crazy. So much money was coming in during 1999, we were going nuts. We were gazing at the soft trend like a rabbit hypnotized by a snake.

The distinction between hard and soft trends is not always so obvious. To many observers, that trillion-dollar surplus looked quite believable. That's the problem with soft trends. Sometimes they look ridiculous, and sometimes they have the appearance of being credible. Still, soft is soft, and unless the trend is based on a direction of change that is clearly fixed, there is nothing certain about that trend. Saying something *could* happen is very different from saying it *will* happen, and that difference makes all the difference.

A hard trend can be either cyclic or linear in nature; both types of change yield hard trends. For example, if the stock market is falling today, we know that in the future, it will go back up again — and we know that *with certainty*. The rise and fall of the stock market is a cyclic change and a hard trend.

The Pace of the Rise and Fall

Exactly when will it turn and start going up again, and how high will it go when it does? We don't know. The exact timing and extent of the market's behavior is a soft trend because our behavior and choices can influence it. What we know is that after it falls, it will rise, and after it rises, it will fall. That may sound like a simplistic hard trend, but it has been reliable enough to make Warren Buffett a very rich man.

Is the world changing faster than ever before? Absolutely. But within that bewildering maelstrom of

change, there are always vast currents of certainty — currents that allow us not only to predict the future, but to positively *shape* it. We just have to know where to look.

If we don't make this shift today, it will be far more difficult tomorrow. Because as dizzying as the pace of change has been these past few years, this has been only a warm-up. Things are about to start changing a *lot* faster.

Anticipate

You know what they say about problems: A problem is "an opportunity in disguise." But that is typically not true, because by the time we know we have the problem, it's too late to turn it into any kind of opportunity. The wave is traveling too fast. A problem is only an opportunity if you *see* it before you *have* it.

Being proactive is agile; being preactive is anticipatory. The shift from proactive to preactive, from reaction to anticipation, also creates a shift in the nature of our relationship to change. We tend to think of change as disruptive, but this is generally true only when change comes *from the outside in*. When a new technology comes out that changes customer behavior, or when the boss changes strategy, or when a competing marketplace opens up overseas, we scramble to adapt.

Whenever change comes at us from the outside in, we are forced into a position of reaction, of putting out the latest fires. And those fires are coming at us faster and faster, which is why the idea of agility has become so compelling.

There is an alternative to living as a constant crisis manager: taking the initiative to become an *opportunity manager*.

Being preactive means putting yourself into opportunity mode, looking at problems before they occur, and then preventing them from happening in the first place. It means, instead of *reacting* to change that happens from the outside in, *creating* change from the inside out.

Change from the outside in is typically disruptive. Change from the inside out is purposeful and constructive. Inside-out change, preactive change, opportunity-managing change is where growth, both personal and organizational, comes from. This is the kind of change that allows you to direct your future and seize your destiny. And the only possible way to operate in that kind of change is by becoming anticipatory.

The Accelerating Speed of Technology

A tectonic shift miles out at sea triggers an earthquake, creating a quiet series of tidal waves that nobody sees or senses. Because of the ocean's great depth, its waves are very small, yet the energy from the earthquake can cause these unnoticed waves to build to speeds of as much as 500 miles per hour — about the cruising speed of a 747. It is only when these waves approach the shoreline that their magnitude becomes plain for all to see.

That is what is happening right now with digital technology. The tectonic shifts in the ocean floor have already happened, and the ripples are flying toward us at astronomically accelerating speeds. Can we even comprehend what this will look like as that relentless doubling of processing power, storage and bandwidth forms vertical lines that go straight off the charts?

This accelerating rate of change is as certain as the sun rising in the east tomorrow morning, and it's going to sweep across our landscape like the technological tsunami it is. It will burst through every industry and every institution, metamorphosing everything and leaving nothing untouched in its wake. It will catastrophically disrupt every aspect of every industry and every aspect of human activity — *except for those who see it coming.*

Stop, Look, Listen

As change accelerates around us and the pressure to keep up intensifies, we need to slow down, stop and think:

STOP: For a moment, put all your current problems aside and make the decision that you are going to devote a little time, on a regular basis, to becoming an anticipatory individual. If you work within a company or other organization, decide that you are going to become an anticipatory organization.

LOOK: Take a look into the visible future and ask yourself this question: "What are the problems I'm about to have?"

LISTEN: Listen to clues that might be lying just outside your range of vision. As you learn about how to see the visible future and your sense of flash foresight gets keener, you will pick up more and more of these clues and, in time, solutions will start to appear almost the moment you look for them.

Transform

According to the *New Oxford American Dictionary*, change means "to make something different," while *transform* means "to make a thorough or dramatic change." It is a difference of degree, but that degree is

so extreme that it becomes a *qualitative* difference.

Changing means continuing to do essentially the same thing, only introducing some variation in degree. Build it a little bigger, smaller, faster, higher, longer. Increase the marketing budget. Add a few staff to the department. Build a snazzier-looking SUV. Come up with a new slogan. But GM cannot be fixed by *changing*, nor can the recorded music industry or television networks survive simply by *changing*. Embracing change is no longer enough: We need to *transform*.

In the early 1990s Barnes & Noble superstores changed how we shop for books. By the mid-1990s, Amazon was *transforming* how we shop for books, which then transformed how we shop for everything.

Why You Must Transform the Box

In the 1990s, we were telling ourselves to "think outside the box." It's a neat image, evoking creativity and unconventional thinking as a way to arrive at ingenious new paths and solutions. Here's the problem with thinking outside the box: We all know that no matter how creative we get during the weekend seminar, come Monday morning we're going to have to crawl back *into* the box again and deal with our current reality. The problem isn't that we need new ways to simply step outside the box — we need to completely transform the box itself.

In fact, whatever your box is — your job, company, career, situation — it is going to transform whether you like it or not. There is no field or profession, no business or organization, no country or society that is not going to transform dramatically and fundamentally over the years ahead.

The New Golden Rule of Business

The old Golden Rule in business was to find out what your customers wanted and give it to them. "Do unto others as they want to be done to." Today, if you ask your customers what they want and you give it to them, you're missing a huge opportunity because their answers will never give you more than a fraction of your potential.

Our capabilities are changing far too rapidly for this old rule to be useful. Customers today don't know what they want because the things they most want are things they don't yet know are possible. Customers did not know they wanted an iPod until Apple gave it to them.

The new Golden Rule in business is this: *Give your customers the ability to do what they can't currently do but would want to if they only knew it was possible.*

To survive and thrive, look into your customers' visible future, look at their hard trends, at what you're certain about regarding their future. See what problems they are going to have and solve them before they happen, so that by the time they're just starting to experience the problem, you already have the solution. ●

Take Your Biggest Problem — and Skip It

The year was 1865, and the British Empire faced a problem that possibly threatened its very existence. Spurred by the development of the steam engine, an epic shift had been taking place for decades, an accelerating boost of productivity and standard of living that people were starting to call an *industrial revolution*. It was the fuel that drove this revolution that was at the heart of the problem, or more accurately, the looming shortage of this fuel, as the great British economist William Stanley Jevons had just spelled out with crystalline clarity in his latest book. In *The Coal Question*, Jevons surveyed the matter with thorough precision and predicted that Britain's coal capacity would soon reach its peak, thereafter causing the decay and collapse of the empire.

History would prove Jevons right — and wrong. British coal production did peak within decades, just as he predicted, but it hardly mattered, because by then the Industrial Revolution had learned how to run itself on a new fuel, one that Jevons himself had dismissed as impractical. On Aug. 27, 1859, a retired train conductor named Edwin Drake sank the first successful oil well in Titusville, Pa. Six years before the publication of *The Coal Question*, the petroleum age, which would carry the Industrial Revolution to heights that Jevons and his contemporaries could scarcely have imagined, had already begun.

Running out of coal was not the real problem. The problem was running on coal in the first place. Coal was not a problem we needed to solve — it was a problem we needed to skip over altogether.

Your Problem Is Not Your Problem

Here is an exercise: Close your eyes for a moment and ask yourself: *In my work, what is the biggest problem I'm facing right now?* Keep your eyes closed until you've come up with an answer.

Our biggest problems have a way of sitting right on our shoulders, ready to jump in and make their presence known at a moment's notice.

To get maximum benefit from the exercise, you may want to jot down your answer. Now, with that biggest

problem firmly in mind, here's what we're going to do: We're going to take that problem … *and skip it.*

Mired in the Mud

The typical approach is to grab that problem and attempt to *solve* it. The problem with trying to solve your problem is that in order to solve it, you engage it, and by engaging it, you embrace it — which often leads to getting your wheels mired in the mud of the problem, stuck in crisis mode and unable to move forward.

Flash foresight takes a different path. Rather than engaging with your biggest roadblocks by confronting them, you'll find you can simply leap over them.

Skipping your biggest problem means stepping outside the flat plane of the existing situation and gaining a clearer perspective, and this often triggers flash foresights that lead to new opportunities far bigger and more productive than you could have imagined based on the original (incorrect) problem you were trying to solve. ●

Go Opposite

My consulting business has an education division dedicated to helping our nation's schools. As part of this work, we created a program we call Designing Thriving Schools. The program, which revolves around creating flash foresights and actionable strategies relating to whatever challenges are facing the organization, uses two decks of cards, one consisting of Strategy Cards and the other of Technology Cards.

In the early years of the new century, we were in the Detroit metro area taking leaders from a number of school districts through the process. Someone brought up the problem of their crushing budget squeeze, so we set out to explore the issue and see if we could trigger a flash foresight. Someone pulled out a Strategy Card that bore the phrase "Create Income Streams" and said:

"Hey — what if we looked for ways to generate an income?" A public school in a struggling urban district — acting like an entrepreneur? It was totally outside the box.

Someone drew out the Technology Card called "Processor Sharing" and asked, "Is there some way we could use this one?"

Here's what the card says: *Distributed computing allows networked computers to share processing power, turning idle computers into a collective supercomputer.*

"Well," I mused, "let's see. Does your school have any idle computers that are networked?"

No, they told me, their computers were all pretty much in use throughout the day.

"Throughout the day," I repeated back. "OK …" and I let it hang, the unfinished sentence suggesting a flash foresight principle: *Opposites work better.* Sure enough, within moments an idea flashed within the group.

"That's it!" shouted the woman who had first pulled out the "Create Income Streams" card. The others turned to look at her, and she explained excitedly: "They're busy during the day. But what about at night?"

In fact, this school had several *thousand* computers that were all networked together and were completely idle from the close of each school day until 8 a.m. the next morning — nearly 16 hours a day. Not counting weekends.

"We've got 16 hours of computer time every day," she went on, "that's 80 hours a week — with weekends, more than 120 hours! Times, what … say, 4,000 computers? That's … half a million computer hours every week." She turned to me. "But what can we do with all that potential computing power?"

I said, "Why not lease it out?"

'Supercomputer'

And that's just what they did. They went searching for a company whose products no parent could object to, and eventually leased out their "supercomputer" to a pharmaceutical firm who used the raw number-crunching power of their network of PCs, turning them into a giant after-hours parallel processor to help work out chemical formulas to find treatments for cancer and other diseases.

Months later, that school district was earning six figures per year from that one flash foresight. Rather than being forced to cut some of their most cherished programs from the budget, they were able to supply the needed funds from their own coffers. They hadn't had to sacrifice a thing or invest a dime to generate those funds, either; all they'd needed was the flash foresight principle: *Go opposite*. Public school systems are generally on the receiving end of funds. This school system decided to see themselves as fund *generators*. ●

Redefine and Reinvent

Transformation is an accelerated, magnified force of change. Redefining and reinventing is a way of harnessing that wild force and applying it to a product, service, industry or career.

In a sense, transformation is a hard trend, while rein-

vention is soft. Transformation is going to happen, all around us and also *to* us, whether we want it to or not. Reinvention, on the other hand, will happen only if we make the decision to do it — and if we don't do it, someone else will.

Rewrite Your Own History

You might think of it this way: We have each been dealt a hand from the same deck of cards. We cannot change what's on these cards; they are the transformational hard trends of our world and our future. And if that were all there was to it, there would be no point, no hope, no options to change or improve the future; it would all be *predefined*. But that's *not* all there is to it, because you also have a wild card in that hand. That wild card is *you*. You have the option to anticipate the coming transformations in your field, your industry, your career and your life, and approach them preactively. How? By redefining and reinventing. Redefining and reinventing means seizing the opportunity to rewrite your own history — before it happens.

In the coming years, dramatic new developments are going to be flying at you so fast, from so many places and so many competitors, that it will become easier than ever to be overwhelmed. In a transformational time, disruption multiplies. The only solution to this increasing dilemma is to become experts at reinventing ourselves, our careers and everything we do.

Your basic nature, personality and talents don't change much over time. But what you know, what you learn and what you do can change a good deal. People who have been laid off or fired from their jobs can hope they will find another job just like the one they lost, or they can learn new skills and shift from an industry in decline to working in an industry that is growing, both today and into the visible future.

When you combine self-reinvention with the certainty of hard trends, you are bound to create a huge win, both in the marketplace and in life.

The Reinvention Imperative

Reinventing oneself has always been a powerful strategy. But in the past, corporate and product reinvention was an *option*; today it is an *imperative*. We live in a unique context, an environment we've never seen or experienced before. We have never had this kind of processing power and bandwidth, this kind of runaway acceleration in technological capacity, and it has completely transformed our relationship to the concept of *stability*. In the past, stability and change were two contrasting states: When you achieved stability, you did so *despite* change. Today, change has become an integral part of stability: Today, you can achieve stability only by *embracing* change as a continuous and permanent state.

Direct Your Future

Flash foresight starts with seeing the certainty of hard trends and, based on that, learning how to anticipate accurately. It also lets us see soft trends as factors we can influence to shape a better future. But it's not enough to *see hard trends and soft trends, anticipate, transform, go opposite, skip your biggest problems and reinvent yourself.* These are all valuable and vital steps, but there is something larger and more embracing: We need to actively shape our own future.

Directing your future is the conscious exercise of your creative capacity to envision and rewrite your future life and career that wraps all the other flash foresight principles together.

If Martin Luther King Jr. had stood on the steps of the Lincoln Memorial on that hot August day in 1963 and declared, "I have a plan," he would have sounded like a politician, and nobody would have remembered the words. But that's not what he said.

Our vision of the future drives our choices and our behaviors, which produce our outcomes and shape our lives. We become what we dream. Which means that if we want to know what we are becoming, we need to ask, what are we dreaming?

The Character of the New Future

We are shifting into a fundamentally different economy, one based on abundance, rather than on scarcity, because of our changing relationship to information. This changing relationship also brings with it three forces that will be critical to shaping our future: *communication, collaboration* and *trust*.

Informing is one-way and static, doesn't necessarily lead to action and tends to waste time. Communicating is two-way and dynamic, typically results in action and tends to save time.

When you share information, you simply inform. When you have a two-way dialogue to establish the best result by sharing knowledge and wisdom (that is, consultative value), you have entered the communication age.

Collaboration

The second key force shaping our future is *collaboration*. Collaboration is as different from cooperation as transformation is from change. When you and I cooperate, we are doing our own thing as we make some

accommodations for each other. When we collaborate, we are not simply making room for each other's creations, we are *co-creating* the future together.

Collaboration is a function of genuine communication. The facilitated communication environment of the Internet becomes a productive cycle that amplifies itself: Communication fuels collaboration, which fuels more communication, which fuels more collaboration.

Trust

Trust is the third force that will play a major role in our future. In the communication age, trust has assumed an entirely new economic and structural significance. In an industrial economy based on physical resources, trust was important, but if it was broken, few would find out. In today's electron-based economy, if trust is broken, people tweet it to the world.

Digital trust is the trust that develops between people who will never see or meet each other physically. How do you create digital trust? The same way as any other kind of trust: by operating with honesty and integrity and delivering on your promises.

Every time you implement any kind of change, you are presented with an opportunity to escalate trust, or to undermine and diminish it. The future is all about relationships, and good relationships are all based on trust. ●

Epilogue: An Experiment

I thought it would be interesting to conduct an entrepreneurial experiment with myself as the guinea pig.

In August 2009, I filed the papers creating a new company, Visionary Apps.

Our first product turned out to be a trio of products: Complete Foreclosures, Complete Homes and Complete Rentals. We called it the Complete Realty Suite.

Complete Foreclosures lets you search more than 1.6 million foreclosure listings nationwide, with new listings appearing every time you open the app.

The smartphone's GPS technology lets you quickly locate homes on the go with an interactive map, just like the maps app that comes standard with the iPhone: When you look for homes in a certain area, little pushpins drop down on the map. You can touch any pin and it will expand to show you the address, price, how many beds and baths, the year it was built and other typical descriptive information. The app also provides pictures and satellite aerial views of each property and its neighborhood, as well as driving directions to the home.

The other two apps, Complete Homes and Complete Rentals, are very similar in scope and feature set, allowing users to find national listings and information on real estate agents, and to search for apartments and rental homes.

The Launch

We launched the Complete Realty Suite on Monday, Feb. 22, 2010.

That first week, the Complete Realty Suite was covered by the *Wall Street Journal* blog and then reviewed in *Forbes, BusinessWeek, Bloomberg, USA Today* and about three dozen other major publications. *Forbes* called it "a must-have tool for serious real estate investors." By the end of the first week, it was No. 6 on Apple's list of most-downloaded business apps, and No. 17 on the most-downloaded list of *all* apps.

Because we used certainty based on anticipating the transforming nature of technology, because we jumped ahead by skipping over the current limitations of the app world and used every opportunity to do the opposite of what others were already doing and because we constantly asked ourselves how we could redefine and reinvent, within some eight months we had developed a revolutionary business that was already drawing significant income and was, for all practical purposes, infinitely scalable.

Surfboards don't have engines: Just position them in the right place, point them in the right direction, keep your balance, and the pull of the wind and waves does the rest. That's exactly what we did.

The reason we didn't need massive capital financing or a big staff is that we designed the concept, from the very ground up, based on where trends were going. All we had to do was put ourselves in the right place, point ourselves in the right direction and keep our balance. The onrush of technological transformation provided the power.

You can do that, too! ●

Full Engagement!

Inspire, Motivate and Bring Out the Best in Your People

by Brian Tracy

THE SUMMARY IN BRIEF

As a manager, it's your role to achieve the highest possible return on the physical, emotional and mental efforts your people put forth. It's not just a return on investment … it's a return on energy. But how are you supposed to light a fire under each employee when studies find that most of them are working at only a fraction of their potential?

In *Full Engagement!,* Brian Tracy shows how to unlock superstar performance from every single member of your work team. Based on decades of research and thousands of hours invested in maximizing personal and organizational performance, the hard and fast secrets of what you can do (and what you should *stop* doing) to inspire your employees to peak performance are now available.

Packed with powerful, practical ideas and strategies, *Full Engagement!* provides the keys to unlocking not just the hidden drive and abilities that exist within every one of your people … but also your own.

IN THIS SUMMARY, YOU WILL LEARN:

- How to create a high-trust work environment.
- How to drive out fears that hold your people back.
- How to set clear goals and objectives.
- How to unlock the potential of each person.
- How to motivate and inspire employees to greater heights than they ever believed themselves capable of.

Introduction

Welcome to the new world of business! We have gone through a watershed in business activities and operations since 2008 and things will never be the same again. What you are dealing with today is the "new normal." The good old days are gone forever.

Because of shrinking markets, increased competition, demanding customers and a never-ending shortage of highly qualified, productive people, you will have to do more with less, and get better results from limited resources, more than ever before.

As a manager at any level, you are essentially the operator of your own personal business unit. You have revenues and expenses, inputs and outputs, production requirements and measures of performance. Your profit-and-loss statement reflects your ability to combine people and resources to get results — especially financial results — that are in excess, and, ideally, greatly in excess, of their total costs.

Most People Work at 50 Percent of Capacity

According to Robert Half International, the average person works at about 50 percent of capacity. Because of unclear job assignments, lack of priorities, poor management and direction, and lack of feedback, the average employee wastes 50 percent or more of his or her time in activities that have nothing to do with the job.

This wasted time is consumed in idle chitchat with co-workers, extended lunches and coffee breaks, employees coming in late and leaving early, surfing the Internet and engaging in personal business and other time-filling activities that represent virtually no return to the company on the amount of money invested in paying people's salaries, wages and benefits.

But, as Napoleon said, "There are no bad soldiers under a good general." A good manager with a clear vision can quickly organize a group of average performers into a peak performance team that is capable of achieving tremendous results for the company. You just need to learn how to do it.

The Heart of the Matter

Here's the lesson: The way you treat people, what you say and do that affects them *emotionally*, is more important than all the education, intelligence or experience you might have at doing your job. The best news is that because you are motivated and influenced by the same things other people are, you already know everything you need to know to become an outstanding manager. You already know how to unlock the potential of the people around you, how to build a peak performance team that delivers consistently high levels of results for your company. You just need to apply it.

Peter Drucker once said that the most important shift you can make in your vocabulary in business is to use the word *contribution* instead of *success*. When you start thinking in terms of contribution, your whole attitude about yourself, as a manager, and other people in the workplace as well, changes in a very positive way. ●

Happy for Good Reasons

In my sales and marketing classes, I often ask the participants, "What percentage of human decision making is rational and what percentage is emotional?"

Most people answer "80/20" or "90/10." I then complete the exercise by pointing out that people are 100

percent emotional. Human beings, including yourself, decide emotionally and then justify logically. We make emotional decisions instantaneously, sometimes with a single glance or a single piece of information, and then we often spend several hours or months underpinning our emotional decision with logical justifications.

I then ask, "What is the basic emotional drive behind all human action and behavior?"

After a few random answers such as "money," or "fear of loss," "desire for gain" or even "love," everyone finally agrees that the most powerful single motivator is the "desire to be happy."

Aristotle talked about this in his work *Nichomachean Ethics*. He said that behind every human motive there is a further motive until you finally arrive at the basic motive for everything — and that is to be happy.

Happy Customers

The most important question in business is: "If the purpose of a business is to create and keep a customer, what is the most important goal you must achieve with each customer if you want the person to buy and buy again?"

The answer is simple: Make the customer happy that he or she did business with you. Make the customer *happier* doing business with you, from the beginning of the buying experience through to the customer service experience afterward, than he or she would be if he or she had bought from someone else. Happiness is the key.

Happy Employees

The logical extension of this line of questioning for managers is: "How do you get the best out of each person who reports to you?"

How do you get people to willingly contribute their highest levels of physical, emotional and mental energies to you, and to do their jobs in the very best way possible? How do you get people to be committed, loyal and dedicated to you and the company? How do you get people to work together harmoniously and continually seek ways to do their jobs better, faster and at lower cost?

And the answer is: make them feel happy. Organize the work, from the first step in the hiring process through to the final step in the retirement ceremony, so that people are happy with you, their work, their coworkers, as well as in their interactions with your customers, suppliers and vendors, and in everything they do that has an effect on your company.

A Crash Course in Happiness

Here are eight ideas that you can apply to create a peak performance work environment and to ensure that each person makes a maximum contribution to your company:

1. *Smile.* When you see someone for the first time each day, smile at that person.
2. *Ask people questions.* Talk to them; ask them questions about how they are feeling today and how everything is going. When you express a genuine interest in other people, it makes them feel valuable, respected and important.
3. *Listen to them.* Listen attentively when people talk to you.
4. *Be polite.* Always be polite, courteous and respectful when you talk with your staff members. Treat them as if they are talented, intelligent and accomplished.
5. *Say "thank you."* For everything they do, small or large, thank people.
6. *Keep people informed.* The most satisfied employees in every organization report that they feel they are insiders, that they are "in the know" and that they are aware of everything that is going on around them that affects them or their work in any way.
7. *Encourage improvement.* Encourage people to come up with ideas to do their jobs better or to improve the company in any way possible.
8. *Treat your employees like volunteers.* Treat them as if they were working for free. In nonprofit organizations, where almost everyone is a volunteer, each person who comes to help out in organizational activities is treated with tremendous respect because the managers want those people to come back and help out in the future.

Practice Golden Rule Management

Fortunately, "make them feel happy" is both simple and easy to do. All that is necessary is for you to practice the Golden Rule in all of your actions: "Do unto others as you would have them do unto you." It has been said that there are many ideas for improving human relations that have been discovered over the centuries, but nothing has yet been discovered that is superior to this simple principle. ●

The Psychology of Motivation

A breakthrough in the understanding of individual motivation took place in 1928 at the Hawthorne Works,

a Western Electric plant just outside of Chicago. Following Frederick Taylor's principles of scientific management, a group of human resources specialists decided to experiment with different ways to increase the productivity of women assembling electric motors. They selected a small group to be the subjects of this research. They told the women that they had been selected for this research because of their excellent work records. The researchers explained that they were going to be looking for ways to increase productivity and output in the plant, and would be changing different factors in the work environment to observe those factors that seemed to have the greatest impact on productivity levels.

No Clear Explanation

Over the next few weeks, they began their experiments by raising the light levels in the special assembly area. Not unsurprisingly, productivity levels went up as the light levels were raised. Then, they *lowered* the light levels. To their surprise, productivity levels increased again over the daily average.

This seemingly inexplicable phenomenon occurred when they raised and lowered the temperature, raised and lowered noise levels, raised and lowered the air-conditioning and the factory's ambient odors. In every case, with every change, productivity levels improved.

By the end of the experiment, the researchers were beside themselves. They could not decipher the data in any meaningful way. Finally, one of them said, "Why don't we ask the women workers if they have any insights into these production levels?"

An Incredible Breakthrough

The researchers brought the women in, sat them down and explained what they had done and the results that they had gotten from the experiment. They explained that no matter what they had done, production levels went up. This outcome did not fit any of the explanations based on scientific management.

After some discussion and questioning, the women finally made an admission that explained why production levels had gone up. It was simple: The women said that when they had been selected from the work force in the plant for this experiment, they had felt "special." They felt that they were highly appreciated and valued by the plant's management.

As a result, whenever the experimenters changed some factor in the workplace, it *reminded* them that they were special, different and more highly productive. As a result, they worked longer, harder and better. They dedicated themselves to doing a better job and to constantly look for ways to improve.

The researchers eventually dubbed this the "X factor." Later, it became known as the "psychological factor." They concluded that tapping into the thoughts, feelings and emotions of the workers had a far greater power to motivate higher levels of production than any physical change in factory or work conditions.

Internal Versus External Motivation

In your workplace today, the people around you do their jobs because they want to, not because they have to. They do their jobs well because they feel internally challenged and externally appreciated. People respect their jobs and treat their companies well because you respect them and you treat them well. ●

Ignite the Flame of Personal Performance

To get the very most out of others, you must develop a solid understanding of how you became the person you are today and, by extension, how others have become the people they are as well. You have to develop a fairly good idea of how people think, feel and react. You need to know why people do or don't do things and how you can influence them in positive ways.

The Master Program of Success

The discovery of the "self-concept" was one of the most important breakthroughs in psychology in the 20th century. It turns out that each person has a self-concept that largely precedes and predicts that person's performance in every area. All changes and improvements in performance begin with changes and improvements in the self-concept of the individual.

The self-concept is made up of all of the thoughts, feelings, desires, actions, experiences and decisions made by the individual, starting in infancy and often before.

The self-concept is the key to understanding human personality, performance, productivity and happiness. Each person behaves on the outside exactly as he or she thinks about him- or herself on the inside.

For you to release more of the potential of each person who reports to you, you must understand how the self-concept of the person works, and how you can influence it in a positive way. The self-concept, the bundle of beliefs that serves as the master program of the mental computer of the individual, is made up of three parts: the self-ideal, the self-image and the self-esteem.

1. The Self-Ideal. Each person has within him or

her an *ideal* of the very best person he or she could possibly be. This ideal can be defined as "the person you would like most to become."

A clear, exciting, inspiring, uplifting vision, combined with a mission, purpose and goals, is the key to satisfying one of the deepest subconscious needs that people have, which is to aspire toward and achieve high ideals in every part of their work and personal life.

2. The Self-Image. Your self-image is defined as "how you see yourself" prior to any situation of importance and whenever you are actively engaging in a particular behavior.

The first part of self-image is the way you see *yourself*.

The second part of the self-image is how you *think* other people see you. If you think that other people see you in a positive way, you will tend to act in a positive way.

The third part of your self-image is the way people *really* see you.

The ideal for a balanced personality is when the way you see *yourself*, the way you *think* others see you and the way others *actually* do see you are all in harmony.

3. The Self-Esteem. The best definition of self-esteem is "how much you like yourself." The more you like yourself, the more you like others. The more you like other people, the more they like you right back. The more you like other people, the better and more valuable results you achieve at work.

There is a direct relationship between self-esteem and *self-efficacy*. The more you like yourself in your work, the better you do your job. ●

Make People Feel Important

The key to keep motivating people to perform at their best is to build self-esteem (which leads to self-confidence and self-respect) in each person who reports to you. Each person has unlimited potential that the individual can bring to bear on the job to do that job better and faster. People have huge reservoirs of creativity that can be unleashed to solve problems, overcome obstacles and achieve business goals.

Knowledge workers on your team are motivated more internally than they are externally. They perform at their best because they *want* to perform at their best. The fact is that you cannot motivate people; you can only create the environment where motivation takes place naturally and spontaneously.

Destructive Criticism

Destructive criticism is the fertile soil in which grows all of the negative emotions. Destructive criticism promotes and multiplies the fears of failure and rejection. The thought or experience of destructive criticism makes a person feel angry and defensive, sometimes for years and even decades.

As a manager, the first step you can take to get the best out of others is to eliminate destructive criticism from your vocabulary, for any reason. Resolve today that you will never criticize, attack, insult or diminish another person for any reason. Instead, you will look for something good in everything that happens.

The best managers think about problems as things to be solved and difficulties to be overcome.

No More Complaining

The second thing that you must stop doing is complaining for any reason.

There is a major problem with both criticizing and complaining. In both situations, when you do it, you are saying, "Ain't it awful; I am a victim of this situation. Look what has happened to me."

When you complain you actually weaken yourself. You generate feelings in yourself of inferiority and inadequacy. You feel angry and resentful. You feel negative and unsure. Your level of self-confidence and self-respect actually declines as you complain about anything to someone else. You hurt yourself by complaining much more than you hurt the target of the complaints, who you may not affect at all.

No More Condemnation

The third behavior that you can stop is that of condemning anyone, for any reason, either inside or outside of your company. When you condemn other people, usually in private, you demoralize the listener, and the person you are talking about will hear about it almost immediately. When you condemn people *outside* the company, someone will eventually tell them what you have said, usually in a distorted version, and it will come back to haunt you. This seems to be a law of nature, and is completely unavoidable. ●

Drive Out Fear

The biggest single obstacle to success, happiness, performance and productivity in any area of your life is contained in fears of all kinds.

Fear is and always has been the greatest enemy of mankind. More personalities are undermined and destroyed by fear than by any other factor. More relationships are hurt by fear, however it is manifested, than

by anything else. More psychosomatic illnesses are caused by fears than by any other single factor. The minimization and elimination of fear is the key to becoming a fully functioning, happy, self-actualizing human being.

One of the most important recommendations of W. Edwards Deming, who revolutionized Japanese quality control in the 1960s and 1970s, was "drive out fear." He concluded that the opposite of a fearful workplace is an atmosphere of innovation, creativity, spontaneity, higher energy and increased productivity. In a work environment where no one is afraid of doing or trying new things, everyone focuses more and more on doing the job better and better.

A Great Place to Work

In the research into what makes a "great place to work," perhaps the most important single factor is trust. Trust exists when you can say, "I know I can make a mistake at work without being criticized or fired."

When people feel free to try new things in order to do the job more effectively, increase quality and improve customer service, all of their time, attention and energy is focused outward, toward getting the job done better.

Abraham Maslow referred to self-esteem and self-actualization as "being needs." These are the needs that people have to fulfill their individual potential and become more and more of what they are truly capable of becoming. When you drive out fear, what emerges is the most productive person that the individual can possibly be.

Eliminating the Fear of Failure

You can cancel out a negative thought by replacing it with a positive thought. Perhaps the most powerful way to eliminate the fear of failure and the feeling of "I can't, I can't" is to say the words, "I can do it. *I can do it!* I can do anything I put my mind to!"

When you repeat the words "I can do it" over and over, your fears of failure diminish and your feelings of confidence increase. When you say those magic words over and over, you begin to cancel out those negative messages from childhood and earlier experience. You start to become a new person. You begin to shape your own personality. ●

Create That Winning Feeling

Because of the powerful needs for self-esteem and self-efficacy, each person has a deep-down need to perform well, to succeed, to get results and to feel valuable and effective. In short, almost everyone wants to feel like a "winner."

How does a person come to feel like a winner? Simple: by winning! It is only when a person actually wins that he or she gets the emotional enjoyment and satisfaction of that "winning feeling." Your job as a manager is to structure the work in such a way that people feel like winners much of the time.

Expecting the Best

In a multiyear study of the most effective methods of motivating employees, the human resources executives involved came to the conclusion that the most powerful single motivator of all was having "positive expectations." The more the manager expresses positive expectations about the talents and abilities of his or her people, and the more that individuals confidently expect to be able to do the job in the right way and at the right time, the more positive and motivated they are to perform at their best.

The good news is that most people want to do a good job. What they need more than anything else is your leadership, guidance and encouragement to make that possible for them. They need to work in a climate of clear, positive expectations, knowing exactly what you want, when you want it, to what standard of quality and the very best way to get it done. It is your job to provide them with just such a work environment.

Five Steps to Winning

There are five ingredients in the recipe of creating that winning feeling. When you structure individual and team jobs around these five items, you will release a continuous stream of energy and enthusiasm toward improvement and excellence.

Step 1. Clear Goals. Clear, specific, written, time-bounded goals are absolutely essential to creating the environment in which people can win and feel like winners.

Step 2. Concrete Measures. For a person to win, he or she has to know where the finish line is, has to know how you define winning and has to know exactly what he or she has to do to complete the task and cross the finish line.

Step 3. The Success Experience. For a person to feel like a winner, that person must succeed at the task. He or she must achieve the goal, fulfill the responsibility and get the result that he or she was tasked for. The person must clearly win.

Step 4. Recognition for Achievement. Everybody needs to be recognized for their individual accomplish-

ments by the people around them, and especially the people above them.

Step 5. Tangible and Intangible Rewards. You can only get by with offering praise and recognition for task completion for a limited amount of time. At some point, you must give some kind of reward to acknowledge superior results. ●

Select the Right People

All of your hard work and effort in building up people's self-esteem and self-image won't help you achieve your goals as a manager and leader if those people are the wrong people for your organization in the first place.

Your job is not to find people and transform them into something that they are not. Your job is to find good people and create an environment where they can perform at the highest levels possible for yourself and your business.

Your ability to select the right people for your team will account for 95 percent of your success as a manager or business owner. It is amazing how many managers hire people who are wrong for the job and then try to work around them, causing enormous frustration and disappointment for everyone.

Everything starts and ends with having the right people in the right jobs at the right time. One difficult person or poor performer can sabotage the performance of the entire team.

Drucker said that "most hiring decisions do not work out over the long term." It seems that about one-third of the people that you hire will be excellent for their jobs. But one-third will be average and the final third will be completely unacceptable. Your job is to improve these odds and make better hiring decisions more often than the average manager.

The Law of Three in Hiring

The Law of Three is a powerful technique that you can use to increase the quality of your hires to as much as a 90 percent success rate. This principle forces you to slow down the hiring process and to make more accurate decisions. There are four applications of this law:

1. Interview three candidates. Always interview at least three candidates for a job before you make a decision. No matter how good an impression a person makes at the first meeting, never make a job offer. When you interview three different candidates, you get three different perspectives on the kind of people who are available.

2. Interview three times. Interview the person that you like at least three times. Many companies know that by taking a long time in the selection process, they will get top people who will stay with the company for many years.

3. Select three different meeting places. Interview the person in three different settings. As you move people around, they will demonstrate different facets of their personalities, sometimes admirable and sometimes not. The slower you go, the better decision you will make.

4. Have three different people interview the candidate. When your team members are involved in the interviewing and hiring process, they are much more engaged with the company than they would be if the new hire were just dropped in among them, like a fox among the chickens. ●

Results Are Everything

Results are the beginning, middle and end of all organizations. You get results by combining the complementary talents and abilities of several people to achieve goals that would not be possible for a single person working alone. It doesn't matter how much people like themselves or feel important if the results don't follow.

Remember, you are not a cheerleader; you are not a life coach. You are a manager and a leader. Your responsibility is to get results.

Results are specific, measurable and time-bounded. They are simple and clear, and can be explained to a child. Einstein once said, "If you cannot explain what you are attempting to accomplish to a six-year-old child, then you are probably not clear about it yourself."

Planning for Results

Here is a simple exercise: Make a list of all the results that are expected of you. Then ask yourself, "If I could only achieve one result on this list in an excellent fashion consistently, over and over again, which one result would make the greatest contribution to my business?"

Put a circle around that task or activity. Then ask the question again: "If I could only achieve two results on this list, which would be the second most important result that I could accomplish?" Put a circle around that.

Then, do this exercise one more time. What would be the third result on your list that could make the greatest contribution to yourself and your business?

In doing this exercise, you will be surprised by how important these three results are and how secondary or

irrelevant all the other tasks and activities are.

Make a second list of everything that you could do in the course of a day or a month to achieve the most important results expected of you. Write down all of your tasks and activities, from Monday morning to Friday night, and throughout your days and weeks. Once your list is complete, review your list and ask this question: "If I could only complete one task on this list, which one task would have the greatest impact in achieving the most important result expected of me?"

Put a circle around that task on your list. Then ask yourself the question again: "If I could only accomplish two tasks on this list, which would be the second task that would help me the most to make the maximum contribution to myself and my business?"

Put a circle around this task and then ask the question one more time. What would be the third task?

Once you have determined the three most important results you can get, and the three most important activities that you can engage in to get your three most important results, select the one activity that is most important to getting your most important results and begin on it immediately. Then, discipline yourself to work single-mindedly on accomplishing that one task, even if it takes many hours and forces you to put everything else aside, until that task is accomplished. ●

Be the Best You Can Be

Here are 10 management principles you must learn to apply to your company and your team:

Principle 1: Clarity is essential. Your chief responsibility as a manager is to be absolutely clear about what it is you are trying to do and how you are trying to do it, and then making the job responsibility of each person who reports to you absolutely clear as well.

Principle 2: Competence is critical. Others must see that you commit to excellence in the most important things that you do.

Principle 3: Identify your constraints. The best leaders accurately identify the constraint that determines how fast they achieve their goal; they are then prepared to try a different approach or a different strategy to overcome the constraint.

Principle 4: Unlock your creativity. To unlock your inner genius, you need three things: (1) intensely desired goals, (2) pressing problems and (3) focused questions. One good idea is all you need to change the future of your business and your life, and you stimulate these ideas by focusing and concentrating your mind on your goals, your problems or on key questions.

Principle 5: Concentrate single-mindedly. Your ability to concentrate single-mindedly on one thing at a time is perhaps more important than any other skill or discipline that you can develop in your entire career. All successful men and women have developed the ability to concentrate on their most important task and to stay with it until it is done.

Principle 6: Have the courage of your convictions. To succeed greatly, you must develop the courage to take risks, to move out of your comfort zone and to try things with no guarantee of success.

Principle 7: Develop your character. Your character, your reputation, is the most important quality you develop throughout your career. Shakespeare wrote, "He who steals my purse steals trash; but he who steals my good name, steals all."

Principle 8: Plan every detail in advance. Your ability to plan, to think through what needs to be done, in advance, on paper, is a critical skill that largely determines your entire future. The key to planning is for you to be very clear about the results expected.

Principle 9: Organize your work before you begin. The job of organizing in management means bringing together all the necessary resources you need to get the job done.

Principle 10: Staff properly at every level. Ninety-five percent of your success as a manager will be determined by the people you select or keep to help you to do the job.

Just Do It

Remember, all successful managers are oriented to results, solutions and actions. But the most important quality of effective managers is that they are action-oriented. When they think of an idea or see an opportunity, they take action on it immediately. When they hear a good idea, they move quickly. They have a sense of urgency. They have a bias for action. They practice fast tempo in everything they do. And so should you. ●

Become a Great Leader

Leadership is the most important requirement for business success. In the simplest terms, leadership is the willingness to be accountable for results, and then to fulfill that responsibility, no matter what the external situation or pressure.

A leader is someone who is willing to do what it takes to get great things done. It doesn't happen on the first or second try. Leaders expect to fail over and over. They don't like it, but they don't quit when things don't work out. In fact, it is during difficult economic times and major crises that your character as a leader really stands out.

Why? In tough times, your competitors run for safety and survival instead of focusing on their customers. They pay less attention to quality. They slash back service and invest less in innovation. They cut back on staff at all levels. As a result, there are more great people actually available to work with you.

It is usually in a crisis that organizations reconnect with what made them great in the first place. In a crisis, leaders must make bolder decisions that will make them great in the future. It was said that "the North wind made the Vikings." In times of crisis, you have an opportunity to reignite your spirit and find better ways to delight your customers.

Your Leadership Matters

Today, more than ever, your leadership is needed. It is now time for you to step up in a new way. It is time for you to counterattack; to move forward; to innovate; to find better, faster, easier, cheaper ways to get results.

What you choose to do today — right now, in this market — can have more of an impact on your company and career than at any other time. Greek philosopher Epictetus wrote: "Circumstances do not make the man; they only reveal him to himself."

Your ability to take charge, make hard decisions, accept responsibility and lead effectively can have a greater impact on the success of your team or your organization than any other single factor. Everything that you do to become a more effective leader has a multiplication effect on your entire organization.

The Future Belongs to Risk Takers

The future belongs to those who are willing to take calculated risks to move forward. As a leader, your role is to carefully gather all the information possible about a particular decision or commitment of resources, and then take the initiative. Winston Churchill wrote, "Courage is rightly considered the foremost of the virtues, for upon it, all others depend."

Perhaps the biggest single obstacle to success in life is the *fear of failure*. Many people are so concerned with the possibility of failing that they play it safe and hold themselves back from taking any chances at all.

The leader is different. One of the qualities of courage is *boldness*. Boldness is the willingness to initiate action in the face of uncertainty and possible failure. As the leader you must be willing to take action with no guarantees of success and a substantial likelihood of failure, at least in the short term. The leader practices the Wayne Gretzky philosophy: "You miss 100 percent of the shots you don't take." ●

Develop a Great Business Plan

People and organizations with clear visions, values and plans tend to accomplish far more and do it faster than their competitors. When everyone in your organization is united by a clear strategic vision of your desired future state, you create a powerful mental synergy that will move you toward your goals and move your goals toward you.

The major reasons for success in business and in life are focus and concentration. The major reasons for failure are lack of direction and diffusion of effort.

The Battle of the Business Plans

With financial markets on the verge of collapse in 2008, Mike Moritz and his partners at Sequoia Capital huddled with business owners to review a *slide deck of doom,* a 56-slide PowerPoint plan describing a brave new world without credit, where nothing would be financed without solid cash flows. They predicted it would take years for the world to recover.

It is difficult to plan for economic scenarios like the one experienced in 2008-2009. Fortunately for Moritz, the dot-com bust a decade earlier had given his team experience in responding to sudden changes in fortune. When the economy imploded, they knew how to shift risk and cut costs faster than ever before.

No successful investor in the world was immune from the pain, and Moritz is one investor who has seen it all. Sequoia has launched many legends in California's Silicon Valley, including Apple, Cisco, Atari, Google, YouTube, Zappos and Yahoo.

Planning Works

When the storm descended, Moritz and the management teams of his companies undertook a crash course in strategic and financial planning. They worked around the clock to create many different versions of their business plans. Moritz would often reassure those who had pulled all-nighters by repeating an ironic-sounding mantra: *Plans may not work, but planning does!*

In other words, the economy may not make it possible to deliver on your plan exactly as you planned it, but the process of planning is mission-critical. It is the only way to be clear about your choices. Planning is essential to consider what it takes to survive, grow and prosper in any economic environment.

In turbulent economic cycles, the planning *process* is no longer the abstract endeavor taught in business school; every alternative must be considered and the best options turned instantly into action. During the crisis, Moritz's companies had a clear plan to track where every penny was spent and tie it back to customer service, quality, innovation and growth.

Your ability to develop a great business plan, and then to set and implement business strategy, is at the heart of your business success.

Key Players in Setting Strategy

Who should be involved in the strategic planning process? The simple answer is that *everyone* who will be responsible for carrying out a part of the strategic plan should be involved in creating the plan in the first place.

Start with the company owner or the chief executive officer, the president, the chairperson or whoever is the key person whose agreement, position or authority is necessary to put the strategic plan into motion. If the plan is not totally supported from the top down, it will be ignored; or worse, it will be sabotaged. Take a look at the incentives or disincentives that people in the company have to implement the new strategy.

Setting corporate strategy is like improving your overall health. You must first put the right incentives in place to make sure that everyone has a vested interest in making the plan successful. ●

Leaders Are Listeners

The best leaders spend 50 percent or more of their time listening carefully. They dominate the listening and let the other person dominate the talking.

Surround Yourself With Great People

The greatest and most expensive untapped natural resource in any organization is its people. Motivating people to make their full contribution to the organization is the fastest way that managers can multiply their personal effectiveness. It's the only way to grow a great company.

This means that the greatest improvement in performance and in results can come from unlocking and unleashing the latent potential of the *average* person in the business.

The People Equation

Getting the people equation right is the hardest thing you will ever do in business. When discussing this subject, Charles Schwab said, "Your job as a leader is to

find, attract and develop other leaders. If you do that, your business will grow. If you don't, it won't. It's that simple."

Schwab learned early in life to surround himself with people who not only shared his ambitions, but who were more gifted than he was in important parts of his business. If he wanted to make progress and get things done, he had to become a team leader.

Schwab discovered something entrepreneurs often realize when it's too late: He had great talent in one area and not nearly enough skill in many other facets of his company. The only way to sustain his success was by finding, recruiting and empowering others who had talents that he didn't have. It is a skill that few entrepreneurs learn until they have a crisis that teaches it to them.

Until you can trust other people to carry the torch, your company can only get as big as *your workweek*. When you have found people you can groom to fill your shoes, "only then have you graduated from being an entrepreneur to a leader," Schwab said.

Their Company Is Their Mission

Schwab's company dodged the bullet that destroyed many banks and brokerage firms during the financial crisis because he already had a leadership team in place that shared his values. They didn't fall in love with sexy investment schemes that were short-lived and dangerous. In fact, Schwab gained market share with customers during the "great recession" because the company's leadership team had stuck to its knitting. The company is one of the most profitable and fastest-growing financial services companies and consistently ranks among J. D. Power's leaders in quality service.

"You need people who buy your vision as much as you do. And because they love it, they also have the ambition to take what you did to the next level," Schwab insisted. "You want people with the energy to make things happen *for their sake* [not just yours]. They want to take your company on as *their own mission* and make it even better."

The best thing you can have going for you in business is to hire a team of people knowing that each and every one of them can be leaders in their own way. Benjamin Zander, conductor of the Boston Philharmonic Orchestra, says that you need people "with shining eyes" — those who gleam with enthusiasm, who can "lead from the 11th chair." Great people do their job with pride from anywhere they happen to sit in the orchestra that particular day. ●

The Long Tail

In his book *The Long Tail: Why the Future of Business Is Selling Less of More*, Chris Anderson argues that when the major competitors fight over selling the most popular books and movies, the profit margins for those few big "hits" get slammed. Blockbuster movies and books tend to get deeply discounted in price by big retailers and flame out in popularity quickly. In contrast, specialized products have a "long tail" — they stay popular in smaller quantities and are sold at higher margins by more specialized retailers. Instead of going after the obvious blockbusters, Anderson advises that savvy marketers can go after narrower, more specialized segments of customer groups all over the world.

Offer a Great Product or Service

A great product or service is the key to business success, and without it, nothing else works for very long. Fortunately, there is a simple measure that you can use to determine and predict your current and future levels of sales and profitability. It is this: Pay attention to how often your customers say, "This is a *great* product" or "This is a *great* service." Everyone in your company should be focused on triggering this response from your customers every single day.

Differentiate or Die

Leather is not a hot, high-tech, well-differentiated product category, is it? But one Mexican company became a very successful and profitable manufacturer when it changed the way it looked at the business and how it was serving its customers.

"We used to make commodity leather products," said Hector Cuadra, co-founder of Cuadra Boots in central Mexico. But when yet another financial crisis devaluated the peso, many companies were flushed down the drain along with the economy.

At the same time, new lower-cost competitors in China and India emerged, and so Mexico lost its natural advantage in low-cost labor. The Cuadra brothers, Hector and Francisco, decided they no longer had a choice to remain a commodity business. They would have to change to survive or grow.

The problem was there was no way to beat Asia on price alone. "We realized that the only way to win was to add value to the leather goods in a new way, to differentiate them," Hector said. They already specialized in exotic leathers. But that wasn't enough.

In 1991, the Cuadra brothers started to compete on the basis of quality craftsmanship. It took several years of hard work, but the strategy eventually worked brilliantly and catapulted Cuadra to a place among the top leaders in the leather business worldwide.

The Four Little Secrets to Innovation

There were four essential lessons in product quality and innovation that the Cuadra brothers and others like them had to learn before mega-success was possible. These lessons are called *dirty little secrets,* because they aren't the politically correct advice you'll get in most MBA programs. They are downright counterintuitive.

1. Don't follow the leader. Cuadra Boots discovered through trial and error that fashion was too fickle and too ever-changing to allow them simply to undercut the price of the best Italian designers with a knockoff product. They had to have their own designs to give the product a unique character and appeal to the wealthiest customers.

2. Create exclusivity. Lower-end, everyday products — whether work shoes or stuff at the hardware store or supermarket — need to be in stock and on the shelf or else you won't get the sale.

But some higher-end products can benefit greatly from scarcity and lower volumes to keep margins high. Whether it's an exclusive watch, credit card or first-class airline seat, people don't want to think it's available for everyone else. And customers will pay for rare and exclusive products.

3. Keep in continuous customer contact. Cuadra Boots opened retail stores to generate sales, but the brothers found that it also let them closely monitor the pulse of the whims of their clients. They could see which shoes sold and why, minute by minute. They could experience how their customers felt about which fashions worked or didn't.

4. Testing takes you from good to great. To succeed, Cuadra found that only 100 out of 1,000 products make the cut with customers in their stores. That's a brutal statistic for an innovative company. Their odds are 1 in 10. But that ratio of success to failure took Cuadra from good to the best in the world in its market niche. ●

Design a Great Marketing Plan

"The purpose of a business is to *create and keep* a customer," Peter Drucker famously said, "therefore the basic management functions are innovation and marketing, because only they are capable of generating sales, revenue and cash flow."

Marketing is the art and science of customer engagement. It's about determining what your current and future customers perceive that they really want, need, can use and can afford — and then helping them get it by creating and structuring your products and services in a way that delights customers and motivates them to embrace your mission as their own.

Four Key Strategic Issues for Your Marketing Plan

There are four key strategic questions that you must consider as frequently as possible, to test every product or service idea:

1. Is there really a market? Are there people who will actually buy your product or service? There may be a good reason why other companies aren't making this product available. To discover the answer, great companies try several variations of the product side by side and see which works best for customers. They test various price points and make different types of packaging and product names for the new item.

2. Is the market big enough to make it worth pursuing? There may be a market, but is the market large enough to justify all the time, trouble, effort and expense necessary to develop the product or service and bring it to market? Can you sell enough of your product or service to make it economically worthwhile? There are many products or services for which there is a definite market, but the market is too small to make it worth pursuing. Market research in this area can be invaluable in helping you make the right decision.

Three Ways to Increase Sales

There are basically three ways to increase sales:

1. **Increase the number of transactions.** Volume can be accomplished through marketing and advertising, using special promotions, discounts and a variety of other means to get customers to buy from you for the first time.
2. **Expand the size of each transaction.** Once you have attracted a prospect, you can up-sell, cross-sell and even down-sell if the customer cannot afford the main product or service.
3. **Increase the frequency of purchases.** The key measure of customer satisfaction is repeat business.

3. Is your market concentrated enough? Assuming that there is demand for your product, and the demand is large enough, do the means of advertising and promoting the product exist that would enable you to sell to that market in a cost-effective way?

4. Who is your competition for the same customer dollar? Even if your product isn't out there (yet), there will always be competition for the customer's dollar. That's how you should think about it. Remember, the overwhelming majority of new product or service offerings fail because there is no market, or the market is not large enough, or the market is not concentrated enough to be reached in a cost-effective manner, or your competitor's offerings are superior to yours in some way.

User-Generated Content

Think about it: The "content" that attracts viewers to Google's paid advertising is contributed by the billions of websites generated by the customer. Google serves up ads just in time as customers are searching to find what they want. Services like Facebook are taking this trend to a new level by vastly expanding the consumer's ability to socialize with other consumers.

This online community of customers contributes content, and in effect, these users are actively marketing these social media services in the most powerful and "viral" way any consumer can: through personal referrals. They are signing up their colleagues and friends by the millions. ●

Perfect a Great Sales Process

Customer retention is the key to sales success. Single-purchase customers are too hard and expensive to acquire. Your focus must be on the second sale, and the third sale. Your goal must be resales to the same customer, over and over. In addition, your goal should be to get referrals from your satisfied customers.

You can win the first sale with promises, special offers and discounts, but you only attract repeat business when your customers feel that you delivered on your promises. This causes them to prefer to buy from you again rather than someone else.

The Second Sale

The second sale takes approximately one-tenth of the time and expense to attract, and it is therefore much easier and more profitable than the first sale. The fact is that winning customer loyalty today is harder than ever before. It takes more calls to find qualified prospects. It takes more callbacks to make individual sales, or more contacts or visits. It takes more service. This is why the majority of sales, and the largest purchases, from the most successful retailers and wholesalers come from repeat customers, not from first-time buyers.

The way that you generate repeat business is with high-quality products and outstanding customer service. The true measure of the success of your business is the percentage of your business that comes from repeat sales and referrals.

Seven Rules for a Great Sales Process

In selling, you must follow this specific seven-step sales process to ensure the maximum number of sales, resales and referrals.

Rule 1: Prospects versus suspects. Your first job is to separate prospects from "suspects." Take your time and ask questions. Your sales energies and resources are limited. You cannot waste them by spending too much time with people who either cannot or will not buy.

Rule 2: Establish rapport and trust. Once you have made the sale, you must deliver the product or service, make sure that it is satisfactorily installed and utilized, and take care of customer concerns or complaints for a substantial time afterward.

Rule 3: Identify needs accurately. When you speak to a customer, he or she may have a need that is *clear, unclear or nonexistent*. If the need is clear, the customer may be accurate or inaccurate about how to satisfy that need. Maybe what the customer needs is very different from what he or she thinks he or she needs.

Rule 4: Present persuasively. You can make a lot of mistakes in the sales process, but the quality of your presentation determines whether or not the customer buys.

Rule 5: Answer objections effectively. There are no sales without objections. Objections indicate interest. The more the prospect questions you about your product or service, the more likely it is that he or she is interested enough to buy it.

Rule 6: Close the sale. The most powerful word in the sales process is "ask." Even if the customer wants the product, needs it, can use it and can afford it, the responsibility of the salesperson is to reach out verbally and ask for a buying decision.

Rule 7: Get resales and referrals. Everything must be aimed at taking such good care of your customer that he or she buys from you again and recommends you to friends and associates.

Selling to a referral takes one-fifteenth of the time,

money and energy required to sell to a cold-call or a new customer.

Create a Great Customer Experience

The secret to success in business can be summarized in a single sentence: "Make your customers happy."

The key to your business future is the degree to which you create that experience for people — that you delight customers over and over again and make them happy that they decided to do business with you.

Nothing generates greater customer satisfaction, loyalty and repeat business more than a companywide commitment to pleasing your customers. It is the key to triggering the response, "This is a great company!"

It is expensive to acquire a customer for the first time. Once you have a customer, you must do everything possible to "bind him to you with hoops of steel." Develop an obsession with customer service. Take care of your customers better than your competitors and continually look for ways to improve.

Your aim should be to get your customers selling for you. You want your customers to "go viral" and infect the market with your message. You want them telling their colleagues and neighbors about your company. You want your customers to be sending e-mails and blogging about your products and services to each other.

The 'Ultimate Customer Experience'

The starting point of developing an excellent customer service policy is to define how you intend to treat your customers. Start by defining the "ultimate customer experience."

Here are 12 factors that give insight into the ultimate customer experience:

1. Reliability and Consistency: Be predictable. Reliability and consistency mean customers can count on the brand to represent the same thing every time they experience the product or service.

2. Responsibility: Raise your hand when you make a mistake. Study after study shows that when most customers complain, they don't really want their money back or to cancel the purchase. They just want the product to work. They want the company that sold the product to fulfill the promises it made.

3. Responsiveness: Get in front of the story fast. The longer Toyota remained in denial about the acceleration problem in certain of its vehicles in 2010, the bigger the crisis became — and the longer it will take the company to repair its reputation.

4. Specialized Service: Make it feel like a custom fit. Home Depot's stress-free return policy gives buyers much more confidence about buying anything, anytime, from the store or the website. It builds trust and loyalty.

5. Selection: Be sure to have the product available. You need to find a way to have the right product when the customer needs it.

6. Quality: It's defined by your customer. Quality means that your product or service conforms to (and hopefully exceeds) the customer's standards and requirements.

7. Delivery: Exceed expectations as often as possible. It's no surprise that companies that offer fast, dependable, predictable delivery of their products attract business away from suppliers whose delivery is slow or inconsistent.

8. Employee Experience: Make your people feel happy about working for you. Entrepreneurs like Zappos founder Tony Hsieh understand that if you make your people feel important, that is exactly how they will make your customers feel.

9. Commitment by Employees: Make them love it or leave it. The key to an extraordinary customer experience is to make sure the people on your team who don't want to be there go somewhere else.

10. Installation: Make everything work for your customer. Best Buy has revolutionized the retail electronics industry by sending out its Geek Squad installation technicians in black-and-white Volkswagens to make house calls. Any business that offers to serve its customers faster immediately becomes the preferred supplier, even at a higher price.

11. Context: Find out how it feels to be a customer. There's nothing more powerful in business than context. When you see a product or service in action (or inaction), you will learn more than you would with a million phone surveys.

12. Competition: *Be* the customer. Most business leaders sit at their desks and say they are customer-focused, but you usually can't get a full flavor for the customer when you are sitting in the office. You have to get out and into the trenches with your customer.

Now … Build a Great Life

While building a great business and maximizing profits are important goals, your main goal should be to live a *great* life. You have to fix your own life before you can

fix your business or become a productive business leader.

Regardless of short-term economic fluctuations, we are living in the very best time in all of human history. There are more opportunities and possibilities for more people to achieve more of their goals in the years ahead than have ever existed before. Your goal should be to be one of those people.

Future Orientation

The starting point of living a great life is for you to decide exactly what a great life would be like for you if you could create it. As they say, "You've got to have a dream if you want to make a dream come true." This practice is called *future orientation*.

Top people think about the future most of the time. To create a great life, you must think and act the way great men and women have thought and acted throughout the ages. You must think and imagine the way they did (and still do), and soon you'll get the same results.

Goal Orientation

A second orientation that you need to live a great life is *goal orientation*. This means that you have clear, specific written goals for what you want to accomplish in the months and years ahead.

Make a list of 10 goals that you would like to accomplish in the next year or so. Use the three-P formula: present tense, positive and personal.

1. Present tense. Always write your goals in the present tense, as though a year has passed and you have already accomplished the goal. Instead of saying, "I will earn $XXX," you say, "I earn $XXX over the next 12 months."

2. Positive tone. Write your goals using a positive tone rather than a negative one. Instead of saying, "I will quit smoking," say, "I am a nonsmoker" (positive and present tense).

3. Personal action. Make it personal. There are two ways to do this. For many people, it's most effective to begin each goal statement with the word "I" followed by an action verb: "*I* have a 34-inch waist." Other people may prefer to address themselves as "You" with each goal statement. Try saying, "*You* are enjoying your brand-new office" or "*You* have achieved your goal."

The shorter and more precise your goal statements — starting with the word "I," followed by an action verb, in the present tense with a positive tone — the more rapidly they are accepted by your subconscious mind. Once your goals are programmed into your consciousness (which is the reason for writing them down), your subconscious and superconscious minds go to work to bring them into your life 24 hours a day.

Once you have made a list of 10 present-tense, positive, personal goals, go over your list and imagine that you could accomplish the goals on this list sooner or later — as long as you wanted them badly enough. But imagine also that you could accomplish any one goal on this list within 24 hours. Here's the question: What one goal, if you could accomplish it in 24 hours, would have the greatest positive impact on your life? Do something every day that moves you forward.

Action Orientation

The final key to building a great life is *action orientation*. The ultimate law of attraction says that when you apply the law of action first, you put into motion everything that demonstrates to other people (and further convinces you) that you are excited about your future. Nothing is more infectious than your excitement about doing what matters to you.

All successful people are intensely action-oriented. They are in constant motion. They try, try again and then try something else. They believe in "doing it, fixing it, trying it."

The Law of Probabilities

Success in life is more a result of the law of probabilities than of the law of attraction or plain luck. The law of probability says that there is a probability that anything can happen, including your achieving your most important goals. This law also says that "the more things that you try, the more likely it is that you will triumph."

The more action you take in the direction of your goals, the greater the probability that you will achieve those goals. The more things that you learn and try, the faster you move, the more ground you cover and the more likely you are to achieve your most important goals on schedule.

The truth is that you can do, be and have anything that you put your mind to. Decide what you want, write it down, make a plan and take action today. ●

Management: Hands On

How Companies Win

Profiting From Demand-Driven Business Models No Matter What Business You're In

by Rick Kash and David Calhoun

THE SUMMARY IN BRIEF

For more than 20 years, the growth formula for business has been to increase revenues by expanding product offerings while simultaneously streamlining supply. But with the recent "Global Recession," the world economy has changed, in all likelihood forever. The old tools — most notably supply-chain management — are no longer enough. In this Demand Economy, characterized by long-term oversupply and virtually all goods and services flat to contracting demand and diminished pricing power in almost every market, the challenge is to locate and capture the elusive pools of high-profit demand.

The answer is a revolutionary, demand-driven model that has already proved successful for some of the world's most admired companies. At the heart of this powerful new business model is an achievable vision for a new kind of winning company, one that uses sophisticated new tools and techniques to discover, characterize and then serve these pools of high-profit demand — and, in the process, gain pricing power in that marketplace.

How Companies Win shows how organizations can use everything from social networks to more revealing and effective consumer-research techniques, and then introduces the demand chain, the logical new partner to your supply chain. The principles, case histories and insights presented in *How Companies Win* will help your business run faster, cut costs, and become better able to deliver high-quality products and services, even in the tightest economic climate.

IN THIS SUMMARY, YOU WILL LEARN:

- How media companies, retailers and manufacturers work together to serve demand with much greater precision.
- What it takes for companies to win in a new era of heightened global competition.
- How to engage every level within a company, small or large, local or global.
- How to find real-world solutions that take advantage of the rise of social networks.

Introduction: A New Strategy for a New Era

The "big idea" in the air in the 1990s was *disintermediation*: the notion that business systems, empowered by the new information and communications technologies, would strip out the middleman and grow more efficient in the process. The dot-com era was essentially this idea of disintermediation, propelled by the Internet, reaching the retail world — replacing traditional bricks-and-mortar businesses with e-commerce companies.

As we all know, the explosion of thousands of new online retailers that targeted almost every retail business from overstock inventory to groceries to pet food was followed instead by a massive shakeout in the industry that quickly killed the vast majority of those companies. The dot-com bubble was followed by the dot-com bust.

Those companies that did survive the shakeout — Amazon, eBay, Yahoo, Orbitz, Google — have proven to be some of the most important and influential companies of recent years. And they in turn set the pattern for the Web 2.0 social media firms such as Twitter, MySpace, Facebook and YouTube that have redefined modern life. What did those survivors have in common? Their business was based on what customers wanted, rather than what the suppliers already had. They were the harbingers of the demand-driven economy, if only we had noticed.

One of the lessons they taught is that we have now entered an era of oversupply. Oversupply is a situation where significantly more supply exists than there is demand to absorb it. Oversupply is often characterized by a lack of differentiation, with price becoming the primary factor underlying purchase decisions. As a consequence, pricing power virtually disappears and organic growth and profitability become increasingly difficult to achieve.

The Concept of 'Need States'

The second lesson to be learned is that in an era of oversupply it is imperative that you construct a framework in your company that encompasses and aligns everyone toward meeting, not just the current, but also the latent and emerging demand of your highest-profit customers and consumers. And before you can do that, you need to understand who those customers and consumers are, where they are and what "need states" they exhibit as they make their purchasing decisions.

The concept of need states is important for developing an in-depth understanding of demand. Need states are the circumstances or the occasions that cause someone to want something and to take action in its pursuit.

This is not reengineering; this is *rethinking*. This is not reorganizing, it's reshaping manufacturers, retailers and the media into a collaborative network that will work to the benefit of all who participate. For a long time, this new model of organizing and collaborating has been intuitively felt, and now it's real. It's called the "demand chain." ●

The Demand-Driven Company

By almost any measure, McDonald's is one of the most successful and influential companies of all time.

But from the mid-1990s until 2002, the company lost

its way by choosing to focus almost exclusively on supply — in its case, building even more restaurants and acquiring other food chains — rather than on what its millions of customers really wanted. It was only when McDonald's went back to paying attention to those customers — what they liked, what they wanted and what they might like — that the company found its way back to success.

The modern McDonald's story traditionally begins in 1955, when franchisee Ray Kroc opened the ninth store of the 15-year-old company. McDonald's had already pioneered the idea of "fast food," but it was Kroc who systematized the process and, buying the company, turned it into an international corporation and a global symbol of American culture.

By the end of the 20th century, McDonald's was enjoying revenues of almost $15 billion annually from more than 28,000 stores around the world. Net income was nearly $2 billion in 2000.

McDonald's Winning Shift

In 2002, McDonald's suffered its first quarterly loss since 1954, ending a celebrated half-century of continual growth. And the bad news kept coming: Even as profits disappeared and revenues flattened, consumer satisfaction levels fell below that of the company's major competitors. As a further insult, a spate of articles from 1998 to 1999 that eventually became the book *Fast Food Nation* in 2001 singled out McDonald's as contributing to America's health and obesity problems.

And so McDonald's began 2003 by embarking on one of the most remarkable restructurings in modern business history.

What did "doing better" really mean? McDonald's developed a table that showed the components of customer satisfaction and how they related to the company's own values. McDonald's called this its "Plan to Win" and it addressed five components that constituted McDonald's new model for total customer service: people, products, place, price and promotion.

The result? After hitting bottom in 2002, McDonald's revenues and income both returned to their historic upward march, even during a growing recession. Since 2004, McDonald's total sales have increased from $50.8 billion to $72.3 billion in 2009, a jump of more than 42 percent.

It hasn't been easy, but McDonald's has transformed itself into a demand-driven corporation.

The single most important lesson to take away from McDonald's remarkable turnaround is this: In a world where supply is growing ever more efficient while demand is flattening or even contracting, understanding demand becomes the new imperative for how companies will compete and win.

With the high levels of competition that characterize the present and the foreseeable future, the margin for error has gone down and the need for precision has gone up. In particular, precision in understanding exactly which pools of customers and consumers offer the greatest potential profitability for your company has increased in importance as well as degree. With this knowledge you can align your supply and your resources to better satisfy this demand and thus capture the largest possible share of the most profitable markets. ●

Two Types of Customer Analysis

Several tools are available to enhance precision in a company's operations. Here are two:

- **Demand Gap Analysis.** Demand gaps are the distance between what your customer wants and what it gets from you or your competitors.
- **Customer Demand Analysis**. It is designed to determine first who the most profitable customers are for your business. The second step is to actually contact those customers, who provide valuable insights.

The Demand-Driven Economy

Just how did McDonald's know that it was time to introduce salads and to keep their stores open 24 hours per day? How did Apple know that consumers wanted to bring the best of mobile phones and PCs together into a device that might ultimately reinvent both industries? How did IBM know that it was time to evolve from the world's largest technology hardware supplier to one of the world's most respected technology services providers?

The simple answer is that each of these companies understood, in a very deep way, the facts, the economics and the content of what their customers and consumers demanded. Companies like these, which win on a continual basis, operate above all by understanding demand at the higher market and sector levels.

By comparison, companies that struggle to compete quarter to quarter operate at lower levels of understanding that encompass only basic customer needs and product attributes. The result is that informed by an under-

standing that markets evolve at the level of current, latent and emerging demand, demand-driven companies consistently have a larger and longer perspective than their competition.

The demand-driven company not only thinks about today and tomorrow, but next year and the next five years. The supply-driven company only thinks about today, tomorrow and the end of the quarter.

What these great companies do is the result of a business model that operates beyond the simple — and increasingly risky — strategy of "asking customers what they want."

These great companies see trends and recognize patterns forming in their markets, their category, among their different customer segments — and even outside their businesses, in adjacent markets and across the entire culture — and develop hypotheses about what those customers *will* want. Only then are they in a position to query customers — and even then, only the right customers — and begin to align current strategies, resource allocation, products and other offers to intercept this demand as it approaches.

This is a far more powerful and multifaceted approach to identifying your *real* customers than was ever before possible.

About Supply

Supply is the sum total of what the provider does to satisfy the customer's demand, both physical and emotional. It is important to recognize that supply is not just the product itself, but also all the elements that support the product including price, packaging, messaging, the channels of distribution, customer service and the brand. ●

Part II: Strategy

Imagine how your business would benefit if you had a single integrated framework to:

- Find the high-profit customers who can raise your margins and revenues.
- Understand current, latent and emerging demand.
- Determine which channels are growing and which channels are slowing.
- Assess where your competitors are strong and where they are weakest.
- Understand the media habits of your most important consumers.
- Identify the best potential opportunities for innovation.
- Build a financial model for resource allocation to drive faster growth.
- Develop insights about the demand of your most profitable customers that your competitors don't know.

Differentiated Demand

When you build an effective demand landscape and understand the demand profit pools within it, all of these questions can be readily answered. Once you have this understanding, you are in a better position to satisfy the demands of the most attractive of these demand profit pools. You can use your knowledge and understanding to align your differentiated brands and products so that you capture a larger percentage of the profitable demand than your competitors. The framework also becomes the basis for how to manage your brands and products as a portfolio. And because it includes information about virtually every function within the company, from finance to manufacturing to marketing and sales, it is the integrated framework through which all can understand, talk about and manage the activities of their operations.

Demand profit pools exist because demand is not homogeneous. Indeed, in the world of demand, no size fits all, which ultimately means that in any given market there are likely to be multiple distinct pools of demand. Mercedes sedans, GMC pickup trucks, Honda Hybrids and Cadillac Escalades can all be successful and profitable car brands while serving very different demand profit pools within the larger vehicle market. Most markets feature at least six different demand profit pools. That's a lot of opportunity.

Customers within those demand profit pools are attracted to both the rational and emotional benefits of these submarkets. So why the range of products? Because people have different lives, tastes, lifestyles, needs and personal histories. They also live in different environments and are at different points in their lives. The result is a wide spectrum in both rational benefits (quality, performance, safety, comfort, eco-friendliness, mileage, power, price) and emotional rewards (status, "greenness," hipness, safety).

Demand profit pools are groups of customers who make similar decisions based on the common needs they want satisfied. Any given market, whether in consumer or business-to-business industries, will have several distinct demand profit pools. These should be defined not simply by who these customers are or what they purchase but, most important, by why they make the decisions they make. And beyond understanding the who, what and why of customers by group, businesses that win must fully understand the economics of each demand profit pool. Determining which ones spend the

most, which are most and least price sensitive, and which offer the highest and lowest profit potential are all critical to determining which demand profit pools to focus on and how to serve them.

The Fifth *P*

In the new demand economy, the margin for error for all businesses grows smaller and smaller.

In the flagrantly expansionary economy of the past several years, sloppiness in planning and execution were hidden as business sales and profits went up constantly. These days, you are not only competing with ever-growing sources of supply from competitors all over the world, but all of that supply is competing for flattening — even contracting — demand. In this new competitive reality, *any* mistake can have significant consequences.

The solution must go beyond tightening the screws still further on the supply chain. Now the precision must occur on the demand side of the equation.

Achieving a New Level of Precision

One reason for this is a shift in expectations. Today's customers and consumers expect more precision from business because, thanks to the tech revolution, the world around us has become much more precise. GPS devices will show you within inches how to get from point A to point B. Atomic clocks measure to the billionths of seconds. Twitter can tell you exactly what your friends are up to at any given moment. YouTube, TiVo and iTunes allow you to access the history of recorded entertainment to find exactly the experience you want at that moment. And cellular telephony lets people contact you anywhere on the globe.

In the face of this unprecedented increase in precision, is it any wonder that customers and consumers are increasingly impatient with inaccuracies, delays and imprecision? Precision has become the leitmotif of the lives of your consumers — and if you fail to match that precision, those failings will seem even more amplified.

What consumers also instinctively understand is that precision has long been a precursor to progress. In high technology, ever smaller chips also have ever more functionality. In medicine, laparoscopic and laser surgery enable doctors to work in small, almost microscopic, spaces instead of using more invasive procedures. Heart stents are implanted with precision to prevent heart attacks and strokes. The Kindle delivers thousands of books to your home on a small device within seconds, and soon tiny chips called RFID (for radio frequency identification) will track individual packages as they travel across America or around the world. Precision is almost always the path into the future.

The New Marketing Mix

Supply chain management became a science through the creation of more rigorous approaches that increased quality, reduced costs and shrank production cycle time. Every aspect of what before had been the siloed functions of purchasing, manufacturing and distribution was now assessed, optimized and interlinked using several fact-based approaches.

Today, an equally rigorous approach to demand is both necessary and practical. It needs to be done and it can be done.

The marketing mix is best known as the "four *P*'s of marketing": product, promotion, place and price. If we apply the philosophy of precision to this mix, the potential benefits become enormous.

It is time for the adoption of a fifth *P*, precision, to make sure that each of the first four P's operate at their maximum efficiency and lowest cost. A lot of companies have already noticed; Coca-Cola, for example, has already declared this "the Age of Precision Marketing."

Total Innovation

Myth-Free Innovation

Of all of the activities that companies engage in, *innovation* may be the one that is most mythologized, misperceived and misunderstood. According to studies, American corporations spend more than $1 trillion per year on innovation, and only get a fraction of that back in return on their investment, in large part because of this misperception.

The confusion begins right at the start, with the very definition of the word. In everyday usage, "innovation" is perceived as a creative exercise. It is nothing of the sort; in truth, at least in the world of business, *innovation is a disciplined, demand-based process.*

There has never been a successful long-term innovation that did not better satisfy an existing or emerging customer demand. That suggests a definition: **Innovation is finding unsatisfied profitable demand and then fulfilling it.**

Total Innovation

You'll note that in defining innovation, no constraints were placed on where that innovation may occur. That was intentional, because a big mistake companies make is to narrow their idea of what innovation should result

in, typically focusing on new products alone.

It is also worth noting that the word "innovation" itself has a way of freezing people in their tracks. Over and over we've heard people say, "I'm just a creative person, so I can't be very good at innovation." That's why, when Jim Kilts was CEO of Gillette, he and his SVP of strategy, Peter Klein, took the pressure off of everyone by reframing the entire topic. They told the company to stop referring to innovation and to just "find a better way."

Gillette's Success

Kilts and Klein applied what they called the "Total Innovation" process at Gillette to great effect. While Gillette had enjoyed a reputation as a highly innovative company, the truth was that its innovation pipeline and innovation successes were running out of steam in the years before Kilts and Klein arrived.

Within six months of putting the Total Innovation process in place, Gillette's revenues increased by approximately 15 percent and net income jumped by more than 18 percent. While there were arguably other factors at play contributing to Gillette's financial success during this time, for example favorable exchange rates and a series of hurricanes spurring battery sales, the Total Innovation process was clearly a major contributing factor to Gillette's success. With the new innovation process and a new confidence throughout the organization — all begun by taking the pressure off the need to be "creative" — Gillette began to post double-digit revenue gains each year after having suffered several years of declining revenues.

Real innovation is total innovation. That is, it begins, like all new products or services, with the idea or market analysis, but it continues all of the way through the manufacturing process, packaging, distribution, retail, consumption and even beyond, through that product's or service's entire lifespan. In a world of oversupply and flattening demand, this is the only strategy that ensures that all of the potential profit is realized from the process, and that the product or service itself is precisely aligned with the most important demand pools. ●

The Price Is Right

Pricing strategy is often the one area where managers feel least confident about their approach. On the one hand, these managers recognize that if they price their offerings too low, they risk leaving money on the table. And on the other hand, if they set prices too high they risk losing valuable consumers or customers; or just as bad, risk pricing themselves out of the retail or distribution channels they need to reach those customers. It is a dichotomy that haunts almost every business on the planet: Lose profits or lose customers.

Surely there is a better way, one that ends not with compromise, but with a win.

Pricing Power

There really is a rational and systematic way to price products and services in such a way as to escape the lost profits/lost customers dichotomy. Better yet, this kind of intelligent, demand-driven pricing can actually uncover new sources of customers and profits. And that can be a very valuable advantage.

How valuable? The numbers are so compelling and decisive that it is astonishing that every future manager isn't taught this in business school. A 1 percent price increase has a *50 percent* greater impact on operating income than does a 1 percent decrease in variable cost. More remarkably, that same 1 percent price increase has a *215 percent* greater impact on operating profit than does a 1 percent volume increase in sales.

If you can find a way to raise the price of your product or service by just a few percent — through more targeted marketing, by improving product image, by finding more lucrative profit pools or by adding new features without adding cost — the impact on your bottom line will be so great that almost no realistic amount of cost cutting or increased production will be able to match it. ●

Part III: Execution

You need to ask yourself: "Does my company have a simple — and easily understood — plan for how it will succeed?" and "Does everyone in the company understand that plan and their role within it?"

Great companies (the ones that stay on top of their markets for decades) align their internal operations, from the boardroom to the receptionist, to be in total support of that plan. And they regularly communicate that message to their employees.

We call these external/internal strategies the "thesis for winning" and "mental models."

The Thesis for Winning

As the years have gone by, it has become absolutely clear that all truly outstanding leaders have a thesis for winning — that is, a set of individual principles, each in itself important, that when taken together represent the strategy to take and the pathway to follow for that busi-

ness to win. It is what Ed Liddy, former chairman and CEO of Allstate Insurance, calls "The Theory of the Game."

Liddy speaks with authority and experience, because his own thesis for winning across his eight years at the top of Allstate produced remarkable results. When Liddy became CEO in 1999, company revenues were $27 billion and net income was $2.7 billion. When he retired in 2006, revenues had increased to $36 billion, but profits had skyrocketed to almost $5 billion.

Liddy credits the success, in part, to giving Allstate a strong thesis for winning. Liddy had three elements in his thesis:

1. *Deliver better service* at all levels of Allstate, starting with their agents.

2. *Deliver better pricing* based on the lifetime value of the customers.

3. *Communicate constantly* to Allstate's 12,000 agents the importance of good service in attracting and retaining customers and to its millions of insureds that Allstate puts its "good hands" commitment to customer service foremost.

Here is a definition of the thesis for winning:

Management's set of beliefs and objectives, which, taken in combination, establishes the basis on which a corporation intends to win versus its competitors.

The Mental Model

A mental model is the same picture in every employee's mind of how their company is going to compete and win — and their own role within that plan.

It is the commitment by the company to the notion that every function in the company — and every person within those functions — must share the same understanding of what they are going to do, and how they are going to do it, to win. And that this message must be shared with the entire company, ratified by employees and made manifest in every move the company makes.

The mental model creates comfort for employees because they understand the larger picture and their important role within it. From that comfort springs confidence, which is the hallmark of high-performing employees and winning companies. ●

The Demand Chain

Today, perhaps more than in any time in the past 80 years, manufacturers, retailers and media companies are all finding themselves under assault, not just by a deep global recession but by a seemingly inexplicable loss in effectiveness of some of their most important and proven business tools and strategies.

These companies watch helplessly as their consumers, now networked, get smarter — and realize, to their dismay, that they aren't keeping up. The game keeps changing and the rules are evolving quickly. Clearly there's universal demand by business leaders for a new solution.

This period of economic complexity and turmoil will be a historic opportunity for some companies to gain enormous market share and profit share by participating in a new collaborative business model. This model includes a new level of collaboration and coordination between manufacturers, retailers and media companies that goes beyond traditional data-sharing efforts and approaches such as category management.

This certainty of winning is driven by a truly proprietary understanding of what consumers demand and which of these consumers offer the greatest profitability. With these in hand, a network is formed between manufacturers, retailers and media companies to capture the largest share of profitable demand. The commitment to this network allows all of the participants to grow at faster rates and to higher levels than would be possible without the collaboration of the network.

This new model is the demand chain. It stands as the counterpoint to the traditional supply chain, its information flowing in the opposite direction, with results driving capabilities rather than the other way around.

For manufacturers it means aligning their different brands and products so that they capture the highest share of the most profitable demand.

For retailers it means organizing and merchandising their stores so that they better meet the demand of the people who shop in their stores versus those of their competitors.

For media companies it means that on the horizon there is a new level of precision that will enable them to reach the specific consumers that the manufacturers and retailers most want to communicate with and motivate.

In the collaborative environment of the demand chain, where information is shared and plans are coordinated, everyone becomes more efficient in what they make, how and where they distribute their products and how they use their marketing and media budgets to motivate consumers and stimulate purchase behavior.

A demand chain is a collaborative network composed of a manufacturer, retailers and media companies that enables each participant to better

understand and more completely and precisely fulfill customer demand. ●

Supply, Meet Demand

In the years to come, the real power of the supply chain will have less to do with the micromanagement of details regarding cost and performance, or with one's comparative advantage relative to competitors' supply chains. Instead, the true measure of power for one's supply chain will lie in its ability to more precisely target and serve the right demand at the right time at the right place in the right package and in the right environment. Supply chain advantage will now be driven by how closely it is guided by, and responsive to, the demand chain as it enables the supply chain to deliver the right product to the right place at the right time.

Simply put: *Your supply chain can no longer be optimized without a complementary, and equally optimized, demand chain.*

Going Forward

Going forward, winning supply chains will precisely align demand and supply in ways that have never before been possible. New technologies, combined with the intellectual capital of demand profit pools, will afford companies the ability to align the right supply to precisely the right demand — thus enabling growth in the only way possible in flat markets: taking volume, share and profits from your competitors.

One important implication of this is that managers will need to focus much greater attention on:

1. *Identifying* the target, highly attractive demand profit pools of customers.

2. *Determining* how the supply chain can best respond to, and satisfy, this precise group of consumers.

The strategy of having a demand-led supply chain goes beyond organizational alignment; it is in fact a structural change with enormous implications for organizational efficiency and continual profitability. There are four key benefits:

1. Start Better. One of the first benefits of this partnership is the demand chain's ability to get the right product to the right retail outlet at the right time. This essentially converts the supply chain from its current task of replacing what is on the shelf today with more of the same to that of determining what *should* be on the shelf.

2. Communicate Better. In the shared network of the demand chain, the communication between retailers and manufacturers improves greatly. The improved communication is the result of shared data, shared inputs and shared outputs. The result enables better coordination and provides consistent opportunities for high-level supply chain performance.

3. Align Better. This balanced approach also drives much greater internal alignment and communication. As the benefits of the partnership between the demand chain and supply chain become apparent, it fosters further collaboration and helps resolve the potential tension between identifying and responding to demand opportunities and the desire to maintain the discipline of the supply chain.

4. Structure Better. Over time, this partnership leads to improvements in the overall structure of the supply chain and its ability to serve profitable demand. Fully informed by an understanding of demand on a store-by-store, local market, regional and national level, the flexibility, adaptability and responsiveness of the supply chain can be improved. ●

Afterword: A Fresh Start

These tools work, as the case studies show, and they can be applied right now.

Evolving from a supply-driven company to a demand-driven company is as much a matter of attitude as it is a process. If your thesis for winning is revised to include the critical challenge of finding your high-profit demand pools and then giving them what they want; if your orientation shifts from asking what your best customers want now to what they want next; and if your company's mental model realigns your organization away from making your supply chain a little more perfect to making it a lot more accurate, then these are not going to be the worst of times, but the best of times.

Your company will enjoy bigger profits, greater market share and higher customer loyalty, even as your competitors struggle and fade. And it all begins with a change of perspective.

Business is always about change, it always has been. The constant companion of change is opportunity. ●

Good Company

Business Success in the Worthiness Era

by Laurie Bassi, Ed Frauenheim and Dan McMurrer with Larry Costello

THE SUMMARY IN BRIEF

Companies shirk taxes while padding profits. Firms foul the planet but keep raking in revenue. Reckless greed on Wall Street goes largely unpunished. More evidence that bad guys finish first in business? No. A different story is unfolding.

In *Good Company*, noted economist Laurie Bassi and her co-authors, Ed Frauenheim, Dan McMurrer and Larry Costello, show that, despite the dispiriting headlines, we are entering a more hopeful economic age. They call it the "Worthiness Era." And in it, the good guys are poised to win.

Good Company explains how this new era results from a convergence of forces ranging from the explosion of online information sharing to the emergence of the ethical consumer and the arrival of civic-minded Millennials. Across the globe, people are choosing the companies in their lives in the same way they choose the guests they invite into their homes. They are demanding that companies be "good company."

Using a host of real-world examples, Bassi and company explain each aspect of corporate worthiness and prove that virtue is now more than just its own reward.

IN THIS SUMMARY, YOU WILL LEARN:

- How the business world is changing for the good.
- How a convergence of economic, social and political forces is now pushing businesses to behave better — or else.
- How you can assess other companies with which you do business as a consumer, investor or employee.
- How to determine who the good guys are — those companies that are worthy of your time, your loyalty and your money.

PART I: THE WORTHINESS ERA

Home Depot didn't look bad on paper in early 2007. But online, the home improvement giant didn't look good. And the story of that disconnect gets at the heart of this book: We're entering an age when goodness matters for companies like never before.

In January 2007, Home Depot ousted an unpopular, highly paid CEO, Robert Nardelli. And although Nardelli's whopping $210 million severance package irked investors, the company signed a much more reasonable deal with his successor, Frank Blake. The Nardelli-Blake transition earned Home Depot positive press. And although Home Depot was suffering from the housing market decline, Blake announced a hopeful outlook in late February.

But one month later, this corporate giant — which, in 2006, had ranked 14th in the Fortune 100 — was beset by the consumer equivalent of a mosquito swarm. The trouble started with an essay by personal finance columnist Scott Burns at website *MSN Money*. In the article, Burns lamented that Home Depot no longer held an intimate place in his life.

"Sixteen years ago, I sent my wife a love note. It went like this: *Carolyn: I've gone to Our Store. Be back soon. Love, Scott.* We called Home Depot 'our store' because we spent a lot of time there back in 1990. We're house freaks. ... But I have a confession to make. I still love my wife, but we don't shop much at Home Depot anymore. Indeed, we generally try to avoid it and grieve for the loss."

The reason Home Depot fell from his good graces, Burns wrote, is that the company shifted from serving customers well to abusing their time through skimpy staffing. "The result is that a once-iconic, wonderfully American store has become an aggravation rather than a blessing," he wrote.

MSN Money invited readers to share their own experiences with the "Big Orange Box." They did. By the thousands. Within the first week alone, some 4,700 comments were posted at the site. The bulk of them told withering tales of unhelpful employees and unpleasant visits.

Amid all the lamenting and lambasting, Home Depot stepped into the fray — in an unconventional way. Rather than have the firm publish a traditional press release, Frank Blake himself posted a comment directly on MSN's discussion board. Blake said the company was taking steps to improve its service and shopping experience, and apologized for the disappointment.

"There's no way I can express how sorry I am for all of the stories you shared," Blake wrote. "I recognize that many of you were loyal and dedicated shoppers of The Home Depot. ... And we let you down." The torrent of unflattering testimonials about Home Depot by everyday people and the fact that its CEO felt compelled to make a personal, direct appeal to customers speaks to a profound change under way in the business world today.

More and more, companies must be good to succeed. That is, they have to be good to their customers — as Home Depot wasn't a few years back — as well as good

stewards of communities they touch and of the broader environment. And they must be good employers. Not just generous and caring, but also smart about managing people effectively and inspiring them — something that Home Depot apparently wasn't doing well at the outset of 2007.

Companies Behaving Better

Chief among the factors pushing companies to behave better are the rise of interactive Web 2.0 technologies and a corresponding culture of participation and disclosure, whereby millions of people are publishing their experiences and opinions online. Also forcing companies in the direction of worthiness is a growing global consciousness. Heightened appreciation of human interdependency — fueled by factors like international trade, travel and concern about global climate change — is making people care more about how companies treat workers, customers, communities and the environment.

Now more than ever, people are interested in and able to evaluate which companies are worthy of their business as customers, their best efforts as employees and their capital as investors. In short, people have newfound power to reward and punish corporations for their actions and they are doing so in a rising wave of "ethical" economic behavior.

The idea that good behavior is becoming a requirement may seem far-fetched at the moment. After all, among the companies profiting during the recent downturn were financial services firms like Goldman Sachs, which bet against its own clients and whose trading practices arguably worsened the economic crisis. And American workers have never been more "disposable," as a Bloomberg *Businessweek* cover story in early 2010 put it. Many workers have had little choice but to settle for precarious or part-time jobs amid high unemployment, greater use of temporary labor and continued offshoring.

Green-Washing Won't Work

Exactly how a company puts worthiness into effect will depend on its particular industry, work force and abilities. But it won't be enough to have piecemeal corporate social responsibility programs. Nor will greenwashing — the all-too-common practice of cloaking less-than-good environmental stewardship with eco-marketing — fool a public ever-more savvy about what true sustainability looks like. Organizations will be increasingly judged on how thoroughly worthy they are.

Not many corporations receive a top grade on that test right now. We developed a measurement of worthiness based on multiple criteria associated with customer care, people management and stewardship called the Good Company Index. Our research shows that just two Fortune 100 firms — shipping titan FedEx and entertainment giant Disney — earned an A, thereby meeting our definition of a Good Company. Plenty of the largest companies are laggards with grades of D or F.

If we are right about the dawning of a new era, such less-than-fully commendable companies may still be able to survive in the years ahead. But unless they shift to a course of real reciprocity with their stakeholders, they will not flourish. As Home Depot discovered in 2007, the business world is changing. Changing for good. ●

The Economic Imperative

The Disneyland employees most pivotal to the famed theme park's customer satisfaction aren't the ones roaming around in Mickey Mouse and Goofy costumes. They're the folks carrying brooms.

Scholars John Boudreau and Peter Ramstad have shown that the sweepers who continually tidy up the park and often answer guest questions are vital to Disney. The caliber of these workers and their ability to solve problems are crucial to the holistic "magic" Disney aims to create for visitors.

"Disney sweepers have the opportunity to make adjustments to the customer-service process on-the-fly, reacting to variations in customer demands, unforeseen circumstances and changes in the customer experience," Boudreau and Ramstad have written. "These are things that make pivotal differences in the 'Happiest Place on Earth.' … At Disney, sweepers are actually front-line customer representatives with brooms in their hands."

The importance of sweepers to Disney speaks to the way in which consumers' desire for integrated experiences is propelling companies to greater worthiness. For Disney to delight customers on premium-priced vacation packages, the company can't just focus on excellent rides, good food and friendly costumed characters. It has to make sure even the employees carrying out clean-up duties are sharp thinkers and sociable to boot. It has to recruit the right people to be sweepers, train them, engage them and retain them — it must be a good employer.

Consumer hunger for more than just goods and services is one of several economic factors ushering in the Worthiness Era. Others are technological change, global trade and the public's growing focus on economic security.

Ultra-Hipness at Virgin America

Virgin America airlines has lured travelers away from existing airlines largely because of its ultra-hipness, including a commitment to fuel efficiency, cabin mood lighting, sleek black-and-white seats and irreverent flight attendants. The airline, launched in 2007 and partly owned by Richard Branson's Virgin Group, reported a net profit by the third quarter of 2010, when it also saw revenue jump 28 percent year over year to $202 million.

Customers continue to patronize low-price specialists, but even discount giant Walmart has taken a page from the customer experience playbook. In 2007, Walmart de-emphasized its "Always Low Prices" motto in favor of a tagline that tries to connect bargain shopping to a more profound goal: "Save money. Live better." ●

The Social Imperative

In the past decade or so, people have begun disclosing aspects of their experience as never before. They are documenting their daily lives, emotions, observations and opinions through public venues such as blogs, Twitter, YouTube and Facebook. The number of active Facebook users, for example, jumped from 12 million in late 2006 to more than 500 million in early 2011. Half of those users log on to the site on any given day.

Much of the self-expression spills over into people's experiences as workers, consumers and investors. Facebook has page after page devoted to businesses, some of which are created by employees and consumers.

Publication of the Personal

This growing publication of the personal is fueled and made forceful by emerging social media technologies. Blogging sites like LiveJournal.com and social networking sites like Facebook make it easy for people to start online journals and discussion groups, contributing either named or anonymous entries. And the interactive, viral nature of these Web 2.0 tools — where people can comment on postings and pass links to the content to their network of friends and contacts — helps explain why an anonymous lament about working conditions at Electronic Arts elicited more than 2,000 comments.

Related to the upsurge in public autobiography is a rise in online involvement more generally. Through the Internet, many people are becoming more participatory as consumers, citizens, investors and employees. They are joining conversations about the strengths and weaknesses of products and services, stocks and employers.

Time magazine captured the emergence of "user-generated content" and the democratization of media by naming its 2006 person of the year "You."

In this world, individuals have the power to call attention to business successes and shortcomings as never before. And they are. They are using the site Glassdoor.com to assess employers. They are praising and panning stocks at Yahoo Finance. They are tapping Yelp to post reviews of restaurants, pet services and dentists. ●

'Real People. Real Reviews.'

Yelp depends on people submitting unpaid assessments of local businesses. With a motto of "Real People. Real Reviews," the site has generated more than 15 million reviews since it was founded in 2004. And Yelp is popular. More than 41 million people visited it during a single month in 2010.

The Political Imperative

Computer chip maker Intel, famous for its "Intel inside" motto, got dinged from the outside in 2009. Outside the marketplace, that is.

European regulators slapped Intel with a record-large fine of $1.45 billion for abusing its dominant position in the market for chips. After a lengthy probe of the market for chips known as x86 central processing units, the European Commission concluded that Intel engaged in illegal anticompetitive practices, such as making direct payments to a major retailer on condition it stock only computers with Intel x86 chips.

"Intel has harmed millions of European consumers by deliberately acting to keep competitors out of the market for computer chips for many years," said European Commissioner for Competition Neelie Kroes. "Such a serious and sustained violation of the EU's antitrust rules cannot be tolerated."

Kroes' indignant tone is telling. The antitrust penalty her organization levied on Intel is part of a pendulum swing back toward greater regulation of businesses by governments around the world. That regulatory push is among several political factors forcing companies in the direction of greater goodness.

Regulation Rising

In the United Kingdom, sweeping legislation known as "the Equality Bill" began to take effect in 2010. Among other things, the measure gives additional power to employment tribunals and protects employees who discuss their pay to uncover discrimination, even if their employment contract bars them from talking about their pay. What's more, in late 2008, Britain's Equality and

Human Rights Commission announced it would probe the financial services and construction industries because of inequality in pay or ethnic minority representation in the work force.

The U.S. push toward more regulation began in earnest when Barack Obama took office in early 2009. One of his first actions as president was to sign into law a measure that makes it easier for workers to sue employers for pay discrimination. His administration declared that greenhouse gases are hazardous to public health and welfare, opening the door to tighter emission controls and regulations under the Clean Air Act. The U.S. Congress passed major pieces of legislation to overhaul the healthcare system and increase oversight of the financial services industry. And Obama's 2011 budget called for $25 million to crack down on the problem of employers misclassifying employees as independent contractors. ●

PART II: EVIDENCE AND RANKINGS

A growing body of evidence shows that companies can do well by doing good. But that's only part of the story in the world taking shape. The individual trends outlined in Part I — when taken together — indicate that goodness is rapidly becoming necessary to doing well.

What's more, the convergence of the trends we've identified calls for a comprehensive response. Many companies during the past decade have launched disparate initiatives, such as becoming an employer of choice, reducing carbon footprints and beefing up compliance efforts. But firms that aim to succeed in sustainable ways must move to become good companies through and through.

Doing Well by Doing Good

The stock market — despite all of its wild swings and, at times, seeming irrationality — provides one of the best available lenses for understanding the payoff that good companies enjoy over an extended period of time. To be sure, the performance of any given stock can be erratic, as can the performance of the entire market at any point in time. But over the long haul, the performance of "good companies" (relative to the market) has a great deal to teach us.

Fortune magazine's annual list of the best companies to work for provides one of the best available methods for looking at how being a good employer relates to subsequent performance in the stock market. From 1998 to 2009 the average annual return on a portfolio of the (publicly traded) companies on this list was 10.3 percent, compared to an annual average return for the S&P 500 (the standard U.S. benchmark) of 3.0 percent. Even after controlling for company characteristics, the companies on this list outperformed risk-adjusted industry benchmarks. They also exhibited significantly more positive earnings surprises — occasions when their quarterly earnings surpassed what analysts predicted they would be — than their industry benchmarks.

While this evidence does not necessarily prove that being a good employer causes these results, the findings strongly suggest that companies can do well by doing good as employers.

Sustainability Spelled Stock Success

Sustainability also spelled success in the stock market during the recent financial crisis, according to a study by consulting firm A.T. Kearney. Although the study covered a relatively short time frame of six months, the findings were telling. A.T. Kearney discovered that in 16 of 18 industries studied, companies committed to sustainability outperformed industry averages by 15 percent from May through November 2008. ●

Ranking Companies' Goodness

More and more, people are demanding that the companies in their lives be "good company." The convergence of economic, social and political forces put us at the dawn of a new economic era in which genuine, broad-based worthiness is no longer an added bonus, but a necessity. Some of the world's largest companies are in the vanguard, pointing the way and serving as examples for others to follow. Many others, however, are laggards, apparently oblivious to these forces — and to the fact that ignoring them imperils their existence, their employees' livelihoods and their shareholders' investments.

The Good Company Index

In our framework, being a good company is based on how a company acts in three different arenas: as an employer, as a seller, and as a steward of its community, the environment and society overall. In order to (1) identify which organizations are already behaving as good companies, (2) identify which ones have a long way to go and (3) track progress in the years ahead, we sought to create an objective system of ranking companies' actions in these areas. We explored multiple sources of information to feed into this ranking system, seeking data that ideally had all of the following characteristics:

- Reflective of our concepts of good

employer/seller/steward

- Reliable and of high quality
- Available for a large number of companies
- Timely
- Publicly available

In sum, we consider this first-ever Good Company Index to be an important step in the right direction. In the years ahead, we expect to both improve and update these rankings, including expanding them to a larger range of companies. ●

PART III: GOOD EMPLOYER, GOOD SELLER, GOOD STEWARD

A "value-creating organization" might sound like a corporate motto more appealing to CEOs or shareholders than to employees. But the truth is that great places to work also have to be places that create value for customers and other stakeholders, including owners who expect a good return on their investment. Only those organizations are capable of a long-term commitment to their employees, providing job security and opportunities for development and advancement. It can be a self-reinforcing cycle because organizations committed to employees typically bring out the best in their workers — who in turn create value.

In other words, chief among the ingredients for a value-creating organization is a long-term commitment to employees.

An organization with a long-term commitment to its employees is one where employees:

- Are rewarded for developing skills needed to meet the organization's business goals
- Are provided with opportunities for advancement
- Receive recognition for their accomplishments
- Feel secure in their jobs

Job Security

It is this last point — job security — that has been among the most contentious in recent decades. Globalization and changes in technology have rendered lifetime job security a quaint relic of the past. As the pendulum has swung, some employers have gone too far in the opposite direction and shed workers at the first sign of trouble (or even before it). This, too, is not sustainable. A tendency toward hair-trigger layoffs is one of the manifestations of an excessive focus on short-termism. And, not surprisingly, it has long-term, negative consequences. It is a form of unworthiness.

Worthy employers — employers that are committed to their employees — get this. HCL Technologies, an India-based technology company with an "Employees First, Customers Second" ethos, announced a no-layoffs policy in the midst of the Great Recession. What's more, in recent years HCL has increased employees' income security by reducing the percentage of compensation that is variable (based on bonuses). HCL appears to have been handsomely rewarded for its foresight, enjoying significant growth during the downturn and gaining market share against rival Infosys Technologies. That's what happens when employees reciprocate their employer's commitment and give the gift of their discretionary effort.

Other elements are necessary to complement commitment to employees in developing and maintaining a value-creating organization. These fall into three categories: leadership, work environment and learning.

Reams and reams have been written about leadership. It all boils down to what leaders say and what they do — their communication and their behavior.

The work environment is more complex. It consists of multiple components, including hiring practices, job design, work processes, conditions, accountability and compensation practices.

Much has also been written about an organization's ability to learn. This too can be winnowed down to two components — formal means for fostering learning and informal means for doing so. ●

The Good Seller

From its origins as a shipper of valuables in the 1850s to its charge card with the famous tag line, "Don't leave home without it," American Express has had a long legacy of strong service. But the company left the 20th century without it. AmEx hovered in the 50th percentile for service quality during the years 1999 to 2004, according to research firm wRatings.

Like many companies, American Express was focused on cost containment. The priority was reducing time on the phone with customers. American Express' nod to service came primarily in the form of a checklist for such behaviors as saying the customer's name three times during a call and avoiding 10 seconds of awkward dead time on the phone.

This not only led to a stiff experience for customers but also robbed employees of the autonomy that helps make for meaningful work. Annual turnover in its service centers, although not as high as the 100 percent annual turnover sometimes experienced in the call-cen-

ter field, was nonetheless in the double digits.

To their credit, executives at American Express saw the service slide as a serious problem. Jim Bush took over the company's service organization for the United States in 2005, where he began a push to upgrade customer satisfaction partly by upgrading the employee experience.

Instead of ending calls as quickly as possible, AmEx call center agents now seek to deepen relationships with customers by providing relevant information and asking about their use of the card. This might sound like the irritating "upselling" consumers frequently face, but under the new American Express program, dubbed Relationship Care, agents typically aren't selling anything new. Rather, they try to help customers understand all the features of their card so they will use it more.

The service surge is paying off. American Express' wRatings scores on service quality dipped in the first several years of the initiative but spiked to the 97th percentile in 2009.

American Express embodies key features of good sellers. Good sellers offer safe products, communicate honestly and seek reciprocal relationships. The win-win scenario of American Express customers taking greater advantage of card features — thereby spending money that translates into transaction fee revenue for the company — falls into this latter category. Good sellers also show restraint, avoiding practices like aggressive upselling. ●

The Good Steward

Seventh Generation is among the most environmentally responsible companies in the world today. But leaders of the household and personal care products company will be the first to tell you they aren't perfect.

They did just that in their 2008 Corporate Consciousness Report. "We are still working to replace the remaining synthetic ingredients in our products and to eliminate the contaminant 1,4-dioxane from our cleaning products," co-founder Jeffrey Hollender wrote.

A likely carcinogen, 1,4-dioxane can form in cleaning products when modifying natural oils with the petrochemical ethylene oxide and sulfur trioxide. Both Seventh Generation's fabric softener and its soap dish liquid tested positive for 1,4-dioxane, the company said in the report.

Despite this admitted black eye, Seventh Generation's track record has been a bright shade of green. Among numerous environmental awards, it was ranked as the best company on the planet by Better World Shopping Guide, a buying resource for ethically minded consumers. And Seventh Generation's actions back up this honor. For example, in 2008, the company upgraded its product-testing regime, which led it to discover phthalates in its automatic dishwasher gel with a synthetic green apple scent. Although the particular phthalate found — DEP — is not a suspected carcinogen or endocrine disruptor, other phthalates have been found to be probable or possible health hazards. The company discontinued use of the green apple scent, replacing it with a natural grapefruit fragrance.

The firm, founded in the late 1980s, has also taken steps to reduce its carbon footprint. It estimates that a plan to decentralize manufacturing and distribution operations would cut delivery miles to retailers by 48 percent.

It's all in line with Seventh Generation's deep commitment to environmental and social responsibility. The company's very name refers to the Iroquois concept that decisions today should account for their effect on the next seven generations.

Communicate Honestly with the Public

Seventh Generation embodies many key features of a good steward. To start with, it communicates honestly with the public and other stakeholders about its effects on people and the planet. And its warts-and-all candor about challenges in making effective cleaning products that are environmentally sound — in contrast to many glossy, annual reports that only tout a company's greenest side — captures the kind of transparency that is increasingly necessary.

Seventh Generation also takes care of communities and the environment. This includes philanthropic giving, work to limit the environmental damage of its operations and products, and efforts to educate the public on eco-friendly habits, such as washing clothes in cold water.

Beyond all this, Seventh Generation demonstrates another vital trait of good stewards — a degree of restraint. In particular, the company embraces the precautionary principle, which presumes a chemical may cause harm unless tested and shown otherwise. After all, DEP has not been shown to carry health risks like its chemical relatives. Still, the company is erring on the side of caution. ●

PART IV: THE FUTURE

The ability to move fast, companies are learning, involves both weight and strength. And strength has to

do with beefing up rather than breaking down connections with workers, suppliers and customers. To be sure, companies can grow fat and bureaucratic. Some streamlining of workers and processes may be needed. But quickness also has to do with reciprocity and trust. As consultant Stephen M.R. Covey has pointed out, lower trust taxes a firm through lower speed and higher cost. And a growing field of research is highlighting the power of the *connected enterprise* — meaning companies with active, decentralized networks of communication and healthy relationships within their walls as well as with external parties such as suppliers and customers.

Companies have started to move toward greater connectivity and stronger ties. HR outsourcing deals focus more on creating partnerships with frequent interaction between company and service provider. In general, businesses have moved toward selecting preferred vendors with whom they have deeper relationships. Those bonds, in turn, offer greater odds that final products will be safe and environmentally sound. And after years of trying to minimize customer service costs through skimpy staffing levels, outsourcing or a focus on minimizing time on the phone, companies like Home Depot and American Express are investing in thicker ties with customers — which can lead not only to heightened loyalty but also better real-time feedback. ●

A Hope*fully* Idealistic Vision

The Great Recession could have crushed the momentum toward better corporate behavior. Consumers, workers and investors could have concentrated strictly on selfish needs like low prices and high returns. But they didn't. People continued to seek out good companies. It's worth repeating findings from Edelman's 2009 study of 6,000 consumers globally. Fully 61 percent bought a brand that supports a good cause even if it wasn't the cheapest brand, and 64 percent said they would recommend a brand that supports a good cause, up from 52 percent only a year before.

This new economics of purposeful profit is unlikely to dissipate with a recovery. It will be easier, rather than harder, for people to buy, take jobs and make investments based on their principles. Indeed, in 2010, 70 percent of global consumers said that a company with fair prices that gives back is more likely to get their business than a company that offers deep discounts and doesn't give back.

Technology-Enabled Transparency

The participatory culture of disclosure is unlikely to ebb anytime soon. If anything, it seems to be expanding into the massive Chinese working class. Consider the way Chinese workers at a Honda plant used cell phone text messages and the Internet to organize strikes for higher wages in mid-2010. The workers in Zhongshan uploaded video of security guards roughing up employees and urged co-workers to resist factory bosses.

It turns out those workers were inspired in part from an earlier protest in another Honda factory in Foshan, China, where workers used Internet forums to organize.

The Honda strikes are part of a broader shift in China, where younger workers are standing together and standing up for themselves in ways older Chinese workers didn't. Listen to Lan Yimin, a 22-year-old migrant worker in the Pearl River Delta. "The young generation has a wider social circle," she told the *China Post*. "We talk more about factory conditions and we know more about our legal rights."

This is the world that is emerging. One that is fundamentally a more connected one. Where people are, in effect, keeping each other company like never before.

Bad companies won't be invited into the new world that is taking shape. They will wither. Good companies, though, will find themselves welcome and they will flourish. ●

Rising Shareholder Activism

Taken as a whole, shareholder activism is on the rise. Consider a study of activism trends from 2006 to 2008 that examined SC 13D disclosures. This type of U.S. Securities and Exchange filing applies to persons and institutions that take a 5 percent or greater stake in companies and reserve the right to influence management. The study by research firm Audit Analytics found that such activist shareholders expressed concern over share price five times more in 2008 and 2007 than they did in 2006.

Design to Grow

How Coca-Cola Learned to Combine Scale & Agility (and How You Can Too)

by David Butler and Linda Tischler

THE SUMMARY IN BRIEF

In today's ever-changing marketplace, every company is at risk of having a "Kodak Moment"— watching its industry and the competitive advantages it has developed over years, even decades, vanish overnight. The reason? An inability to adapt quickly to new business realities. Established companies are at risk, but it's no easier being an agile startup, because most of those fail due to their inability to scale. Tomorrow's business winners — regardless of size or industry — will be the ones that know how to combine scale with agility.

In *Design to Grow,* a Coca-Cola senior executive shares both the successes and failures of one of the world's largest companies as it learns to use design to be both agile and big. In this rare and unprecedented behind-the-scenes look, David Butler and *Fast Company* senior editor Linda Tischler use plain language and easy-to-understand case studies to show how this works at Coca-Cola — and how other companies can use the same approach to grow their business.

Design to Grow is a must-read for managers inside large corporations as well as entrepreneurs just getting started.

IN THIS SUMMARY, YOU WILL LEARN:

- Key differences between scale and agility.
- What it means to design on purpose.
- The three realities underlying the new normal of today's marketplace.
- The power of modular design for creating agility.
- How open systems can help you create a leaner organization.

PART I: DESIGNING FOR SCALE

It's not enough to be big: At its peak, Blockbuster had about 9,000 retail stores across the United States. It had the scale but not the agility to remain relevant. And, while every founder dreams of creating the next Twitter or Instagram, 90 percent of companies won't live to see year two. While they're all designed to be agile, most of them struggle with scale. Every company needs both scale and agility to win.

If you're working for a startup, you *get* agility. You're iterating your product/market fit daily and pivoting when necessary, just to stay alive. But the thing that keeps you up at night is *scale* — stabilizing your business model so that you can move to the next stage and become a company. This requires more funding, more staff, more customers, more of everything.

If you're working for an established company, you *get* scale. You're successful because you know how to leverage scale with a high degree of effectiveness and efficiency. Managing your scale is always a concern, but what keeps you up at night is mainly agility — how to meet expectations this quarter but also create the speed and flexibility your company needs to drive innovation and create the culture you need to remain relevant to the next generation.

What if there were something that you — your startup, your team, your function, your division — could use to create the kind of scale and agility you need to win? Design can create both scale and agility.

Coca-Cola and Design

When you think of Coca-Cola and design, your mind probably goes immediately to the company's most iconic brand — Coca-Cola — with its familiar color, distinctive logo and iconic packaging. While logo and colors are important, it's the stuff you can't see, the stuff that's invisible, that's often doing the heavy lifting.

For example, when Coca-Cola designs a new package, its goal is to actually solve business problems, not simply to pick colors, specify materials or determine its shape and size. All those things are important, but the new package must also connect to its supply-chain strategy, help the company meet its sustainability goals, work within the constraints of its bottling and distribution system, fit well with its retail customers' business plans and, of course, meet the needs of its consumers. When all these things connect, the company is using design strategically to help it grow.

Originally, Coca-Cola used design to simplify, standardize and integrate its business, which made it much easier to drive its growth strategy. That's essentially how the Coca-Cola company grew from a little startup in 1886 to a company valued at over $120 billion in 2001. By 2002, the same design strategy would no longer work for a product portfolio that ranged from sparkling beverages to coffee drinks to dozens of juices. Coca-Cola needed an approach that would help it to leverage its scale but also help create more flexibility and adaptability across its business.

The company's design revolution had to start with Coca-Cola. An idea was mapped out called "designing on purpose." Designing on purpose refers to design that is strategic, with a clear connection to our growth strategy; design that creates scale and agility — across markets and media; and design that inspires people. Designing on purpose should ultimately be design that leads culture.

Over time, Coca-Cola introduced a systems-based approach to design. This would give both the consistency that was needed to design at scale and the agility they were lacking to quickly adapt to a rapidly changing world. It was a journey based on learning by doing.

They began with an area that most people could easily understand — branding and communications. They then moved to packaging and equipment. Then, they tackled retail experiences. Finally, they expanded the approach deeper into the operations of the business, into the distribution system and supply chain.

However, what really made the difference was opening up design to everyone, every function and every geography. The goal was to change how everyone designed — to make everyone a designer using a common approach — no matter what his or her title was.

In the past decade, Coca-Cola has added 10 billion-dollar brands to its portfolio and doubled its stock price. It is now on a trajectory to double the size of its business by 2020, essentially replicating in the space of a decade what took the company 100 years to build. Design isn't the only factor that's created this kind of growth, but it is an important one.

Design

Everything you see is designed by somebody. That coffee mug you're holding, or the plastic cup holding your airline O.J., the lamp beside the chair, the pattern of the fabric on the seat. In fact we're all designers — we all design things like meetings, deals, plans for the weekend, the menu for dinner. It's just that each of us is better at designing some things than others. The challenge, for all of us, is to design better — to get the most value out of the way we design.

Design is about intentionally connecting things to solve problems. Design is only good if it solves a problem. Good design makes something easier to read, easier to understand, easier to use. If you want to run a company successfully, you have to solve problems for your firm, your customers or your stakeholders. As a business, you may use art to stimulate. But you need design to solve problems.

Once you understand that we're all designers and the difference between good and bad design, we also need to understand how design relates to the stuff that we can't see. To really understand the value of design, you have to begin to understand how the visible and the invisible elements connect.

Another way to think about how visible and invisible elements connect is to think about them as a system. A system is a set of elements and behaviors that connect to do one thing.

If you're in business, your goal is to make sure the visible stuff (your products, communications, employees, etc.) connects to the invisible stuff (partnerships, processes, culture) in a way that helps your company succeed. If they don't connect in the right way, this can actually hinder growth. And this is how design becomes *strategic* — the way you design, or the way you connect the visible with the invisible can actually enable growth or prevent it.

Anyone can learn how to connect things in a way that makes them less complicated, simpler and easier to do. Connecting can apply both to very tangible things like machines to abstract things like supply chains, organization charts and customer relationships. When you design the solution as a system, you can begin to solve many connected problems across your business.

Designing for the Why

The Golden Circle is a model that Simon Sinek, researcher, author and educator, first introduced in his book, *Start With Why*. Sinek uses a simple model — three concentric circles — to discuss the interdependencies between the what, how and why great people and companies succeed. Great leaders, companies or individuals "think, act and communicate" and "inspire action" by starting with the Why. They focus on their purpose first — why they do what they do — not how they do it or what they make.

Most companies focus on what they design. But companies that get the full value out of design start with why they design and then shape how they design — their process — around their purpose.

Ask yourself these three questions:

1. Is design aligned with your growth strategy? Start with the Why — what's the purpose driving how you design in your organization? Is your growth strategy more about growing through scale or agility?

2. Then move to the how — what's your design process? Have you codified how your organization designs? Does it align with your growth strategy — your Why?

3. Do your products (or services) enable your Why? Does everything connect to enable your purpose? Does the invisible connect with the visible? When you look at your products or services — are all of the elements and behaviors connected to drive the Why?

Scale

Scale is the ability to increase in quantity without reducing quality or profit. All companies struggle with scale on some dimension. Every company is trying to expand to the next level, however they may define it, but startups have an especially hard time. All startups are temporary. They only exist to find a viable business model.

These are the questions startups need to answer if they are to become viable companies:

- How can we create a product that can scale up and down? As sales grow, patterns begin to develop. Your challenge is to figure out how to make more stuff when your customers need it and less when they don't.
- How can we create a business model that will scale? Your goal is to figure out how to do more for the same cost.

Scale is all about flawless execution — to create or leverage scale, everything must be designed to make it as easy as possible to execute with precision. To do this, you must eliminate all ambiguity, excess and waste. To achieve scale, everything must be simplified and standardized to integrate with the least amount of friction.

You must understand the critical details that make your product unique — the specific things people love — and then codify them so that they remain fixed over time and across geographies. Once you do this, it's time to standardize as much as possible. Standardization helps a company plan, resource, predict and, ultimately, grow consistently. Everyone moves in the same direction. That creates massive efficiency. Standards create a common language and clear direction.

Scaling Coca-Cola

There are seven different systems the company has used to scale Coca-Cola. Each of them was designed for scale and contributed to helping the company reach the vision to be "within arm's reach of desire."

1. The Formula. Very little has changed in the Coca-Cola pattern since it was launched over 100 years ago. The formula, locked in a vault in Atlanta, is still the basis of the product. That has made it much easier for the company to scale into so many markets.

2. The Spencerian Script. The company's first accountant thought using a cursive form of the brand name would differentiate Coca-Cola from other brands. The company standardized the logo in 1923, and it's exactly the same today, 90 years later. It is one of the most recognizable logos in the world.

3. The Contour Bottle. By 1920, the contour bottle, as it's been called, had become the company's most celebrated artifact. That bottle has become one of the most recognized objects of the 20th century, available in more than 200 countries.

4. Thirty-Six Degrees. Coca-Cola was designed to be consumed at 36 degrees Fahrenheit. The ice-cold language the company used on its various pieces of point-of-sale communication was a subtle reminder that the company expected retailers to always serve Coca-Cola at no more than 40 degrees.

5. The Nickel Price. For 70 years, from 1886 to after World War II, a bottle of Coca-Cola cost a nickel. The nickel price was a part of a very innovative form of brand building. Keeping the price fixed for seven decades greatly simplified the business and was critical in helping Coca-Cola scale globally.

6. Brand Marketing. By 1895, everywhere an ad for Coca-Cola appeared, it had the same four words: "Drink Coca-Cola. Delicious and refreshing." By 1908, some 2.5 million square feet of American building facades were advertising the delicious and refreshing properties of Coca-Cola. Designing for standardization helped scale the brand and the company on a national level.

7. The Franchise Business Model. The genesis of the company's franchise business model was an interdependent partnership between The Coca-Cola Company and more than 250 independent bottling companies around the world. This model has allowed the company to leverage global brands but remain very local. The Coca-Cola Company isn't one giant company; it's a system of small companies.

In 2001, the company's management decided that it would become a total beverage company. This changed everything. Simultaneously, the environment in which Coca-Cola was doing business was also changing, becoming more challenging and complex.

If the company wanted to build the next set of billion-dollar brands — in juice, in coffee, in water — it needed to figure out how to combine its expertise in designing for scale with a new aptitude: designing for agility.

Complexity

Our world is more complex than ever. This complexity is making it harder for every business to grow. What used to be called "getting back to basics" doesn't always work. Marketers must now be experts in *social listening*. Listening and reacting quickly is everything. Your management

team used to worry about taking costs out of your supply chain and meeting monthly sales targets. They still have to do that, but they also worry about big societal problems.

Everyone Needs Agility

Let's take a look at three new realities that create more complexity for everyone — from the startup that launched yesterday to the century-old multinational.

Reality #1: We are surrounded by wicked problems. Wicked problems are highly complex — they have many connected issues with no single solution. Examples include political upheaval, economic turmoil and natural disasters. Everyone is affected by wicked problems: people, governments and companies. However, for a company, some wicked problems not only disrupt business but can fundamentally change the industry, significantly challenging long-term goals and short-term results.

One of the most global wicked problems that affects Coca-Cola's business and the communities in which it operates is water. There's the issue of scarcity, of quality, of pricing, of policy, of flooding, of climate change and of infrastructure, to name just a few.

In 2010, the company outlined a goal to be *water-neutral* by 2020 — to safely return to nature and to communities an amount of water equivalent to that which it uses in all its beverages and production. To date, Coca-Cola has close to 500 water projects in development around the world.

Reality #2: We live in an After-Internet world. Today's world is open sourced, collaborative, dynamic, two way, co-created, always on, constantly evolving, shifting, linked, fluid and changing every second of the day. According to Internet visionary Joi Ito, one of the biggest disruptors for established business is that the cost of innovation, collaboration and distribution has decreased significantly. That means that big companies no longer have a monopoly because of their capital resources, factories or networks.

A couple of guys with a big idea in Bangalore can go to Startup Weekend for $100, rent a desk in a coworking space for $500 per month, buy some space in Amazon's cloud, and possibly disrupt companies that have huge assets and have been around for decades. This is what an After-Internet world looks like. What's more, young entrepreneurs don't need the permission of an organization to act on their ideas.

Reality #3: Winning is about creating shared value. Companies must think much more holistically about value creation beyond simply doing the responsible thing in the geographies in which they do business. Growth must be based on a shared understanding of the goals of everyone involved. Truly sustainable companies create not only economic value but also value for the communities in which they operate. Michael Porter and Mark Kramer call this shared value.

You have to create value in all areas of a company's activities to win — for you and for your suppliers, your customers, your consumers, your community.

PART II: DESIGNING FOR AGILITY

Only a few brands make it to the billion-dollar status — a special club of brands that have a market value of at least 1 billion dollars. While it's getting easier than ever to create a brand of this magnitude, it's getting harder than ever to keep one.

Billion-dollar brands only stay that way by finding new ways to create competitive advantage and relevance. Resting on your laurels in today's world is an open invitation for disruption. Unless companies, especially big, established companies, can actually embrace complexity by being more agile, they put their billion-dollar brands at risk.

Startups like Airbnb, Square and Uber started very lean — with little to no cash — and focused on a big unmet need and their business model from day one. By the time they reached billion-dollar status, they had devised and validated a repeatable business model that could challenge the old guard and even disrupt entire industries. The way startups design everything, from their products to their staff, partnerships and revenue model, enables agility.

If big companies, with their huge assets and global scale, can adopt new entrepreneurial behaviors — like the agility of a startup — they can actually lead in this new era.

Smarter

Like a startup, in many cases, a company doesn't fully know what consumers want or how a market may evolve; no one does. The only thing it knows is that things will change, and it needs a way to change with the market. The way it designs must help it learn and adapt.

One example that perfectly encapsulates how we need to think about design in fluid situations is Legos. Think about it. All the Lego bricks work together to help you make whatever you want to make — a wall, a house, a bridge, a starship.

And the great thing is that they are designed so that it's super easy for a child to make something great. You don't have to know anything about physics or architecture or en-

gineering to create a masterpiece. Plus, they're easy to use right out of the box. You don't need a manual to tell you how they work. They come in just enough different colors and sizes to bring an idea to life, simply and intuitively.

Integrated systems work best when you want to scale, but modular systems work best if you want to create agility. Like Legos, each element in a modular system is designed to be interchangeable and connect with other interchangeable elements in many different ways. This difference may sound small, but it is actually quite big.

Modular systems, like Legos, allow you to learn by doing. They give you options. They let you learn and adapt on the fly. When you were a kid playing with Legos, if you didn't like how your house or castle or airplane was looking, it was quite easy to change it. In this massively volatile world, this is how we need to learn to design our products.

More is More

Design must connect to a company's growth strategy. And for most companies, growth is all about agility. For agility, less is actually *not* more — in fact, *more* is *more*. To adapt, we need more elements, more options, not fewer. We must use design to adapt — to figure out what works — to move quickly in rapidly changing conditions.

The Coca-Cola Company is acutely aware of this. For example, most of what the company sells tastes better when it's cold. One of the biggest challenges for the company, especially in developing countries, is simply to keep Coke cold — not perfectly cold, just cold.

But most people in China have never even had a Coke or know that it tastes better when chilled. In fact, lots of people have never even heard of drinking a cold beverage. And since everything is new, there are no standards, no patterns, no formats for anything. That's a problem if the perfect way to enjoy your product is for it to be frosty.

The company doesn't need one standardized cooler in China; it needs an adaptive system that can respond to very different and changing conditions. It needs little ones, medium ones and big ones. It needs low-cost ones and premium ones. It needs coolers that are easy to service and ones that can essentially service themselves. It needs coolers that can manage different types of electricity.

It needs coolers that it can brand Coca-Cola, Sprite, Minute Maid or VitaminWater, depending on what the shopkeeper wants to feature. The bottom line is, the company doesn't need one perfect cooler. It needs a box of Legos — an adaptive system it can use to design different kinds of coolers that can flex to different conditions. This approach itself is infinitely flexible. The company has used it to design everything from musical signatures to coolers, to its distribution systems.

These days, companies must learn how to continuously disrupt themselves, or someone else will. It only happens by design. The way you design your products, your relationships, your operations and your organization can help you learn and adapt. Most of the issues that companies face today are not only complicated but connected. However, any company can design for the agility that it needs to fail fast, adapt to constantly changing conditions and remain relevant.

The fundamental difference in designing for agility is that you need to think about many solutions to many problems simultaneously. This goes against our natural inclination to think that there's one right answer, one elegant solution, which will adapt to all situations.

Understanding the need for flexibility, allowing for continuous iteration — being constantly open to better ideas or solutions as they present themselves — is a powerful way by which to stay ahead of the game and keep your business viable and ahead of the competition.

Faster

There are two things that make Legos modular. First of all, Legos have *fixed* and *flexible* elements. Among the fixed elements are color and shape. Their material — plastic — is also fixed. This helps Lego manage a global supply chain and maintain consistency and quality across its manufacturing and fulfillment processes.

In addition, all Legos connect in the same way, with little round studs on top that snap into holes on another brick's bottom. They're super easy. This is what makes the whole system of bricks modular — each brick, no matter what size or color, connects with the other ones quickly.

Designing this way, with both fixed and flexible elements, has created agility for Lego. The company is able to easily create, delete or combine various elements to introduce new sets into the marketplace based on changing consumer behavior.

What if you could design your products, your factories, your supply chain, your marketing campaigns and even your strategies to be modular systems? Imagine that you could add a new feature or quickly swap a component or bolt on a new acquisition as quickly as you used to add a few bricks to your Lego house when you were a kid. That's the power of designing this way as a company.

Coca-Cola used this approach to design a new modular system for one of its fastest growing categories: juice.

Global Juice Visual Identity System

A brand's visual identity system has to do two things. First, it must translate the brand's emotional connection to people. Second, it must connect with the product's rational attributes, creating a unique identity for the brand. Then, art directors, designers and brand managers can use the visual identity system to brand everything from packaging to advertising to the retail experience.

The company needed a visual identity system (VIS) that could provide a common look and feel across its juice portfolio. To do that, it needed a modular system that would give it the flexibility and speed it needed to add (or delete) various brands and products as it tried to capture maximum share of the juice market.

They needed a solution that could adapt from Beijing to Buenos Aires.

From their research, they knew that the packaging needed to reflect the actual fruit inside with visceral resonance. Then it hit them: "The one core truth around Coca-Cola's juice business is that the company is in it from grove to glass," said Coca-Cola design director Tom Farrell. "It owns the farms. It partners with the growers. It doesn't buy juice on the open market. So this notion that it's connected to the land is fundamental." How do you translate that into a brand's identity? What does "from grove to glass" look like?

They finally landed on a very deliberate presentation of the fruit. They knew they were on to something when one person in the test group, looking at the cartons lined up next to each other in the refrigerator case, said, "Oh, it looks like the produce aisle."

Local marketers amplify the pieces that resonate in their regions, while the design's DNA remains recognizable worldwide. Take the Minute Maid logo, with its black rectangle, white text and green horizon line that appears above. That green line acts as a metaphor for the company's deep connection to the land, and it stays the same across all packages.

The Global Juice Visual Identity System that was created had three parts: the brand identity elements (fixed and flexible), the information architecture (the logic) and the standards (the rules) for how everything connected to one another. Together, they created a consistent, or common, look and feel across the portfolio. And because they had designed a modular system, the company could pivot faster than before.

Minimum Viable Product

There's a lot we can all learn from how startups develop products. When companies like Twitter, Foursquare or Evernote were startups, they first began designing features or products by learning what end users really wanted or needed, which was often very different from what the developers thought they wanted.

The only way to do this is to get a very rough version to market — in front of actual users — as quickly as possible. The process for doing this is often called hack, release, repeat. The goal is to design a *minimum viable product*, a product that's just good enough to get in front of users — real people, often early adopters — who can use the product and give feedback on what's working and what isn't, as quickly as possible. Then developers go back and hack, or tear their product apart, to make it better, stronger or more intuitive to the user. The more users like it, the more users. The more users, the faster the startup can get to scale.

Then, Do It Faster

In short: Speed is the critical differentiator in a world driven by relentless change and daunting unpredictability. Every company wants to be able to get its products out faster and better than its competitors. Here's the rub: Could you be both faster and better at the same time?

The key to success is learning by doing. Constant iteration, a willingness to test ideas with real customers and gauge their responses, then pivot if they're not working, is critical. Rather than betting the ranch on a big idea, small tests can help a team determine if an idea has the legs for a bigger rollout.

Using design to learn by doing — using minimum viable products to learn as fast as possible — actually reduces risk and the fear of failure for everyone. You don't have to be a startup to move as fast as a startup, but it never happens by chance — only by design.

Leaner

Design can actually make a company leaner: You can design to use fewer people, less time and less money to get better results.

Open, Not Closed

Modular systems have fixed and flexible elements. But there is a third aspect: Modular systems are designed to be open. This openness makes it easier for everyone to take part in the design process, to contribute new ideas, elements and behaviors into the system. Open systems allow others to play in your sandbox.

Why is this important? Modular systems enable more collaboration and create much more diversity. Opening up and letting others in allows the system to develop in ways it never could by remaining closed. Crowd-sourcing, crowd-funding, coworking and open-source development are all based on this kind of approach to design.

While it may seem counterintuitive, opening up, sharing and allowing others to codesign, develop and build your products actually makes you leaner. When a company opens up, it can tap into the creativity, resources and passion outside its own team, group, function or company, often for free.

When you're designing an open system, the goal is to enable sharing. With an open system, if you can get your whole company to join in, the very act of participation creates a lot of buzz and excitement, since everybody feels as though he or she is contributing to the company's success.

Emergence

Emergence is when individual elements interact or work together to create something new, something that couldn't be created if each element acted alone. The word may be unfamiliar, but we've all seen emergence in action.

In the startup community, a good example of emergence is Kickstarter. In November 2010, Scott Wilson, a Chicago designer, posted his idea — a watch that grafted an iPod Nano onto an aluminum case — on the popular funding platform for creative projects. Within a week, he had raised $400,000 from 5,000 backers. Within a month, he had amassed a war chest of $1 million from 13,500 people in 50 countries. Kickstarter had enabled Wilson's project to emerge.

Emergence relies on self-organization. To create emergence, you have to design in a way that creates order between diverse elements so lots of people can share lots of stuff. The order must be spontaneous and decentralized, not directed or controlled by anyone. It must come from within the system and feel intuitive to everyone involved.

Focus

To win, you have to focus. Without focus, it's easy to waste resources, like time, money and people.

There is a great tool that startups use to stay focused on what really counts — it's called the "One Metric That Matters." As the name implies, it's the one indicator of real progress. At any given time, you'll be trying to answer a hundred different questions and juggling a million things. You need to identify the riskiest areas of your business as quickly as possible, and that's where the most important question lies. When you know what the right question is, you'll know what metric to track in order to answer that question. That's the OMTM (One Metric That Matters).

One of the OMTMs Coca-Cola has created is around the packaging it uses in its products. In 2009, the company set a goal of sourcing 25 percent of their PET plastic for packaging from recycled and renewable materials by 2015. This easy-to-remember (but hard to do) metric has created great focus for employees. It's easy to understand, actionable and fundamental to reaching the company's sustainability commitments.

A more recent goal is to use PlantBottle Packaging in 100 percent of its PET packaging by 2020. PlantBottle is not only the name it uses for the material but is actually another great example of a very open modular system.

"The majority of our products are produced locally," says Scott Vitters, head of Coca-Cola's global PlantBottle Packaging program. "We're not shipping products all over the world. Because of that local production, we can actually shift the type of packaging we use for local markets."

When you design for agility and let others play in your sandbox, everybody wins.

Epilogue

In his book, *Massive Change,* designer Bruce Mau said, "It's not about the world of design; it's about the design of the world."

As the world becomes more complex, we all have the opportunity to use design to make our world — our families, our communities, our companies, our cities, our countries — better, more agile and adaptable to change, if we design on purpose.

Elevate

The Three Disciplines of Advanced Strategic Thinking

by Rich Horwath

THE SUMMARY IN BRIEF

Understanding the basic principles of strategy is just the prerequisite for becoming a truly strategic leader. In *Elevate,* Rich Horwath focuses on advanced strategic thinking that will drive results in the short- and long-term. His three-discipline approach breaks strategy down into its fundamentals: Coalesce, Compete and Champion.

Effective strategic leadership starts with a bird's-eye perspective, but it doesn't end there. Incorporating new insights and influencing commitment are part and parcel of advanced strategy. Through research, exercises, thought models and lucid explanations of key concepts, *Elevate* guides leaders in the process of building these essential skills.

Too often, managers are so busy with day-to-day business operations and fire drills that they forget to take a step back — to *elevate* their thinking. Horwath demonstrates that more advanced strategic thinking among managers would lead to greater strategic innovation and fewer fire drills, freeing leadership to take the initiative necessary to drive the organization to the next level.

Leaders who are unable to think strategically could find themselves being phased out. *Elevate* helps leaders get ahead in their careers by stepping back to focus on the big picture.

IN THIS SUMMARY, YOU WILL LEARN:

- What strategic thinking really means.
- How executives can practice strategic thinking daily to guide their businesses.
- How to use a concrete framework to keep your career vital through innovation and inspiration.

Introduction

To elevate means to lift up or to raise to a higher rank or intellectual level. One of the biggest challenges I continually hear from CEOs and talent management leaders is, "We need to elevate our manager's thinking." In essence, they're saying that managers need to be able to quickly elevate their thinking from down in the tactical weeds of day-to-day operations to a higher level. At this higher level, they can expand their perspective to understand how the core foundational elements of their business fit together and provide superior value to customers.

The inability to elevate thinking in order to set strategic direction can have devastating long-term effects on an organization. To enable managers to elevate their thinking to a level that allows them to see the foundational elements of the business from a higher, more holistic vantage point, I've developed a framework called *the three disciplines of advanced strategic thinking*:

1. **Coalesce:** Fusing together insights to create an innovative business model
2. **Compete:** Creating a system of strategy to achieve competitive advantage
3. **Champion:** Leading others to think and act strategically to execute strategy

The three disciplines of advanced strategic thinking provide leaders with new concepts to change mindsets and practical tools to enhance behaviors so that they are maximizing their strategic leadership potential. The fact that the framework elements are referred to as "disciplines" means that it takes time, effort and commitment to master them.

In our action-oriented world, where we're electronically tethered to one another, investing time to think on a regular basis can be a challenge in itself. While it's easy to be pulled into one more meeting that you really don't need to be in and check email for the 47th time today while meeting with others, this lack of discipline is going to chain you to mediocrity.

The adrenaline rush that comes from scrambling to fight another urgent but unimportant fire is addicting and much more exciting than spending 30 quiet minutes thinking about the business. But it's these types of decisions that create your patterns of thinking and behavior. It's the discipline, or lack of discipline, that can make or break your career and determine the success or failure of your business.

Discipline #1: Coalesce

Strategic thinking is the ability to generate insights that lead to competitive advantage. Using the lens of *new value* on the ideas, projects, initiatives and tactics proposed each day provides a powerful filter for eliminating meaningless activities. It forces you to more closely examine *why* things are being proposed and pursued instead of just *what* is to be done.

Advanced strategic thinking requires not only the insights generated but the ability to coalesce these insights into meaningful differentiated value. Coalesce means to bring together, and we see this skill evident in great strategies and the strategists who have devised them.

Patterns in Strategy

The patterns of decisions your managers make regarding their strategic direction will ideally lead to the

achievement of their goals and objectives. As strategy involves the intelligent allocation of limited resources, it's imperative that positive patterns emerge in how those resources are allocated and, just as important, reallocated.

For many managers, resources stuck in dead-end projects and unproductive tactics simply stay there until the next planning process rolls around. The strategic thinking trap of the sunk-cost effect — continuing to invest in a losing endeavor because resources have already been spent on it — can put an anvil around the effort to elevate thinking. The results can be damaging not only for companies but also for their individual leaders.

One clear indication of a lack of strategy is a random and patternless hodgepodge of decisions with no consistency in approach. Leaders who describe their strategic approach as *opportunistic* believe that every opportunity is considered a good one. These opportunistic leaders fail to create a disciplined pattern of focus on providing maximum value to the right type of customer.

Inherent to identifying patterns in the marketplace and within the customer and competitor arenas is the ability to understand the business context. One method of pattern detection is to examine snapshots of the business at different points in time to identify combinations of activities or tendencies. To do so, a series of Contextual Radars can be created on a periodic basis and then examined for patterns.

Contextual Radar provides a visual snapshot of the four primary components of business market, customers, competitors and the company. At the center of the radar are any issues or activities that are at the core of changes in the business. It's the recording and review of events within the Contextual Radar framework over time that can then be mined for patterns. Once the patterns are detected and described, thoughtful conversation around their meaning, impact and warrant of resource allocation can occur.

Systems

A strategist's ability to see the big picture involves not only the elements of the picture but also how those elements are connected and what functions they serve. When these elements have connections and a purpose, we can refer to their whole as a system. As the first core skill of the advanced strategic thinker is to coalesce, or bring together, it's fitting that the concept of a system helps us do just that.

One of the ways we know a soccer team is a system, for example, is because if we take away elements, connections or purpose, the system is fundamentally changed. Remove the players or ball (elements), rules (connections) or score (purpose), and you no longer have a soccer game. As rules of thumb, if you cannot identify the elements, connections or the effects they have upon each other, then they most likely do not form a system.

As a system develops, it generates patterns of behavior due to the connections between elements in an organized fashion. That's one of the reasons it's important to look at your business strategy as a system, involving your employees, customers, suppliers, competitors and shareholders. Changes in any one of these elements or their connection (relationship) to others can fundamentally alter the course of your business. Understanding the systems that comprise your business is an important part of developing long-term strategy.

Business Model

At the foundation of a company is the business model. A business model is a structural description of how the organization creates, delivers and captures value.

The three phases of a business model can be described as follows:

Phase I: Value Creation

- Core competency: Primary area of expertise (what you know)
- Capabilities: Activities performed with key resources (what you do)
- Value proposition: Rationale for the offering (customer, need met/job done, approach to satisfy need, benefit to customer)

Phase II: Value Delivery

- Value chain: Configuration of capabilities to provide value (how you do it)
- Channels: Customer access points for offerings (where you offer it)

Phase III: Value Capture

- Price: Amount customers pay for the offering
- Revenue: Price multiplied by volume sold
- Cost: Expenditure of resources to provide offering
- Profit: Revenues minus costs

Profitable Growth

The point of coalescing insights into strategic direction is to generate profitable growth. Building pipelines of continuous, profitable growth is the lifeblood of any business. Therefore, it's important to understand the potential levers for growth as well as the pitfalls that can stall it.

A research study found that 87 percent of stall points, a term for the start of a prolonged financial decline, are caused by factors that are within management's control.

A staggering 70 percent of these stall factors result from choices about strategy.

To spur your thinking on organic growth, it's helpful to have an understanding of the range of potential pathways to increase profits. A tool to help leaders explore their growth options is the Strategy Spectrum. The Strategy Spectrum graphically lays out six columns of levers for creating new value for customers that can stimulate profitable growth.

1. **What:** Offerings (products/services)
2. **Who:** Potential target customers
3. **Why:** Customer need or job fulfilled
4. **Where:** Channels to access offerings
5. **When:** Time of access to offerings
6. **How:** Activities

Beginning with the current business model, items are placed in the columns representing the business as it operates today. Then new items borrowed from other companies and industries are used to complete the columns. The key is to play with combinations from the various columns to generate new ways to profitably grow the business.

Strategy and Innovation

Strategy and innovation are often shown to be two primary contributors to sustained financial excellence and competitive advantage. The common denominator for both strategy and innovation is insight. An insight is described as the joining together of two or more pieces of information or data in a unique way to come up with a new approach, new product, new service or new solution that delivers value. Insights come from the ability to wade through the waves of input we receive each day and mentally connect the dots in new and creative ways.

Business strategy is defined as the intelligent allocation of limited resources through a unique system of activity to outperform the competition in serving customers. The only way to truly intelligently allocate resources is to have strong insight into how your product or service provides value to customers in ways that are different than competitive offerings.

Innovation is the continual hunt for new value; strategy is ensuring that we configure our resources in the best way possible to deliver that value. When a leader embarks on innovation efforts, there are four potential outcomes:

- **Differentiation:** providing a distinct offering that leads to new profits.
- **Neutralization:** eliminating a gap in offerings or performance relative to the competition and market standards.
- **Productivity:** increasing efficiency or efficacy of processes in order to reduce costs.
- **Waste:** efforts that don't result in the first three outcomes and miss the mark of providing new value at an acceptable cost.

Discipline #2: Compete

To compete means to strive toward a goal. In attempting to reach the goal, we strive with others seeking that same goal, which supplies the motivational catalyst for us to try harder.

Research shows that in the arts, athletics and academics, the act of competing helps most people perform at a higher level. This motivational aspect of competition is even stronger when people know that they are just slightly behind those they are competing with.

Winning in any endeavor is often a result of competing to one's maximum potential.

A leader is a company, product or service that has market leadership and is in the position of protecting the business they have while looking for new, profitable growth. A challenger actively seeks ways to increase brand awareness and expand business. A spectator is a "me-too" type that operates in either a constantly reactive or mind-numbingly passive way. The goals and strategies you set can be conditional, depending on which of these positions you find yourself in.

Leader

When a new challenger enters the leader's market, there exists the temptation to immediately react with a flurry of tactics or completely ignore the new player altogether. But before either of these approaches should even be considered, a thoughtful assessment of the new entrant will provide a range of available options to strategically manage the situation. The following are the top 10 questions to catalyze your thought process and initiate a productive conversation around the topic of the new challenger:

1. Does the challenger's offering provide different benefits from our offering?
2. Do the challenger's unique benefits include functionality, quality, reliablility, convenience and/or cost?
3. Does the challenger enter the market with a different business model?
4. Does the challenger's business model differ from ours in how they create, deliver or capture value?
5. What is the challenger's value proposition?
6. What is the challenger's core competency?

7. What are the challenger's top three capabilities?
8. Does the challenger's offering target the same customer segments as our offering?
9. Is the challenger capable of taking away our current customers?
10. Should we respond to the challenger at this time or just monitor their activity?

Challenger

A challenger may be a new entrant into the market or one that has maintained a secondary or tertiary position for various reasons. One of the reasons failure rates for newly launched products are as high as 50 percent is that the challenger sees the market from a product perspective instead of through a customer-need lens.

When you find yourself in the role of challenger in a market, consider the following 11 questions to stimulate your thought process and initiate a productive conversation around how to topple the leader:

1. What customer needs or jobs are not currently being fulfilled?
2. Which customer segments are underserved by the leader?
3. Does the leader's offering provide different benefits from our offering?
4. Do the leader's unique benefits include functionality, quality, reliability, convenience and/or cost?
5. How does the leader's business model differ from ours?
6. What is the leader's value proposition?
7. What is the leader's core competency?
8. What are the leader's top three capabilities?
9. Are we capable of taking away customers from the leader?
10. Are we capable of transforming non-users into customers?
11. In what part of the value chain can we establish a foothold of success in this market?

A challenger mindset demands the discipline to make real trade-offs and focus one's resources with laser-like precision in only one or two areas that allow them to provide the greatest differentiated value to their targeted customers. It means not whining about a lack of resources and realizing you can't do a little bit of everything in order to play it safe. It means embracing risk and breaking with industry convention to do something that truly stands out.

Spectator

Many products and services continue to receive time and budget each year without providing much value to customers or profit to the company. These spectators either mindlessly react to the competition's moves, or they sit passively by and watch competitors continue to grow at their expense.

If you find your product or service in a spectator role, it's time to honestly answer the following five questions:

1. Why are we in this category?
2. Is this offering contributing profits to the business?
3. How can we redesign or reposition the offering so that it brings unique value to key customers, resulting in greater profit?
4. Would the customers we value most miss this offering if we discontinued it?
5. Could we bring more value to the market if we discontinued this offering and focused our resources on more profitable offerings?

Taking into account your position in the market when developing strategy means it's conditional. Not taking into account your position in the market when developing strategy means you're ripe for getting beat.

Competitive Advantage

While it's been debated how long a company can sustain competitive advantage in a market, the aim of most firms is to deliver superior value to their customers in a profitable way. Research shows that the primary means to profitably deliver superior value is through differentiation.

Creating, developing or discovering real differentiation that fuels that delivery of superior value takes time, thought and the courage to make trade-offs with one's resources. True differentiated value isn't determined by you. It is determined by your customer, and it shows up in the form of your profits.

Competitive advantage can be defined, then, as the ability to deliver superior value based on differentiation rooted in capabilities. Capabilities are comprised of resources and activities that are competitively relevant. Capabilities are what you do (activities) with what you have (resources). Competitive advantage isn't defined as having the best product or a better service, because in the end, best and better are subjective, depending on the customer and the type of value they seek.

Indirect & Intangible Competition

When we think competition, we think rivals. However, the true intent of business competition is not to beat the opponent. The real goal is to earn greater profits for the company. The battle for these profits is fought on multiple fronts, only one of which is with direct rivals. The indirect competitors for profits include customers, suppliers, potential entrants and producers of substitutes.

While direct rivals consume most of the mind share of leaders, it's the indirect competitors that can quietly eat away at your profits and position in the industry value chain.

In addition to direct and indirect competitors, there is also the effect of intangible competition on a company's profits. Intangible competition by its very nature involves factors that you can't see or touch. Intangible competition includes affinity for the status quo, apathy and priorities.

Status quo. An affinity for the status quo is a human condition where people tend to favor the way things are versus potential change. Internally, the affinity for the status quo manifests itself during the strategic thinking planning process as managers continue to allocate their resources in virtually the same way year after year.

A customer's affinity for the status quo is a formidable competitor. When you introduce a new product or service, in most cases you're asking customers to make changes in their thinking and behavior. Then you're hoping they sustain those changes over time.

Apathy. Apathy is described as a lack of interest or excitement in something that others may be passionate about. Apathy is indifference to the product, service, event, person or situation at hand.

Priorities. Internally, priorities can prove to be an intangible competitor because different groups are often tasked with different goals. The external challenge with competing priorities can be seen when companies are not truly driven by fulfilling customers' unmet needs. Instead, they work off their own internal agenda and hope it somehow meshes with the customers' agenda so they can be considered strategic partners. Unless an organization has taken the time to observe customers, identified their key jobs to be done, and produced solutions that deliver differentiated value on those unmet needs, the term strategic partner is a farce.

Your ability to assess, understand and outperform the various types of competition will influence your organization's trajectory. Competition involves striving together, reaching for higher levels of performance. Higher levels of performance are directly related to your insights for providing customers with differentiated value.

Discipline #3: Champion

To effectively champion a group's strategic direction could very well mean the difference between success or bankruptcy and employment or unemployment for thousands of people. Developing a strong strategy means that you've made trade-offs, and trade-offs mean that some of your potential customers aren't going to be happy.

While we know good strategy is not going to please all potential external customers, what's often overlooked is that good strategy is also going to upset some of your internal customers as well. Moving resources (time, people and budget) from one area to another is sure to stir up emotions as some people will see the changes as hurting their ability to run their part of the business. Therefore, any good strategy will come under attack internally because of the changes it causes.

And when the strategy comes under attack, you'll need to defend or champion it. In championing the strategy, a disciplined approach to managing time, influencing others, and continually developing new skills will be critical to success.

Using Time Strategically

As leaders move to higher levels in an organization, it's natural for them to continue applying their expertise to a wide variety of operational and tactical issues that arise, even if those issues are no longer within their realm of responsibility. While performing these unnecessary types of tasks is a natural inclination, it also does them a disservice in the long run. Their inability to let go of past tasks results in not cultivating new skills that will be instrumental to the firm's future success, and it hinders the development of other managers who should be fulfilling these responsiblities.

Leaders who are unable to delegate often rely more heavily on multitasking. While working on several things at once may provide a feeling of overachievement, it's in fact a smokescreen for lower productivity.

Leaders lacking a disciplined approach to applying their expertise and time can also become meeting magnets, where they are pulled into far more meetings than they actually should attend. If you're constantly being pulled into meetings without firm decision-making intent or an agenda not aligned with key priorities, you're wasting precious time. As managment guru Peter Drucker noted, "Time is the scarcest resource, and unless it is managed, nothing else can be managed."

To more effectively utilize time in your leadership role, consider the following three ideas.

1. Dedicate chunks of time to a single task.
2. Send fewer emails.
3. Make time trade-offs.

People want more time. What most people really need is more direction and greater discipline in how to use the time they already have.

Influencing Strategy Commitment

Influence is defined as "the power to change or affect someone or something; the power to cause changes without directly forcing them to happen; a person or thing that affects someone or something in an important way."

In the matrix organizational structure employed in many companies, the ability to influence is crucial if one is to gain their share of internal resources and effectively align their priorities with those of other key players.

During the strategic thinking phase of the strategy development process, people from different functional areas and different levels in the organization should have the opportunity to contribute insights. Having representatives from these different areas share input sends a powerful message to the organization that there is real importance in their work and ideas. It's equally important to share with everyone *why* the strategy being pursued has been chosen. People don't have to agree with the strategy or the rationale behind the why. The important thing is they want to know what the strategy is and why. In essence, they need the *because*, as in "We're doing X, because Y."

Increasing Buy-In with Social Proof

In addition to providing people with the reason or *why* behind the strategy, you can also gain a greater level of commitment to the strategy using social proof. The principle of social proof explains that someone is more likely to behave in a way that is similar to how they see others behave.

When it comes to strategy, social proof can be a powerful influence. When employees see their leader fully engaged and committed to a strategy, it demonstrates to them that it isn't another flavor-of-the-month initiative. A leader's words can move people to action, but a leader's actions can move people to commitment.

One of the challenges leaders face in getting their people to commit to a strategy is in the nature of strategy itself. New strategies are instantly working against a tide of doubt, not to mention people's reluctance to change. Therefore, another application of the principle of social proof is to provide people with evidence that the chosen strategy provides the best course of action.

As you hone your strategy and communicate it with others in the organization, it's important to bring it to a personal level. One of the reasons strategic planning has become a mind-numbingly ambiguous exercise is because it's not translated to the individual level. The lesson for leaders: Tailor the meaning of the strategy to your audience and how it relates specifically to them and what they're doing on a daily basis.

Strategic Behavior

The ability to influence others to commit to goals and strategies over the long-term doesn't come from a one-time motivational speech or a colorful banner. The success of influence is determined by one's ability to shape others' behaviors. A behavior is defined in its simplest form as an observable activity.

Whether it's at home, school or work, behavioral direction needs to be specific, concrete and observable. When developing new behaviors for a group to effectively create and implement strategies, remember the power of games. A game typically involves goals, rules, challenges and interaction. Professor Mihaly Csikszentmihalyi, a leader in the field of positive psychology, showed that activities involving game criteria such as goals, rules and clear feedback can create *flow*: the state in which people become so engrossed with an activity that it creates an optimal state of inner experience.

As you design new behaviors to implement strategies, attempt to include built-in opportunities to loop in goals, guidelines, challenges and frequent feedback. The important thing to understand is that the behaviors you develop should contain the game and flow criteria to build a greater sense of inner fulfillment and drive within your team members. A strategic leader understands that their role is not only to stimulate this new thinking for their group, it's also to ensure it's accompanied by the appropriate behaviors to generate new growth. We can capture this notion in an advanced premise: **New thinking inspires new behavior, leading to new results.**

Practicing Strategic Thinking

Once you've identified the behaviors that will have the most impact on the success of your business, it's important to give your people an opportunity to practice them on a regular basis.

In order to effectively develop a new behavior, it's helpful to break the behavior down into its component pieces, practice those pieces individually, and then practice those pieces together. When practicing the individual pieces, it's more effective to do so slowly, allowing for mistakes and then correcting those mistakes as you go.

A skill deteriorates if the primary circuits comprising the activities in a particular behavior are not used for 30 days. If you're not dedicating time at least monthly to questions and frameworks to think strategically about the business, then you will not be strategic.

Leaders have the opportunity to practice key behaviors and hone and develop their people's skills during their daily interactions. Opportunities for shaping how your

managers practice include one-to-one conversations, customer visits and staff meetings. Monthly strategy dialogues and workshops can be highly formative experiences that raise everyone's performance. As these situations arise, there are three practice principles that can guide your instruction.

Practice Principle #1: Begin with the Goal. Each practice needs to have at least one goal to work toward. Once the goals have been identified prior to the practice, the activities that build toward the goals can be chosen.

Practice Principle #2: Break the Whole into Pieces. Once a manager has a goal to practice, the next step is to break that behavior into its individual pieces. Mastery is then demonstrated when the manager can seamlessly weave together the individual elements of the behavior into its whole.

Practice Principle #3: Correct with a Solution. The correction provides specific, concrete direction on how to improve and then gives the person a chance to enact the feedback immediately.

Strategy Conversations

Strategy should be an ongoing conversation. One of the keys to maximizing your strategic leadership potential is to facilitate effective strategy conversations. A strategy conversation is a systematic method of encouraging the exchange of ideas, beliefs and opinions on the key strategic elements of a business. In a strategy conversation, the participants mentally move with one another from point to point. Three characteristics promote healthy strategy conversations:

1. **Candor:** The willingness to express honest ideas and opinions.
2. **Suspension:** The discipline to actively listen without judging.
3. **Openness:** The ability to thrive in a situation where the outcome is unknown.

The participants' ability to embrace these criteria can encourage new and different perspectives that can generate breakthrough strategy.

New strategy conversations begin with *dialogue*. A strategy dialogue facilitates the exchange of insights and understanding between two or more people on the important issues of the business. Once the group has exhausted the topics of strategic relevance through dialogue, the facilitator directs the group to begin *discussion*. Through discussion, the group breaks down the insights generated in the exploratory dialogue phase and harnesses them to develop solutions that move things forward. What emerges from the discussion are the actionable strategies, accountability and implementation that bring the conversation its end result. This is where focus becomes clear, trade-offs are weighed, and decisions are made.

Strategy discussions should not be concentrated at the top; they must take place at every level of the organization. Strategy will remain stranded in the executive suites unless teams throughout the organization can effectively translate broad corporate objectives into concrete action.

Conclusion

Just as a helicopter pilot monitors his planned course during flight for conditions that would warrant adjustment, we too must monitor our strategic direction to determine when a change in strategy is appropriate. Here is a checklist of five moments when it is critical to evaluate your strategy:

1. Goals are achieved or changed.
2. Evolution in customer needs.
3. Innovation in the market.
4. Competitors change the perception of value.
5. Capabilities grow or decline.

What's your end game? How will your colleagues, employees and customers describe you? Most important, how will you assess your run? It's not about the little things. It's about how you create the defining moments that shape the trajectory of a team, a business, a life. It's about coalescing insights into competitive advantages that you champion. It's about rising above the fray and seeing things others don't. And you can make that happen, if you're willing to elevate.

Emotional Intelligence for Project Managers

The People Skills You Need to Achieve Outstanding Results

by Anthony Mersino, PMP, PMI-ACP

THE SUMMARY IN BRIEF

Without good people-management skills, even the most carefully planned project can fall apart in a flash. And managing people effectively means more than just keeping them in line: It means using finely tuned interpersonal skills and astutely reading emotional cues to get the job done right and on time.

According to the latest research, an astounding 70 to 80 percent of management success rests on this kind of "emotional intelligence" (EQ). Even if you already recognize the important role of EQ in the workplace, *Emotional Intelligence for Project Managers* by author Anthony Mercino will help you take your understanding to the next level.

This indispensable guide provides tips on using EQ to lead and coach Agile Teams and explores the concept of Servant Leadership, which enhances productivity by promoting emotional connection with your staff. Also, there are sections on self-awareness, self-management and self-care because before you can build and lead a winning team, you need to understand and nurture yourself.

The keen insights and practical tools you'll find here will help you transform your results from "good enough" to "beyond expectations" — all by improving your ability to read between the emotional lines. Improve your EQ, and you'll soon be getting the best work out of everyone involved — including yourself.

IN THIS SUMMARY, YOU WILL LEARN

- How to establish the kind of high-energy approach that attracts top performers.
- How to encourage flexibility and collaboration among team members.
- How to deal productively with change, blame, stress and criticism.
- How to leverage emotional information to make better decisions.

PART 1: AN INTRODUCTION TO EMOTIONAL INTELLIGENCE

My Growth in Emotional Intelligence

"Do you have any idea how dangerous it is not to be in touch with your feelings?" This question was posed to me by Rich, my career coach and mentor. Rich's question resonated with me, but I wasn't sure why. The truth was that I wasn't aware of my feelings or emotions. I knew I needed to make some changes. Until then, my relationships with my project teams and other stakeholders were weak or nonexistent. That was largely the result of my project management style as a taskmaster. I was all business. Unfortunately, I placed a higher value on tasks, productivity and outcomes than on relationships. I lacked empathy. I had a way of driving the people on my project teams that was hostile and irresponsible.

My big shift came when I began to recognize the value of emotions and relationships in the workplace. I became aware of feelings and learned to trust them as a source of information. I learned how critical relationships and support were to achieving success on large projects. My relationships began to grow along with my ability to lead others.

What Is Emotional Intelligence?

The term *emotional intelligence* was actually coined by two psychologists, Peter Salovey and John D. Mayer, in 1990. They gave it the following definition: "the ability to monitor one's own and others' feelings and emotions, to discriminate among them, and to use this information to guide one's thinking and action."

As a project manager (PM), I hold a pragmatic view of emotional intelligence, thinking of it as "knowing and managing our own emotions and those of others for improved performance." I am interested in the application of emotional intelligence to life in general as well as specifically to the field of project management. In a project setting, the understanding and use of emotions helps us to have more enjoyable, predictable and successful projects. ●

A Brief Primer on Emotional Intelligence

Emotional intelligence is a popular though often misunderstood term. It would be hard to have missed the buzz about it since Daniel Goleman's 1995 book *Emotional Intelligence* became a national bestseller. What made Goleman's book so popular were two claims: (1) that emotional intelligence may be more important than intelligence quotient (IQ) and (2) that you can improve your emotional intelligence. Those claims are what made headlines and got emotional intelligence noticed. And while I believe those claims are true, it is not as simple as that to be successful with emotional intelligence.

Can we objectively measure emotional intelligence? If objective and accurate emotional intelligence tests were available, they would be at least as valuable as IQ testing — perhaps even more valuable. Unfortunately, this has led to a proliferation of various emotional intelligence instruments. It has also fostered a great deal of criticism among the various authors of emotional intelligence instruments.

The good news is that some level of agreement has been reached about the framework to be used for applying emotional intelligence.

Let's take a brief look at this framework and the five domains.

- **Self-Awareness.** The first domain of the framework is self-awareness, which means understanding ourselves and our emotions. It involves the competencies of emotional awareness, accurate self-assessment and self-confidence. Self-awareness is the first building block of emotional intelligence.
- **Self-Management.** Building on the emotional understanding we gain with self-awareness, we use self-management to manage and guide our emotional state. Self-management is the ability to control our emotions so they don't control us. In fact, the domain of self-management includes just one competency — self-control.
- **Social Awareness.** Social awareness occurs when we expand our awareness to include the emotions of those around us. The domain of social awareness includes empathy, organizational awareness, seeing others clearly and emotional boundaries.
- **Relationship Management.** Relationship management means using the awareness of our own emotions and those of others to build strong relationships. Those strong relationships will serve us on our projects. After all, projects are nearly always team efforts. The domain of relationship management includes the competencies of stakeholder relationships, developing others and truth telling.
- **Team Leadership.** Team leadership is focused on the emotional skills needed to effectively lead project teams. This includes communications, conflict management and inspirational leadership.

Project managers (PMs) need to be great communicators. The larger the team, the more important communications become. The communications competency includes the ability to understand and manage the emotional tone of the project team through communications as well as the ability to be congruent between actions, one-on-one communications and communications in groups.

PART 2: PROJECT MANAGEMENT BEGINS WITH SELF-MANAGEMENT

Self-Awareness

Self-awareness, which is the first building block of emotional intelligence, is our ability to recognize our own emotions and their effects on us and others.

Self-awareness is about the here and now. With self-awareness, we strive to get in touch with exactly what we are feeling right now. It is about knowing ourselves in this moment.

Self-awareness is not about what happened yesterday or what will happen tomorrow. Yesterday's events are only relevant if they affect how we are feeling right now. Otherwise, leave the past in the past. The key to self-awareness is to focus on what we are feeling now.

Emotional Self-Awareness

Self-awareness is the ability to understand our own emotions. It is about being conscious or mindful of our own emotional state. Self-awareness may be challenging for us for a number of reasons. First, our emotions can be as volatile as the weather. Feelings mix, morph and evolve, often in a short span of time.

Second, we may actually experience a mix of emotions at any time. We can be excited, happy, scared and angry all at once.

A third reason that self-awareness may be difficult is due to childhood wounds that inhibit our ability to access our feelings or simply to poor modeling of emotions by our parents.

Learning about emotional intelligence often includes unlearning what we were taught and breaking unhealthy bad habits.

It's rare that you can work on a project without experiencing at least one emotion, and this emotional awareness directly affects how successful we are in our work. We actually become stronger when we recognize the underlying feelings we're experiencing. Self-awareness is about developing this capacity. It is similar to building a physical muscle in our bodies.

Self-Confidence

Like accurate self-assessment, all PMs need self-confidence. No one wants to follow a leader who lacks self-confidence.

Individuals who lack self-confidence don't give themselves the freedom to laugh at themselves. It is as if they are on the defensive all the time, trying to make sure no one sees through their façade.

Ask yourself the following questions:

1. Are you aware of your weaknesses or the areas where others might get a chuckle about you?
2. Are you willing to let others have a laugh at you about those areas? Would you even make a joke out of it and let others laugh at you?

3. Do you ever feel as if you wouldn't dare let others know about mistakes you've made?

If you are too serious about yourself or feel threatened by the idea that others might see your weaknesses or flaws, consider loosening up a bit.

Self-Management

Self-management happens when we use our awareness of our feelings to manage ourselves. Building on the base of self-awareness, we use that information to control and manage our emotions. Self-management is the ability to control our emotions so that they don't control us.

Individuals who don't manage their emotions in the business world are called rage-aholics and drama queens. They cause others to sigh, roll their eyes, even leave the room in fright, and respond themselves with anger. If you cannot manage yourself, you cannot manage others.

Awareness can be a big help when it comes to managing negative emotions. When we are feeling a negative emotion, we can often disarm or control the impact of that feeling just by being aware of what it is and why we are feeling it.

Self-Control

Self-control is the ability to remain composed in spite of our emotional state. For most PMs, managing the negative feelings is going to be the biggest priority.

Here are some of the ways to improve self-control and emotional resiliency and reduce the likelihood and severity of emotional breakdowns.

1. Know Thyself. The key to self-control is self-awareness. Make it a point to understand your specific emotional triggers, your patterns of distorted thinking, and things that reduce or build up your emotional resiliency. Try to avoid putting yourself in situations where you aren't able to choose a graceful response.

2. Use HALT. HALT stands for Hungry, Angry, Lonely and Tired. These four conditions are warning signs that we might be vulnerable to emotional breakdowns. The key thing that the HALT acronym tells me is whether or not I am putting myself at risk.

3. Evaluate Your Physical Environment. If you are a work-at-home professional, try staying connected with Instant Messaging, or go to work in a public space like a Starbucks rather than staying at home in isolation.

4. Take Care of Yourself and Stay Healthy. If you don't take care of yourself, it will be hard for you to care for others.

5. Sharpen the Saw. Stephen Covey talks about the importance of sharpening the saw in *The Seven Habits of Highly Effective People*. In essence, he is talking about self-renewal. This means taking your vacations as well as investing in training and development.

6. Avoid Long Work Weeks. If you are working more than 45, 50 or 60 hours every week, you are likely setting yourself up for fatigue and illness.

7. Get Support. Reach out to others and engage them on an emotional level. Get the help you need to stay on top of your game.

8. Reduce Your Stress Level. There are a multitude of stress-reduction methods, from easy things such as exercise and self-care all the way through more radical approaches such as getting a new job or leaving an abusive relationship.

9. Talk It Out With Someone. If you don't have someone in your professional life whom you can bounce ideas off, find someone.

10. Give Yourself a Time Out. If you find yourself heading toward a breakdown, give yourself a time out. Leave the building, go to lunch early, quit for the day, or just head out to the nearest coffee shop for a snack.

PART 3: BUILDING PROJECT STAKEHOLDER RELATIONSHIPS

Social Awareness

Social awareness is the ability to understand the emotions of others. It includes the competencies of empathy, organizational awareness, seeing others clearly and emotional boundaries.

Simply put, social awareness is the ability to accurately read situations and people and to understand and empathize with the emotions of others.

Empathy

Empathy is one of the most important parts of social awareness and, perhaps, one of the most critical people skills for PMs and other leaders. Empathy is the ability to understand and relate to the emotions of others. It helps us walk in the shoes of another person or to see things from another's point of view.

The importance of empathy was explained perceptively in Stephen Covey's book *The Seven Habits of Highly Effective People*. Covey's fifth habit was empathy: Seek first to understand, then to be understood.

Embedded in that phrase is the simple wisdom of orienting first to the other person. A great deal of con-

flict that we experience on projects could be reduced or eliminated if we simply tried to understand the other person's point of view before we tried to convince them of our own message. We need to listen with the intention of understanding what others are trying to say.

One of the key applications of empathy is empathetic listening, listening without judgment. When we listen empathetically we 1) focus on the words and behaviors of another without judgment and 2) periodically summarize what they think, feel and need in the moment. PMs who master empathetic listening benefit by

- Making the speaker feel valued and important.
- Improving the depth of the communication.
- Understanding the underlying emotions, which adds richness to the conversation.
- Building trust and the relationship with the other.

Seeing Others Clearly

For those of us who want to improve our abilities to see others clearly, here are some steps we can take:

1. Recognize Our Own Biases. We can start by recognizing that we all have biases and prejudices.

2. Practice Studying Others. We can expand our understanding of others by viewing life as a game of exploration.

3. Practice Looking for the Best in Others. Make it a regular practice to evaluate your team and identify the strengths and weaknesses of each team member.

Organizational Awareness

The third competency of social awareness is organizational awareness. This awareness includes not just the project but also the company, customers and vendors related to the project.

The two main aspects of organizational awareness that Daniel Goleman and co-author Richard Boyatzis discuss are identifying key power relationships and understanding the values and culture of the organization.

Emotional Boundaries

The next facet of social awareness for PMs is the competency of emotional boundaries. An emotional boundary is where one person's emotions leave off and another's begin.

Empathy does not mean we should take on the emotions of others. As PMs, we need to recognize that we are separate and distinct from others. We need to be responsible for our own emotions and let others be responsible or theirs.

Here are some ways that we can respect our own emotional boundaries as well as those of others.

- **Set Limits.** It is often helpful to set limits in advance so that you can establish a clear boundary with others when you start. The point is to limit their ability to impact you. This can be as simple as establishing a length of time that you will be together, whether on the phone or in person; establishing limits on the type of behavior you will tolerate, as for example, you won't tolerate others yelling at you, or you won't sit by while someone criticizes your team.
- **Respond Appropriately.** How we respond to the emotions of others is a key to our own emotional sanity. While we want to understand the feelings of others, we need to be careful not to become "hooked in" to the emotions they are experiencing.
- **Take Responsibility.** Our response should include taking responsibility for our feelings. This means acknowledging that they are my feelings alone and that I have a choice about them.
- **Let Them Be.** The flip-side of our responsibility is letting others be responsible for their feelings. We cannot control others. Often we need to simply let them react to our words or actions. If they are going to be angry or sad, so be it.

Relationship Management

Relationship management is about using our emotional understanding of others to create relationships with them. The relationship management domain builds on the first three emotional intelligence domains. In other words, our success in relationship management is a function of our success in self-awareness, self-management and social awareness.

The PM Framework for emotional intelligence includes the following three competencies for the domain of relationship management: stakeholder relationships, developing others and truth telling.

Stakeholder Relationships

The goal of the stakeholder relationships competency is to strategically establish meaningful one-on-one relationships that are going to do the following:

- Increase our likelihood of success on the project.
- Provide cushioning to weather the inevitable storms that occur on every project.
- Provide an environment that is personally satisfying.

Stakeholder relationship management is the process of systematically developing stakeholder relationships that

help us with the project. We can break it down into the following four steps:

1. Identify our project stakeholders.
2. Collect and analyze information about the stakeholders.
3. Develop relationship strategies.
4. Manage the ongoing relationships with the stakeholders.

Developing Others

The second competency in the relationship management domain is developing others. For PMs, developing others means to invest in and grow the project team. Most PMs would agree that developing their staff is an important component of the job.

As PMs, we need to recognize that developing others means making an investment in them. As a result of this investment, we create goodwill and deepen our relationship with our team members.

Telling the Truth

The third relationship management competency is telling the truth. Being honest and forthcoming with the people we interact with on our projects sounds quite simple, but it is rarely a simple thing to do.

Fortunately, there is help for those of us who have a hard time telling the truth with diplomacy. Here are some tools and techniques to provide a framework for telling the truth in the project environment.

• **Providing Your Reaction.** What others do and say affects all of us. It is entirely appropriate to provide your reaction, especially if you are asked.

• **Saying No.** Many of us struggle with saying no. When we are asked to do something, most of us like to oblige by saying yes. For some of us, saying no is a muscle we simply have not practiced using. As a PM, saying yes too much can damage our careers. We need to know when to say no. If we don't protect ourselves and our team by saying no, we will alienate our team and perhaps even cause them to leave the project.

• **Using "I Like/I Dislike" Statements.** A very helpful technique for relationship building is to state what you like or dislike. You might say, "I like when you get your deliverables done on time" as a way to encourage your team members. A higher-risk version is to say, "I didn't like when you made that disparaging comment about Bob." That type of communication is clear and to the point.

PART 4: USING EQ TO PROJECT TEAMS

Project Team Leadership

Project team leadership is the overarching aspect of the emotional intelligence framework for PMs. It is about getting the right people on your team, successfully communicating with and motivating them, and then clearing conflicts and other roadblocks so that they perform and achieve the project objectives. This domain includes the project management competencies of communications, conflict management and inspirational leadership.

Communications

Undoubtedly, PMs need to be great communicators. The reality is that for most PMs, a big part of the job is communications. That may take the form of walking around and talking with team members or stakeholders. It may also mean sitting in lots of meetings. That is communications. Communications can also include talking on the telephone, writing emails and instant messages, preparing for meetings, creating and delivering briefings, and generating status reports.

No matter what form they take, communications contain and evoke emotions. Well-planned communications, therefore, help the PM set the emotional tone for the team. Poorly executed communications can trigger negative emotions in the team.

Communicating with emotional intelligence involves applying the domains of self-awareness, self-management, social awareness and relationship management. PMs who are competent in each of those domains will do a better job of communicating with emotional intelligence. If you want to be intentional about your project communications, consider the following steps:

• Determine your objective.
• Understand your own emotions.
• Choose an appropriate time, place and mode.
• Approach others with empathy.
• Listen and respond to the emotions of others and not only to the content of what they say.
• Share your own emotions when appropriate, being as open and honest as possible.
• Check for understanding and reactions.

Conflict Management

Project conflict can be disruptive. If not properly channeled, conflict can stifle communication, kill creativity and squash productivity. Project teams that are not able to manage conflict may ultimately fail to reach their objec-

tives. The PM is the one who will make the difference between leveraging conflict and having conflict wreak havoc on the team.

Conflicts involve both facts and feelings. It is important to probe to find out what the parties in a conflict are feeling. When we understand the underlying wants and needs of the affected parties, we better understand their motivation. Then we can work together to address the issue or conflict that is caused by the underlying want and need.

Inspirational Leadership

The third and final competency of team leadership is inspirational leadership. This is the ability to inspire others by casting a vision for the individual and the team. PMs who are inspirational leaders make work attractive and interesting to the team, create high team morale, and attract and retain good resources.

Vision casting is the process of stating a future, positive picture of the goals or objectives for the team, assisting the team to understand why they are important, and helping the team to connect with those goals and objectives. Vision casting for projects is the responsibility of the PM.

One way to cast a vision is through the use of the mission, vision and values statement for the project or team. The mission is a short statement about the overall objective for the team or what is going to be accomplished. The vision is a statement on how that mission will be accomplished. And the team values are the framework for pursuing the mission.

Creating a Positive Team Environment

As PMs, we want to create the best possible team environment to attract and retain great team members and help them to be productive. If we want to get the best from our teams, we need to create an environment that will support our team members and encourage them to perform at their best. The PM is responsible for creating that team environment and setting the stage so that team members can do their best work.

Creating a Positive Team Environment

Here are seven techniques for creating a positive team environment:

1. Assess How Team Members View the Team Environment. I have found it helpful to poll my team to see how they feel about the environment. Most members will be flattered if you ask how they think you are doing in this area. Consider a mini-assessment that will evaluate how you are doing in terms of creating safety, establishing and communicating values, and resolving conflict.

2. Put It in Writing. PMs may choose to document their expectations for their team members to make sure those expectations are clear. Consider working with the team members to create a set of values, rules or expectations for team behaviors.

3. Establish Clear Accountability and Hold People to It. Once you have established responsibility and accountability for deliverables, you need to hold others to it. Rate yourself on how you are doing in this area. If you are not doing as well as you would like, think about what you need to do to make it better.

4. Hold Others to Your Highest Vision for Them. Dedicate a chunk of quality quiet time to think about each person on the team and his or her true potential. Try to see people at their very best. Envision what their future could look like and how you see them succeeding.

5. Catch People Doing Something Right. Develop the habit of catching people doing something right, and make it part of your leadership style. Make it a point to track your efforts for each individual. Give more to those people who are junior or new to the team to help them integrate.

6. 1001 Ways to Recognize People. Some time ago I stumbled across a book entitled *The 1001 Rewards & Recognition Fieldbook*. The title helped me to appreciate that the ways to recognize and reward the individuals on our teams are nearly unlimited.

7. Fix Your Broken Windows. Take a moment to conduct an honest assessment to see if there are any rules or standards that people don't adhere to in your environment. Develop an inventory of the rules and standards, and if there are lapses, develop action plans to address any regulations that are not being followed.

Leveraging Emotional Intelligence on Large and Complex Projects

In the large project environment more than any other place, the PM has to be flexible in approach and have the ability to vary leadership style. In *Primal Leadership*, Goleman and his co-authors described six inspirational leadership styles.

Applying Different Leadership Styles

Four of those styles are considered to be resonant; that is, they cause a positive effect on the team environment.

• **Visionary Leadership.** Visionary leaders tell people where they are going; they provide the vision and the big picture. On a project, visionaries describe the end goals but leave individuals plenty of latitude on how to achieve them.

• **Coaching Style.** Coaching style focuses on personal development rather than on the accomplishments of tasks. The project becomes the vehicle that we can use to help people stretch and develop. The key outcome for the coaching style of leaders is the growth of the team members.

• **Affiliative Style.** Affiliative leaders are great relationship builders. They tend to focus less on tasks and goals and more on building relationships with their team members. Affiliative leaders create an environment of harmony and friendly interactions. They work to nurture personal relationships, using empathy and conflict management.

• **Democratic Style.** The democratic style is similar in some ways to the affiliative style. Democratic leaders tend to take input from many sources. This input leverages the experience of the team, provides for better decisions and gets buy-in from the entire team.

• **Pacesetting Style.** The pacesetting leader expects excellence and models that to the team. They have high expectations for performance and for continuous improvement. Pacesetting leaders tend to put pressure on everyone on the team to perform at their very best.

• **Commanding Style.** The commanding style is one in which leaders require everyone to do it their way. PMs who use the commanding style don't want questions; they want compliance. They are reluctant to share power and authority, and they rarely take the time to explain themselves fully.

The commanding style should be used sparingly. It works best during emergencies or crisis situations, such as during a project turnaround when there is no time to explain the rationale behind every decision. Otherwise, the commanding style takes a toll on the team and should be avoided.

Success with Agile Projects

The last five to 10 years have seen a tremendous growth in Agile projects. Whether Scrum, Lean, XP or some other methodology, Agile methods are quickly becoming mainstream for software development projects, and inroads are being made into other types of projects.

PMs usually have different titles and roles when working in the Agile environment. Scrum is the most common Agile method used today; it is a project management framework for Agile teams. The Scrum Master is the facilitator for the Scrum Team and is the rough equivalent to the PM.

Anyone who has used Agile methods, though, will attest to the fact that leading Agile teams is not the same as leading traditional teams. Agile teams are expected to be self-organizing. This doesn't mean there are no leaders, but it requires a style of leadership that is less prescriptive and more supportive. It is often called Servant Leadership, and it requires a lot of emotional intelligence.

Servant Leadership

Servant leadership is about making the needs of others a priority and then serving them. In the case of Agile, it means putting the needs of the Agile team first. The key ways that Agile leaders do this is through removing impediments and supporting the team to work better together. When leaders make the resolution of impediments a top priority, they help the team be productive, and more importantly, they send the signal to the team that the leader is there to serve and contribute.

Be a servant leader. Agile team leaders, Program Managers and Functional Managers all need to support the Agile team. They frequently need to serve as a buffer between the Agile team and the rest of the organization. Tune in to the organizational norms that run counter to Agile and run interference for the team. Help streamline mandatory documentation or other PMO requirements so that the Agile team can be empowered and self-organizing.

We can always improve in the area of people skills. And the great news is no matter what our current level of EQ is, we all have the ability to improve our level of emotional intelligence.

Orbit-Shifting Innovation

The Dynamics of Ideas That Create History

by Devika Devaiah and Rajiv Narang

THE SUMMARY IN BRIEF

Orbit-shifting innovation happens when an area that needs transformation meets an innovator with the will and the desire to create, and not follow, history. At the heart of every orbit-shifting innovation is the breakthrough that achieves a transformative impact. Businesses, social enterprises and even governments need orbit-shifting ideas to create a transformative impact. But how does that groundbreaking idea come about, and what translates it into actuality?

Charting the vast global landscape of orbit-shifting innovation and using unique examples from prominent businesses, the social sector, entrepreneurs and public services, authors Devika Devaiah and Rajiv Narang build insight into the key drivers behind taking on a transformative challenge and provide a unique framework to navigate the pitfalls and challenges in making it happen.

Orbit-Shifting Innovation empowers everyone to overcome the obstacles to innovation and provides the tools to maximize the impact of transformative change. The inspirational examples and tools for success compel leaders and entrepreneurs to not only pursue impossible challenges but lead the successful journey from conception of an orbit-shifting idea to actually creating history.

IN THIS SUMMARY, YOU WILL LEARN:

- Powerful myths about innovation and how to overcome them.
- How to define and take on orbit-shifting challenges.
- How to break through mental-model boundaries and generate groundbreaking insights.
- How to excite stakeholders and stand out as an orbit-shifting leader.

Introduction

What are the real dynamics of executing an orbit-shifting innovation with as much focus as it takes to conceive it? Surfing through the multiple uncertainties of innovation has revealed many innovation myths. The first innovation myth is at the heart and soul of every innovation endeavor: the WHY of innovation. Most managers interested in innovation have become mesmerized with newness to such an obsessive extent that "What's new about this idea?" is almost always the first evaluative question. Orbit shifting is the real passion, and the driving purpose and innovation are merely the means to make the orbit shift happen.

There is also the myth that innovation equals ideation. In reality, an orbit-shifting innovation emerges not with a search for ideas but by recognizing boundaries. To create breakthroughs, we need to move from ideation to breaking through mental-model boundaries.

Most big ideas don't get killed; they just get diluted. Orbit-shifting innovation brings insights into overcoming execution obstacles. As much, or more, innovative thinking is needed to execute a new idea than was required to come up with it. Another well-established myth is that breakthrough innovation starts with an out-of-the-box idea. Orbit-shifting innovation really starts with an out-of-the-box challenge. An out-of-the-box challenge is what is needed to propel thinking beyond the current box to generate an orbit-shifting idea.

A common myth is that the fear of commercial failure prevents us from taking on orbit-shifting challenges. In reality, it is the fear of personal failure and the loss of credibility that prevent leaders in organizations from burning their bridges or removing their escape buttons. Another myth is that the top management can mandate innovation. The reality is that innovation *cannot* be mandated because ownership and excitement cannot be mandated: people have to take charge. How do those who lead innovation inspire others to also believe in the new idea, the new proposition, with as much commitment as they do?

The final myth is that once the big idea has been developed into a working prototype, then taking it to market is a simple case of Test and Launch. But a new idea entering the old pipeline may suffer its greatest dilution in the last mile.

Here, finally, is the compass to navigate the fog of innovation in all its messiness, uncertainties, complexities, paradoxes and ambiguities, not just a sanitized formula or a tool or process for innovation. A compass that doesn't stop at conception but that navigates an orbit shift end to end: from conception all the way to realization.

PART I: ORBIT SHIFTS THAT CREATED HISTORY

Orbit Shifts That Created History

The Swiss firm Vestergaard Frandsen has invented a product that is and will have a transformative impact in areas where there is a pernicious shortage of clean drinking water. It has created a straw through which water is purified as it is drunk from any water source, regardless of quality. With an ultra-filtration cartridge embedded into it, this straw filters 99.9 percent of water-borne bacteria and parasites. A single straw costs about $6.50 U.S. and

filters about 1,000 liters of water, which is enough for one person for one year. This has brought potable water within the reach of millions of people for whom traditional water purifiers or bottled water are simply not affordable. Vestergaard is truly saving lives with this orbit-shifting straw by safeguarding against water-borne diseases, which are among the commonest sources of illness. No wonder, then, it has been named LifeStraw.

Vestergaard was originally a clothing company, in the fabric industry. And yet fabric became the trigger, rather than the boundary, to create the LifeStraw — its central component is a cloth-based filter membrane.

Microsoft, Apple, Vestergaard Frandsen, Smart Telecom and Vodafone are all business innovators that have created an orbit shift. They all began by identifying a transformation need: an area where following the existing route and mere incremental improvement was just not enough. Once they had identified the potential for the orbit shift, it created a restlessness that got them to challenge and break out of the current orbit. This restlessness led to an orbit-shifting innovation: a breakthrough that has created a disproportionate impact.

Redefine and Recast Innovation

The vast landscape of orbit-shifting innovation provokes us, indeed, forces us to re-examine and recast *innovation as a concept*. The first myth to be shattered is the deep belief in the romance of innovation. Today, the world is seduced with the act of coming up with novel, world-first ideas. For orbit shifters, however, the spotlight shifts from innovation itself to actually making the orbit shift happen. For them, orbit shifting is the purpose and the passion, and innovation is merely the means. Orbit shifters first set out to create a transformative impact. What follows later is the innovation.

The next myth to be shattered is that innovation equals technology and product innovation. Most traditional models of innovation are still preoccupied with R&D, technology and product innovation. The orbit-shifting innovation landscape painted earlier breaks this myth. What stands out is that equally powerful orbit shifts have come about through service, process and business-model innovation. The canvas of orbit-shifting innovation doesn't furnish only new products, business processes and business models. It goes further with innovating the *people engagement model* and even further to include *ecosystem innovation*.

Orbit-shifting innovation is not just about innovating the technical or operational process; it is as much about innovating the managerial process.

PART II: SEEDING ORBIT-SHIFTING INNOVATION

Confronting Gravity

Orbit-shifting innovation stories are very romantic in hindsight. They inspire, encourage and even provoke dreamers into positive restlessness and action.

However, what is usually not visible behind these stories are the extreme odds that orbit shifters had to overcome in making their dreams a reality. It is here that most people give in and give up. Most orbit shifters recognize and realize that when the rubber hits the road, they are all alone.

What drags down and even decimates orbit-shifting dreams and ideas? Most people are stuck because their mindsets block them. They have come to perceive "reality" in a certain way, and this, more than anything else, limits them from innovating. Just as gravity is an all-pervading force that cannot be seen or even felt, day after day, but prevents us from breaking the bonds of earth, so is mindset gravity a pervading force that traps people, without conscious realization, into their current orbits.

Four layers of mindset gravity stall orbit-shifting innovation:

Organization gravity: Organizations accumulate gravity with frightening ease. Past successes become best practices. Best practices become templates. And templates become the unquestionable sacred truths. Organization gravity not only stifles a new market entry strategy but also prevents the emergence of new opportunities. Managers and organizations excel in slicing and dicing the market into neat categories: customer categories, usage categories, sociocultural categories. Categorization simplifies, but it also becomes the mindset gravity that prevents the emergence of the new.

Industry gravity: Organizations in highly regulated industries like pharma and finance often fall into the trap of attributing the reason for not innovating to the imposed regulations. While regulations are necessary and mandatory, over time what begins to happen is that gravity makes organizations follow the regulations to the letter rather than to their original intent and purpose. Over time, gravity sinks in and more and more assumptions get treated as facts.

Country gravity: Any game-changer at the industry level is strongly influenced by the undercurrents of country and culture mindset gravity. If these mindsets are not surfaced and resolved, this deep, unquestioned gravity can become the silent killer to a disruptive innovation

attempt. So powerful is country and cultural gravity that it sweeps across sectors and traps entire nations of people into "self-limiting beliefs" that are invisible, endemic and even paralyzing.

Cultural gravity: Cultural gravity embeds itself even deeper than country gravity and can breed the extremes of arrogance and subservience — instinctive arrogance in developed markets and deep-rooted subservience in the developing markets. Cultural subservience in developing countries is all-pervading: most people are not aware of how deeply it runs in their veins and how much it drives the way they think and operate with respect to the developed world. Cultural arrogance builds a blinding self-confidence that can become an equally strong force of gravity.

Take on an Orbit-Shifting Challenge and Burn the Bridge

Most orbit-shifting innovations did not start with an out-of-the-box idea but with an out-of-the-box challenge, an orbit-shifting challenge. It takes an orbit-shifting challenge to create the escape velocity needed to break through gravity. An out-of-the-box idea is a consequence. An orbit-shifting challenge leads to an orbit-shifting idea and not the other way round.

Triggering the Orbit-Shifting Challenge

How does a leader or an organization go about uncovering and identifying orbit-shifting challenges? What are the new reference points? What triggers the identification of an orbit-shifting challenge as against a traditional performance goal? Orbit shifters, unlike followers, don't reference last year and create stretch goals. They trigger orbit-shifting challenges with a series of nine triggers.

First trigger: Discovering a positive inflection point. While followers look at market trends, orbit-shifters sense a positive inflection point in the market — an ecosystem-need gap that when bridged can unleash a huge wave of demand.

Second trigger: Designing for extreme conditions. Extreme conditions present extreme challenges. There are many instances of orbit-shifting innovations emerging when a society or an organization has been thrust into extreme conditions. Coming up with solutions for an army that is based in extreme terrain and for astronauts in space has led to an array of new ideas.

Third trigger: Turning around a threat. When faced with a threat, gravity-infested followers play safe and even withdraw into a shell. Orbit shifters turn a threat into an orbit-shifting challenge.

Fourth trigger: Making an exception the new reference point. Some followers look at the average and create stretch goals; others benchmark with the industry best practices and create catch-up goals. Orbit shifters go beyond the average, go beyond best practices. They search for the exception across industries and domains and make the exception the reference point for an orbit-shifting challenge.

Fifth trigger: Rediscovering lost pride. Sometimes it is not an intellectual but an emotional trigger that leads to an orbit-shifting challenge. A strong impulse to reclaim lost pride can lead to an orbit-shifting challenge with the highest escape velocity. Nothing fires people up more than reclaiming dented pride.

Sixth trigger: Refusing to accept a suboptimal equilibrium. A suboptimal equilibrium occurs when a community or society has learned to live with an inequality or a gap that causes great dissatisfaction as an inherent part of life. Orbit-shifting challenges get triggered when an orbit shifter spots and chooses to eliminate a suboptimal equilibrium rather than live with it.

Seventh trigger: Pursuing a causal adjacency. What do we do when we reach a point where growing a business is not enough to motivate us — where business as usual has reduced itself to a series of meaningless chores without inspiration or drive? Most people give up or get out. Orbit shifters can literally reinvent the path forward by finding a causal adjacency to the business. A cause becomes the anchor around which the next business is built or pursued.

Eighth trigger: Not targeting the best possible but the theoretical best. What is practical and what is possible are two questions rooted in the current orbit. They become the gravity that reduces a challenge to the point of being immediately doable.

Ninth trigger: Transforming the input-output equation. Orbit shifters take on orbit-shifting challenges that upend the established input-output equation. They take on development and growth challenges that are deliberately non-linear.

Breaking Through Mental-Model Boundaries

An orbit-shifting challenge needs orbit-shifting ideas to bring it to reality. To discover orbit-shifting ideas, mere ideation is not enough. What is needed is the ability to

first recognize and then break through mental-model boundaries. Orbit-shifting aspirations pursued with mental models that are trapped in the current orbit fail to take off.

To move the innovation and growth drive into the next orbit, an organization needs to recognize and confront the invisible limits of the existing orbit and uncover the strategic blind spots embedded in the current orbit.

Uncover Boundaries and Not with Ideation

Faced with an orbit-shifting challenge, traditionalists launch themselves straight into "idea generation" sessions. Orbit shifters, on the other hand, restrain their natural instinct to rush into ideation and instead start by deliberately mapping and identifying the boundaries of their thinking. They probe and push the boundaries of their thinking by exploring questions like, "Why are we in this business? What is currently hitting the wall of diminishing returns? Where are we saying no to the customer? What do we consider impossible? What are the suboptimal equilibriums that we have become used to? What parts of our industry do we consider saturated? How do we break out of this capital-intensive business model? They use a series of such triggers to first uncover and identify the mental-model boundaries.

Redefine the Core

Over a period of time, the best of industries get caught in the trap of value adding. In the zest to add value, they forget to question and re-examine the core. Every bit of value added seems good when seen independently, but if the core remains the same, the additions can soon become peripheral. Unknowingly and inevitably, the product or service gets over-engineered.

The airline industry became the epitome of an industry that focused on adding value with vision and zest. Reward miles, gourmet meals and increasing freebees were among the never-ending list of value adds that they hoped could build the franchise and ensure loyalty.

This mental model was broken with the emergence of low-cost airlines. At the heart of it, the core need is to get from one point to another on time and at the lowest cost. The rest is peripheral — desirable but not essential. A service that promised comfortable seats and on-time arrival at a low, in fact unbeatable, cost became the success model of budget airlines.

Orbit-Shifting Insight

An orbit-shifting insight will break through mental-model boundaries, join new dots and make the orbit-shifting idea visible. Orbit shifters believe that the one thing that cannot be delegated or outsourced is market insight. They demonstrate the will and the focus to immerse themselves in the market and get first-hand insights. They believe only first-hand market experiences have the power to uncover new questions and new insights. Insight is the capability to go beyond what customers want to why they live the way they do or don't and to find solutions to questions that genuinely mean something to them.

The Origin of Microfinance

The microfinance model that broke through the mental model of traditional banking began when Muhammad Yunus had an orbit-shifting insight. Muhammad Yunus spent long hours with the people at the bottom of the pyramid, trying to understand their context and needs. What stood out for him was that these people lay completely outside the mental model of traditional banks that needed assets as collateral in order to sanction a loan. It was a vicious cycle: they had no asset for collateral, but they needed loans to move out of the poverty cycle.

His determined and empathetic drive led to a social insight: "For people in this part of the world, losing face in their community was far worse than losing money." This further led to the breakthrough business insight: use community, rather than assets, as collateral. It was then developed into a business model of small loans to women, with community as collateral. This started the microfinance revolution.

The microfinance insight did not come from a bank! What made it genuinely difficult for even a very progressive bank to get a "microfinance-like" insight? Self-projection traps us into seeing the world through our own lens. Looking at the third world through a first-world lens blocks an orbit-shifting insight, and the organization remains stuck in the existing mental model.

PART III: COMBATTING DILUTION IN EXECUTION

Overcoming Walls of Doubt: Excite and Enroll Stakeholders

The notion of a maverick acting like a Lone Ranger to conceive of and succeed with a radical idea can and does work for entrepreneurs. However, in large organizations, if mavericks become lone rangers, though they still can and do conceive bright new ideas, they are rarely able to make

them happen. An idea can begin to crumble when it comes up against skeptical gatekeepers and indifferent peers.

What does it take to excite and enroll stakeholders? What does it take to move stakeholders from doubt to confidence and conviction? What an orbit shifter really needs are generative stakeholders, who not only help to solve unsolved problems but are also proactive in uncovering and leveraging opportunities to maximize the innovation.

Co-Building with Stakeholders

Moving stakeholder engagement from "evaluating" to "co-building" is what an innovation champion needs to be able to do. The biggest realization for an orbit shifter at this stage is that she/he has to move from thinking of the orbit-shifting idea as "my dream" towards building it into a "shared dream."

This move can be emotionally and intellectually tough, as the innovation champion is by now in love with the idea, and as new stakeholders are enrolled, chances are that the idea could grow and be shaped differently from the creator's original thought. But orbit shifters also realize that to get the stakeholder to go the extra mile, to solve problems beyond their current know-how, will take extraordinary motivation. And this can only happen if the stakeholders' ownership of the idea is as big as their own.

Orbit shifters also reach out and think and act as equals with their bosses and peers. Orbit shifters do not get preoccupied with managing perception; they enroll their bosses into the purpose. They put the purpose before the position of the person they are talking to.

From Unconditional No to Conditional Yes

Innovators often come up against decision makers who might say "no" to one part or to the whole of the big idea. The orbit shifter recognizes that a "no" is not unconditional — that behind a seemingly absolute and irrevocable "No!" is usually a genuine concern or a series of assumptions that is leading to the stakeholder's conclusion of "no."

Faced with a "no," the orbit shifter doesn't back off. Instead she/he steps forward to engage with and uncover the underlying concerns and also enables the stakeholder to recognize these as concerns, which if not handled is leading to "no." However, the orbit shifter reframes it to become a conditional "Yes!" Solving the concern has opened up a path to go from a "no" to a "yes."

After an engagement like this, a stakeholder is likely to feel more understood, and his/her resonance with the orbit shift increases.

Navigating the Fog: Overcome Daunting Obstacles

Executing an orbit-shifting innovation is a journey filled with tunnels of fog — multiple points where the orbit shifter is confronted with new, unforeseen problems. Faced with fog, orbit shifters don't give up or give in. It is their capacity to navigate the fog that differentiates an orbit shifter from a settler.

Orbit shifters navigate the fog in execution in three dominant ways:

By turning around never-faced-before problems. Navigating the execution fog is not just about dogged persistence. Overcoming execution obstacles sometimes calls for as much innovation as was needed in coming up with the orbit-shifting ideas. Where is the fog confronting you? How can you move your team to positively navigate the fog — shift from seeing the obstacle as an "idea-maximizing threat" to an "idea-maximizing opportunity"?

By attacking the known and persistent problems with a new lens. The toughest fog is actually caused by recurring, often predictable problems. Faced with persistent execution problems, managers and bureaucrats take refuge in "powerlessness" — they don't confront and navigate the fog; they simply avoid it. As a result, most actions lose all impetus, and everything settles at the lowest common denominator.

Where have you attempted to execute an orbit shift with an over-simplistic organization-restructuring exercise? Making a structural change that sharpens accountability for executing the new is not enough to navigate the fog in execution. Where do you need to complement the structural change and inspire your managers to make the mindset shifts needed to navigate the fog in execution to attack persistent problems with a new lens?

By not letting a new idea enter an old pipe in the last mile. For most organizations, a mature, proven, well-organized, well-disciplined and almost regimented take-to-market model is the last mile. It is here that the new idea almost inevitably enters the old pipe. Most organizations mature their sales channel into an efficient pipe and lock it down. A new idea now has to either fit in or die in the last mile. Hence, the idea ends up getting retrofitted to suit the old pipe rather than innovating on the old pipe to leverage new ideas.

Re-examine the last time you took an innovation to market: How many complementary innovations were deployed to reshape the last mile? What has been the real cost of avoiding the fog in the last mile?

In-Market Versioning and Fissioning

Orbit shifters see the first go-to-market stage not as the first stage of market launch but as the last stage of proposition development. They recognize that the new idea will need to have space to play out and evolve in the market, and that will in turn impact how it should scale up and grow. Therefore, they are prepared to iterate and grow the idea in market. The approach is how to make it work.

Settlers, on the other hand, approach the go-to-market stage as the first stage of launch. Hence, their motive is not to evolve the idea in the market as much as it is to see *whether it works*, and if not, then to park it and move on. This testing mindset, "see if it works," often results in an orbit-shifting idea being abandoned too early.

In-Market Versioning, Not Piloting

The most effective way to deal with the uncertainties inherent in taking a new idea to market is to have an in-market evolution process: a series of in-market experiments that systematically uncover and resolve the unanswered questions and discover opportunities to maximize the market impact.

What is needed is in-market versioning in three stages: best conditions, real conditions and scalable conditions. These three stages of in-market versioning are designed to systematically uncover the unanswered questions and evolve situations for the three key unknowns: customer engagement, channel engagement and execution team engagement.

Best condition version: The market chosen is the one with the most conducive customers and the most ready distribution channel. The focus of the best conditions version is on customer engagement only. The sole intent is to evolve a tipping customer value proposition — a proposition that will engage and enroll the maximum number of customers. The best team from the organization is directly involved in the execution.

Real conditions version: The team implementing it is the actual go-to-market team and not the best team. The market chosen is not the best but the average/normal market — one where the customers and the channel are both the most natural representative of the target market. The real conditions version is focused on finding ways to engage the team and the channel in making the orbit-shifting idea successful while further evolving the successful customer value proposition.

Scale conditions version: Once the orbit-shifting proposition has achieved the promised impact in real market conditions, it is now ready to be taken into the scalable version stage. The focus is to evolve the in-market success model to a level where it can reach the promised impact over a large spectrum of target markets. A market/cluster of markets are chosen where scale variables in customer engagement, channel engagement and team engagement come into play.

Scaling-up the Orbit Shift: Fissioning Across Geographies

Having succeeded in one market, traditional organizations like to build the success model into a formula and then cascade it to other geographies. For a traditional manager, "Once an innovation has succeeded in one market, all that is needed is to cascade the success formula to other markets." This works for incremental ideas, but attempting to simply replicate the success formula in other geographies can run into major hurdles in the case of an orbit-shifting idea.

Orbit shifters recognize that scaling-up an orbit-shifting idea is more like building a social movement, where the idea catches fire as it moves across large swatches of community and yet is localized to reverberate with that community. An orbit-shifting idea, no matter how successful it was in the previous market, will disrupt the comfort zones of whichever market it enters next. The idea has to be adapted to the market rather than blindly replicated.

PART IV: LEADING ORBIT-SHIFTING INNOVATION

Ascending the Orbit-Shift Mountain

Making orbit-shifting innovation happen is more like scaling a daunting, unclimbed mountain than like managing just another tough project. An orbit-shifting innovation journey is not a process to be achieved stage by stage. It is more like a journey from one energy threshold to the next. A burst of energy needs to be unleashed at each threshold to bear with not just the visible organization dynamics but also with the unanticipated fears, uncertainties and doubts of all stakeholders including the innovation team. It is not only about the task or process; it is as much about the people involved.

The Five Orbit Thresholds

To create and not follow history, to scale the orbit-shift mountain, orbit shifters need to prepare for and cross five thresholds:

Threshold One: The first threshold is crossed only when the orbit shifter has taken on an orbit-shifting

challenge that is beyond the current capability, one that is anchored in uncertainty, in the unknown, and has shown the courage to *burn the bridges.* Now the orbit-shift mission is at the point of irreversibility. To scale and cross this first threshold, the orbit shifter has to first uncover and then confront the gravity of the current orbit.

Threshold Two: The second threshold is crossed when the orbit shifters have identified the orbit-shift keystones: the key boundaries that when breached have the power to yield orbit-shifting ideas.

Threshold Three: This is an orbit-shifting Insight Quest that will take orbit shifters into insight dialogues with a wide spectrum of market and knowledge insight sources, with edgy customers, ecosystem players, and the market and knowledge intersections.

Threshold Four: The business proposition is presented to stakeholders for their assessment. The first step is accomplished when they have shared and co-evolved the orbit-shifting market proposition with the key decision stakeholders. Successful co-evolution leads to shared conviction.

Threshold Five: The final step is in-market versioning: to evolve the product/solution into an in-market success model. It is only by experimenting and developing the idea in live market conditions across best conditions, real conditions and scale conditions that the orbit shift grows to its fullest potential.

What Differentiates Orbit Shifters?

What gives orbit shifters the capacity to scale the five thresholds, to confront gravity and new unknowns at every threshold, and restart again and again without feeling demotivated? Six mindsets are the core drivers that these orbit shifters share:

Attitude towards growth: Orbit shifters have a deeply held belief that growth comes from the size of the challenge rather than the size of the kingdom. In their minds, growth comes from handling a bigger, more exciting challenge, not from the number of people reporting to them. This motivates orbit shifters to move out of their comfort zones into the unknown and take on the next big challenge.

Attitude towards an orbit-shifting challenge: The orbit-shifting challenge is a transformation vehicle and not a performance goal. And hence, the orbit shifter approaches it as a direction and not a destination. Orbit shifters believe that the orbit-shifting challenge is the ultimate peak, and in the pursuit of it they will get much further than where they are today, even if they never get there.

Attitude towards gravity: Innovators will repeatedly need to break through gravity to come through with solutions. Attackers look at the current orbit with a sense of positive irreverence rather than with deference. Where others see "how the world is" and accept it, orbit shifters see "how the world could be" and attempt to transform it.

Attitude towards new insight: Orbit shifters believe that what points the way towards new insight is the discovery mindset, which comes alive in the quest for new questions, rather than a validation mindset, which only searches for answers. The discovery mindset is curious and exploratory: looking to join new dots, find new meanings and connect the unconnected. It is only a new question in the discovery state of mind that can create a seismic shift and point towards a new reality.

Attitudes towards stakeholders: Orbit shifters don't convince; they tip stakeholders into adopting and even co-owning the orbit shifting idea. They do this by engaging stakeholders in tipping conversations and tipping experiences.

Attitude towards execution obstacles: Faced with an obstacle, orbit shifters' response is never "if we can find a solution to the problem — only then will we pursue our challenge"; it is always "How can we overcome the obstacle; How and how else can the problem be solved?"

Whether in fiction or reality, the most enduring stories, the ones that excite us the most, are the ones of orbit shifters, where extraordinary people achieve the extraordinary. Where they create history rather than follow it. Where they show us that there are no impossible dreams or problems, only limited dreamers and problem solvers.

So what is your orbit-shifting story going to be?

Sticking Points

How to Get Four Generations Working Together in the 12 Places They Come Apart

by Haydn Shaw

THE SUMMARY IN BRIEF

Leaders and companies face a new challenge: For the first time in history, there are four generations in the workplace: Traditionalists, Baby Boomers, Generation Xers and Millennials. Anywhere people get together, the "ghost stories," or histories, of the different generations impact the way they think. Generational tensions are inevitable, but they don't have to leave you stuck.

Sticking Points is a practical resource for those people who need a guide to generational differences. In this up-to-date, readable guide, popular speaker and consultant Haydn Shaw offers valuable comparisons and a clear five-step plan for how to get the four generations working together in the 12 places they tend to come apart. When we understand why another generation thinks the way they do, we are much more likely to appreciate their differences and speak their language. We are much more likely to "stick together."

Let *Sticking Points* show you how to lead in today's uniquely rewarding and challenging organizations.

IN THIS SUMMARY, YOU WILL LEARN:

- To understand how different generations think.
- A five-step plan for leading rather than managing generational differences.
- Ways to apply this five-step plan to each of the 12 generational sticking points.
- Answers to the most common questions asked about generational differences.

Sticking Together or Coming Apart

Generational friction is inevitable today. Sticking points are inevitable, and they often get teams and families stuck. But they don't have to. The same generational conflicts that get teams stuck can cause teams to stick together.

Stuck in the past or sticking together going forward: It's a matter of turning a potential liability into an asset.

The most common complaint I hear from frustrated people in all four generations is "They don't get it." "They," of course, means a boss, coworker or family member from a different generation who the speaker believes is the cause of the problem. And in my experience, "it" usually refers to one of the following 12 sticking points — places where teams get stuck: communication, decision making, dress code, feedback, fun at work, knowledge transfer, loyalty, meetings, policies, respect, training and work ethic.

"They don't get it" is usually a sign that a sticking point is pulling the team apart. Each generation attempts to maneuver the others into seeing the sticking point their own way. And that's the first mistake — viewing a sticking point as a problem to be solved rather than as an opportunity to be leveraged. The irony is that when we say another generation doesn't get it, we don't get it either.

Once we get it, we realize that these sticking points are more than intergenerational differences. They are catalysts for deeper understanding and appreciation that can make teams stronger and better balanced. Sticking points can make things worse or better depending on whether the four generations can work together in the 12 places they naturally tend to come apart.

Blue Screen of Death: The Difficulty of Leading Four Generations

When there were only three generations, the time-proven process of "wait your turn" worked. But now we have four generations. "Wait your turn" is history because people live longer. Life expectancy was 47 years in 1900. Today, most people are just getting warmed up at 47. Second, there has been a huge acceleration in the speed of information, resulting in generations developing much more quickly and younger generations contributing significantly at earlier ages in knowledge-worker jobs. And finally, the "wait your turn" approach no longer works because we raised the last three generations as consumers. They were taught to question authority, shop for the best deal, and expect to be entertained.

Even if the people on your team came from the same town and attended the same schools, they did not grow up in the same place. The 1924 town that Traditionalists grew up in was very different from the one their grandkids experienced in 1984. If we miss that, we get frustrated and wonder what is wrong with others for not responding like we do. Frustrations lead to stereotyping. Once we begin talking in stereotypes, conflicts get worse.

Leadership starts with understanding, no matter what generational differences we face. Leadership is understanding other generations and how the world looks from their point of view, learning how to solve problems with them without first trying to "fix" them. It's not that hard to move from management to leadership; it means understanding five steps for leading through differences.

Getting Unstuck: Five Steps for Leading Through the 12 Generational Sticking Points

Having four generations at work causes scores of conflicts every day, but 12 sticking points come up most often:

1. Communication: What is the best way to interact with my coworkers?
2. Decision making: How do we decide what to do?
3. Dress code: How casually can I dress?
4. Feedback: How often and in what ways do I want input?
5. Fun: How much fun at work is allowed?
6. Knowledge transfer: How do we pass on critical knowledge to new employees?
7. Loyalty: When is it okay to move on?
8. Meetings: What should happen in our meetings?
9. Policies: Are policies rules or guidelines?
10. Respect: How do I get others to respect me?
11. Training: How do I learn best?
12. Work ethic: How many hours are required, and when must I work them?

Knowing what the 12 sticking points are isn't the same thing as knowing what to do about them. Having a process makes all the difference. Whoever your are, whatever your role, you can help your colleagues work through generational differences by using the five steps.

Here are the five steps for leading through the sticking points the four generations encounter:

STEP 1. Acknowledge: Talk about generational differences. Competitive advantage goes to the team that can bring differences and frustrations into the open where they can be resolved.

STEP 2. Appreciate: Focus on the "why," not the "what," and the common needs. Appreciating other generations keeps generations talking instead of fighting. Emphasizing the common needs early on redirects the goal from "fixing" another generation to resolving the sticking point. Appreciating common needs settles down the emotions so we can start talking about the whys.

STEP 3. Flex: Agree on how to accommodate different approaches. Once people acknowledge and appreciate their differences, they can decide how to flex for each generation. When it comes to generational sticking points, the hardest thing for many people is separating their preferences from the needs of the organization. Clear definitions can protect your team from generational preferences masquerading as business policies.

STEP 4. Leverage: Maximize the strengths of each generation. At best, cutting a deal produces a compromise, but maximizing differences produces leverage. Leveraging generational differences so that one person's strength makes up for another's weakness provides a large impact from a small team. Leveraging the strengths of each generation builds a better team.

STEP 5. Resolve: Determine what option will yield the best results when flexing isn't enough. If there are four generations in the workplace, you can't rotate a policy every four weeks in order to please each generation. Therefore, when flexing isn't enough, we have to resolve the issue. You will ultimately have to decide how you will move forward in those situations where everyone's preferences can't be accommodated.

PART ONE: GHOST STORIES: UNDERSTANDING THE FOUR GENERATIONS

Telling Ghost Stories

Historical events are like ghosts because their impact lingers long after the events are over. Each generation has its own historical ghost stories, especially the "I remember what I was doing when…" moments. We don't fully appreciate another person until we understand his or her ghost stories. In the same way, we won't appreciate another generation until we understand their ghost stories. The historical events during a generation's childhood years shape their values, worldview and definitions of success. Their shared experiences are what distinguish them as a generation in the first place. Telling ghost stories helps get four generations working together in the 12 places they come apart.

Traditionalists: Born Before 1945
The Four Biggest Ghost Stories

Ghost Story #1: The Great Depression. With little welfare and no Social Security, millions of people barely fed their families despite sacrifice and hard work. Traditionalists became more economically conservative, and that spread to other areas of life. They learned to sacrifice and show patience.

Ghost Story #2: World War II. World War II united the country like no other war. Sacrificing individuality for the cause was the norm, and complaining was the exception. World War II proved that large, hierarchical organizations could get things done. World War II introduced

large numbers of women to mission-critical jobs outside the home. Authority figures at home were not questioned because the threat overseas was far more terrifying.

Ghost Story #3: The Move from Farm to City. The transition from an agricultural to an industrial workforce accelerated after World War II. At the beginning of the 20th century, two-thirds of the United States and Canada lived on farms or in rural towns. By 1970, almost three-quarters lived in the city and suburbs. Farm life was significantly different because it made it easier to instill work ethic; it provided meaningful adult roles at a much earlier age; it made it harder to commit crimes; and it was driven by the sun, not the electron.

Ghost Story #4: Mass Marketing and Confidence in Experts. Radio changed things for the Traditionalists. It became their link to the broader world and created the voice of "the expert." The golden age of radio (1920s-1940s) was also the golden age of mass marketing. Each radio show was sponsored by a single company. The stars of that show plugged the sponsor's products, creating powerhouse brands. Traditionalists valued the guidance of experts. Traditionalists ended their childhoods trusting in experts, confident in their leaders, and tuned in to mass advertising.

Baby Boomers: Born 1946-1964
The Four Biggest Ghost Stories

Ghost Story #1: The Boom of Babies. Never before in history were so many babies born so quickly. The Baby Boomers were taught that you have to compete to get what you want. Baby Boomers come across as domineering because they are used to being the center of attention.

Ghost Story #2: Affluence. Boomers grew up in one of the most economically optimistic times in history. Affluence strengthened the Boomer focus on self because parents no longer needed to have lots of children to support the farm.

Ghost Story #3: Television. For the first time, television allowed the entire country to see the same thing at the same time. And when the "thing" was Kennedy's funeral or the first moon landing — powerfully emotional events — the nation shared common experiences as never before.

Ghost Story #4: The Generation Gap. Teenage Baby Boomers questioned their elders' beliefs, listened to rock and roll, grew their hair long, and tried to spend all of their time with friends, embarrassed to be seen with their parents. The generation gap signaled a massive shift in values far more important than the music, tie-dye or protests that usually get the focus. The "Me" generation had the money, time and freedom to explore self and search for meaning.

Generation X: Born 1965-1980
The Four Biggest Ghost Stories

Ghost Story #1: Squished. Numerically, Gen Xers are 25 percent smaller than the huge generations of Boomers that preceded them and Millennials that followed them. Marketers and the entertainment industry pay less attention to them, and they have less political clout. Being squished also meant they could forget about working their way up quickly, because they were stuck behind the Boomers. Boomers moved up twice as fast as Xers in their early years as the postwar economy expanded. Organizations also eliminated layers of middle managers just as Xers came along.

Ghost Story #2: Divorce. The first half of Generation X watched divorce become commonplace during their childhood. Between 1960 and 1982, the rate of divorce nearly tripled and then leveled off. The rocket rise of divorce left many Xers feeling alone. They turned to friends to find a family. This affected all Xers, even if their parents stayed married because they read about it in stories at school, watched it on TV, and listened to adults whisper about "another couple splitting up."

Ghost Story #3: Downward Mobility. The confidence in the economy went bust for the Xers. It was now clear to everyone that lifetime employment and job security were history. Generation X missed the almost magical economic growth that made the Boomers so optimistic. What it did not miss was the growth in prices. In addition to being squished for jobs and housing, Gen Xers saw college expenses quadruple while grants and aid were slashed.

Ghost Story #4: Parody. Parody creates a poor imitation of something serious in order to make light of it and expose its perceived flaws. Access to information creates parody, as does skepticism — and the Xers have both. Generation X was the first to question and verify the backstory behind the news on their computers; they knew that news is always shaded by someone's perspective. They learned that you can't believe everything you are told. Gen Xers are skeptical of organizations. At work, they may trust their managers, but they wonder about their companies. They want organizations to quit spinning the facts and "get real."

Millennials: Born 1981-2001
The Six Biggest Ghost Stories

Ghost Story #1: Heavy Parental Involvement. The Millennials were a "wanted" generation. There were half

as many children per family in this second Baby Boom, but far more women gave birth. Safety became an increasing concern during this time, with parents reluctant to tell their children to "go outside and play until it was dark" like their parents did. Parents became their children's activity directors, arranging play dates, driving their kids to activities, and staying involved even when they went off to college. They stay involved in their children's work lives, too. This is not just a case of overprotective parents — Millennials and their parents have a mutual affection and admiration. Millennials want their parents involved in their lives.

Ghost Story #2: Fear of Low Self-Esteem. Millennials are confident. Their parents and teachers convinced them they are special, and they believe it. Also, while they had less freedom to be outdoors without parental supervision, they had more freedom to disagree with their parents and to express their feelings. They have the confidence to speak up even if they've only been on a project for a few days.

Ghost Story #3: The Consumer Age. The Millennials were raised as consumers. Their parents could offer them choices previous generations never had. That's taught them to ask for what they want and look someplace else if you can't give it to them. This often gets interpreted as an entitlement mentality. However, there are two halves to this generation. The first half grew up in a strong economy with available jobs, so they could be picky because there were plenty available. The second half has struggled in an economy with unemployment at record-high levels. Millennials are facing increasing college costs, a difficult job market and lower wages.

Ghost Story #4: September 11, 2001. Traditionalists and Baby Boomers believed in delayed gratification — work hard today and get rewarded tomorrow. But these young adults have grown up knowing that tomorrow may never come. September 11, 2001 shaped Millennial culture in at least two ways. First, they have learned not to wait until tomorrow to do something important. Second, they have a strong impulse to keep work and life in balance. They see no reason to sacrifice everything today for a future reward that may never come.

Ghost Story #5: Technology Everywhere. Millennials are the first generation to grow up digital. Millennials spend more than 53 hours a week with media because they use more than one kind at the same time. Millennials love technology because it makes them important to the older generations; it gives them freedom; it shrinks and expands their world; and it gathers them into tribes.

Ghost Story #6: Emerging Adulthood. Some Millennials take longer to figure out what they want to do than members of the older two generations did. There are many reasons emerging adulthood is more obvious today, but the biggest one is that we don't believe a person is an adult until around 26. Remarkably, twentysomethings agree, thinking it takes that long to figure out what they want to do, commit to a long-term love relationship, and have enough saved up for their own place.

PART TWO: STICKING POINTS: HOW TO GET FOUR GENERATIONS WORKING TOGETHER IN THE 12 PLACES THEY COME APART

Decoding the Generations

If the four generations will acknowledge the 12 sticking points and work through them as a team, they will find themselves liberated to become a team with a unified vision instead of a group with different agendas. But to lead through the sticking points, you must be able to decode what the generations mean — and don't mean. Use the five-step process (acknowledge, appreciate, flex, leverage and resolve) to lead through the following generational sticking points with your team.

Communication

Communication is one of the easier sticking points to get out on the table because people already speak openly about new technology and the differences in the way the generations communicate. When one generation says that another generation's preferred method of communication isn't as effective as theirs, things can get tense. Differences with communication etiquette get people even more upset. How much you should flex is based on business necessities and generational preferences. Here are some things to remember:

The older generations will need to flex with more technology, and sometimes younger generations need to go "old school."

Acknowledge that every generation has its own communication preferences, which all have strengths and weaknesses.

Etiquette guidelines should be clearly established, because people say things online that they would not say in person or even in an e-mail. What employees say can impact the organization.

We can all increase our proficiency with the different communication preferences of the people we work with, live with or serve.

Decision Making

The six most common ways decisions are made are as follows: 1) The boss decides; 2) The boss asks all employees for input and then decides; 3) The boss asks more tenured employees for input and then decides; 4) The boss and a few employees meet and decide; 5) The savviest person on the topic decides; 6) The team talks it over and comes to a consensus or clear majority. If not, the boss or savviest person decides.

Older generations are used to decisions coming down from the top, while younger generations are more comfortable with a flexible approach, usually deferring to the person most knowledgeable or savvy on the given topic. Each of the approaches has its place, but numbers 2, 5 and 6 better fit a global, information-driven economy.

The generational differences can help your organization become more effective by pushing employees to pick the best decision-making process for each situation rather than staying ingrained in their standbys.

Dress Code

Any dress code conversation must begin with acknowledging that the four generations give four different answers to the question of which clothes communicate the professional image you want for your organization. But it's also helpful to remind people that all generations want the same things: to be comfortable, attractive and to be taken seriously.

The different generations help one another by being translators who can help decode what clothing means to each generation. Older generations can help younger generations understand that clothing sends a message to other generations, even if that message is unconscious and unintended. Older generations also need to understand when clothes have no message other than what is now the style for an age group. Let the generations help one another understand the messages that are being received.

Feedback

Millennials grew up with constant feedback, so they expect that in the workplace. But all generations report that they want more feedback but aren't getting it. If the Millennials' push for greater feedback helps us all get more of it, then they, like a lever, will lift everyone's performance.

Your organization can dramatically increase that leverage if your people start asking one another for feedback, because they will be tapping into the wisdom of all the generations. Get your team to talk about what they want and new ways to provide it. Then, the five-step process will transform generational tensions into a competitive advantage.

Fun at Work

The Millennials value fun more highly than other generations, but every generation wants to find enjoyment in their work. You have to ask your team what could make things more fun. It's also important to come to a resolution, an agreement as to when people can have fun as long as they get their work done. Clarifying the policy and sharing your intentions will ease generational tensions.

Just realize that the Millennials won't "grow out of it" if that means separating work from fun or personal life from work life. Technology allows them to blend these aspects of their lives. It's a 24/7 work world, and they know they have to take fun when they can get it.

Knowledge Transfer

It's a business necessity that we have the knowledge we need and that we eventually transfer it to the next generation. Because it's foundational, we need Step 5, Resolve, for this sticking point. When you understand each generation's preference regarding knowledge transfer, you can find the process that works for you.

Traditionalists and Baby Boomers need to acknowledge that Gen Xers and Millennials are comfortable with technology and would rather learn at their own pace, using high-tech methods rather than the observational and oral methods of their predecessors. Huge companies can use video (and other web-based technologies like podcasts and online discussions) to speed communication and increase knowledge transfer.

Loyalty

Getting unstuck around loyalty has two parts. First, we have to help the generations get a clear definition of loyalty that fits current economic and work realities. If we don't, older generations will always think younger generations have a moral defect because they're not as loyal as the older generations, and the younger generations will think the older generations don't understand the new economy.

Second, we must shift our energy away from criticizing other generations and towards discovering ways to make our organizations better so all generations want to stay longer. Loyalty is one of the sticking points that requires step 5, resolution. Here are five ideas that will help your organization resolve this issue:

- Remember that loyalty is the by-product of everything you do.

- Gather a cross-generational group, and let them bring you ideas.
- Quit measuring yourself by Boomer-era standards. There will be more turnover.
- Millennials get bored easily and need new challenges.
- Make sure employees know what opportunities you have internally because new jobs are only a screen away.

Meetings

Acknowledge that the four generations view meetings differently:

Traditionalists met infrequently, and the boss did most of the talking.

Baby Boomers held meetings to gather information, and they created new political opportunities for everyone.

Gen Xers will multitask if meetings are not relevant or do not keep moving. They would rather do some of it electronically.

Millennials think meetings are okay, but don't want to be bored. They want meetings to be interactive and may interrupt.

Put this sticking point on your next meeting's agenda, acknowledging that each generation can improve meetings. Traditionalists are a stabilizing force, because they've faced many of the challenges that make people emotional in meetings. Boomers bring process and remind us of the value of face-to-face meetings. Xers help us get to the point. Millennials will make meetings a lot more fun if we let them.

Policies

You can't manage generational differences using top-down policies in today's workplace — you have to lead. This is one of the sticking points in which generational differences really stand out. Here's an overview of how policies have been viewed by each:

Traditionalists: Everyone needs to do what they're told.

Baby Boomers: Let's create a policy or procedure so everything runs smoothly and is fair for everyone.

Gen Xers: Rules are made to be broken.

Millennials: If it doesn't make sense, I'll assume it's a guideline.

A different approach to policy creation that recognizes all generational preferences is to use step 3, Flex. In this approach, a policy task force is created made up of representatives from all four generations. This task force has great leverage when using this recommended process:

Find representatives who are respected by colleagues of their generation.

Tell them you're not promising to agree with every detail of their recommendations but that you have complete confidence that by leveraging their generational differences, they can come up with something better than you could.

Lay out the business challenges. Tell them about prohibitive regulations, customer complaints and budget limits.

Let them work through the five-step process.

Because Millennials feel comfortable questioning policies and see them as guidelines rather than rules (if they don't buy the reason for them), the question is, "How do we get the Millennials to follow our policies?"

This is a generational collision. For Traditionalists and Boomers, policy is a reason. For the other two generations, it's an invitation to ask more questions. Boomers were the last generation to respond to policy. Millennials respond to people. Show them how policy impacts people.

Don't neglect two key things when dealing with Millennials and policy:

You need to translate the generational differences so that the Millennials understand why what they're doing is bothering Traditionalist customers. And you must relate the policy to the Millennials' values. Ask them to relate older customers' preferences to someone in their own lives of the same age. Link it to showing respect for that person.

Respect

Respect is foundational to relationships and often raises emotional misunderstandings. All four generations need respect, but they meet that need in different ways. Stereotyping other generations can be a real problem.

Many of the other sticking points — work ethic, communication, decision making, dress code and meetings — intensify if you and your colleagues don't understand how to navigate through differing definitions of respect. When people appreciate why the generations see respect differently, they naturally want to figure out how to flex so that everyone's common need is met. Here are some ideas on how to flex:

Identify their definition of respect, then flex. Like a person visiting another country, employees need to better read the reactions of the other generations and flex their personal preferences.

Don't take it personally. Realizing that the four generations have different views of respect helps to not take individual actions personally. One simple rule will keep your team working together when stereotypes threaten to pull them apart: They didn't mean it personally, so don't take it personally.

Approachable and respectful works for everyone. Randstad's 2009 World of Work survey showed that all four generations want their managers to be approachable (92 percent for Boomers, mid-80s for the other three) and have an attitude of respect (91 percent for Traditionalists and Boomers; 89 percent for Gen X and 85 percent for Millennials).

It doesn't matter if you are the manager for a team or project or are simply an associate. It doesn't take big things to make a real difference when it comes to respect.

Training

Employees of all generations want more training. Both organizations and individuals have one thing in common — they will both have to learn to survive. It's a business necessity to make training work for all generations. That requires organizations to offer content in forms that suit the different generations best. Here's how each generation has viewed training:

Traditionalists: We got trained in the "school of hard knocks."

Boomers: Training is a reward.

Gen Xers: Training is my security. If I'm not learning, then I won't be prepared for the future.

Millennials: Who would work for an organization that didn't provide training?

Let me suggest four lessons: Don't complain that the younger generations don't have what it takes. Don't assume you know what your people need. Create hands-on practice opportunities. Be clear on what you want your employees to be able to do when they're done.

Your organization will increase the time, energy and money they spend on training not only to attract and retain all four generations but also for your own survival.

Work Ethic

Tensions around work ethic come up more than any other sticking point. When you're addressing generational sticking points, it is critical to find the common need. For the sticking point of work ethic, the common need is fairness and balance. We all want everyone to do their fair share so no one feels taken advantage of.

The older two generations see work as the steak and everything else as the vegetables, salad and dessert. The younger two generations see life as a waffle. Work is one quadrant of the waffle, and everything else — friendships, family, volunteer work, and other things they value — make up the other three squares. So please, boss, keep your work syrup off the other three squares of my waffle.

Focusing on results rather than hours places the emphasis on business necessities rather than generational preferences. But that means if an employee doesn't deliver results, you need to address performance.

Your team will work best when you leverage the strengths of the four generations. Together they will help each other get more done while having more fun doing it:

Traditionalists know that there is no trophy until you put in the hard work.

Boomers know that good processes save time and prevent errors.

Xers can show us how to cut to the chase.

Millennials can figure out where the shortcuts are.

Work ethic is the most common sticking point in the workplace, but it doesn't have to leave you stuck. The generations need to help each other figure out how to get things done and balance their lives in our 24/7 world.

Conclusion: Sticking Together

You've learned how to spot generational sticking points and what to do about them, and you can do it. You can turn stuck to sticking together with your teams, organizations and families.

And you can also use the five-step process when you're stuck around generational differences with individuals. The most powerful impact of learning about generational sticking points for most people is that they realize those differences play a part in the frustrations they have with coworkers or family members.

Instead of getting irritated, look for ways to leverage generational strengths rather than getting stuck around the differences. Remember these two things, and you've got this: 1) Don't take it personally; the other person doesn't mean it personally; and 2) Speak the other person's generational language.

The Three Rules

How Exceptional Companies Think

by Michael E. Raynor and Mumtaz Ahmed

THE SUMMARY IN BRIEF

Finally, an answer to the ultimate business question: How do some companies achieve exceptional performance over the long term?

Michael E. Raynor and Mumtaz Ahmed have analyzed 45 years of data on more than 25,000 companies. Their five-year study began with a sophisticated statistical analysis to identify which companies delivered truly exceptional performance — 344 in all. In collaboration with teams of researchers, Raynor and Ahmed then put a carefully chosen representative sample of 27 companies under the microscope to uncover what made the standout performers different. They found that exceptional companies, when faced with difficult decisions, follow three rules:

1. **Better before cheaper.** They rarely compete on price.
2. **Revenue before cost.** They drive profits through price and volume, not thrift.
3. **There are no other rules.** Everything else is up for grabs, and they are willing to change anything to remain true to the first two rules.

The Three Rules provides an indispensable compass that any company can use to chart its own path to greatness. Is it better to keep price down or invest in creating value that commands a higher price? Should you focus on talent and developing the abilities of your people or build processes to extend the capabilities of your organization? According to Raynor and Ahmed, the right answers to these and just about every other question are the ones most closely aligned with the rules.

IN THIS SUMMARY, YOU WILL LEARN:

- What the rules are and how following them drives superior profitability.
- What challenges you can expect when attempting to follow the rules and how to overcome them.
- What it means to treat the rules like *rules.*

More Than a Fortune Cookie

The quest for greatness leads naturally to the study of great companies. Unfortunately, the study of great companies does not lead naturally to great insight. Inquiries into the ebb and flow of top performers yield, as often as not, explanations built on the concatenation of unlikely and impossible-to-repeat events. These often amount to little more than entertaining corporate biography, falling far short of the powerful generalizations we seek.

With this in mind, our search for the drivers of superior, long-term performance began with a radically different premise: that what constitutes standout performance is not obvious. It is not enough simply to set up a performance benchmark, no matter how demanding it might seem, and see who clears it. We wanted only those companies that were good enough for long enough that we could be confident something special was going on. We wanted companies that were truly *exceptional*.

To that end, we analyzed 45 years of Compustat data on more than 25,000 unique companies — nearly 300,000 company-year observations from 1966 to 2010. From that universe we identified a population of 344 exceptional companies in two categories: 174 Miracle Workers, or the best of the best, and 170 Long Runners — still exceptional but at a lower level and for a longer period of time.

From this population of exceptional companies we selected a representative sample of trios, three companies from each of nine industries. Each trio consists of a Miracle Worker, a Long Runner, and a third company of average performance that we call an Average Joe. By comparing the very best with the very good and both with the merely average, we hoped to shed light on two different types of exceptionalism. First, what does it take to pull away from the pack, that is, how do Miracle Workers and Long Runners separate themselves from Average Joes? Second, how do Miracle Workers — the very best — pull away from Long Runners — the very good?

Better Before Cheaper

At the most generic level, whenever we buy anything, there are two dimensions to the value we get from our purchase: *price* and *non-price*. Price value is a function of how much we pay for something, and the less we pay, the more price value we get. Non-price value is a function of all the other dimensions of value that are not price: durability, functionality, quality, convenience, ease of use, style, brand, etc. How much of each of price and non-price value a company provides relative to its competitors defines its *position* in competitive space; that is, how a company creates value for its customers.

Of course, no company can afford to ignore its relative price position. That is why the rule is "better *before* cheaper": being price competitive is far from irrelevant, but when it comes to *position* in the market, exceptional performance is caused most often by greater non-price value rather than by lower price.

Revenue Before Cost

A company's position defines how it creates value for customers relative to other companies. A company's *profitability formula* describes how it captures value for itself compared with others. It turns out that just as there is a pattern in how exceptional companies create value (*better*

before cheaper), there is a pattern in how they capture value.

We measure profitability using return on assets (ROA), which is defined as income divided by the book value of assets. Return on assets is the product of return on sales (ROS), or income divided by sales, and total asset turnover (TAT), or sales divided by assets. Consequently, there are only three ways either individually or in combination that a company can improve its ROA: increase revenue, decrease cost or decrease assets.

Our research reveals that exceptional companies are systematically more likely to drive their ROA advantage through higher relative revenue than by lower relative cost or lower relative assets. Going down one more level, a revenue advantage can be driven by higher unit price or higher unit volume, and exceptional companies tend to rely more on price. And so rule number two is *revenue before cost*.

We see evidence of our profitability formula rule in many industries, even ones in which you might think cost leadership would be indispensable. Take, for example, Family Dollar, a discount retailer. For more than 30 years Family Dollar delivered performance that has been hidden in plain sight, besting the legends of discount retailing since the mid-1970s and doing it in ways few might have guessed.

Family Dollar's Position

Family Dollar has consistently focused on serving the needs of customers from lower economic strata. You might think that if ever there were an industry in which lower prices and lower cost were key to superior profitability, discount retailing would be it. Certainly that was our assumption. It did not turn out that way. Family Dollar's success has been a function of *higher* prices earned through a willingness to incur *higher* cost and tolerate *lower* efficiency than many of its larger, lower-performing (but still successful) discount retail competitors.

How is that possible? How does a discount retailer serving the most cash-strapped customer segments turn in superior profitability for more than three decades with higher prices and higher cost than its most ferocious foes?

Start with Family Dollar's position compared with its competition. To capture the benefits of the low prices of the largest discount retailers, customers must often drive several miles to 100,000-plus-square-foot suburban locations and purchase products in relatively large quantities. In stereotypical but representative terms, spending $5 on gas to buy a package of 150 diapers at a unit cost of 15 cents adds up to $27.50. That makes more sense than walking three blocks and buying 15 packages of 10 diapers at 20 cents each for a total of $30.

When a customer has $27.50 to spend, the larger discounter wins the business. However, in the days or weeks leading up to the next paycheck when money is especially tight, a customer's calculus is much different. In these circumstances, poorer people can afford only smaller quantities and typically are shopping only for a smaller range of items that vary on a week-to-week basis. This week one has run out of diapers; last week it was laundry detergent; next week it might be toothpaste. In these circumstances, walking to a 20,000-square-foot Family Dollar located in an urban center for a package of 10 diapers at 20 cents each makes a lot more sense.

Serving customers coping with these constraints has led Family Dollar to build a position defined by convenience, selection and lower basket size — all non-price dimensions of value. An analysis of the company's financial statements reveals the economic implications of these choices. Family Dollar enjoys a gross margin advantage over its most significant competitors but suffers a sales, general and administrative (SG&A) cost disadvantage and inferior asset turns. Of course, a gross margin lead could well be driven by lower cost of goods sold (COGS) and not higher prices, but this is not the case: Family Dollar appears to have consistently higher quality-adjusted prices.

Now, Family Dollar has lower cost, greater growth, lower prices and better asset turns than high-end retailers such as Bergdorf Goodman. But then, Family Dollar does not compete with Bergdorf Goodman. It is when stacked up against another leading discounter that the nature and significance of Family Dollar's choices become clear: It has incurred the higher cost required to establish a position based on non-price dimensions of value. This has inflicted an efficiency penalty, but the company has been compensated with relatively higher prices. The net result has been more than 30 years of exceptional profitability.

There Are No Other Rules

The first two rules tell you what you *should* do: *better before cheaper* and *revenue before cost*. The third rule tells you what you should not do, namely, think anything else matters in a systematic, specific way.

Finding Signal in the Noise

In many success studies, claims of generalizability most often turn on the diversity of the companies in the sample — the range of industries, the time periods examined and so on. We have adopted this approach as well: Our nine

trios are drawn from a diverse set of industries, including pharmaceuticals, electrical wiring, confectionary, trucking and fashion retail.

A diverse sample is certainly more likely to be generalizable than a homogeneous one, but diversity per se is far from sufficient, especially given what is at stake. The problem is that we cannot know what characteristics of similarity and difference are relevant. Should the industries studied be different with respect to asset intensity or growth rates? Regulatory constraints or technological change? Competitive pressures or exogenous shocks? There are simply too many ways to be different for any sample to be different in every possibly relevant way. Diversity helps, but it will not suffice.

In our case, we identified the population of exceptional companies and then chose a sample essentially at random from that population. We can confidently claim that our case studies at least potentially matter because they shed light on a much larger number of companies. Our explanations have a hope of saying something about companies other than the ones we happened to study.

Great Companies

Similarly, the study of great companies can leave us wondering if we have set our sights too high. Google is *Google*, for heaven's sake. The company certainly captures our imagination, but perhaps we are kidding ourselves if we think that the drivers of its exceptional performance are relevant to the rest of us.

The good news is that alongside the iconic, magazine-cover material of Microsoft and Oracle in software or Amgen and Genzyme in biotech, we find many companies and industries that exist on a much more human scale. Precisely because our method isolates the effect of managerial decision-making on performance, we find exceptional performers of all shapes and sizes.

Our methods are not perfect; no method is. But we believe that we have developed and employed material improvements in the identification of truly exceptional performance, isolating periods of higher and lower performance and connecting behavioral differences to performance differences in ways that justify a higher level of confidence in our conclusions.

Better Before Cheaper

Better before cheaper distills to its essence what our research reveals about the relationship between competitive position and exceptional performance. Of course, competitive position has been the subject of research and discussion for decades. For all the seeming differences among the various approaches, competitive space has typically been defined in terms of the non-price value the customer receives and the relative cost of production of competing suppliers.

For us, competitive position defines how a company creates value for customers, and thus the more useful of these two traditional dimensions is non-price value. For example, when buying a car, customers typically consider a variety of attributes, including safety features, reliability of operation, customizable features (for example, color or interior upholstery), the sales experience, ease and accessibility of servicing and so on.

Most elements of non-price value can be measured, albeit with different degrees of precision: a car's acceleration is highly quantifiable, safety ratings less so, and the "stylishness" can be given at best perhaps the appearance of specificity. Tools such as conjoint analysis can use these measurements to estimate the relative importance of each dimension, allowing companies to assess on which aspects, alone or in combination, they should seek to surpass the competition in order to win the business of specific customers or customer segments.

The second dimension of traditional approaches to positioning analysis, relative cost of production, is not directly relevant to *better before cheaper* because it does not describe how companies create value for customers. Companies can choose to exploit a lower-cost position to enjoy superior profitability at prices similar to their competitors. In that situation, although lower production cost is good for the company, it is irrelevant to the customer. Since *better before cheaper* is about creating customer value, our second dimension of position is relative price value, where price value (as perceived by customers) typically goes up as price goes down. Price — what a customer pays for something in money — is readily quantifiable, so one can usually determine fairly easily which of two sufficiently substitutable offerings is less expensive (has superior price value).

A car that was better than all other cars on all dimensions of value in the eyes of all customers would have 100 percent market share. No car has 100 percent market share, however, because different customer segments want combinations of dimensions of value that are necessarily negatively correlated. Some customers want a larger car (say, for seating capacity) and some want a smaller car (say, to fit in small parking spaces). In any pair-wise comparison, no car can be both larger and smaller. Similarly, speed and energy consumption are negatively correlated (all else equal) because it takes more power to move a given mass

faster. Still other limitations are entirely contingent: Creating a minivan that has more sex appeal than a sports car requires only that people's tastes change.

In other words, constraints impose trade-offs. No product or service can be all things to all people, and everything we know about the power of market segmentation and focus is based on this inescapable fact. Companies that refuse to accept trade-offs among different dimensions of performance very often end up "splitting the difference" in ways that make few people happy.

In summary, the dimensions of position are price value and non-price value. Products or services occupy different locations in competitive space to the extent that they differ along these dimensions. Thanks to the existence of trade-offs among at least some dimensions of value, differentiated competitive positions can be profitable, while positions based on being better along all dimensions of performance simultaneously are rare.

Non-Price Positions

Non-price positions are systematically more profitable and more sustainable than in-the-middle or price-based positions. This falls far short of a complete blueprint for success, but it does, we hope, provide valuable guidance when you have to make tough choices among equally viable alternatives.

For example, when your customers are yelling for price cuts, you can drop prices and then squeeze your company elsewhere to try to preserve profitability, or you can see through their complaints on price to the more difficult truth that maybe you have gotten lazy or lost focus or that the competition has upped its game, and you no longer provide the superior value you once did. Addressing that problem means taking on the challenge of increasing and perhaps even changing the value you provide; it could mean changing any or all of your technologies, processes, markets or customers. Both courses of action — cutting price or increasing value — can be difficult to pursue successfully, and each of them can make equally good sense.

It is in just these circumstances that *better before cheaper* proves its worth. Faced with a choice between two difficult, similarly plausible but mutually exclusive solutions to what can be an existential challenge, the best you can do is play the odds. Our research suggests strongly that the most profitable course of action is to devote your resources to tackling the hard problem of creating anew the non-price value your customers will pay for, not the hard problem of how to remain profitable at lower prices.

Position comes first. It is the height to which your roller coaster climbs, and so it defines the upper limit of the profitability you can aspire to. Execution comes second, for it defines the thrill of the ride promised by that climb, or how much of that potential you capture as kinetic energy. Poor execution wastes potential energy in the form of noise and heat. So execution matters, but no level of greatness in execution can make up for poor positioning any more than a smooth ride can compensate for a short climb.

Industry, of course, is critical: It is difficult to imagine how any company could hope to be successful running clearly counter to the dictates of its context. All of our exceptional companies, in their heydays, were astute surfers of industry waves. But the key to winning is standing out from the background noise, not blending in.

Revenue Before Cost

How best to create value for customers is a question that can be usefully seen as a choice between competitive positions defined by an emphasis on price value (that is, low price) or non-price value. Perhaps somewhat unusually, seeing the question in these high-contrast terms is not a dangerous oversimplification. It is instead an accurate distillation of an underlying structure that is too often hidden beneath unnecessary complexity. Sometimes the world is nuanced and complex and colored with shades of gray. But sometimes there are clear choices to be made, and we simply do not want to face up to them. *Better before cheaper* is an unambiguous answer to a straightforward but too often ignored question.

Creating value for customers is a necessary condition for exceptional performance, but it is not sufficient. The value you create is only the "size of the pie." Whether or not a given company is an exceptional performer is also a function of the "size of their slice," or how value is divided between customers and the corporation. In other words, exceptional companies must not only create value but also capture it in the form of profits.

A company can increase its ROA by increasing price, volume or both, or by decreasing overall cost, the sum of cost of goods sold (COGS) and other costs, or reducing assets. As with the trade-offs among the dimensions of performance that define position, however, there are typically trade-offs among the variables that determine a company's profitability. For example, increases in both price and volume increase revenue, which increases income and hence ROA. However, price and volume can be negatively correlated, making it difficult to increase both simultaneously.

On the other hand, although higher cost (which reduces ROA) can be a consequence of inefficiency, it can also be a function of using higher-quality materials or more skilled labor, each of which can contribute to non-price value, thus justifying a higher price (which increases ROA). Consequently, price and cost can move in the same direction. Volume and assets also often move together yet exert contradictory pressures on ROA: Higher volume can increase asset turnover, which increases ROA but only if the higher volume does not require disproportionately more assets.

The key to superior profitability, then, is not how well a company manages any one variable in the ROA equation but how it manages the interdependencies among them in light of often unavoidable trade-offs. We call this a company's profitability formula.

We discovered that exceptional companies, by an overwhelming margin, have a common profitability formula, which we have summarized in our second rule, *revenue before cost*. This means that when exceptional companies face a trade-off between increasing profitability by increasing revenue or by decreasing cost, they systematically choose increasing revenue *even if that means incurring higher cost*. We have never seen an exceptional company spend with abandon. Rather, we have concluded that sustained profitability advantages are rarely driven by disproportionately lower cost or asset bases when compared with the competition and instead are very often driven by disproportionately higher revenues.

A large part of the significance of this finding lies in the fact that our data could have revealed the opposite, namely, that superior profitability is typically driven by relatively lower cost. But it is not. Profitability advantages driven by higher revenue, even when they incur higher cost, prove to be more valuable than advantages driven by lower cost.

The Structure of Differences in Profitability

The ROA decomposition analysis on our case study companies suggests very strongly that Miracle Workers (top companies) rely most heavily on a gross margin advantage for their overall ROA lead. Disadvantages in other costs (SG&A, R&D and so on), asset turnover or both are simply the consequence of unavoidable trade-offs, the cost of the differentiated products or services that earn the higher gross margins.

We wanted to know if this pattern was reflected in a meaningful way in our full population of 174 Miracle Workers, 170 Long Runners and 1,208 Average Joes. To figure that out, for each year that each company is in our database, we calculated the difference in gross margin, other costs and asset turnover between the company and the industry median. We then regressed each of these differences against each company's ROA difference from the industry median in that year. This allowed us to see how changes in advantages in these three drivers of ROA translated into ROA advantage. In other words, we could see how much an additional point's lead in gross margin percentage over the industry median affected the ROA lead over the industry median for Miracle Workers, Long Runners and Average Joes.

The results were telling and entirely consistent with the patterns revealed in our case study analysis. For each additional point in gross margin percentage advantage, Miracle Workers realized 0.51 percentage points in additional ROA advantage. The same increase in a Miracle Worker's advantage in other costs, however, yielded only 0.47 percentage points in additional ROA advantage. The implication is that Miracle Workers tend to have a profitability formula that is more efficient at translating a relative gross margin improvement into a relative ROA advantage than it is at translating a relative reduction in other costs into a relative ROA advantage. In more practical terms, it means that Miracle Workers have positions and profitability formulas that favor *revenue before cost*.

Companies classified as Long Runners will necessarily have a smaller ROA advantage over the industry median than Miracle Workers since these categories are defined by their different profitability levels. This does not say anything, however, about how efficiently they turn gross margin or other cost advantages into ROA advantage. Long Runners could easily have been more efficient at translating advantage in one or more of the drivers of ROA but simply have been unable to generate a similar magnitude of advantage.

Average Joes, not surprisingly (but by no means necessarily), are the least efficient of the three performance categories but, like Miracle Workers, are more efficient with respect to gross margin than other costs.

There Are No Other Rules

It might seem somewhat precious to posit "there are no other rules" as our third rule, but we feel it serves two important purposes. First, it is our admission that we were unable to find any other meaningful patterns in the behaviors of our case study companies that were associated with differences in performance. We cannot prove a negative, but in what follows we will explore at greater length why we dismissed such perennial favorites as M&A

or diversification as systematic drivers of performance. The irretrievably idiosyncratic and contingent nature of how these and many other behaviors contribute to performance led us to conclude that exceptional companies all have the same recipe (*better before cheaper, revenue before cost*) but use different ingredients.

Second, in addition to creating superior levels of performance, exceptional companies deliver superior levels of performance for longer than anyone has a right to expect. It seems worth exploring, then, if and how exceptional companies adapt. Is exceptional performance a function of deep moats and thick ramparts, or does it require agility and flexibility to cope with competitors' attempts to imitate a winning formula or with the technological, regulatory or other environmental changes that can render onetime advantages useless or even turn them into liabilities?

We found that not only were there no patterns between companies from different performance categories; there were no patterns across time within individual companies. So not only did Miracle Workers and Average Joes show no differences in their appetites for M&A, but individual Miracle Workers were just as likely to adopt M&A as to abandon it over time. In short, what mattered when assessing how a behavior affected performance was not the behavior or even its implementation but the contribution made to a company's adherence to or deviation from the first two rules. Where Lost It Miracle Workers typically changed in ways that violated the rules, Found It Miracle Workers became more aligned with the rules. Most revealing, Kept It Miracle Workers often showed evidence of the greatest degree of change in their specific behaviors, but always in the service of remaining in alignment with the rules. We conclude from this that exceptional performance demands an ability to change in order to stay the same.

Change to Stay the Same

The absence of any rules beyond the first two has important implications for how exceptional companies adapt. As with questions of position (*better before cheaper*) and profitability (*revenue before cost*), whether exceptional companies change over time is an empirical matter. It could have been that exceptional performance is typically achieved through relative intransigence: Find a winning formula and stick with it. Eventually it will be overtaken by events or the competition, but little matter; nothing lasts forever. On the other hand, superior performers might be characterized by change. In this case, we would like to know if there are any guiding principles that might help determine when and what to change.

We found that just as the specific recipes for exceptional performance were unique to each Miracle Worker, the nature of the changes each employed in order to create or sustain its exceptional performance defied meaningful generalization. There was neither a small, consistent subset of activities that responded to competitive or environmental shifts, nor did "everything" have to be reinvented. About all that seemed to matter was the first two rules.

Why You Should Use the Three Rules

An efficient market depends on the ability of a buyer to assess the merits of a purchase either before or after purchase and trial. The more completely and inexpensively one can make these assessments, the more efficient the market is.

By these criteria, the market for, say, instant coffee is likely to be relatively efficient. When faced with the challenge of deciding whether or not to try a new brand, you could explore the design and execution of the focus groups and surveys the coffee company undoubtedly conducted before launching its product. But you probably will not do that. Instead, because there is relatively little at stake in any given trial and few lingering aftereffects if it goes poorly, you will more likely listen to your friends or people who like what you typically like and try it out, or not. If you are the victim of a false negative, and you erroneously forgo trying something you would have liked, there is no real harm done there, either: You cannot miss what you have never known.

The market for pharmaceuticals that treat life-threatening, chronic illnesses is very different. When it comes to figuring out whether you should take blood pressure medication and, if so, which one, listening only to your friends is a very bad idea. The cost of a false negative — not taking something you should — could materially shorten your life, but so could a false positive (taking something you should not). Worse, we often cannot know after the fact whether taking the drug was good or bad for you, because your condition and the drug are but two of many factors affecting your health, and we cannot redo the experiment on you. Consequently, the mechanisms of market efficiency are much more heavily skewed toward understanding what is likeliest to work before you try it out. That means experimental design, data collection and analysis are absolutely critical to making an informed choice.

The most relevant companies to look to for indications of what works are most likely your competitors, but if you

do what they are doing, you will not improve your relative performance. No individual can hope to have had a sufficient quantity or variety of experience — never mind the challenge of avoiding well-documented psychological biases that would render difficult an objective interpretation of that experience — to come to reliably correct conclusions of their own. Adopting any study's advice typically requires a commitment over time, often many years, and connecting outcomes to adoption of the advice can be very difficult since a company's performance is a function of many other variables.

Yet the behavior of both purveyors and consumers of popular management advice, including and perhaps especially that an offer in success strategies, suggests to us that we are treating what is more appropriately seen as a beta-blocker as if it were a caffeine-free breakfast blend. It is only too frequently that otherwise accomplished executives endorse and adopt the findings of prescriptions of a given work because the advice offered confirms what they already felt were the key drivers of corporate success. That is, they like what they have read precisely because it does not tell them anything fundamentally new.

Hence our emphasis on questions of research design and standards of evidence.

Glider Pilots

Glider pilots, like all airplane pilots, know the expression "takeoffs are optional; landings are mandatory." It means that no matter how high, fast or far you fly, you are going to come back down. Gravity always wins.

The same can be said of corporate performance. The only certainty for any company doing well is that eventually it will be doing worse. Every company that has ever soared has or will eventually become entirely average — or worse. Although you might not be able to predict precisely what will bring down any given high flier, it is a sure thing that something will.

Sometimes greatness erodes because of internal failings: Inertia born of complacency might lead you to resist obvious and necessary changes; or entropy born of hubris might dilute your focus on key customers or markets. Sometimes external forces undermine performance: Competitors, spurred on by your success, emulate your behaviors or even improve on your original insights, leaving you with no advantage at all; changes in customer preferences or regulatory or legislative constraints can render historical strengths irrelevant or even turn them into encumbrances. Whatever the proximate cause, just as no glider can stay aloft forever, no company can remain on top eternally.

This unfortunate fact of corporate life imposes an upper bound on the extent of the claims one can hope to make about the drivers of long-term, superior profitability. No advice can come with a credible promise of perpetual superiority. It might be theoretically possible for a corporation to deliver endlessly standout profitability, but as an empirical matter, we lack even an existence proof, never mind the sort of sample that might make possible the inference of general principles.

We have concluded, however, that even if defeating gravity is impossible, we can realistically hope to defy it. Despite the inevitability of a return to earth, some glider pilots do fly higher, faster and farther than others. Using the same equipment in the same circumstances, some pilots — the exceptional ones — remain airborne far longer, soar far higher, and travel far greater distances than others. For these pilots, gliding is not a passive experience. They understand their aircraft, the conditions and themselves and use that understanding to find lift where others find only the void, to achieve just the right angle of attack or to exploit the paradox of diving earthward to generate lift and head skyward again. Even exceptional pilots must land — but not until long after the rest of us.

Similarly, some companies are exceptional. They are able for a time — and occasionally for a long time — to overcome inertia, resist entropy and adapt to competitive or environmental changes. They create better performance and sustain it for far longer than anyone has a right to expect. Nothing lasts forever, but then, that is not the goal. The objective is to deliver the best possible performance for as long as possible.

Every glider lands eventually. But how long it stays up, how far it flies and the heights it reaches are all profoundly affected by the pilot's choices. It is our belief that by consciously adopting the three rules — *better before cheaper, revenue before cost* and *there are no other rules* — you can reasonably hope to defy gravity its due for just that much longer.

Team Genius

The New Science of High-Performing Organizations

by Rich Karlgaard and Michael S. Malone

THE SUMMARY IN BRIEF

Teams — we depend on them for both our professional success and our personal happiness. But isn't it odd how little scrutiny we give them? The teams that make up our lives are created mostly by luck, happenstance or circumstance — but rarely by design.

In trivial matters — say a bowling team, the leadership of a neighborhood group or a holiday party committee — success by serendipity is already risky enough. But when it comes to actions by fast-moving startups, major corporations, nonprofit institutions and governments, leaving things to chance can be downright dangerous.

Offering vivid reports of the latest scientific research, compelling case studies and great storytelling, *Team Genius* shows managers and executives that the planning, design and management of great teams no longer have to be a black art. It explores solutions to essential questions that could spell the difference between success and obsolescence.

Throughout, Rich Karlgaard and Michael S. Malone share insights and real-life examples gleaned from their careers as journalists, analysts, investors and globe-trotting entrepreneurs.

IN THIS SUMMARY, YOU WILL LEARN:

- Why good "chemistry" often makes for the least effective teams.
- Why cognitive diversity yields the highest performance gains.
- Why groups of 7(±2) and 150 are magic sizes for teams.
- Why "pairs" are so special and how many types there are.
- What the life cycle of a team is.

Introduction

Successful teams are at the core of powerful organizations. But what explains game-changing teams — start-up teams, creative teams, R&D teams, project teams and sales teams?

Let us be clear. When we talk about teams, we are not talking about formal teams as depicted in company org charts and Web pages. *Team Genius* is about how work really gets done. Experience says that the world's most creative and impactful work gets done by informal teams.

It's time to take a look at teams systematically and scientifically. To prepare ourselves for the world to come in the rest of this century, we need to find the genius that resides in great teams.

Change Kills — If You Don't Have the Right Teams

Talking about the rapid pace of technology-driven change has become commonplace. Our acceptance of the reality of this change doesn't necessarily mean that we understand it or that we have developed effective strategies to cope with it.

Here is the uncomfortable truth: Humans run to a much slower evolutionary clock than our inventions. To use an engineering term, we are the "gating factor" that keeps a process from running faster. It is people, not scale or technology, who determine how well an organization adapts to change.

So, whether we know it or not, the difference in our rapidly accelerating world between a perpetually successful enterprise and a struggling, dysfunctional also-ran comes down to the people in those enterprises — and even more, to how those people relate to each other as they form and re-form into teams. Maneuverability will become the new essential for sustained rising value, and it will come from the combination of global reach, great technology and highly optimized teams — *team genius.*

Mastering Maneuverability

Maneuverability is more than rapid evolution. Sometimes even that is too slow. Rather, maneuverability is the capacity to turn, even reverse direction, quickly, to deal competently with whatever new change — technology, market opportunity or competition — has just burst onto the scene, and to do so without losing internal cohesion and breaking up. This is a challenge facing almost all institutions, from small retailers to the governments of great nations around the world.

The exponential forces at work in today's culture and economy reward winners quickly and punish losers mercilessly. Over here you'll find a resurgent Apple, but over there is sad, old Eastman Kodak; Germany on the one hand, Greece on the other; Silicon Valley and Detroit. Whether the global economy improves or worsens, this new unevenness is here to stay.

That's not to say that older and larger organizations cannot maneuver effectively and even make stunning reversals in direction. But it is exceedingly rare. And it almost never happens unless a small, cohesive team is found at the center or top of that organization and is endowed with two other crucial factors: the power to execute its decisions across the entire organization and the trust of its players in the periphery around that team. Indeed, even the largest organizations can maneuver widely and with stunning speed in the face of rapid change if they are built out of genius teams in support of an empowered leadership.

The Magic Numbers Behind Teams

Researchers into the nature of leadership recognized decades ago that even the best leaders have a limit to their successful *span of control,* usually six to 10 people — the number of individuals whom they can personally manage at the highest levels of productivity. Beyond that, even the most talented leaders simply don't have enough intellectual, emotional or temporal bandwidth to provide the requisite personal attention. Thus, smart leaders begin to divide up their direct reports into multiple teams; each with a subordinate emplaced and empowered to serve as the new team leader.

A second force at work in creating team archetypes is *structural stability.* Here one can draw an analogy with atomic theory. Certain molecules are inherently stable due to the nature of their atomic bonds and structure. Others are much more volatile, and unless constantly maintained in the unstable condition, they will quickly revert to more stable structures.

Human teams exhibit the same combination of stability and volatility. Some teams, most obviously pairs but also large groupings such as the 150-160 people in a typical tribal village, are considerably stable. Pairs, of course, are the most stable of all, not just because of their simplicity but also because they manifest those most basic of all human relations: friendship and marriage.

But add a third team member and things become much more complicated — sometimes even explosive. Trios work, of course, but often it seems they do so only by serial pairing. After all, history doesn't show many triumvirates and troikas, especially among rulers, that have survived for long.

Beyond three members, the next optimal team size has been the subject of considerable debate. Susan Healthfield, a human resources expert, offers this: "So, optimum team size is not an easy answer. From experience and research, the optimum team size is five-seven members. The team size that continues to function effectively is four-nine members. Teams are known to function cohesively with a size up to 12 members."

Studying everything from Hutterite religious communities to the Yanomamo people of the Brazilian jungle, British anthropologist Robin Dunbar discovered that the same human group sizes appear over and over. He called them "clusters of intimacy," and he identified "cliques" of five people, "sympathy groups" of 12-15 people and "bands" of up to 35 members.

Dunbar's biggest discovery, now named after him, was that there appeared to be an upper limit to team size. Precisely: 147.8, normally rounded up as the "Dunbar number" to 150.

The figure of 150 seems to represent the maximum number of individuals with whom we can have a genuinely social relationship, the kind of relationship that goes with knowing who they are and how they relate to us.

Until now, teams have by necessity largely been recruited and formed by hunch, intuition and experience, with little to no empirical support. That is about to change.

The New Science of Teams

The most fundamental questions one can ask about teams are, "Are human beings designed to work together?" and "Can each person grow and perform at his or her best if properly fit into the right team?" Some of the most compelling new research in brain science says yes.

In fact, the human brain is evolutionarily designed so that individuals can adjust to one another's perspectives and emotions in order to engage in cooperative activity. When we engage with another person, we are, in fact, embarking on an intimate brain-to-brain connection with that person. The deeper that engagement, the greater that relationship affects our brains and our well-being to the point of actually activating genes controlling our immune systems. Thus, nourishing relationships really are beneficial for our health, while toxic ones can actually be physically destructive.

Mirror Neurons, Spindle Cells, Oscillators

The discovery of mirror neurons, among the most important findings of the last decade in neuroscience, helps us understand many heretofore paradoxical social phenomena, including the evolution of language, emotional empathy and personal social identity.

Mirror neurons are nerve cells in the brain whose purpose appears to be creating a copy of an observed action — either by the owner of that brain or, even more astonishingly, the action of others.

The discovery of mirror neurons could be a game changer, with the potential to offer breakthroughs in everything from how teams are created to the nature of leadership.

It is because of mirror neurons that people are able to emulate within seconds the emotions and actions of others. Mirror neurons also allow us to navigate our social world and create an instant sense of shared experience. And they are particularly important to leadership, because followers don't just act out the orders of leaders, they actually tend to mirror the feelings and actions of those leaders. For example, a leader who smiles and laughs will trigger similar laughter in his or her team — a process that also helps in team bonding.

Mirror neurons aren't the only cells in the brain that help regulate how we interact with others in team settings. In practice, intuition can seem like ESP, coming from a place deep in the recesses of your mind. But recent research has found that intuition is partly produced by a class of neurons in the brain called *spindle cells*. The role of these spindle cells is to quickly transmit thoughts and feelings to other cells. Within one-twentieth of a second, spindle cells trigger neural networks designed to make judgment calls with only a minimum of evidence — such as deciding whether one person is trustworthy or whether another is right for a job. In our fast-moving digital world, this ability to make accurate "gut calls" can be crucial for team leaders.

Meanwhile, another class of neurons called *oscillators* regulates physical coordination between people. When two cellists play together, they hit their notes in unison because of their respective oscillators. In a sense, human beings find harmony when their oscillators do.

For now at least, we don't know how to strengthen or regulate the firing pattern of mirror neurons, spindle cells and oscillators. But what we can understand is that these fundamental factors do exist, and not only are happiness and stress contagious, but they can spread within seconds across a team.

Measuring Teams in Real Time

Teams these days are not just being studied statistically or as part of isolated experiments, but in real life and while they are in operation.

Alex Pentland, the director of MIT's Human Dynamics Laboratory, and his team have used "sociometers" to generate data on communication patterns and productivity of teams in real organizations. Sociometers are wearable electronic sensors that measure patterns of communication — including the amount of face-to-face interaction, conversation time, physical proximity to other people and physical activity levels — using social signals derived from vocal features, body motion and relative location. They capture tone of voice, how one faces others in groups and how much people listen and talk. For Pentland, great teams do the following:

- They communicate frequently.
- Team members talk and listen in equal measure.
- They communicate informally.
- They look for ideas and information outside the group.
- They adjust their patterns of communication.

Another way of looking at teams in real time is called *team neurodynamics.* This is the science of modeling teamwork through the measurement of members' neurophysiologic indicators. In other words, wire the team up and send them back to work. The field of neurodynamics is based on the discovery that an individual's brain rhythms become synchronized to the frequency of the stimulus presented to him or her.

All of these experiments and observations lead to the possibility of one day being able to assemble teams, test them in action and then see if their individual and group responses indicate a team that will work well together.

The Power of Difference

When it comes to teams, traditional definitions of "diversity" are meaningless. Cognitive diversity — *how* people think — is all.

One common source of this cognitive diversity is cultural and is the result of different patterns of socialization. For example, in some cultures, people tend to be holistic thinkers, and in others people tend to be more analytical. Another form of cognitive diversity can be found between

socially contextual (context-dependent) and independent (context-independent) thinkers.

Here's the thing: A team needs both independent and socially attuned thinkers. Leaders also need to know the distributions of the different types of thinkers on the team and manage accordingly. Studies have found that the optimal balance of people on radical-innovation teams requires that 50 percent of the members have the following distribution of personality types:

- Creative: 20 to 30 percent. Teams with too many creative types struggle with implementation. That's because (surprise!) creatives are not always practical, are not concerned with rules and may initiate conflict.
- Conformist: 10 to 20 percent. Conformists are the backbone of the teams, and their key role is to support the creatives. Conformists help boost cooperation and improve team confidence. They make teams predictable in a good way.
- Detail-Oriented: as much as 10 percent. Detail-oriented people may often be risk-averse, but they help strengthen important team functions such as budgetary control. The detailers make sure that the team is still there each morning.

More than 40 years of research on diversity has been conducted by psychologists, sociologists, economists and organizational scholars. A review of this literature in 1999 by Katherine Y. Williams and Charles A. O'Reilly of Stanford Graduate School of Business underscored that diversity is a double-edged sword.

The good news is that group diversity can enhance performance, because group members bring to bear varied ideas, knowledge and skills to accomplish tasks. However, in a diverse group, members may view each other through a biased lens of stereotypes based on social categories (the same differences in race, gender and so forth that are supposed to help). This bias invariably reduces the effectiveness of the group's interactions.

Getting the Best from Diversity

The bottom line is that your greatest chance to create a successful, productive team involves a diverse membership — but the more diverse that membership becomes, the worse the odds are that the team will survive long enough to produce those results. So you need a strategy to mitigate the cost of that increased diversity. The scientific evidence suggests that this strategy should take two tracks.

First, diverse teams need to be actively managed. Abandon now any notion you have that you can build the most powerful team possible, wind it up and let it run by itself. In fact, the more diverse the team, the more hands-on management it will need.

Besides increasing the quality and participation of direct management, you will also need to be constantly vigilant against a number of threats to the team's continued existence. These threats include but are not limited to the following:

Turnover: Turnover is a problem in groups in which the members perceive each other as too different. The added stress of dealing with the "other" will drive some people to seek the safety of being with people more like themselves in other teams.

Framing: Framing is how a potential challenge or opportunity is presented to team members in relation to their overall project. So, how the challenge of the workforce diversity is framed by the team leader will affect how team members manage diversity-related tensions. Here, it is best to frame the value of your team's diversity as a matter of staying competitive and emerging victorious.

Belief: Research has found that teams with pro-diversity beliefs are better at harnessing the power of that diversity. That is, if they believe that their diversity is a competitive advantage, it will usually turn out to be so.

Tenure: It turns out that the longer you keep a team together, the fewer the negative effects of its diversity. Teams with high degrees of familiarity are better able to take advantage of diverse experiences among team members.

Now that you've built your team and populated it with a diverse group of members, your final challenge to keep it running at its full potential is not just to drive it to full productivity but to keep it running at that pace by minimizing its long-term losses.

Managing Teams to Genius

Fortunately, there is more than one path to team success. Fully armed with this knowledge, you should be able to find the team for you — as well as a leadership style that suits your personality and your organization's culture.

Here again, research in the last decade has revealed some interesting discoveries. One of them is that the values instilled in a team at its formation will shape the way its members approach tasks and their social interactions, and that over time those attitudes will solidify as a feature of the group's structure. That means that how your

team begins will determine how it ends and how it will perform during its existence.

J. Richard Hackman, an esteemed expert on teams, summarizes the leadership challenge most aptly. He notes that you cannot guarantee team success, but you can increase the probability of it by managing at the margins and setting up the right conditions. According to Hackman, these "right conditions" are

- The team has a compelling direction: The team task is clear, challenging and consequential.
- The team is bounded (it is clear who is and who is not on the team) and stable (the team's membership is not constantly fluctuating), and its members are interdependent (that is, they interact with one another to accomplish the team's work).
- The team is set up with the right mix of members, who have norms of conduct that guide their behavior. Team members are different but not so different that they cannot work with each other. Team members have the right set of skills and expertise for the team task.
- The team has a supportive organizational context that provides team members with access to resources, information and training to help accomplish their task.
- The team receives coaching from experts, peers and leaders.

Up to now, all information has been concerned with the inside of teams. Now, we follow by looking at teams from the outside — from the perspective of a manager assigned to build them and ensure their success.

The Power of Pairs

In today's tough and competitive economy, the demands of daily life at work and play are almost impossible to manage by oneself. What's needed instead are people with complementary skills. And we find such pairs everywhere: the engineer who teams with the technical writer, the trial lawyer with the researcher, the executive with the operations expert, the inventor with the entrepreneur.

Pairs often take on a wide and colorful array of forms, some of them quite unlikely at first glance. Not only is the success of these teams not correlated with compatibility, but some of the most successful pairs consist of two people who have nothing in common and may actually despise each other. Stranger still are the pairs in which one member may be long dead — or have never existed.

Needless to say, this is not the way we normally think of pairs nor how we typically assemble them in business, government or academia. Rather, we tend either to team up people who we think will work well together, or simply stick together the two best individuals for the job we can find. That this selection process remains so crude even into the 21st century is shocking. And yet, when those talented individuals are finally hired and put to work, they are paired with others, or put into larger teams, through a process that hasn't changed in millennia: perceived compatibility, common interests, similar personalities, intuition and, more often than not, proximity and expediency.

Is it any wonder that, for all the empirical tools that are now brought to bear on corporate HR functions, we still have almost no ability to predict whether a given pair will actually get the job done?

When the revolution in team construction and management finally arrives, it will no doubt start with the very foundation of all teams: pairs. After all, pairs are not only the most common of human (and animal) teams, but they are also the basic bricks from which the edifices of larger teams are built.

Successful Pairing

To be human is to be a member, both serially and in parallel, with a succession of pairs — numbering perhaps in the hundreds — over the course of a lifetime.

There are pairs defined by occasion. For example,

Chained Together by Success: These are "antagonistic partnerships," and they can be the strangest, scariest and most remarkable of any pair type. "Chained" pairs feature a duo of people who are hugely successful together but for various reasons simply do not get along with each other. An example here would be movie critics Gene Siskel and Roger Ebert.

There are pairs defined by similarity. For example,

Castor and Pollux: These are the "perfect partnerships," the ideal among teaming individuals who are so much alike that they each can take on the other's duties with barely a hitch. These partnerships can range from near clones — often taking the form of siblings such as Orville and Wilbur Wright — or very different people who still match each other in the details of their joint efforts, such as Bill Hewlett and David Packard.

There are pairs defined by difference. For example,

Yin and Yang: "Yin and Yang" pairs are teams of two individuals whose different skills combine to produce a

complete and competitive force. These pair teams are typically found among salespeople, educators and law-enforcement officers, and in the creative business professions such as advertising, art design and copywriting. In the classic Yin and Yang teams, one individual is artistic, the other empirical. Think of the many songwriters and lyricists, from Rodgers and Hart to Elton John and Bernie Taupin.

And there are pairs defined by inequality. For example,

Remember the Force: "Force" pair-teams are mentor partnerships in which the two members are unequal. In a typical case, these teams consist of an older veteran who serves as an adviser and guide to a younger partner. The title of this type of team comes, of course, from *Star Wars* and the relationship between Obi-Wan Kenobi and Luke Skywalker.

Matchmaker, Matchmaker

When it comes to the care and feeding of perfect pairs, you should start as a leader by identifying your most talented people, especially those who are described as difficult, unpopular, eccentric or odd.

Don't look at the obvious strengths of these individuals, but instead focus on their weaknesses. Compare these weaknesses to see if they can fit together in a way that neutralizes them. If you can't find a suitable match among this select group of individuals, look elsewhere in the organization. Remember, the best pairs may be quite alike, complete opposites or somewhere in between. The key is that, on the job if nowhere else, these individuals fill each other's voids.

Next, put these potential pairs in close proximity, as isolated as possible from outside influences — especially peer groups — which may amplify their differences and undermine their synergies. Assign the pair a task for which they have the requisite skills but are unlikely to accomplish as solo operators.

You should now step back but continuously monitor what happens. If the team proves to be either dysfunctional or, conversely, enjoying itself too much to get any work done, dissolve it. If it proves to be highly productive — and this will be obvious quickly — keep it intact, find more challenging projects for it and clear a path for it through the company's bureaucracy.

Trios – The Plutonium of Teams

If pairs are like inert gases — pairing up and becoming profoundly stable — trios are more like radioactive elements: They seem to exist for only a brief time before they break down to their natural state, pairs. Make the most of your trios for as long as they exist, but don't depend on them to survive, and don't be surprised when they fail.

Trio teams inevitably take one of four forms:

2+1 Trios: This, at its core, is a pair to which has been added a third player in a vital but not an intimate partner-like role. The greatest strength is it's a pair with a third peripheral person acting as a consultant or specialist.

Parallel Trios: Often what we perceive as a trio is, in fact, two pairs sharing a common member, while the other two members rarely interact. Parallel Trios are the most powerful because the members of the trio don't actually all work together; it is possible to fill the two outside roles with individuals who are the best at what they do without worrying about their compatibility with the other, only their compatibility with the sole inside member. This architecture also features its own inherent hierarchy. Inside, because he or she is the traffic cop between the two outsiders, is the uncontested leader of the trio. This solves a lot of the stress found in most trios.

Serial Trios: Serial Trios differ from Parallel Trios in a temporal way. Rather than the one common member dividing his or her time between the two other members, the various members of the trio simply and sequentially work briefly with each other in pairs.

Instrumental Trios: If 2+1 Trios are the easiest to construct and Parallel Trios the most powerful, Instrumental Trios — three people with carefully defined roles working together on a single, equally well-defined task — are the most consistently successful.

Creating and managing trios can actually be easier than doing the same thing for pairs. That's because trios can exhibit an internal structure and a level of self-management not typically possible with pairs. They can also usually be created simply by taking a successful pair and adding a third player, compatible or not, who brings the requisite skills.

Four and More – The Wild Bunch

Most of the successful small teams range in size from five to nine members — referred to as **7±2 teams**. These teams show up almost everywhere: sports, the number of key players in sitcoms (think Friends), rock bands

(the Rolling Stones) and the number of members of the United States Supreme Court.

Managing a 7±2 team usually means that you are a member of that team. And while in theory that shouldn't make a difference, in real life it always does. And so, while you are still trying to assemble the best possible team, in the back of your mind is the lingering thought that whomever you pick you will have to work with closely on a daily basis for the duration of the project. So if you aren't careful, subjectivity can sneak into what should be a hard-nosed, objective decision.

15±3 teams are the smallest teams that can actually divide their labor and still have dedicated management for each resulting subteam. This formulation offers some real advantages; in particular, it means that those subteams can truly operate independently and not have to wait on a single manager racing back and forth among those teams making command decisions.

The basic rules of management theory apply: work through your subordinates, but maintain a connection with all the team members; continuously monitor the team's health; recognize hard work and achievement; defend the team against outside challenges; manage the budget carefully; and shepherd the team through major challenges and transitions. If you've built the team properly, it will take care of the rest.

The Birth and Life of Teams

Every team is a narrative, a story that typically begins with a **formation phase** in which strangers are thrust together under unusual circumstances and then are forced to quickly establish their relationships with each other even as they rush to understand their assignment, divide it up and then parcel out the pieces to the right members. Soon thereafter, the team enters into an **establishment phase,** in which it needs to establish rules, metrics, milestones and its communication apparatus. And all of this must be done even as those same members begin to work on the task itself. That shift of focus from organization to actual work on the assignment marks the transition to the **operational phase**.

As time passes, and as the initial results of its work are known, the team inevitably has to adjust — resetting milestones and deadlines and coping with the personalities, idiosyncrasies and the strengths and weaknesses of its members. This is the **functional phase**. External forces are in play as well: New competitors with threatening new products or services may appear unexpectedly, deadlines may change and budgets may shift. All of this puts further stress and confusion on the teams.

Assuming the team survives, these events ultimately have another effect: They become elements in the team's growing story, the legends and experiences that help define its internal culture. This is the **cultural phase**. The longer a team endures, the more likely it is to lose original members. The healthier a team's culture, the less productivity it will lose to newcomers making their way up the learning curve. This is the **sustainable phase**.

As the team overcomes any technical obstacles and approaches its goals, it now moves into a **maturation and consolidation phase.** The challenge now is to resist the desire to rush ahead and, instead, to maintain the pace and finish the project properly. Good teams survive to enter the **completion phase.** Once everything is packaged, bundled up and either handed or sold off, the team reaches its **end phase**.

When you do reach that end, formally announce that fact — and then celebrate. This is not a time for reserve, or weary acceptance or polite acknowledgment of a job well done. Even if you've failed to achieve all of your goals, your team deserves a full-blown recognition of its loyalty and hard work.

The teams in which we work, and the teams we lead, may not change the world. But they can make the world a better place, make our company (and everyone who depends on it) more successful and secure, and give ourselves and our teammates a more rewarding and fulfilling career.

The Coaching Connection

A Manager's Guide to Developing Individual Potential in the Context of the Organization

by Paul J. Gorrell and John Hoover

THE SUMMARY IN BRIEF

The Coaching Connection presents a useful framework for coordinating a coaching culture throughout your organization, whether you're a coach-at-large, a mentor, an onboarding specialist, a career coach, a manager in an advisory/guidance role or an individual being coached. You will become expert in Contextual Coaching, a methodology that can help align what individuals do best with what organizations need most, ensuring a win-win for all involved.

If you are new to coaching, this book outlines the beginning of an exciting journey. If you're an experienced coach, you are about to learn and apply a new systemic model that aligns the growth and development needs of the individual with those of the organization. As the authors say, "Coaching is never only about the organization, nor is it about individuals in isolation. It is about all of it, all of the time."

IN THIS SUMMARY, YOU WILL LEARN:

- The single key success factor underlying most positive outcomes in coaching.
- How to align coaching design and execution with organizational strategy.
- A winning formula to address the three critical ways individuals enhance — or inhibit — alignment.
- Methods for dealing with the difficult coaching client.
- How to apply a 360-degree assessment that covers the 10 most essential skill sets of well-balanced, effective leaders.

The Tale of Two Clients, or The Coaching Conundrum

Executive coaching has often in the past been used to remediate damaging behaviors demonstrated by those with enough institutional authority to do significant damage to people and to the organization that employs them.

Anything, such as coaching, that helps managers and executives make good decisions is worth the investment, whether that means turning around a manager's or executive's thinking or involving them in more productive habits, skills and activities.

The Coaching Connection is, in part, about connecting the dots between the need for highly skilled, knowledgeable and wise coaches and the exponentially increased benefits of pre-emptive managerial and executive skill and competency building, as opposed to reactive, after-the-fact interventions.

The Conundrum

Who, then, is the coaching client? Is it the individual or small team receiving the coaching or the organization that is paying for it?

Our final answer: The individual *and* the organization that employs the individual are *co-clients*. We are talking about the growth and development of individuals specifically in how they do their jobs and interact professionally with others now and in the future, both of which are inexorably linked to the well-being of the organization that employs them.

Conundrum solved. The tale of two clients unfolds. The highest value a coach or manager who coaches can bring to the individual or to a small team is to find the place where the best interests of both converge. Ultimately, if the coaching is successful, the individual's and the organization's interests become one — or as blended as humanly possible. A well-coached employee who has experienced such convergence will be able to articulate how his or her function adds value to the organization.

The Contextual Coaching process provides leadership development to everyone who shows potential. All growth and development of your coaching clients take place within the context of the organization. As the coaching progresses, the identity, agenda and priorities of your clients begin to merge with those of the organization, resulting in more continuity and consistent alignment between the organization's needs, the client's needs and ultimately your clients' performance.

The Benefits of Using the Contextual Coaching Model

The 10 components of the Contextual Coaching model shouldn't be thought of as the 10 Commandments of Coaching. They represent architectural knowledge for a well-balanced organizational leader. However, you should be knowledgeable about all 10 if you want to serve the organization well and help it become an employer of choice filled with well-balanced employees of choice.

A Coaching Culture

Besides generally educating and raising awareness, there are three primary categories within which people contribute to or detract from the success of the organization — three ways they enhance or inhibit the

alignment between what individuals do best and what their organizations need most: habits, skills and activities.

Habits. As coaches, we help our clients discover where, when and how their habits enhance their careers or how they might adopt new ones in order to overcome old behaviors that impede their growth and development.

Skills. You can help your coaching clients make better choices in developing and applying their skills/natural talents.

Activities. Activities are totally deliberate, chosen because of their functional purpose and strategic benefits.

Change starts with "C," and so does coaching. There is virtually nothing you will do as a coach that is not about creating or sustaining positive change in your organization. There is nothing individuals do in the coaching process that is not about changing habits, skills and/or activities.

The 10 Contextual Coaching categories, representing competencies in well-balanced leadership, are paired into five dyads as follows:

Strategy and Structure. How the organization's strategy creates an impact on leaders and how they manage relationships across different levels of authority within the structure.

Culture and Communication. How cultural markers of the organization create challenges and opportunities and how communication style affects success.

Talent Systems and Talent Solutions. The use of processes related to the acquisition, management and successioning of talent and the learning and development opportunities created by the organization.

Development and Dynamics. Specific areas of individual development for the coaching process and the impact of any change in behavior on the dynamics of the leaders' team.

Career and Competence. The career plan of the leader and the gaps the leader has vis-à-vis the organizational definitions of leadership.

Whether it comes fast or slow, if your clients' new habits, skills and activities are demonstrably improved, everybody wins. Creating a coaching culture in your organization might mean pushing back the boundaries of everything you have ever thought about coaching and venturing into a space where it is never about either only the organization or about only individuals in isolation.

The Basics of Contextual Coaching

The idea of working with a client may seem threatening at first. If you are an experienced coach or manager who coaches, you know the feeling. You also know that your clients just as often feel threatened. Two key points to remember and share with your clients: 1. Executive coaching represents a major investment in your clients. 2. Truly effective coaching must be conducted within the context of your organization.

Confidentiality is the cornerstone of any effective coaching in engagement. Your clients must be assured that what is discussed between the two of you stays between the two of you unless your client decides to share information with others and/or expressly grants you permission to discuss selected information.

Steps in the Contextual Coaching Process

A well-managed Contextual Coaching process will accelerate the development of your clients' leadership potential and provide a connection between what your clients do best and what the organization needs most. The program comprises five key stages, each with a specific focus.

1. Engagement Launch. This introductory phase begins with a dialogue involving you as the coach, your client's human resource partner and/or the client's direct supervisor regarding a general set of objectives for the engagement. Once selected as the coach, in the initial coaching meeting between you and your new client, discuss the coaching process, identifying initial goal(s), make plans for the assessment process and begin to build rapport and trust. In the ensuing sessions, you and your client will focus on initiating the assessment process, often including 360-degree feedback and/or personality assessments.

2. Assessment and Exploration. Assessment tools fall into two broad categories: (1) those that guide your clients toward self-knowledge through directed self-insight and (2) those that provide your clients with the objective observations of others (360-degree assessments). These assessments are incorporated into the coaching process early on so that the engagement can be used to address issues that the assessments identify.

3. Strategy and Goal Setting. Your clients will be challenged to grow in personal performance as well as leadership capability through a personalized experiential learning process in the Coaching Action Plan.

The plan is further broken down into specific actions and incremental accomplishments that will make the

individual's progress seem realistic and doable and ensure that your clients are developing in areas that they value.

4. Ongoing Development and Reinforcement. This stage involves several steps:

- Tracking of behavioral changes.
- Ongoing development and reinforcement.
- Modification of goals and strategies to adapt to changing conditions.
- Filing of a midterm report on your client's progress.

5. Engagement Conclusion. Here you identify strategies for your client to use in the post-coaching process and roundtable discussions with your clients, HR partners and your client's manager.

Area of Behavioral Focus: Strategy

Coaching your clients around theoretical strategic planning and execution will produce limited results, benefiting neither the individual nor the organization. The best opportunity and incentive for your clients' growth and development related to strategic thinking, planning and execution takes place in real time and, of course, within the context of the organization.

There are specific behaviors that are part of the Contextual Coaching 360-degree assessment that measures your clients' proficiency in using strategy as a tool:

- Successfully managing resistance to new ideas
- Formulating a strategy related to business goals
- Applying organizational strategy and managing strategic planning within an area of responsibility

One of the main ways to connect Strategy to the Coaching Process is to raise your clients' collective consciousness about how strategy is the fascia tissue that connects their career ambitions to the ongoing well-being of the organization.

360-Degree Feedback Questions for Strategy

Sitting and talking through questions and noting the answers (verbal and nonverbal) of your clients and their feedback providers is a terrific way to assess the state of your clients' relationship and mastery of the 10 Contextual Coaching components.

Here are questions specific to strategy that you should ask your clients:

- How would you describe your management of strategic responsibilities?
- Can you provide some examples to illustrate this description?
- Who looks to you for strategic guidance and information related to the company's strategy?

Use the 360-degree feedback data as a global positioning satellite to plot where your clients are now, where you want them to go and any detours that might be encountered along the way. Comparing what you have at present and what you want in the future will provide you with some gaps to be filled.

Area of Behavioral Focus: Structure

Structure is the way an organization sets up its employees, property and other resources to manage process, determine lines of authority, identify workflow within and between departments and create a management architecture that maximizes opportunity while minimizing risk.

The Coaching Connection Among Organizations, Individuals and Structures

Structure is an element of the Contextual Coaching model because organizational alignment is an essential element of the company.

In the Contextual Coaching model, structure and strategy are partnered to remind ourselves that organizational structure is not in place for its own sake. The goal of any organization is to think critically about strategy and to determine how the people in the company can best meet the company's goals and objectives. This includes the way people are organized and assigned tasks.

As a coach, your exposing your client to a broad view of organizational structure can provide a roadmap to new levels of success.

360-Degree Feedback Questions for Structure

As a means of further assessment, here are questions specific to structure to ask your coaching clients:

Please provide examples of when you worked with people from multiple departments to solve a problem, and describe your role in the process.

The earlier anyone in the organization starts talking structure, the better. Knowing who is tuned into organizational structure and who is not will ensure that your client's coaching engagement is aligned with your position in the organization's structure.

Area of Behavioral Focus: Culture

Culture is reflected in the predominant behaviors, beliefs and values characteristic of a particular organization. Not only do humans create culture whenever they organize, but also those cultures can change shape and intensity as individuals at various levels of an organization influence them.

Why Culture Is Important to the Individual and Organization

Your coaching clients will benefit when you consider how different aspects of the organizational culture will bring success to your clients or present them with obstacles.You can help clients remain adaptable in the face of shifts in culture and also become "culture carriers" who communicate the culture to others through their words and deeds. If an organization wants to maximize the skills, competencies and capacity of its population, there must be a deliberate, methodical effort to synchronize all that the organization members have to offer.

360-Degree Feedback Questions for Culture

If your coaching client has direct reports, you want to know how your client's management style supports the strategic imperatives of the organization.

Here are questions specific to culture that you can ask your coaching clients:

- Can you describe any aspects of the culture that challenge your integrity?
- Can you provide examples of change processes in which you have participated?
- When the organization is facing change, what role do you take?
- How do you reflect the cultural values of your organization in your day-to-day work?

You will be able to tell from your clients' answers if they have habits that resonate with the kind of culture your organization is seeking to build. If not, then you play a vital role in helping them shed counterproductive tasks and replace them with productive habits and new skills.

Area of Behavioral Focus: Communication

Communication is serious business when it comes to individual and organizational success. Perhaps more than anything else, an organization expresses its culture by the way it communicates.

As a coach, when dealing in the context of culture, you and your client will consider how communication is managed within the organization. Do your clients share information openly or on a "need to know" basis with others above, below and/or beside them on the organization chart? Understanding how an organization communicates internally and externally will help your clients create communication plans for customers at critical times within the execution of coaching strategies.

Why Communication Is Important to the Individual

As a coach you need to help your clients understand that their career moves, both up and down the ladder, are determined during conversations between people who have the institutional authority to alter careers.

The ability to communicate effectively with direct reports, peers, superiors and customers of all kinds is pivotal to developing the legacy your clients need to succeed.

360-Degree Feedback Questions for Communication

- What are some examples of your communication style when essential information is necessary for completing work?
- How do you acquire a sense of where others stand on important matters?

By defining good communication habits like active listening, clear and concise writing, and expressing oneself succinctly, you identify a platform for your clients to build on. If you begin with a conversation about the Contextual Coaching model and show how effective it is in dealing with all 10 components, your clients will surely agree that effective communication is one of the most important. Your clients can work toward an enhanced skill level that

will make them more effective in their current jobs and prepare them for expanded responsibilities in the future.

Area of Behavioral Focus: Talent Systems

A talent system is any structured process that helps organizations manage their people; it forms a bridge between the individual and the organization. Through talent systems, employers of choice manage employees of choice across an organization to meet specific goals like talent acquisition, retention, career management and succession.

Talent systems are sometimes known as performance-management systems. These are some examples of generalized talent systems processes: talent acquisition, career management, performance management, potential management, succession planning, rewards and recognition, compensation, and health and well-being.

As a coach or a manager who coaches, you need to help your clients continuously seek optimal balance in their emerging leadership styles and delivery. Mastering talent systems is part of their complete balance as leaders and effective team members.

360-Degree Feedback Questions for Talent Systems

As a means of further assessment, here are questions specific to talent systems to ask your clients:

- Can you give examples of how the management of talent is a major investment of time, energy and focus for you?
- How do you acquire a sense of where others stand on important matters?
- How do you give people the feedback on their performance that will help them do a better job?

The very act of exploring these topics with your clients and gathering data about them will heighten your clients' awareness of the many hats a manager must wear. If your client is on track to become a manager, this is a good opportunity for your client to learn about talent systems in the context of the organization.

Area of Behavioral Focus: Talent Solutions

Talent systems define, measure and monitor the raw and experienced talent that talent solutions develop and optimize. More and better talent solutions based on ever-evolving definitions of needs, new measurements and feedback provided by talent systems can keep individual and organizational learning alive and growing. Solving a talent challenge can be seen in three prongs of the talent solutions fork: new knowledge, restorative knowledge and enhancing knowledge (making something better).

Talent Solutions in Perspective

Talent solutions can be put into the context of sales and customer service. The term "solution selling" involves convincing customers that it is in their best interest to buy into a solution that offers a people-based advantage. In a solutions world, investment in product development should be matched with a corresponding investment in staff development, of which your coaching activities are a part.

360-Degree Feedback Questions for Talent Solutions

As a means of further assessment, here are questions specific to talent solutions to ask your coaching clients:

- Can you give examples of times when you have provided learning opportunities for members of your team?
- How have you assigned job responsibilities that might have caused difficulties or dissensions within your team?

You will use your clients' answers to see how well their understanding and perspectives on talent solutions align with yours. Then you will use the answers your clients' feedback providers provide to see how the three perspectives align and where the gaps exist.

Area of Behavioral Focus: Development

For our Contextual Coaching purposes, "development" encompasses three main activities: training, education and development. Development is a holistic approach to improve and enhance everything professional about your

clients for current and future benefit of your clients and the organization.

Developmental Change is Simple – Not Easy

There are two things required before people will change and develop: People will participate in change, support change and even champion change if they think they (1) will be happier with the new outcome than they are with the present situation and (2) believe the change is possible. Participants can discuss their challenges, receive assessment that provides self-insight, build an action plan for change and reflect on behaviors and relationships that impede success. Coaching is the most successful individual-development activity.

360-Degree Feedback Questions for Development and How to Use the Responses

Here are questions specific to development to ask your coaching clients:

- What areas of individual development are most important for you in this process?
- How open are you to feedback from others in the organization when individuals communicate concerns, feedback and/or advice?

You will explore where your clients struggle when trying to execute the activities associated with growth, if their development plans resonate with the objectives of the organization, and how they can shift focus from the tactical tasks of the moment to what will be needed in the future.

You need to state that planning and executing their own development plan is a large part of what they're getting paid for. A strong, well-developed leadership team is essential for the organization's future.

Area of Behavioral Focus: Team Dynamics

Team dynamics is the study of how teams influence the environment in which they exist and how teams are influenced by their environments. A team can be united by a common cause, a goal or an objective, which may be short term or long term, official or unofficial, naturally forming or synthetic. As a coach you can discuss these elements of team dynamics with your clients:

Working Style. You can calculate the composite personality of the team by considering the individual personalities through a personality assessment.

Interrelationships of team members. These include histories of work experiences and the ways in which team members form alliances.

Group Knowledge and Experience. The way a team uses its competencies and balances the power dynamics can determine the team's level of success. As a contextual coach, you need to observe your clients leading teams.

Level of Clarity in Roles and Responsibilities. You must conduct critical conversations with your clients about how important it is that a team make fullest use of the skills individuals bring to the process and that a team create an equitable balance in the work expected of individual members.

360-Degree Feedback Questions for Team Dynamics and How to Use the Responses

- Can you provide examples of how you engage the team that reports to you?
- Can you describe the best and worst team meeting that you have attended in the past year?

Do not get caught in your clients' defensiveness. Not all of your clients will defend themselves unreasonably against critical feedback. However, some will. Be prepared. It is perfectly natural for human beings to be, at the very least, nervous about receiving feedback. Never take the position that, since everybody seems to think your clients have problems, they are a problem. Gaps can be corrected with perception-altering behaviors.

Area of Behavioral Focus: Career

Your clients' careers and professional futures are the culmination of the balanced abilities you help them acquire through the Contextual Coaching model. Career development is a strategic practice to fortify the enterprise while at the same time providing practical career development to your clients. Companies have merged career planning with talent management and employee development as a retention strategy. Companies are also providing processes for internal mobility through which individuals can identify open roles inside the company and create career plans that follow organizational templates. As with talent solutions,

you as the coach need to help map out your clients' career-development opportunities. You might focus on how to build a deeper network of relationships or on how to close experience gaps in your clients' resumes.

Why Career Is Important to the Individual and to the Organization

If employees experience opportunities for growth and career planning, they feel more in control of their future. As well, career expertise provides employee engagement and greater loyalty, which translates into effective performance. A key benefit from career development is the employment brand, a magnet that attracts new talent because the organization is known in the marketplace as a great place to work. In short, when people are the most important resource within an organization, developing them for future roles is a wise investment.

360-Degree Feedback Questions for Career and How to Use Those Responses

Here are questions specific to career to ask your coaching clients:

- What are your ultimate career goals?
- What is your plan to attain those goals?
- What is your commitment to the career aspirations of others?

The internationally acclaimed professional photographer Dewitt Jones said that we must all place ourselves in the "place of greatest opportunity" if we are to reap the rewards that opportunity offers. That is his message to your clients: Prepare constantly so that you will be recognizably ready when the opportunity to move up presents itself. Your clients need your help to navigate the uncharted waters of career mobility and to negotiate their way toward maximum career success for themselves and for the organization.

Area of Behavioral Focus: Competence

Competence is at the very core of your clients' abilities to add value to the organizational equation. Beyond the organization at large, competence relates to the ways in which our field, marketplace and competitors identify standards for career potential. As a coach you can help your people understand competence on the company level, and you can measure progress against goals, hire the right folks and promote people with potential.

360-Degree Feedback Questions for Competence

- What is the most constructive feedback you have received regarding competence?
- What gaps do you believe exist between how you view your competence and how the organization views leadership competence?
- What are some examples of how you plan to close these gaps?

Coaching using the Contextual Coaching process is the only way to achieve total and unquestionable success for the individual and the organization.

Epilogue

As you coach, you are riding the cutting edge in individual and organization development because the most remarkable and sustainable organizational improvements take place one person at a time.

Never forget that you are "never not communicating." Make sure everything about how you do your work and everything you preach to others reflects the impact that coaching has made in your job and your career.

The power of the Coaching Connection begins with you and resides at that critical juncture where you embrace what is best for you and what is best for the organization in the same moment and in the same context. Although you might eventually retire from it, the work of a contextual coach is never done.

Discipline Without Punishment

The Proven Strategy that Turns Problem Employees into Superior Performers

by Dick Grote

THE SUMMARY IN BRIEF

More than 30 years ago, Dick Grote developed a powerful, nonpunitive discipline system that turned a troubled Frito-Lay plant from a hotbed of employee sabotage and toxic relations into a productive, respectful environment — one where employees took personal responsibility for their behavior, and managers helped problem employees become productive players.

Grote's method gained national recognition with the release of *Discipline Without Punishment*. The book has become a management classic, helping thousands of companies and managers move to a responsibility-based approach for handling unacceptable performance and problem behaviors. But many companies continue to cling to their long-established system of verbal warnings, written reprimands, suspensions without pay and probationary periods — all fear-based approaches that instill lots of resentment, with little or no payback in improved performance.

IN THIS SUMMARY, YOU WILL LEARN:

- How to become better at confronting a subordinate with the need to change.
- The procedures for Reminder 1 and Reminder 2 steps of the Discipline Without Punishment process.
- Why Positive Contacts are essential to improving employee performance.
- Tips to prepare for and conduct a performance improvement conversation.

The Birth of Discipline Without Punishment

For some 75 years, American organizations have been using a standard procedure to handle lapses from organizational discipline. This approach, "progressive discipline," is described by attorney James R. Redeker as such because its "purpose is to correct behavior through progressively more severe penalties."

The traditional progressive-discipline system was created by unions. In the 1930s, unions demanded that companies eliminate summary terminations and instead develop a progressive system of penalties that would provide an employee with a new benefit — protection against losing his job without first being fully aware that his job was at risk.

The basic premise of the traditional progressive-discipline system is that crime must be followed by punishment. This system almost perfectly parallels America's system for handling criminal deviants, and it works no better than the criminal justice system works in transforming lawbreakers into responsible citizens.

Problems with a Punishment-based System

The use of punishment produces side effects and long-term consequences — anger, apathy, resentment, frustration — that end up being far more costly than whatever the original misbehavior might have been.

The new system retained the progressive aspect of the traditional approach but redesigned all of the steps of the system to eliminate punishment. Instead, the new system concentrates on personal responsibility and decision-making.

The New System

The Discpline Without Punishment approach redesigns all of the steps of the old system to eliminate punishment and concentrate on personal responsibility and decision making.

To begin, the Discipline Without Punishment approach includes "Positive Contacts" as a formal element of the system. Including "Positive Contacts" tells managers that recognizing good performance is as important as confronting poor performance.

Most supervisors see coaching as part of their ordinary day-in, day-out responsibilities for managing people. These coaching sessions tend to be casual, spur-of-the-moment discussions aimed at showing someone how to do her job better or immediately correcting some minor problem.

Instead of being spontaneous and spur of the moment, a Performance Improvement Discussion requires the supervisor to make notes in advance of the meeting and conduct it with all of the seriousness of a formal disciplinary transaction but to advise the employee that the matter is still between the two of them. The purpose of the Performance Improvement Discussion is to avoid the need for any more serious action.

The "verbal warning" and "written warning" have been renamed. The first step of disciplinary action has become a Reminder 1. Instead of being reprimanded for what he had done, the individual is now reminded of two things: the company's expectations and the employee's personal responsibility. The purpose of the supervisor's discussion is not to deliver a reprimand or warning; instead it is to make sure that the employee fully understands what is expected and that it is his responsibility to deliver.

The second step of the procedure is called Reminder 2. It almost exactly parallels the first step. the supervisor again meets with the individual privately, reviews the situation and in a serious and businesslike way reminds him of both the performance expectation and his responsibility for meeting it. Because the situation has now become more serious, he is told that he will be receiving a memo after the meeting documenting the transaction. While this memo will be placed in his personnel file, he can earn the right to have it deactivated and removed if he goes one year with no further disciplinary problems.

Decision Making Leave

The most remarkable change comes in the final step of the new procedure: the Decision Making Leave. This is a one-day disciplinary suspension. While the employee would be paid for this day, he would be required to use it in both his and the company's best interests. He must use the day off to think about whether he really wants to work with the company. On the day following the suspension, he must return with a final decision: either to solve the immediate problem and make a commitment to totally acceptable performance in all areas of his job or decide that working for the company was not for him, quit and go find more suitable employment elsewhere.

The traditional progressive-discipline system takes a problem employee, punishes him and leaves the organization with a punished problem employee. The Discipline Without Punishment system requires the problem employee to become one of two things: either a good employee or an ex-employee.

PART I: BUILDING SUPERIOR PERFORMANCE

Recognizing Good Performance

The Discipline Without Punishment system begins by recognizing that the overall objective of the enterprise's discipline system should properly be the development of well-disciplined individuals who are committed to the organization, its mission, its values and its vision. As a result, the first element of Discipline Without Punishment is Positive Contacts, the recognition of good performance and the development of motivation. In essence, "Behavior rewarded is behavior repeated."

Reinforcing Good Performance

Our greatest opportunity for increasing overall organizational performance lies with our solid, competent performers. And the best way to spur performance improvement is to make sure that we provide a positive consequence — recognition — whenever it happens.

Our challenge is to find examples of good performance to recognize. Somewhere between the parameters of barely acceptable and genuinely heroic are hundreds of people who are simply doing their jobs just a little better than they have to. If we actively seek out this level of performance, we will discover an abundance of it.

The single most important guideline for using Positive Contacts as a tool to influence good performance is, do it often. Positive Contacts are most influential when they rapidly follow the behavior being reinforced.

Recognition Tools

Managers have many tools at their disposal to use in arranging for positive consequences for good performance. They include, among other tools,

- Assigning the individual to work on a more desirable job;
- Buying her a cup of coffee;
- Ordering the individual their own business cards;
- Letting him take an extended lunch;
- Asking his advice about a business-related matter;
- Writing her a memo commending a job well done.

But of all these, the most important are the sincere and genuine words that come out of the manager's mouths: "Well done," "Thanks" or "I genuinely appreciate that."

Recognizing good performance — arranging positive consequences to increase the frequency of desired behavior — is not a way of being nice to one's workers and increasing one's popularity. It is a practical, tough-minded and demanding management tool to influence people's behavior on the job.

To use positive reinforcement effectively, we must not only provide it actively to those whose performance justifies our providing it, but we must also withhold it from those whose performance does not. Managers have no difficulty agreeing that positive consequences should be provided to those whose performance qualifies them for it. They have enormous difficulty accepting the corollary of that statement: that the intangible rewards of organizational life should consciously be withheld from those who have yet to earn it.

Solving People Problems

For an organization to enjoy universal high performance, it must recognize the good performance delivered by the great majority of organization members. The more

that the manager provides positive consequences (Positive Contacts) for good performance, the more likely it is that good performance will be delivered. In spite of any action that managers take, however, people problems will still arise. Some performance problems can easily be defined in a specific and measureable way. In other cases the gap between desired and actual is more difficult to define. But whatever the issue may be, problems cannot be solved until they can be identified specifically.

Types of Problems

To begin, it is useful to recognize that all problems of human performance in an organization fall neatly into one of three categories. Therefore, it is helpful to start the problem-solving process by narrowing down the specific category into which the specific concern falls:

- **Attendance.** Attendance problems arise when an individual fails to meet the company's expectation that she will be at work on time every day.
- **Performance.** These issues involve problems with the quality and quantity of the individual's work.
- **Behavior.** The behavior or conduct category involves those issues that deal with violating the organization's rules or standards.

It is helpful to note that the three categories of performance problems are mutually exclusive; there is no overlap between the three.

Determining the Cause

Once we have clearly identified the specific gap between desired and actual performance, the next step is to determine why the employee isn't doing the job properly right now.

When a person isn't performing the way we expect, there are only two causes. The performance deficiency involves either a lack of knowledge or a lack of execution.

It's important to distinguish between knowledge and execution problems because the solutions will be very different. Training is the obvious solution to a knowledge problem, but training won't help when the cause of the problem is a lack of execution.

Removing Obstacles

Deficiencies in knowledge are cured by training. What do you do when the person knows how to perform properly but still isn't doing the job right? The need here is not for training; it is for job engineering.

The solution to a great many performance deficiencies lies in re-engineering the job. Arrange for people to get feedback so that they know exactly how well or poorly they are doing, remove any obstacles that thwart good performance and rearrange the consequences so that performing well makes a difference.

Shifting the Responsibility from Manager to Employee

There are five things that clearly specify the exact gap between desired performance and the employee's actual performance:

1. Clarify expectations.
2. Provide training.
3. Arrange appropriate consequences.
4. Provide feedback.
5. Remove obstacles.

Once the manager has addressed these five aspects of honing in on the reason for the deficiency, he has done everything that he is responsible for. The burden for solving the problem now shifts to the employee. The individual with the problem now becomes the one who is fully responsible for its solution.

PART II: PERFORMANCE IMPROVEMENT

Preparing for a Performance Improvement Discussion

When performance problems initially arise, the effective manager starts by determining the most likely cause. This problem-identification process does not happen in a vacuum. Good managers are always talking with their people, doing the constant reviewing and discussing that causes problems to become visible early when they can be easily solved. He can determine the cause of a subordinate's failure to meet expectations by informally and casually talking with the individual whose performance is the source of concern.

A Performance Improvement Discussion is not a spur-of-the-moment event. It has specific goals and follows a definite structure. Holding a Performance Improvement Discussion with an employee allows the supervisor to communicate the urgency of change at the same level of seriousness as she would in one of the formal steps of disciplinary action, but without the sometimes burdensome administrative requirements of approvals and documentation and witnesses and other impediments.

Conducting the Performance Improvement Discussion

Performance Improvement Discussion involves three components: What the manager does before the meeting

to prepare for the face-to-face session, what she does during the meeting, and what she does when the meeting is over and the employee returns to work.

Start by determining which of the three types of problems is the primary concern. While an individual may have a need for improvement in several areas, keeping unrelated issues separated increases the chances of getting each problem solved.

The manager can concentrate on the most significant issue and then, once agreement to solve the critical problem has been gained, can mention the need for a total commitment to acceptable performance as the meeting is wrapping up.

The Purpose of the Discussion

What is your goal during the meeting itself? What needs to happen while you and the subordinate are talking to tell you that you can now bring things to a close because you have accomplished your objective? The goal of the meeting is to get the subordinate to agree to change. That's it. Period.

The reason that the goal of the conversation is to get the employee to agree to change is this: If the person agrees to correct a problem and then later the same problem arises again, the manager will hold another conversation with the individual. But the subject of this second conversation will be different than that of the first. This time the subject will be the employee's failure to live up to the agreement.

Determining the Consequences

Every choice brings consequences. When an individual chooses to perform in a way that the organization finds unacceptable, and the individual chooses to continue that unacceptable behavior even after learning that it is unacceptable and the reasons why, the individual has the right to know what the consequences of that choice are.

Once the employee understands that decisions have consequences, she can make an informed decision to meet the standards of the organization, not because of threats or intimidation but because she understands fully the consequences of both meeting and failing to meet the standards of the organization.

Conducting the Performance Improvement Discussion

Whether the discussion with the employee is a non-disciplinary Performance Improvement Discussion or a formal step of the Discipline Without Punishment system, the goal is the same: to get the employee to agree to solve the problem and return to fully acceptable performance.

Before initiating the discussion, it is important to prepare fully, anticipate any difficulties that may arise and create the conditions that will assure the highest probability of success. In order to be fully prepared for the discussion, create a short, written summary of the essential information that will be needed in the meeting.

Opening the Discussion

Perhaps the most difficult 10 seconds in a manager's life occur at the moment when a subordinate shows up at his door for a scheduled Performance Improvement Discussion. The manager knows that if he is able to get the meeting off to a good start, the chances of overall success will be great. So, how do you get things off to a good start? By getting right to the point, the manager will put the employee at ease.

"Joe," the manager begins, "I've got a problem and I need your help." With those 10 words, the manager has accomplished four worthwhile ends:

1. By using the employee's name, he has begun the discussion on a personal basis.
2. He has gotten right to the point.
3. By using an "I" message, the manager has prevented defensiveness that comes with a "you" message.
4. He has enlisted the employee's help.

The use of the magic phrase, "I've got a problem and I need your help," will command the individual's attention. Then immediately move to a full description of the concern you just introduced. Explain the problem in terms of actual and desired behavior. In a straightforward, businesslike way, the manager simply makes three statements: "Here's what I want;" "Here's what I get;" "There is a difference."

Letting the Employee Speak

Having opened the discussion and stated clearly the specific desired and actual performance, the manager now turns the conversational ball over to the employee by saying, "Tell me about it."

Listening carefully certainly indicates that you really are interested in what the other person has to say. By listening, you send a message that the other person — his feelings and perceptions — are really important to you. By careful listening, we can confirm that there is no other information that could cause you to change your decision about the actions to take.

Closing the Discussion

If the conversation has been a Performance Improvement Discussion, simply thank the person for agreeing to correct the situation, and express your confidence that the

two of you will never need to talk about the matter again. However, if the discussion is a formal disciplinary transaction, the manager must take two additional steps:

1. Advise the employee that it is a formal disciplinary transaction.
2. Advise the employee which step of the Discipline Without Punishment system is being taken.

When the manager has gained the employee's agreement, discussed and decided upon the action the individual will take to solve the problem, advised the employee whether or not the discussion is a formal disciplinary transaction, and expressed a personal belief that this will be the last time they will ever have to address the matter, the Discuss step has been completed.

PART III: DISCIPLINE WITHOUT PUNISHMENT

The Mechanics of Discipline Without Punishment

Let's look at the most important similarities and differences between Performance Improvement Discussions and formal disciplinary transactions. Both Performance Improvement Discussions and discipline steps are carefully planned, initiated by the immediate supervisor and have the same goal — getting the employee to agree to change.

But there are some significant differences. Disciplinary action usually requires the supervisor to get someone else's OK before proceeding, and a witness is often present. Also, there is no limit on the number of Performance Improvement Discussions a supervisor can conduct.

Procedures: Reminder 1

Before the meeting. The same information that you gathered for the Performance Improvement Discussion is needed before conducting a Reminder 1 or Reminder 2 transaction: category of problem, desired and actual performance, adverse effects, logistical consequences.

During the meeting. There is no reason to vary from the approach used to open the Performance Improvement Discussion of saying, "I've got a problem and I need your help in getting it solved," reviewing the desired and actual performance or the rule violation, and then asking the individual to respond.

After the meeting. The key difference in post-meeting activity between the Reminder 1 and the Performance Improvement Discussion involves documentation. A Reminder 1 must be documented. The simplest way to document a disciplinary discussion is to create a discussion worksheet that is a post-meeting summary.

Procedures: Reminder 2

Before the meeting. Since the worksheet the supervisor filled out in preparation for the previous Reminder 1 will probably be available, most of the information should be readily on hand. Virtually every organization requires that before initiating a Reminder 2 disciplinary discussion, the supervisor get approval from one higher level of management in her own department as well as the concurrence of the human resources function. With necessary approvals obtained, the meeting may begin.

During the meeting. The manner and approach of the supervisor is no different from earlier transactions. She is serious, calm, dignified, businesslike and unruffled regardless of what the employee's behavior may be. When the employee proposes an action that might correct the situation, the manager will press the employee, firmly but respectfully, to make good on his intentions.

After the meeting. The greatest difference between the Reminder 1 and the Reminder 2 is the documentation of the two steps. The Reminder 1 is documented by the supervisor's completions of a discussion worksheet and placing it in the department file. To document the Reminder 2, the supervisor should also complete the discussion summary form, but the primary documentation of the transaction is a memo confirming the discussion and the employee's commitment to correct the problem.

Effective disciplinary documentation provides complete information about the problem itself, the history of the problem and, more important, the discussion that occurred between the employee and the manager about the problem. After the meeting is over, the manager will write the employee a memo summarizing everything that was said and the fact that the meeting was a Reminder 2.

Decision Making Leave

Of all the elements of Discipline Without Punishment, certainly the one that attracts the most attention is the final step of the system — the paid Decision Making Leave. Managers who can comfortably accept the idea of dealing with employees who create problems as responsible adults during the first steps of the process sometimes have difficulty extending that same philosophy to the last step.

When the Employee Returns

While cynics may scoff at giving people a "vacation day" and managers may be concerned about the appearance of rewarding bad behavior, almost universally the individuals

who receive a Decision Making Leave treat it very seriously indeed.

With surprising consistency managers report that people that they did not expect to respond as adults actually take personal responsibility for their own behavior when the chips are down. In the frequent number of cases where this does occur, managers also report that the relationship between themselves and the individual is strengthened.

When problems arise after a Decision Making Leave, our human compassion may tempt us to give the employee a second chance. But is it a "second chance" we are actually providing? In the absence of gravely mitigating circumstances, it is time to say, "Enough is enough," cut your losses and hire a replacement who will appreciate employment with your organization.

Discharge

A few people fail to make the changes required to maintain membership in the organization. In these cases, termination is appropriate.

Reaching the Termination Decision

The most difficult terminations arise with an individual who receives a Decision Making Leave because her performance is simply not up to par. After her return, she struggles to do the job right, but in spite of her sincere efforts her performance still is unacceptable, and no compatible job exists within the organization.

Whatever scenario produces the decision to terminate, the manager's first responsibility is to the enterprise itself. Arrange the termination so that it occurs with the least damage to the company and fellow workers.

Creating a Discharge Plan

Good plans have three parts. The first part covers all the things you need to do before meeting with the individual to announce the termination. The second part involves the actual face-to-face meeting with the terminatee. This is your script — the exact words you will say to open the meeting and the checklist of points you will cover while the two of you are together. The final part of your plan covers exactly what will happen once the two of you shake hands and part company forever.

A good way to make sure that you are on solid ground in terminating an employee is to imagine yourself defending your action in front of a jury.

The Discharge

Bungled terminations usually result from the manager's acting without thinking. Before you utter a word, write down the most important things you plan to say, and then stick to your script.

Once you have written your script for the meeting, it is wise to prepare a written termination summary that spells out all of the information the person needs to know regarding benefits and final pay. Putting a written termination statement in the individual's hand also demonstrates the organization's belief that the interests of both parties are best served if there is a clear statement that summarizes all of the issues that surround the termination. Finally, the termination statement helps keep the meeting short.

When terminations are well justified and professionally executed, the rest of the work group realizes that the discipline system actually works. If the termination is handled with dignity and grace, the notion that this is a good place to work is strengthened.

Solving Attendance and Attitude Problems

Of all of the problems that supervisors in organizations have to deal with, the two that are most commonly reported are those of attitude and absenteeism.

Whatever the reason for the absence, the effect is always the same: The job doesn't get done. Your customers don't care why your staff is missing. They just know that they aren't being served.

Building Personal Responsibility

How do we build individual responsibility in each employee so that he understands that coming to work is, in fact, a condition of employment? It starts by having supervisors shuck off excuses and focus instead on delivering the personal-responsibility message. In counseling an employee about the need to be at work on time every day, it's important for the supervisor to start by stressing the organization's attendance expectation.

Managers can increase the probability that the employee will change and correct the attendance problem if they discuss the need for change in terms of the choices the employee makes. We each have the capability for choice; the coaching process turns that capability into reality.

Dealing With Attitude Problems

Just what is an attitude anyway? When you think about it, all an attitude is is a judgment that we make about a person based on what that individual says and does. It's the label we slap on another person's behavior when we don't like that behavior very much. But rather than using judgments and labels, the trick to solving attitude problems is

to focus on what you know for sure — the specific things that the person did or said.

Instead of using the word "attitude," instead narrow the problem down to specifics. What exactly is the person doing? Is he egotistical and credit-grabbing? Does she spend too much time socializing? Does he engage in pouting or sulking when he doesn't get his way? All of these behaviors are different, but all of them are commonly slapped with the "attitude problem" label.

The Administration of the Discipline System

Besides the inherent flaws of the traditional, punitive progressive-discipline system, there is another problem that causes this procedure to be an ineffective problem-solving tool: the way in which the system is administered.

Supervisors often hesitate to initiate a disciplinary action simply because they don't know the answers to the common questions that arise when the procedure begins, such as

1. Who should initiate the action in question? Almost without exception, the immediate supervisor is the person who bears the responsibility for initiating the elements of Discipline Without Punishment.
2. Whose approval must be gained before the action can be taken? No organization requires the immediate supervisor to gain approval before conducting a Positive Contact or Performance Improvement Discussion.
3. Where should the meeting be held? The critical requirement is that the location be somewhere private and on the premises.
4. Is a witness required to be present? No organization requires a management witness to be present for a Positive Contact or Performance Improvement Discussion. Many require a witness at the Reminder 2 stage, and most require a witness when an employee is placed on a Decision Making Leave.
5. How will the action be formally documented? Typical documentation involves a memo to the employee and sometimes a copy for their file.
6. Should the employee be required to sign the documentation? No employee signature is required until the final step, the Decision Making Leave.
7. Who gets copies of the documentation? Records are typically kept in the departmental file.
8. Does the employee's slate get wiped clean after he maintains satisfactory performance? Most organizations agree that having a disciplinary action deactivated after the problem is corrected is a good idea.

Creating a Discipline Without Punishment System

Individual managers can achieve a great deal of personal success by applying the techniques of dealing with people in a nonpunitive way. However, an organization-wide implementation of Discipline Without Punishment involves a major cultural change effort. Supervisors need to be trained in the new approach, and management must communicate to everyone concerned the purpose of the system and the reason for the change.

But Where's the Pound of Flesh?

Old ways die hard. Both in convincing senior managers to adopt the Discipline Without Punishment system and in convincing managers to give up their old ways and deal with troublemakers with dignity and grace, a lot of emotional resistance must often be overcome.

Giving up a deep-seated, visceral need to settle the score is the price managers have to pay for implementing Discipline Without Punishment. They get improved performance and a deeper commitment to the organization and its expectations, but they don't get revenge. You give up the ability to gain the emotional satisfaction of settling the score, and sometimes that is not enough. What we really want is that pound of flesh. It can take every ounce of maturity that we've got to turn loose of our need for revenge and be satisfied merely with solved problems and enhanced relationships.

The final test of the effectiveness and success of Discipline Without Punishment is when it stops being a program…a project…a policy. Discipline Without Punishment is finally and fully implemented when it has become so incorporated into the grain of organizational life that everyone considers it "just the way we do business here."

Manager 3.0

A Millennial's Guide to Rewriting the Rules of Management

by Brad Karsh
and Courtney Templin

THE SUMMARY IN BRIEF

Millennials mean business, and they are shaking up the workplace as they enter management roles for the very first time. They are tearing down the corporate ladder, communicating on the fly and bringing play to work. Millennials are creative, big thinkers, and they will change the face of leadership — IF they can bridge the gap between the hierarchical management style of senior executives and the casual, more collaborative approach of their peers.

Manager 3.0 is the first management guide written specifically for millennials. You will learn to master such crucial skills as dealing with difficult people, delivering constructive feedback and making tough decisions — while gaining insight into the four generations in the workplace and how to successfully bring out the best in each. *Manager 3.0* will help new millennial managers enhance their unique talents while developing an effective leadership style all their own.

IN THIS SUMMARY, YOU WILL LEARN:

- How to recognize and understand the difference among the generations and capitalize on the benefits that a diverse team brings.
- A method to develop a management style that is collaborative, flexible, transparent, casual and balanced.
- Ways to give and take feedback, criticism and praise, regardless of the source.
- How to build a team culture that is rewarding, inspiring and inviting.

Talkin' 'Bout Your Generation

According to a 2011 Society for Human Resource Management (SHRM) poll, 75 percent of respondents reported some level of conflict among the generations. These generations are comprised of unique individuals, and there are exceptions to every stereotype. However, each of the generations is shaped by the society and culture in which its members were raised. As a millennial manager, you likely will be working across all generations. You can't fall into the trap of managing people how you would like to be managed. Each of the generations' approaches works differently, and to succeed as a manager, you need to understand the driving forces and styles of each group.

Although there are exceptions, on the whole each generation has some predispositions.

Traditionalists (born 1928-1945). The traditionalists are the World War II generation, and they are a very loyal group. They mostly stay with one company. You go to work, you earn a living and you don't complain or ask for too much. As managers, traditionalists are more likely to give orders and resist change.

Baby Boomers (born 1946-1964). At 79 million strong, the baby boomers rightfully deserve serious consideration. To boomers, work is more than just work. Work is life. Boomers are much more defined by their work than other generations. As they have evolved in their careers, they became the first generation of workaholics. Boomers are overflowing with experience and insight, and as you are an emerging leader, they are excellent mentors for you.

Generation X (born 1965-1980). For 15 years, the birth rate goes down, down, down. Since they often had to fend for themselves while growing up, generation X is very independent. They are accustomed to doing things on their own. More entrepreneurs come from this generation. As managers, gen Xers typically are independent and hands off. Millennials — who love collaboration, constant structure and feedback — can struggle with an Xer manager. If you are managing Xers, it's best to give them some leeway and refrain from micromanaging.

Millennials (born 1981-2000). The tables turn as millennials — you! — are born. The birth rate goes back up, and there is a tremendous focus on community, family and importantly — babies, babies and more babies.

You grew up in a world where you were the most special, precious and extraordinary being. What did your parents tell you that you could be? — anything you wanted to be!

In addition to the idea that children are the single most important part of a family's life, you also grew up in a time where philosophies on parenting shifted. Boosting self-esteem among kids became a powerful notion in the 1980s. When it comes to the workplace, your generation doesn't abide by a strict chain of command. Your respect for authority must be earned, and you rely more on your network than a hierarchical ladder. You love working in teams, and you're a very hopeful and optimistic generation. You want to change the world, and you want to make a difference.

As a millennial manager, you can recognize and understand the differences and capitalize on the benefits that a diverse team brings. You can help bridge the gap. Each generation is molded and influenced by the society in which they were raised, and although everyone claims to be a member of the "best generation," there are no bests. When

you are working across generations, just think, "They're not better. They're not worse. They're just different."

Millennials Defined

The millennial generation is comprised of more than 75 millions Americans born between 1981 and 2000. According to the Bureau of Labor Statistics, there will soon be more millennials than boomers in the workplace. If you already are a millennial manager, then you may be on the "older" end of the generation. You are what we call a "cusper" — an individual on the edge of two different generations.

Neil Howe and William Strauss, authors of *Millennials Rising,* use seven distinct terms to describe your generation — "conventional, sheltered, team-oriented, achieving, pressured, confident and special."

Here is a quick look at the assets and liabilities of your generation. It's important to know the "perception" of you as a manager, and it's also significant as you manage other millennials.

- **Asset:** Goal-oriented. **Liability:** Distaste for menial work.
- **Asset:** Positive attitude. **Liability:** Lack skills for dealing with difficult people.
- **Asset:** Tech-savvy. **Liability:** Lack of experience.
- **Asset:** Collaborative. **Liability:** Confidence beyond ability.
- **Asset:** Multicultural awareness. **Liability:** Impatient.

With a better understanding of what makes everyone tick, you can work more effectively with your bosses, colleagues and direct reports. As your generation enters management roles, you undoubtedly will shake up the way business is done and how managers manage. Having a firm foundation of understanding on all of the generations — including yours — gives you the leg up when it comes to building a strong and cohesive team.

From Individual Contributor to Manager

As you become a manager, you will begin thinking less about your individual performance and more about the performance of your team. We're going to look at what I hear from your elders as being a dichotomy in viewpoints. This will help you see where some of the struggles come into play as you go from individual contributor to manager. It's important to note that these are just perceptions, but as a manager, perceptions make a big difference.

On four separate measures the perspective of a millennial manager will be just the opposite of other generations. I'm not saying that once you're a manager, you have to "sell out" and go to the "other side," but it is helpful to see these ideas from different viewpoints.

Entitlement vs. Duty. When older generations are asked about millennials, the number one issue that is heard is entitlement. You want to get promoted instantly, or you believe you have a college degree so you shouldn't have to do any menial tasks.

Based on the downfall of summer jobs as well as the business icons of the day, you can see how your generation might act more entitled than other generations. Many professionals say they have learned critical skills through their sense of duty — working their way up and gaining experiences along the way.

Equality vs. Hierarchy. Maybe everything was perfectly equal when growing up. At work, there is a hierarchy. You have a boss. Your boss's boss has a boss, and so it goes all the way up the line. There is a hierarchy; there is a leader; and everything isn't always equal. In the working world, fair does not always mean equal.

Explanation vs. Action. This is the biggest and most profound difference between the generations, and it's very important to recognize as you enter a management role.

First, let's talk about the disappearance of "Because I said so." This is vanishing from the vernacular of the millennial parent. Parents are now taught to answer their children with real explanations to their questions. Now that millennial comes to work. His manager gives him a menial assignment to do. That millennial — accustomed to asking questions and getting real answers — asks, "Why?" Your generation likes to see how your duties connect and contribute to meaningful work or a purpose.

Let's look at another example. During their entire lives, millennials have looked up — at a coach, a teacher, a chaperone, a parent — and someone has told them EXACTLY what to do. As a result, when they come to work, they look up and expect their bosses to tell them exactly what to do. Boomers and Xers dislike authority figures telling them what to do, and they have an extreme distaste for structure.

This speaks to probably the biggest disconnect between the generations. This may sound counterintuitive, but due to the way you were raised, your generation almost needs to be taught to think on its own. As a millennial manager, you will have to think and act on your own, and you can teach your millennial employees to follow your lead.

Partnership vs. Ownership. Due to all of the group work in school, the clubs that you've been involved in and the team sports you've played, the tendency is to think in terms of shared responsibility versus ownership. But success or failure is up to you. I often hear that senior leaders complain that millennials don't see projects through from start to finish. The perception is that millennials think their boss will make the final touches and correct any problems. Of course, there will be collaboration, but millennials also need to have ownership over their responsibilities.

From Individual Contributor to Manager

Especially as you enter a management role, you must start thinking more in terms of "What can I do for my team and my company?" instead of "What can the company do for me?" Thinking on your own more and taking ownership of your responsibilities will help you bridge the gap among the generations and move from an individual contributor to a positive and influential manager.

Defining Management Characteristics: Shaking It Up

JB Training Solutions interviewed and talked with hundreds of millennials and works with thousands of millennials every year. In these conversations, we heard a few themes that rang true for the majority of millennials. For millennial managers, work isn't just work — it's an extension of themselves. The main characteristics that define your management style are collaborative, flexible, transparent, casual and balanced.

Collaborative: We're In This Together

It's all about the team, and it's all about the people. Millennial managers want to like the people on their teams — and they want the people on their teams to like them as managers. We had numerous quotations about how millennial managers don't want to be leaders who just issue orders; they want every person's voice to be heard. "Building a relationship" with your team is one of the accomplishments millennial managers are most proud of.

Your generation is known to care about your team members, encourage their growth and hear their opinions. Even as you move through the ranks to take on larger leadership roles, you will uphold your value of teamwork and working together.

Flexible: Open to How the Job Gets Done

When talking with millennial managers, they stressed the importance of flexibility not only in work schedules but also in what work is done and how it gets done. For millennials, there aren't hard and fast rules and policies for everything. There can always be an exception or a personal situation that warrants a targeted solution. Millennials are also flexible in their management style — they can decide as they go along.

Transparent: Being "In the Know"

Millennials say, "If you want my team to be part of the solution, then I think they deserve to know the full story." Millennials ask, "Wouldn't that help people make better decisions if they can see the whole picture?" They want companies and their leaders to be transparent in their strategies and values; according to millennials, it helps build trust and respect. The push for workplace transparency stems from their need to know "why?" and, importantly, the transparency that social media brings to the lives of millennials.

As a millennial manager, you will share the full story with your team, because you would want to know. Millennials think it's respectful and necessary to share. In general, millennials will forge a strong path toward transparent leadership.

Casual: Just Be Yourself

Gone are the days of suits and ties and pantyhose. Millennials are not backing down on this one. The casual tone isn't simply limited to clothes; it extends to their attitude, the way they work and the way they talk and interact as professionals.

Business is conducted much more casually, where ideas and strategies can come from anywhere. You blur the lines, so work is not just work and play is not just play. Work and play come together to create a much more casual scene. Millennial managers wanted to stress that the "casualness" of the generation isn't necessarily due to a lack of respect or interest. With the blurring of work and life, millennials are bringing a more casual way of dressing, writing, communicating and managing to the workplace.

Balanced: Successful at Life as a Whole

Millennials are not workaholics, and there is not a clear boundary between work and life. Leading a balanced life is not something that millennials aim for; rather, it's ingrained in them. Furthermore, for millennials, it's more of work/life integration and less about balance.

In our interviews with millennial managers, we often heard that millennials want to succeed in work AND outside of work. Friends, family and extracurriculars are very important to your generation. Here are a few of the anecdotes we hear from millennials:

I want to be known for working hard and playing hard. I love that I have things outside of work that make me happy. I think it's sad when all you have is work.

If you look at companies started by young professionals, they are little microcosms that reflect all of these millennial values. Millennials are attracted to companies that reflect their values.

Rewriting the Rules of Management

For millennials, it's not about the hierarchy ladder. It's not about busting your tail and working countless hours to move up a rung on the ladder. With social networking, connections can be made like a spider web. In previous generations, a chain of command was just that — a chain. It started and ended at specific points.

Millennial managers are breaking down the walls — figuratively and literally. Millennials do not want obstacles that put "walls" in between levels or groups of employees. Your generation does not see any benefit in bureaucracy. Millennial managers have an open-door policy. Millennials want their physical spaces to be transparent as well.

Millennials are also breaking down the walls between people. Millennials are more racially diverse than any generation before them. One of the most multiculturally aware generations, millennials see and connect with people first, and they are open to differences — gender, religion, age, culture, experiences, sexual orientation and the list goes on. In general, millennials are tolerant and accepting, and they appreciate the richness that diversity brings.

Millennials are making business communication much more casual. Many millennials are of the opinion that long e-mails will never be read, and most important things can be said in less than 140 characters. As stated, millennials are all about flexibility, and they want work to be enjoyable.

Leading Your Team: CONNECT

Most individuals are promoted because they are high performers and excellent individual contributors. Often, the skill set that makes you a high-achieving individual contributor is very different from those that make you a great manager of people. Going from individual contributor to manager is a significant change and requires a fundamental shift in your mindset. You may have to look for new sources of satisfaction — guiding an employee toward writing his first winning proposal or eliminating obstacles so your star employee can crank through her to-do list.

To guide us through this beast of a topic, the advice has been grouped under seven key themes. As a millennial manager, you want to make sure you CONNECT — Communicate, Own it, Navigate, Negotiate, Engage, Collaborate and Teach.

Doing some of this upfront work of connecting with your personal leadership values will help guide you as you face some of the tougher parts of managing. Once you understand and solidify your management ideals, you can focus on connecting to your organization and your people.

Communicate: Just Say It

The foundation of any good working relationship — or any relationship for that matter — is built on trust and communication. Communication is a key part of being transparent and collaborative — two core values of your generation. Here's the catch: The majority of the millennial managers we spoke with said "having difficult conversations" or "delivering tough feedback" is their main weakness. As you move through your career, holding people accountable through constructive conversations will become increasingly important. It's an essential skill that you can begin honing now.

Establishing Your Expectations: The Blueprint

Establish your expectations right from the start. For your team to be effective, you must have boundaries and something to shoot for. In laying out expectations, one fundamental thing that you can do is share the individual's job description and go through it together.

After reviewing the higher-level job description, discuss and describe their upcoming duties and projects. With a running to-do list, it's helpful to your team to know what the priorities are. It's your job as a manager to keep your team focused on what matters most.

Setting Push Goals: Infiltrating Fun

You can set a successful path forward by developing PUSH goals. At the heart of a push goal is a goal that pushes you past mediocre or pretty good into the realm of great and excellent. A PUSH goal is not easy to achieve. To break it down, a PUSH goal is Passionate (passion and excitement), Urgent (let's make it happen now!), Specific (can it be measured?), and Hairy (it's not easy). Once you talk through these goals, write them down and plaster them wherever they would serve as a reminder.

Giving Feedback: The Good, the Bad and the Ugly

The second overarching theme under "communicate" is feedback. You want to build strong, close relationships with members of your team, so you might struggle when it comes time to give constructive criticism. It may seem a little awkward or difficult to deliver, but people want to know.

If your employees are making mistakes or could be doing something better, they want to know sooner than later. As millennial managers, it may be tough to get in the habit of delivering constructive criticism. You may be afraid that the person will take it the wrong way or get emotional, defensive or discouraged. You must engrain this idea in your mind — feedback is for the employee's own good.

There are three types of feedback that you will deliver to your employees:

1. **Day-to-day feedback.** This is the best enforcer of behaviors — to let someone know how they did right after the fact. Think of it as on-the-spot coaching.
2. **Informal, regularly scheduled feedback.** Take 15 to 20 minutes every month to sit down and chat with each of your direct reports. These meetings are about your direct reports and how they are doing at work.
3. **Formal review.** Most companies have a formal annual or semi-annual review. The most important point is to not wait until the annual review to deliver your feedback. There should be no surprises at the annual review.

There is another side to this form of communication — listening. You also want to receive feedback openly. Listen. It's never as bad as you think.

Own It: Taking — and Giving — Responsibility

Ownership is holding yourself accountable for what you do and how you do your job. Since your job is manager, your ownership goes a step further. You are the leader of the team, so you must hold yourself accountable for how the team performs. What can YOU do to improve results? Some negative feedback we hear about millennials is that they don't take ownership of their position. Millennials often seek permission when it comes to incorporating new ideas, or they miss a few steps when "seeing a project through from start to finish."

As a manager, you will find that it is less about you. If you recall the way you were raised, it was all about you and your specialness. Now, as a manager, you have to take a step back from this mindset. Truly great leaders are concerned with values and ideals greater than themselves. To "own" your management position, you must put your team leaders and the success of your team first.

There are a few elements to think about when it comes to owning your role as manager:

- Failure is on the road to succeeding. Have confidence to make decisions. Don't be afraid of mistakes.
- Do what you say you're going to do. Own your words and actions.
- Be your own CEO, and ask others to be their own CEOs.
- Orchestrate success and ownership. Unify your group, set the tempo, execute and shape. Lead the way.

Navigate: Managing Through the Unknown

When you're "navigating," there's always an element of the unknown. The unknown makes it exciting — yet scary. As a millennial manager, you have to navigate quite a few things — changes in business needs, personality style of your team members, ups and downs of workflow and much more. Instead of fearing the unknown and skirting away from it, seek it out, run toward it and embrace it.

How do you gain a vision for your team? Navigating is easier if you constantly check in with yourself and your surroundings. Here are a few questions you can ask yourself to keep you and your team on track and moving in the right direction:

- What's next? What's new?
- How can we do things better, faster or bolder?
- What hasn't been working and how can we improve?

Work your way through tough situations by serving as an open and hopeful leader. Know what level of transparency is needed. You now have a larger responsibility to support your senior leaders and your company's initiatives positively. You have your team, but you're also on the management team, so you have to represent those views and perspectives as well.

Understand the unique communications styles on your team. Everyone is different and wants different things, so it absolutely makes sense that different people excel under different management styles. The business golden rule is to "Do unto others as they would have you do unto them."

Negotiate: Working Through Different Perspectives

One thing you need to do is reframe your thinking around negotiating. Negotiating is actually positive and essential in business. Done right, there isn't a winner and loser, and it doesn't always revolve around money. You negotiate every day. As a manager, you undoubtedly will come across people with different perspectives, and you will have to negotiate and sell your ideas — on your own.

Negotiating is a dialogue — a conversation. It's respectful and insightful. Everyone has a chance to talk, and everyone has an opportunity to listen. There doesn't always have to be consensus, and you don't want to fall into groupthink. Bringing up new and differing concepts truly is helpful to negotiation and conversation.

The idea of negotiating means that you have an opinion, and you have a stance worth taking time for. Have an opinion, find your voice and stand up for it when appropriate. This doesn't mean be close-minded to differing views. It means don't fold the second someone voices an opposite concern. Listen first, and know your value proposition.

Keep reminding yourself that negotiating is not bad and that it's worth standing up for your opinions and ideas. As you go along, you and your team will feel more comfortable negotiating, exchanging different ideas and arriving at the best conclusion.

Engage: Connecting to the Big Picture

An engaged and empowered team will go above and beyond. You want to get in tune with your team. How's the morale? How is everyone functioning individually? How are they working together as a team? You may find that you learn a lot more from observing rather than talking. I urge you to step back, listen and observe to get a real pulse on the engagement of your team.

Recognition goes a lot further than the employee-of-the-month star on the bulletin board. There are many options for recognizing your team! Praise, flexibility (when, where and what), visibility, responsibility, autonomy (freedom) and more. Appreciation and recognition go hand in hand. You can customize your appreciation, recognition and rewards for your team, and they will keep generating and customizing great results for you.

Recognize, appreciate, empower, challenge and engage to feed positive results and passionate people. It's all about building a team culture that is rewarding, inspiring and inviting. You want people to want to do an amazing job. Pepper in the "thank yous," and sprinkle in the fun. If you build it, they will come — and play — and stay.

Collaborate: Making It Happen

A strong team is powerful. Resilient. Seemingly unstoppable. You can build it, but it takes hard work and discipline. Part of collaborating is communicating expectations, delivering feedback, getting to know your people and adjusting your style. Here are some of the intricacies of maintaining a collaborative but action-oriented team:

- Matching the person with the responsibility: Do you have the right people in the right roles? Help your team members foster their strengths.
- Collaborating to take action: Just do it: One thing we heard from older generations is that millennials spend too much time in the "collaboration zone." You want to hear from everyone, and you want to solve problems together, but you must know when to move from information gathering to the decision-making stage. Just commit. Go for it. Not everything is going to go as planned, and maybe you won't make the best decision. Make a decision and own it. This is what your managers want more of from millennial managers.
- Manager or BFF? Drawing the line: Watch the fine line between friend and manager. You can be friendly without being a friend. Maintain your level of influence. If you don't, you will struggle with everything you have learned in this book. Choose being friendly over being friends.
- Collaborate and work together: But take action. Lead productive meetings. Just do it. Just say it. Decide.
- Make a difference in your company culture and your community: Be the change you want to see.

Teach: Being a Mentor — and Student

One of the first lessons you can teach your people — including yourself — is always to be learning and growing. Be a lifelong student and teacher. Take the time to teach. Give your people a push, an insight, a new perspective — just because. Teaching is more of a mindset. Everything that you do can be a teaching and learning moment.

Storytelling is an amazing and engaging way to teach your employees. You can tell stories to relate and show

understanding, and you can tell stories to share a vision and paint a picture.

Delegate responsibility to empower your team. Delegating can be hard work. It's about letting go and empowering someone else to own that responsibility. A few things NOT to do:

- Dumping without help or input.
- Checking in too much.
- Don't let them get too far off track.
- Refrain from assigning only menial tasks.
- Don't blame your team for reasonable misses.

Help your employees see what they can't see in themselves. Give them the benefit of the doubt that they will achieve and be downright awesome. Mentor, coach and expect greatness. When your people know that you believe in them, they start to believe in themselves.

Push, challenge, ask insightful questions and teach. Be that manager that expects greatness. Share your knowledge through storytelling and nurturing creativity.

Leading When Things Get Sticky

A theme that you have heard echoed throughout this book is that it won't be easy to lead and inspire a team. When talking with millennial managers, there were three scenarios that we heard time and time again as being prevalent and extra sticky.

Managing Your Peers: From Buddies to Boss

One of the biggest obstacles that millennials say they face is managing their peers. To make the transition from peer to manager, there are a few things to keep in mind:

1. **Go all in.** You are the manager. Assume your role with a humble confidence — an openness to ideas with a strong self-assurance in your leadership abilities.
2. **Determine your boundaries.** Right from the start, you must set clear expectations and boundaries when managing your peers.
3. **Find the balance between power-hungry authoritarian and friendship-preserving push-over.** Remember, you can be assertive AND nice.
4. **Chat it out.**
5. **Find a mentor.** Having a mentor gives you a great third-party, objective view of the situation, and you can play off their years of experience.

Managing Someone Older Than You: Building Credibility

If you're a millennial manager supervising older employees, they likely are skeptical of your performance. Employees who are older than you want to see that you're knowledgeable, action oriented and have your stuff together. With this perspective in mind, we have some ideas for you:

1. Know your stuff.
2. Respect their experience, but don't be intimidated by it.
3. Have confidence.
4. Share information and experiences.
5. Try to see the whole picture.

Although most of the CONNECT tips still apply when managing a remote team, there are a few specific things to consider.

1. Set crystal-clear expectations.
2. Resist the urge to micromanage.
3. Be creative with recognition and appreciation.
4. Give and receive regular feedback.
5. Make some face time.

Conclusion: Go Forth

This is it. This is your time. You already are rewriting the rules for the workplace; don't stop once you enter management — and leadership — and mentorship. Don't lose that energy.

Go forth. This is your guide. You can connect to your people, to results and to the big picture. You can go forth, rewrite the rules of management and forge a path toward open and collaborative leadership. Just CONNECT.

The New Manager's Tool Kit

21 Things You Need to Know to Hit the Ground Running

by Don Grimme
and Sheryl Grimme

THE SUMMARY IN BRIEF

The single greatest challenge in today's workplace is the management of that most inscrutable of resources — people.

All too often, organizations view their employees in much the same way as they view their material resources: as a commodity, homogeneous and easily interchangeable.

In fact, however, employees are not headcount nor merely the means to organizational ends. They are also ends unto themselves. A human being needs to be treated with respect. As a human resource, an employee deserves (and needs) to be viewed differently than the inanimate resources of the organization. The power tool to tap the full potential of your workplace is grasping this fact so that it influences every aspect of how you think about and interact with this invaluable "asset"— your fellow employees.

The various ramifications of this power tool are the 21 tools in this book. They provide a fresh approach to employee management.

IN THIS SUMMARY, YOU WILL LEARN:

- How you can engender open two-way communication.
- Why you need to coach the good employees ... and the not-so-good.
- A critical look at eliminating conflict, harassment and workplace violence.

Introduction

The single greatest challenge in today's workplace is the management of that most inscrutable of resources: people. A human being needs to be treated with respect. The power tool to tap the full potential of your workplace is grasping this fact, not only intellectually but also in your gut, so that it influences every aspect of how you think about and interact with this invaluable "asset" — your fellow employees.

PART I: LEADING PEOPLE

Tool One: Turn On Talent…and Turn Off Turnover

There is a crisis in America today. We're referring to the diminishing ability of organizations in every sector of our society to attract, retain and motivate talented employees. In this tool, you will learn the secret to transforming this crisis into an opportunity. Here are four tips:

Tip #1: Pay employees fairly and well; then get them to forget about money.

If employees believe they are unfairly paid, they will be demotivated. They will complain, goof off and eventually quit. But assuming that wages are competitive and fair, studies have shown that pay itself has no impact on retention or productivity.

Therefore, the second part of our tip is to then get them to forget about money. Don't bother coming up with a complicated incentive pay program, particularly if it pits employees against one another. Such programs just get in the way of employees focusing their attention where it should be — on doing a good job!

Tip #2: Treat each and every employee with respect.

Show that you care about each employee as a person, not just as a worker. One of the things employees most want is sympathetic help on personal problems.

Tip #3: Praise accomplishments … and attempts.

Praise accomplishments using positive feedback. Remember, more than anything else, employees want to be appreciated for the work they do. And not only accomplishments but also good attempts. Make sure to

- Praise at least four times more than you criticize.
- Do it promptly, as soon as observed. Do not wait for the annual performance review.
- Do it verbally and in writing.
- Do it publicly and in private.

Tip #4: Clearly communicate goals, responsibilities and expectations.

Tool Two: Unleash Their Productivity

Excessive job demands detract from productivity and interfere with the enjoyment of our work, that is, job quality. These tips were developed to address both issues.

Tip 1: Make work more meaningful by applying your organization's core competencies in creative ways.

Try to identify a synergy between your products and services and your employees' values: home, family, recreation, education, giving back to the community and so on. For example, perhaps you could utilize available space and employees to provide ad hoc child care during school holidays.

Tip 2: Effectively communicate the mission and vision of your organization.

One of the five principle reasons employees leave their jobs is they do not get or do not agree with their employer's reason for being.

Once you have a mission and/or vision statement, don't bury it in a desk drawer. Communicate it and reiterate it to all stakeholders, especially to your employees. Employees should constantly be asking themselves to what extent their actions are contributing to the fulfillment of the mission.

Tip 3: Link the mission and the job to the talents and aspirations of each employee.

One of the main causes of burnout is job mismatch (or culture misfit). Make hiring and promotion decisions based on

- Relevant talent more than on skills or experience.
- Culture fit and values.
- Temperament and lifestyle.

Tool Three: Balance Their Work and Life

Work-life supports on the job are powerfully related to positive work outcomes such as job satisfaction, commitment to employer and retention. Here are five principles for balancing employees' work and life:

Principle #1: Really care about the effects that work demands have on your employees' personal and family life.

Your employees can tell if you really do care. If, in all honesty, you don't care, you might want to reread the introduction to this book. And also think about the practical results of such caring.

Principle #2: Never show favoritism when responding to employees' personal needs.

Evenhandedly assess the significance of each employee's work/life issue, collaborating with that employee to develop a workable and perhaps creative solution.

Principle #3: Accommodate employees when they have personal business to take care of.

This could range anywhere from approving an extended lunch hour for a doctor's appointment (for the employee or family member) to flexible work schedules to assistance with day care.

Principle #4: Demonstrate understanding when employees talk about personal or family issues that affect their work.

Put on your fellow-human-being hat when listening to employees' work/life concerns. How would you feel in that situation?

PART II: DIFFERENT STROKES

Tool Four: Embrace Diversity

Many people regard diversity with some skepticism: as a fad or a code word for affirmative action. The reality is that diversity is one of the most fundamental and significant issues of the American workplace. The first thing to know about diversity is that it is not, or should not, be a code word for affirmative action.

Diversity is not a social problem to be solved but a business opportunity to be optimized: for example, an expanded customer base, a broader source of employee talent or a more harmonious workplace.

How to Break Down Stereotypes

How do we break out of this circle or break down our stereotypes? You need to ask yourself,

- Does your opinion hold true for everyone in the group?
- Is the person thought of as part of a group first rather than as an individual?
- Do your past experiences with members of this group affect this interaction?

Does your opinion reflect the knowledge, skills and abilities necessary to do the job? For example, do you view people in wheelchairs as cripples or as unique individuals with one obvious mobility limitation and all kinds of abilities?

Tool Five: Get a Grip on Generations

Another significant way in which we are different from or similar to each other is our generation. This can create conflict or, at least, tension and confusion.

For example, traditionalists tend to be motivated by duty and honor and climbing the career ladder. Boomers are more interested in a meaningful experience and personal growth. Gen X wants leisure time (they've been at the forefront of "work/life balance") and tends to be skeptical and pragmatic. Millennials crave stimulation and share Gen X's desire for leisure time, but more so.

To communicate and interact effectively with anyone, it helps to know where the person is coming from and adjust your style as much as possible to what is most familiar and comfortable for that person.

Tool Six: Focus On Ability

The Americans with Disabilities Act (ADA) of 1990 has had the most far-reaching impact on the workplace since the Civil Rights Act of 1964. Yet many Americans remain uncertain about their rights and responsibilities under the law. This tool helps to eliminate such uncertainty and will enable you to comply fully with the law and forge a productive and harmonious workforce.

Concept #1: Focus on Ability!

The image we hold in our mind to underscore this concept is Stephen Hawking, who has an extremely disabling affliction ... and is perhaps the most able person on the planet! Notice a disability only as it may impact performing essential job functions or as requested by the person.

Concept #2: Challenge assumptions, prejudgment and fear.

Our primary model for this concept is Christopher Reeve. After his accident in 1995 left him paralyzed from the neck down, most people assumed his career was over. He certainly challenged those assumptions — going on to deliver his most distinguished performances as an actor and director.

Concept #3: Focus on what is to be done … not how or when!

As you will see, this gets to the essence of reasonable accommodation and impacts job descriptions, pre-employment inquiries, scheduling and day-to-day interactions.

PART III: LEADER EFFECTIVENESS

Tool Seven: Tell Them What Worked … and What Didn't

What is feedback? It's simply information given to and received by people regarding their behavior. Notice: behavior, not character. Feedback is a continuous and interactive process, best given as close to the time of the behavior as possible. Do not wait until an annual performance review; instead, frequently have a two-way communication with employees regarding their performance and interactions with others.

Positive Feedback

Unfortunately, most of us are criticized four times more than we're praised. We need to reverse that! Here's how to do it:

1. Start by describing the behavior (not the person). Use specific language and examples.
2. Then describe the impact of the behavior. What positive consequences does it have? Why are you praising the person for it?
3. And show appreciation for the person's effort. This can be as simple as saying "Thanks!"

Be sincere, not manipulative. Your goal is to catch people doing something right and make them aware of it.

Tool Eight: Ask Them…Then Listen

The other side of the two-way communication coin is inquiry to solicit your employees' ideas and opinions and active listening to ensure that you hear them and that they feel heard.

What is inquiry? It is the opposite of telling or advocating. You ask for a person's ideas or input in a nonjudgmental way. You withhold telling what you think and avoid arguing your own point of view.

1. Inquiry can be used to confirm understanding, for example, as part of the constructive feedback process.
2. Most employees probably know their jobs better than anyone else. They are your in-house experts for many issues, including their own performance-improvement and development needs.
3. Inquiry gets the person involved. Remember that employees really want to feel in on things.
4. Inquiry helps build buy-in and commitment. Is gaining the commitment of your employees ever a challenge for you?
5. Inquiry helps build a person's self-esteem. Requesting a person's ideas and opinions implies that his or her thoughts are important, that the person is important.

PART IV: OPTIMIZING CONTRIBUTIONS

Tool Nine: Diagnose Problems

All too often, when dealing with an employee whose performance or behavior does not meet expectations, we attribute the problems to some flaw in the person's character — labeling the individual a "problem" employee. Such attribution usually is unfair and is always counterproductive.

The Five Root Causes of Performance Problems

The real cause of most problems falls into one or more of the following five categories:

1. Expectations. Does the employee know what is expected? Does the employee even know there is a problem?
2. Training and Ability. Does the employee have the requisite skills, abilities and aptitudes to perform the task? If he or she does not have the aptitudes, you may need to reassign or fire the employee. But if it's a skills/abilities issue, then they may need on-the-job training.
3. Job Design. Does the employee have the necessary tools and resources to perform the task? Those resources include not only physical tools but also convenient and timely access to information and to you, the manager. Does the system support good performance? This gets into such issues as communications, scheduling and teamwork, within a department and between departments.
4. Work Environment. This refers not only to the physical environment but also to how employees are treated. Is good performance rewarded or punished? For example, is there an informal standard set by peer pressure to not work too efficiently? Or are you assigning extra, more demanding tasks to your best employees without rewarding them appropriately? Is poor performance rewarded? That is, do you tolerate it? Do you treat your marginal employees the same as you treat your outstanding ones?
5. Personal/Motivational Problem. Does a problem exist in the employee's personal life that may contribute to poor performance? Low morale or even a negative attitude may be a symptom of excessive job demands or not receiving deserved positive feedback.

Tool Ten: Coach the Good Ones… and the Not So Good

Coaching is the first of three strategies we present to optimize employee contributions. It brings together all of the skills addressed in previous tools as a cohesive process to improve or enhance the performance of both marginal and good employees.

Although the process is essentially the same and the same skill set is utilized, it is helpful to distinguish two categories of coaching, based on the type of employee to be coached:

1. Performance-problem coaching for marginal employees.
2. Development coaching for good employees.

Performance-Problem Coaching

Performance-problem coaching is used with an employee whose performance or behavior is not meeting expectations. The purpose is to correct problems so that the employee meets standards or expectations.

Use performance-problem coaching whenever

- An employee's quality or productivity does not meet expectations.
- An employee's behavior interferes with his or her performance.
- An employee's behavior interferes with the performance of others.
- An employee violates a policy or procedure.

Development Coaching

Development coaching is used to further develop employees whose overall performance already meets expectations. The purpose is to maximize an employee's performance in the current job.

Development coaching usually is less intense or emotionally demanding than performance-problem coaching, because the stakes are not as high, that is, the employee's continued employment is not in question. Development coaching helps a good employee become a great employee.

Use development coaching to

- Add new skills or hone existing skills.
- Help the employee apply knowledge or skills to the job.
- Enhance performance so the employee works more effectively.
- Prepare for an upcoming project or assignment.
- Help the employee solve problems.

Four Steps of a Coaching or Mentoring Dialogue

Whether you will be conducting performance-problem or development coaching (or the mentoring discussed in the next tool), you'll be doing it in the form of a conversation.

To be most effective, there are four steps:

1. Set the purpose of the meeting. Describe what you want to discuss and why. Seek the employees' involvement in the meeting — why it is in their self-interest to actively participate.
2. Gather and clarify information to define the situation. Use inquiry to gain information. Offer your ideas, as necessary. Apply the diagnosis process described in the previous tool.
3. Identify and develop ideas to address the situation. Use inquiry to solicit ideas, offer your ideas and discuss and develop best ideas.

4. Determine an action plan. Agree on action steps that are clear, measurable, achievable and have target dates, and on a plan to monitor progress. Offer encouragement and support.

Four Tips for Performance-Problem Coaching

1. Address problems early. Nip them in the bud, so to speak.
2. Be a problem-solving ally, not an adversary. People move toward and with their allies but fight or flee from their adversaries.
3. Involve the employee as much as possible in the process. It is the individual's job or career that is on the line.
4. If the problem persists, document your actions. Keep your manager informed, and work with your HR department to take further action (e.g., the steps entailed in your organization's progressive disciplinary policy, up through termination).

Tool Eleven: Mentor the Great Ones

Mentoring is the strategy used with an employee whose performance exceeds expectations and therefore is ready for new opportunities. The purpose of mentoring is to groom and guide an employee to assume additional responsibilities and/or advance in his or her career.

Mentoring involves sharing your knowledge and experience to help an employee create and fulfill a career plan.

Tips for Mentoring

1. Inquire into your employees' career desires and frustrations. Do not make assumptions! For example, not all outstanding employees want to be managers.
2. Help them grow and advance. Whatever their aspirations, offer the developmental assignments, training, networking and personal/professional contacts that will aid in fulfilling those goals.
3. Do not make promises about promotions or future jobs. Instead, talk about possibilities.
4. Coordinate your efforts with senior management. Employees' careers may take them into areas that are outside your direct control.

Tool Twelve: Turn on Teamwork

Most so-called "teams" do not work for one of two reasons:

1. They're not supported or encouraged by the surrounding organization and are not recognized or rewarded for their efforts.
2. They're not really teams but merely groups (at best) or pseudoteams (at worst).

Teams without access to necessary resources that are discouraged from investing time in team activities or find their results and recommendations ignored eventually flounder in frustration.

The ultimate in team effectiveness is the high-performance team. Such teams possess all attributes of a real team plus a deep commitment to each other's personal growth and success. Their output is much more than the sum of individual contributions.

PART V: PERSONAL AND INTERPERSONAL EFFECTIVENESS

Tool Thirteen: Blow Away Burnout

The more overworked employees are, the more likely they are to make mistakes at work, feel angry at their employers and resent their co-workers. This tool unlocks what individuals can do to alleviate job burnout. Here are two Cool Tips:

Cool Tip #1: The Physical Arena

This tip is pretty straightforward:

1. Get a physical exam. How is burnout impacting your health?
2. Eat healthy. Consume all four food groups in moderation. No fad diets or binging.
3. Exercise. Work out regularly, moderately, appropriate to your age and condition.
4. Practice relaxation.

Cool Tip #2: The Mental Arena

Ultimately, stress is internally generated; it is how you process external triggers of burnout.

1. Develop or improve coping skills. These coping skills are perhaps best summarized by the Serenity Prayer, which can be viewed either as a religious prayer or a secular self-dedication: "…grant me the serenity to accept the things I cannot change, courage to change the things I can and the wisdom to know the difference."

2. Understand your strengths and weaknesses. Capitalize on your strengths and find ways to shore up your weaknesses, for example, through others and/or self-improvement.
3. Learn effective (not so much time management) but inner resource management:

- Take breaks.
- Relax during your time off (and work breaks).
- Delegate and/or swap tasks with others.
- Ask for time off, and use all allotted vacation time.

4. Set realistic goals. These are goals that are important to you, not to please others, and that are challenging but attainable.
5. Learn to schedule "me time." Not time for work, family or friends, but for you.

Tool Fourteen: Stay On Top of Stress

What causes stress? An over-demanding job? The juggling of work and family responsibilities? Having to deal with other stressed people?

Well, believe it or not, stress is what we do to ourselves. All those external-event stressors that seem like stress really are just triggers of our own erroneous thoughts.

It is the internal conflict between absolutes, such as "I must" and "I can't," that is the root of all stress. So how do you resolve it? By challenging either or both of those (erroneous) absolutes. Reframe the "must" to "want" and the "can't" to "can." Sounds simplistic. Well, sometimes it is simple but not necessarily easy. In general, this reframing requires extensive practice to become a habit, as well as a rethinking of many of your most closely held precepts, or fundamental convictions. Such flawed logic usually is deeply rooted and reinforced by the world around you.

Tool Fifteen: Accentuate the Positive

Attitude is the underlying way we think, feel and act: how we react to the world around us. It determines the quality and effectiveness of all of our thinking, emotions and behavior and, thereby, the positive or negative consequences of that behavior.

Attitude is the one thing we can count on as a lifetime companion. Jobs and relationships come and go, but attitude is always with you. You can't take a vacation from yourself!

Stay in the Present Tense

You cannot change the past. And you cannot yet take action on the future. What you've been given to work with is the present. In which of these do you spend most of your mental life? Ruminating about the past? Worrying about the future? Or are you in the moment, fully focused on what you're thinking, feeling and doing at this time. Be here now!

Tool Sixteen: Assert Yourself ... and Deal with 'Difficult' People

We've seen several definitions of assertion. This one is our favorite: Assertion is speaking honestly about your thoughts, feelings and desires, while considering those of others.

Sounds pretty good, doesn't it? Honesty. Respecting yourself and others. Considering its inherent uncontroversial virtues, it is puzzling that more people are not assertive.

When you assert, you take responsibility, you solve problems and you are straightforward rather than underhanded or devious.

A word of warning: Assertion is not a guarantee that you will get the response or results you want. There is no such guarantee. But, in addition to all the benefits enumerated, assertion stands a far better chance of getting those results than aggression or submission, at least in the long run and without the negative backlash inherent in those alternatives.

Tool Seventeen: Own Your Anger ... Don't Let It Own You

Anger is neither good nor bad. If you feel it, you feel it! Many people deny that they ever get angry. The first rule of anger is to acknowledge that you are angry.

It really is OK to feel your anger. Denying your anger or repressing it is the worst thing you can do. The second rule of anger: Let yourself experience it fully. Although you want to experience your anger fully, you do not want it to take you over and contaminate your actions. The third rule of anger is to process your anger instead of reacting to it.

Open, honest and direct expression can be the most effective way of managing anger. The fourth rule of anger: Whenever feasible ... express it!

Even if we don't immediately lash out at the person who has triggered our anger, too often we hold onto it, letting it fester and poison our interactions and well-being.

The fifth and final rule of anger: Give it a time limit ... then let it go.

Tool Eighteen: Rise to the Challenge of Change

Dealing with fear is one of life's greatest challenges. It tends to paralyze us. Rather than facing our fear, our impulse is to run from it, to evade, deny, escape. Perhaps you see yourself or people you know in some of these resistance behaviors. But in order to move forward we need to face our fear.

Six Steps for Dealing with Change

Here are six steps for dealing with change:

1. Recognize that change involves loss.
2. Accept or reject the change.
3. Approach change as a process.
4. Develop a positive outlook.
5. Make a plan.
6. Allow yourself to be flexible.

Remember, you can handle this!

PART VI: ELIMINATING CONFLICT

Tool Nineteen: Prevent All Forms of Harassment

What does harassment mean to you? This question elicits a wide range of responses, such as feeling bullied, disrespected, insulted, treated as an object, put down and so on. In essence, harassment is aggression against another person's body or mind.

Often, harassment is an abuse of power, whether physical power or the power of position.

How would you respond to harassment? You might be tempted to wallop the harasser. The hope is that, instead, you would practice some anger management and use less violent means of expression.

Those who work in the human-resources function have a significant role to play in harassment prevention and EEO compliance. Outside of HR, the role of the manager is no less significant, but it is more constrained. In addition to avoiding harassment yourself, you need to detect and respond to all forms of harassment.

Tool Twenty: Prevent Workplace Violence

Most of us have yet to wake up to what may be an even greater danger, certainly a more chronic one: that of unorganized terrorism — those so-called random acts of violence that have been plaguing this nation, and especially this nation, for years.

There are two prevailing myths regarding workplace violence. Myth 1: It can't happen here. This myth is "The Ostrich Syndrome." If the wave of violence over the past several years has demonstrated anything, it is that violence can strike at any time, in any community and in any workplace.

Myth 2: It can't be prevented. Balderdash! In fact, 99 percent of incidents have clear warning signs, if you know what to look for. Within just hours of the Lockheed Martin murders in Mississippi in 2003, reporters learned that the gunman had had frequent conflicts with managers and co-workers. He was a known racist and talked about killing people. You do not have to be a forensic psychologist to detect warning signs like these.

Tool Twenty-One: Defuse and Protect

In a sense, "postal" has become a metaphor for the potential workplace-violence perpetrator. When it comes to defusing a hostile co-worker or customer, turn to the postal carrier's traditional nemesis: DOGS. This is an acronym for Defusing of Grievance equals Safety.

Visualize a big balloon that's about to explode. Instead of puncturing the balloon with confrontation, you want to *gradually* deflate the balloon. You can do this by confirming a person's perspective without necessarily agreeing with it.

On Fire at Work

How Great Companies Ignite Passion in Their People Without Burning Them Out

by Eric Chester

THE SUMMARY IN BRIEF

What key question do managers and supervisors at Marriott Hotels ask their employees each day, enabling them to maintain a turnover rate that is one-third of the industry standard?

Why are there more than 500 "co-presidents" at a software firm that has twice been recognized as the best place to work in Minneapolis?

Why does a burgeoning healthcare consultancy firm in Philadelphia ban its people from sending business-related emails after 6 p.m. and on weekends?

The answer to these intriguing questions — along with many others — can be found in Eric Chester's *On Fire at Work*. Chester reveals the *seven cultural pillars* that today's leading employers focus on to attract and retain top talent: compensation, alignment, atmosphere, growth, acknowledgment, communication and autonomy.

On Fire at Work is a practical field guide that leaders in any organization can implement to build more than an engaged workforce, but rather a workforce that's *on fire!*

IN THIS SUMMARY, YOU WILL LEARN:

- The seven cultural pillars used to attract and retain top talent.
- What sparks *on-fire* commitment to a job.
- Five ways to ensure core value alignment.
- The Four Ps of Recognition and Reward.

The Old School and the New Deal

Your success — and the success of your business — is tied directly to the quality of the people you attract to your organization, your proficiency in getting those people to consistently perform up to and even beyond their potential, and your ability to keep them on your payroll for as long as possible. And all of that hinges on one thing: your culture.

The Old School Deal

Today's Old School employers don't place much credence in buzzword-sounding mumbo jumbo like *employee engagement* and *workplace culture*. What's inherent in the Old School mindset is the assumption that the exchange of money for time and effort is sufficient. In other words, the financial deal that exists between an employer and employee — compensation for work performed — is the *only* thing that really matters. You took the job knowing what you were going to have to do and how much you'd be paid to do it, so keep your head down and your nose to the grindstone.

When jobs are scarce or the wage offered is above market rates, workers will grudgingly accept "the deal" and do what's asked of them, for fear of getting kicked to the curb. On the other end of the spectrum, when the economy improves and jobs are plentiful — or when the wage offered is nothing to write home about — Old School employers struggle mightily to attract and retain highly skilled people.

Unhappy Employees

Regardless of which study you point to, there's little question that an overwhelming percentage of people aren't happy at work. They don't like their jobs or the company they work for. They can't envision the way up and out of the hole they're in.

Many if not most employees arrive to the job on day one fully engaged, which is to say they have a vested interest in meeting or even exceeding your expectations. The challenge facing employers isn't how to engage employees. It's how to keep the fires of passion burning once the honeymoon period is over.

Beyond Engagement = On Fire

Amazing things happen when either party in an ER (employer)/EE (employee) relationship begins to exceed the expectations set for them. For example, say an employee's exceptional performance allows her to advance faster than she anticipated. What often results is more than simple engagement — it's an ongoing cycle of *on-fire* commitment to the job, to fellow employees and to the company. When employees are on fire, their energy level increases, sparking a similar increase in productivity, motivation, creativity and performance. They're going to want to stick around a little longer, and you're going to want to reward, promote and invest more in them. This is the on-fire cycle.

Like all successful relationships, an on-fire employer-employee relationship requires commitment, focus and hard work. And that commitment, focus and hard work begin with you. Why begin with you? Because you can control what happens on your side of the ledger.

To whatever degree your authority reaches, begin with you. Make improvements where you can, and make those improvements early and often. If you want to create a legion of on-fire employees, making these improvements isn't negotiable. It's something you absolutely must do.

Employees expect seven things from their employer: compensation, alignment, atmosphere, growth, acknowledgement, autonomy and communication. These are the *pillars* of workplace culture that reflect the true identity of the company and the workplace community you've worked so hard to build.

Compensation

Counterbalancing This and That

Your objective as a business leader is to find the best way to compensate your employees. And while having the right compensation methodology in place for your people won't guarantee that they will be on fire for you, the wrong one will almost certainly ensure that you won't get on-fire performance from them, at least not for any length of time.

At a certain point, money ceases to be a motivator. The time at which that point is reached depends on a variety of factors, not the least of which is the job itself, but what's clear is that it's reached fairly early on. After an employee hits that point, then money alone won't tend to motivate the employee to go above and beyond.

Compensation Models

The most commonly used compensation models tend to be Old School paradigms that do not lay the groundwork for on-fire employee performance.

For example, while it would be far simpler for a business to pay all employees the exact same amount, it would be unfair to each of them — and it would also be unfair to the business.

Also, exchanging money for time is easy to calculate, but without any additional incentives or performance bonuses these time-based compensation models will disengage and demotivate your people faster than you can say "train wreck."

Payroll trimming may often be standard operating procedure for businesses that compete solely on price, but it makes it extremely difficult to attract and retain a high-quality workforce.

And, the practice of assuring and promising bonuses or other perks to come to attract talent and effect high performance at bottom dollar is still commonplace. Even the best-intentioned ambiguous promises have no place in the compensation strategy of a great culture.

With all this in mind, here are three of the essential elements of today's most effective compensation models:

- **Strive for Transparency:** In many organizations, salaries and wages are a taboo subject, and in some organizations discussing what you make with coworkers is grounds for termination. Shrouded in secrecy, these cultures operate under a blanket of "don't ask, don't tell" thinking. The idea that what employees don't know won't upset them may have worked a few decades ago, but it's no longer the case. Employees now look for and expect sensible and uniformly applied compensation practices.
- **Pay People More Than You Have To:** A growing number of profitable companies spanning a wide range of industries attribute their sustained profitability and successes to the practice of paying some of the highest wages in their respective industries. Research from Towers Watson shows employees who believe they are paid fairly are 4.5 times as likely to be highly engaged employees compared with people who do not believe they are paid fairly.
- **Tie Employee Income to Employee Outcome:** People will support what they help to create. When employees have a selfish interest in the outcomes they create for their employer, they rejoice when company profits are high. They also feel the pinch when times are tight. Compensating employees in this manner eliminates the train wreck money-for-time models by aligning the motivations and goals of the employers and employees.

There's no question that compensation plays a significant role in how employees approach their jobs, how long they remain in their jobs and how they feel about their employers. But as crucial as compensation is to a company's workplace culture, there's no evidence to suggest that it can ignite and sustain on-fire employee engagement. It can, however, lay the foundation on which on-fire performance is built.

Alignment

Inculcating Core Values from the C-Suite to the Custodian's Supply Room

At a time when people yearn for the time-honored values and social mores of the past, words like integrity, excellence, service, respect and trust resonate. As consumers, we want to believe that these words mean something, that they're the foundational principles of the company that uses them. But the acid test of these claims is in how the company's employees live out those values.

The New School says that a company's values are much more than an expression of priorities or ethics; they're the markers by which a workforce and executive management

go about the business of fulfilling their mission and making a profit. Alignment between employer and employee is key.

Five Ways to Ensure ER-EE Core Value Alignment

These days, employees and customers alike demand more than lip service. They want to work for and buy from companies that believe in something and live and act according to those beliefs.

Start by creating, revising or at the very least reviewing your organization's core values. If you're creating or revising them, make certain you involve employees from all departments and at every level in the process. Next, follow this five-step process:

1. **Interview and hire according to your values.** Corporate values have meaning only when they're internalized — believed — by the employees themselves.
2. **Train around those values.** Sure, your corporate values will be listed in the piles of new-hire materials that employees receive, but mention of and reflection upon those values shouldn't stop there. Talk about values throughout your employees' tenures, and give employees constant opportunities to internalize those values.
3. **Discipline employees who don't honor the values, and reward those who do.** One of the best ways to show that your values really mean something is to recognize and praise employees who honor those values and reprimand and discipline those who disregard them.
4. **Evaluate performance in accordance with core values.** Every employee review should include — if not narrowly focus on — how the individual is performing according to the company's core values. Doing so ties aspirational words and phrases on the walls of the corporate headquarters to the specific actions and behaviors of the people who are expected to live up to those values.
5. **Model behaviors.** No matter what all those plaques say, your employees will do as you and your managers do. Take your company's values seriously every single day, and your employees will follow.

It doesn't matter how impressive your company values appear when displayed in the lobby of your headquarters. The only thing that matters is how your organization actually functions, how it goes about its daily business, and, most importantly, what guiding principles serve as the foundation for the important decisions made throughout your company each and every day.

Atmosphere

Ensuring Your Employees Are Safe, Well Equipped and Goofing Off!

Key employees in your business are perpetually pursued by headhunters, recruiters and competing employers. The bait most commonly used to lure them away is a sizable bump in pay. And if money alone won't get them to jump, an offer involving a better workplace atmosphere might just do the trick.

What one might consider a great atmosphere could seem dreadful or repulsive to someone else. One thing is certain: The atmosphere at your workplace is far too important to be left up to chance or happenstance. Atmosphere is a choice. It must be deliberate.

Generally, there are seven questions/issues that employees often ponder in relation to their employers:

- Is my employer doing everything possible to keep me safe?
- Can I be my authentic self while I'm at work?
- Do I have everything I need to excel in this job?
- Do I like, respect and trust my boss?
- Do I genuinely like the people I work with day in and day out?
- Does this environment energize me or make me want to find an escape hatch?
- Are we having any fun around here?

Because people are different, they'll reflect on these questions and your company's atmosphere at various speeds, intervals and sequences based on what they value most. However, it's doubtful that anyone who has options will ever be attracted to your company if any of these questions aren't answered "yes."

The trick is to never stop trying to create the best possible cultural atmosphere.

Growth

Grow Them Big or They'll Go Home

There was a time when an employee and his or her employer were in it together for the long haul. Back then, people tended to spend their entire careers at a company, and that company returned its employees' loyalty with secure jobs, reasonable pay and pensions. These days few companies can so much as guarantee a stable job with

steady pay and benefits anymore. So if the companies can't offer loyalty, then why should they expect loyalty from their employees in turn?

And yet, many companies do demand loyalty, and the frustration of their leaders is almost palpable when employees don't toe the line. Leaders who think this way don't understand that employees won't give their loyalty unless they receive it first (and even then it's a gamble).

The reason why is simple. Because it's not really loyalty employees are after. What they really desire is a chance, a leg up. Another thing they want is mutuality. An employee who helps a company become successful expects to get a piece of the pie, a share of that success.

The larger problem isn't that employees aren't loyal anymore; it's that managers have realized that buying loyalty doesn't work and have, therefore, given up on trying to instill loyalty in those employees. Giving up on producing loyal employees doesn't help anybody. It certainly doesn't help you, especially if you don't see the value in investing time and money in ungrateful people who are going to leave anyway. And it isn't helping the employees who, if they weren't looking for the exit before, are sure to start once they figure out that the company's goals and their own goals aren't even remotely in sync.

Deloitte released a benchmark study in 2011 titled "Talent Edge 2020: Building the Recovery Together: What Talent Expects and How Leaders Are Responding." For those employees looking to bolt, Deloitte found that a majority rated their current employers' "efforts at creating career paths, developing leaders and retaining top performers" as fair to poor. Indeed, 53 percent looking to leave said that they would reconsider their decision if their current employers improved their job advancement and promotion prospects. As the research shows, most of those who are secretly looking to leave would actually prefer to stay — as long as you give them a compelling reason to do just that.

Giving employees the chance to show their stuff, build stronger skills and grow at the company — this is the solution or at least an essential part of the solution.

However, a disconnect occurs when either the employer or employee feels as if they're getting the raw end of the deal — giving more than they're getting. The trick is to stay in that Growth Retention Zone — as long as there's growth on both sides, harmony exists and balance reigns.

It's simple really. You want them to grow, and they want to grow. So, let's focus on a five-step how-to formula to ensure your employees remain in the growth and retention zone, which leads to long-time on-fire performance.

Five-Step Process for Staying in the Growth and Retention Zone

Step 1: Agree on a growth agenda. One reason couples often cite for a failed marriage is that the husband and wife discovered over time that they each wanted different things. The employment relationship works the same way — both parties have to be moving in the same direction. This sort of mutuality requires both parties to meet at the onset of the hire as well as periodically discuss, agree to and map out each of their future ambitions.

Step 2: Establish the timetable. Just as both parties need to agree on what new skills and abilities the employee is going to be learning, they also need to establish and agree upon the time frame. Without a timetable in place, one or both parties are going to eventually disengage.

Step 3: Individualize the learning methodology. It's critically important to figure out how each employee learns best. Knowing how each employee learns and designing the learning agenda around what works best for them are the keys to ensuring that they stay on course.

Step 4: Celebrate milestones and success. Many of us can recall when our parents charted our height on a doorway. Even a half-inch of progress drew applause and cheers. The same principles are at work here. It's important to chart the growth progress of each employee and let them recognize how much they're learning, how much experience they're gaining and how much more valued they are becoming to you in the process.

Step 5: Rinse and repeat. Every employee, from your receptionist to your EVP, needs to be on a growth trajectory — and they need to understand and agree on that trajectory. Once they get where they want to be, they're going to see a new future for themselves off in the horizon. That's a good thing for them and your organization.

What It Really Means to Put Your People First

A company that has made *Fortune*'s "100 Best Places to Work For" every year since the list began in 1998 is Wegmans Food Markets. In fact, in 2012 and 2014 *Consumer Reports* named Wegmans the best supermarket chain in the United States.

People who go to work for Wegmans may initially arrive with a "just another job" mindset, but it doesn't take long until most realize they've found a career and never want to leave.

What company wouldn't kill to have this degree of loyalty? Wegmans must be offering some serious compensation and benefits packages to foster such a devoted workforce, right? Yet according to *Fortune*, Wegmans pretty much pays equal to or better than the competition, without leading the market. The company manages to be the employer-of-choice in grocery retailing by taking a holistic view of Total Rewards, one that embraces all aspects of the employee experience without having to offer pay for sabbaticals, childcare or 100 percent of healthcare. What is it, then, that sets them apart?

In a word, Wegmans *acknowledges* its employees. It's engrained in their culture as deeply as it's engrained into Maslow's hierarchy of needs. In a world where everyone wants to feel like they belong and that they matter, Wegmans is the high-water mark for employee acknowledgement.

Notice the word acknowledgement, not *recognition*. That's because acknowledgement is really a higher order of recognition. To acknowledge something requires thought plus action, whereas to recognize something is often a neutral, passive act. You *recognize* the distinctive human forms in a Picasso painting. You *acknowledge* the painting's beauty and the artist's mastery.

That's not to say recognition isn't important. It's no secret that employees crave recognition. Far too many companies, however, treat recognition as just another form of compensation. However, compensation and benefits are negotiated terms, mutually agreed upon, expected at regular intervals and in many cases legally enforced. In other words, they're *expected*.

Recognition by itself doesn't carry enough force or mean very much, which is likely why so many employers fall back on Old School incentive programs.

With rare exceptions, incentive programs are just that — programs. Everyone is treated the same. Every action is treated the same. You're just another brick, only this time you're a brick with a bonus.

If all employers have are rigid programs or contests, then they're missing most of what it means to recognize an employee. Because acknowledgement isn't a program, it can't be automated, nor can it be impersonal. It requires caring, personalization and a human touch.

Recognition 101

The four Ps of Recognition and Reward are

• **Personal:** Regardless of the type of recognition, its perceived value escalates when it's individualized for the employee.

• **Proportionate and pertinent:** Any recognition or reward should always match the level of performance being recognized and should always correlate directly with the employee's actions.

• **Prompt:** Celebrating an employee's "above and beyond" actions the moment you see them is far more effective than patting the employee on the back six months later during the performance review.

• **Public:** The value of a reward multiplies exponentially in the presence of peers and colleagues.

Wegmans tops the charts as a destination grocery store chain because it has reversed the Old School "customer is always first" model. Industry leaders like Apple, Firehouse Subs and Wegmans put employees first. In doing so, they gain harder-working, happier employees who then treat their customers the way they should be treated.

Acknowledging your people doesn't take anything out of your pocket, but it's sure to work better than an expensive incentive program.

Autonomy

Building an Army of Intrapreneurs

Remember the day you got your driver's license? Remember the excitement? For many of us, it was our first real brush with freedom. Looking back I can understand the anxiety my parents had watching me take the car out. It's the same fear most parents feel. The question for parents is whether their children will return their trust with thoughtful, responsible action.

No matter how well we think we raise our children, we can never answer these questions for certain. That's kind of what trust is all about. It's the absence of assurance. In this way, trust is a lot like faith. You can have faith in people only if you don't try to control their actions. The moment you begin to monitor their every move, out goes that faith.

So it's no surprise that many employers don't *really* trust their employees. After all, it's the employer's business, their department, their division at stake. It's their butt on the line if something goes wrong.

Trust is the foundational element of any healthy relationship. For the relationship to work, both sides need some independence — some autonomy — lest they suffocate from too much smothering.

Where the problem comes in is when leaders want their employees to give their all while doing exactly what they're told — no more, no less.

In this day and age, some companies still expect employees to be humbly submissive and overly dependent on their managers' orders and oversight. The way they

see it, employees are like children: watched so they don't misbehave. Halted in their tracks before they ever make a mistake. Employees arrive late, take long lunches, slack off, don't care about what's good for the company, and take every opportunity to exploit any chink in the carefully constructed corporate armor so they can kill time and goof off. Then to top it all off, they leave early if no one's watching. The way the managers see it, they have to crack the whip in order to keep the place from becoming a freewheeling fun fest or a sea of inertia.

Let's be clear: Employees who behave and act this way do exist. Want them to do the jobs they were hired to do instead of breaking their backs to get the hell out of Dodge? Leaders who are seeking on-fire performance from their employees need to be the ones to lead the charge. They need to show trust in order to earn trust.

Autonomy Means Different Things to Different People

On-fire employees — the kind you're looking to hire and keep — are looking for some latitude to make decisions in the workplace. The best companies in the world, in turn, trust and empower these employees to think and act on their own — everyone wins!

Say you're willing to step up to the challenge and give your employees your trust … what then? Well, the next step's a big one, but it's critical to the success of on-fire employee engagement: You foster a company-wide culture of autonomy where the employees work on behalf of your business while also working for themselves.

That's the essence of intrapreneurism. Take the best elements of entrepreneurism — independence, creativity, passion and a desire to succeed — and match them with each employee's day-to-day responsibilities. Then build a workplace environment where all of those employees perform as if it's their own company.

A culture of autonomy involves not just trust from the employer but also accountability from the employee. It's a two-way street. Telling employees they can start working in the way that fits them best without providing any guidance or overarching goals is like giving them permission to jump out of a plane without a 'chute. Cultures that promote autonomy need employees to work toward targeted, concrete objectives — priorities and deadlines set by the company or manager.

Think of it like establishing the rules of the game before the players take the field. The employees have the opportunity to use their strategic skills and creativity to score more points, but they also recognize that they need to play within the rules to win.

Following are 10 ways to cultivate a culture of autonomy for on-fire performance:

- **Share your vision.** Help employees feel part of something bigger than themselves. Communicate your missions and visions to them early and often so they see what you see and are committed to working toward that result.
- **Involve employees in goal setting and planning activities.** Seek out their ideas, knowledge and insights, and invite them to help make important decisions. At the very least, let them see your process for making difficult decisions.
- **Explain the why.** Don't just tell someone what to do without making absolutely certain they also understand why that task needs to be completed and why you've selected that individual for the job.
- **Let them choose the how.** Whenever possible, let your employees decide how to achieve the task you've assigned. Agree upon what constitutes a successful outcome; then let them chart their own course.
- **Delegate authority, not just work.** Give employees a leadership role in some of the meetings they attend. Leadership skills develop over time, and they require practice.
- **Trust them before you have to.** Eventually, you'll have to trust them, but sometimes it's worth the risk to trust them before that point to make a decision or step into a role that pushed them to the limit. Your trust in them will give them confidence, and that confidence is crucial to their personal development.
- **Encourage them to solve their own problems.** Listen to their problems, but don't bark out the answer. Instead, ask probing questions that will lead them to determine the right answer.
- **Hold them accountable.** Remember that employer trust and employee autonomy is a two-way street. Holding employees accountable for their work and for meeting established goals and deadlines motivates them to achieve better results.
- **Provide constructive feedback.** Regardless of the results, let them know how they're doing, and give them the coaching they need to improve.
- **Acknowledge them on the spot for stepping up.** A few seconds of genuine one-on-one acknowledgement and recognition can go a long way toward reinforcing an employee's willingness to step up and stand tall. Show you appreciate their above-and-beyond commitment with a reward that matches the result.

Communication

The Inextricable Link Between Transparency and Trust

Bad things happen to good companies, and even when employees aren't to blame and can't really do anything to right their ship, they still want to know what's going on. When management chooses not to disclose the extent of the difficulties they're facing, trust begins to erode, and the workplace culture is fractured.

Without straightforward information from the upper ranks, employees are left guessing, speculating as to what has really happened and what it means to them. Even if they don't quit, workers may begin to disengage and lose confidence in their company, feeling that their employer isn't looking out for their best interests. A bunker mentality develops as they shift into survival mode. Rumors circulate.

Regardless of the company or industry in question, there are three specific types of information that are controlled by management:

What Employees Need to Know: Employees must have some information in order to do their jobs effectively (e.g., job training, safety precautions, etc.).

What Employees Should Know: Employees should have a basic working knowledge of the company that employs them. This includes the company's history, ownership structure, management hierarchy, basic product/service lines, etc. In addition, employees should know anything that Wall Street knows about the company, as well as anything that is being reported about the company by the media.

What Employees Want to Know: In the employee version of a utopian universe, employees would be privy to everything their CEO knows about their company. Naturally, this is not possible or even plausible. Nor would it be wise for any company to share all of its information with every employee. But suffice it to say, employees want to know what's really happening, not only within their industry but also regarding all of the developments, changes and updates that are taking place within their company — especially those that can have any impact at all on their jobs and their future.

No matter what the situation, employees feel a stronger connection to their leaders and their company when they feel they are kept accurately informed and continually updated with any and all developments.

When leaders share current and future change with employees, they reinforce a culture of transparency. Rather than treating employees like cogs in a wheel, companies treat them like they have a stake in the game — which they do. Savvy employers recognize that employees deserve to know — and need to know — simply because they work at the company. They are part of the team.

A transparent company is one where information between employer and employees flows freely. As Warren Bennis and Daniel Goleman write in their book *Transparency: How Leaders Create a Culture of Candor,* "An organization's capacity to compete, solve problems, innovate, meet challenges and achieve goals — its intelligence, if you will — varies to the degree that the information flow remains healthy." In other words, transparency isn't just good for engaging your employees; it's just plain good for business.

When was the last time you asked your people what they needed to better perform their jobs? Employee surveys can be useful tools, but by themselves they're not enough to truly know what your people are thinking.

There's no survey and there's no digital app in the world that can take the place of a manager finding a few moments of quiet, pulling one of her employees aside and asking questions like, "Hey, how are you making out around here? Do you have all the tools and resources you need? What can I do to support you?"

And once her employees start to open up, the most important thing she can do is to shut up, listen, take notes and then take action.

When you go beyond what your workers expect, you'll build a workforce that will surprise you in ways you didn't think were possible. You'll find that they increasingly display a positive attitude, reliability, professionalism, initiative, respect, integrity and gratitude.

Live the seven pillars day in and day out — compensation, alignment, atmosphere, growth, acknowledgement, autonomy and communication — and you'll go further than that. You'll create not just an engaged workforce but a legion of loyal employees who are on fire.

The Optimistic Workplace

Creating an Environment That Energizes Everyone

by Shawn Murphy

THE SUMMARY IN BRIEF

When it comes to work these days, we're expected to do more with less — but is this nose-to-the-grindstone philosophy the best way to run a business? Alarmingly low employee engagement numbers indicate otherwise.

So, if pushing everyone harder isn't the path to productivity, what is? Supported by the latest research, *The Optimistic Workplace* argues that our best work is the product of a positive environment. That's good news for you as a manager. While you can't personally transform the corporate culture, you can influence the workplace climate and create meaningful and lasting change.

Advocating a steward model of management, *The Optimistic Workplace* demonstrates how a people-centric focus ignites employee potential, increases innovation and catapults the organization to new levels of performance. Author Shawn Murphy reveals how to explore personal and organizational purpose and align them for astonishing results, build camaraderie and deepen loyalty, increase intrinsic motivation and more. Far from being a wish-upon-a-star discussion of workplace happiness, *The Optimistic Workplace* presents an array of surprisingly simple strategies to focus your actions and make employee optimism not just a worthy goal but a real and measurable result.

IN THIS SUMMARY, YOU WILL LEARN:

- Why workplace climate is easier to change than culture.
- The three dynamic elements of an optimistic climate.
- How to foster meaning and purpose at work.
- How to be a human-centered leader and cultivate optimism in yourself and others.

Introduction

The Optimistic Workplace is about modeling the expectations necessary to contribute to the emergence of optimism in the work environment. Optimistic workplaces need diversity in perspective and in people from all backgrounds and inclinations. What unites them is a workplace mood that gives hope that good things are possible from applying one's experiences to ultimately help the organization create value for its customers.

Stewardship is caring for people and things that don't belong to you. Conversely, the term "management" is associated with control and dominance: "I need to manage you." Or, "You're my subordinate, and because of my years of experience, I know what's best. Do as I say."

You are the steward of your people, of resources and time, and of the business. The subtle shift is in the focus. It isn't about the control you flex, the dominance you project or the power you wield. It's about purposefully crafting a work environment that allows the human side of business to flourish. The shift is in caring for people in a way that improves their lives and positively influences the value they create for your organization.

The truth is, management has become soulless. It's rote. It's impersonal. Why is that important? Simply put, business has always been and will always be about relationships. We have veered too far away from hiring and treating employees as mature, fully functioning adults.

Stewards create workplace contexts that assume people can be trusted to do their best work and to do the right thing. The human-centered business is fundamentally built on a foundation of helping people understand and leverage their potential for good — a good that benefits others. The good you can bring about is a positive work experience created through workplace optimism.

The Future of the Workplace

Culture is how things are done in an organization. It's the company's history, stories passed down over time. Yet what is equally important as culture is what it feels like to work day to day in the workplace. This is climate, and it's the element of organizational life that isn't discussed much. Harvard University psychologists Robert Stringer and George Litwin explain climate as the quality of the workplace environment and its influence on the work experience and team members' behaviors and perceptions.

In the workplace, who has the greatest influence on the climate? According to Hay Group's research, it's the immediate leader — you. You set the mood in the work environment. In fact, your leadership style impacts climate by up to 70 percent.

It's the words you use and the tone of your interactions with your team that influence climate. Purpose influences climate. Stringer and Litwin explain that clear role definitions help to positively shape climate. High performance expectations are also essential. Autonomy shapes climate. Trust and a sense of belonging are also key to a positive work environment. These are all elements within your control. This is what makes climate a powerful influence.

From a leadership perspective, climate is easier to influence than culture and is useful in creating lasting change necessary for the organization to create value. Culture is embedded deep into the bedrock of the organization and is hard to change. It can take years to shift culture.

Through your leadership style, you can shape the climate to positively influence how team members perceive, experience and respond to work.

Workplace Optimism

Workplace optimism is a characteristic of climate and is the belief that good things will come from hard work. Research shows that you can transform the work experience by focusing on the best positive, potential realities. You can position employees to believe that work is a bright spot in their life. The following beliefs are essential to helping create a positive work experience:

1. The team is more important than any individual.
2. There's value to experiencing joy at work.
3. Doing good is good for business.
4. Relationships with employees need to be richer.
5. Work should align with purpose and meaning.
6. Leaders need to actualize human potential.

Origins of Optimism

Optimistic climates don't follow a people-first philosophy. They don't follow a profit-first philosophy either. Instead they follow a dynamic exchange among three elements that create a motivating environment: purpose, meaningful work and extraordinary people. These three elements are the Origins of Optimism.

The dynamics among these three work like this: Purpose informs employees' work, at the same time influencing a community of people to align with its own aspirations. The work directs what extraordinary people focus on. Simultaneously, the people influence what work needs to be done, how and when. Both extraordinary people and the work advance the purpose. The Origins of Optimism interact with each other in one dynamic exchange. There is no number one. The three elements are interdependent.

Destructive Management

Destructive management is really a collection of symptoms of ill-fitting practices for the modern workplace. They result from misjudged or uninformed choices. Mostly the symptoms present themselves when a steward doesn't shift along with the demands of today's workforce and workplace expectations. If you think of destructive management like a disease, people and the organization can't perform at their peak potential. Both are often distressed.

Along with distress, a host of unpleasant outcomes dominate people's experiences. Recovery from problems is slow. In severe cases, people just can't seem to shake the feeling that things just won't get better. The negative feeling of the workplace is alienating. Optimism is choked before it can even emerge. Ultimately, the impacts from destructive management can be traced back to six symptoms:

Symptom 1: Blind impact. A leader who is unaware of how her actions, attitude and words impact others, and damages any opportunity for workplace optimism.

Symptom 2: Antisocial leadership. This symptom is all about one's inability to encourage, build and evolve a community of people united by a shared purpose.

Symptom 3: Chronic change resistance. The seduction of the status quo overpowers rational thoughts and actions. With this leader in charge, only incremental change is possible.

Symptom 4: Profit myopia. The outdated belief that profit is the only success measure.

Symptom 5: Constipated inspiration. The leader is unsure of how to inspire people on her team. Often she is too focused on her own needs, giving little attention to what her employees experience when at work. At the core of constipated inspiration is ignorance of personal values.

Symptom 6: Silo Syndrome. Silo syndrome afflicts a leader when he cannot see beyond his immediate responsibilities. Also, silo syndrome blinds a leader from seeing the impacts of work on other people's lives.

Gallant Acts

If you are to move past the adverse effects of some decisions and create workplace optimism, you will need to face reality as it is and take action to move your team closer to optimism. Here are some leadership actions you can take to set you and your team down the path to the optimistic workplace:

- Bring your team together, and demonstrate that you understand how the team has been negatively impacted by management decisions.
- Meet one-on-one with members of your team, and learn what's important to them in terms of the workplace.
- As you continue to discuss what a positive work experience means with individuals and with the team, begin to talk as a group about what the team can do to support the goal of working in an optimistic workplace.
- Reduce the effects of blind impact by exploring what your team's purpose is.

- Participate in a 360-degree assessment. The goal is to learn how your leadership style positively and negatively influences people.

The Power of Contagious Emotions

Our emotions are contagious and influence how people feel. How people feel influences the quality of their work. The emotions people experience shape their willingness to connect and deepen relationships. It's a powerful insight for leaders to leverage when working to shift to the optimistic workplace.

Psychologist Barbara Fredrickson's research reveals that positive emotions broaden our "ideas about possible actions, opening our awareness to a wider range of thoughts and actions than is typical." In other words, we broaden our capacity to act positively based on the good actions of another person. The positive emotions we experience then help us build new skills, connections and knowledge, and have a positive impact on other people.

Pause long enough to understand the influence positive emotions can have on you and those on your team. Own the emotions that you're spreading. As the steward of your team, expressing such positive emotions as joy, gratitude, serenity, interest, hope, pride, amusement, inspiration, awe and, yes, love can positively influence how others feel and experience work. You get to help your people achieve their greatest potential through their work. Model what you want for and expect from your team, and grow from the effort.

The Downside of Optimism: Missteps and Excess

Even though the positive climate helps employees do better work and creates joy, your team is not impervious to the downsides of work life. So it is important to know the potential missteps and excesses that can surface when cultivating optimism in the climate.

Misstep 1: Believing it's somebody else's responsibility. Invariably the point is made that workplace optimism must start at the top. This belief lets us off the hook from doing something about the bad vibe hovering over the teams.

Misstep 2: Failing to build alliances to support your effort. Here are a few essential things to consider when identifying allies: You can have honest conversations with them. They are comfortable challenging your thinking. They believe in action and are not all talk. They genuinely believe the Origins of Optimism.

Misstep 3: Assuming you know how your team members feel about the climate. The best place to start is to have conversations with your team.

Misstep 4: Assuming people understand the importance of their work. Help employees understand their purpose in the organization: why their roles exist and why they matter to the team's and organization's success; how their strengths and talents influence outcomes and other people.

Misstep 5: Unknowingly over-promoting individualism. Not only is team cohesion compromised but so is a shared mood, both of which are vital to a positive work climate.

Too Much of a Good Thing?

What are the signs and outcomes of an excess of optimism?

Sign of Excess 1: The struggle from the balance of opposites. When only good news is shared and leaders don't acknowledge the influence discord has on the climate, employees' well-tuned BS detectors signal "fraud." Instead, assume that people have the skills to handle difficult conversations or conflict.

Sign of Excess 2: The country club effect. In the context of the workplace, when a team becomes isolated from the realities of business, the country club effect emerges. Keeping people "happy" becomes more important than holding them accountable for commitments and results. Unleash employees' potential by finding opportunities that deepen their skills, and build a relationship with each person on your team.

Sign of Excess 3: Overreliance on advocates. Advocates can fall into the trap of blindly promoting its importance, ignoring contrarian perspectives. The solution for this sign is in building and nurturing authentic relationships with peers and team members, relationships where confidants can freely share their thoughts, even if unpopular or difficult to hear.

Sign of Excess 4: Inflexible methods. Inflexibility is a result of too much comfort with the way things are. You should identify the inflexible methods that might interfere with your work to create an optimistic workplace and see if you can influence changing the rules and policies that cause them.

Values-Based Leadership

To know your values is to have insight into why you make decisions, with whom you make friends or the type of work you pursue or don't. Knowing your personal values helps you know where your line in the sand is — what you'll tolerate and what you won't.

Identifying, knowing and showing your values help prepare you to be a more effective, compassionate and understanding steward. In short, you are more relatable because of a deeper, evolving awareness of what you stand for, which attracts and appeals to others. To identify, know and show your values helps guide your decision-making process.

Values work begins with identifying values, such as accountability, achievement, collaboration, competence, creativity, decisiveness, fairness, generosity, integrity, joy, justice, loyalty, resourcefulness, stability and so forth. Select the top five that resonate most with you.

Now that you've identified your values, it's important to know what they mean to you. Take the time to define carefully for yourself your top five values. Use your life's events to define each value. Imagine explaining the value to other people. Would they associate the value with you?

Now it's time for you to think of ways to bring your values to life. List behaviors or ideas that bring to life your values. For example, for relationships, you might list "Block time on my calendar for one-on-ones with each employee to learn what or who is important in my employees' lives," or, "Each quarter take my team to coffee to discuss success and lessons."

Getting Employees to Think the Same Way

What would it take to begin integrating values-based conversations within your team? Tell the team why it's important to you to know your personal values. Open up by explaining what insights you got from doing the values exercises. Encourage your employees to complete the values exercises. Hold a team meeting to discuss insights.

Ask your team members how knowing and living by their personal values could be helpful to them in their work. In your one-on-ones with employees, explore more personal ways they can live and work by their values. Help employees identify where their values aren't present in work and where they are. Build a plan to strengthen the alignment.

The outcome of knowing and showing your values is a greater awareness of who you are. The awareness significantly influences how you show up as a leader. Consequently, you begin to create the stickiness that holds your team members together and helps them begin to see a positive picture of the workplace and of their team. Connecting the dots further, this helps shape the climate and supports your effort to create workplace optimism.

It All Starts With Purpose

The first element of the Origins of Optimism is purpose. Purpose is the reason you do something. It might be a calling. It might be a matter of ethics. Purpose calls each of us to act in a way that may be unpopular or different from what most would say, do, think or feel. Deeply personal purpose can and should be shared. It is the ultimate guide to your way of living. In the business world, it guides your stewardship.

Personal purpose has been segregated from the business world for too long. It's an unnatural bifurcation of your two worlds. Clarifying your purpose is essential to your leadership. It's no longer enough to focus on *what* you do as a leader. It's *how* and *why* that rounds out your effectiveness and your ability to work alongside people.

These questions are designed to help deepen your awareness of the role that purpose has in your life:

- Write down the meaningful or rewarding behaviors from your work. From the meaningful or rewarding behaviors, what new insights do you notice about yourself?
- When in your life were you most energized? What were you doing? For whom were you doing the energizing activity? What value did you get from the activity?
- What themes do you notice underlying your responses? What insights do the themes hold?
- What values of yours do you see in your examples?
- Now consider who was involved in your examples. What role did each person play? What support did they provide?
- What did you learn about yourself from the examples you referenced?
- What makes your heart sing? Are you doing enough of that in your life? How could you increase doing more of what makes your heart sing?

Aligning Purposes

The following questions are designed to help you connect your purpose to those of your organization and your team.

- What is your organization's purpose?

- What is your team's purpose? How does your team support the ultimate purpose? Where is there alignment between the organization's purpose and your team's? Where can you tighten the alignment?
- What evidence is there to show alignment between your purpose and your organization's? What about alignment between your purpose and your team's?
- What immediate next steps can you take to make alignment stronger?
- Who are allies who can help you better align your purpose with those of the organization and your team?
- What themes do you notice in your answers? What is the significance? Does the significance change your immediate next steps?

The Meaning Makers

We all want to be touched, moved and inspired by life. Meaning is a source not just for life but for work, too. As a steward of unlocking human potential, meaning is an opportunity to turn your people's work efforts and interest into something that matters. Meaningful work is the second element in the Origins of Optimism. It's also your shot at helping people see how their work contributes to a bigger picture and to feel connected to a group of like-minded people. Your part is to help shape the context for meaningful work to emerge. Let's look at the key actions of meaning makers:

Meet people's basic needs. You help employees meet their physiological and safety needs by paying them enough to have a roof over their heads and food on their tables. In terms of how employees perceive the climate at work, safety needs are key: Do employees feel secure in their work? Are expectations clear? Is there consistency in how you show up as a leader? Are your expectations of people clear and consistent? When basic needs are met, your team members can shift their focus to higher levels of functioning, helping them to do their work better, experience higher levels of happiness, and uncover meaning in what they do.

Make room for autonomous work. Today, having autonomy means team members can rely on their experiences and use their ideas to leave their mark. The intrinsic motivation inherent in autonomy is a source of fulfillment and helps employees find meaning.

Invite people to be in on things. Employees want to believe they are in on decisions and hear news in a timely manner. You can loop employees in on important ideas and considerations sooner to get their input before decisions are made.

Give people the freedom to express themselves. Meaningful work emerges when people know they can share what's on their mind and that a pink slip won't be on their desk the next day, or they won't be made to feel shame for speaking out.

Model values-based leadership. Learn what your employees' personal values are. Discuss how their personal values show up in their work and where they are absent.

Hold regular one-on-ones. At least monthly, discuss employees' progress in achieving their performance goals. Hold employees accountable to their growth commitments.

We Must Change the Way We Work

Employees are overwhelmed, stressed, burned out and disillusioned with their ability to positively make a difference through their work. Yet, the relationship employees have with work, the pace and quantity of it and how they achieve desired outcomes is central to cultivating workplace optimism. Leaders need to improve how employees relate to and go about doing their best work.

Work today needs a facelift, or a F.A.I.S.E. lift. F.A.I.S.E. refers to five domains leaders need to address when shifting how employees make sense of the importance of their work, how they approach their work, and ultimately how they generate value for the organization and its customers through their work. The F.A.I.S.E. domains are as follows:

Financial: Leaders balance long-term and short-term views on financial performance to determine work priorities.

Aspirational: Use of purpose and meaning help bring significance to work and how it's done.

Individual: Leaders leverage work to promote employee self-awareness. Work identity is important.

Social: Employees make sense of work by developing relationships within departments and teams as well as outside the organization.

Environmental: The conditions and climate of the workplace need to bring out employees' strengths and minimize distractions.

The domains are intended to guide you through how to identify and explain the value of work for both the organization and employees.

At PepsiCo, a program called Performance with Purpose shapes the work of employees. More than a program, Performance with Purpose is a set of beliefs. Whether PepsiCo is focusing on human sustainability (Social domain) or

talent sustainability (Individual domain), it makes decisions to do good for its customers (Aspirational domain) and those who create the value for the organization — the employees. With a comprehensive set of initiatives — ranging from corporate governance to supply-chain diversity to workplace diversity — PepsiCo positions itself for financial performance. According to a 2013 PepsiCo report, 89 percent of the company's employees, including executives, feel pride in their work (Environmental domain) and in what the organization accomplishes through its many efforts to improve the communities it serves and create a workplace environment that motivates and inspires employees.

Human-Centered Leadership

Human-centered leaders believe that financial success is accomplished through genuinely caring about people. These leaders hold employees accountable to continuously develop their talents so they can advance the company's purpose. But human-centered leaders also want employees to become extraordinary versions of themselves.

Employees are expected to anticipate needs, explore alternatives, expand their talents and leverage their strengths, and connect with partners to achieve desired results, not planned results. The marriage of the two — business and human potential — is what the human side of business is about.

What does the human side of business have to do with your relationship with your team? Everything. The human side of business grounds your perspective in truly human elements that help you relate to your team members as people. It guides you to discover commonalities between you and your team that deepen connections. It helps you see where you can make a difference in your people's lives. Such insight is not possible when employees are seen as controllable resources that can't be trusted.

The Universal Elements

The universal elements of the human side of business are health, family/friends, work, identity and purpose. The first element, health, includes the physical, psychological and social health of your people.

The family/friends element places value on the quality of time your employees have with their family and friends when not at work. It has been found to be most associated with happiness and meaningfulness in life. You positively influence the family/friend element by helping employees manage their work-life mix. When you can strengthen family, employee participation at work strengthens.

At the heart of this universal element, work, is helping employees find meaning not only in what they do but in the outcomes they help create. Work shapes our identity. How employees relate to their work self influences their motivation, performance, even job satisfaction. Researchers also find that a healthy work identity helps employees find meaningfulness in their work.

The final universal element is purpose. Purpose, in conjunction with the other universal elements, positions employees to have a remarkable life — personally and professionally.

What can you do to foster positive relationships? Model bidirectional accountability (for positive relationships to flourish, you must be accountable, too), promote employee activism, have your people's backs and recognize employees.

Next Comes Trust: Creating Community

For optimistic work environments, cooperation or self-interest isn't enough for success. You'll have to create a more compelling climate that fosters collaboration. Through collaborative efforts, people generate new insights not possible when working solo. Through collaboration, resources and people are shared. The sharing of resources and people is done because what knits a strong collaborative team together are mutual aspirations and shared goals.

What can you do to boost collaboration in your team? Send employees to learn other parts of the business. Inquire regularly into the team's effectiveness. Screen for collaborative tendencies during new-hire interviews. Develop routines that reinforce collaboration, and make time for face-to-face meetings.

Equation for Community

When collaboration is combined with connection, a community emerges. All stewards need to remember that:

Collaboration + Connection = Community.

This is the Equation for Community. If the Origins of Optimism are the bones to creating workplace optimism, and purpose and meaningfulness are the heart, then the Equation for Community is the blood that oxygenates the entire system.

The three parts to the equation are important by themselves. When you combine them, their influence magnifies. Collaboration is the active participation of people working

jointly together. Connection is a relationship between people focused on and held together by evolving shared interests. Community is a unified group of people with a shared interest. Each part of the equation feeds naturally into the other.

While too often groups of people develop a self-interest in winning and success, the Equation for Community helps people move past it. How? The very nature of each element of the equation strengthens only when the focus is on the group, or the team. The Equation for Community reinforces achieving success for the greater good, not for the select few.

The Cultivation of Optimism

To create workplace optimism, start small and show you care. These two seemingly simple pieces of advice reflect a shift in the quality of relationship employees hope to have with you. It also sheds light on the skills you need to cocreate the optimistic workplace.

The following skills will help you achieve strong relationships with your team, create and shape an optimistic work environment and achieve desired results together.

Two categories of skills and traits are Self and Us. Those under the Self category are the highest-value skills or traits that are needed to bring optimism to the forefront of people's experience at work. Those in the Us category rely on skills or traits necessary to deepen connection among members of your team as well as to create a sense of belonging that people experience while working in your team:

Know Thyself

Humility. Humility helps keep you grounded. It helps you build stronger relationships, a key factor in fashioning the optimistic workplace. It's also key to seeing your flaws and strengths and appreciating them in others.

Honesty. Self-honesty helps you assess situations and your response to them realistically. Are you respectful but honest when sharing difficult feedback?

Reflection. Take time to reflect so you can connect the dots between people and events to make sense of what's happening around you.

Grit. Grit can help you endure hardships and find greater enrichment in living while pursuing meaningful personal and professional goals.

Resilience. Positive emotions like joy, interest and pride help build resilience. Resilience helps generate positive emotions.

Sense-making. By showing your interest in learning the meaning behind people's words and actions, you create a path for mutual understanding and greater chances for collaboration. This is invaluable for cultivating optimism.

Vulnerability. We can relate more deeply to people when we know they also have struggles.

For the Greater Good

Noticing. BambooHR co-founder Ryan Sanders explains this skill as paying attention to the overt and subtle ways people positively contribute to the team and its goals.

Connecting. Your relationship with employees needs to go from transactional to relational. A skill critical to such innovation involves connecting your people to the resources they need to reach their potential.

Experimenting. Shape the conditions in your team that signal to employees it's all right to experiment. Openly share what's working and not working.

Prioritizing. Your ability to prioritize individual workloads with each of your employees positions them to make progress on what matters.

What Self and Us skills and traits have in common is their humanity. They help you become more relatable and more understanding of your employees' aspirations. Cultivating workplace optimism is something you'll go through together with your team.

We are at a time in business when two paths have presented themselves. One path is business as usual: It's management. It's control. Its philosophy is fear of change; keep things the way they are. The other path is business transformed: It's human-centered and values-based. Unpredictability is embraced as an opportunity to maximize success even when its definition is unclear or unknown. This path may appear riskier given its nature, but it's the best path forward if you want to thrive in our hyperconnected, socially enabled, relationship-centric business world.

Driven by Difference

How Great Companies Fuel Innovation Through Diversity

by David Livermore

THE SUMMARY IN BRIEF

Today's workforce is more diverse than ever before. But despite new perspectives and talents, the promise of increased innovation rarely materializes. Why are so few businesses seeing results?

Studies show that diverse teams are more creative than homogenous ones — but only when they are managed effectively. The secret is to minimize conflict while maximizing the informational diversity found in varied values and experiences. To do this, both leaders and team members need a high level of cultural intelligence (CQ).

Drawing on success stories from groundbreaking companies, *Driven by Difference* identifies the management practices necessary to guide multicultural teams to innovation, including how to create an optimal environment, build trust, fuse differing perspectives, align goals and expectations, generate fresh ideas, consider the various audiences when selecting and selling an idea, and design and test for different users.

Cultural differences can lead to gridlock, or they can catalyze innovation and growth. *Driven by Difference* offers a research-based plan to turn diversity's potential into economic reality.

IN THIS SUMMARY, YOU WILL LEARN:

- The meaning of cultural intelligence (CQ) and the benefits of using it.
- To adopt new perspectives and reveal assumptions in your products and organization.
- The five steps for creating the best climate for culturally intelligent innovation.
- The additional five steps of the *process* of innovating with cultural intelligence.

Diversity Is

Today, 36 percent of the U.S. workforce is made up of people of color, and by 2040, there will be no U.S. ethnic or racial majority. That reality is coming even more quickly to Canada. The shift is happening in more traditionally homogenous places like Denmark and Sweden as well. Similar trends exist most everywhere. And when you add the diversity of perspectives that come from one's gender, socioeconomic background, sexual orientation, profession, faith and much more, indeed, "Diversity is."

What ultimately matters is not the source of diversity but the different values and perspectives that emerge from it. The differences that most strongly influence innovation are the varied approaches for communicating, planning and executing tasks. How do you align the values, expectations and work styles of four generations, dozens of nationalities and endless subcultures toward a universal vision and strategy for the organization?

Cultural intelligence is what makes the difference. The cultural intelligence of the individuals on a diverse team determines whether the team's diversity promotes or deters innovation. Cultural intelligence, or CQ, is the capability to relate and work effectively in culturally diverse situations. Research on cultural intelligence finds that the culturally intelligent have developed skills in four capabilities:

1. CQ Drive (Motivation): Having the interest, confidence and drive to adapt cross-culturally.
2. CQ Knowledge (Cognition): Understanding intercultural norms and differences.
3. CQ Strategy (Metacognition): Making sense of culturally diverse experiences and planning accordingly.
4. CQ Action (Behavioral): Changing verbal and nonverbal actions appropriately when interacting cross-culturally.

Fortune 500 companies expect the greatest revenue streams over the next decade to come from emerging markets, and top universities are recruiting students from around the world and from groups previously underrepresented on their campuses. The convergence of consumer diversity with workplace diversity is the nexus of the greatest challenges and opportunities for a culturally intelligent approach to innovation.

PART I: THE CLIMATE FOR CULTURALLY INTELLIGENT INNOVATION

The essential elements for building a climate that promotes culturally intelligent innovation include attention, perspective-taking, focus, space and trust.

The Power of Attention

The first critical element is paying attention to diversity and innovation. You innovate to the degree you *consciously* think about innovation. This is the power of attention. Your experience of any situation or event largely depends upon what you choose to pay attention to or ignore.

Why Are Some More Innovative Than Others?

The organizational culture where you work is the biggest factor for whether you successfully innovate. Three characteristics are consistently found in organizational cultures that foster innovation regardless of the location: a willingness to cannibalize assets, a future orientation and a tolerance for risk.

Most companies and institutions work hard to protect whatever provides their greatest profits. But an organizational culture that consciously promotes a willingness to sacrifice current profit-generating activities is an important part of conscious innovation.

Second, a future orientation primes people in the company to realize the limitations of current technology and systems, and they more readily consider the emergence of a new generation of technology that may become dominant in the future. Finally, innovative organizational cultures create a consciousness in people that views failure as an accepted, important part of the innovation process. They find concrete ways to demonstrate safety around the reality that not all innovations will lead to a guaranteed stream of profits.

How to Pay Attention to Innovation

Maintaining and developing a climate of culturally intelligent innovation among a diverse team requires a deliberate, ongoing effort. Here are a few practices that can help.

Prime for culturally intelligent innovation. The most important way to prime for culturally intelligent innovation is for the leadership to surround themselves with a diversity of perspectives, utilizing that breadth to drive their own innovative approaches. Innovation needs to be built into every person's role and across all the systems and processes for product development and implementation. Images, signs, town hall meetings and written messaging need to be used to keep everyone's attention on the customers of tomorrow.

Become conscious of blind spots. Consider which groups of people you find most difficult to trust. How might that difficulty connect to a deeply rooted bias? And how might it be closing you off from innovative breakthroughs?

Train yourself (and others) to think differently. Make a habit of forcing yourself out of autopilot. Work from a different space. Don't always run your meetings the same way or in the same place. When your team comes up with a solution, stop and ask each other whether this is the best option or whether a third alternative is worth exploring.

The Power of the Empty Chair: Perspective Taking

Jeff Bezos, founder and CEO of Amazon, frequently leaves one open seat at the company's most important meetings. It's there to remind executives and managers of the most important person in the room — the customer. Add an empty chair to *your* most important meetings, but don't stop at that. Learn how to take on the perspective of a diversity of users, known as *perspective taking*.

Perspective taking is "the capability to step outside [our] own experience and imagine the emotions, perceptions and motivations of another." It begins with realizing that two individuals can be presented with the exact same information and arrive at radically different interpretations.

Once you learn to accurately take the perspective of others, you have a whole new ability to design products and services in a way that truly brings solutions. And with a diverse team, you have a built-in mechanism for taking on the perspective of your users. This requires not only learning how to read individuals one at a time but also learning how to see the tendencies, patterns, motivations and connections across a particular cultural group.

The greatest challenges of perspective taking lie not so much in how we deal with entirely erroneous perceptions but how we deal with different, legitimate views and experiences that are each a part of the whole.

The goal is not for all of us to abandon the social group and identity with which we were reared. Neither should we pretend we don't have legitimate self-interests. We want to transcend our existing perspectives without leaving them fully behind.

How to Improve Perspective Taking

There are several practices that can help you make perspective taking a regular part of your innovation process.

Observing. Most innovators are intense observers. They observe people in a different environment and look for how they solved problems. They actively watch people as they use products. They observe people in real situations. They look for what's surprising.

Listening. Effective listening to gain the perspectives of others means intentionally hearing a customer's pain points and desires, and creatively getting them to share things that will enlighten how you go about the innovation process. How do customers order and purchase your product? Is there a way to make that easier and less costly? How do they receive it? What frustrations do they have?

Simulating the user's experience. If you can't actually sit in the home of a customer, like A. G. Lafley from P&G does, the empty-chair strategy can be used by assigning someone to take on the perspective of a particular demographic and to role-play in the meeting, as if he were someone from that cultural background.

Checking for accuracy. Perspective taking relies on your ability to consider other people's perspective accurately. If you don't really know what it's like to be poor, in pain or at the bottom of the corporate ladder, then the mental gymnastics of putting yourself in someone else's shoes isn't going to improve your innovation. Beware of confirmation bias, the tendency to look for and favor information that confirms what you already thought.

The Power of 90 Minutes: Focus

Distraction is one of the biggest roadblocks to innovation. And the more globally dispersed your team, the greater the potential for distraction. From managing countless religious and national holidays to dealing with round-the-clock virtual team meetings, the interruptions and ubiquitous ping of technology, speed and multitasking are often the enemies of culturally intelligent innovation. As a result, it's absolutely essential that we learn how to focus. Focus begins with self-control, and self-control requires focus. It's a symbiotic relationship that needs patience.

Self-control, patience and focus can be taught to anyone, but don't overdo it. Start with a 90-minute block, with no interruptions allowed. And then change tasks. The power of focus for developing truly innovative solutions often rests in simply distracting ourselves from distractions.

How to Increase Focus

Here are a few ways to get started as you build focus into your climate for culturally intelligent innovation.

- Do creative work first. Each task drains your energy and lowers your focus. Start with the tasks that require a greater measure of creativity and concentration and then move to the easier work.

Get out of the office. When you need to tackle a creative task, change environments. Simply being in a different surrounding can stimulate the experiential circuits of the brain.

- Mind your breath. Paying attention to breathing is a way of automatically putting life back into perspective by putting focus on our most essential function.
- Write. Writing encourages you to create a story line and structure that helps you make sense of what has happened and work toward a solution.
- Set three priorities. What three priorities are you focused on this week? If you can't list them right off, that's a red flag.

The more personalities and cultures you have working together on an innovative project, the easier it is to lose focus. But when a diversity of perspectives and styles coalesce around a shared objective, and each individual does the hard work of keeping focused on achieving that objective, the colorful solutions that result are well worth the effort.

The Power of Trees: Space

Few companies have spent as much time considering the power of the work space as Google. Its open office environment, on-site massages, all-you-can-eat gourmet kitchens and flexible work spaces have been featured in many discussions about how the workplace environment influences innovation and productivity.

Culturally intelligent innovation must account for the power of space. The work space influences the generation of ideas, the building of trust and the overall quality of life for individuals and teams as a whole.

Teams that meet in spaces with natural light report a more positive team experience than those who work together in windowless spaces. And people who look out at natural environments from the workplace feel less pressured and more satisfied with their jobs and suffer from fewer ailments such as headaches. Nature, light, temperature and noise have a consistent impact upon how diverse teams engage in productivity. These are universals that need to be factored into any space in order to most effectively leverage the potential of diversity for driving innovation.

Nature. The soothing influence of rippling water, drifting clouds, rolling meadows, trees, rocks and flowers is a refreshing contrast to the constant ping of email, text messages and sitting through PowerPoint presentations. Being absorbed in nature increases our flow.

Light. The best type of light to promote culturally intelligent innovation is natural light. Both the central nervous system and the neuroendocrine hormonal system are influenced by the powerful stimulus of light. Natural light also shapes your level of focus. It has a direct impact on productivity and your overall well-being, regardless of your cultural background.

Temperature. Cold is a stimulant and heat is a sedative. It's pretty simple: To decrease your body's heat production, you have to stop activity. To get warm, you need to move. The temperature in a room influences the way people are able to engage. A team member's complaint about the meeting room being too hot or cold can seem like a petty concern. But these kinds of discomforts are the very distractions that impede optimum performance when we're trying to nurture culturally intelligent innovation.

Noise. The degree to which sound acts as a stimulant or a distraction differs among individuals. Some come up

with their most creative ideas with some music playing in the background, while others are distracted by that. But the universal principle is to stop and consider how sound and noise shape the way different people engage in collaborative work. Quieter spaces typically produce higher productivity, but you have to find just the right degree of quiet. Too much quiet can be a sedative.

How to Use the Power of Space

What's a culturally intelligent way of utilizing the power of space to support the innovative process?

Determine need for more stimulation or less. This includes awareness of the kind of space that best sup-ports creative thinking for you, which may vary according to your current flow, mood and the project at hand. As you engage in creative work, look at the task, and consider when you need complete silence to focus and when working from a more active environment would help you better accomplish your goal.

Create the space you need. Set up your space intentionally. Eliminate distractions, arrange for exposure to natural light, allow for the physical breaks needed, and pay attention to the temperature and how it influences the way people engage.

Allow flexibility. Understand the diversity of preferences among the people on your team. Look for the space that works best for your team, and empower individuals to take control of making the space most conducive for them.

Take control of the innovative process by managing your space. Beware of the differences among your team, and leverage the universal power of light and nature.

The Power of Trust

Innovation involves risk, both for organizations and their employees. And it's unlikely individuals will make themselves susceptible to risk unless there's a climate of trust. When individuals feel trusted, they know they can take the risks required to pursue innovative projects. Failure is expected, and the key is whether bold attempts are made and lessons learned.

Trust means different things to different cultures. It comes down to whether you believe somebody is dependable. It's a subjective evaluation, but it's crucial for innovation to occur. The very same behavior can elicit trust for one individual and erode it for someone else, depending upon how the behavior is interpreted. We implicitly trust people like ourselves. We're all biased. Some implicit favoritism is inevitable. But acting upon that bias is not. We can consciously learn to trust people who differ from us and help others do the same.

What goes into calculating trust? Five factors consistently emerge when calculating trust: likability, competency, intentions, reliability and reputation. The degree to which these factors influence whether you trust someone depends upon the task involved, your personality and your culture.

How to Build Trust on a Diverse Team

Global leaders need to demonstrate trust-building capabilities in two ways. First, they need to gain trust from members from different cultural backgrounds. Second, global leaders need to build trust among team members. The culture and personality of individuals on a team influences how the participants calculate trust according to the five trust factors, so culturally intelligent strategies are needed. Here are a few leading practices.

Leverage the power of in-group bias. Work on developing some in-group identity as quickly as possible. This has to be done very carefully, or it erodes cultural intelligence and promotes an unhealthy "us versus them" mentality. But once you create a sense that you're an in-group together, it allows you to have greater authority in challenging some of the potential blind spots of the group, rather than doing so as a perceived outsider.

Build team competence. Find ways to demonstrate the value of the different skills and perspectives represented by your team members. Give some short-term manageable goals that are possible to achieve only with the shared competencies on the team, and then create a workflow that reflects the respective competencies and expertise among team members.

Develop team results. Create some small wins early on and allow the team to experience successes that they couldn't have had without being together.

Create psychological safety. Psychological safety is a group climate where team members are comfortable that they will not be negatively judged or ridiculed if they speak up with an idea. To create psychological safety, a culturally intelligent leader creates a team culture that builds trust based upon some shared values and practices agreed to by each member of the team.

PART II: THE 5D PROCESS FOR CULTURALLY INTELLIGENT INNOVATION

Once the climate is in place, you need to manage the *process* for culturally intelligent innovation. The 5D process

for culturally intelligent innovation includes the steps of define, dream, decide, design and deliver.

Define: Align Diverse Expectations and Goals

The global companies that most successfully and consistently innovate are the ones that spend more time developing a specific goal and strategy up front. Everyone on the team needs to be able to answer the who, what, why, when and how questions related to the innovation at hand.

Paradigms of Global Innovation

One way to gain a shared mental model is to discuss what paradigm for cross-border partnerships best characterizes what you want to develop and how. The most common paradigms for working across borders are internationalization, localization and globalization.

Internationalization is when Culture A expects Culture B to adopt A's way of doing things. Localization often emerges as a knee-jerk reaction to the perceived ills of internationalization. Culture A decides that the best way to relate to Culture B is to allow B to fully retain its own cultural values and way of doing things.

The globalization paradigm is usually a better way of moving toward culturally intelligent innovation than internationalization or localization because it can draw the best from each culture involved. Think of the globalization paradigm as a Venn diagram where cultures overlap at the point of an intersecting goal or interest. McDonald's has internationalized its fast-food system and brand but globalized its menu offerings. They don't serve beef burgers in India, and they serve beer in Germany with many overlapping food items most everywhere in the world.

The greatest opportunity for innovation comes from creating and sustaining a fusion paradigm for working together that utilizes the best of the differences involved. The fusion approach seeks to minimize the interpersonal conflict that comes from the cultural differences and leverage the informational diversity that exists from them. It combines creativity with realism, and it purposely amplifies the differences through passionate discussion and disagreement rather than simply focusing on what you have in common. Fusion allows different cultural norms to coexist, and each person is invited to transcend and include her personal preferences as part of the team process.

Fusion Lab: Define

Here are a few leading practices to use when defining the goal and aligning expectations on a culturally diverse team.

1. Map your differences. Identify each team member's differences. Create a list with names and the most relevant differences each member brings to the team. Start with the two kinds of diversity that are most relevant for how you work together: visible diversity and underrepresented groups. Consider other differences that might also be relevant. Calculate the relative importance of the five trust factors for each team member.

2. Compare your expectations. Next, compare your expectations for the job that needs to be accomplished, including a list of criteria for a successful outcome. What would "better" look like for reaching this goal? Find ways to get input from diverse groups. Avoid trying to convince each other at this point. The purpose right now is to understand the different expectations that exist. Solicit contrary opinions, listen and seek to understand.

3. Take each other's perspective. Once you've mapped your differences and expressed your varied expectations, try to empathize with each other's perspectives. Set personal expectations and preferences aside for a moment, and ask everyone to take on the perspective of someone who views the goal or project differently from how he does.

4. List what you have in common. Begin with the obvious (e.g., all working for the same organization, all serving on the same innovation team), and then explore some of the other shared similarities that might be easily overlooked. This can be a useful way of developing a sense of team, and you might find some creative ideas that lie implicitly within some of the unique similarities you share.

5. Define a common goal. Finally, define the shared goal for the innovation at hand. You want each individual to have a sense of personal ownership while also seeing the goal as something that is bigger than any one person can pull off alone. The best goals on a fusion team are viewed as "mine" and "ours." Get agreement around a one-sentence summary of the goal. Don't move on until you have consensus. Describe what successfully achieving the goal would look like.

Taking the time to create a shared mental model and define your goal is a non-negotiable for a diverse team.

Dream: Generate Diverse Ideas

Communication is the biggest challenge when trying to get diverse teams to dream up ideas together. Cultural

differences heighten individuals' anxiety and uncertainty for speaking up. What you say and how you say it is strongly shaped by your cultural background.

For example, direct eye contact signals attentiveness in some cultures, while it's a sign of rudeness in others. Some individuals come from a cultural orientation that feels ideas and emotions should be expressed openly, while others have been told to repress demonstrating their feelings. As trivial as these may sound, such differences directly shape team chemistry, trust and productivity.

Fusion Lab: Dream

Everyone wants to be heard. An intentional strategy is needed to give diverse participants culturally intelligent ways to voice their ideas. There are several practices you can use to effectively manage the process of generating ideas from a diverse team.

1. Redefine "speak up." The very words "speak up" sound like an assertive, verbal advancement of your ideas. Underscore that participation and offering ideas is what is needed most — but how that's done can vary according to the distinct preferences across your fusion team.

2. Give advance warning. Let groups know ahead of time that you want their input. Not only does advance warning reduce the anxiety of participants who don't like to be put on the spot, but all team members are likely to have more thoughtful input if they spend some time thinking about it ahead of time.

3. Be explicit about expectations. If every participant needs to offer something, be sure that's understood. You can say something like "I need to hear back from everyone by the close of business on Friday. You can either offer your input at our meeting this afternoon, by talking with me one-on-one or by sending me an email."

Decide: Select and Sell Your Idea

In order for ideas to be translated into solutions, you have to decide which idea to pursue and convince people to adopt it. Selecting an idea and selling it to others are two sides of the same coin. Part of how you determine the best idea to pursue involves anticipating how you will convince others that it successfully solves a problem.

Fusion Lab: Decide

Consider the fusion strategies that follow to decide and sell your idea.

Encourage bottom-up-intervene top-down. One of the biggest cultural differences on diverse teams is the varied cultural preferences for top-down versus flat approaches to leadership and decision making. A fusion approach utilizes both. Alibaba in China, HCL Technologies in India, Banco Galicia in Argentina and Pixar in the United States are all companies that have created an environment that fosters bottom-up innovation. They understand that the more ideas and decisions that bubble up from the bottom of the organization, the more innovation is likely to occur. However, the leaders in all these companies also exert strong and timely direction.

Vote. In many cases, a diverse team organically reaches consensus about which idea to pursue. But when conflict and indecision are keeping the team from making a decision, consider voting. Voting helps you move forward and prevents you from bulldozing ahead with an idea that is supported only by the most vocal participants.

Map reactions to the idea and pitch. Team members from more collectivist cultures may want to involve their sponsors and constituencies as part of the decision-making process, whereas those from individualist cultures may be more comfortable selling the decision of the group to the constituencies after it's been decided. A fusion approach allows these preferences to coexist rather than insisting everyone do the same thing. One way to do this is by giving everyone ample information and time so that the collectivist participants or stakeholders can be approached before the decision is finalized.

Recruit early adopters. Some cultures, organizations and individuals thrive on being first, but most prefer to know that someone else has tried it. A fusion approach gets early adopters to get buy-in from both groups — inviting those who want to be the pioneers and using the experience of the pioneers to convince cultures that are more risk-averse.

Design: Create and Test for Diverse Users

In today's image-conscious world, the way an innovation is designed and tested can easily make or break its success. A culturally intelligent approach to innovation requires developing a design and testing process that accounts for cultural differences in form and function. What a user in one culture may find efficient, another may find clunky.

The golden rule of design and testing is to know the user. When the people working on the project reflect the values and needs of the users, a better solution will emerge. And the more a team utilizes its diversity in the design and testing process, the greater the likelihood the

innovation will be useful to a diversity of users. Design also has to be informed by observing users up close.

Fusion Lab: Design

Take time to consider and respond to the following questions when designing and prototyping your innovation, and make the most of your diverse team to come up with a fusion design.

1. **What needs does it meet?** Do you have to create the need (e.g., the iPod or Starbucks), or is there already pent-up demand for this innovation? What cultures will have the hardest time seeing the need? How will the needs influence the way you design it? Taking the time to identify the felt and real needs of your target users can help inform the way you design the innovation.
2. **What prior knowledge is assumed?** Does the consumer know how to use it effectively, and what kind of instruction and support needs to be offered? Be sure to benefit from those who have no insider knowledge to see what implicit assumptions and tacit knowledge may be guiding your design process.
3. **What does the design communicate?** What does the color communicate? How does it make you feel? Might there be hidden meaning to the images you aren't aware of? Have you accounted for language differences? How does the level of functionality influence users from different cultures?
4. **With whom should you test?** Users are excellent at reacting to concrete, visible designs. They bring important "folk knowledge" to the innovation that may have otherwise been overlooked by the design team.

Deliver: Implement Global Solutions

The ideas that change the world are built around the not so sexy implementation plans that translate ideas into real-life solutions. Diversity is unlikely to impede implementation as long as you develop a plan for implementation. And if you've consciously managed the diversity throughout each step of the 5D process, you will be much better positioned to implement effectively.

There are a number of things that stand in the way of diverse teams delivering innovative solutions, including technical knowledge/skills gap, skepticism and resistance to change, time consumed and procrastination.

Fusion Lab: Deliver

A fusion approach to implementation requires attention to the following areas:

1. **Formalize leadership.** Leaders of fusion teams need to consider the bottom-up/top-down paradox of fusion leadership. Formalizing this kind of leadership includes a project lead, senior leadership support and champions.
2. **Agree on timing.** Discuss how to develop timelines based upon expectations that meet the objective and account for how to make the most of the diverse participants involved in the project.
3. **Define your communication and conflict-resolution process.** Create a specific process for how communication will occur and when and the process for how decisions will be made. How often will you meet? What is the purpose of those meetings? What kind of communication protocol is needed? The more diverse your team, the more explicitly you need to spell this out.
4. **Motivate and monitor follow-through.** Culture plays a strong role in how we're motivated. Stop and consider what kind of value completing this project has for the other parties involved. Look at the different cultural-value orientations on your team. What are the benefits for meeting the deadline (or the consequences for not doing so)?
5. **Launch, and do a post-implementation review.** The launch may happen incrementally or all at once. Determine what kind of fanfare, if any, is appropriate for the various markets involved. And be sure to have all hands on deck for the inevitable glitches. Highlight the diverse inputs that led to the innovation. Before you move on to the next project, create a deliberate plan to audit the implementation process and assess it in light of the goal defined at the beginning of the process.

Leading companies need talent who are creative and adept at working across different cultures. Culturally intelligent innovation offers a way to awaken the sleeping giant within diverse teams. A fusion approach that intentionally utilizes diversity leads to the best, innovative solutions.

From Impossible to Inevitable

How Hyper-Growth Companies Create Predictable Revenue

by Aaron Ross
and Jason Lemkin

THE SUMMARY IN BRIEF

Why are you struggling to grow your business when everyone else seems to be crushing their goals? If you needed to triple revenue within the next three years, would you know exactly how to do it? Doubling the size of your business, tripling it, even growing 10 times larger isn't about magic. It's not about privileges, luck or working harder.

From Impossible to Inevitable provides a template that the world's fastest growing companies follow to achieve and sustain much, much faster growth. This template includes the seven ingredients of hyper-growth: Nail a Niche, Create Predictable Pipeline, Make Sales Scalable, Double Your Deal Size, Do the Time, Embrace Employee Ownership and Define Your Destiny to make a difference, for yourself and your company, no matter what you do or where you work.

Authors Aaron Ross and Jason Lemkin take each ingredient and break it down into specific steps to guide you through implementation. *From Impossible to Inevitable* helps you take impossible goals and turn them into inevitable successes for your business and team. You will achieve success even bigger than you can imagine from where you're sitting today.

IN THIS SUMMARY, YOU WILL LEARN:

- To understand and apply the seven ingredients of hyper-growth.
- How to specialize your sales process and scale your sales team.
- What it really means to "do the time" in today's business environment.
- The difference between functional ownership and delegation.
- How to define your destiny in a new or existing business.

Nail a Niche

You're excited about your business, your ideas, products and services … and you're ready to grow faster. You might be a startup, a consultant or a Fortune 100 brand. And you know that lead generation is the #1 lever that drives revenue growth and can create hyper-growth. You've been trying to grow your leads, and thus sales, but it's been harder than you expected … maybe a lot harder.

Are you *sure you're ready* to grow faster? Because when it feels like you're swimming upstream every day to generate leads or to sign new customers from the ones you do get, you usually have a bigger problem. All that time, energy and money invested in growing new leads and closing sales can be poured into a black hole — if you haven't Nailed a Niche.

When you Nail a Niche, you're not "thinking small," limiting your dream or permanently shrinking your addressable market. Niche here means focused. On a specific target customer with a specific pain. Regardless of how many types of customers you could help or how many of their problems you could solve.

Hyper-growth doesn't come from selling many things to many markets, covering all your bases (really, dividing your energies). Hyper-growth comes from focusing on where you have the best chances of winning customers, making them successful, building a reputation of tangible results and then growing from there.

Focusing on specific industries or types of customers is part but not all of it. It also means focusing your unique strengths (not all your strengths) where they can create the most value (not any value) and solve a specific pain for an ideal target customer in a believable, repeatable way, with predictable methods to a) find and b) interest them.

If you focus on solving a single problem really well and can adapt as the market evolves, the sky's your limit.

How to Nail It

Maybe you already know your best target. Perhaps your head's still exploding with options. Let's narrow it down with a step-by-step approach to prioritize your best bets and how to get more from them.

Step 1: Make a List. List your top five to 10 customers and/or types/categories of projects by size of deal or impressiveness of results. The best predictor of future success, or at least the best place to begin, is with the history of where you've been most successful. What was the pain or problem they wanted to solve? Why did they decide to solve it — what triggered them to decide to buy? What was the solution they wanted? On a scale of 1 to 10, how much do you want more projects like these ones?

Step 2: The Matrix. Once you get a broad list together, rate or rank them across five aspects: Popular Pain, Tangible Results, Believable Solution, Identifiable Targets, Unique Genius. Don't overanalyze things (yet); narrow down to a few best options (two to five) to dig into next.

Step 3: Choose. Now pick a primary opportunity to pursue. If you have more than one great one, you can pick a secondary opportunity to test and compare against the first.

Step 4: Validate. If you're ready to jump in, get started by finding a couple of prospects in that niche(s) to interview, to fill out and update your niche with details — especially the Pains and Results. Find people who either don't know you too well or a customer who's not afraid to give you brutally honest answers.

Step 5: Campaign to Learn Now and Grow Later. If you feel like you are ready to start targeting that niche, you should be clear enough by this point to start a lead generation program around it. It's not the leads here that are important — yet. It's the learning. Essentially, what you're doing here is four things: define a target list, usually of prospects, partners or marketing outlets; decide on how you want to reach out, that is, cold emailing, calling, referrals, social, mail, blogging and so on — and what you'll say and ask for; what's the minimum required preparation needed before you can start campaigning?; finally, stop procrastinating and just send the first campaign. Act, learn and adjust. The more tests you run, the faster you learn.

Your Pitch

You've identified your best target and perhaps a backup. And you know their pains. So when you meet a prospective customer at a conference or email one, what do you say or write? How do you tune your elevator pitch and messaging?

Get to that one thing people want from you, at which you're the best. Remove the clutter to make it easier for the right customers to see why they need you. The simplest way to do this is to go narrower, that is, to further specialize and simplify. Remember, you can try this as a whole company, for a product, for a project, or for a marketing campaign or even as an individual working to advance your career.

Let's say you're a part-time CFO. Is it easier to write an elevator pitch as "a part-time CFO" or as "a part-time CFO who lives in Los Angeles and works with media companies with $1–$10 million in revenue"? Going narrower can be by type of target customers. Or where you work. What you offer. What you're fixing. The results you create. Anything that makes it simpler for a prospect to tune in and see why they need you.

Create Predictable Pipeline

You can have the best product, investors or sales process, but without predictable ways to fill your revenue or sales pipeline, you're going to struggle. Predictable lead generation is the lever to creating hyper-growth. And it's more than throwing marketing campaigns online or on billboards, cold calling or pumping out free stuff to give away. Many aspiring and first-time founders have the idea that "if we just create an amazing thing [app, video, ebook, blog post …], it'll catch fire online and we'll be inundated with people excited to follow us or buy from us." This works just often enough to create the fairy tale for everyone else. Just like the lottery.

The best way to triple new sales isn't by tripling your salespeople (the traditional method for sales-driven companies) but by growing your qualified leads. There are three types of leads: seeds, nets and spears.

Seeds — Customer Success

Seeds are many-to-many campaigns; they're based on word of mouth and relationships. Some companies, like Dropbox, Box and Slack, have been able to take off by creating products that spread like wildfire through word of mouth. But for most companies, seeds will mostly come through systematizing how you ensure your customers stay happy and get value from your service, and who then generate more referrals and lower attrition rates.

The best way to methodically grow your seeds is with a repeatable program or with systems that ensure your customers are successful. This field is now commonly called Customer Success Management or just Customer Success. It means systematically reducing customer churn, increasing upsells, increasing referrals, and helping capture more and better case studies and testimonials. But this is really important: Customer Success is not about increasing customer satisfaction but creating revenue growth.

Here are six keys to Customer Success:

1. Customer success is your core growth driver.
2. Customer success is 5x more important than sales.
3. Start early; hire early.
4. Visit customers in person.
5. Customer success needs financial responsibility and metrics.
6. Evolve customer success goals and metrics as you grow.

Nets — Inbound Marketing

Nets are one-to-many campaigns to generate leads, with tactics like inbound marketing, in-person and online events, and online advertising. EchoSign, HubSpot and Marketo have all driven $100 million–plus businesses mostly through Nets.

These leads create quantity over quality, because you're literally "casting a wide net." For example, if 50 percent of word-of-mouth leads (Seeds) might turn into customers, perhaps just 1-3 percent or less of marketing-generated leads will convert into customers. So, you usually want a lot more of them. The idea is creating marketing that

customers love or learn from, inspiring them to want more from you, eventually buying your stuff. Every business can benefit from creating content. Beyond creating leads, making your ideas and customer stories public speeds "time to trust." People get to know you faster, better, when they can learn about you, your business and customers besides just face-to-face or over the phone.

Spears — Outbound Prospecting

Spears are one-to-one campaigns, such as targeted outbound prospecting or business development initiatives for getting appointments with anyone who's not coming to you — whether customers or partners.

Outbound prospecting was in the doghouse for years as inbound marketing took off. Now it's hot again because all kinds of companies are seeing how it can supercharge growth in highly predictable ways — especially when going after bigger companies that often aren't as responsive to marketing campaigns.

You don't need to cold call, although you can. Outbound prospecting shouldn't be a burnout job, if it's done right. And it's not about interrupting people who don't need you; rather, it's about reaching out in friendly ways to find the people who do. If you want to go big with outbound prospecting, it works best when you have these four conditions in place: you can sell deals that are large enough to be profitable, usually $10,000–$20,000 in lifetime value (bigger is better); your value proposition is easy for a prospect to understand and say yes or no to; you're different; and you're not trying to replace other people's stuff.

Make Sales Scalable

Growth creates more problems than it solves, but they are better problems. Once you solve the problems for Big Customer #1, then you get 10 more Big Customers, which mean 10x more problems. Then 100 more customers, which is 100x more problems. It gets worse, not better.

But it gets easier in other ways. Much of the operational pain, especially in recurring revenue SaaS companies, seems to go away around $10–15 million in ARR. At that point: Your customer base is highly diverse and not dependent on any whales. You have enough reference accounts. Your sales and client success teams are working as a team, as an imperfect but effective engine, and not dependent on a single rock star or two. You have a brand, maybe a small brand at first but a real one. You can't be killed by BigCo entering the space or the competition. You know the market so well, it's pretty easy to see two years out, not only from a product side but also from a scaling revenue and team side.

So growth won't magically eliminate all your worries, but it will get easier. And you'll keep coming up with new — and hopefully better — problems to solve.

Specialization: Your #1 Sales Multiplier

If you haven't specialized your sales team roles yet, nothing will make a bigger impact in your ability to increase sales productivity and grow. If you don't specialize, you're going to struggle. Doesn't matter if you have amazing customers, product and closers — you won't make the most of any of it without the right structure.

Specialization is standard in Silicon Valley. And growing. But still the exception. So why do most companies expect one salesperson to fill all their own "positions" of prospecting, responding to leads, closing and managing accounts? Usually because that's how it's always been done.

Exactly how you make specialization work for your particular situation is up to you. The principle is about helping your people focus and do fewer things better — because when salespeople multitask (overtask), most end up doing many things poorly.

While every team is different and creates different flavors, start with the template of four categories of roles that fit most (but, of course, not all) companies:

- Inbound lead qualification
- Outbound prospecting
- Closing new business
- Post-sales roles, such as account management, professional services and Customer Success.

Scaling the Sales Team

CSO Insights' studies show average sales teams' annual turnover of around 25 percent (it varies by a few points year to year), with half quitting and half fired. That means out of 100 salespeople, 25 are lost every year. So you need to hire (and train, and ramp and transition pipeline or customer accounts for …) an extra 25 salespeople per year just to tread water. But would you hire 10 HR people and then expect to fire three to five? Managers? Supply chain people? Losing a quarter of your engineering team, total employees or customers would be a board-level catastrophe. But it's accepted, even expected, in sales.

Sales team churn is especially expensive because of the time required, the lost opportunities and customer frustration. They are your face to customers, people!

If you are losing 25 percent of your sales team a year (whether they leave or are fired) — is it the people or is it your system? If almost every new sales hire is taking twice

as long now to ramp, is it them — or your system? See the pattern here?

Who sets quotas and incentives? Who defines territories, roles and responsibilities? Who's ultimately responsible for hiring and training? Who promotes, hires and trains the sales managers on the front lines? It's not the salespeople. Ultimately, it's the responsibility of the VP Sales and CEO to ensure sustainable sales success.

Your ability to scale a sales team depends on making everything a system. When salespeople leave for any reason — missed quotas, dissatisfied, bad apple — it means you have "defects" in your system.

There can be a million underlying causes behind high sales attrition, but the three most common ones are

Lead generation: The company isn't doing enough to support the reps with quality leads.

Specialization: The company isn't specializing at all, the right ways or going far enough with it.

Management: Leadership (mostly the CEO & VP Sales) isn't connected with what's going on "in the trenches," or is still very traditional or conservative.

In addition, go talk to your people, one by one, and identify patterns that lead you to discover the main one or two problems that are causing high attrition.

Double Your Deal Size

Which is the fastest way to get to $5 million in revenue, selling a million orders at $5 each, or selling 100 at $50,000 each, or selling 10 at $500,000 each? You can make millions without needing millions of users.

When you're attempting to grow by major leaps, work on doubling your average sale size as much as you work on finding and closing twice as many deals. Or if you already have the lead generation machine working smoothly, it's how you can quadruple growth — doubling deal sizes while doubling leads.

You can do it through a mix of targeted lead generation, changing pricing, designing higher-end packages, through premium products with enterprise features, carefully developed channel partners or whatever. It doesn't happen overnight, but you can take concrete steps to get there. Start with the question, "What conditions would have to exist to close deals that are 10x larger than we are doing today?"

How can you think bigger? For example,

SaaS products: What kinds of management features would you need to sell packages of 50, 500 or 5,000 seats?

Freemium or cheap products: What do companies need so badly that they're willing to pay for a five-, six- or seven-figure annual subscription deal?

Smartphone apps: Is there a way to sell bulk packages to businesses? Or resell the technology or your unique expertise to other business?

Books, online programs or workshops: Are there partners who can help sell bulk orders? How can these lead to five-figure consulting/services, then six-figure, then seven-figure?

With bigger deals, you will (a) make a lot more money, (b) exert less effort and (c) help customers become more successful. If you're selling to someone who's close to your Ideal Customer Profile, closing a $100,000 deal shouldn't be much more work than closing a $10,000 deal and may not even take longer. So if it takes two to three times the time and effort — but if you get 10x the revenue and your customers get 10x the value, it's worth it!

Going Upmarket

If your product is 100 percent individual-focused and you add just enough features to sell to a team, to tilt just slightly upmarket — you can grow your revenue, at least a segment of your revenue, by 20 to 30 times. Because deal sizes can go way up, and customers will stay with you much longer.

Virtually every self-service, individual-seat Web service churns at a relatively high rate — from maybe 2.5 percent a month at best to 3.5 or 4.0 percent a month or more in many cases. (There are rare exceptions.) Now come up with a slight extension of that same product whereby some team or segment of an entire enterprise can use it together. Let's call it just five seats to start, instead of one. Maybe you add management-level analytics. And then some sort of collaboration. Let's call it the most basic features necessary so that a team or a group will buy, instead of an individual user. What you'll find is epic on the churn side. As the deal gets just a smidge bigger, your churn will drop by 50– 80 percent, toward 1–1.5 percent per month. As you add more seats, the churn will trend toward 0 percent and eventually become negative: Your customers will add more seats than they cancel over time.

To do this, you have to learn how to go after and sell to companies who are hundreds or thousands of employees. And it's a new skill. Because selling an enterprise-wide deal is a lot like getting a bill passed in Congress. Decision-making in large organizations is a long, tortuous process due to legacy technology deployments, internal politics, entrenched home-grown solutions, sunk cost of

integrations, account control by incumbent vendors and the sheer size and scale involved.

Doing that may require hiring salespeople who live across the country or the world, in addition to the inside salespeople who work at headquarters. It's precisely when the product seems to be selling itself that building out this sales team and process is critical: Stopping or stalling at that point could expose the company to the competition and lose the race to be number one in its category.

Do the Time

If you're wondering if you should start your own SaaS company, here are three questions to ask yourself:

First: Are you prepared to give a full 24-month commitment to hit Initial Traction? Not 12 months. Not 18 months. But 24 months? It's going to take you nine to 12 months just to get the product right, and another six to 12 to get significant revenues.

Maybe an Instagram or a WhatsApp or a Pinterest can explode in just 12 months (though again, it took years of development and trial and error before they got to their "overnight" successes). You can't afford to expect miracles like that in business-to-business software, services or whatever business you might be in. Can you afford to commit for 24 months just to get to something, to real initial traction? If not, you should pass.

Second, are you able to commit to 8,760 hours a year? That's 24 hours a day times 365 days. This doesn't mean committing to being in the office 14 hours a day — that's not really necessary (that's for the Y Combinator kids). But can you really, honestly commit to obsessively thinking, worrying and stressing about how to do The Impossible? Every … Single … Moment? You'll be thinking of nothing but work, even when you are playing with the kids or having dinner with your husband. That's what it's going to take. If you don't have the mental bandwidth, you should pass.

Third, will you take the leap? This is, perhaps, most important. If you keep a mindset that you're "just trying it out" but you maintain other options, it never works, at least not for high-growth startups. Great founders Take the Leap. Not because they are crazy risk-takers but because they see the risk and decide to go for it anyway. They know there will be many challenges — with funds, customers, family — but they decide to figure them out along the way. They have doubts. They have fears. They have money troubles. But they see The Future and believe in their own (eventual) success. If you aren't ready to Take the Leap, you aren't ready to do a startup.

Success Isn't a Straight Line

There's never been an easier time to start a business — even with less than $100. Businesses are growing faster than ever. It seems like every week another company's gone from nothing to $100 million in record time or been acquired for $1 billion or some other huge amount.

Yet there's also never been more anxiety, frustration and depression — especially among CEOs and aspiring entrepreneurs. Whether you're new to business or have been at it for decades, everybody struggles with the now overwhelming number of choices in what you can do, build, use and ways to grow … that all keep changing constantly. You can't do all of it and do it all well.

In addition, what used to work now doesn't: You can't rely on the growth of your business in the same way. The number of new businesses, apps and ideas published and updated every day is overwhelming. This is also true of the number of daily email, social messages and alerts. There's no way any one person can stay on top of it all. The overload is making decisions more difficult for people to make — including your customers. And if you're on social media at all and follow many news sources, you're bombarded with stories of other people's successes.

Remember three things when overwhelmed:

- Embrace your struggle, because it's real and not going away. Everyone else has it too — even when it doesn't look like it. Use your struggle as a fire under your butt to change things, rather than resisting it. Turn it to your advantage!
- Don't let "keeping up with the Joneses," whether friends or competitors, distract you from doing the important things you, your team and customers need.
- Cut the "blah blah" crap from your communication to employees and customers. "Simple to understand, easy to act on," honest information that's valuable to the reader (not just the sender) will help cut through the clutter they're dealing with. Be blunt. Be honest. Be helpful.

Embrace Employee Ownership

You're passionate and committed to what you do, which leads you to forget that many others aren't or that they haven't learned yet how to execute as you do. And they won't, unless you embrace Functional Ownership.

How can you help employees go above and beyond their job description — not in hours but in initiative? In feeling

like and acting like owners. If most CEOs and executives wish their employees took more initiative and acted like owners, and then it's not the people that are the problem, it's the system of management that needs to change.

When you hear "owner," do you immediately start thinking about Financial Ownership (equity, commissions, ESOPs)? Financial Ownership doesn't consistently create both the Functional Ownership and the "it's really all on me" moments of 100 percent responsibility that inspire people to go beyond the bullet points of their job description.

Delegation isn't true ownership. Employees need Functional Ownership, to own something, to learn how to act like owners. Someone has Functional Ownership, and the emotional commitment that comes with it, when they, as a single person, clearly and publicly own a slice of how the business works, whether it's the P&L for a billion dollar division or the office refrigerator cleaning routine. He or she is 100 percent responsible for it, including its results, related decisions and improvement.

People support what they help create — the size of what they own doesn't matter as much as the reality of their ownership. Including an inability to hide from that responsibility, which is why shared responsibility tends to create pointed fingers. So, Functional Ownership is a key piece of the motivation puzzle.

Change is unavoidable. So are you going to react to changes in the market or get ahead of them and help create the changes yourself? If your employees wait around for orders rather than taking initiative on their own, growth will always be a struggle, because you're going to be responsible for the whole burden.

There's no better way to do this than to develop more owners and continuously frustrate them with uncomfortable challenges that drive learning. Yes, by definition you and your people should feel frustrations when getting outside your comfort zones. As long as it's new frustration from new problems, not from the same ones that never get solved or evolved.

For Executives: Create Functional Ownership

Answering the question "Who owns marketing?" is easy if you have a VP of Marketing. And usually, they own everything in marketing, with all important decisions being made or affirmed by them. But who runs the blog? That's not the VP Marketing, unless they are a one-man marketing team and run everything themselves. Whoever runs the blog on the team should own it. That means the head of marketing would defer to that person on decisions about the blog, which could include decisions about the visuals, rhythm, format, content and style. And that person would own it and be 100 percent responsible for the metrics related to the blog.

To create functional ownership, start with these three questions:

- What needs an owner? Make a list: What's on your plate that you'd like someone else to own? What other things are in need of focused Ownership?
- Who should the owner be? With a few most important functions, who is the person who will own it? They can volunteer, be designated or be selected by group consensus.
- What's the initial Forcing Function (an inescapable obligation)? The owner, with help as needed (or being challenged by a manager, as needed), should come up with what will be delivered next and by what time. Keep up the Forcing Functions, and they will keep driving everything that needs to get built: results, decisions and learning loops.

If you want your people to start picking these ideas up but someone's just plain stumped, then their first Forcing Function can be to find something to own (by a specific date). "On June 5th, I'm going to announce what I'm owning." This can include making the rounds with the team to find the right project.

Define Your Destiny

There's always someone or something you can blame when you're not getting the recognition, excitement or results that you want: a manager, a job, the market, teammates, the CEO, HR…

But you can't control them. You can control only yourself. And you can't wait around for the perfect opportunity to drop into your lap. Stop waiting for someone else to fix it, and use your frustrations to motivate you to Define Your Destiny rather than letting others define it for you.

There's a difference between (a) giving up in the face of challenges and (b) using them to motivate yourself to be more creative, to push for change, to find a way forward — no matter what. There will never be an ideal time, opportunity or idea — there will always be challenges. Owners and entrepreneurs succeed despite them, not without them. Even in baby steps. A step is a step, no matter how small.

You can use the same lessons above to help you with your personal opportunity. Because that's where you begin, let's call it "nailing a personal niche" in the company, in what you're interested in and can be great

at, and then creating leads and opportunities for yourself, specializing your time, looking for fewer, bigger ways to make an impact, doing the time and so forth. But here's a quick start:

- Make a list of what you want to do or what most interests you — whether it's related to business or not. Then add to the list at least three ideas around revenue that you could or should be interested in, such as "Learn how to sell" or "Learn copywriting." From this list, can you see any ways to learn any at work, to get paid to learn what you want to learn or do anyway?
- Interview people in your company as well as partners, prospects or customers as needed. What problem do you want to solve? If it's not something that your leaders care about, how can you reframe it from a "nice to have" into a "need to have" for them?
- Find a mentor, coach, or champion at your company to ask for advice, who can support you and will be painfully honest with you about the areas where you need to improve (everyone does).
- Create a Forcing Function to come up with something tangible to deliver (a prototype, an analysis, a presentation, a blog post, a talk, an event …). If you aren't sure what that is, first pick a date and tell some people you're doing "something" on it. There's no better way to pull yourself forward in life or business than to publicly commit to doing something specific by a deadline, even before you know how you're going to do it.
- Do the Time, repeating steps 1 through 4 over and over and over and over again …because, chances are, it's going to take a lot longer than you want or expect to turn any idea first into proven results, much less recognition, career and money.

Combining Money and Meaning

It's cool now for people to expect their work to be purposeful, to be meaningful. As it should be. And Meaning Snobs can go on and on about how meaning is more important than money or how impactful their gigs are … and that's great.

The truth is, putting meaning first, second and third on your list of priorities won't make you money. For Avanoo's Daniel Jacobs, building a meaningful business didn't take off until he put money first, realizing that without being able to create predictable revenue or funding, nothing he created — however inspiring or meaningful — would last. Luckily, there are many ways to make money meaningful.

For example, how can you make unique contributions to the business and team? What would make your job more fulfilling? How can you stand out from the crowd?

Once you ask the question, "What is my Unique Genius?" your mind will begin trying to answer it. Here are some questions to help you figure out how to better combine money and meaning.

- What do you want to learn about, if you could learn about anything? List at least 10 things, and then pick the top few.
- Imagine having more money than you could ever spend, so you don't need to work. What would you want to do if you could do anything?
- Ask co-workers or customers the question, "What's the one thing you hired me for or would hire me for?"
- Complete this: "If I could help anyone/any kind of person, I would help…" Or, "If I could have any kind of customer, I would have…"
- If you could start a project that wouldn't fail, that is assured of success, what would it do? Who would it help? What about it would make you proud?
- What frustrates you that you would like to personally help fix in the world? Especially something that you deal with personally or daily.
- What parts of work do you enjoy most? What daily activities do you like to do?
- What do people keep coming to you for help with, to ask your advice on?
- If you're in a bookstore, what section do you go to first? What's your ideal book to read (or write)? What if you stick only to the business section?
- What would it take to make your work so enjoyable that you'd do it for free?

When you're pursuing anything vitally important to you, you can figure it out. If you stick to it, especially through the times that feel like failures. Even if it takes you years longer to get there than you wanted, and in totally unexpected ways.

Committed Teams

Three Steps to Inspiring Passion and Performance

by Mario Moussa, Madeline Boyer and Derek Newberry

THE SUMMARY IN BRIEF

Committed Teams: Three Steps to Inspiring Passion and Performance is based on a deceptively simple philosophy: set a direction, try to stay on track and make adjustments when necessary. Easy to do? Hardly — especially when the typical workday is time-crunched, stressful and deadline-driven.

Drawing on research done at the Wharton School of Business, the authors reveal how to deliver results under these tough conditions. *Committed Teams* will help you gain buy-in for shared objectives, assign roles to the right people and establish norms for effective collaboration. Whether your team aims to execute a strategy, produce breakthrough innovations, collaborate across global boundaries or launch a new venture, this how-to guide offers the pragmatic advice you need. This game-changing book provides the tools for aligning every member of your team behind a motivating vision, making team meetings efficient and productive, and closing the gap between stated goals and actual behaviors.

If you want to be competitive in a demanding, fast-paced work environment, you need to rely on a high-performing team. *Committed Teams* is the indispensable resource for creating one.

IN THIS SUMMARY, YOU WILL LEARN:

- To establish goals, roles and norms in your organization.
- To adopt an observer's mindset and solve problems.
- To bridge key gaps between saying and doing.
- To establish and strengthen culture in different types of teams — even virtual teams and startups.

Introduction

Increasingly, being good at teamwork is synonymous with simply being good at work. And for a valid reason: The complexity of today's world — shaped by rapidly accelerating technological, economic and cultural trends — demands that organizations of all kinds seek out the synergistic potential of teams. But too often what teams deliver is a lot of talk and little accountability.

How do you create a team that is committed to high performance when few teams end up being truly greater than the sum of their parts? The answer is a simple framework: the 3×3. It is built on three foundations and supports an interactive three-step process. By helping you get better at leading teams, the 3×3 will help you get better at virtually all aspects of your work.

The first 3 stands for the Three Foundations of highperforming teams, or HPTs: clear goals, roles and norms. If you have read or heard anything about good teamwork, you are probably familiar with some version of these foundations. But even with the best of intentions, teammates quickly stray from commitments.

To address the issue of alignment, there is a three-step process for resolving differences and deepening commitment. The three steps are called Commit, Check and Close. In the 3×3 framework, (1) You first need to get your team to Commit to goals, roles and norms. (2) You need to regularly Check alignment with these commitments. 3) Finally, you need to Close the gap between saying and doing.

Let's now look at the tools and techniques to establish commitments on your team, check on the alignment of behaviors with the commitments and close the saying-doing gap. The process will help your team stay deeply engaged and perform to the maximum of its potential.

PART I: THE 3X3 FRAMEWORK

Commit: To Know the Rules, You Have to Make Them

It's important to be explicit about the rules governing team behavior. It is just too easy to become committed to the wrong ones. So, develop the right rules collaboratively as soon as your team forms.

What rules should you establish? The first step in the process is all about committing to the rules that matter. Research on teams tells us that these fall into three categories, or the Three Foundations: Goals, Roles and Norms. HPTs establish those foundations by having a structured conversation. Research has shown that conversation is simply the best tool for organizing collaboration and making commitments.

The outcome of your conversation is what management scholar Leigh Thompson calls a *team charter*. A team charter can be something formal you write on a piece of paper and post, or it can be as simple as a set of verbal agreements. The key is having a conversation about concrete commitments you can refer to later and hold one another accountable for.

Goals

To be successful, every team needs strong, collective goals that members can rally around. In order for team

members to put the collective goals first, they have to feel there is a clear answer to the WIIFM question: What's in it for me? Team members are much more likely to embrace collective goals when they are aligned with personal goals and motivations. For just this reason, the goal-setting processes that are a critical aspect of team formation have to begin with a conversation — even a negotiation — about individual goals.

The process of checking and aligning individual goals with team goals thus does as much to support team performance as it benefits individuals. Of course, it is not always possible to close this gap completely, but even the act of trying will often foster engagement, honesty and trust among team members.

Even the most well-aligned goals will encounter barriers. As you set goals with your team, do more than write a set of milestones down on paper. Imagine the likely issues that could derail your success and create rules for managing them.

Roles: How Do the Pieces Fit Together?

In addition to goals, teams need rules determining what each person does within the team. Research on team performance and workplace productivity consistently finds that teams work harder and better when members have clear, interdependent roles that tap into their skills, expertise and sense of meaning.

To start, you should make sure you have the basics: the skill sets and kinds of expertise needed to achieve desired outcomes. Team members should also consider how they want to shape their roles based on how they derive meaning from work.

You should also consider how all of the roles fit together to form a team's structure. In general, team cultures are differentiated along two major spectrums:

- Are they more hierarchical or flat? Hierarchical teams give more authority to a strong leader, whereas authority is more widely distributed among the members in a flatter team.
- Are they more individualistic or more cohesive? This axis characterizes the team's working relationships. Individualistic teams tend to have more transactional exchanges, while cohesive ones interact in more personal ways.

Norms: Making the Behavioral Rules That Matter

If goals are about where your team is going and roles describe what you will do to get there, norms are the rules governing how you interact to fulfill both goals and roles. These rules tend to fall into three major buckets, each of which prompts a question: How do we resolve conflicts? How do we communicate? How do we decide? Managing differences, sharing information and acting on it are the three fundamental processes in which teams engage.

How can you write effective rules for your team? Focus on the top three to five things that you think will be most important for the team dynamic based on what you know about your particular group. To determine what these might be, go back to the potential barriers you identified in your engagement-building process. Creating norms that head off those challenges are likely to be your most important priorities.

Check: What You Don't Know Is Probably Hurting You

For HPTs, reflection is the core activity in the second step of the 3×3: checking on alignment. Teams often underperform because people fall out of sync with one another and their environment. The result is a saying-doing gap: a disconnect between what a team says it is doing and what it is actually doing.

Research shows that the saying-doing gap is the most common explanation for poor teamwork. The saying-doing gap develops for two basic reasons. The first occurs when a team is conflicted about its commitments, while the second is related to a team's commitments being out of step with the external environment, such as other parts of an organization or the marketplace. What the two reasons have in common is misalignment with situational factors, caused by a lack of situational awareness.

How can you reveal saying-doing gaps and keep your team aligned with its internal commitments as well as its external environment? To bridge the gaps, you have to view yourselves as outsiders would. True, this is a tall order. But others have learned how to do it, applying a tried and true method of qualitative research: participant observation.

Learning to Become Your Own Observer

To find and close the deep disconnects embedded in this mundane interaction, you need to perform three tasks:

- Adopt an observer's mindset to view your own behavior the way others would see it.
- Collect data about situational factors that produce rule conflicts.
- Create a psychologically safe space for problem solving.

Adopt an observer's mindset. To be able to identify the underlying misalignments on your team, you have to reduce the biases that distort your judgment and cause you to miss important cues. You can become an "outsider insider" by paying attention to two common conceptual biases that can blind you to the impact of your own behaviors. One of those biases leads to "overvaluing outcomes." As Harvard professor Max Bazerman has shown, when a process results in a favorable outcome, we tend to ignore the mistakes or tensions that could cause problems in other situations. To overcome this bias when reviewing past decisions and actions on your team, even if you achieved desired outcomes, get in the habit of imagining what would have happened if a situation had taken a turn for the worse and how your team would have responded to the resulting problems.

Another common bias goes by the name of "motivated blindness." In the famous words of Upton Sinclair, "It is difficult to get a man to understand something when his salary depends on his not understanding it." To reduce the effects of this bias, actively seek out evidence that disproves your beliefs to ensure you are not letting your own preferences and interests cloud your judgment.

The power of systemic data gathering. Once you have created the observer's mindset, you should systematically gather data that helps anticipate potential situational conflicts that will sap your team's engagement and hurt performance. In your own team environment, you can anticipate conflicts by looking for the sources of similar tensions on three levels: interpersonal, team and environment.

Create the space for problem solving. Before teams can solve problems, they have to create a space for giving and receiving honest feedback. Teammates should feel that they can speak up about issues, admit mistakes and ask for help without being shamed or penalized by the group. Amy Edmondson calls this "psychological safety." Her research demonstrates that teams with this characteristic communicate more openly, share information more freely and ultimately make better decisions. How do you foster psychological safety? Build individual relationships with one-on-ones. Taking the time for one-on-one conversations usually leads to a valuable outcome: a feeling that you are willing to walk the talk when it comes to hearing people out.

Since team discussions often involve negotiation, take account of individual bargaining styles to ensure that, as a group, you communicate in the most effective way. Using one-on-ones to discuss bargaining styles and clarify informal roles will help you develop strategies for having productive discussions and encouraging team members to disagree constructively.

Close: To Bridge the Saying-Doing Gap, Act Like a STAR

Getting specific is the key to closing saying-doing gaps. Field research has shown that HPTs create the conditions for peak performance by acting like STARs.

- Be specific.
- Take small steps.
- Alter the environment.
- Be a realistic optimist.

Be specific. In order to make improvements, teams need to be hyper-specific about the changes they want to make. A powerful tool for helping your team drill down into specific changes is the Start/Stop/Continue exercise. It unfolds in simple steps:

- Divide a flipchart or white board into three vertical sections.
- Ask team members to write on individual Post-it notes the specific action they want to start doing, detrimental behaviors they think the team should stop, or positive practices the team should continue.
- Place each Post-it in its proper place on the board.
- Review the postings to see whether there are common themes, and consider collectively what you want to change or encourage in the group dynamic.

Resolve to take small steps toward improving. To work on small-step changes with your team, start by using "feedforward." Leadership coach Marshall Goldsmith coined this term to highlight the importance of getting team members to look ahead toward specific ways to make positive change. To see how this works, consider a colleague who always shows up late to meetings. Rather than telling him, "You're always late and it prevents us from getting to important items on our agenda," imagine saying something along the lines of, "If you aim to be at meetings 10 minutes early, it will help us make sure we can get started on time and hit every item on our agenda."

Alter the environment. Research shows that pure willpower is unlikely to be effective if the environment encourages old behaviors. Simple reminders, or nudges, often make the difference between success and failure. One of the most effective nudges you can use is a checklist. Checklists help HPTs in cockpits, oil tankers and hospitals perform the right tasks in the right way at the right time.

Another powerful type of reminder is an "accountability buddy." If you are trying to set better deadlines, or be more transparent about your opinions, ask a team member to observe your behavior and remind you when you are falling back into old patterns. Accountability buddies are powerful because they leverage the power of positive social pressure.

Become realistic optimists. Everybody knows about the power of positive thinking, but an HPT goes out of its way to anticipate problems. HPTs from top military units to cyber security groups use so-called Red Teams to reveal all of the risks inherent in a given strategic direction. Red Teams are either groups of insiders or knowledgeable outsiders who test a strategy by trying their best to defeat it. Your own version of a Red Team could be someone in your group who is assigned the role of devil's advocate in your meetings, or it could be an external party you consult. The point is to make sure your thinking stays grounded in reality and accounts for the inevitable barriers that could lead to failure.

PART II: FIVE COMMON TEAM TYPES

Making Virtual Teams Work

As technology continues to advance, virtual teams are becoming increasingly common. In today's mobile world, you can communicate from just about anywhere, even if the conditions are often less than ideal. What you lose in nuance you gain in valuable flexibility, right?

Indeed, for individual team members, flexibility has lots of appeal. If you don't have to drive or fly to meet regularly with your team in the office, you can build your schedule around chores, family obligations and personal time. For organizations, projects can be staffed with the most talented and best-suited employees and contractors, no matter where they are located.

In a virtual setting, you are likely to have a hard time with two teamwork essentials: trust and communication. Without the frequent opportunities for face-to-face contact that co-location affords, you have to tweak the 3×3 Framework to reduce the misalignments that so frequently occur.

Build Trust Early

Trust is one of the keys to success for any team, but for virtual teams trust is the essential glue to bind teammates together across distances and time zones. If people do not trust others to deliver, they waste time on duplicate efforts, timelines are delayed, and creativity and innovation suffer.

Basic human connections are the foundation of trust, which in turn is the foundation of teamwork. It just takes more work to build those connections in the virtual world. The key is to use a mixture of both digital and face-to-face trust-building mechanisms. Let's look at a few ways you can do this with your own team:

- **Build a reciprocity circle.** Easily performed on a digital platform, this simple exercise models the give and take team members should practice on a regular basis. Simply have people make requests of others by email or on a shared group document. The requests can be about anything from connecting with someone in another area of your organization to getting help with a programming problem. Encourage people to respond to as many requests as they can. The reciprocity circle exercise will deepen the bonds of mutual commitment among your teammates.
- **Make socializing an agenda item.** Make time during virtual meetings for teammates to catch up with each other. By formalizing this as an agenda item, you legitimize socializing and make it more likely that people will build trust-based relationships.
- **More frequent, shorter check-ins.** When your virtual team meets only once or twice a month on video, chat or conference calls, the amount of work that needs to be done can build up and create stressful real-time discussions. By touching base more often — either by having more meetings or communicating more frequently through chats — teams do better at staying in sync, emotionally and otherwise.

Use Your Channels Wisely

Good communication is tough for any team, but the distance created by virtual teams makes it harder. Finding the right channels and setting ground rules for virtual communication become even more crucial to staying in sync.

New York Times journalists reach a global audience, yet these high-profile writers were having trouble communicating with colleagues in their own organization. Employees in Manhattan felt disconnected from co-workers stationed in other parts of the world, struggling to keep abreast of fast-moving stories in far-flung regions. Texts were ignored, emails languished in inboxes and phone calls were tough to manage across international time zones. The Gray Lady was struggling with too many communication platforms to keep up with.

The app Slack was a godsend for the *New York Times* journalists. It is like Microsoft's Yammer, AOL's Instant

Messenger (AIM) or the generic Internet Relay Chat (IRC). But Slack differs from those applications in that it archives messages, has a strong search engine and allows for easy file-sharing. It is also automatically synced across devices, and it promotes transparency and visibility in internal communications. After implementing Slack as an email replacement, the *New York Times* started to see the results. While Slack helped virtual teams at the *New York Times* feel closer together, some other channel may work better for your team. The point is that you need to discuss this question.

No Time for Teamwork? Lessons from Startups

What separates startups from other teams is the lack of a well-developed organizational context. This simple fact shapes everything that gives startups open space to make their own decisions even as they dangle on the precipice of bankruptcy.

Startups exist in an intense environment in which wild highs and lows are the norm. Teams are free to dream big and make radical changes. Energy can be poured into a single idea, unfettered by the demands of other projects in a larger company. Startup teams lack the resources of a larger company, too. And the comfort of knowing if a project fails you can return to your old job. Startup teams are a seatbelt-free roller-coaster ride. In this environment, reflection can go by the wayside. You may not have time for long corporate-style retreats to establish your culture, reflect and adapt.

Precisely in these times, the key is to devote as much energy as you can to managing your team culture. In a VUCA (volatility, uncertainty, complexity and ambiguity) environment, the best-articulated vision for your company is likely to be radically altered sooner or later. Only passion and commitment can pull you through the changes. For this reason, the 3x3 Framework is still crucial in a time crunch. But a modified process is needed — one that focuses on what are called "reflection triggers" rather than more elaborate steps. For startup teams, and other teams that need to move fast, focus on two teamwork tasks: creating a culture of resilience and identifying 3x3 checkpoints.

Building a culture of resilience. In forming a startup team, a general rule heard over and over from successful entrepreneurs is to find good co-founders before worrying about the fine details of your offering. When picking the members of your startup team, therefore, prioritize bringing people on board who have proven that they are able to drive doggedly toward fulfilling a vision, even if they have to completely change how they approach it in the process. Take note of those who proactively reach out. Probe them in interviews on how they have responded to setbacks. Watch for red flags, such as blaming others rather than focusing on what they did to adjust. Forget about their past failures. Focus on what they learned from them. Hiring to fill specific roles is secondary. Like your product, chances are team roles will change, dramatically. Any role you hire for may become obsolete. What does not become obsolete is a team member who can adapt and learn a new set of tasks on the job.

Create 3x3 checkpoints. Typical startup teams evolve from groups of friends and work together more consistently than teams in large organizations. Because of this closeness, startup teams tend to fall into the trap of believing that everyone is in sync and that they can focus on executing without spending time thinking about alignment. Rather than thinking of the 3x3 Framework all the time, you should create predetermined triggers that lead to specific actions, such as a meeting or a decision-point. Establish checkpoints for three types of team issues: checking the participation and engagement of individual team members, flagging problems as they arise and making pivots when necessary.

Who Has a Good Idea? Insights on Innovation

Innovative team cultures have a few distinctive habits. You can help your teammates develop those habits by asking the right questions, or "kickstarters." They will enhance the way you solve problems, conduct meetings and collaborate with people outside the team. The result: closing the saying-doing gap that frequently exists in innovation-related work. Each of the following sections includes a "kickstarter" question that you can put on the agenda of your next team meeting about innovation.

Define values. Innovative companies and teams are committed to values that everybody takes seriously. Values are like guardrails that keep ideas from veering off the path leading to core goals. IKEA employees are knowledgeable about what the company stands for. Many stores display an image of a stone wall as a reminder of the region where its Swedish founder, Ingvar Kamprad, was raised. Largely agricultural and poor, Smaland imbued Kamprad with an appreciation for innovative frugality. This value has driven the creation of myriad well-designed products, including a table that can be sold at a profit for five euros. Five euros?

At a profit? Given the challenge of developing a prototype that met these specifications, team members networked with colleagues across the company and reached out to suppliers. The exploration led to an improbable source: door manufacturers. Cut a door in two — presto! You have a table. In retrospect, this makes perfect sense. But it took creative thinking to get there. A team that has committed to a well-defined set of values knows how to spend its creative energy. It also knows how not to spend it.

Multiply perspectives. Values help orient your team and guide exploration of multiple perspectives on a problem. Innovative teams encourage this sort of purposeful yet wide-ranging inquiry. There are several ways to do it. One way is to read — voraciously, widely and intensely. Bill Gates takes reading vacations, laying aside a diverse collection of books for most of the year and quickly working through them during a one- or two-week binge. When you immerse yourself in this way, you make connections that are harder to see when you read more slowly and forget details.

Chez Panisse founder Alice Waters creates an environment that promotes learning. She pays her chefs to visit local farmers markets and even to travel in search of innovative culinary ideas. Chefs can also take four months off, at full pay, to work as teachers in cooking schools. IBM organizes "jams," using the Web to facilitate high energy interactive discussions involving thousands of employees. Topics range from business strategy to programming.

Tinker. Innovators tinker — or, in other words, they experiment. Innovation is messy. While you can use a highly structured activity like a tournament to generate ideas, the core process of creating a new product, a strategy, a novel or a symphony is always iterative. It happens in fits and starts. It involves serendipity. It requires that your team members listen to themselves think out loud, babbling half-sentences and nonsense. The innovation research shows that good ideas are cobbled together in just this way. You reach the same conclusion when you read about how creative people — artists, scientists, strategists, political leaders — actually produce their ideas. They do it little by little, experiencing equal amounts of confusion, disappointment and passion.

Lead or Follow? Guidelines for Leadership Groups

The same leadership teams have shown considerable strengths and shocking limitations. For this reason, top teams never overcome the need to focus on the fundamentals of high-performance collaboration. While there is no guarantee that your top team will always make great decisions and avoid disasters, there are three questions that will help you stay on track. Devote part of a team meeting once a month to reviewing these essential questions.

Are we still having productive discussions? Top teams produce mixed results. One reason is the predictable entropy that afflicts leadership groups. According to one study, less than 10 percent of top teams were prepared to make good decisions, and approximately a fifth of the teams were dominated by CEOs who made unilateral decisions. Even if norms were established in the first place, the findings indicate that most executive teams need to review how they make and communicate decisions.

Another closely related question you should consider is whether there is enough followership on your team. Just as some CEOs display subpar leadership skills, some team members are ineffective followers. Put a discussion of followership on your monthly agenda. A review of your norms might raise some difficult issues, but it will ultimately recharge your performance.

Do we need to realign our priorities? MIT researchers have shown that high-level agreements about goals can mask deeper misalignments that affect top team performance. These misalignments reflect naturally evolving differences over the relative importance of issues such as profit, corporate responsibility and customer satisfaction. When these differences go unaddressed, teams are slower to make decisions and implement them — or, often a worse outcome, implement them in the wrong way. During her tenure as Xerox CEO, Anne Mulcahy made a point of encouraging top team members to publicly discuss conflicting perceptions and interpretations of stated goals. The open exchange promoted engagement. As Mulcahy observed, leaders who "consider a diverse set of opinions… create 'followership' around decisions that might not come naturally."

Have we become too isolated? Just as members of a top team need to make sure they are aligned behind shared priorities, the whole top team should ask whether it is aligned and connected enough with the rest of the organization and the broader environment. In this sense, every member of the team should make organizational relationship-building a priority. Studies reveal why these relationship networks are essential: 90 percent of the information a top team uses to make decisions comes through informal channels rather than formal reports.

Why Are We Here? Engaging Committees

It is notoriously difficult to engage the right committee members in the right way. Here is how to do it.

The first question you should ask about your committee: Does it even need to exist? Getting rid of just one committee can have nearly transformative effects. Exaggeration? A Bain and Company study calculated the number of man-hours devoted to supporting one weekly executive committee meeting. In total, just one committee cost the company 300,000 hours per year. Keep this number in your head next time you think there is no harm in creating just one more committee.

To decide if a committee really is the most effective tool for your needs, ask yourself the following three questions:

- Would the decisions made by this committee materially affect the performance and objectives of the organization?
- Is there an existing standing committee whose purpose could serve this decision?
- Does this decision actually require diverse opinions and input from across the organization, or can it be made unilaterally?

Inspiring Passion

Let's assume you have reviewed the questions and decided that you do, in fact, need to create a committee to solve a problem. Now you face the daunting task of getting your members on the same page as part of a team that can often feel disconnected from "real work."

Get the right people in the room. Since committee members are often forced or assigned to serve on committees, it is critical for leaders to evaluate carefully whom they are choosing to serve. The key considerations for committees are the 5xS factors: size, schedule, skills, social capital and styles. They can be applied to any team formation but are especially crucial in the planning phase of committee work.

Figure out what's important. When it is easy for members to disengage and suffer few consequences, the WIIFM questions become even more important. You can start by asking a simple question: "What do you want to learn by participating in this committee?" Learning goals are powerful motivators. They focus members on developing personal skills and knowledge while contributing to the team.

Committees similarly need a central idea that guides their actions. In helping teams develop one, use the image of the Eiffel Tower. No matter where in Paris you are, you can look up to the tower and reorient yourself to find your way. That is what a central idea needs to do — orient the committee or board such that every decision can be measured against whether it takes them toward or away from the Tower.

Decide on roles. Role clarity is especially important on committees, because accountability can often be lacking and authority is often uncorrelated to seniority. Set clear expectations for participation and agree upon meaningful consequences for when it falls short.

Also, establish informal roles. Leadership scholars Green and Molenkamp define informal roles such as the caretaker, coordinator or antagonist who helps a team accomplish tasks and build relationships in ways that formal roles tend not to cover. Acknowledging and designating informal roles are helpful on committees and on any kind of team. Caretakers make sure that conflicts are handled productively. Coordinators make sure everyone understands what is expected of them. Antagonists challenge a team when it falls into groupthink.

Every team — now and in the future — needs to make commitments in the form of goals, roles and norms. Team members will need to be honest with themselves and each other about their abilities and their competing commitments. Fortunately, teammates will help get projects back on course when they have been properly prepared to identify and address misalignments. Successful teams will be disciplined about developing habits that support their commitments.

In the early 20th-century, William James said that habits are the great flywheel of society. That same flywheel will continue powering the age of digital communication, wide teams and project-based work.

What Millennials Want from Work

How to Maximize Engagement in Today's Workforce

by Jennifer J. Deal and Alec Levenson

THE SUMMARY IN BRIEF

Millennials have been burdened with a reputation as spoiled, lazy and entitled, but the reality behind the stereotype is far richer and more complex. Who are Millennials, what do they really want, and what can you do about it?

Based on fieldwork and survey data from global research, *What Millennials Want from Work* paints a comprehensive, scientifically accurate picture of what really motivates Millennials around the world. Learn how to engage Millennials by improving workplace flexibility, because Millennials don't separate life and work; providing adequate support and feedback, because Millennials like to learn and grow; coaching, not micromanaging, because Millennials value autonomy; designing competitive salary structures, because Millennials know what's up; and providing opportunities to contribute to society, because Millennials care about doing good.

In this essential book, Jennifer J. Deal and Alec Levenson explain who Millennials really are, and offer practical advice to help those who manage, lead, and work with Millennials, to improve teamwork, increase productivity, strengthen organizational culture and build a robust talent pipeline.

IN THIS SUMMARY, YOU WILL LEARN:

- Common misconceptions and realities about Millennials in the workplace.
- How Millennials can be both entitled and hardworking.
- The economic and social conditions that motivate and challenge Millennials at work.
- Practical tips for attracting, engaging and retaining Millennials.
- Important trends to help organizations plan for the future.

Introduction

So many generalizations about Millennials promoted by pundits, consultants and even some researchers are based mostly on anecdotes and not on rigorous data. Just as important, even when the conclusions are based on data, they typically focus on only one or two factors, not the complete package of who Millennials are and what they want. For example, Millennials have been described as needy and entitled. Their detractors say that is because life was easy for them when they were growing up, at least in comparison with their parents. On the other hand, many of their families experienced financial hardship as a result of economic and social shifts. So some people posit that these hardships make Millennials skeptical of organizations in general and authority within organizations in particular. They have been derided as disloyal, uncommitted and unwilling to work hard.

Those who work with and lead Millennials need an accurate picture of what the Millennials want from work and how organizations can benefit from that knowledge: a picture that is both nuanced and simple enough to be actionable.

This book introduces and explains the results of a series of projects conducted between 2008 and 2015. The data used are global and include a total of more than 25,000 responses from Millennials and more than 29,000 responses from older employees from 22 countries. The research included both surveys and fieldwork, numerous interviews and focus groups. Only those Millennials currently in the workforce were included, which means those born from 1980 to 1995. In addition, most stereotypes about the Millennial generation at work primarily focus on a specific subset: people in professional, technical, managerial and executive positions who have college degrees (bachelor's or higher). The sample is not representative of all Millennials everywhere. It is, however, a very large sample of Millennials working in a range of organizations in professional or quasi-professional roles. This book speaks to the characteristics, behaviors, proclivities and desires of that group.

Fundamentally, Millennials want to do interesting work with people they enjoy, for which they are well paid, and still have enough time to live their lives as well as work. Everything you need to know about working with and managing Millennials follows from there.

You can provide an environment where Millennials can be both happy and effective without ruining your organization, if you focus on what actually is important to them.

Entitled *and* Hardworking

Most people have heard the complaint that Millennials act entitled. Many of the complaints about Millennials' sense of entitlement are focused in three areas:

- They want a life outside of work.
- They think they can say whatever they like.
- They don't want to do repetitive work.

Millennials Want a Life Outside of Work

A common reason Millennials are called entitled is because they want to have a fulfilling life in addition to work, and they want it now rather than some time in the future. More than half of Millennials say that their work

often interferes with their personal lives in a way that makes it difficult to fulfill their personal responsibilities.

Part of the reason Millennials are so concerned about having enough time for their lives away from work is that they feel like they're never off the clock. The prevalence of smartphones and other devices means that employees can be contacted about work at any time — and often are. Millennials usually don't mind work interrupting their personal time, but if work is going to continue after hours, they expect to have enough time away from work demands so they don't have to postpone enjoying their lives now.

Millennials Think They Can Say What They Want

There has been a cultural change in the past 30 years in how acceptable it is for people lower in the hierarchy to express opinions directly to people higher up, and that includes younger people expressing their opinions to older people. Society in general is less formal today than it was a generation ago. People are much less likely to use formal titles when addressing each other. Within organizations there is a more open communication environment, fostered by encouraging lower-level employees to speak up, make contributions and point out problems to improve the business, regardless of their age or tenure with the organization.

Millennials reflect this cultural shift, with a strong majority believing employees should be able to disagree with their supervisor, even about something as sensitive as a performance appraisal. Millennials also believe that they should be able to be critical of their supervisor. Employees are more engaged with work when they are encouraged to contribute their ideas. These contributions are more useful when managers help employees learn how, where and when to speak up.

Millennials Don't Like Repetitive Work

While the majority of Millennials didn't say that their job was too routine, 20 to 25 percent of Millennials do believe that their jobs are too routine and don't have enough variety.

But the data show this is not simply a characteristic of Millennials. Nearly as many older staff believe that their job is routine (18 percent) or doesn't have enough variety (15 percent).

If being born Millennials does not cause people to think that their jobs are boring, what is the root cause? Data suggest that level within the organization is the root cause. The higher you are in the organization, the less routine and lacking in variety your work is, regardless of your generation. Since Millennials are younger, they are more likely to be in lower-level jobs in the organization. The fact that Millennials in higher-level jobs are less likely than those in lower-levels jobs to say that their work is repetitive is additional evidence for the point: thinking work is boring is not just a characteristic of Millennials; it is a characteristic of the work itself.

Entitled Doesn't Mean Lazy

Millennials may hold some expectations that cause people to accuse them of being entitled, but that doesn't mean they are lazy. In fact, Millennials as a group work very hard, are quite motivated and really want to contribute to their organizations. A study by Universum found that 39 percent wanted to learn new things on a daily basis, and 45 percent said they would spend time to learn new things if given the opportunity to prioritize.

Millennials work long hours: 56 percent work more than 9 hours a day, and 33 percent work more than 10 hours a day (the same is true for those older than Millennials).

More than half of Millennials said they were motivated to do their job because it would help them fulfill their career plans or because they enjoyed it. In addition, rather than perceiving themselves as being hired just to do a job, Millennials want to contribute to the organization as much as possible, even beyond the specific requirements of the job. They feel they should be speaking up and sharing their ideas, not only because it benefits them but also because it benefits the organization.

Needy *and* Independent

Many supervisors say that Millennials are needy because they want to know how they're doing all the time. They want to be provided with very specific criteria for success. They want a map to tell them precisely how to get from here to there (with here being their current state and there being nirvana, both personally and professionally), and when they don't get it, they are needy and clingy, wanting constant reassurance. At the same time, they are incredibly independent. They want coaching on how to achieve their goals, but they don't want to be told what to do (which is how they often perceive advice). Many of the complaints about Millennials being needy are focused in three areas:

- They want their parents involved.
- They want constant mentoring and assistance.
- They want frequent feedback.

Do Millennials Want Their Parents Involved?

Parental involvement in one form or another is relatively common. Universum's global survey found that a quarter of Millennials surveyed said that they involved their parents in their career decisions, and a 2007 Michigan State University study found that about a third of large companies had witnessed parents being involved in their children's work lives.

The issue is really about the *level* of involvement. From what was found and heard during interviews, Millennials want their parents' help but don't want them closely involved. While there are many stories about parents helping Millennials find their first job, 90 percent of Millennials do not think parents should be involved in their child's job interviews, and 85 percent of Millennials do not think an organization should send parents a copy of their child's offer letter.

It is a good idea for organizations to provide information that anyone (including parents) can use to understand the organization. But it is not necessary — or even desired by most Millennials — for an organization to include parents in the hiring process and other aspects of the employment relationship.

While Millennials don't want their parents to take an active (interfering) role in their work lives, they do want support. Millennials perceive mentors as a support in their careers. They believe that a mentor will help them better negotiate the organization, plan their career, and open doors for them. Ninety-one percent of Millennials say they either have or want a mentor (the remaining 9 percent say they don't like their current mentor or don't want one). Millennials will be more engaged if they feel that they are getting enough mentoring in general, and enough support from their manager in particular.

Millennials Want Frequent Feedback

Millennials want to know how they are doing on a regular basis. This desire is following the tradition of Baby Boomers and Gen Xers, who challenged their bosses and organizations to provide more and better feedback for employees. It is consistent with Millennials' experience because many of them have grown up in a world where they received frequent feedback about how they were doing. While 54 percent of Millennials would like developmental feedback monthly or more frequently (daily or weekly), only 23 percent say they get feedback that frequently.

Managers should work on making sure that employees receive feedback at least every other week about the work they are doing. The door should be left open for employees to ask for feedback about their work if they are wondering how something went. The feedback doesn't need to be extensive; often an acknowledgement of the work is enough.

Needy Does Not Mean Dependent

While Millennials want support, feedback, mentoring and appreciation, that doesn't make them dependent. They actually are being quite strategic. They think about what they need to be successful, and that's what they ask for.

Millennials believe that they have no choice but to be independent actors in their careers. Baby Boomers grew up watching their parents (the World War II generation) in a work world characterized by long organizational tenure, secure pension plans and organizational loyalty (employees staying with one organization for a long time were rewarded with steady, if slow, promotion). Millennials grew up in a different world altogether. They saw their parents (many of whom are Baby Boomers) deal with long hours, cutthroat competition, layoffs, wage stagnation and insecure retirement plans. They saw dependence on an organization as an invitation to be taken advantage of, rather than something that is rewarded. As a consequence, they are independent: They want control over their work, don't trust or defer to authority much and want their work to be flexible.

Do Good *and* Do Well

Millennials believe that their work should make a contribution to the world, not just make them money. Ninety-two percent say that making the world a better place is at least somewhat important to them. Eighty-eight percent of Millennials think that getting involved in community and charity efforts is at least somewhat important.

These percentages show that Millennials want to help; the question is why. A study published by the organization Achieve in 2013 found that Millennials gave a number of reasons they chose to volunteer. When asked, 79 percent of Millennials said it was because they were passionate about the issue, 56 percent said it was because they wanted to meet new people who were interested in the same issue, and 61 percent said it was to broaden their professional skills. So even when doing good, Millennials are thinking about how it fits in with their career strategy and how they as individuals can benefit from the volunteering.

Millennials don't want to help only as individuals; they think organizations should want to help their communities

as well, and 97 percent believe it is important to work for an employer that shares their values. The good news is that the majority of Millennials believe that their organizations are socially responsible. In a 2014 study, Achieve reported that 92 percent felt they were working for "a company that was having a positive effect on the world."

Doing Good Isn't a Higher Priority Than Doing Well

Yes, Millennials think doing good is important. However, it isn't their only — or even highest — priority. Ninety-two percent of Millennials believe their company has a positive effect on the world. On the other hand, only 34 percent say that they stay because of their company's mission. What that tells us is that doing good is important, but by itself it isn't a distinguishing enough factor for Millennials. Forty-three percent say compensation is extremely important, and 38 percent say it is very important.

This is definitely a "both/and" situation — Millennials want work that both enables them to contribute to society in positive ways and rewards them appropriately. One is not a substitute for the other. After all, most Millennials believe that their organizations are contributing, and they can move to other organizations that both make a contribution to the community and pay better. Therefore, emphasizing the organization's contributions to the community while being cheap on compensation isn't an effective strategy for attracting and retaining Millennials.

The primary reason Millennials are so focused on compensation is they have bills to pay. Debt is a significant concern. In 2013, 69 percent of Millennials graduating from university had student loans. For many Millennials in the United States, payments on student loans are their single largest monthly expense, so a primary concern for them is whether their compensation is high enough to live on after they have made their loan payments every month.

High Tech *and* High Touch

Millennials love their tech toys. They want the latest hardware and software. They have grown up with technology, starting at an earlier age than any previous generation. According to a 2010 report by the Pew Research Center, half of Millennials believe that new technology allows people to use their time more efficiently.

In some cases, what Millennials don't realize is that their tech "solution" is actually shifting the workload to others. So the high-tech solution that causes them less work because they already know how to use the system causes more work for those who don't know the system or have to implement it. Managers need to explain the problem to Millennials if their preferred solution simply shifts the uninteresting work to other employees. Organizations and all employees will benefit if solutions can be found that reduce unnecessary drudgery.

Millennials Maintain Friendships Through Cyberspace

Perhaps one of the most hyperbolic stereotypes about the Millennial generation is that they are so connected to the Internet and social networking that they do almost all of their socializing that way. That of course is not true — most see their friends as well as texting, emailing and IMing them, rather than only interacting with them virtually.

But a 2010 study by the Pew Research Center reported that a majority of Millennials in the United States believe that new technology helps people stay closer to their friends and family. With the increase in global mobility, people are increasingly likely to live far away from their friends and family. Facebook, email, instant messaging, Instagram and Skype help them keep up with friends who are far away. Millennials say they are more likely to use phone, email and text messaging for connecting with friends they don't see very often.

Millennials report maintaining some social relationships almost exclusively through cyberspace. Twenty-nine percent say that they have friends they have met through the Web whom they haven't met in person, while 42 percent of Millennials say that they have friends they interact with only in cyberspace. This capacity will be an advantage to them in the long term, as organizations continue to become more dispersed. Organizations can leverage Millennials' ability to manage and maintain relationships through cyberspace by engaging in practices such as assigning them to work on geographically dispersed teams.

Millennials Are High Touch

One of the complaints often heard about Millennials is that they don't understand the importance of nonverbal communication in effectively understanding and communicating with others.

Data suggest that Millennials actually prefer face-to-face communication to other forms. In interviews, Millennials were clearly aware that they can have greater influence and improve the perception of themselves more through face-to-face interaction than through technology-mediated communication. When they think about how to communicate with others, they are balancing importance

and expediency. If face-to-face communication will take substantially more effort than electronic, Millennials are likely to make a calculation about whether the importance of the communication merits the additional effort.

While technology is important, the human aspect of work is even more important. If Millennials don't feel emotionally connected to their workplace either through friends or team members or their boss, they are a flight risk. At work, they want friends, teams they feel friendly with, a boss who cares about them and an organization of which they feel part. Ninety-eight percent of Millennials say that developing close ties with co-workers is important to them. In fact, having friends and close co-workers at work is so important that it is strongly related to how committed a Millennial feels to the organization. Organizations benefit when they provide environments for Millennials that allow them to work with others on teams so they can develop the community at work that they need.

Committed *and* Leaving

Millennials are quite committed to their organizations. More than half say they are emotionally attached to the organization, about two-thirds say they enjoy discussing their organization with people outside it, and about two-thirds don't intend to leave. They clearly like the idea of a long, stable career.

One common complaint about Millennials is that they aren't driven, that they don't want to move to the top and run organizations. Research doesn't support that conclusion. A Pew study done in 2013 showed that 70 percent of Millennial men and 61 percent of Millennial women would like to be a top manager someday.

Committed Does Not Mean Stay No Matter What

Millennials may be committed to their organizations, but about a third say they are looking for other opportunities. Feeling overloaded is common among Millennials: 42 percent believe they can't get everything done on their job, and 49 percent believe that because of the workload, they cannot possibly do all their work well. Millennials are also very likely to say that they are looking to leave their organization if they believe (1) that there is a politically powerful group within their organization that no one ever crosses; (2) that it is easier to remain quiet than to fight the system; or (3) that pay and promotion are primarily based on organizational politics.

A majority of Millennials also think compensation is important and are dissatisfied with theirs. They think their pay and benefits are not fair recompense for the skills and effort they put into their work. Further, they believe they are underpaid in comparison with their peers within their own organization and in comparison with those at other organizations at the same job level.

Millennials will look for a new job that raises some aspect of their life to a higher level. They often look to improve their compensation, work-life balance, promotion and development opportunities or to find a sense of belonging to a community. Organizations that see retaining talent as a strategic advantage need to be aware of this desire to "level up" and provide options for employees that have this need.

What Millennials Want and How to Give It to Them

Millennials are remarkably similar around the world. They like their jobs and their organizations, and they largely want the same things: an interesting, high-paying, stable job and working with people they like, trust and feel appreciated by, in organizations that are socially responsible and value them enough to provide flexibility and opportunities for growth and promotion.

Many organizations have three primary goals for their talent management strategies for Millennials: attraction, engagement and retention. The three dimensions that help you achieve these objectives are

- The people (friends and mentors, team and boss);
- The work (interesting, meaningful and balanced);
- Opportunities (feedback and communication, development and pay).

The People: Friends, Mentors, Team, and Bosses

Friends. Organizations need to structure the workplace environment so Millennials can develop friendships with co-workers and have positive relationships with mentors, team members and their bosses. Create the conditions for friendships to flourish. Sports teams, interest groups and clubs are ways people with similar interests can get to know each other and perhaps become friends. Support community building at work.

Mentors. Set up formal mentoring programs, but encourage people to take on mentees outside of formal

programs. Educate managers on promoting diversity and taking on mentees who are different from themselves.

Team. The team Millennials work with is incredibly important to them. They are the ones who, more than any others, can make or break Millennials' ability to get their jobs done right. Many effective teams are self-led. This does not mean zero supervision from outside the team. But it does mean that the leaders the team members report to need to create the conditions for the team to succeed, step in to help realign it as necessary, and get out of the way so the team can solve problems and resolve conflicts on its own as much as possible. Provide the resources the team needs to succeed, and hold everyone on the team both individually and jointly accountable for results.

Bosses. It is commonly said that people don't leave bad organizations, they leave bad bosses. This is just as true for today's Millennials as it is for Gen Xers and Baby Boomers. Don't just talk — listen, observe, and make sure Millennials know they are appreciated; trust and be trustworthy; set goals and hold Millennials accountable; provide mentoring and support; and be authentic.

The Work: Interesting, Meaningful, and Balanced

Interesting. There is no real substitute for interesting work. If the work is interesting, it doesn't require a lot of convincing or clever framing by management to make it palatable. Make sure Millennials are clear on the business reasons for the tasks they are given that they find boring, and show how what they do contributes to the organization's objectives. Outsourcing is an option to consider when Millennials complain about having too many routine and monotonous work tasks.

Encourage Millennials to provide ideas to improve work processes. Provide opportunities for Millennials to engage with the outside world (customers and stakeholders) through assignments in other locations (including overseas, if possible), task forces that enable them to interact with the community, jobs that expose them to different segments of your customer base and so on.

Meaningful. Broadly speaking, Millennials want to engage in doing work *they* feel is meaningful with organizations *they* believe are good corporate citizens. What precisely that means varies from one Millennial to another, but you can still implement strategies to meet their needs and create win-wins for both them and your organization. For example, connect the work the Millennials are doing to positive social outcomes. Offer company-sponsored volunteering. Do a better job of explaining your organization's contributions relative to others in the same industry.

Balanced. If you pile so much work on Millennials' backs that they feel they have no time to live their lives, they'll do their best to get out from under the weight — just like the rest of your employees. Don't require face time for its own sake. Set up the systems so working off site is productive. Allow for flexible careers, and smooth out spikes in the workload.

Opportunities: Feedback and Communication, Development, and Pay

Organizations that want to attract and retain Millennials need to make sure to provide them with enough feedback, development and compensation for them to feel they are continuing to progress even as they stay with the same organization.

Feedback and communication. Millennials want to know what they need to do to be successful. At the same time, Millennials don't want to be micromanaged (who does?). So remember to approach them with guidance and coaching, not command-and-control dictates. Provide feedback as a normal part of the workflow, not as an annual event. Two-way communication is important. Help Millennials learn how to speak their truth, constructively. Have important career-related conversations with Millennials in person, and help Millennials learn to have conversations others consider to be important in person.

Career development. Provide Millennials with good development opportunities, or be prepared for them to go elsewhere to find them. Help Millennials realize that they'll learn the most on the job. Have a plan for developing them, and make it clear that development is about growing in position as much as it is about moving on to the next promotion. Also, don't ignore the B players.

Pay. The question is not whether Millennials will find information about their pay from nontraditional sources; it's what the sources of that information will be and how accurate they are. The more transparent you can be about your organization's pay practices, the better.

Understand that compensation first and foremost pays the bills and is also a measure of value and self-worth. You can underpay people you don't work very hard, and you can overwork people you pay really well. But you can't underpay *and* overwork employees for very long before they'll decide to go somewhere else.

Seize control of the conversation about pay back from the Internet. Pay transparency is increased by what's available online, but the quality of the information can be very

poor. Also, for Millennials, compensation isn't just how much shows up in their pay packets every two or four weeks. It is also about their development, how appreciated they are made to feel through nonmonetary means, how much they are expected to work, how much flexibility they have, whether they see taking less now as paying back over time, and so on.

Looking to the Future

Current research and the past experiences of other generations suggest what organizations should be thinking about and planning for with regard to Millennials in the future:

Starting a career during a recession depresses total career earnings. A large part of the Millennial generation has come of age during an era encompassing two very different economic environments: the moderate growth of the early 2000s followed by the Great Recession of 2007, the effects of which will take many years to play out. The research on the long-term impact of starting work during an economic downturn indicates that people who enter the labor market during economic hard times make less than those who start during an economic boom for at least a decade, if not longer. In a difficult economy, there are fewer good jobs to choose from. The jobs that people are able to find when they enter the workforce don't pay as well or offer the same breadth of developmental opportunities as the jobs available in a growing economy. Therefore they start at lower pay in a less optimal job, and that starting point can affect the rest of their career.

Millennials will live longer and be less economically secure in retirement. Today in the United States, life expectancy for both men and women has increased, to age 84.3 for men and age 86.6 for women. The question currently being debated is how to pay for retirement, as there are concerns about whether the current programs are sustainable in the long run and at what level.

For most Millennials, there is not going to be a pot of gold at the end of the career rainbow. While global poverty has been reduced over the past four decades, the United States, the United Kingdom and many other industrialized societies have had increases in within-group inequality. This means that among groups of people who have similar education or who work in the same field or occupation, the differences between the winners and (relative) losers grew larger. The wages of college-educated workers also have been affected by the proliferation of the Internet and high-speed communications, which allow knowledge work that used to stay within national borders to be shopped around the world to the lowest bidder.

The high cost of education reduces choices. In the United States, the cost of college continues to increase faster than inflation. As a consequence, Millennials are facing rising education costs and student debt in a labor market where they cannot be assured that choosing a historically lucrative occupation will provide them with the financial outcomes they could have anticipated in the past. This will increase strain on Millennials as they set up their households and move on to their midcareer jobs.

Millennials form families later, which impacts the timing of their career flexibility. In the United States, Millennials are getting married later, buying homes later and having children later. This results in increased flexibility in their early career years — flexibility to take more risks, work more hours, change jobs when they don't like them, take advantage of opportunities overseas, and so on. However, Millennials' increased flexibility early in their careers will be balanced by less flexibility later on. Organizations that want to keep the best and brightest Millennials must be prepared to be flexible in their career demands.

Greater connectivity in their personal lives may make employees more mobile for work. With technology more prevalent and able to help people keep in touch, it is easier to move to other cities, countries or continents and still keep up with friends and family. Millennials are particularly good at staying in touch with loved ones, even if they don't get to see them in person. This skill gives Millennials the flexibility to be highly mobile. The good news for organizations is that this fits well with a world where work is done ever more by people in far-flung locations who work together virtually.

Remember, the more solutions you can find that work for both employees of all generations and for the organization, the better off everyone will be . . . including you!

Winning Well

A Manager's Guide to Getting Results — Without Losing Your Soul

by Karin Hurt
and David Dye

THE SUMMARY IN BRIEF

It can feel like a rigged game. Executives set aggressive goals, so managers drive their teams to burnout trying to deliver. Or, employees seek connection and support, so managers focus on relationships . . . and fail to make the numbers. The fallout is stress, frustration and disengagement, and not just among team members — two-thirds of managers report being disengaged.

To succeed, managers cannot choose between results and relationships. They need both: They must get people to achieve while creating an environment that makes them truly want to.

Winning Well offers managers a quick, practical action plan. They will learn how to stamp out the corrosive win-at-all-costs mentality; focus on the game, not just the score; reinforce behaviors that produce results; sustain energy and momentum; correct poor performance without drama; build productive relationships; and be the leader people want to work for.

Today's hypercompetitive economy has created tense, overextended workplaces. Keep it productive, rewarding and even fun with this one-stop success kit.

IN THIS SUMMARY, YOU WILL LEARN:

- Why Winning Well doesn't mean perfection.
- Why you should emphasize behaviors, not the metrics scorecard.
- The four principles of managers who win well.
- How to lead meetings and make decisions that inspire your team.
- To help your team solve problems, double productivity and own their results.

The World of Winning Well

The hypercompetitive postrecession global economy puts frontline and middle-level managers in a difficult position — expected to win, to "move the needle," to get the highest ratings, rankings and results. Many managers become hell-bent on winning no matter what it takes, and they treat people like objects — in short, they lose their soul.

This exacts a high price from managers as they work longer hours to try to keep up. Those unwilling to make this trade-off either leave for a less competitive environment or try to stave off the performance demands by "being nice" to their team. After years of trying to win while sandwiched between the employees who do the heavy lifting and leaders above them piling on more, they give up and try to get along. Inevitably, after prolonged stress and declining performance, they surrender to apathy, disengage or get fired.

Winning doesn't mean you reach some imaginary state of perfection. Winning means that you and your people succeed at doing what you're there to do. The real competition isn't the department across the building or the organization across town. Your competition is mediocrity.

Winning Well means that you sustain excellent performance over time, because you refuse to succumb to harsh, stress-inducing shortcuts that temporarily scare people into "performing." You need energized, motivated people all working together. Your strategy is only as strong as the ability of your people to execute at the front line, and if they're too scared or tired to think, they won't. You can have all the great plans, six-sigma quality programs and brilliant competitive positioning in the universe, but if the human beings doing the real work lack the competence, confidence and creativity to pull it off, you're finished.

In fact, in today's connected world, people increasingly expect a positive work environment. When you don't provide it, they can easily go across the street to your competitor or go into business for themselves as freelancers or independent contractors. Now everyone else but you benefits from the time and training you invested.

Winning Well doesn't mean you'll be a pushover. It means you'll be a manager known for getting results, whom people respect and whom people want to work with. You can win — and you can win without losing your soul.

How to Win Well in Every Situation

Managers who sustain results over time operate from four principles. Internally, they value confidence and humility. Externally, they build on this strong internal foundation with a combined focus on relationships and results. Let's start with confidence, because yours will inspire others' and make the other three principles easier to enact.

Confidence. Know your strengths, own them and use them. You don't need to manage exactly like anyone else, but you do need to be confident in who you are and what you bring to the table. If you don't believe in yourself, your employees won't either. Stand up for what matters, and speak the truth.

Humility. As an internal management value, humility means that you have an accurate self-image. You know your strengths and you know your challenges. You recognize your internal worth and you also recognize and respect the dignity and worth of every human being. Have an accurate self-image, admit mistakes and invite challengers.

Results. There are three keys to staying focused on results: clarify, plan and do. Your people need to

understand why your group exists, what results you are accountable to produce, the impact of your work and what success looks like. With the purpose and results clear to everyone, managers who win well work hard to create tight plans that will make these results happen. And without intentional action there are no results.

Relationships. Winning means you achieve results, but those results don't become sustainable until you add the second external focus of relationships. This includes three key activities: connect, invest and collaborate. You treat everyone with respect and dignity, not as a number, object or problem. You build trust with, and between, your people; you listen to their values, needs and insights; and you encourage their success. You recognize and value that each of your employees has unique strengths and perspectives. You draw out the strengths, talents and skills from people while helping them minimize their liabilities. Collaboration is more than simply working together. It's an attitude that communicates you are in it with your people, not apart from them.

Master the Metrics Maze

Your customer doesn't care what you received on your internal scorecard. No employee can concentrate on 27 metrics at a time. Managers who win well pick a few meaningful measurements that encourage the right behaviors and make it tough to manipulate the stats just to get a short-term lift with no real improvement. They understand that the score is not the game.

There are four ways you can use data effectively:

1. **Know what matters.** Your scores don't really matter. They are there to help you and your supervisors make decisions, but the scores … don't … matter. What is truly significant? There is one surefire way to find out. Ask, What does your customer or client care about? The results — what you do for your customers or clients — that's what matters.
2. **Know the key behaviors that produce real results.** Whatever your business, there are always key behaviors that drive your meaningful results. Do you know yours? This is a critical step; you can't win, much less win well, if you don't know what drives your success.
3. **Emphasize key behaviors (not the score).** Consistently emphasize the key behaviors. "This is how we succeed: We do A, B and C." All your communication — in team meetings, in one-on-ones, in email — everything must emphasize these core practices. When you do discuss metrics, put them in terms of the key behaviors. For example, "When we do A, B and C every day, we will be in the top 10 percent of the stack rank. We will get the revenue we need to serve our clients. We will maintain 80-percent-plus repeat visits."
4. **Check the score at appropriate intervals.** How often should you check your metrics? The answer is: as often as necessary to keep you on track and no more than that.

Winning — Achieve Results, Get Things Done and Move to the Top

There are specific techniques to increase your team's focus on what matters most, to recover from distractions and to hold your team accountable.

To keep your people focused on results, start with your own mindset. Managers who win well understand that people will be distracted. You can help reduce distractions and build a foundation for consistent results and healthy relationships by following these four steps.

Step 1: Set clear expectations. Roughly 90 percent of the problems managers have with poor performance result from deficiencies with this first step. No matter how clear your expectations are to you, it's likely they're not as clear to your people. When you finish a discussion or share instructions, don't leave the conversation until you check for understanding. Here are several questions you can use: "Before we go, Joe, will you share what you understand the expectations to be?" " Joe, can you tell me what you heard?" "Let's review what we're doing next."

Step 2: Train and equip people to meet the expectations. After unclear expectations, the next pitfall is to assume that everyone has the knowledge or skills to meet those expectations. Ensure that your team members are set up for success. Be sure to train and equip people to meet expectations.

Step 3: Reinforce expectations. Your mind receives 11 million bits of information every second you are awake. With that much information coming at your people, it can't hurt to say things twice. Your major strategic themes, objectives and key priorities warrant repetition at least once every 28 days.

Step 4: Close the loop with celebration and accountability. You can easily demotivate your team when you fail to celebrate success or practice accountability. Think of celebration and accountability as the final part of the expectation circle, the feedback that closes

the loop and makes it likely your team will stay focused on what matters most. Celebration can be as simple as gathering your people and privately acknowledging that they did it.

Lead Meetings That Get Results and That People Want to Attend

Horrible meetings are a cliché of the business world, and with good reason. Many meetings are a waste of time and don't accomplish anything. The minutes creep along while the meeting leader fritters away everyone's time, people have meaningless conversations that don't solve problems, and everyone is frustrated that they could be doing something more productive with their time. When you don't run meetings well, not only do your results suffer, so does your credibility.

Think about meetings as commitment creators. In other words, the outcome for every decision-making or problem-solving meeting you ever have is to create commitment. You get the right people together to discuss the problem, you make a decision and people commit to do something. The product of a good meeting is a commitment to activity. You build this commitment with three questions:

Commitment 1: Who will do what? Until someone actually does something, nothing has changed from before you made the decision. Until then, it is just a nice idea. There are actually two questions here: What is to be done? Who will do it?

Commitment 2: By when? This one is straightforward. What is the finish line for the tasks people have agreed to complete? When these deadlines are shared and publicly available, everyone is more likely to meet them.

Commitment 3: How will we know? "How will we know?" is the magic question that moves your meeting from good intentions to real-world impact. It closes the loop from intention to action and creates momentum without you having to spend hours every day tracking down action steps.

Here's how it works: When someone completes a task, what does he do next? Does he need to pass the results to another person or group? Should he update the team? Should he make a presentation of his findings? The specific answers depend on the task and project. What matters is that the accountability and next step are baked into the decision. Everyone knows what they are accountable to do, the team knows if it's been completed and no one is left waiting around for information. Combine these commitments into one sentence — Who does what, by when, and how will we know? — and you have the Winning Well Meeting Formula to get clarity, accountability and results in just five minutes at the end of every meeting.

How to Make Business Decisions Your People Get Behind

Winning Well managers are clear on how the decision will be made and who is involved, erring on the side of inclusion whenever possible. The truth is that most people will work with a decision when they are clear about what is required, why the decision was made and if they had input into the decision. It doesn't mean they have to love it. They're adults and don't expect that every single decision will go their way. They do want to know that their information, values and perspective were taken into consideration.

One of the most common types of meetings you hold is the meeting to make a decision. If you want your team to win, you've got to build their decision-making expertise. There are just two critical pieces of information you need to introduce at the start of your discussion: 1. What kind of decision is this? 2. Who owns the decision?

The first step to making decisions that everyone gets behind is to make just one decision at a time and limit discussion to that single decision. The good news here is that there are only two types of business decisions to make. The first type is a decision about goals: Where are we going? The question can take many forms, but it's always about your group's goal, destination or outcome. Other ways to ask this question are, "What is the outcome we need to achieve?" or, "What does success look like?" You can't talk about how you're going to do those things until you've first clearly decided what success looks like. Know where you are going before you discuss how to get there.

The second type of decision is, How will we get there? This is a discussion about methods. Separate discussions about where you are going from how you will get there.

The second decision-making mistake managers commit: lack of clarity around decision ownership. When you are clear about who owns the decision and how it will be made, people will readily contribute and are far more likely to own the outcome. This isn't difficult, because there are only four ways to make a decision:

- A single person makes the decision.
- A group makes the decision through a vote.
- A team makes the decision through consensus.
- Fate decides.

Before discussion begins, state how the decision will be made. You get yourself in trouble if you suggest a vote and then change back to "I'll decide" when you think the vote won't go your way.

How to Hold Your People Accountable Without Losing Your Soul

The definition of accountability is not beating someone up for poor performance, but keeping your mutual commitments to one another. This goes both ways: Managers who win well encourage their employees to hold them accountable for their commitments. A Winning Well accountability mindset brings results and relationships into laser-like focus.

Winning Well managers approach accountability conversations with a clear plan that will build relationships and achieve results. Your overall goals in these conversations are to 1. Draw attention to the performance issues. 2. Have a mutual discussion. 3. Confirm commitment to new behavior. Use the INSPIRE method to achieve these goals with a short, to-the-point, specific conversation about what must change.

I — Initiate. Initiate the conversation in a respectful manner. Feedback is best received when you've been welcomed to provide it. Sometimes, though, the conversation isn't optional. You may need to be more direct. Initiate accountability conversations as close to the moment of concern as possible. Don't wait three days to address something that happened this morning. Take care of it at the first opportunity.

N — Notice. Share your concern or observation. "I've noticed there are paint drips on the floor when you leave a job." "In listening to your calls, I've noticed you don't connect with the customer." "I noticed that you arrived late this morning."

S — Specific Support. Provide specific, supporting evidence you can see. "When the customer told you he was calling to disconnect his line because his spouse had died, you didn't express any empathy. You said you would be happy to disconnect the line." "The meeting was scheduled for 9:00, and you arrived at 9:30."

P — Probe. After you present the situation, the employee needs a chance to talk. Ask a question in a neutral, curious tone to allow her to share any relevant information. Generally, "What happened?" is adequate and allows the person to share information or to own the situation. "What happened on that call?" "What happened that you were late?"

I — Invite. Once he's had a chance to share his thoughts, invite him to solve the problem. Start with a review of the expectations, then ask for his thoughts on how to resolve the issue. Usually, this will be straightforward. If he can't come up with an effective solution, you can provide specific suggestions on how the employee could improve. Sometimes you may discover that the employee needs more training.

R — Review. Ask one or two open-ended questions to check for understanding and one closed-ended question to secure commitment. "What concerns do you have about this approach?" "Is this your commitment going forward?" Ask the employee to review her specific commitment: "Would you please recap what you will do next time?"

E — Enforce. Enforce the behavior and why it's important while reinforcing your confidence that the employee can do this.

Get More Done in Less Time

When you care about winning, it's easy to feel overwhelmed. There's always more that you feel you should do, and there never seems to be time to get to all the tasks that matter. Winning Well managers recognize they can't do it all and have a system to identify what matters most and know what to let go.

First, you must acknowledge that you cannot do everything. This is called the Winning Well approach to time: "infinite need, finite me." At any moment in time there are literally thousands of things you could be doing, but you get to do only one. That's it. One. Before you can focus your time and energy for results, you have to reach an understanding with yourself that you can do only one thing at any given moment.

Once you've made peace with the reality of infinite need, finite me, it's time to get crystal clear about WMM: what matters most. In your work, what are the two or three most important organizational values, and what are the most important outcomes that move your relationships and results forward?

Now you're ready to organize your day around your MIT— the most important thing. Your MIT is the single most important task you can do that day. At the start of each day, look over your projects, tasks and to-dos and select the one item that is the MIT for that day. Hint: It should align with your WMM values and activities.

Do your MIT first. You will be distracted. Real issues will come up, you'll face a change of direction, your boss will need something — life happens. Be clear about your MIT and do it first — before email, before voice mail, before checking in with your boss or your team. Whether it takes 30, 60 or 90 minutes, you'll be done and ready to deal with everything else.

Focus your time and energy with the Rule of One. When you work on your MIT, turn off your phone, your email, your Facebook and Twitter notifications (unless like

in some social media companies, your MIT really is to check Twitter), and focus on that MIT.

Winning Well — Motivate, Inspire and Energize Your Team

You can't motivate your employees. By definition, motivation comes from inside a person. It's not something you can provide externally. If you could, the Gallup Polls wouldn't consistently be showing that 68 to 70 percent of American workers are disengaged (with similar statistics around the world).

That's why most employee-engagement programs don't work. You can, however, cultivate motivation by uncovering it, tapping into it and inspiring lasting change. But you can't just dive into a discussion like that. It begins when you create the space to know your employees for who they truly are.

As a manager, your values and your vision are also important. You shouldn't set them aside. However, if you want people to walk with you, you must first walk with them. Discover what's important to them.

- Why are they a part of the organization?
- What do they value?
- What do they dream of for their future?

Hold deeper developmental discussions, let your employees outgrow their past and give your employees new challenges. When you walk beside them and support them in that purpose, those values and their dreams, while also sharing your own, then, and only then, you will see true motivation. Walk with them and they'll walk with you.

Build a Loyal Team of Problem Solvers

Do you ever wish your people took more responsibility for problems, came up with ideas on their own and solved problems without always involving you? When people don't solve problems, there's a good chance the management culture is part of the problem.

To build a culture that nurtures innovation and problem solving, practice these steps:

1. **Make it safe to try.** When someone brings you an idea that you've tried before, don't send him away with a terse, "We tried that. It didn't work." Try this invitation instead: "Thanks for thinking about this with us. We tried a similar idea last year and we found an issue with …. Would you be willing to think about that issue and see if you come up with any ways to make this idea work? I'd love to hear them."
2. **Start small.** The technology sector is well known for its minimum viable product practice. What is the smallest way you can test an idea and learn how to improve it? Get moving, get feedback and get better.
3. **Reward behavior, not just success.** This is important. When you ask people to solve problems, you are actually asking them to take a risk. Their solution might not work. How do you respond? Are you grateful they tried, or do you get upset at the failed effort? To build a culture that nurtures innovation and problem solving, reward effort.

Inspire Your Team to Double Productivity

Communicating the big picture is a skill that's often lost in management-development programs. After all, big-picture thinking is for execs, right? No. Everyone needs to know how the pieces fit together, where they fit in and why their work makes a difference.

Winning Well does not require you to be a cheerleader in business clothes, full of rah-rah with a fake smile. That's not what inspiration looks like for anyone paying attention. Inspiration comes from connecting people to meaning, purpose and their own ability to succeed.

Try these three steps to improve your ability to connect people to the bigger picture:

Magnify the meaning — Talk to your team about the impact their work has on the greater good: the customer, the world and others they serve. Engage in dialogue and ask them to identify what makes them most proud about the work they do.

Clarify priorities — It's vital that the work you ask people to perform doesn't feel like a random list of unrelated tasks. Bundle the work into meaningful chunks that link back to the bigger picture.

Simplify the message — If you can't explain your team's mission in one sentence, you don't fully understand it. If you're really struggling, ask a few strong team members to give it a shot. Everyone on your team should be able to describe your team's mission in a similar way.

Energize Your Team and Ensure That They Own the Results

Breakthrough results require every heart and brain working together to achieve results. Change requires confidence and inclusion, not selling. When you can take

your audacious vision and make it feel real, practical and achievable, your team will sail along with you.

Establish a clear vision. Be crystal clear about what you want to accomplish. Communicate and reinforce your vision through every medium possible. When you're sure everyone's got it, communicate even more. It's important to explain the reasons behind a change as well as to identify the specific behaviors you need from employees in each role.

Be honest about the benefits. The notion that all that employees care about is WIIFM — what's in it for me? — is BS. Sure, employees want to know what's in it for them. They equally want to know what's in it for you and for their customers.

Start small. Don't advocate for an idea or change that's half-baked or full of flaws. Test it first with a small group, take their feedback seriously and get it right. Even if it looks great on paper, your boss is sold and it worked well in the IT war room, field test the change first. Go slow to go fast.

Establish easy-to-access listening posts. This is perhaps the most important part. Really listen to what your people tell you. Most important, respond to feedback with solutions, not selling.

Leverage reluctant testimony. Share as many testimonials as you can, especially from people who were doubtful at first. Get your most excited employees showing how your new idea, system or process changed their world.

Involve the team in key decisions. No one wants stuff done to them or even for them. *With* them goes a lot further. Ask employees, "What's working well, and how do we leverage it? What enhancements do we need? Where should we head next?" All these questions go a long way. Include employees by involving them in your change efforts.

Sustain Your Team's Energy and Momentum

Human beings need encouragement. It's a fact of life. You get more of what you encourage or celebrate and less of what you criticize or ignore. If you want a team that doesn't need to be encouraged, get a cat. Otherwise, if you're working with people, they need encouragement.

Remember, Winning Well management is a relationship, and the quality of your relationships depends on what you invest in them. As with most of the Winning Well practices, once is never enough.

In order to provide healthy encouragement that fuels performance, focus on three traits. Make sure the encouragement is relevant, specific and meaningful.

Relevant. The first key to make encouragement work for you and your team — to be the real fuel of Winning Well — is to ensure that your encouragement is relevant to the work. Encourage what you want. What are the specific things people do that contribute to healthy relationships and meaningful results? Encourage those things that are relevant to the relationships and results you want to achieve.

Specific. You've taken the time to identify your team's relevant behaviors. Now, when you acknowledge them, be specific about what you encourage. Describe what actually happened and why it was important. Ineffective: "Hey, Bob, great work!" Effective: "Hey, Bob, I really appreciate the extra hours you put in on that project last week. The customer was happy with the results and renewed his account. Thanks again for the extra effort!" When you take the time to get specific, people know you understand their work, and you reinforce positive contributions.

Meaningful. Effective leaders know that people are different. They want encouragement in different areas, and they receive encouragement in different ways. Meaningful encouragement is relevant to the work and to the person. Here are six ways to make recognition more meaningful:

- Customize it. Find out what is meaningful to each member of your team before the time comes to recognize them.
- Personalize it. Some people like time off. Some people like a chocolate bar. Some people like public recognition.
- Make it timely. When someone does something awesome, she knows it. There's no better time to show that you know it, too, than when the endorphins are still flying high.
- Encourage strengths. Acknowledge the work they did in the area that is meaningful to them.
- Align it. Make sure words and actions align with organizational behaviors.
- Make it meaningful for the team. When you acknowledge individuals in front of the team, talk about how their actions contributed to the team and helped everyone to win.

It's Time to Win Well

Confidence and humility are cornerstones of Winning Well. They're also vital in maintaining an effective relationship with your boss. Remember some of the confidence-leveraging behaviors: know, own and use your strengths; stand up for what matters; and speak the truth.

Be brave enough to have and share your opinions, even if they differ from those of your boss.

Of course, every boss is different. Understand and play to their style.

How to Inspire and Motivate Yourself

You cannot hope to take your people someplace you cannot go yourself. This becomes more difficult when you don't have a Winning Well manager yourself.

Fortunately, you can inspire and motivate yourself when you take responsibility for yourself first, empower yourself with a simple question, find confidence even when you don't feel it and learn how to thrive even in a negative workplace.

When things get bad, start with three words: "How can I...?" With those three words you return focus to your own power and ability to act, tap into the energy of your prefrontal cortex, the part of your brain that problem solves and plans, and vastly increase the odds of finding a solution. Take responsibility and ownership for the one thing you can control: yourself.

For example, ask, "How can I get more input and feedback from my team?" "How can I set clearer expectations?" "How can I build better understanding with my boss?" Or maybe even, "How can I find a job that doesn't make me so frustrated?"

Many managers say the hardest part to master is confidence. Impostor syndrome describes that feeling of strong self-doubt that you're a fake, that your success is due more to luck or your ability to fool people than it is due to your work, and it often comes along with the fear of being found out.

The brutal truth is that you can't be the manager you need to be when you're tied up in knots like that. You'll try to overcompensate, or you'll stay silent when you should speak. Either one will kill your credibility and end your influence.

There are tools you can use to overcome self-sabotage:

Honor your past and present. Your experiences in childhood and earlier life can serve you, help you make good decisions, give you an appreciation for people from all walks of life and keep you from being judgmental. But it would be foolhardy not to also acknowledge today's circumstances.

Use your people. It's nearly impossible to trip over your own insecurities when you focus on serving others.

Your Winning Well Legacy

How do you know that you're Winning Well? As you assess your impact, revisit the Winning Well model. First, start with your values and how you feel on the inside — how's your confidence-humility balance?

Are you able to manage your team according to the values you hold most deeply? Do you stand up for what you believe and speak the truth, even when it's hard?

How do you feel on the humility front? Do you have a realistic view of where you need to improve? Do you surround yourself with people who will tell you the truth? Are you listening well? The truth is, you can't win well on the outside if you're not Winning Well on the inside.

On the people front, do you build healthy relationships, investing in people and seeing people grow? At the end of every day, can you look back and find at least one place you invested in another person? Did you hold someone accountable? Are the employees you work with better because of their time with you? That's a simple but powerful test of your leadership, and it's all about the health of your relationships.

The next benchmark is results. At the end of every day, can you look back and find at least one place or that one most important thing that contributes to the results you're responsible for achieving?

How will your winning ways survive you? Long after you finish your reports, spreadsheets, fund-raising, meetings; long after the organization you started or work for has closed, or been sold or you have left it; long after your daily work is forgotten — what will survive you?

It isn't the "stuff"— the products, the sales or the decisions. Many times, it's not even the organization. These things are no guarantee of a legacy. It's the people. People are your legacy. The people you helped to win well, who now lead others — others who, in turn, win well themselves.

Long after everything else fades away, it is your influence, your relationships and how you impact the people around you — these things endure. That's a Winning Well legacy.

PART I: DESIGNING AN EXTRAORDINARY WORKPLACE EXPERIENCE

Success is Overrated

What do Shakespeare, Dickens, Tolstoy, Picasso, Monet, Bach, Mozart, Wagner, Schubert, Brahms and Dostoyevsky all have in common? They produced far more than their contemporaries.

Importantly, not every one of their creations was a masterpiece. Today, in fact, they are remembered for a mere fraction of their complete body of work. Creative geniuses simply do not generate masterpieces on a regular basis. Yet, the quality that distinguishes them would be impossible without the quantity of attempts.

Creative geniuses don't just attempt more solutions — they also miss quite often. Before the iPhone and iPad revolutionized the world of personal computing, Steve Jobs accrued a remarkably long list of failures that includes the Apple I, the Apple II, the Lisa, the Newton personal digital assistant and NeXT hardware.

The willingness to grow through failure is an approach that's not limited to individuals; a surprising number of leading organizations tend to do the same. Take Google. We all know about its game-changing products, including its search engine, Gmail and Google Maps.

But what about Google X, the homepage customization tool that lasted all of one day? How many of us remember Google Reader, Google Web accelerator or Google Buzz?

Google co-founder Larry Page said, "Even if you fail at your ambitious thing, it's very hard to fail completely. That's the thing that people don't get."

And in a way, that's what makes them so prolific. It's the successful innovator's dirty little secret: They fail more than the rest of us.

Why Successful Teams Make More Mistakes

In the mid-1990s, Amy Edmondson was analyzing the data to what she thought was a fairly straightforward study when she noticed something peculiar.

She was exploring team dynamics within hospitals, as part of her graduate work in organizational behavior at Harvard University. The question at the heart of Edmondson's research was this: Do nurses with better colleague relationships perform fewer errors?

What Edmondson found was that the better the nurses' relationship with their manager and co-workers, the more errors they appeared to make.

Edmondson was dumbfounded at first, but slowly the answer revealed itself. Nurses in tightly knit groups don't actually perform more errors — they simply report more of them. The reason is simple: When the consequences of reporting failure are too severe, employees avoid acknowledging mistakes altogether. The fascinating implication is that fearful teams avoid examining the causes of their blunders, making it all the more likely that their mistakes will be repeated again in the future.

The Right Way to Reward Failure

Software-development company HCL Technologies invites its executives to create a Failure CV. To enter the firm's highly coveted internal leadership program, applicants are required to list some of their biggest career blunders and then explain what they've learned from each experience. To advance their careers, potential leaders must first show that they have the ability to turn failure into progress.

If there's one unifying insight we can draw from the experience of extraordinary achievers, it is this: Sometimes the best way to minimize failure is to embrace it with open arms.

The Power of Place

The last few years have witnessed stunning breakthroughs in knowledge about the way design affects our thinking. Already, organizations like Google, Intel and Cisco are pouring millions of dollars into redesigning buildings, tearing down walls and reconfiguring conference rooms. It's not simply for the sake of giving employees an appealing environment — it's driven by a newfound recognition that there is a connection between space and innovation.

The Caveman's Guide to Building a Better Office

Ask the average CEO how to optimize a workspace, and they might suggest you consult with an interior designer. Ask the same question of an evolutionary psychologist, and he'll direct you to a very different set of experts: our ancient ancestors.

Evolutionary psychologists argue that many of our current design preferences can be traced back to our shared history on the savanna. We're drawn to environments that promoted our survival as hunter-gatherers, and feel uneasy in situations that would have put our forefathers at risk. These preferences, they argue, are largely unconscious. We simply experience safe settings as pleasurable and dangerous ones as repellent, without being able to identify exactly why.

It's not hard for the evolutionary psychologist to see why so many offices fail to engage their employees. Depriving people of sunlight, restricting their views and seating them with their backs exposed is not a recipe for success — it's a recipe for chronic anxiety. So is placing workers in expansive rooms, inundating them with stimulation and failing to provide them with an area for refuge, where they can recover from attention fatigue.

Caves and Campfires

How do you choose among cubicles, private offices and open spaces when all three present significant downsides?

There is a simple answer: You don't.

One thing research has taught us is that no single environment is conducive to every task. By offering a selection of options, companies can support both focus work and collaboration, using the space they have to enhance their employees' efforts.

Why You Should Be Paid to Play

Sometimes, what appears to the outside world like slacking off is actually the path to smarter decisions and more innovative ideas.

Frequently our most brilliant insights come in the gaps between hard work, when we let our guard down and allow disparate ideas to emerge. In those moments when we distract ourselves with a walk to the restroom, the commute home or the in-flight movie on a business trip.

Think back to your last truly great work-related idea. Now ask yourself: Where were you? Chances are that you weren't sitting behind your desk.

In many ways, problem solvers are like artists. Taking a few steps back provides painters with a fresh perspective on their subject, lending them a new angle for approaching their work. Walking away doesn't just put our unconscious to work: It helps us see our problem with a new perspective. We become less emotionally attached and free ourselves from the influence of those in our immediate surroundings.

One way many organizations leverage this insight is by deliberately scheduling play into the workday. Play may seem like the domain of children, and in some ways that's the point. We are naturally creative when we're young, in part because our brains have not quite developed the capacity to prejudge and censor our ideas. Putting ourselves in a childlike mindset opens us up to alternative ways of thinking.

The Creativity Diet

A well-timed diversion can help employees process information they already have in a way that leads to better insights. But when you're looking for outside-the-box solutions, sometimes what you really need is a way of encouraging them to be mentally adventurous.

Our minds naturally search for connections between ideas. And where we direct our attention determines the combinations we find. When we stare at a problem using a single lens, being creative is difficult. We get stuck in old ways of thinking. To uncover new solutions, we need to break our mental frames.

A diet of diverse mental stimulation is a vital component of creative thinking. The challenge in most workplaces is that employees are exposed to the same information day after day, making it difficult to come up with new and

innovative solutions. But a growing number of companies, inspired by well-known success stories at Google, Yahoo! and Facebook, are trying to break that mental rut. They've begun inviting employees to set aside a portion of their time each week for free-form exploration and for pursuing projects of their choosing. The only requirement is that their efforts have the potential for benefiting the company in some way.

What Happy Workplaces Can Learn From a Casino

How exactly do you foster happiness in the workplace? By taking a cue from casinos and embedding psychological triggers into the employee experience that promote a positive mindset.

Why Workplace Happiness is Hard to Find

One of the more distressing facts about human nature is that we are not particularly good at staying happy. Often the process doesn't take very long. Consider what happens when you order a wonderful dish at a new restaurant. The first bite is exquisite. The second is very good. By the third, you're ready to share. The more you eat, the less enjoyment you derive from your meal, until after a certain threshold you couldn't eat another bite.

The good news about our inclination to adapt is that the same psychological process responsible for acclimating us to positive events is also at work when we experience a tragedy.

Our brains are programmed to adapt to our circumstances, and for good reason. Too happy and we'd lack any ambition; too sad and we'd never leave our beds.

Recently psychologists have begun examining ways of slowing the adaptation process as a means of prolonging happy experiences. If we can prevent ourselves from habituating too quickly to positive experiences, the reasoning goes, we can sustain the initial high for longer periods of time.

How do you delay adaptation? Here's a look at what we've learned so far.

Insight #1: Frequency is more important than size. Small, frequent pleasures can keep us happy longer than large, infrequent ones. We may be better off splitting up positive annual events into quarterly ones.

Insight #2: Variety prevents adaptation. Increasing the frequency of positive events isn't the only way of delaying adaptation. So is introducing variation. One way of introducing variety into the workplace is by linking certain happiness boosts to specific seasons.

Insight #3: Unexpected pleasures deliver a bigger thrill. How do you surprise your employees? One idea might be renting out a movie theater and taking everyone out for the premiere of a major release.

Insight #4: Experiences are more rewarding than objects. Why is this the case? For one thing, it's because experiences tend to involve other people, and being in the company of others elevates our happiness. Experiences also expose us to new ideas and surroundings, growing our intellectual curiosity and expanding our horizons.

Insight #5: We don't always know why we're happy. One feature of our environment that we rarely pay attention to is scent. Music can also lift our mood unconsciously. The findings do hint at subtle ways ordinary workplaces can tweak their environments to promote better moods.

Insight #6: A grateful mind is a happy one. While traditional staff meetings certainly have their place, their focus on what's missing does little to promote a sense of gratitude. Instead of asking everyone to talk about what they haven't done, use the meeting as an opportunity for staff members to share what they are most proud of having accomplished since the group last met.

Is there value to promoting happiness in the workplace? Absolutely. But it's only by doing so in ways that complement the requirements of employees' tasks and allow them to be authentic about their experiences that we can expect it to drive success.

How to Turn a Group of Strangers Into a Community

Why would friends be better at working together than acquaintances? A joint study by management professors at the University of Pennsylvania and the University of Minnesota offers a clue. Researchers began by asking students in a large course to identify classmates with whom they have a "close interpersonal relationship." They then used that information to assign students to small groups made up of either close friends or mutual acquaintances.

What the researchers wanted to know was this: Could pre-existing friendships benefit some activities but interfere with others? To find out, they had all the groups complete two different assignments. The first was a decision-making project involving collaborative thinking, and the second was a model-building task involving repetitive manual labor.

The results were definitive: Friends outperformed acquaintances on both tasks. The reason? Friends were more committed at the start of a project, showed better communication while doing the activity and offered teammates positive encouragement every step of the way.

Research suggests that workplace friendships yield more productive employees, and it's not just because friends are easier to work with. It's also because there is more on the line. Feeling a connection with colleagues can motivate employees to work harder for a simple reason. When colleagues are close, a poor effort means more than a dissatisfied customer or an unhappy manager. It means letting down your friends.

The Key to Lasting Workplace Relationships

As a leader, what can you do to continue to promote new employee connections and help sustain old ones?

Shared activities catalyze workplace friendships in ways few interactions can. They foster proximity between employees who rarely meet, boost their levels of familiarity with one another, highlight similarity of interests and leverage informal, nonwork environments to prompt self-disclosure.

By allowing colleagues to direct their attention to a common task, shared activities create opportunities for dialogue without the pressure of forced conversation. When shared activities include a physical component, such as running or dancing, they have the added feature of increasing psychological arousal. Research indicates that when we experience a rush of adrenaline in the company of others, we like them more and even find them more attractive. The more opportunities employees have for sharing in physical activities, the easier it is for them to get along.

PART II: MOTIVATING EXCELLENCE

The Leadership Paradox

Charles Henry's company, Johns Manville, had just been purchased by Berkshire Hathaway. Retirement would have to wait. After meeting with Berkshire CEO Warren Buffett, Henry kept his role at Johns Manville, and not merely until his company had made it through the transition. He gave Berkshire Hathaway another four-and-a-half years.

What was it about Buffett that caused him to change his mind? Much of it has to do with Buffett's unorthodox approach to management, which involves giving his direct reports complete autonomy over their own decision-making. When he does speak with his direct reports, Buffett rarely instructs. Instead, he uses his distance from the day-to-day minutiae to ask clarifying questions that help his managers find their own insights.

The idea of allowing employees such a high degree of independence when it comes to doing their work can seem a little unsettling. To some it might even smack of managerial neglect. Shouldn't Buffett be telling them what to do?

Perhaps. But from Buffett's perspective, that's not the point. Because the feeling of ownership that's created by allowing employees decision-making freedom is itself an investment, one that pays dividends in the form of better motivation, stronger organizational loyalty and sustained engagement.

The Man Who Turned Management into a Science

In 1874, Frederick Winslow Taylor approached his supervisor with an idea. In addition to his responsibilities on the factory floor, he would conduct an experiment to identify the most efficient way for cutting metal. Slowly, Taylor's studies evolved. He became less interested in the operations of the machines and turned his attention to the factory's men.

Taylor carried around a stopwatch and measured compulsively, breaking down individual jobs into their component tasks. He then presented his findings, offering painstaking analyses and recommendations for eliminating waste and enhancing performance.

Thinking, from Taylor's perspective, was the concern of management. Doing was the domain of workers. To ensure compliance, Taylor believed in motivating employees using both the carrot and the stick. Pay in Taylor's factories was not determined by job title or experience, as the labor unions might have wished. Instead it was directly tied to an employee's performance.

Taylor versus Buffett: The Truth About Motivating Performance

From Taylor's perspective, motivation was about one thing: quantity. Employees were either highly motivated or they weren't. And it was up to managers to energize them, by enticing them with seductive bonuses and threatening them with losing their jobs. It's a perspective that continues to be popular in many organizations today. But a growing number of motivational experts argue that this view is not only simplistic — it's actually wrong.

Here's why. Motivation, we now know, varies not just in quantity but also in type. Some employees are motivated by the intrinsic enjoyment they derive from doing their

work, while others are motivated by the lure of extrinsic factors, like the appeal of money or an important title.

Interestingly, when the work itself is rewarding, an emphasis on rewards can have an unexpected effect. It reduces intrinsic motivation. That's because the moment rewards take center stage, we begin to view our work as a means to an end and start enjoying it less. Economists call it the "crowding out" effect. We stop focusing on the enjoyment the work brings us and become fixated on receiving our reward. Consequently, the more emphasis an organization places on salary and bonuses, the less likely its employees are to enjoy the work for its own sake.

How do you get employees intrinsically motivated about their work? One vital component, according to psychologist Edward Deci and Richard Ryan, involves taking a page out of Warren Buffett's managerial playbook and helping people feel autonomous while doing their job. When people are empowered to make their own decisions at work, they naturally feel motivated to excel for one simple reason: Autonomy is a basic psychological need.

Ultimately, the value of autonomy is that it allows people to fully embrace their goals and see the investments they make as their own choice. It's that feeling of personal ownership that inspires employees to be driven by their own interests, curiosity and desires to succeed.

Psychologists offer a number of recommendations for promoting the experience of autonomy, even when real choice appears to be lacking.

Provide a meaningful rationale. Research shows that when people are given a meaningful rationale, they're more likely to invest more effort and to view their contribution as important.

Define the outcome, not the process. Why wouldn't you tell your team what to do? Here's why: Spoon-feeding instructions comes with a cost. Sure, overseeing every detail might speed up productivity on this particular assignment, but that short-term lift is likely to undermine your team's overall experience of autonomy, leading to long-term declines in their motivation.

Use open-ended questions. Open-ended questions — ones beginning with the words "how," "what" or "why" — unconsciously communicate a respectful interest in the way another person thinks. They also allow the respondent to direct where the conversation goes from there.

Acknowledge negative feelings. When people voice a complaint, the first thing they want is to feel heard. Paradoxically, having our feelings accepted defuses some of the negativity by legitimizing our experience.

Minimize the focus on rewards. Feel free to offer your team a modest gift, but wait until after the project is done. The key is to let success on the task serve as its own reward while the work is getting done.

The bottom line: Any time you speak from a position of authority, the more supportive you are of others' autonomy, the more likely you are to inspire their best efforts.

Better than Money

The notion that our happiness is largely driven by the respect we receive from others makes a good deal of sense from an evolutionary perspective. In the past, being a valued member of a tribe meant security, access to attractive mates and influence over important decisions.

Being recognized feels so good because it's the ultimate sign of belonging. And while the data suggest that we adapt to money rather quickly, there is also some compelling evidence that we never quite get used to feeling respected.

What happens when we fail to receive recognition for our work? Our motivation suffers, we lose interest and eventually experience burnout. It's why, year after year, jobs with the highest turnover rates tend to belong to telemarketers, fast-food employees and retail associates. Work that involves continuous sacrifice and garners little appreciation is psychologically exhausting.

One reason that recognition is vital to doing good work is that it feeds our need for competence. When we receive positive feedback, we experience an emotional rush. Competence is inherently motivating, which is why feeling like you're good at your job leads you to invest even more of yourself in your work.

Recognition at work is also important because the positive feedback is instructive. If we're deprived of feedback on our performance — positive or otherwise — we lack the information we need to improve. And when we're missing clear direction on what we need to do to succeed, it's just a matter of time before our enthusiasm wanes. It's a fundamental truth of the human condition: Being ignored is often more psychologically painful than being treated poorly.

Why the Best Managers Focus on Themselves

Although we like to think of ourselves as independent decision makers, the truth is that we've inherited a brain

that's designed to mimic. From the moment we're born, we show a tendency to imitate.

Mimicry is quite noticeable when it occurs in children. And as adults, many of us dupe ourselves into thinking we're immune to its effects. But studies show we're prone to mimicry throughout our lives, in ways we rarely detect.

Given how much time we spend with our colleagues, it's natural that the people we work with also have a powerful impact on our behavior. When we mimic the postures, facial expressions and vocal tones of those around us, we tend to "catch" their emotions. The reason is simple: Our minds spend a lifetime associating certain physical movements with specific patterns of thought.

Mirror Neurons, Social Norms and the Roots of Company Culture

When it comes to setting social norms, some group members are more influential than others. High-status group members are watched more closely and carry more credibility, which is why their behaviors and attitudes often set the tone.

Which behaviors matter most when it comes to shaping company culture? In his landmark book *Organizational Culture and Leadership,* MIT management professor Edgar Schein identifies a number of specific actions by which leaders (often unconsciously) influence the culture of a workplace:

What leaders pay attention to (and what they ignore). The more focus a leader places on particular areas of the business — by personally controlling them, measuring them or regularly commenting on them — the more they become priorities for their teams.

Emotional outbursts. When a leader's mood swings abruptly, employees take notice.

Reactions to incidents and crises. The way in which a leader reacts to unexpected negative developments communicates their core values and contributes to organizational norms about how adverse situations should be handled.

How leaders allocate rewards and status. Over time, organizational culture tends to reinforce actions that leaders consistently reward.

Managers are often told that paying close attention to their employees is the key to doing the job effectively. But what this research suggests is that there are times when managers would be better off focusing a little more closely on their own behaviors.

PART III: ATTRACTING AND RETAINING TOP PERFORMERS

Seeing What Others Don't

Generally speaking, there are two ways of finding extraordinary employees. The first is to get better at choosing between candidates, which is tricky. The other is improving the quality of your applicant pool before starting your evaluation. It's a lot easier to reach smart hiring decisions when the vast majority of your applicants are a good choice.

One way of improving a candidate pool is by turning outstanding employees into recruiters. Research shows that people tend to socialize with those with similar personalities. This means that if you have hard workers with an optimistic mindset, chances are they know a number of people who share those characteristics.

The best scenario from an organizational standpoint is one in which employees recruit others because they want to work with great teammates and believe that their company would genuinely benefit from bringing that particular employee on board.

Getting the right candidates in your applicant pool is only half the battle. Once you do, how do you select among them? Fortunately, there are a number of steps you can take to improve your chances of making the right choice.

The first involves tearing a page out of the orchestra interviewing playbook and using a modified version of the blind audition. There is a workplace equivalent to this approach, and it involves creating an interview that's centered on a work assignment.

What assignment should you ask applicants to complete? The answer depends on the position you're looking to fill. The important thing is to create an assignment that is job relevant, allowing your impressions to form around skills that are pertinent to the role.

Another step to help you minimize your interview blind spots: Include multiple interviewers, and give them each specific criteria upon which to evaluate the candidate. Without a predefined framework for evaluating applicants, it's hard for interviewers to know where to focus.

To create a great workplace, you need to excel at hiring. It's because no matter how well you manage, how often you recognize or how generously you reward, there's simply no substitute for selecting talented people and placing them in the right roles.

Conclusion: Three Keys to Creating an Extraordinary Workplace

Every year or so, the Gallup organization releases a poll on employee engagement that inspires the collective hand-wringing of news anchors and editorial writers around the country.

The results are as predictable as they are bleak. The latest figures indicate that a full 70 percent of American employees feel disengaged at their jobs. Of these, 18 percent are "actively disengaged," meaning that they're not simply failing to meet their potential — they're acting out in ways that measurably damage their company.

Organizational leaders have tried to increase employee engagement, but they've gone about it the wrong way. As Jim Harter, Gallup's chief scientist for workplace management and well-being, put it, "There is a gap between knowing about engagement and doing something about it in most American workplaces."

This is where science can help. Here are the three overarching lessons of *The Best Place to Work:*

Lesson 1. Psychological needs are at the heart of employee engagement. How do you get employees engaged in their work? By daily providing opportunities for autonomy, competence and relatedness.

To promote autonomy, provide a rationale when tasks are presented, offer flexibility on how and when a task is performed and minimize the focus on rewards. Help employees feel competent by creating a workplace that provides them with immediate feedback, meaningful recognition and opportunities for growth.

Within the business world, relatedness has long been the most underappreciated of the three psychological needs. But connecting employees to one another doesn't just help them enjoy being at work; it leads to quantifiable gains in their performance. To build employee connections, it's important to create interactions that harness the natural catalysts of close relationships: proximity, familiarity, similarity and self-disclosure.

Lesson 2. Organizations are more successful when they address the limits of the mind and body.

Our brains have limited mental bandwidth, and when the cognitive resources we have are depleted — whether because we're surrounded by a hectic office environment, inundated with too many requests or working continuously without a break — our mood sours, and our performance slumps.

Instead of ignoring the body's limitations and insisting that employees power through periods of low energy, organizations are far better off designing workspaces that allow employees to conserve their mental resources, and offering them opportunities for restocking their energy supply when they are running low.

The nature of work is changing. What might have once appeared to traditional managers as wasted time can today be an important key to delivering high-level performance.

Lesson 3. Integrating Work and Family Life Improves the Quality of Both

Instead of pretending that work and personal time are separate, organizations are better off when they actively seek to blend the two worlds. When organizations trust employees to manage their time responsibly, making it acceptable for a worker to take an hour during the day to watch his daughter's soccer game, they create loyalty and commitment that ends up saving them money in the long term.

The future of great workplaces lies in helping employees fuse their personal and professional lives in ways that position them to deliver their best work.

Creating an Extraordinary Workplace

We now have striking proof that many aspects of the modern workplace are outdated, counterproductive and even psychologically harmful. Which is why it should surprise no one when Gallup reports that more than 80 percent of employees worldwide are disengaged. They're working within structures that make it nearly impossible to thrive.

When we fulfill employees' needs for autonomy, competence and relatedness, when we allow them to leverage the full breadth of their mental capacity, when we provide them with the flexibility to succeed in both their personal and professional lives, we achieve more than an extraordinary workplace. We create an organization that performs at its very best.

Project Management for Non-Project Managers

by Jack Ferraro, PMP

THE SUMMARY IN BRIEF

As a manager, you may feel that "project teams" brought in to accomplish goals and objectives affecting your department may as well have crash-landed from another planet, speaking a jargon-filled language all their own and referring to complex-looking graphs and charts you don't recognize. Yet, it's your responsibility to ensure that the results of a project initiative have a positive effect, benefiting your department, your customers and, ultimately, your organization. You may not be a certified project manager — or even have been trained in the basics of project management — but without an understanding of how project management works, you may be doing a disservice to your department, your company … and even your career.

Whether you're being asked to work together with a project management team or are eager to put proven project management techniques to work for you, this book will enable you to use the tools that will help you become a productive spearhead of change in your organization.

IN THIS SUMMARY, YOU WILL LEARN:

- How to productively engage with project managers and teams to increase the probability of real business value being created from the project.
- Tips to eliminate the unnecessary work that often slows projects down.
- Ways to manage risk and prevent changing requirements from derailing the completion of important milestones.

PART I: THE CRITICAL ROLE OF THE FUNCTIONAL MANAGER IN PROJECT SUCCESS

The most common vehicle for implementing change within an organization is the project or a combination of projects known as a program. Projects are becoming more strategic in nature and scope, and an increasing number of traditional white-collar workers are involved with projects in some fashion. These projects often require unprecedented collaboration within an organization's lines of business and across the business enterprise. This dynamic is creating a need for functional managers to work in collaboration, communicate effectively and appreciate the best-practice methods of project teams.

What the Functional Manager Should Know About the Project Organization

Many functional managers reject project management methodologies, processes and terminology because project teams either consistently miss their deliverable dates or over-run their budgets. This leads functional managers to underestimate the value of project management in general and feeds attitudes of "project management is a waste of time," or "project management slows down the process," or "project management is just a bunch of bureaucratic silliness." Such attitudes create a formidable barrier between project teams and their business units.

Who Is the Functional Manager?

In traditional project management literature, a functional manager is anyone with management authority over an organizational unit — such as a department — within a business, company or other organization. Functional managers are not necessarily affiliated with a project team, nor are they directly involved in the day-to-day management of the project. However, they are supposed to ensure that the team's goals and objectives are aligned with the organization's overall strategy and vision. And the functional manager is responsible for providing the project team with the resources needed to complete the project.

The Challenge of Integrating the Project Team into the Organization

The challenge is getting members of the project team to see the big picture and how their work is affecting the organization's overall long-term goals. The solution is establishing a customer-focused project team that creates an integrated provider/customer relationship. And you as the functional manager must accept your role as the spearhead of change and take this step yourself. You cannot rely on your project manager, your Project Management Office (PMO — the standards enforcers) or your project sponsor (the financier and visionary of the project) to integrate this team into the project organization.

The Functional Manager's Role in Creating an Integrated Project Organization

The structuring of the project organization must clearly define the role of the functional manager as an educated consumer. Whether in IT, marketing or accounting,

whether running a collection department or managing the faculty, the functional manager can define what is needed and enhance the project team's understanding of the business need. Therefore, the functional manager needs to be the catalyst for transferring critical knowledge in order to establish a true provider/customer partnership. When they become project management aware, functional managers can better participate in project planning sessions, understand why key planning documents are needed, interpret project reporting artifacts and recognize when project teams are wasting precious time and resources. The sooner this awareness occurs, the sooner you will see dramatic increases in project performance.

Three Types of Organizational Structure

Functional managers must understand the type of organizational structure in which they are operating, its impact on projects and the implications for the project manager, the project team and themselves. Three basic structure scenarios exist:

Functional. The functional organization structure aligns around the major functions of the business. Typically, they can no longer adapt to the changes of their competitors or demands from their customers. Most projects in such organizations underachieve their promise by between 20 and 70 percent, and project and functional managers become cynical. Success of the project is often associated with keeping the project boundaries within the functional manager's control. The more other departments or organizations get involved in the project, the greater the probability of conflict and poor project management.

Projectized. At the other end of the spectrum is a projectized organization, one that is primarily aligned around projects or programs. The planning, execution and control of projects and programs is usually a part of the organization's core business, and revenue is often tied to the successful completion of projects. Project management processes are mature, and financial tracking of project expenditures is ingrained into management information systems.

Matrix. The most common type of organizational structure, and the one in which most of us work, is the matrix organization. The grid-like structure allows a company to address multiple business dimensions using multiple command structures. However, matrix organizations may lack clear authority definition, which can lead to role ambiguity — the greatest obstacle to any project. Some may require significant administrative and overhead resources to support the matrix.

The Importance of Project Planning

When you, as the functional manager, partner in the planning process, the project organization will gain foresight from your collaboration. Foresight is accomplished by being close to the project's work, its outputs and consumption, without disrupting it.

A solid project plan allows both you and the project manager to work in the present with a plan for the future. Without it, you are no longer leading, but reacting to events. When a project is in trouble, teams find themselves continually reacting to the latest crisis. The project plan becomes outdated as tasks and activities become disconnected from the plan. Foresight moves the team from surviving crisis after crisis, which erodes trust and ignites fear, to executing with creativity and confidence.

What Is a Good Plan?

A good project plan should increase the confidence of stakeholders that the objectives set out for the project are achievable within the organization's parameters, particularly the budget, the time allotted and the project scope or functionality. A good plan does the following:

- It lays out an entire scope of the project in a manner that is easily understood and agreed upon by stakeholders and decision makers.
- It tells a simple story of how project work unfolds in a logical sequence and identifies the key decision points and milestones that must be reached before additional work can proceed.
- It presents 30 days of detailed activities and deliverables that show obvious progress or lack thereof.
- It presents uncertainty in a manner that stakeholders can comprehend, so they can then take appropriate action.

Basic Steps to Planning Projects

A project plan is an input to the execution or completion of the work of that project plan. Executing the plan is as simple as doing what you say you will do. However, creating the plan documents can be more complex. Here are eight of the most important steps:

1. Establishing project objectives
2. Developing the project scope
3. Decomposing/deconstructing the project into deliverables
4. Identifying resources
5. Defining activities

6. Estimating resources, costs and durations
7. Scheduling the work
8. Determining the budget

Summary of Project Planning

As someone new to project management and project planning, you may benefit from remembering these points:

- This planning process is iterative; each pass through these steps adds more detail to the plan.
- This process must be done in a true provider/customer partnership; the project team is not likely to be successful unless you are engaged and committed to creating a meaningful project plan.
- The goal is to get an initial plan created and then begin to execute; then do more planning and more executing. Momentum is generated by the accomplishment of incremental activities that the team said they would do.
- Don't be overwhelmed by the detailed project schedules and other PMO templates. Demand simple, meaningful project plans that can validate the competency of the project manager and the teams' ability to execute.

Understanding the Business Side of the Project

Project teams and their members move rapidly from one project to the next and are often under tremendous pressure to produce deliverables and results. Arriving quickly, then disappearing as they move on to the next urgent organizational need, project teams are becoming business and knowledge agnostics. Yet specific business knowledge is essential for project success, and the critical role of providing the relevant business knowledge to the project team belongs to you, the functional manager. This business knowledge becomes the foundation for project requirements, a key component to your project scope.

The Connection Between Business Knowledge and Requirements

Poor requirements are a common cause of project failure and are often rooted in a lack of understanding of the business. Although project managers pride themselves on being generalists, they often fail to acquire and utilize the business matter expertise that is available to help them on projects. As a result, changing requirements and scope creep can lead projects to the grave.

Writing Good Requirements

What exactly is a requirement? It's vital that you, the functional manager, have an in-depth understanding of what project managers mean by "requirement," because the project team will rely on you to communicate requirements for documentation as a part of the project scope.

A requirement is a condition or capability needed by a user to solve a problem or achieve an objective. Often, a system must meet or possess this condition or capability to satisfy a contract, standard, specification or other formally imposed document. Thus, the provider will be relying on you to provide clear, articulate information. The most common mistake is not considering requirements in light of a business process or processes. Understanding business process impacts is critical, not only to the specific process on which you may be focusing but also to related processes.

Scope Creep

One phase that almost everyone in basic project management training classes seems to understand is scope creep. Next to requirements, it seems to be the most-used layman's term in the daily events of project life. Scope creep is directly related to requirements and their mismanagement. It has many root causes besides poor requirements, such as undisciplined customers, use of the wrong system development methodology, and not having clear linkages of requirements to the business process. Further impact can come from changes in the business environment, new regulations, market demands, competition and cost factors.

The Ideal Functional Manager in the Project Organization

Functional managers who are asked to drive strategic change in their organization must be prepared to lead and have qualities that make working on such projects a success.

"Get It"… or Risk Getting Moved Out

Functional managers who are asked to step outside of their normal duties and participate in important projects need to adopt the following principles:

1. Take ownership of the responsibilities of being a good customer.
2. Embrace the provider/customer relationship.
3. Make decisions based on facts, not feelings.
4. Connect the project with organizational strategy.
5. Recognize the importance of structure in projects.

6. Get comfortable working outside your zone.
7. Understand the success factors of organizational change:
    a. Create urgency.
    b. Structure a powerful alliance.
    c. Vision the change.
    d. Communicate the vision.
    e. Remove obstacles.
    f. Create momentum with quick wins.
    g. Don't declare victory too soon.
    h. Embed the change into your culture and systems.
8. Be willing to take risks.

PART II: FOUR CRITICAL PROJECT MANAGEMENT SKILLS FOR FUNCTIONAL MANAGERS

Articulating the Real Customer Need and Business Case for the Project

A fundamental understanding of project management is one step; understanding your role in the provider/customer relationship is another. Now you must acquire the skills to complement those of your provider.

A skill lacking in many projects is the ability to find and articulate the real customer need, a need that is met by a mission. This skill must be applied during the initiation of projects but often is glossed over. If you expect a project team to deliver results and the project to provide the desired benefits, you must play a central role in articulating the need. Users have a sense of the needs but do not realize their implications. Sponsors and executives know the benefits they want but often do not fully understand the details of how to get them. This is where you fit in. You must be able to translate the sponsors' vision into real needs, potential solutions and process changes.

Understanding the real need of your project is a discovery process, one that involves continual dialogue and collaboration, which implies that a relationship must exist between the provider and customers. Discovering the real need requires you and the project manager (the customer/provider partnership) to pursue an open and honest dialogue with all members of the project team. The dialogue should include questions such as

- Why does capacity need to increase or cost need to decrease?
- How much does it need to increase/decrease?
- How is it measured?
- What if this need is not met? What happens? Who is at risk?
- Who ultimately benefits from having these needs met?

The questions must be pursued vigorously and satisfactorily answered if everyone is to comprehend and buy into the mission. Once you have the answers, you can complete the following critical steps:

1. Produce a compelling project mission statement based on real needs.
2. Create a meaningful current state and future state comparison.
3. Base your requirements on the business process.
4. Prepare a realistic business case for your project.

Staying Focused on Project Deliverables

As a functional manager, your goal is to keep the project team and your stakeholders focused on deliverables. This does not mean that you need to become an expert at decomposing/deconstructing deliverable structures, also known as work breakdown structures (WBS). However, deliverable structures are a fundamental element of project planning, one that is often misunderstood and incorrectly used.

The Deliverable Structure: A Portrait of the Work

A deliverable structure can be considered a portrait of the work. Provider/customer partnerships must be effective in creating a portrait — preferably using graphics — that aligns with the real need and vision of the project. This planning document is built with and for the customer and team members. It is essential for defining the scope and then executing and controlling the project.

A simple process to create a deliverable structure is as follows:

1. Identify the final product of the project. This is the top level of the deliverable structure and may also be the project name.
2. Identify the major components of the product, service, or result to be created (product approach) or the sequence of phases of the project (phase approach).

3. Decompose/deconstruct the major deliverables within each component, following the rules of deliverable structures:
   - Each element should be a single, tangible deliverable.
   - Each element should be an aggregation of subordinate elements.
   - Deliverables should be unique and distinct.
4. Review and refine with stakeholders.

Deliverables vs. Activities

The process of identifying lower level deliverables is called decomposition (deconstruction), meaning breaking down the deliverables into smaller, more manageable components. The common mistake is to dive immediately into tasks or activities when decomposing your project. Our brains are trained to think in terms of actions first, not outputs. Understanding these two terms is important:

- Deliverables are any tangible work product (e.g., documentation, analysis, process map, data file, software interface).
- Activities or tasks are actions performed to create deliverables (e.g., create draft specifications, conduct meeting, review plan).

Thinking about activities at this point is fine, but you should think through activities to the point of creating an output or tangible deliverable.

Missing Pieces

If your project manager takes the initiative to develop a straw model of the deliverable structure and present it to you, make sure he has included the following five components that are often missed:

1. Integration. Technology projects commonly have multiple system efforts in scope, and these systems likely have to communicate or integrate with each other. Each system may have its own deliverables for requirements, design, code, etc. But the project also needs deliverables that address any integration points.

2. Business analysis. Business process modeling deliverables are often left out by project managers with a technical orientation. The development of current and future state processes and a gap analysis should be in the structure.

3. Testing. Although testing deliverables are not usually left out, they may be less visible than they should be on the deliverable structure. If they are subdeliverables of a build stage, the effort is likely to be underestimated. If testing is a critical component of the project, elevate it to level one or two in the deliverable structure. A common problem is project managers' borrowing time from testing to make up for slippage that occurs in earlier phases. The more visibility testing has, the harder it is for them to do this.

4. Communications. For change initiatives, communications are critical components. These could be newsletters, websites and email campaigns to drive the behavior in project customers that produce benefits.

5. Project management. Project management deliverables consume time and resources and must be a part of any deliverable structure. This category includes not just planning documents but status reports, regular project updates and project reporting deliverables.

Maintenance of Your Deliverable Structure

Your project manager is responsible for updating the deliverable structure on a regular basis. Here is a good test to determine whether your project scope is stable: Walk around the halls of your project team and ask them what they are working on, with a copy of the deliverable structure in hand or at least in your mind. If team members are engaged in efforts that do not directly relate to a deliverable on the deliverable structure, then you have potential problems. Either the scope has changed and the deliverable structure does not reflect the actual work (a common occurrence), or team members are working on unapproved changes, which is, unfortunately, an even more common occurrence.

Understanding Key Project Dependencies

Once you have mastered defining the work of the project in a deliverable structure — the portrait of the project — you must enhance this by developing the high-level dependencies between these deliverables. Think of it in terms of telling the story of the work — how it plays out, what work must be done before other work can start, and what are the critical relationships between deliverables. Your deliverable structure is an input to this story of the work. The story of the work illustrates critical decision points for primary and secondary stakeholders and shows where customer acceptance — sign-off — occurs. It also provides insight into risks: If this deliverable is not done properly, it will impact the quality of other project management deliverables.

Sequencing project work and the project management output of this process can be complex. Your goal as a functional manager is to keep it simple and tell a story to

your stakeholders that they can easily understand. You do not need training in project management scheduling or on sophisticated project management software. That is for your project manager; he or she should be experienced in the details and nuances of producing an accurate schedule with a critical path and be proficient in using the software tools that produce it.

The common mistake is to let your project manager sequence the details of the work without input from you and the primary and secondary stakeholders. Often, project managers believe this is a purely technical task of working through the dependencies of project work, which only they can figure out. The solution is to create simple, high-level sequence diagrams that depict the major relationships among the significant deliverables (the story), which you defined in your deliverable structure (the portrait).

Another benefit of getting the story of the work in front of primary stakeholders early is the ability to successfully negotiate scope, schedule and cost. Sponsors tend to drastically cut schedules while not wanting to compromise scope or quality. If you involve the customer and sponsors in the deliverable structure creation at the appropriate level, the proper use of a simple flow diagram highlights the risks of compressing timelines.

Being Proactive About Project Risk

Another critical skill is the articulation of risk. Project managers must understand risk management processes, but your role in the partnership is to create an environment where risk can be discussed openly and prudently.

Here is the problem: Project managers are notorious for capturing issues, assumptions and hidden risks around projects and aggregating them into lengthy lists that get little attention and quickly become outdated. Articulating risks with clarity makes them real and manageable. A project manager may be more focused on the technical risks that impact their personal interest, such as meeting a deadline or budget constraint.

Another problem is that many organizations have a culture that frowns on talking about risk. "Risk" is a forbidden four-letter word; it implies that a situation is out of control.

Basics of Risk

Risk is based on uncertainty about the future. What creates risk is a possible event or condition that, if it occurs, will affect at least one project objective, such as scope, schedule, cost or quality. Without a clear definition and understanding of your objectives, risk management becomes more difficult. Risk conditions could include aspects of the project or organization's environment, outdated technology, untrained project workers, turnover or uninterested customers. Risks could be related to the project-specific work, the relationships between deliverables or the relationships between stakeholders.

Every project has known risks, those that can be identified, but projects also have unknown risks, which cannot be managed proactively. Project leaders address known risks by identifying and analyzing them and then creating response plans. Response plans that mitigate risks — reducing their probability and/or impact — are a part of your scope and budget. The unknown risks, those that cannot be identified or proactively responded to, are not part of your baseline scope or budget, but you may allocate a contingency fund or plan to managing them.

An issue is not the same as a risk; rather, an issue is the result of a project risk that has actually occurred. Remember, project risk is always in the future. Risk management should be embedded in all project planning processes and all common processes in all projects. These common processes are:

- Initiation
- Planning
- Executing
- Monitoring and controlling
- Closing

Risk Management Process

The risk management process is intuitive and can be summarized in five steps:

1. Decide how you will handle risks on your project in general. You should determine how to approach and plan for project risk, identify the level of risks and types of risks to be managed and decide what level of management visibility is required. Keep in mind that management visibility should be consistent with the risk's level of importance.

2. Identify actual risks. Your key inputs into risk identification are project artifacts with which you are familiar:

- Mission statements
- Deliverable structure and acceptance criteria
- Flow diagram
- Requirements
- Stakeholder analysis

3. Quantify the risks. Risk events always have two elements:

I. The probability of the event occurring in the future.
II. Its potential impact on your project objectives.

If your objectives are vague, the impacts or risk events will be vaguer and will generate no interest or concern from your stakeholders. Risks have sources or causes, which may include changes in requirements or scope, design errors, poorly defined roles and responsibilities, poor estimates, lack of skills and staff turnover. Based on your project's objectives, you must determine how likely these risks are and the specific impacts they would cause.

4. Prioritize the quantified risks, and discuss responses with stakeholders and team members. Responses can fall into the following four categories: Accept or ignore the risk. Avoid the risk. Transfer the risk. Mitigate the risk.

5. Continue to monitor your risks. This includes continual identification of new risks that appear and others that go away as project work progresses.

An excellent place to find risks is in your assumptions list. Assumptions are project conditions that are assumed to be true in your project, and documenting them will help validate the accuracy of your project plan and determine when changes need to be made. Assumptions can be dangerous if they are not continually validated as being true. A typical software project may have an assumption that user security profiles are accurate based on business manager sign-off. A project manager leaves this as an assumption, but you should translate the assumption into a risk event, such as, if user role security profiles are incorrect, the resulting changes to user profile security after user acceptance testing will create the need for additional test cycles, increasing testing costs by 5 percent.

With a specific risk event, a discussion can occur about the probability of the risk event, risk sources, and decisions can be made about acceptance, mitigation and subsequent planning activities. Too often, risks get documented as generic issues or assumptions or, even worse, pushed under the table. By properly identifying the risk event or condition and its probability and potential impact, the sources can be rooted out and mitigation plans built into the project plan.

The Power of Principles

When facing the temptation of the latest project management fads — automated PMOs, Agile PM certifications, Lean Project Management — it's useful to revisit some basic principles:

- **Relationships are extremely important.** Trust-based relationships make it possible to survive the chaos that change in organizations brings to people's lives.
- **Good planning is essential to project management.** A good plan has the right amount of detail for the specific situation, it arrives in the right time to align stakeholders and is easy to comprehend.
- **No matter how good you are at building relationships and planning projects, you must still be able to execute.** Executing the project plan begins with communicating it to your stakeholders. Those initial encounters with your key stakeholders are truly critical because the first impressions of your plan are lasting.
- **Strategic plans are embroiled in conflict — conflicts between the status quo and agents of change, the risk averse and the risk takers, the pacifiers and inciters.** This conflict must be awakened for the organization to address and resolve the tension that has long been dormant. Without that tension, the organization is not likely to move forward. Managing this conflict is a part of the landscape. How you manage it will determine whether the conflict becomes positive energy to support lasting, fundamental change in the organization or whether it becomes negative energy, worsening the organization's inability to change.

Projects cannot be successfully executed by a project team alone. As a functional manager, you must step out of your normal duties and participate in important projects. You must take ownership of the responsibilities of being a good customer, embrace the provider/customer relationship, integrate the project team into the business and keep it aligned with the organizational strategy. You must facilitate good decision-making based on facts and recognize and participate in the structure and planning necessary to execute projects. Finally, you must be willing to take risks and work outside your comfort zone. Ultimately, you need to "get it," or risk being moved aside.

The Team-Building Tool Kit

Tips and Tactics for Effective Workplace Teams

by Deborah Mackin

THE SUMMARY IN BRIEF

The Team-Building Tool Kit is the most trusted resource on team building. Packed with fast and ready-to-use tools and techniques, *The Team-Building Tool Kit* gives you all the information and strategies you need to get the most from your teams.

It includes critical information on team accountability, decision making, and problem solving. *The Team-Building Tool Kit* provides easy-to-understand guidance on how to have effective team meetings, assess team performance, resolve team conflicts, train for high performance, and much more.

Few organizations derive the full benefits that successful teams can provide, simply because their teams are not nurtured and managed correctly. Whether you read the entire summary or use it as a quick reference, *The Team-Building Tool Kit* is a crucial resource for anyone working with a team.

IN THIS SUMMARY, YOU WILL LEARN:

- Tips to improve accountability for results and team-member behavior.
- A better method for effective team meetings.
- How to resolve team conflicts before they cause permanent damage.
- Techniques to design a plan for implementation.

Getting Started

Team building begins with a clear decision by leadership to encourage, and even to require, employees to operate in teams. Leadership must recognize that teaming is a cultural change that will include

1. Developing awareness of teams both as a tool and a culture shift.
2. Acquiring knowledge and understanding about how teams function.
3. Learning skills to perform new teaming behaviors.
4. Internalizing attitudes and beliefs so that teaming becomes a way of life.

The role of leadership is critical through each of these steps. Lack of leadership support remains the number one cause of team failure.

Types of Teams

As an organization begins its team-building efforts, one of the first concerns it must resolve is what type of team to create. The green light for team building is typically a top-management decision. Some organizations begin with high-level policy-making teams charged with identifying broad concerns and setting goals, whereas others begin with small departmental teams. Whether the impetus comes from a company-wide policy review or from a departmental task force, teams should be formed only when an achievable common goal can be identified. The various types of teams are somewhat like the flowers in a garden: All serve a particular purpose and have their own characteristics and set of benefits:

Multifunctional Teams

- Identify major areas of organizational concern/opportunity; articulate organizational needs.
- Develop philosophy, strategy, policies and direction.
- Include members from various levels of the organization and across functional areas.
- Are sometimes called design teams or quality councils.

Task Force or Cross-Functional Teams

- Include between eight and 12 members; membership based on common purpose.
- Bring together individuals from multiple work areas at a similar level.
- Necessitate regular meetings over either a short or an extended period of time.
- Implement a strategic plan for addressing problems/concerns/opportunities; others may complete the implementation of the plan.
- Assume investigative, corrective, interactive function.
- Are sometimes called steering teams, process improvement teams, product launch teams or Kaizen teams.

Improvement Teams (Functional or Value Stream)

- Include members of one department or one value stream.
- Focus on problem solving; identifying solutions.
- Restrict scope of activity to within departmental or value stream boundaries.
- Hold regular meetings over a short period of time.
- Have a short life span.

Self-Directed Work Teams (Functional or Value Stream)

- Comprise an intact team of employees who work together on an ongoing, day-to-day basis without direct supervision and who are responsible for a "whole" work process or segment.

- Assume "ownership" of product or service and are empowered to share various supervisory and leadership functions.
- Function semi-autonomously; are responsible for controlling the physical and functional boundaries of their work and for delivering a specified quantity and quality of a product or service within a specified time and at a defined cost.
- Are all cross-trained in a variety of work skills.
- Share and rotate leadership responsibilities; team members have equal input decisions.
- May prepare own budgets and coordinate work with other departments.

The Basics of Team Functioning

The first step in forming a team is to define the team's goal on the basis of the purpose or problem to be examined. The founding person or body drafts the team's preliminary charter, including the mission, team goals, expected outcomes, time requirements and authority level. In addition, the founding person or body is responsible for defining, communicating and negotiating the "what" (direction), "why" and "when" to the team. The team is then responsible for determining the "how" (the approach).

Determining Level of Authority and Responsibility. When a team is created, the coach or team sponsor must clearly define its level of responsibility and authority, setting the limits within which the team may act autonomously. Although it may be cumbersome, the most effective way to detail authority is to create a RACI chart:

- **"R" Responsible.** The "doer" of the task, responsible for completing the task or making the decision. Multiple people/teams may have responsibility for completing a task or making a decision.
- **"A" Accountable.** The person or team held accountable for ensuring that the task/decision is completed on time and meets expectations. This person does not have to do the task. However, in a team-based environment, the accountability should focus on the "doer" whenever possible.
- **"C" Consulted.** The person/team who will be consulted with by the responsible ("R") person/team, before performing a task or making a decision.
- **"I" Informed.** The person/team who will be informed that a task or decision has been completed or made.

Even in traditional management structures, decision-making authority is often not clear. In the excitement of getting started, teams often give themselves much more authority than they truly have or should have based on their development. When the presumed authority is clarified later on, the team often experiences considerable disappointment. It is wise to place clear limits on the team at the beginning and grow the level of authority as the team demonstrates maturity and focus.

Key Components in High-Performance Teams

High-performance teams display the following characteristics:

- Team goals are considered to be as important as individual goals; members are able to recognize when a personal agenda is interfering with the team's direction.
- The team is able to focus on both task completion and process maintenance.
- The team understands the goals and is committed to achieving them; everyone is willing to shift responsibilities to meet demands.
- The team climate is comfortable and informal; members feel empowered and understand that individual competitiveness is inappropriate.
- Respect, open-mindedness and collaboration are high; members seek win/win solutions and build on each other's ideas.
- The team continually works on improving itself by examining its charter, protocols, procedures and practices, and experimenting with change.
- Team responsibilities become integrated with job responsibilities.

Closing Out a Team

When a team has completed its purpose, it is important to provide closure for the members. This is often a time to reflect on progress and to celebrate the team's accomplishments. However, teams tend to construe closure with failure. Many are concerned that closure will bring about the end to comfortable relationships with team members, and they fear that their accomplishments will get lost. Consider this sample process for making the closure effective:

1. Empower the team by asking its members how they would like to bring closure to the project or merger with anther team.
2. Schedule a meeting to present the team's findings and recommendations; invite anyone affected by the team's recommendations.
3. Decide on a review procedure and a completion date for assessing the team's recommendations.
4. Recognize and reward the team's accomplishments in some formal manner.
5. Identify any other areas of the organization that could benefit from the team's ideas or skills.

6. Encourage the team's members to develop "lessons learned," both as individuals and as a team, that they are willing to share with other teams.
7. Discuss any transition issues for the team, such as team files/records and transfer of information to a follow-up team.

Let's Meet: Team Meetings

The team meeting is the team's "playing field," where the processes of initiating, planning, executing, following through and controlling all take place. However, a meeting whose only purpose is information sharing will never be effective for a team. The team's meeting must focus on important team activities such as planning, problem solving and decision making, with as little time spent on information sharing as possible. With email, voice mail and memos, all the information the team needs can be shared outside the meeting. Then, at the meeting team members can bring their questions, concerns and actions required based on the information shared earlier. There's no more coming to meetings without knowing what's going to happen, because team members have completed their pre-reads and expect to participate and work hard together.

Typical Meeting Problems

Although meetings are vital for the team's health, they can also be a source of considerable wasted time. Here are some of the problems often encountered in poorly run meetings:

- Meeting roles are poorly performed by team members, resulting in other members taking over. This is especially true of the facilitator's role.
- The team jumps into discussing agenda topics before planning the work: agreeing on the goal of the discussion and structuring the approach the team will use.
- Members' silence is treated as if it means agreement, when often it doesn't.
- The team relies on the coach or sponsor to generate ideas.
- No outcomes are identified for agenda items, and the meeting goal is not clear.
- No agenda exists, the agenda is not distributed in advance or the agenda is too "lightweight" in terms of topics.
- The facilitator is not prepared or monopolizes the discussion.

Facilitating Team Meetings

The role of the facilitator is critical to the success of a meeting. A skilled facilitator has the ability to ask just the right question to open discussion and keep the team moving. It is critical for the balance of power that the role of facilitator be rotated among team members. Here are some general pointers to keep in mind when you facilitate team meetings:

- Remember that every agenda must have a desired outcome identified, and these outcomes must focus on planning, problem solving and decision making.
- Remember that the tentative agenda requires the consensus of the team before proceeding. Change the agenda only when the entire team agrees, not when only one person suggests a revision.
- In tense situations or when solutions are difficult to reach, remember the value of small-team discussion, humor, quick games for energy, affirmation and silence.
- End the meeting with a sense of gathering together and a summary.

Team Behavior

Effective teamwork is not just about getting a set of tasks done. It also requires the ability to manage the process of working together: listening to each other, communicating openly, surfacing feelings, exploring different approaches and reaching decisions. These behaviors are often not taught in our early educational experiences, and many people have achieved success as managers and supervisors without needing these behaviors. It's only when we need to work together — as a team — that these behaviors are crucial.

Behavior Changes

Teamwork becomes particularly difficult when members recognize that they will each have to change some parts of their behavior. Making excuses, procrastinating, blaming and feigning ignorance are just a few of the stall tactics members will use. Here are important behavior changes for employees, supervisors and managers:

Critical Behavior Changes for Employees

- Learning to speak up in groups.
- Taking responsibility for one's own thoughts/actions.
- Learning to state an opinion and offer a proposal.
- Receiving and expressing positive and negative feelings.
- Saying no.
- Responding to criticism.
- Making requests of authorities.
- Negotiating for something desired.

Critical Behavior Changes for Supervisors

- Being willing to share power and responsibility.
- Proposing ideas for discussion.
- Asking questions instead of making statements.
- Listening to others.
- Remaining open-minded.

Critical Behavior Changes for Managers

- Having the courage to resist recommendations that are not beneficial.
- Accepting decentralized decision making.
- Believing that everyone has good ideas.
- Being willing to implement team suggestions whenever possible.
- Recognizing team accomplishments.
- Seeing teams as a long-term effort.
- Thinking "yes" before saying "no."

Team Accountability and Decision Making

Some teams think that as soon as they're called a team, they have the right to make all the decisions without any involvement of others, including their coach or sponsor. That is not the case. The transfer of authority and accountability is a gradual process that occurs as the team develops and matures. Similarly, decision making begins with small decisions, such as when to have meetings and how to rotate team responsibilities, before the team tackles larger and riskier decisions.

Accountability: An "I" Experience

Even though we think of teaming as a "we" experience, the act of assuming accountability is actually an "I" experience. As a result, we try to identify all the opportunities for individuals to be specifically assigned tasks to build their accountability to the team's results. Here are a few examples:

- The requirement of rotating team meeting roles throughout the entire team.
- The scribe recording action items with specific names of team members who assume responsibility for getting tasks done with definite deadline dates.
- The maintenance of an open action items list with names and deadlines assigned. Teams have found it helpful to cross out missed deadlines but not remove them from the list, to illustrate how many weeks something has not been completed. This action drives accountability in the team member assigned to the task.
- The assignment of "buddy" roles, in which each team member has a buddy who is responsible for performing the meeting role, collecting materials and updating the member when he or she is absent.
- The assignment of subject matter experts (SMEs) within the team who have specialized capabilities in certain skill areas.
- The requirement in the conflict resolution protocol that team members go "one-on-one" first when a conflict occurs, before going to a coach.
- The individual assessment by team members of how the team is doing and reporting of the results to the team.

Team Decision Making

Team decision making and accountability go hand in hand in the teaming process. This stems from a fundamental belief that "we" are smarter together than any of us alone. Although most teams use the consensus process for making their decisions, a team truly has a range of decision-making options it can use. For example, the team can decide by consensus to authorize a team member to make an autocratic decision, such as what item to buy when talking to a vendor. The team can authorize minority rule by having a few members make the decision in a subgroup. In an impasse, the team can decide by consensus to use majority rule (voting) to help break the stalemate. However, although all of these options are available to the team, the members must decide by consensus to exercise any of them.

Best Team Decision-Making Behaviors

There are six behaviors that the best teams use when making decisions:

1. **Ask many questions and avoid positioning.** Team members must ask positive, provocative questions rather than take sides or defend a position.
2. **Develop multiple alternatives.** Team members need to develop at least three options for the team to explore. That way if the option chosen doesn't work, the team can go back to earlier options to get started again.
3. **Test all assumptive statements.** Team members need to become adept at distinguishing between things people say that are actually true facts and things they say as if they were facts but are actually assumptions. Those assumptions should be tested by having a team member say, "How do we know that? Where are the facts?"
4. **Identify well-defined criteria.** Prior to making any decision, the team must develop the criteria it will use to determine whether a choice is a good one. A

decision matrix is an effective tool for doing this. This tool allows the team to score each decision option according to predetermined criteria.

5. **Encourage challenge and debate.** Early in the team process, it helps to identify one or two members to play the role of "challenger" so that healthy debate exists for all the options.
6. **Use a fair process.** When people don't feel a process is fair and the decision has already been made, they begin to "vote with their feet" and miss team meetings. Research shows that when members feel the decision process is fair — even if their preferred choice is not selected — they will support it.

Team Problem-Solving Process and Tools

Successful teams work three components of teaming simultaneously:

1. **Task.** Getting tasks done and producing results through goals, work plans and timelines.
2. **Process.** Managing processes such as meetings, information sharing, problem solving and decision making.
3. **People.** Blending the skills and knowledge of members to create something that is better than any individual could create alone.

Effective problem solving tests all three of these capabilities on the team. When the team is clear about the problem to be solved, has process skills to implement an effective approach and draws on the talents of members, the probability of effective problem solving increases dramatically. However, most team members dread the idea of trying to solve problems as a whole team. They anticipate that a few people will dominate and argue, that the problem will never be clearly defined and that the solution chosen will be the one that's easiest to implement. Yet one of the true benefits of teaming is the synergy created when talented minds create an idea or approach that no one person would have suggested alone.

A Simple Problem-Solving Approach

Most teams need to have a common problem-solving approach that they can use over and over to the point that it becomes automatic for them:

1. **Find the problem to work on.**
   - Brainstorm a list of problems to work on, select one by agreed prioritization criteria and draft a clear statement about that problem.
   - Identify the impact of the problem in terms of failure costs: How much is this problem costing us in terms of delays, rework and upset customers?
   - Draft a statement of the SMART (specific, measurable, achievable, realistic, time-bound) goal to be achieved when the problem is fixed.
2. **Analyze the problem.**
   - Identify the assumptions being made about the problem. A useful tool for this is Chris Argyris' Ladder of Inference that begins with a small piece of data, to which the team adds meaning, expands that meaning to an assumption, forms a conclusion and develops a belief. Based on that belief, the team takes action that often perpetuates the original problem. Requiring the team to lists its assumptions about the problem is a very enlightening experience.
   - Identify the data needed to test whether the assumptions are true.
   - Identify any other data needed to understand the problem more fully.
   - After the data are collected, synthesize the data into a clear understanding of the root causes of the problem. Tools such as Fishbone diagrams and/or interrelationship diagramming are useful at this point.
3. **Develop and select a best solution.**
   - Identify the criteria to be used for selecting a solution, and weight the criteria and what an acceptable score would be. For example, if the team uses five criteria and a five-point scoring scale, the top score would be 25. The team should identify how low a top idea can score as well.
   - Generate at least three solution ideas.
   - Give voice to both pro and con arguments for each idea to avoid the groupthink effect.
   - Score each idea against the team's criteria to surface the top idea.
   - Reach consensus to go forward with the top idea.
4. **Execute the solution to solve the problem.**
   - Define a specific goal for problem resolution, including a deadline.
   - Create a work breakdown that spells out the milestones, or "buckets of work," that must be accomplished to solve the problem. Identify an owner/champion for each bucket and specific time frames for completion.
   - Capture all deadlines on future team agendas to discuss progress and difficulties.
   - Complete a RACI chart showing responsibility and accountability for solution implementation.

- Use a tool such as a Gantt chart to track all tasks associated with the solution plan.
- Assign subteams to complete specific buckets of work if needed.
- Develop a method to monitor and measure whether the solution is working.
- Establish a corrective action plan if the solution idea is not effective.

Team Scoreboards and Performance Assessments

The quality-control maxim "what gets measured gets done" is equally valid for a team-based organization. The team will need to design two processes: one to track its performance and one to determine how it is functioning as a team.

Team Measurement Systems

As soon as possible, the coach or sponsor will want to help the team determine what results to measure on an ongoing basis. The team might measure the amount of work produced; the number of error-free days, customer complaints or delinquent action items; and improvements in cycle times, downtime and safety audits. Usually the team identifies four or five measures that it will track and discuss. This process of measuring results helps to build a sense of ownership and responsibility among team members.

To prevent a team from becoming too insular, it is helpful to include some measures that require the team to work closely with other teams or to be sensitive to the organization as a whole. However, it's important that the measures represent items that the team can control or influence through its own results. The goal is to get the team to own its measures, rather than management. That means the team must determine what it will measure, how it will measure, and how it will analyze results and discuss when things are going right or need improvement.

Special Tips on Team Assessments. Assessing a team's performance is not designed to put the team on the spot and show weaknesses. It is designed to help the team grow and develop, learning from its strengths and weaknesses. Along the way, certain points have proven to be important:

- The assessment system must reinforce and support the beliefs, attitudes and behavior required in a team-based organization.
- The team assessment process must begin early in the team's development and not be aligned initially with compensation or tangible rewards. Members should not be looking for a reward for standard performance required of all team members.
- It is best to assess total team performance before having members conduct peer reviews.
- Avoid linking other personnel decisions such as promotions, demotions and compensation to the feedback process, especially if negative feedback is likely.
- Individual peer reviews are best conducted when a team has reached an advanced stage of team building.
- When team members openly discuss problems they are having with other team members, they may exaggerate and generalize about the problems to gain team support. Members must actively work to avoid the bandwagon effect and maintain a level of open-mindedness.
- Plan to implement the individual team member review system along with the compensation system as the last areas in the team sequence.

The Teaming Road Map

How do you put all the pieces together and transform a workplace into a high-performance, team-based culture? To be successful, there are a number of pieces that have to be strategically placed to bring about the change. Unfortunately, some organizations use teams just to involve people (get their opinion and insights) but not engage them in the decision-making process. Others, in vastly reduced numbers, empower employees to run their piece of the organization's real estate — to own it like a home or small business. The teaming road map is designed to help the latter type of organizations initiate, plan, execute and control the teaming process.

Too often organizations launch pilot teams as their first steps, even though they are often clueless about what to do and how the teams will interact with the existing operational structure. The teaming road map provides the transitional structure to lead the organization from where it is to where it needs to go. The road map uses an inclusive, dynamic approach that must be customized along the way to the organization's unique requirements: There is no cookie-cutter approach to teaming. However, there are specific strategies that have proven to be successful when supported and encouraged by management.

Creating a Design Team

Managing the organizational upheaval that comes with converting to a team-based organization requires the formation of a design team — a multifunctional represen-

tation of the organization charged with recommending the new organizational structure to leadership. The job of the design team is to

- Design a natural value stream, or virtual work team structure, for the organization that supports productivity, safety and quality goals.
- Determine the launch sequence for all pilot and regular teams, including self-directed, cross-functional, multifunctional and even cross-cultural teams.
- Implement the team structure in a planned, effective fashion.
- Initiate other change support teams, including the communication team and the in-house training team.
- Develop and implement systems to monitor and evaluate the progress of the teams.
- Champion the continual improvement of the team structure for the long-term benefit of the organization.

Launching Work Teams

If the organization intends to launch multiple workforce teams within a short period of time, the design team provides the ideal mechanism to organize and orchestrate the rollout. The design team must consider the readiness of the areas where teams will be launched, the rollout schedule for new team coaches, the organization's critical areas in terms of workload and schedule and the feasibility of getting the teams trained. The design team creates the master rollout schedule, notifies the coaches and teams and oversees the process, troubleshooting as any problems arise.

Virtual Teams

Not only does the design team need to address the local transition but also the effect on virtual teams in the organization. Virtual teams are defined as teaming networks, or virtual communities, that exist outside geographical boundaries yet are committed to common goals and approaches, similar to co-located teams. To succeed, virtual teams must follow these guidelines:

- Team members must regard communication as part of the work of the team, not as support for work or adjacent to work, but designed as an intentional action with firm rules.
- Logging on is a signal of the team member's arrival in the electronic workplace. Skills in working with electronic tools and virtual operations are required of all team members. Team members must agree on standard technology common to all.
- Team members must believe that virtual members want the same results as they do even though they all work independently. Face-to-face time in the beginning of the team's formation is critical to forming this belief.
- Team members must proactively seek out the information needed rather than wait for it to come from others.
- Coaches must understand that leadership in a virtual team requires the ability to keep the team focused on its overall mission and goals, manage a complex network of dependencies, create and sustain virtual communication and relationships, and present technologies in ways that team members will utilize and embrace.
- Team members must visualize themselves in a teaming community, establishing regular times for team interactions, including informal chitchat, socializing and celebration.
- Team members must learn to test assumptions as a regular part of communicating and give and receive feedback, especially with team members who are communicating poorly. Team members must be reminded that the written word can be viewed as much more harsh than the spoken word.
- Although the team's meeting room is a virtual setting via the Internet, e-room, website or electronic bulletin board, team members must understand that all the roles and meeting protocol requirements are the same as for co-located teams.

Individual Team Road Map

Typically, most teams find themselves between various phases of team development. The teaming road map provides a structure for the teams to use that identifies the competencies needed at each phase of teaming and a mechanism for assessing whether they are being demonstrated. As teams accomplish each phase of the road map, they can elect various rewards and/or recognition to motivate their advancement. Simultaneously, as the coach increases the level of the team's accountability, the coach is also assessed on his or her skill and development.

Mastering Civility

A Manifesto for the Workplace

by Christine Porath

THE SUMMARY IN BRIEF

Incivility is silently chipping away at people, organizations and our economy. Slights, insensitivities and rude behaviors can cut deeply and hijack focus. Even if people want to perform well, they can't. Ultimately incivility cuts the bottom line.

In *Mastering Civility,* Christine Porath, the leading authority on workplace incivility, shows why it pays to be civil and how people can enhance their influence and effectiveness with civility. Combining scientific research with fascinating evidence from popular culture and fields such as neuroscience, medicine and psychology, Porath makes clear what's really at stake regarding civility, helps individuals evaluate and improve their own behavior and provides valuable strategies for how leaders can find and keep employees who help to create civility in organizations.

Mastering Civility provides managers and employers with a much-needed wake-up call, while also reminding them of what they can do right now to improve the quality of their workplaces.

IN THIS SUMMARY, YOU WILL LEARN:

- The physical, psychological and monetary costs of incivility for individuals and organizations.
- Why you can be civil *and* get ahead.
- To evaluate your own civility and concrete strategies to improve.
- A four-step plan for organizations to improve civility.
- How to respond if you are the target of incivility.

Introduction

One question defines our professional success more than any other. Just one: *Who do you want to be?*

Whether you know it or not, you're answering this question every day through your actions. How you treat people means everything — whether they will trust you, build relationships with you, follow you, support you and work hard for you, or not.

In the past 20 years, the incivility problem has gotten much worse. All of us desperately need to change this reality, for the sake of people *and* organizations.

Many leaders know that incivility is costly, but they don't always recognize just how much civility pays or how to make it happen. Research confirms that your kindness, consideration and respect can have a potent effect, creating a positive dynamic of civility that others will respond to and build on.

Ask yourself who you want to be several times a day as you react to all the challenges, victories, surprises and tensions you encounter. How do you want to affect people? What impact do you want to have? Take the advice and science presented here to answer these questions, and make your team, organization and society a bit better.

PART I: THE STAKES: THE HIGH COSTS OF INCIVILITY AND THE POTENTIAL GAINS OF CIVILITY

Clueless

In the Civility in America 2016 survey, almost all respondents — 95 percent — believed we have a civility problem in America; 74 percent believed it was worse now than it had been a few years ago; and 70 percent believed incivility has reached crisis proportions. By all accounts, incivility has only gotten worse.

Rude behaviors range widely — from ignoring people to not listening to intentionally undermining others. Other common examples include walking out of a conversation due to lack of interest or answering calls in the middle of meetings. Some leaders behave uncivilly by publicly mocking and belittling people; reminding subordinates of their "roles" and lesser titles in the organization; teasing direct reports in ways that sting; or taking credit for wins, but pointing the finger at others when difficulties arise.

In any of these instances, what matters is not whether people actually were disrespected or treated insensitively but whether they felt disrespected. Incivility is in the eyes of the recipient. It varies not just by individual but also by culture, generation, gender, industry and organization. What you consider uncivil may not be the same thing your boss considers uncivil. And guess what. What you think matters *most!*

Interpreting the Trends

Why is incivility getting worse? One factor is globalization — colleagues from one culture sometimes unknowingly behave or speak in ways that colleagues from other cultures find rude. Another factor is generation. Research conducted by Jean Twenge, professor at San Diego State University, reveals that students are about 30 percent more narcissistic than the average students were 25 years ago. We can also tie our epidemic of rudeness to a general fraying of workplace relationships.

In a survey, respondents were asked why they behave uncivilly. More than half claimed it was because they are overloaded, and more than 40 percent said they had "no time to be nice." A quarter said they were rude because their leaders were disrespectful.

A crucial point is that *incivility usually arises not from malice but from ignorance.* Most bad behavior reflects a lack of self-awareness. We don't want to hurt others, but we do.

Sidelined

Modern science has a lot to tell us about the health impacts rudeness can have. Robert Sapolsky, author of *Why Zebras Don't Get Ulcers,* explains that when people experience intermittent stressors like incivility for too long or too often, they also experience significant health problems. Incivility can deplete your immune system, causing cardiovascular disease, cancer, diabetes and ulcers. Studies have found that "psychosocial" factors, such as work-related stress, are the most important variables in determining the length of a life.

All of this costs organizations a ton of money, to put it mildly. The American Psychological Association estimates that workplace stress costs the U.S. economy $500 billion a year. A poll of 800 managers and employees across 17 industries shows that among workers who have been on the receiving end of incivility, 48 percent intentionally decreased their work effort, 80 percent lost work time worrying about the incident, and 78 percent said their commitment to the organization declined.

As monumental as losses due to incivility are to companies, incivility exacts an even deeper toll because of the subtle ways in which it affects people's thinking skills. Experiments show that incivility robs you of your cognitive resources, hijacks your performance and creativity, and sidelines you from your work. Even if you want to perform at your best, you can't, because you're bothered and preoccupied by the rudeness.

In a study of 4,500 doctors and nurses, 71 percent tied disruptive behavior (defined as "abusive personal conduct," including condescending, insulting or rude behavior) to medical errors they knew of, and 27 percent tied bad behavior to the deaths of their patients.

Once incivility occurs, it's easy for negative thoughts to seep into people's heads and to stay there, translating into negative behavior. Experiments show that once people are exposed to rudeness, they are three times less likely to help others, and their willingness to share drops by more than half. It makes sense: When someone behaves poorly or offensively, bad feelings spread and behaviors escalate, sometimes even becoming aggressive.

Civility Buys Everything

It's tempting to think that if you're not rude, then you're behaving in a civil fashion. In fact, you're only behaving in a neutral way; you haven't harmed anyone. Civility in the fullest sense requires something more: positive gestures of respect, dignity, courtesy or kindness that lift people up.

In the workplace, civil behaviors can be extraordinarily small. A colleague can smile and say hello to you in the hallway; an associate can ask an assistant to *please* do a task and thank her after she completes it. Leaders can behave civilly by engaging others in conversation rather than ordering them around, or by taking time to applaud subordinates when they do a good job.

Movin' On Up

Civil people usually have more opportunities for collaboration handed to them. Think about it: If you needed help from a colleague, would you call upon someone who was nice or someone who was more capable but a bit uncivil? Most people claim they would select the more capable one, arguing that ability is what counts. Yet, their actions don't match up.

In a study of more than 10,000 work relationships, people chose colleagues for collaboration by asking the question "Do I enjoy working with her/ him?" rather than the question "Does this person know what he/she is doing?" If you treat people well, they're more excited to work with you. Over time, your reputation spreads, and still more people want to choose you over a possibly more talented but less civilized peer.

What ultimately helps people move up faster, of course, are the results they produce. And civility helps here, too. Research confirms that small behaviors, such as thanking people, listening attentively, humbly asking questions, acknowledging others, sharing credit or smiling, can give you a performance boost, while their converse — seemingly insignificant acts of incivility — can cost you.

Civility Cultivates Team and Organizational Wins

Research shows that civility enhances the performance of teams and organizations as well. A study of cross-functional product teams revealed that when leaders treated members of their team well and fairly, the team members were more productive individually and as a team. They also were more likely to go above and beyond their job

requirements. It all starts at the top. When leaders are civil, it increases performance and creativity; allows for early mistake detection and the initiative to take actions; and reduces emotional exhaustion.

The Incivility Bug

Many people think of rudeness as a self-contained experience, limited to one person or interaction. In truth, incivility is a virus that spreads, making the lives of everyone exposed to it more difficult.

We each have a much bigger effect on one another's emotions than we might think — for better and for worse. In their book *Connected,* Nicholas Christakis and James Fowler show how happiness spreads not only among pairs of people but also between a person and his friends, his friends' friends and their friends. Civility and incivility spread the same way. A seemingly small act of kindness or rudeness ripples across communities, affecting people in our network with whom we may or may not interact directly.

On a non-conscious level, people become aware of the concept of rudeness when they're around it in any form, even when they aren't the target of it directly. A node in the brain is activated, and this activation rapidly spreads across the neural network to nearby nodes. In practical terms, a rude email you read might activate nodes in your brain associated with memories of other encounters in which you experienced or witnessed rudeness. In your mind, the activated concepts — in this case, rudeness and incivility — become more accessible; they come to mind and can shape your judgments and decision making.

If incivility can spread rapidly, its effects lingering long after the initial instance of rudeness, then civility can, too. It's up to us to gird ourselves against rudeness, to fight back hard when it's expressed, and to do everything we can to spread kindness and joy to those around us. Each one of us, through even the smallest of actions, has the capacity to create an atmosphere that's warm, affirming and energizing. We can do it today — right now.

PART II: CIVILITY CHECKUP: HOW YOU ARE DOING AND HOW YOU CAN IMPROVE

Are You Civil?

Now it's time to get real. *Are you civil?*

Do you ever neglect to say "please" and "thank you"; use email when face-to-face communication is needed; email or text during meetings; keep people waiting needlessly; talk down to others; pass the blame when you've contributed to a mistake; spread rumors; belittle others nonverbally (e.g., roll your eyes, smirk); retreat into your e-gadgets; take advantage of others; don't listen; ignore invitations; write uncivil or rude emails; or interrupt others?

Don't get down on yourself if you do many of these. Some of us have an advantage: We are genetically predisposed to be nice due to hormone levels. But in the end, we're all human. The point is to improve your behaviors.

To gain the self-awareness you need, you must solicit others' help. Ask others to serve as an honest mirror for you, using the following seven simple strategies.

1. Ask for focused feedback on your best and worst behaviors. Collect feedback from about 10 to 15 people — including co-workers, friends and family — about your best behavior and areas for improvement.

2. Work with a coach. A great coach can detect subtleties in your behavior of which you might not be aware, and can identify underlying assumptions, experiences and personal qualities that make you prone to uncivil behavior.

3. Conduct a team tune-up: Use colleagues or friends as coaches. Making progress on civility doesn't have to be a solitary endeavor; you can and should do it alongside other members of your team. While you're working to improve your own behavior, encourage your team members to do the same.

4. Get 360 feedback. Identify one behavior you'd like to change. This could have come from the civility test or from others' feedback, including performance reviews. Then solicit feedback from your teammates, direct reports, and managers — "360 feedback" — about how you might change.

5. Teach yourself how to read emotions. Observe others closely as you go about your day, especially people who seem to be great at civility. Use emotional intelligence quizzes and tools to test how well you're able to read others and their emotions. Look for role models.

6. Make time for reflection. Keep a journal to provide insight into when, where and why you are your best self and when, where and why you are uncivil. Identify people or situations that cause you to lose your temper.

7. Take care of yourself. The most common reason people give for behaving poorly is the feeling of being overloaded or stressed. So take better care of yourself, starting with the basics: good nutrition, sleep and stress management.

The Fundamentals

To become more civil or help your organization build a more civil culture, you need to focus first on getting the basics right. Let's start with the low-hanging fruit, the small behaviors we frequently overlook that allow us to connect by our being attentive. For now, just think about doing *three* things differently.

First civility fundamental: Smiling. The act itself of smiling lifts your mood, boosts your immune system, decreases stress, lowers blood pressure and reduces your risk of heart attack. And smiling rubs off on others. How do you get yourself to smile more? Try an "inside-out" approach. Think about what makes you happy — maybe it's your kids or a favorite hobby or a joke someone told you — and then think about that when you want to smile.

Second civility fundamental: Building relationships with subordinates. The Center for Creative Leadership (CCL) found that the most important success factor for those holding the top three jobs in a large organization was "relationships with subordinates." According to a study by Towers Watson, the greatest driver of engagement was whether workers felt their managers were genuinely interested in their well-being. To relate well with a subordinate, you first have to acknowledge him or her. Practice the 10/5 Way: If you're within 10 feet, make eye contact. If you're within five feet, say hello. Take more time to know the people working for you.

Third civility fundamental: Listening. Listening well is essential for creating, maintaining and deepening relationships; it signals caring, commitment and connection. Listening can also yield vital information and insights. Yet, listening is hard work, requiring both energy and concentration. How can you listen better? Be there completely. Make a list beforehand of questions or topics you want to cover to prevent brain freeze. Get into the moment with the person facing you. Dump distractions; try to clear your mind of all of them. Put your phone away and put your blinders on. Focus all your attention. Join in on the conversation in the fullest sense.

Judge Not

It's well known that diversity adds value to organizations, allowing groups to perform better, make smarter decisions and be more innovative. Diverse organizations that welcome everyone possess greater insights into the marketplace. Diversity is also a valuable recruiting tool that helps organizations land top talent.

Yet diversity's true value depends on teammates' culture and attitudes. People need to feel respected in order to contribute. And that's where civility comes in. We must treat everyone well, including individuals who are different from ourselves or think differently.

Data shows that true inclusion is quite difficult for most people. Even if we consciously want to, we have a hard time welcoming others in. In fact, we show unconscious bias, often through subtle attitudes or actions.

The first step in fighting unconscious bias is to make an effort to bring silent assumptions out into the open. Ask yourself, "What biases do I carry?" "Whom does that affect?" "What are the consequences?" Awareness is the crucial first step.

As social neuroscientists Jay van Bavel and Will Cunningham have shown, an effective strategy for limiting unconscious bias is to take a moment to focus on similarities and common identities. Think about your connections with people. List what you have in common with someone, however different he or she seems to be. Emphasize your shared identity as parents, as residents of a city, as fans of a sports team, as members of a religious community, etc. It's human nature to feel positively toward members of our own group, so the key is to find a shared identity or group.

Try providing structure or routines in areas like hiring, performance evaluations, and promotion decisions that prevent unconscious biases from creeping in. Make it a point to slow down, weigh all the evidence and remove subjectivity from the process. Finally, combat your biases by including others' opinions. For important work decisions, use committees. Research shows that teams with divergent opinions tend to make better, less-biased decisions.

Give More

Once you have the fundamentals of civility in place, take your game to the next level. To master civility at work, we need to give many things, not just smiles. Here are five forms of giving that are especially important for building an atmosphere of kindness and respect.

1. Share resources. To increase your civility, share the tools, knowledge, social contacts and time at your disposal. In a study of more than 400 employees of an international consulting firm, the highest performers shared more than twice as many resources with co-workers than their average or lowest performing colleagues did. Sharing not only elicited a feel-good response but also enhanced

productivity. Of course, you have to be smart about how much and what exactly you give.

2. Share recognition. Look for ways to give credit to everyone who helped you earn any kind of recognition, even if you deserve the lion's share. As scholar and author Warren Bennis has noted, good leaders shine under the spotlight, but great leaders help others shine.

3. Share gratitude. Saying thank you sets you apart. Do you know that most people thank their co-workers once a year at most? Feeling genuinely appreciated lifts people up. It energizes. It's also a powerful tool for encouraging the right behaviors.

4. Share feedback. Help your reports feel valued by giving them regular knowledge and updates on how the business is doing. Create a compelling scoreboard that highlights top priorities or important goals and, more specifically, the current situation, the target result and the deadline. Don't forget to give feedback on personal performance as well.

5. Share purpose. Most people want to do meaningful work, but too many believe their efforts don't make a difference. That's too bad: Having a sense of meaning at work encourages personal growth, work engagement and well-being. Instilling others' work with a sense of meaning also carries benefits, increasing a sense of thriving and performance for that person while also cultivating stronger, deeper relationships.

Practice E-civility

Although email has helped businesses in countless ways, it has also unleashed a torrent of incivility in workplaces. Angry emails, emails meant to embarrass, inappropriately informal emails, excessively long emails — the ways a sender can show disrespect are endless, equaled only by the number of ways receivers can show disrespect: by failing to respond on time or at all, by needlessly selecting "reply all" or by forwarding emails to make someone look bad. In addition to everything we do to foster civility, we need to get our email etiquette in check so we aren't polite offline and monsters online.

Master the ask. Before you send an email asking for something, make sure it's something you really need and something that's appropriate to request from the receiver. Be brief and direct when making a request. Include who, what, when. If the person needs to act on your message, make that clear in the subject line. Thank the recipient — genuinely.

Know when not to send. Sensitive issues, conflict situations and performance reviews all call for an actual, physical presence. A good rule of thumb: If you're wondering whether or not you should send that email, stop. Don't send it. Pick up the phone or meet face to face.

Set a tone of respect. Leaders establish norms about respectful email conduct through their own habits and routines. For instance, if leaders typically send out emails in the evenings and during the weekends, employees will likely feel compelled to read and respond to them. If you write emails at all hours, consider placing them in draft folders until working hours, or use a delayed delivery service.

PART III: LIFT YOUR ORGANIZATION CYCLE TO CIVILITY

How can organizations systematically alter their cultures to make them more civil? The four-step plan called Cycle to Civility covers the entire employee life cycle: recruiting, coaching (orientation and training), scoring (evaluation and rewards) and practicing (improvement, termination and exit).

Recruit

As researchers Dylan Minor and Michael Housman found, one toxic employee can wipe out the productivity gains produced by two or more superstars. A superstar (defined as the top 1 percent of workers in terms of productivity) adds about $5,000 to an organization's annual profit, while a toxic worker costs about $12,000 annually. That's why it's especially important to weed out toxic people before they join your organization.

Throughout the interview process, stay on the lookout for signs of civility. Forgo hypothetical questions, such as "How would you handle…?" or "What would you do if…?" and instead ask the candidate specifically how he or she managed particular situations in the past. Make your organization's values explicit, and inquire how his or her past behavior matches up.

Have team members go out to lunch or dinner with candidates or take them out to an event, such as a ball game. You want to give candidates a firsthand opportunity to observe your team and organizational values, to help them consider whether they're willing to sign up.

It's essential to do your homework on job candidates. Ask references for specific behavioral examples of characteristics that get at the heart of civility, such as "What's it like working with Joe?" or "What could Joe improve on?"

Regardless of what the job is, or how "good" or "bad" a candidate may seem to you, treat him or her respectfully. At Google, internal research shows that candidates' interactions with interviewers are more important to them than the type of work for which they're being considered, the benefits or their interactions with recruiters. Make sure anyone interviewing candidates is civil in their own right.

Coach

Great coaches help people understand what to do to perform well, breaking it down into a few manageable steps. They also don't allow players to get too comfortable or forget the basics. Our organizations must do the same when it comes to civility. The way organizations can properly coach civility is to set expectations, sculpt civility, create norms and provide coaching.

Set expectations. Most companies' mission statements contain some language about how employees should treat customers, but very few mention anything about how employees should treat one another. A single, simple sentence can set the tone for civility. Southwest Airlines' mission statement contains the following: "Above all, employees will be provided the same concern, respect, and caring attitude within the organization that they are expected to share externally with every customer."

Sculpt civility. Reinforce civility at every turn. Make it second nature — so familiar that people don't even think about it; they just do it. Emphasize civility's importance during employee orientations. Repeat it like a mantra. Make it a talking point at every meeting. Challenge employees to master civility fundamentals.

Create norms. Don't simply impose civility. Engage employees in an ongoing conversation, defining precisely what civility means. You will garner more support and empower employees to hold one another accountable for civil behavior by involving them in the process.

Provide coaching. Beyond formal training, coach employees on specific civility fundamentals to get your employees in tip-top form. Help them to listen fully, give and receive feedback (positive and corrective), work across differences and deal with difficult people. You might also coach them on negotiation, stress management, crucial conversations and mindfulness. A coach who reviews fundamental concepts and expectations must also be ready to hold his or her employees accountable, pointing out bad behavior for first-time offenders.

Score

What if you had a way to rate an email a colleague sent you or a status update a friend posted on social media, solely based on how respectful it sounded? That would be a game changer, wouldn't it? One concept would be simple: Use an online tool to provide instant feedback about the civility of a person's communications — similar to Facebook's emoji or thumbs-up feature; the person could learn how they are perceived and moderate their behavior accordingly.

What's your current system of performance metrics like? Does it help foster the civil behaviors you're trying to encourage? If not, here are a few key things you can do to start.

Go beyond results. Focus more generally on the *how* of the work when evaluating performance and not just the actual results. Think about the type of work that gets done and the way kindness and respect might come into play. Use that to arrive at a formulation of appropriate evaluation metrics. Then combine these metrics with more conventional metrics that measure performance.

Thank people for helping. The time employees spend engaged in "collaborative" work — attending meetings, making phone calls, answering emails — has increased in recent decades by about 50 percent, now constituting 80 percent or more of employees' time. Yet most performance management systems aren't capturing how employees interact with one another — the very basics of effective collaboration. A simple thank-you would go a long way toward helping all-star collaborators stay engaged.

Measure down and across, not just up. When it comes to incivility, people tend to kiss up and kick down; you thus need to understand what subordinates and peers and bosses think of an employee. The 360 feedback many organizations currently utilize can work great, but only if sufficient trust exists. If employees don't feel confident about the anonymity of their input and how it's being used, their 360 feedback will misinform you.

Practice

What do you do if your evaluation or scoring system uncovers employees who are behaving uncivilly? You have two options: Work with them or show them the door.

The vast majority of employees who behave rudely can improve their behavior. As one CEO put it, they can be

"recycled." Let's see how you might best work with an employee who has behaved uncivilly.

Establish a feedback loop. To help change people's behavior, follow a specific feedback loop described by coaching guru Marshall Goldsmith. This loop comprises four steps: evidence, relevance, consequence and action.

Evidence should have been revealed during the evaluation stage; for instance, a manager receives feedback that he doesn't listen to employees or he tends to demean employees in front of others.

To establish the *relevance* of this feedback, ask yourself how the manager compares with his peers. Is his performance suffering because of his subpar, uncivil behavior? If so, the feedback becomes relevant.

You should attach *consequences* to the uncivil behavior so as to motivate change. As Goldsmith has remarked, "People will do something — including changing their behavior — only if it can be demonstrated that doing so is in their own best interests as defined by their own values."

If you're satisfied that the employee wants to improve, it's time to proceed to the *action* phase. First, develop a plan with the employee. What do you want him to achieve? What will make him more effective? What do you expect him to change? How will he achieve these plans? Strive for clearly defined, tangible, trackable goals. From here, start the hard work of practicing. Working alone or with the assistance of a coach or mentor, the employee should identify the trigger(s) of his bad behavior.

After an employee has identified the triggers and understands the consequences, Goldsmith has them apologize — ideally face-to-face — to everyone affected by their uncivil behavior and ask them for help in getting better. Following up is especially important. An employee who checks in with colleagues every month for 12 to 18 months reminds the colleagues that he or she is trying and values their opinion.

By working on all four of these steps, your organization won't just free itself of the scourge of incivility; it will reap the full benefits of a pervasive culture of kindness and respect.

PART IV: LIFT YOURSELF: HANDLING INCIVILITY IF YOU'RE THE TARGET

Your Antidote to Incivility

Your antidote to incivility comes down to one core message: Focus on yourself and your future. When people mistreat you at work, you have to take control. The way to do that is to bet on yourself, not on your ability to change the offender or the organization in which you work.

Regardless of how sensitive you are or how quickly you recover, you need to manage your response to incivility, both in the moment and shortly afterward. During this brief window of time, events can quickly spiral out of control, affecting both you and your career. Behave wisely. Remind yourself of what is at stake. Follow the cardinal rule: Don't get sucked in. Give yourself some space to decide what to do. And, above all, avoid the temptation to get even. Doing so will likely require you to stoop to the other person's level, which in turn might prove damaging to your reputation.

Above and beyond how you deal with the perpetrator, another factor can buffer civility's toxic effects: a sense of *thriving.* People who focus more on thriving following an incident of incivility report that their performance suffered 34 percent less. Reinforce your sense of thriving by focusing on personal growth and learning: Identify areas for growth and actively pursue development in those areas; look for opportunities to innovate; turn to a mentor; take good care of yourself by managing your energy; find meaning or a sense of purpose; seek positive relationships inside and outside work; and focus on thriving outside work.

You have more control than you think. Your attitude, mindset and willfulness can make all the difference. Don't let someone make you a smaller version of yourself. Take a deep breath. Gather yourself. Refuel. Stand tall. Play big.

In the end, it's relationships that truly matter, and civility is the foundation of relationships. So what are you doing today to connect with others?

In each moment, we get to choose who we want to be. Who do *you* want to be?

Extreme Teams

Why Pixar, Netflix, Airbnb, and Other Cutting-Edge Companies Succeed Where Most Fail

by Robert Bruce Shaw

THE SUMMARY IN BRIEF

Great achievements are almost always the work of great teams. But most leaders rely on decades-old ideas and practices about teams developed by companies that have lost their edge. Times change and so must our teams. Those who cling to outdated views of teamwork and team-building will be left behind. So, what do you need to do to create a team that can successfully face the challenges of today's world?

To answer that question, Robert Bruce Shaw examines the work practices of innovative, high-growth companies such as Whole Foods, Pixar, and Netflix. These firms became ground-breaking leaders in their industries, in part, by boldly rewriting the rules of teamwork. *Extreme Teams* provides a detailed analysis of how the leaders at these companies think and operate — and, in particular, describes their approaches for creating high energy teams that deliver extraordinary results.

Filled with success stories from some of the most exciting firms operating today, *Extreme Teams* will push you to think about teams in new ways. It is filled with pragmatic suggestions that you can use to move your team to the next level of engagement and performance. It is for those who want to go beyond traditional approaches to teamwork and build truly great groups.

IN THIS SUMMARY, YOU WILL LEARN:

- How to build a new team or turn around an unproductive team.
- Establish clear, concise and obtainable team values.
- Create an innovative and cooperative company culture.
- Redefine and embrace conflict in order to produce results.

Revolutionizing the Way We Work

Whole Foods is a purpose-driven company that takes very good care of its people. Three guiding principles underlie the team environment at Whole Foods. First, the company believes that people are by nature social beings who feel most comfortable when part of a small group. From this perspective, building a company around teams is building a company based on human nature. Everyone in the company belongs to a team. Teams, when designed and staffed properly, also maximize what people can contribute to the success of a business. A second management principle shapes how teams operate at Whole Foods. The company believes teams function best when they embrace a set of companywide practices. Teams at Whole Foods have a great deal of autonomy to make decisions that benefit customers, team members and the company. A third guiding principle at Whole Foods is a belief in the benefits of being open and transparent as a company. The goal is to create a "no secrets" environment where information about its strategies and operations is available to all employees. The firm believes that creating a high-trust culture requires sharing information that is concealed in most firms — and working with people to ensure that they understand the implications.

Potential Problems in Designing Teams

Most companies view teams and teamwork as good things. As a result, the use of teams is on the rise across all companies, with collaborative activities increasing by more than 50 percent over the past two decades. Teams, without question, provide a competitive advantage when they operate well.

The problem is that designing and managing teams is a complicated undertaking requiring a level of creativity and commitment that many firms, and their leaders, lack. The most basic, and common, mistake is to use a team when a team is not needed — that is, the work is better done by individuals not working as a team. The return on the investment of having a team needs to be greater than the benefit of not having a team at all.

A second mistake is failing to provide the support a team needs to be successful (such as group-level rewards). Companies often embrace teams, or at least the concept of teams, without providing attention to what is needed for them to be successful.

A final misconception about teams, or at least high-performing teams, is that they are easygoing places to work. Some companies, including Whole Foods, contribute to this belief by emphasizing the benefits of a friendly work environment. But what is often missing in the accounts of employee-friendly companies is the intensity of working in an environment where talented people, obsessed with their world, hold themselves and others accountable for producing results at a high level. Teams, when well designed, increase the pressure that their members feel to deliver for the group — to deliver for their peers.

Pixar believes that producing great films requires something beyond having highly talented and committed people. The firm believes, given the innovative and complex nature of its films, that success is unlikely if a team doesn't "gel." A common assumption is that people will naturally bond when they become members of a team. Pixar takes care to staff its teams with people who have complementary skills and personalities — people who can work in the intense and often ambiguous environment that comes with producing one of its films. In fact, having people who are too similar may make it easier for them to work together, but it will most likely undermine

the team's creativity. The goal is to find a group of people who can bring their unique talents and experiences to a project and then come together as a team to produce something beyond what they could do as individuals.

Communal and Exchange Relationships

Pixar is unique in being softer than most companies ("The people at Pixar are my best friends") and also harder ("We will fire best friends when needed to make a great film"). One way that academics look at the "hard/soft" dynamic is to distinguish between communal and exchange relationships.

Communal relationships are those based on supporting others without expecting anything in return. Exchange relationships, in contrast, are based on what others provide you and, in turn, what you provide them. These two types of relationships are viewed by most as mutually exclusive. This is the case because each operates with a different set of rules and expectations.

To say that cutting-edge firms and teams operate based primarily on the dynamics of exchange relationships is to miss the depth of communal bonds within these firms and, in particular, the importance that they place on relationships. These firms are hybrids — possessing both communal and exchange qualities. They blur in their own unique ways the distinction between exchange and communal relationships in a manner that combines the positive qualities of each.

Results and Relationships

The goal for Netflix, and other cutting-edge firms, is to create a culture obsessed with results without creating a culture that is too harsh. What is the point at which a firm or team pushes too far on results and, in doing so, undermines the very outcome it desires?

Let's start by defining results. Broadly stated, *results* means that a team delivers what is expected of it by those who benefit from its products and services. This is often seen as a team meeting the expectations of its customers or clients. These goals can involve financial targets (such as monthly sales), as well as growth targets (such as the percentage of customers using a firm's products). Viewing results only in terms of financial outcomes, however, is too limited. In some cases, teams work toward goals beyond, or even in conflict with, revenue and profit. Results, then, are much more than simply achieving financial targets — cutting-edge teams achieve results that move their firms closer to their stated reasons for being. The goal, according to the Whole Foods CEO, is to take the right action for the right reasons — which are actions that advance the higher purpose of the firm.

Social Capital

Robert Putnam, a sociologist and the author of *Bowling Alone,* uses the term *social capital* to describe how relationships among members operate in a variety of settings, including nonprofit, public and private organizations. Social capital, in the simplest terms, is the "glue" that connects people together and, in so doing, helps groups, organizations, and society function more effectively. Social capital consists of three types of relationships: bonding, building and believing.

Bonding with Fellow Team Members: The connection among members within the same group. This includes the ability of team members to gel and produce something greater than the team members could produce working alone. It involves feeling connected to a group of people who share a common goal.

Building Partnerships with Other Teams: The connection among people who work in different groups. Team members need to work productively with other teams. This involves more than simply being aware of those in other groups — It requires a more personal awareness and investment in the relationship.

Believing in One's Company and its Leaders: This is the connection that people have to the organization that employs them. It is based on the belief that their organization is doing the right things and is worthy of their commitment. This results in an emotional investment in the firm and its reasons for being.

Results and relationships, then, are the two essential outcomes that firms and their teams need to achieve. However, both results and relationships have potential downsides. An excessive emphasis on results can embolden people to cross ethical and legal boundaries. Relationships, like results, can also be pushed too far. In particular, strong interpersonal bonds among teammates can lead to increasingly negative outcomes for a team. The bonds can become so strong that they result in viewing others as outsiders who are not to be trusted.

The goal, of course, is to create virtuous team cycles in which results and relationships operate in a manner to produce ever higher levels of team performance.

Foster a Shared Obsession

A paradox of cutting-edge firms is that they make more money because money is not what they care most about. In this regard, they don't act like the stereotype

of a firm focused only on quarterly earnings. They are not even fixated on growth. They make money because it allows them to do the work they love. Profit, in these firms, is necessary and important — but insufficient as a reason for being.

Obsession may not be healthy, but it describes a core attribute of great companies and teams. Obsession comes in three frequently interconnected forms:

- An obsession with the work itself and the resulting product. This is the most important form. In many cutting-edge firms and teams, people view work as central to their identities — not something they do but something they are. People and teams in these firms act with a relentless focus on getting it right.
- An emotional investment in building a great company. Cutting-edge teams want people to be equally obsessed with the culture of their firms. They want those who are consumed not only with their work; they want people who are consumed with creating relationships that are the foundation of a great company.
- The desire to have an impact on society — in most cases, this involves improving the world through one's products, services, and way of operating.

Obsessive teams can be so task focused, so lacking in empathy, that they damage relationships within the teams as well as with those in other teams. But far worse is a group where people are simply doing their jobs — even if they do them well. Obsession is the foundation for making great things happen.

Value Fit Over Capabilities

The stronger and more unique the culture of a firm or team, the more important fit becomes. Cutting-edge firms are passionate about their beliefs and have particular ways of operating. They would rather hire people who are "A's" in regard to cultural fit and "B's" in regard to their talent.

A leader's job, in large part, is hiring and motivating the right people for a particular task. The ability to assess the capabilities of individuals and then determine how they will work together to produce a desired outcome is more of an art than a science.

The simplest definition of *culture* is "the way things are done around here." Each firm has particular patterns of thinking and behavior, which develop over time as a firm overcomes challenges in its efforts to survive and grow.

There are several risks when resumes become more important than cultural fit:

- Those who don't fully buy into a firm's mission and way of operating are, in most cases, less likely to give their all to make their company or team successful.
- Those who don't fit a firm's culture become toxic to that culture.
- People who don't fit a firm's culture are more likely to hire others who also don't fit the culture.
- Those at odds with a firm's culture will not be able to get things done within that culture because they don't understand how the culture works, or they understand it but devalue it.

Cultural fit is a key to influencing others and getting them to work with you in a collaborative manner. It is particularly important when staffing initial positions within a company or team. The tone set by early members of a group impacts subsequent hires and, as a result, has a disproportionate influence on the group's emerging culture. Therefore, great care is needed in selecting a group's first hires to ensure that these individuals fully embody what leaders want to see in their groups.

There are potential downsides to being too focused on hiring those who are a cultural fit. A team that values cultural fit over experience or capabilities may fail to hire or promote necessary talent. Most firms, cutting-edge groups included, look for a threshold level of capability before cultural fit is considered in the hiring or promotional process. The goal is to deliberately hire those who will challenge the status quo within the firm and, as a result, make the firm stronger. An emphasis on culture also requires removing those who, once hired, turn out to be a bad fit.

Developing Values

Most large firms have a set of values that define their ideal cultures. These values, however, often fall short on several fronts:

- Developing a set of values that are so general that they have no real impact on people or their behavior within a firm. There needs to be some authentic edge to the values that are essential to realizing the firm's purpose and values.
- A long list of values that cover everything that could possibly be important to a company or group. The result is a set of values that people either don't remember or don't use to guide their behavior (as there are simply too many to follow).
- A group's values are often defined at such a high level that people don't know what they look like in action.

Values should be defined in terms of expected behavior — both in positive and negative terms.

- A failure to link them to a firm's objectives and work practices.
- Articulating values and then working in a manner that violates them. That is, the company espouses one set of cultural beliefs but acts on a different set of beliefs.

Self-Awareness and Fit

The key is to find those who can partner with others to produce what is needed and, more generally, help build a sense of community within the company or team. Self-awareness is essential if people are to work well together. Cutting-edge teams, then, look for fit on three attributes in making their hiring decisions:

Belief in the Firm's Higher Purpose: Is the person "all in" in his or her support of the firm's core purpose? Does he or she have the necessary passion, if not obsession regarding the firm's reason for being?

Ability to Deliver Results: Does this person have the drive, temperament and skill needed to deliver necessary results at the highest level?

Ability to Build Relationships: Does the person have the drive and temperament needed to develop close, working relationships with his or her team members and with those in other teams?

Each firm or team needs to determine how to screen applicants for each of these three attributes, which will vary depending on the firm and how it defines success in each area.

Focus More, then Less

Every firm and team has limits in regard to staff, time, and resources — and thus needs to focus on the areas that have the highest return on investment in relation to its growth strategy. The other factor that makes prioritization difficult is the risk inherent in doing so. Focusing only on a few priorities means that those few priorities had better be the right priorities. Focus also requires that those selected priorities be executed at a high level. Otherwise, failure to do so will be evident to all.

Understanding Context

Getting everyone to align around a set of priorities begins with context setting. *Context,* a term that Netflix coined in regards to its culture, explains the "why" of a firm's specific priorities. The goal is to ensure that everyone understands the environment in which a company operates as well as the strategies it will use to be successful in that environment. At minimum, people within a company need to understand the following:

- Why do we exist as a company — what is our reason for being?
- How do we make money? What drives our results?
- Who are our most important customers?
- What products or services do our customers value the most?
- Who are our competitors — existing and emerging? What threats do they pose?
- How do we measure our success as a company?
- What is our plan to win in the marketplace?
- What capabilities do we need to be successful?
- What values are most important to us?
- What behaviors are expected of us as members of the company?

Creating Context

Creating the right context supports how Netflix wants to operate in what it calls a highly aligned but loosely coupled organization. Netflix describes this as follows:

Highly Aligned means …

- Strategy and goals are clear, specific, and broadly understood.
- Team interactions are focused on strategy and goals rather than tactics.
- Large investment in management time required to be transparent, articulate and perceptive.

Loosely Coupled means …

- Minimal cross-functional meetings except to get aligned on goals and strategy.
- Trust between groups on tactics without previewing or approving each one — so groups can move fast.
- Leaders reaching out proactively for ad-hoc coordination and perspective as appropriate — occasional post-mortems on tactics necessary to increase alignment.

Developing Priorities

There are several guidelines for developing a clear set of aligned priorities:

Have a very simple and easily explained set of goals (which are often updated annually but can be longer or shorter in duration depending on the situation).

Spell out the desired outcome in clear and, if possible, measurable terms. These are the "success metrics" that delineate how progress will be measured for each priority over time.

Establish accountability. Decide if the group in total is responsible for each priority or, instead, if there is a point person or subgroup that takes the lead.

Review a group's progress over time in each area. Have weekly, monthly or quarterly reviews in which progress is assessed using specific, numeric targets or a more general system of assessment.

Cutting-edge firms and teams relentlessly focus on executing a small set of key priorities. In so doing, they avoid being distracted — pulled into peripheral activities that take time, energy, and resources away from what is truly needed to achieve something extraordinary.

Innovations and Experimentations

The challenge is to keep one's company or team resolutely focused on its key imperatives while also testing new and innovative ideas that will drive the firm's future growth. One way to encourage experimentation is to bring outsiders into a company or team. Pixar will deliberately hire outsiders in order to bring new perspectives and ideas on how to make the firm and its films better. One way to encourage innovation within a larger enterprise is to use teams to experiment with different models and approaches as they go about their work.

Cutting-edge firms also productively defocus by encouraging people and teams to innovate outside of their core businesses. This allows for people to get out of their own areas of responsibility and learn from those doing very different work. This supports the development of people as well as the potential areas of innovation across groups.

Push Harder, Push Softer

Most firms operate with either a hard or soft edge. Those with a hard edge emphasize the need for clear performance targets, disciplined practices and absolute accountability for results. These groups are typically more formal and process driven. Think General Electric. Firms with a soft edge emphasize the importance of strong bonds among people working in a highly creative, sometimes chaotic environment. They are more informal and talent driven. Think Google. No firm is entirely hard or soft, but most favor one over the other based on the demands of their business, their individual histories, and even idiosyncrasies of their leaders. The challenge is to create a work environment that embraces what is often a messy contradiction — a work environment that is at once both hard and soft. Cutting-edge firms, and their teams, do just that.

What is Culture?

Culture includes the core beliefs and assumptions that people have about their work, their company, and their competitive environment. These deeper-level elements of culture function at both a cognitive and an emotional level.

Cognitive beliefs center on what people think, particularly in regard to the factors that will result in success or failure within a team or company.

Emotional beliefs focus on "how we do things around here" or "what we think around here." But more important is "what we feel around here."

One reason why culture provides a competitive advantage is that it can't be easily replicated. The fact that culture is difficult to build and sustain is what makes it valuable.

The Look and Feel of Cutting-Edge Cultures

Cutting-edge firms embrace, in various ways, each of the listed cultural attributes:

All in: Deeply committed to the firm's purpose, values and successes; act with a high level of energy and ambition to make a difference.

Autonomous: Have the autonomy and authority needed to make decisions about how to achieve the group's goals; flat organizational structure.

Transparent: Know what is expected in regard to performance and behavior; company and leaders share information in an open and authentic manner.

Accountable: Take full responsibility for the way they work and their performance; team-level rewards for superior performance and consequences for poor performance.

Playful: Find pleasure in the work itself; enjoy interacting with colleagues.

Communal: Share a sense of community and willingness to help others; high levels of trust.

The lesson from these firms and teams is the need to question one's own culture, along with the relentless commitment to getting it right.

Take Comfort in Discomfort

In cutting-edge groups, a good meeting is one in which a healthy fight results in a healthy outcome. In more conventional firms, a good meeting is one in which people get along and everyone agrees on the best path forward. Conflict is viewed as a sign that the team is not working well. This is not to say that outcomes don't matter in more traditional firms, but the ability of people to work as a cohesive team and the willingness of people to be team players can take priority over everything else — including results.

Managing Conflict

Managing conflict within a team, however, is more complicated than removing those who can't operate in an open and intense environment. Team members are often on the receiving end of two messages regarding what is expected of them. These messages are conveyed in a variety of ways, sometimes subtle, from a team leader, peers or even the organization in which they work. They are as follows:

1. You must put forward your honest point of view on the decisions we face as a group and offer clear recommendations that help move us forward. If you fail to do so, you are not adding value as a team member and are increasing the likelihood that we will fail to achieve our goals.
2. You must operate in a highly collaborative manner and support your peers. If you fail to do so, you are not being a team player and are undermining our ability to work together as a group to achieve our goals.

Creating a Conflict-Friendly Culture

The first task in creating a conflict-friendly culture is redefining what it means to be comfortable. In many groups, comfort implies a lack of conflict or tension among team members. In cutting-edge teams, this definition is turned on its head — rejected in favor of surfacing or even creating tension among team members. These teams don't want their members to be too comfortable because that means that they have settled for the status quo. It means that they are not pushing themselves to achieve a higher level of performance and innovation. Comfort, then, is redefined as accepting the need to be uncomfortable. Cutting-edge firms are committed to deliberately creating conflict to produce better outcomes.

A second task is setting bold, even audacious, goals. These goals are not designed to produce conflict, but conflict is almost always the result. The pressure to meet high standards in itself results in conflict as team members work to find the best solutions to the tests that inevitably arise in the pursuit of their goals.

The third task is to focus the team's efforts on the areas that will make the greatest difference. In other words, not all conflict is equal. Many teams engage in a good fight, but they do so over the matters not worth fighting about. One of the most important tasks of a team leader is to focus his or her team on the "vital few" issues and not let the group be distracted by less important issues.

Productive conflict in teams requires the following:

1. An understanding that the discomfort that comes with conflict is necessary and productive. The enemy of high performance is not conflict — It's complacency.
2. Accountability for pursuing audacious goals that generate a healthy level of tension within a team.
3. An ability to focus the team's conflict on the "vital few" areas that will make the most difference in the achievements of its goals.
4. The group having the temperament and skill needed to have a productive fight.

Teams at the Extremes

Entrepreneurs are adept at managing newness — pushing the boundaries of what exists today. Cutting-edge leaders and their teams push both results and relationships further than traditional firms. But there are risks and sometimes a price to pay for doing so. Results, pushed too far, can produce a variety of unintended consequences such as a harsh company culture or unethical business practices. Relationships, pushed too far, can create a soft environment that lacks the drive and toughness needed to achieve success. The challenge is to drive results and relationships to the breaking point while managing the very downside of doing so.

There are two common challenges facing leaders who want to build extreme teams. The first is creating a team where no team currently exists. Leaders who are responsible for a new team will benefit from considering the following practices of cutting-edge firms:

Right purpose: The need to define a compelling purpose for one's team and taking that purpose to a higher level of intensity and dedication.

Right people: Hiring people who have the attributes needed for a group to be successful.

Right priorities: A leader needs to clarify the vital few priorities and success metrics.

Right practices: Leaders need to determine the desired culture of their teams by identifying the few essential beliefs and behaviors that will define what is expected of group members.

The second challenge is turning around a stagnant or failing team. This need becomes particularly salient when a new leader, often with no history with the group, is tasked with its revitalization. This need can also surface when a long-tenured leader feels that he or she is investing an inordinate amount of time and energy to get a team to perform at a high level. There are two key questions to answer at this point in the turnaround process:

- Does the team deliver results consistent with what is expected by its organization, leaders, and customers?
- Does the team foster productive working relationships among its members as well as with those in other groups?

The measure of a team's performance varies by team but often includes both outcome measures (i.e., sales and revenue) and process measures (i.e., milestone achievements and budget performance). The key is to look at metrics that are closely linked to the firm's purpose. These metrics should be augmented by more informal input from a team's customers as well as its members. The other factor to consider is the quality of the relationships among the members of the team.

The next task is to identify the causes of the team's poor performance, particularly in relation to the performance gaps uncovered in the above assessment. Leaders seeking to understand their underperforming teams need to look for the deeper issues that influence other, often more noticeable, behaviors or outcomes.

The key for those leading a turnaround is to recognize the value of contradictions in understanding what is going on within a team — paying particular attention to aspects of the team that are surprising or puzzling. The goal is to surface the group's contradictions, understand why they exist and analyze their impact on the group's results.

A final area to assess is the practices of the team and how they impact its culture. This is one of the most challenging aspects of a team's turnaround because existing cultures are notoriously difficult to change. The leader of a team turnaround effort needs to be bold in changing the mindset and behavior of his or her group.

Starting a new team and turning around a stagnant team are challenges that most leaders will face at some point during their careers. Both situations underscore the importance to a leader of getting his or her team right in order to produce results. Organizations and their leaders value what teams can achieve and are quick to talk about the benefits of collaboration. But, many fail to provide the support that teams need to be successful. The problem, in most cases, is not a lack of knowledge but an unwillingness to give up control. Companies that want the benefits of extreme teams need to give them autonomy to do what they believe is needed given the challenges they face.

Why Teams?

Teams are seductive because they offer a clear advantage when designed and managed well — an advantage that is difficult for others to copy. But extraordinary teams are less common than we would think because they come with a steep price — notably the need for organizations and their leaders to give up control. We thus find people at all levels in a company who collectively support the idea of teams — but lack the commitment and creativity to make them work.

Almost all great achievements, in business and society, are the result of small groups of people working together to achieve ambitious goals. Teams, not individuals, make the difference. There is a deep human need to bond with others, often in a risky endeavor, in the pursuit of a larger or even heroic purpose. Extreme teams provide that opportunity.

Radical Candor

Be a Kick-Ass Boss Without Losing Your Humanity

by Kim Scott

THE SUMMARY IN BRIEF

From the time we learn to speak, we're told that if you don't have anything nice to say, then don't say anything at all. While this advice may work for everyday life, it is, as Kim Scott has seen, a disaster when adopted by managers.

Scott earned her stripes as a highly successful manager at Google and then decamped to Apple, where she developed a class on optimal management. She has earned growing fame in recent years with her vital new approach to effective management, the "Radical Candor" method.

Radical Candor is the sweet spot between managers who are obnoxiously aggressive on one side and ruinously empathetic on the other. It's about providing guidance that involves a mix of praise as well as criticism — delivered to produce better results and help employees achieve.

Great bosses have strong relationships with their employees. *Radical Candor* offers a guide for those bewildered or exhausted by management, written for bosses and anyone who has a boss.

IN THIS SUMMARY, YOU WILL LEARN:

- How to build radically candid relationships with your team members.
- How to get, give and encourage guidance.
- Techniques for avoiding boredom and burnout on your team.
- Things you can do to get stuff done together — faster.
- Understand why radically candid relationships with your employees will allow you to get the results you want.

PART I: A NEW MANAGEMENT PHILOSOPHY

Build Radically Candid Relationships

Bringing Your Whole Self to Work

We undervalue the emotional labor of being the boss. But this emotional labor is not just part of the job, it's the key to being a good boss. Many people feel they aren't as good at management as they are at the "real" part of the job. Often, they fear they are *failing* the people who report to them. Ultimately, though, bosses are responsible for results. They achieve these results not by doing all the work themselves but by guiding the people on their teams.

Relationships, Not Power, Drive You Forward. There is a virtuous cycle between your responsibilities and your relationships. You strengthen your relationships by learning the best ways to get, give and encourage guidance; by putting the right people in the right roles on your team; and by achieving results collectively that you couldn't dream of individually. Of course, there can be a vicious cycle between your responsibilities and your relationships, too. When you fail to give people the guidance they need to succeed in their work, put people into roles they don't want or aren't well suited for, or push people to achieve results they feel are unrealistic, you erode trust. Your ability to build trusting, human connections with the people who report directly to you will determine the quality of everything that follows.

Radical Candor. There are two dimensions that, when paired, will help you move in a positive direction. The first dimension is "Care Personally." The second dimension is "Challenge Directly." "Radical Candor" is what happens when you put "Care Personally" and "Challenge Directly" together. When Radical Candor is encouraged and supported by the boss, communication flows, resentments that have festered come to the surface and get resolved, and people begin to love not just their work but *whom* they work with and *where* they work. When people love their job, the whole team is more successful. The resulting happiness is the success beyond success.

Care Personally. Part of the reason why people fail to care personally is the injunction to "keep it professional." That phrase denies something essential. We are all human beings with human feelings, and even at work, we need to be seen as such. In addition to the obsessive devotion to "professionalism," there's another, less virtuous reason why people fail to care personally. When they become bosses, some people consciously or unconsciously begin to feel they're better or smarter than the people who work for them. There are few things more damaging to human relationships than a sense of superiority. Of course, if you are a boss, there is some hierarchy involved. Just remember that being a boss is a *job,* not a value judgment. Caring personally is the antidote to both robotic professionalism and managerial arrogance.

Challenging Directly. Challenging others and encouraging them to challenge you helps build trusting relationships because it shows 1) you care enough to point out both the things that aren't going well and those that are and that 2) you are willing to admit when you're wrong and that you are committed to fixing mistakes that you or others have made. In the end, caring personally about people even as you challenge them will build the best relationships of your career.

Get, Give and Encourage Guidance

Creating a Culture of Open Communication

"Operationalizing" Good Guidance. There are two dimensions of good guidance: care personally and challenge directly. It's useful to be clear about what happens when you fail in one dimension (ruinous empathy), the other (obnoxious aggression) or both (manipulative insincerity).

Obnoxious Aggression. When you criticize someone without taking even 2 seconds to show you care, your guidance feels obnoxiously aggressive to the recipient. When bosses belittle employees, embarrass them publicly or freeze them out, their behavior falls into this area. This Obnoxious Aggression sometimes gets great results short-term but leaves a trail of dead bodies in its wake in the long run. When this is the toxic culture of guidance, criticism is a weapon rather than a tool for improvement; it makes the giver feel powerful and the receiver feel awful.

Manipulative Insincerity. Manipulatively insincere guidance happens when you don't care enough about a person to challenge directly. People give praise and criticism that is manipulatively insincere when they are too focused on being liked, think they can gain some sort of political advantage by being liked, think they can gain some sort of political advantage by being fake, or they are just too tired to care or argue any more. Guidance that is manipulatively insincere rarely reflects what the speaker actually thinks; rather, it's an attempt to push the other person's emotional buttons in return for some personal gain. When you are overly worried about how people will perceive you, you're less willing to say what needs to be said.

Ruinous Empathy. Most people want to avoid creating tension or discomfort at work. Bosses rarely intend to ruin an employee's chance of success or to handicap the entire team by letting poor performance slide. And yet, that is often the net result of Ruinous Empathy. Similarly, praise that's ruinously empathetic is not effective because its primary goal is to make the person feel better rather than to point out really great work and push for more of it. Ruinous Empathy can also prevent a boss from asking for criticism. Needless to say, this strategy does not build trust on either side.

Moving Toward Radical Candor. When developing a culture of Radical Candor, start by asking for criticism, not by giving it. It's the best way to show that you are aware that you are often wrong and that you want to hear about it when you are; you want to be challenged. You'll learn a lot — few people scrutinize you as closely as do those who report to you. The more firsthand experience you have with how it feels to receive criticism, the better idea you'll have of how your own guidance lands for others. Asking for criticism is a great way to build trust and strengthen your relationships.

- Bosses get Radically Candid guidance from their teams not merely by being open to criticism but by *actively soliciting it*.
- Balance praise and criticism: Worry more about praise and less about criticism — but above all be sincere.
- Understand the perilous border between Obnoxious Aggression and Radical Candor.

Understand What Motivates Each Person on Your Team

Helping People Take a Step in the Direction of Their Dreams

Rethinking Ambition. To keep a team cohesive, you need both rock stars and superstars. Rock stars are solid as a rock. They don't want the next job if it will take them away from their craft. Superstars, on the other hand, need to be challenged and given new opportunities to grow constantly. For many bosses, distinguishing between the two means rethinking ambition. Centering questions around growth trajectory can help you discover what motivates each person much better than a set of questions about "potential" or "talent" could. These questions will help remind you that trajectories change, and you shouldn't put permanent labels on people. They will help you build stable teams that achieve astounding results.

Growth Management. Shifting from a traditional talent management mindset to one of growth management will help you make sure everyone on your team is moving in the direction of their dreams and ensure that your team collectively improves over time. The most important thing you can do for your team collectively is understand what growth trajectory each person wants to be on at a given time and whether that matches the needs and opportunities of the team.

Understanding What Matters and Why. To be successful at growth management, you need to find out what motivates each person on your team. You also need to learn what each person's long-term ambitions are and understand how their current circumstances fit into their motivations and life goals. "Steep growth" is generally characterized by rapid change: learning new skills or deepening existing ones quickly. "Gradual growth" is characterized by stability.

The Problem with Passion. Insisting that people have passion for their job can place unnecessary pressure on both boss and employees. Your job is not to provide purpose but instead to get to know each of your direct reports well enough to understand how each one derives meaning from their work, to recognize the significance of what you hear and to create working conditions that allow everybody to find meaning in their own way.

Excellent Performance. Keep your top performers at the top of your mind. Be a partner, not an absentee manager or a micromanager. You must take the time to help the people doing the best work to overcome obstacles and make their good work even better. Managers often devote more time to those who are struggling than to those who are succeeding. Moving from great to stunningly great is more inspiring for everyone than moving from bad to mediocre.

Excellent Performance/Gradual Growth Trajectory. We all have periods in our lives when our professional growth speeds up or slows down. For too many bosses, recognition means promotion. But in most cases, this is a big mistake. Promotion often puts these people in roles they are not as well suited for or don't want. The key is to recognize their contributions in other ways. Part of building a cohesive team is to create a culture that recognizes and rewards the rock stars.

Excellent Performance/Steep Growth Trajectory. The best way to keep superstars happy is to challenge them and make sure they are constantly learning. It's vital not to squash these people, so allowing transfers is important. Management and growth should not be conflated. When management is the only path to higher compensation, the quality of management suffers and the lives of the people who work for these reluctant managers become miserable.

Managing the Middle. Sadly, a lot of people never find work they are truly excellent at because they stay in the wrong jobs for so long that any change would require a step or two backward. Assuming that people who are not thriving are therefore mediocre and can't do any better is both unjust and unkind. Allowing them to continue down that path might be the worst case of Ruinous Empathy that managers regularly display and is a great source of wasted possibility. Everybody can excel somewhere. And to build a great team that achieves exceptional results, everybody needs to be doing great work.

Poor Performance/Negative Growth Trajectory. When somebody is performing poorly and, having received clear communication about the nature of the problem, is showing no signs of improvement, you must fire that person. How do you know when it's time to fire somebody? Here are three questions to consider: Have you given Radically Candid guidance? How is this person's poor performance affecting the rest of the team? Have you sought a second opinion, spoken to someone whom you trust and with whom you can talk the problem through? The way you fire people really matters, and to do this hard job well, it's important not to distance yourself from the person you're about to fire.

Low Performance/Steep Growth Trajectory. One of the most perplexing management dilemmas is when a person who ought to be taking on more and more and getting better every day is instead screwing up or just doing a lousy job. There are four reasons this can happen:

- Wrong role
- New role; too much too fast
- Personal problems
- Poor fit

No Permanent Markers. It's tempting to see certain people as fit only for a certain role or having a certain set of skills/weaknesses that will never change. The truth is, people really do change. It is important for the team member and the boss to be clear about what is driving the degree of trajectory at each juncture so that both the team member and the company can benefit. Make sure that you are seeing each person on your team with fresh eyes every day.

Drive Results Collaboratively

Telling People What to Do Doesn't Work

The Art of Getting Stuff Done Without Telling People What to Do. It is possible to achieve spectacular results without a purely autocratic style. The process, which the author calls the "Get Stuff Done" (GSD) wheel, is relatively straightforward. But the key, often ignored by people who think of themselves as "get stuff done" people, is to avoid the impulse to dive right in. Instead, you have to first lay the groundwork for collaboration. When run effectively, the GSD wheel will enable your team to achieve more collectively than anyone could ever dream of achieving individually.

Listen. You have to find a way to listen that fits your personal style and then create a culture in which everyone listens to each other so that all the burden of listening doesn't fall on you. Figure out how to listen to give the quiet team members a voice without weirding out their louder colleagues. It's hard enough to get yourself to listen to your team members and let them know you are listening; getting them to listen to one another is even

harder. If you can build a culture in which people listen to one another, they will start fixing things that you as the boss never even knew were broken.

Clarify. Once you've created a culture of listening, the next step is to push yourself and your direct reports to understand and convey thoughts and ideas more clearly. As the boss, you are the editor, not the author. Take the time to help your direct reports explain what they mean so that they can do something about fixing the problem or pursuing the opportunity rather than just complaining about it. It's not just important to understand new *ideas* clearly, it's equally important, and often more difficult, to understand the *people* to whom your team will have to explain the ideas clearly.

Debate. Debate takes time and requires emotional energy. But lack of debate saps a team of more time and emotional energy in the long run. Here are some ideas that can help you keep debate going without grinding everyone down too much:

- Keep the conversation focused on ideas not egos
- Create an obligation to dissent
- Pause for emotion/exhaustion
- Use humor and have fun
- Be clear about when the debate will end
- Don't grab a decision just because the debate has gotten painful

Decide. Kick-ass bosses often do not decide themselves but rather create a clear decision-making process that empowers the people closest to the facts to make as many decisions as possible. Not only does that result in better decisions, it results in better morale. The decider should get facts, not recommendations. Facts come inflected with each person's particular perspective or point of view, but they are less likely to become a line in the sand than a recommendation is. When you are the decider, it's really important to go to the source of the facts. The more often you can do that, the more empowered your whole organization feels.

Persuade. Now that a decision has been reached, it's time to get more people on board. This isn't easy, and it's vital to get it right. Expecting others to execute a decision without being persuaded that it's the right thing to do is a recipe for terrible results. Explaining the decision is not enough. You must establish that the decider, whether that's you or somebody else on your team, has credibility if you expect others to execute the decision.

- **Emotion:** You might have a strong emotional connection to a decision, but if you fail to take into account your listener's emotions, too, you won't be persuasive.
- **Credibility:** Part of credibility is knowing your subject and demonstrating a track record of sound decisions. But it also requires a third component — humility, which is sometimes in short supply.
- **Logic:** Sometimes, the logic may seem self-evident to you, so you fail to share it with others. Show your work. Don't just describe an idea, share how you got to it.

Execute. Part of a boss's job is to take a lot of the "collaboration tax" on themselves so that his or her team can spend more time executing. In order to balance these responsibilities with the work you need to do personally in your area of expertise: Don't waste your team's time, keep the "dirt under your fingernails" by staying connected to the actual work that is being done and block time to execute.

Learn. It's obvious that good bosses learn from mistakes and successes alike and keep improving. And yet, denial is actually the more common reaction to imperfect execution than learning. There are two enormous pressures that tempt a boss to quit learning: pressure to be consistent and burnout.

PART II: TOOLS AND TECHNIQUES

Relationships

An Approach to Establishing Trust with Your Direct Reports

Here, the author talks about staying centered, staying on an equal footing with the people who report to you and the art (and dangers) of socializing at work.

Stay Centered. Managers who create a stable foundation for themselves are invariably more effective at building teams on which people can do the best work of their lives. The essence of leadership is not getting overwhelmed by circumstances.

Free at Work. Think about how to give your team a sense of autonomy and agency so that they, too, can be centered and bring their best selves to work. The first rule of building the kind of relationship with people that will make them feel free at work is to relinquish unilateral authority. Relationships are more effective and more satisfying.

Master the Art of Socializing at Work. You already spend a lot of hours every day with your colleagues and direct reports. Use *that* time to build relationships. For the

most part, it's better to use the time after work to keep yourself centered than to socialize with work colleagues. When you do organize a social event at work, bear these warnings in mind: Even nonmandatory events can feel mandatory, and booze can land you in dangerous territory.

Respect Boundaries. Building radically candid relationships requires you to walk a fine line between respecting other people's boundaries and encouraging them to bring their whole selves to work. You'll need to negotiate boundaries differently with each person you work with. Do this by building trust, sharing values, demonstrating openness, navigating physical space, recognizing your own emotions and mastering your reactions to others' emotions. Building relationships with your direct reports takes time and real energy.

Guidance

Ideas for Getting/Giving/Encouraging Praise and Criticism

Guidance is the "atomic building block" of management, but it is profoundly uncomfortable for most people. In order to build a culture of Radically Candid guidance *you need to get, give and encourage both praise and criticism.*

Soliciting Impromptu Guidance. What are the things you can do to get criticism from your team? It's not so easy, because when you are the boss people really do not want to criticize you or tell you what they really think. That's why, when you become the boss, it's important to work so hard to earn your team's trust. If you can listen to the criticism and react well to it, both trust and respect will follow. Here are some tips/techniques to get the conversation flowing: You are the exception to the "criticize in private" rule of thumb; have a go-to question; embrace the discomfort; listen with the intent to understand, not to respond; reward criticism to get more of it; and gauge the guidance you get.
