Giving Impromptu Guidance. If you don't have the courage to give Radically Candid guidance, the people who report to you won't believe you really want to get it from them. And if you don't lead by example, the people on your team are unlikely to guide each other. When delivering Radically Candid praise and criticism, remember the following:

- Be humble
- Be helpful
- Give feedback immediately
- Deliver it in person (if possible)
- Praise in public, criticize in private
- Don't personalize (caring personally is good, but personalizing is bad)

Gauge Your Impromptu Guidance, Get a Baseline, Track Your Improvements. Visual cues that make you aware of when you're moving toward Radical Candor or away from it are invaluable. One of the most effective ways to become more Radically Candid is to explain the framework to your team and then ask them to gauge your guidance each week. The most important thing is figuring out how others experience your guidance.

Being Radically Candid with *Your* Boss. If you are not in a position of authority, I do recommend that you try being Radically Candid, but proceed with caution. Start by asking for guidance before you give it. Next, ask permission to give guidance. The ability to be Radically Candid with your boss is crucial to your success. A strong leader has the humility to listen, the confidence to challenge and the wisdom to know when to quit arguing and get on board.

Gender and Guidance. Gender differences make guidance harder to give for both men and women, but in very different ways. Both bias and "gender politics" can foil efforts to be Radically Candid with someone of a different gender. The pervasive atmosphere of anxiety surrounding gender issues has everybody walking on eggshells and avoiding important truths. Criticism is a gift, and you need to give it in equal measure to your male and female direct reports. When bias plays out over a whole organization, the impact on female leadership is profound.

Formal Performance Reviews. If your company doesn't do formal performance reviews, it's especially important to double down on impromptu guidance. However, if your company does do performance reviews, don't dismiss them out of hand. If handled correctly, they offer an important opportunity to improve your guidance.

Prevent Backstabbing. One of the most important ways to create an environment in which Radical Candor trumps political b.s. is to never let one person on your team talk to you about another behind his or her back. Instead, insist that they talk directly to each other, without you.

Peer Guidance. A good way to get people talking to each other is to explain the Radical Candor framework to your team. Encourage them to gauge their peer guidance. Having a shared vocabulary will help your culture move toward Radical Candor.

Speaking Truth to Power. One of the most important things any manager of managers can do to foster a culture of guidance is to have so-called "skip level meetings." In these meetings, which need to happen only once

a year to be effective, you will meet with the people who work for your direct reports, without your direct reports in the room, and ask what they could do or stop doing to be better bosses. The best way to lower the barriers that hierarchy puts between us is to admit that it exists and think of ways to make sure everyone feels they are on an equal footing at a human level despite the structure. To make sure everyone feels free to "speak truth to power."

Team

Techniques for Avoiding Boredom and Burnout

Ideally, you want everyone on your team to achieve exceptional results. But you don't want 100 percent of them to be gunning for the next job - or to be content with their current role. Instead, you want a balance, so that you have both people who push for change and those who offer stability. And to understand what motivates the different people you work with, you need to have Radically Candid relationships with each.

Career Conversations. To understand a person's growth trajectory, it's important to have career conversations in which you get to know each of your direct reports better, learn what their aspirations are and plan how to help them achieve those dreams. These conversations are your single biggest opportunity to move up on the care personally axis of the Radical Candor framework. In fact, they are the first thing you should do when rolling out Radical Candor on your team.

Growth Management. Once a year, you need to put together a growth-management plan for each person on your team. Take a look across your whole team and make sure that you understand how each individual's aspirations and growth trajectory are lining up with the collective needs of the team.

Hiring: Your Mentality and Your Process. Your hiring process is important; it's a vital part of building a great team. What follows are the basic elements of a hiring process that is as rigorous as possible without being overly onerous:

- Job description: define team "fit" as rigorously as you define "skills" to minimize bias.
- Blind skills assessments can also minimize bias.
- Use the same interview committee for multiple candidates to allow for meaningful comparisons.
- Casual interviews reveal more about team fit than formal ones.
- Make interviews productive by jotting down your thoughts right away.
- In-person debrief/decision: if you're not *dying* to hire the person, don't make an offer.

Firing. It's hard to fire people, but it's hard to quit, too. Sometimes, it's your job as the boss to be Radically Candid when something's just not working. Firing people is not easy, either emotionally or legally. But if you do three things, you can make it far, far easier on the person you are firing as well as on yourself and your team.

- Don't wait too long.
- Don't make the decision unilaterally: Once you've identified performance issues, take the time to get advice from your boss, to calibrate with your peers (if appropriate) and to get help from human resources.
- Give a damn: You have a relationship with the person you're about to fire. When you have to fire people, do it with humility.

Promotions. Few things can create a sense of injustice on a team like having a boss who promotes based on favoritism or a manager who promotes people much faster than the manager sitting in the next office. You can confer with your peers, or if you're a boss of bosses, you can require all your reports to calibrate their promotion plans with one another before any promotions get approved. Announcing promotions breeds unhealthy competition for the wrong things: documentation of status rather than development of skill. Focus on the work the people are doing, not the status they've achieved in the company for doing it. Praise the things you want more of: high-quality work, mind-boggling innovation, amazing efficiency, selfless teamwork and so on.

Avoid Absentee Management and Micromanagement. One of the best ways to keep the people on your team engaged is by partnering actively with them.

Results

Things You Can Do to Get Stuff Done Together — Faster

One of your most important responsibilities to keep everything moving smoothly is to decide who needs to communicate with whom and how frequently. This means meetings.

One-on-One Conversations. One-on-ones are your must-do meetings, your single best opportunity to listen, really listen, to the people on your team to make sure

you understand their perspectives on what's working and what's not working. The purpose of a one-on-one meeting is to listen and clarify - to understand what direction each person working for you wants to head in and what is blocking them.

Staff Meetings. An effective staff meeting has three goals: It reviews how things have gone the previous week, allows people to share important updates and forces the team to clarify the most important decisions and debates for the coming week. Your job is to establish a consistent agenda, insist that people stick to it and corral people who go on for too long or go off on tangents.

Think Time. In addition to all these regularly planned meetings, people are going to want to talk to you about this or that; urgent matters will arise that you must deal with. When are you supposed to find time to clarify your own thinking or help the people who work for you clarify theirs? You need to schedule in some think time, and hold that think time sacred.

"Big Debate" Meetings. "Big debate" meetings are reserved for debate, but not decisions, on major issues facing the team. The sole product of the debate should be a careful summary of the facts and issues that emerged, a clearer definition of the choices going forward, and a recommendation to keep debating or move on to a decision. They serve three purposes:

- They lower tension
- They allow you to slow down key decisions when appropriate
- They foster a larger culture of debate

"Big Decision" Meetings. "Big decision" meetings typically, but not always, follow a big debate meeting. They serve two important roles. The first is obvious: to make an important decision. The second, though, is subtler. It can be hard to figure out when to stop debating and start deciding. It's important that the decisions are final, otherwise they'll always be appealed and will really be debates, not decisions.

All-Hands Meetings. If you have a team of 10 or fewer people, you probably don't need to schedule a separate meeting to make sure everyone is persuaded that the right decisions have been made. However, as your team gets bigger, you need to start thinking about how to bring everyone along. If your team is 100 or more people, a regular, all-hands meeting can really help to get broad buy-in on the decisions being made — and also to learn about dissent.

Execution Time. If you're not careful, meeting proliferation can indeed bring to a grinding halt your ability to execute both as an individual and as a team. Being ruthless about making sure your team has time to execute is one of the most important things you can do as a boss. One effective solution is to block off time in your calendar to be alone and execute.

Walk Around. Listening to the people who report directly to you is relatively straightforward even if it requires time and discipline. But if you are a manager of managers, listening deep in your organization is much harder. Schedule an hour a week of walking-around time. Notice the things you don't notice when you're buried in work at your desk or racing, head down, from one meeting to the next. Find small problems and treat them like "the universe through a grain of sand."

Be Conscious of Culture. A team's culture has an enormous impact on its results, and a leader's personality has a huge impact on a team's culture. Who you are as a human being impacts your team's culture enormously. The most amazing thing about a culture is that once it's strong, it's self-replicating. Even though you've taken a number of conscious actions to impact it, you'll know you've succeeded when it truly is no longer about you.

Getting Started

Radically Candid management takes serious time, but it also leaves you time to pursue your own area of expertise and to deal with the unpredictable. Mostly, it requires you to be conscious and bring your full humanity to work with you.

Remember, *once you build Radically Candid relationships with the people who report to you, you will eliminate a terrible source of misery in the world: the bad boss.* You will achieve results you never imagined possible. You will create an environment in which you and the people who report to you can love work and working together. Perhaps most surprisingly, you'll find that the way you work ripples out into the rest of your life and enriches all your relationships.

The Future-Proof Workplace

Six Strategies to Accelerate Talent Development, Reshape Your Culture, and Succeed with Purpose

by Linda Sharkey, PhD and Morag Barrett

THE SUMMARY IN BRIEF

Nobody can really be sure what tomorrow will bring — what game-changing technology, history-shaping demographic shifts or unanticipated market forces will emerge or how they'll impact the way we work and lead. But, what we do know for certain is that the future will be different from what we've known; it's already taking shape right before our eyes, and if we don't prepare for it now, we can surrender any hope of our organizations surviving or thriving tomorrow.

In *The Future-Proof Workplace,* you'll discover how emerging technologies and advances in neuroscience research are toppling 20th-century organizational paradigms and transforming the way we work. And you'll find out how yesterday's biases are being replaced by tomorrow's values, culture and relationships.

In addition, you will learn to look deep into the heart of your company to determine if it's ready and willing to adapt to the purpose-driven business paradigm of the future. You'll gain powerful insights into the new organizational models that are coming into being at the most successful, forward-thinking companies worldwide. And you'll learn to identify and seize the bold, new opportunities that 21st-century organizational structures will offer.

IN THIS SUMMARY, YOU WILL LEARN:

- How to assess and reshape your company for tomorrow's challenges, today.
- The six factors of change that must be addressed to remain competitive.
- How to adjust your leadership style for the 21st century.
- How to embrace technology rather than shying away from it.

Surviving and Thriving in Turbulence

The future of work is not tomorrow. The future of work is today! You, your career, and your company should be future-proof.

There are three waves of change that test the limits of human convention and create havoc — and opportunity — in the workplace: digital technology, demographics and globalization. These waves of change are having a profound impact on how society, politics, business relationships and innovation are shaping the 21st century.

Six Factors of Change

Six factors are transforming the workplace from the 20th to the 21st century: leadership, culture, organizing principles, relationships, diversity and inclusion, and technology.

These factors require considerable reshaping of fundamentals in any enterprise, including how you develop people, how you organize work to deliver value to your customers and what human relations practices you put into place to advance your workforce. We may be in the midst of a digital revolution, but it's the people revolution that will determine whether we ride the waves of change or drown.

1. Leadership: In the end, company success boils down to leaders, what they value and how they behave. The 21st century demands a shift in leadership to be one of engagement, collaboration and adaptability. These are also the hallmarks of organizations that can innovate. Without a shift in our leadership mindset and our leadership behavior, none of the following factors will be future-proof.

2. Culture: In the 21st century, most organizations understand that culture and values have everything to do with profitability. If leaders want a culture that truly empowers people, they must behave consistently with those values. A healthy culture, and living the values in daily behaviors, is essential for growth, adaptability and innovation.

3. Organizing Principles: Today, a compelling and impactful purpose, around which teams can get excited, is key. Members of the younger generation assess a company based upon their views of the real purpose of the enterprise and how well it is living up to that purpose.

4. Relationships: Today, a greater understanding of the role of relationships, not only at work but in business in general, is coming to light. This is the secret glue that keeps people engaged and emotionally connected to the work while they are there.

5. Diversity and Inclusion: In order to create a truly inclusive environment with a level playing field for all, we need to understand the role of unconscious bias and the role the brain plays in our ability to connect with people who are different from us.

6. Technology: The 21st-century breakthrough in technology was largely missed: the ability to communicate, collaborate and enjoy our work. The 21st-century breakthrough in IT is about discovering patterns that were previously invisible. Because of these trends, the organizational basics need reinvention, retooling and, in some cases, rejection, never to see the light of day again.

Looking ahead, how we manage and develop people will have to be dramatically rethought. With the rapid pace of change, people will need to learn improvisation to build on each other's ideas. We are being challenged, as humans, to rethink and redefine our role in this world and especially at work.

Leadership: Leading the Future

Command and control leaders truly believe they have all the answers. This style has been honed over the centuries through feudal systems, royal dominance, and bureaucratic organizations. It may well be unconscious behavior on the part of many leaders, which is why it is so hard to change. Historically, this dysfunctional management style did not ultimately thwart human creativity. It just made it harder to bring innovation to the workplace.

You don't have to read many business headlines to see greed in action. It is this culture of greed that puts average, honest workers under stress to deliver results at all costs. In order to get compliance, leaders resort to command and control, and followers comply.

Today, with social media, word gets out quickly about where to work and who to work for. Command and control and greed often go hand in hand and aren't sustainable in a future-proof world of today and tomorrow. Today's workforce is not asking to be engaged, it expects to be engaged.

21st-Century Leadership

Leadership of the future is really the same kind of leadership that's always been effective. The 21st-century leader understands that business is also about values, purpose and solving problems.

Leadership is a privilege. Great leaders lead wherever they are and whatever their career level. As a leader, you have a great responsibility, not to yourself but to those you lead.

Leaders need to be clear on their personal values first before adopting and modeling company values. Values must be internalized. Solid personal values give you the platform and the confidence to translate those convictions into authentic company values. Authentic values create a vibrant company culture.

Defining Values

Value is no longer defined by how much money a company makes, but rather it is moving toward how much good it contributes to society.

Five critical dimensions set great leaders apart from everyone else: they are purpose driven even in times of great ambiguity, they act with heart and love toward those they lead, they are team builders but not in the traditional sense, they are highly perceptive, and they are crystal clear about their values.

The greatest leaders have three things in common: passion, the ability to attach whatever their task is to that higher purpose and they find time to develop people. When you practice these three behaviors, not only will you help others and show you care, you will feel great about yourself. This is the power, privilege and purpose of leadership.

Culture: The Key for Innovation and Speed

Cultural innovation should be a top priority for your company. Culture is critically important to any organization, especially one that needs fresh ideas and speed to succeed — which is every industry and every organization today.

Speed and creativity, with more readily available data, are the bywords of this century's organizations. Leading companies today are realizing they can't unleash the creativity of their employees with slow, bureaucratic cultures.

Fast-Forward Culture

Job markets are changing rapidly, with fewer factory workers and more knowledge workers. More entry-level employees have different expectations, are technologically savvy and want to work on meaningful projects. Companies like Google, Facebook and PwC are the new normal. These companies know they can't be fast and flexible with cultures rooted in industrial thinking.

The two areas that worry CEOs the most, according to recent PwC studies, are talent and technological disruption. Culture is a critical part of both of these concerns. Companies must be fast, but they also have to be flexible learning organizations in which innovation can happen quickly — in every part of the organization, not just in the places where the research is done. And execution must be flawless.

Cultures that are toxic by their very nature are not innovative. If you're not purposely investing in a healthy culture, your business is already declining, whether you realize it or not.

Culture is rooted in values. It's the unspoken set of assumptions, values and beliefs that dictate, often subtly, how people relate to each other in organizations. It defines how people in the organization think about their work and contribute to the overall organization.

Bringing Culture to Light

Culture is the DNA of a company that happens whether you want it or not. Culture shapes how employees act, not only with each other but also with the customer. It informs how decisions are ultimately made about

everything from who you hire and reward to how you shape strategy and execute it.

Culture is king for the 21st century. Successful companies are breaking all the rules we believed in the past about how companies need to be run. This means fewer rules, more trust and more freedom for employees to unleash their intelligence and gifts, no matter what roles they play in the organization.

Know your current culture. Understand it not as you would like it to be but as it really is. Define what the culture and values of the organization must be. Then, use those values to guide all your business decisions.

So, how does a company, or division, crystalize its values and create a future-proof culture? Start by assessing your own personal values and answering the question: What is the culture our company needs to execute a successful strategy? Then, look at the behaviors you see every day — in your staff and yourself. Identify the disconnect and begin to articulate the values you aspire to in order to have the success you envision. Leaders create the culture they love. The future-proof culture is one that everyone can love.

Purpose: Navigating Turbulent Waters

Mission and Vision

In the 21st century, work can shift in nanoseconds, and complicated missions can become obsolete overnight. The days of occasional whitewater for a company have given way to perpetual rapids with hidden rocks all along the way.

Instead of building a ship to sail with the changing tides, companies often build massive management machinery that can't move, gets swamped by change and rusts.

Why is Amazon so successful? One main difference is that it has a compelling purpose that drives all other strategies, tactics and activities: Deliver what the customers want to buy, when and where they want it.

Markets change. Technology disrupts. Culture evolves. People learn. Relationships grow. Purpose remains.

Old-fashioned planning and mission statements do nothing to propel a company forward in today's markets. Dump them and replace them with a simple purpose statement. A clear purpose statement unleashes the intellect of employees to meet the needs of team members and customers.

The Power of Purpose

Purpose begins with the promise to customers — not giving the customers everything they want but rather living up to the promise they make to customers. Having a customer-centric view ensures you are delivering on what you say you will deliver.

The best purpose statements are timeless and adjust with changing technology and changing circumstances. However, an effective purpose also has another very important role: to create an authentic emotional hook for the betterment of society.

Purpose aligns people's behaviors around something that makes a difference to others. A command-and-control leadership style, coupled with a focus on greed, causes questionable practices that actually hurt people. Add a mission statement that is solely market-driven, and you have the perfect storm for corruption.

Today, there are more than 2 billion people under 20 years of age in the world. Why is this important? These 2 billion people have a different drummer that motivates them. We have raised children to give back and to be less compelled by making vast amounts of money at others' expense. If companies are to attract these young people, they must also have an awe-inspiring purpose.

In the 20th century, people came into work, but their emotional purpose was outside the workplace — usually back at home. In the 21st century, it's the emotional purpose that causes people to *come* to work.

Purpose is powerful. It appeals to our inner need as humans to contribute to the greater good. What is your real purpose on Earth? It can be hard to live your purpose 100 percent of the time — we are human after all — but good leaders strive to do so. And great leaders regularly reflect on how well they are aligned with, and living, their purpose and make changes accordingly. Purpose is a leadership journey, not a destination.

Relationships: Our Connected Future

Business is built on relationships, whether with employees, customers or other key stakeholders. You cannot be successful in business, or in life, unless you are also successful in cultivating the personal and professional relationships on which these depend.

We are in a transitional phase in terms of how relationships are valued in the workplace. The future of work will center on the fluid workforce, which consists of teams and

individuals who can come together rapidly, build trust, enable information sharing and collaborate to deliver a successful result.

Relationship with Work

We've moved from a local perspective to a global perspective. Our relationship with the workday, and work itself, has expanded from 9 to 5 to 24/7. The lines between work time and personal time are blurred. The evolving expectation is that work and life are a braided system that is blended, overlapping and seamless.

The key to future-proofing both your own social time and the work that needs to be done is providing the resources that allow for both work and play. The millennial generation is drawn to opportunities in which they can work when inspiration strikes them — as long as expectations are met and results are delivered.

The traditional career ladder is no more. With the flattening of organizations, the career ladder is more of a career lattice — where success isn't only about vertical movement. Success is about the horizontal opportunities that provide new experiences and expand skills. We now work in a series of interconnected and interdependent networks, even if they are difficult to chart. To future-proof your career, you need to be connected at multiple levels, to multiple people, and actively cultivate those connections.

Relationship with Employer

The rules of the employer–employee contract, whether implicit or explicit, are being rewritten for the 21st century. There has been a shift from the paternalistic employer to the self-sufficient employee and from employee for life to the more flexible workforce.

Welcome to the social contract. Relationships matter, and the quality of our working relationships matters even more in the modern world. The future of work is less of a chore or a place we have to go to. Instead, work becomes something we choose to do because we want to.

In today's hyperconnected world, it's becoming increasingly difficult to differentiate between friends and colleagues. Building relationships and connections quickly, and paying attention to how we bond so that everyone is included, is paramount. Who you know and what you know is much more important than the formal role you play.

It's the quality of the connection that matters, not the quantity. In the future, success will be achieved through the subtle but high-value combination of mastery and connectivity. The defining factors will be what you know, who you know and how well you can work with others. You must intentionally connect or risk becoming disconnected.

In the future — and more importantly, today — we need to be even more diligent in balancing the needs of the relationships we have with work and the relationships we have with others. Most of all, we must recognize that we have no excuse for not enjoying the kind of working relationships we aspire to.

Diversity and Inclusion: Future Inclusion

Prejudice, bias and exclusionary behavior have always played a role in human society. Young people today have been raised to believe they can achieve their dreams regardless of their race, gender, religion, sexual orientation or age. But as a people, we have not been able to get out of our own way in providing paths for a more inclusive society.

Stereotyping is personal because we apply our own experience and intent to the situation at hand. Advancement for women and minorities — and for that matter, anyone who does not fit our Western view of leaders — has been a slow trickle. Why? Because even well-intentioned programs don't fully address unconscious bias.

Make a tally sheet and, in most cases, those who are perceived to lack executive presence are minorities, women, LGBTQ people, introverts, and foreign nationals. The leaders making these decisions are not necessarily bad people. They just don't realize that the subliminal messages and context they are drawing from to make decisions about others are exclusionary. We have set patterns, images and context for what we believe people should be like, and often, these are so subtle we don't even realize it.

The changing demographics of the new workforce make inclusive hiring an imperative. The opportunity to be included at the top levels of organizations is still slim. If you can't include others who are different, your business will not survive.

Brain Science, Bias and Diversity

We all have unconscious bias that causes us to embrace some and discriminate against others. And this distinction happens unconsciously and instantly. This is the root cause of why programs and processes to increase diversity in the workplace have not worked and will not work — until we come to grips with our own unconscious bias.

If your brain has been conditioned to believe that males hold executive roles or that women can't do certain types of work, you will react and make a decision before

you're even aware of it. You will react before you realize that you had a negative or positive response. The brain stores memories and emotions. It captures every story you have ever been told and categorizes it. Unconscious brain function makes up approximately 80% of the brain's activity. It is not that we inherently dislike other people, but we have been programmed with subliminal and not-so-subliminal messages.

Parents unwittingly pass on their bias and stereotypes to their children, causing an unconscious reaction in their children that can either help them or hinder them as they move into society. This is one explanation for a current phenomenon among women shown in recent research. Many women don't aspire to the most senior roles, despite the fact that more women have advanced degrees than ever before. They were conditioned to believe they could not attain these jobs.

The good news is that the brain can rewire with repetition. All your neurons, circuitry and synapses can respond differently if you can rewire your thinking.

The action we must all take is to dump the focus on diversity and all the programs devoted to shaming and blaming others for lack of diversity. Instead, let's focus on inclusion as the positive, and more accurate, alternative. Creating a culture that fully embraces and includes all participants is essential for a future-proof organization.

Technology: Resistance Is Futile

Technology is ever present, ever advancing and ever pernicious. We are firmly in the embrace of the fourth industrial revolution, a digital revolution that impacts every aspect of our lives — at work, at play, and at home. Technology will continue to both disrupt industries and create new opportunities. You can be a casualty of the disruption or reap the benefits of applied innovation.

Technology: The Disrupter and Enabler

Technology isn't just providing existing services in new ways, it's connecting what were once disparate processes to provide an even more seamless and pleasant customer experience. It's not only disrupting what is created and delivered to consumers, it's also disrupting what is captured and understood about consumers and nonconsumers.

Digitization of information is pervasive. Big data can be described as vast, growing stores of information that can be analyzed by computers to reveal trends, patterns and associations. Analyzing this information is a burgeoning industry in itself. This abundance of valuable information is driving the emergence of new businesses.

Artificial intelligence is already here, driving our cars, providing real-time translation services, reducing language barriers and providing new delivery mechanisms through drones and virtual assistant services like Google Home, Alexa, Cortana and Siri.

Whether AI and robotics will eventually replace jobs is an ongoing debate. It would seem that AI and robotics can only create long-term value if the new processes, systems and apps *augment* the economic system as it currently operates. The time-saving and cost-savings that automation provides is a short-term benefit if the long-term impact of less employment (and hence, less money to spend) is not considered.

The careers and companies that stay focused on the human benefits of technology will live long and prosper.

Technology will redefine the expectations of workers and performance management. Like it or not, people work in small chunks of time, not huge blocks. Technology is driving byte-sized attention spans. Digital transformation impacts what we know and how we analyze data. This allows for increased flexibility, not standardization. To thrive in the midst of rapid technological change, we've got to make work simpler, not continue to add complexity.

Future Workforce

The workforce of the future is one that's iterative and agile. This agile mindset, skill set and organizational structure with flash teams is not just the future, it's the mainstream of today.

Everything is connected and transparent. There are no boundaries. Initial expertise and first-to-market gets you a seat at the table. But keeping pace and growing keeps you there.

As leaders, we have to admit that the problems we face are too big to tackle without collaboration. The winners will have the best human interface.

The future of work will be informed by insights from neuroscience, game design, new expectations of work and life (not work or life) and what it means to be a happy, productive member of society.

With the never-ending flood of data and increased connection, the new risk is cognitive overload, and the next shift will be to intelligent technology, which will sort through information and recommend informed decisions.

Every company, including yours, is now a technology company. To future-proof your company, you must first future-proof your mindset. We have all the shiny objects at our disposal. Instead of restricting access, encourage

a culture of playing with all the toys to connect and do great work.

Resistance is futile…because whether you realize it or not, you've already been assimilated. Stop worrying about technology and start enjoying the benefits.

Learning: Curious Learners

When it comes to navigating the creation of a future-proof workplace, the skill of unlearning and relearning becomes even more paramount. The irony is that the industry of *learning* is perhaps the least prepared to meet the onslaught of the future-proof workplace. It's not just what we are learning that needs to change. We also need to transform the time it takes to acquire knowledge.

If our best and brightest are spending 12 years in secondary school and then feel pressure to spend eight more years in higher education, our ability to respond quickly to change is vastly reduced. The next iteration of graduate education will include not just timeline flexibility (the traditional degree course condensed into a shorter time frame) but also content flexibility to allow learners to pick a more a la carte approach to the content of their degrees.

The future of learning needs to be tipped on its head, a focus on how knowledge is going to be used, the context in which learning will be applied, that will determine the priority of what needs to be learned.

Scarcity drives value. Today, it's not information that's scarce, it's people who know how to use it at work. Learning agility and a healthy curiosity are going to be key skills for future success. The need is there for all of us to become increasingly flexible and to have an understanding across disciplines. There has to be a major change in how we capture, assess and value learning.

Modernizing Talent Management

If lifelong learning and midcareer relearning is the new normal, then the question becomes, "Who owns the learning contract?" A one-size-fits-all or a one-size-only-fits-a-few approach is no longer appropriate. Everyone must be up to the task.

Not only is the time until moving to a new role shortening, but so is the patience level of millennials who are being asked to wait for advancement opportunities. We need a different way to think about readiness for the next big role or promotion.

In the future-proof workplace, investing in your employees will be the differentiator that makes you an employer of choice. Investing in yourself, proactively learning and seeking new experiences will differentiate you from other potential candidates.

Build a Learning Culture

The best way to build a learning culture is to hire the right people. Use behavioral interviewing, and look for clues in job candidates' previous experience. Learning has to move from being an event to being a process. Everyone needs to be a coach and mentor.

Knowledge management matters not only because of the ticking demographic time bomb but also because of the new flexible, tour-of-duty mindset of the millennials. People will be coming and going from your organization, and it would be naïve to think you can retain someone forever. Instead, build the processes that help everyone to share knowledge while they are part of your team.

Throw out the HR rule book. These rules certainly don't reflect an educated workforce or the needs of the future-proof workplace. Many rules actually limit learning, initiative and creative thinking.

In the 21st-century workplace, performance management experiences a workplace makeover. The individual focus of performance management and rewards is at odds with the team-based approach that is required going forward. Short-term goals and milestones ensure meaningful feedback and progress in bursts while aligning to the overarching purpose and culture.

Treat your employees for who they are — adults. Provide them with challenging goals and the resources to achieve them. Then, set them free to deliver the results.

Workspace: The Future-Proof Workspace

Office space is a major capital investment for most organizations, and it's an important one at that. Design your workspaces well, and you'll have a 21st-century environment where people *want* to be and in which they can thrive.

The office of the future has to be designed around the active worker, encouraging people to get up and move around. Cubicle or office walls may not exist in the future-proof workplace. If the goal is to drive collaboration and teamwork, then let's start pulling down the barriers that get in the way. In redesigning the office, many organizations are paying close attention to how employees move about the space, deliberately designing opportunities for chance encounters to occur in which new ideas can be formed.

Anytime, Anywhere

However, one of the most compelling transformations of the workplace is not just for those who use it in person, it's also designed to help remote employees feel connected to the mothership. Remote workers need to be provided with all the necessary technology, training and access to work from anywhere, connecting seamlessly to office systems back at the traditional brick-and-mortar headquarters.

Just because we can work anywhere and anytime doesn't mean we should. A law was recently passed in France that gives employees the "right to disconnect" from email, smart-phones, and other electronic devices once their working day has ended.

Designing the new workplace has to account for employee health and wellness, not just productivity. Providing opportunities for employees to reduce stress and be more aware of their health choices can only benefit them and, ultimately, the organization — a healthier bottom line for all!

The final piece in the workplace puzzle is the increased focus on social and environmental impact. When it comes to community involvement, many organizations are throwing open their doors and encouraging employees to get out and connect with their communities.

There are steps you can take that will transform your office environment into one that more closely supports the needs of your future businesses and your employees. Start by involving your employees and asking what kind of environment would support collaboration, innovation and team building. Ultimately, the future-proof workplace is one that allows all employees to be present (in person or virtually), to work together and successfully deliver results.

Future-Proof Workplace: Waves of Change

Change often feels threatening, and when our livelihoods are threatened, we can often react with a fight-or-flight response. Helping people navigate the waves of change is our role as leaders in the 21st century.

The first step is to take a hard look at your leadership results — both in leading yourself and leading others. Leaders must have a clear set of guiding values and purpose in the 21st century. The future will be built by leaders who build up others and have a heart to serve others.

Having an outside-in, customer view is essential. This perspective keeps a culture fresh, flexible and innovative. If you want to grow, you have to understand what your culture really is, not what you wish it to be.

Your company needs a clear purpose. When you define your purpose, as a company or an individual, you create a barometer to judge your decisions.

Relationships matter. You cannot be successful in business, or in life, unless you are successful in cultivating winning relationships. Inclusion is an attitude, a worldview, not a number. And we all fall short to some degree. Anything that hinders healthy collaboration hurts us all.

Ironically, the digital revolution is placing the human side of business at the forefront. Technology is the primary impetus for a major shift in how work gets done and careers evolve. Successful leaders are those who balance not just the *what* of technology but also the *how*, the *who* and the *where*.

Instead of thinking a vibrant company culture can be built with a new color of paint and fancy desk chairs, understand that a workspace is the reflection of culture.

Work Matters

It's time to retire the whole work/life balance debate. They are forever connected. Work can become someplace where we want to be, not where we have to be — a place that helps us to thrive, contribute to the organization's purpose and leave a legacy that benefits all.

Future-proofing your company and career might be challenging at times, but it's possible. The biggest challenge is to recognize that the future of work is today. The sooner you begin, the further ahead you'll be.

Yes, And

How Improvisation Reverses "No, But" Thinking and Improves Creativity and Collaboration

by Kelly Leonard and Tom Yorton

THE SUMMARY IN BRIEF

The Second City has launched the careers of celebrated comic performers such as Tina Fey and Stephen Colbert and produced award-winning content. But it's the actual improvisational process developed and honed over the years by The Second City that has become its legacy. Players master an ability to co-create in ensembles, using philosophies that celebrate a "Yes, And" approach. They embrace authenticity and failure, and espouse the idea of "following the follower," which allows any member of the team to assume a leadership role.

Here, for the first time, Second City executives Kelly Leonard and Tom Yorton describe how you can use the same skills that thrill audiences around the world to improve your emotional intelligence, increase creativity and learn to pivot out of tight and uncomfortable situations. In this engaging, often humorous and highly practical book, you will learn how to become a more compelling leader and a more collaborative follower by employing the seven elements of improv.

IN THIS SUMMARY, YOU WILL LEARN:

- The Seven Elements of Improvisation and how they have inspired some of the most creative performers in history.
- How Yes, And can be used in coaching, brainstorming and conflict resolution.
- Six distinctive ways The Second City uses failure.

THE COMPLETE SUMMARY: **YES, AND**

by Kelly Leonard and Tom Yorton

The authors: Kelly Leonard is the executive vice president of The Second City. He has worked at The Second City since 1988, overseeing productions with such notable performers as Stephen Colbert, Tina Fey and Amy Poehler.

Tom Yorton has used improvisation and comedy to help business professionals since 2002, when he joined Second City Works as CEO. Previously, he worked in advertising and marketing at Ogilvy, Grey Sears and 3Com.

The Business of Funny

When The Second City first opened its doors on a snowy December night in 1959, few attendees would have suspected that they were present at the birth of an institution that would serve as the leading source of cutting-edge comic artistry for the next half century. Along the way, however, a new breed of performer also began seeking out The Second City: managers, marketers, teachers, lawyers, advertising executives and business-school graduates.

More and more people are recognizing what the people at The Second City have known for a long time: Professional success often rests on the same pillars that form the foundation of great comedy improv: Creativity, Communication and Collaboration.

Seven Elements of Improv

While there's nothing wrong with the quantitative, strategic and analytical skills traditionally taught at B-schools, those alone do not guarantee success in business, where things tend to be messier and more fluid and where success often rests on the ability to form winning coalitions that will back a good idea. Here, the soft skills, such as willingness to listen, forge trusting relationships, take and support responsible risks, adapt to change and stay positive in the face of adversity, are seen as those essential to allowing people and businesses to respond with agility and nimbleness to the fast-moving information, opportunities and challenges of today's workplace. These skills are no longer merely nice to have — they are paramount. And they can be learned, using the same seven elements of improvisation that have inspired some of the most brilliant creative performers of our time:

1. **Yes, And.** These two words form the bedrock of all improvisation. In application, these two words are ground zero to creativity and innovation.
2. **Ensemble.** The ensemble is the pre-eminent focus of everything in The Second City's business, and it pops up everywhere, and it is a vital ingredient in almost any organization's growth and competitiveness.
3. **Co-Creation.** The sum of co-creation is greater than its parts. And in our increasingly connected world, co-creation is fast becoming a fact of life.
4. **Authenticity.** Unfortunately, truth is too often ignored or soft-pedaled in business out of fear of political incorrectness or for the sake of expediency.
5. **Failure.** Failure is more than an abstract tenet for The Second City. It is something they commit to every time we walk onstage. It's vital to give failure a role in your process.
6. **Follow the Follower.** Leadership is more about understanding status than about maintaining status. The ability to knowingly shift status inside the group dynamic is an art — and it doesn't come easily.
7. **Listening.** Deep listening is essential to improvisation. It is also critical in many parts of business, from selling situations, to employee evaluations, to brainstorming sessions and more.

These seven elements are at the heart of The Second City's success and have contributed in no small part to the success stories of its famous alumni. They have also made their way into companies and organizations as diverse as Nissan, Motorola, Google, Nike and McDonald's.

To put it most simply, comedy provides us a safe place to speak and hear the truth. Unfortunately, at our most important moments, especially in the boardroom where the fate of a company may hang in the balance, freedom to speak the truth and, just as vitally, hear the truth, rarely exists.

Yes, And: How to Make Something Out of Nothing

Yes, And is the secret sauce, the source code, the key that unlocks every door worth opening. In the context of improvisation for the stage, where there is no script to guide the direction of a scene, Yes, And goes like this: One actor offers an idea onstage, and other actors affirm and build onto that idea with something of their own.

It's a relatively easy concept to understand but much harder to commit to in actual practice. That's because it requires you to trust others to support and build upon your contribution, and it requires you to do the same for them, whether you actually like the idea or not. In the business world, support is almost always highly conditional: I'll support you as long as I understand immediately where this idea is going, or I'll support you as long as success is guaranteed, or I'll support you as long as there's something in it for me. "No" or "Yes, but" are popular in the work world because they allow one party to maintain control of an idea or conversation, but if control guaranteed success in business, every business would be wildly successful.

To build a Yes, And culture, you have to model Yes, And behavior. You have to be supportive and committed to building on people's individual contributions.

In Interpersonal and Team Communications

The best networkers are those who affirm and build on the ideas of others, not those who initiate and monopolize the conversation. The best way to connect and engage new colleagues, especially in a team project situation, is to listen deeply and build on their ideas, something that comes naturally when you're committed to a Yes, And approach to communication.

In Coaching and Feedback Sessions

If you're a boss, one of the most important responsibilities you have is to coach your people and provide feedback that will help them grow in their work. Yes, And offers three ways in which you can put everyday work communications in a more positive light. First, it helps you to acknowledge when someone does something good and gives you a chance to encourage that person to reach further. Second, adopting a Yes, And mindset can be invaluable in motivating teams to reach for new heights when developing ideas and initiatives. Finally, Yes, And helps boss-subordinate communications by leveling the playing field of the conversation. By committing to listening and building on ideas, you tend to focus more on the merits of the idea, not the rank of the person who generated it.

In Brainstorming and Ideation Sessions

Probably the most obvious place you can apply Yes, And is in brainstorming or ideation sessions, where you and some teammates are trying to come up with a new product idea, marketing slogan or creative theme. It helps teams generate more unlikely or unusual ideas than they would in a traditional brainstorming approach. The reason is simple: When people are building and supporting each other's ideas quickly, they tend to filter and judge less, and when you take off filters at the early stage of a brainstorm session, you allow ideas to go to new places, and you discover new connections that conventional wisdom doesn't account for.

In Problem Solving and Conflict Resolution

Winston Churchill once said, "Never let a good crisis go to waste." He clearly knew how to Yes, And. When faced with unexpected problems to solve, we're often tempted to lock up and focus on the blame, repercussions and grief we're going to feel from the higher-ups instead of focusing on solving the problem at hand. Even a bad idea is just a bridge to a better idea. Yes, And allows everyone to contemplate potentially useful but incomplete ideas before they get shut down. Creating a positive climate in the face of pressure and crises gives groups the confidence that they can solve whatever problem emerges.

In Overcoming Objections

In business, people spend a lot of time, money and energy persuading each other to do stuff. In any high-stakes decision, people are bound to have objections. You want to do everything possible to avoid creating an adversarial atmosphere. Keeping a Yes, And perspective in these situations can help you validate the legitimate concerns of the other party and keep the door open for common ground.

Work cultures that embrace Yes, And are more inventive, quicker to solve problems and more likely to have engaged employees than organizations where ideas are judged, criticized and rejected too quickly. With Yes, And, you don't have to act on every idea, but you do have to give every idea a chance to be acted on.

What we're really saying in the end is that no cannot be your default response if you want to create a work environment that is fast, innovative, supportive and high functioning over time.

How to Build an Ensemble

The word team, which may be defined as a number of persons forming one of the sides in a game or contest, implies competition, which inherently suggests some external foe that the group is working against. Ensemble, which may be defined as all the parts of a thing taken together, so that each part is considered only in relation to the whole, carries no such baggage; it is a thing unto itself, an entity that is only its true self when its members are performing as one. The ensemble is a vital ingredient in almost any organization's growth and competitiveness. Unfortunately, shockingly little attention is paid to building, maintaining and developing ensembles. The consequences of that oversight are all around us, from the conference room full of smart people more interested in showing off their brain power than actually solving a problem, to the leader who takes credit for success and dodges accountability for failure, to the individual who whitewashes all his or her problems.

There are ways to reconcile the needs of individuals with those of the broader team. Whether onstage or in business, stars can emerge out of high-functioning ensembles when all members address its main enemies — the need to be right, the need to steal focus and the need to appear in control even when the evidence is otherwise:

Be in the Moment

When you are in dialogue with your co-workers, stay present in the discussion at hand, and don't dwell on previous mistakes or even previous successes. There is a time for reflection and there is a time for planning, both of which are distinct and separate from the time for creation and innovation.

Give and Take

For any scene to work, you need a balance of Givers and Takers. Sometimes people just don't like to share the spotlight, so they interrupt or otherwise block the Giver's attempts to take focus. Sometimes, people are just natural Takers. At The Second City, John Belushi, Bill Murray and Chris Farley come to mind immediately. The minute any one of those performers stepped on the stage, they took the focus, whether they wanted to or not. In an office setting, the same can occur for an individual who naturally dominates a conversation without even meaning to. But problems can also arise when Givers don't step up — when they don't jump in and take the focus when called upon to do so.

Surrender the Need to Be Right

The need to be right, among individuals, institutions and organizations, is one of the biggest barriers to an ensemble approach to creativity and innovation. If you can create an ensemble where everyone agrees to surrender the need to be right, you will increase productivity by leaps and bounds. Simply by agreeing to remove the word no from your vocabulary and replacing the response with "Yes, And," you will create an environment where innovation can flourish; you will also make everyone happier.

The Co-Creation Story, or Audiences Want In on the Act

Dialogues push stories further than monologues. The sum of co-creation is greater than its parts. And in our increasingly connected world, co-creation is fast becoming a fact of life. Unfortunately, it is not usually taught or applied in the very corners where it is needed most.

There are three keys to co-creating successfully within your own business and ensemble:

1. **Find the Idea, Not Your Idea.** While individuals can come up with great ideas, ensembles that are willing to co-create are ultimately better and more consistent at finding the idea. This concept can be a hard sell, because when an ensemble is engaged in co-creation, ideas no longer belong to the individual who came up with them. Rather, they belong to the group. So, if you want to co-create to get to the idea, you first have to encourage people to cede control over their ideas for the greater good of the group.
2. **Cede Control.** Getting people to cede control often becomes exponentially more difficult the higher you rise up the food chain. Chances are, the top creative thinkers in your organization are not inclined to share. This is unfortunate since creatives willing to cede control over ideas gain a more robust fount of insights than individuals who prefer to go it alone.
3. **Eradicate Fear.** Fear may be a useful emotion for keeping us safe, ensuring that we floss or making sure we turn in our taxes, but it's detrimental to the act of group creativity. Whether it's fear of failure, fear of looking foolish or fear of the unknown, fear does not inspire elegant creative thinking; it inspires knee-jerk, path-of-least-resistance ideas. When used

> as a motivational tool, fear may push someone to run harder, but it's never going to push anyone to run smarter. No organization or business will ever gain creative advantage when governed by fear.

Nothing could be worse for co-creation than a scaredy-cat culture. It's almost impossible to live and create in a moment when you're wracked by fear. After many years of auditioning prospective young improvisers, the authors have identified a list of behaviors that 90 percent of applicants demonstrate as they attempt to externalize their fear:

Asking Questions

One of the very early rules you learn in studying improv is to avoid asking questions of your scene partner. When improvising a scene, you're supposed to be in dialogue, creating together. When you ask questions, however, you put the onus on your partner, and your partner alone, to provide the content and laughs for the material you are supposed to be creating together. People improvising in fear ask questions because they are too afraid — too inside their own heads — to put themselves on the line and take responsibility for making the kinds of declarative offerings that serve to build the content of a scene. There is a place and time for asking questions. You need to know details in order to contribute to the greater conversation, but once those details have been shared, it's time for the team to get creative and brainstorm. At that point, questions are a creativity killer.

Aggression

There is no question that dealing with aggressive personalities is very difficult. If you're a boss, the answer is simple: Dictate the code of behavior that you expect from all your team members — a code that mandates sharing the stage and co-creating with respect. Then give those personalities practice to improve. They will need to unlearn what's become second nature to them.

Yelling

The collateral damage of management-by-volume is significant and long lasting. Any sense of collaboration is thrown out of the window; a culture of "me" permeates the business rather than a culture of "we," and morale is terrible. It's almost impossible to co-create and build for the future in this kind of environment. People who yell are acting out of fear and insecurity. The only way to change their behavior is to help them feel safe and secure. Improv tools such as Yes, And and Give and Take are conducive to this effort.

Waffling

Waffling is merely a delaying tactic, something you do when you are too afraid to leap into the unknown. Unfortunately, waffling is an all-too-common refuge for people put in the position to make decisions but who lack the confidence to act. In business, not making a decision is almost worse than making the wrong decision. The secret to building confidence is practice.

Timing Matters

When it comes to co-creation, whether in improv or in business, timing matters. For The Second City, even seconds between an audience member's suggestion and the response of an improviser can prove fatal to the success of what follows. And in business today, consumers expect a rapid response when they post a comment about a business or brand on social media. That's been hard for a lot of businesses to get used to. Of course, every business has to manage its own response time to customer inquiries, complaints and suggestions. Yet while there is absolute value in a considered response that may take hours or even days, there is a different kind of value in an instantaneous reply. It may be a bit more challenging than taking your time, but the energy and fast, creative thinking a quick response requires can compel you to perform even better.

When you receive real-time customer feedback of the kind a live audience provides, there is not time to separate the generation of content from the analysis of content. As you improvise a scene onstage, you feel the effect of your work upon your audience immediately. Their reaction then affects the choices you make in real time. Because improvisation demands that you stay in the moment, you do it without worrying about the value or validity of your work, which frees you to be more spontaneous, creative and authentic.

Change Is Hard: Comedy and Improvisation Make It Easier

The business or organization that takes itself too seriously and doesn't know how to question its own beliefs is at a strong disadvantage. Rather than pretend that problems and failures don't exist, strong leaders and organizations acknowledge what's not working. They encourage team members to demonstrate their respect for the organization by questioning the status quo, challenging assumptions and traditions that may not be working, and calling out the truth, even when truth is hard to hear.

The line between respect and reverence isn't always easy to see, and we are continually faced with finding the

balance between the two. But individuals and companies who can inject a healthy amount of irreverence into their corporate culture will not only improve their organization's morale, they will also be setting a foundation for being more competitive.

The One-Two Punch of Comedy and Improv

Change is hard whether you work in education, politics, a startup or a Fortune 500 company. When the status quo is no longer working, organizations and leaders need a way to change the conversation and get people to reconsider assumptions that are leading them astray. Comedy makes it possible to grab people's attention and get them to face the uncomfortable reality of the situation without being threatening or disparaging. Comedy makes it possible to talk gently but forcefully about what's broken, while clearly making the case for change.

But popping the tension bubble around an organization's failings and challenges isn't enough. It doesn't help anyone to just do a comedy drive-by and make fun of people's serious problems. To be truly effective, we have to build the capacity to solve those problems. Comedy and improv deliver a powerful one-two punch that makes change easier. Comedy makes it possible to identify and talk honestly about problems, and improv builds the key skills people need to deal with the problems that come with any enterprise-wide change agenda.

Respect, Reverence and Authenticity

When companies and individuals lack a sense of humor, the root most often lies in the mistaken belief that one must remain reverent to institutions and ideas. The Second City thinks differently and offers to replace the word *revere* with *respect*.

Respect allows for dialogue between individuals who may think and feel differently, thus creating a path for potential understanding and change. Reverence makes idolatry of individuals and institutions. It speaks to us rather than with us. Reverence is the enemy of change.

The most important dividend from the respect/revere dynamic is authenticity. Authenticity has always been prized. Business leaders want to be regarded as authentic. Politicians do. Brands want it, too. These days, however, there seems to be more talk about authenticity than in previous decades, perhaps because the Web, for all its failings, forces greater transparency and openness. In a world where everyone with a Web connection has a megaphone and isn't afraid to use it, company flaws and bad corporate citizenship inevitably come to light. Organizations can no longer hide from the audiences and customers they serve, and that new reality is forcing transparency, candor and, in some cases, irreverence that would never have been seen before.

Using Failure

Too often we are told that failure is not an option. But the opposite is true. It's vital to give failure a role in your process. The biggest threat to creativity is fear, especially the fear of failure. By deflating the negative power of failure, you erode fear and allow creativity to flourish. Moreover, how organizations talk about failure can be key to how well they do. Companies that reflexively whitewash or punish failures create environments where nobody wants to take a chance or speak openly. Failure should be a given.

The Second City is regarded as a perfect model of fearlessness. They are proud of their heritage of failing in six distinctive ways:

1. **They Fail in Public.** It's not that people lack ideas, commitment or capability; it's that they are controlled and held back by the fear of public judgment, specifically the judgment that their ideas aren't good enough. The folks at The Second City don't like to fail any more than anyone else. They've just learned to put failure in proper perspective and come to terms with the fact that where there's a chance of public failure, there's also a chance of public acclaim.
2. **They Fail Together.** The commitment to ensembles helps to create a comprehensive support framework. When support, trust and respect are a given in your place of business, you have set the table for invention. Come to the aid of a co-worker who may be flailing in a meeting; take 10 minutes each day to visit the offices of individuals in other departments; when you mess up, say you're sorry. It's not all big, sweeping actions. Sometimes it's the accumulation of small acts of support that provide a true sense of community inside a business. And this is exactly the environment you need to foster if you want to encourage your ensemble members to push into difficult territory.
3. **They Fail Fast.** Improvisers are usually extremely quick-witted and nimble, able to think on their feet and adapt seamlessly to changing environments or circumstances. Their ability to listen and react intelligently and comically is what separates great improvisers from people on the street. Their need for speed also ensures that when the inevitable failures happen, they move quickly on to the next new idea

without stressing over what was wrong with the previous one. They know that there will be a time later on to deliberate over what didn't work. At that moment, however, they can't let failure derail them because they've still got a show to finish.

4. **They Fail Free of Judgment.** No one can feel free to fail — or, conversely, feel free to take risks — if they think they are being judged, either by their colleagues or their supervisors. Failure can be successfully harnessed only when it's allowed to exist inside a judgment-free zone.
5. **They Fail with Confidence.** The Second City ensemble members are able to rebound fast from any mess-up because they bring unshakable confidence that their approach, talent and experience will carry them through and enable them to be successful in the end. They are more than happy to fail because they've seen that failures can lead to success.
6. **They Fail Incrementally.** The improv axiom "bring a brick, not a cathedral" suggests that the best improvisers don't feel compelled to bring wholly formed, finished ideas into an improvised scene. Rather, they know that the ensemble, working together, will ultimately create the full scene, so an individual's responsibility is only to bring the next idea or piece of information that can advance the scene. Because of this, no one actor carries the burden of creation, and because improvised scenes are built one brick at a time, as it were, no single idea is critical, and the scene can grow into something great even if individual contributions along the way aren't spot on or interesting. It's a counterintuitive thing that most employees don't grasp: Their ideas are critical not because they're brilliant, wholly formed pearls of wisdom. They're critical because they encourage the flow of ideas from others.

Follow the Follower

Improv comedy, meet Peter Drucker.

One great way to understand what can be accomplished when we abide by Drucker's laws of great leadership — trusting the ensemble, working in synchrony, taking the I out of team — is through an exercise developed by Viola Spolin, mother of improv theater, called Follow the Follower.

It works like this: A group of individuals sit in a circle facing each other. On a facilitator's cue, each individual starts making sounds and movements. However, at the same time, each person is also to mimic the sounds and movements of others. No one leads, and no one follows — everyone in the group is constantly shifting their attention to see what the other group members are doing. If one person decides to shake his head, the whole group will shake their heads. However, when done right, an outsider would not be able to identify the original head-shaker. It's as though the group is in a total mind-meld, able to anticipate the slightest change in direction with all the precision and instantaneity of a school of fish. The leading and the following are constantly in flux.

Get Out of the Way

Very few businesses have a manual for being the Boss. At least, we never got one. But we did have the benefit of receiving some pretty good advice from those who came before us.

At Second City, the boss doesn't sit in on rehearsals. The producers who oversee the live productions check in on the shows when the director indicates that it's a good time to do so. The case and the director are allowed to work unencumbered by outside eyes or the real-time judgments of anyone not directly involved with the actual work — in this case, creating original comedic revues. That's how the creative process should be allowed to work in other organizations, too. When a team is assigned to build new business plans or brainstorm a new advertising campaign, leaders and managers should set parameters and then go away. The parameters are important, however. Most businesses don't have the luxury of unlimited development times. Create timelines and schedules that everyone feels can be met; make sure the group has all the resources they need to get the task done; do find time to check in during the process to make sure that the team knows that they have outside support *when they need it,* not as an everyday intrusion.

Leadership 2.0

A leader's role is recognizing the shift from a hierarchical leadership model to a flat one; knowing when to lead, when to follow and when to just get out of the way; and trusting your teams and talking to your audience — all while setting the context for both internal and external communication. Leadership today is all about letting go of the old stereotypes. If you have to demand respect, you never had it in the first place, and you aren't going to get it through ultimatums.

Leadership today is a far cry from the cigar-chomping, throne-sitting, order-barking man in charge who dominated the cartoons of our childhood. The best contemporary leaders are skilled at operating in an ever-shifting dynamic that allows them to shift as well, letting the most knowledgeable staff members take center stage when

necessary, and assuming more direct control of the environment when it's called for.

Follow the Follower teaches us that there is a better way to lead. Managers don't need to control every aspect of their workforce in order to achieve the greatest results. In fact, the opposite is true. When managers can access and apply the best ideas and initiatives of the individuals they oversee, they gain a strategic advantage.

Listening Is a Muscle

We have a listening problem — in our world, in our country, at our places of business, in our homes. Why? Because we don't practice. Because we aren't taught. Sure, we're told to listen — by our parents, by our teachers — but despite the fact that listening is the primary means by which we learn, we've never been given the tools to develop our listening skills.

In our professional development classes, we make a real effort to show what business and improv have in common: We both have audiences to reach and win over, we both have to create and work on teams, and we both feel the pressure to perform or be replaced by more talented and differently gifted performers. We also point out the important differences between our worlds. We find strength in ensembles over individuals, we're comfortable — or at least competent — in the absence of a script or plan *and* we listen.

Deep, practiced listening is really a form of meditation. It is a skill that enables you to turn off the judgment part of your brain and allows you to interact with individuals and groups in a seamless way. It is not too much to say that great listening is the difference between flopping in front of 300 people and creating art.

Offstage in the business world, or anywhere people communicate, you don't always feel the consequences of poor listening immediately. When you're drifting off during a boss's rant or listening with one ear to your spouse recounting the challenges of the day, you may miss some opportunities to connect, but you're also likely to get away with it, because you can often hide exactly how checked-out you are. Nod a few times, murmur a few um-hums, and a lot of people will mistake these superficial expressions of listening as the real deal. But just because people can get away being bad listeners doesn't mean that there is no cost.

The Practice of Listening

Sales calls, creative meetings where different visions are being expressed and one-on-one employee reviews are essential moments of communication; how well you listen at these crucial times can determine the success or failure of your entire business. If you are not practicing total listening, you are not bringing your A-game to the endeavor, which, practically speaking, doesn't make any sense if you want to succeed.

You could make the case that listening skills are more important than ever, given the macro changes happening in the world. As business becomes more global and generational shifts occur in earnest in the workplace, it's more important than ever to improve the quality of communications, not just the volume of it. And in order to improve the quality of communications, people need to improve their listening skills; you can't have one without the other. Listening is like a muscle — it needs to be worked in order to see improvement.

Conclusion

Ultimately, improvisation is about making discoveries. You walk onto the stage or into a room with absolutely nothing, and, by the time you leave, you will have created something. The quality of that something depends on a variety of factors, almost all of which come down to how well you and your team can apply your brains and your heart to the task at hand.

That being said, there is no one definitive path, no one way, no line from point A to point B that will make you excel at your work, or be more creative and collaborative or a better communicator. This revolution we are experiencing has no room for absolutes. The world is shifting, accelerating and demanding more of us. Keeping up can be a challenge, whether you're trying to ride the waves of change and innovation or make the waves yourself. Regardless, there's no need to be afraid — improvisation is the perfect toolkit for navigating the unknown.

Excavate, Craft and Present Stories to Transform Business Communication

by Murray Nossel, Ph.D.

THE SUMMARY IN BRIEF

What's your story? It's a question human beings have been asking each other since we first gathered around a campfire. Millennia later, this human need for storytelling hasn't changed. We communicate most effectively through our personal stories — and our professional success depends on it.

Powered by Storytelling shows you how to tap into the timeless power of storytelling to transform your business. Executive coach, motivational speaker and psychologist Murray Nossel, Ph.D., distills decades of experience into a simple method that will enable you to find the right story for a particular audience and purpose; connect with business associates on a more personal, relatable level; share your corporate vision and goals — and get others on board; integrate storytelling into all your communications for ongoing success; and more.

Everyone needs to communicate well to succeed in business. And everyone has a story to tell. A comprehensive guide to Nossel's proven three-step communications method, *Powered by Storytelling* shows you how to tell your story, connect with your audience and achieve results.

IN THIS SUMMARY, YOU WILL LEARN:

- Principles and techniques of the Narativ method.
- To identify and release obstacles to listening.
- To tell stories in a way that excites and engages your audience.
- Presentation tips that help you truly connect with your audience.

THE COMPLETE SUMMARY: **POWERED BY STORYTELLING**

by Murray Nossel, Ph.D.

The author: Murray Nossel, Ph.D., is the founder and director of Narativ. He has taught storytelling for 25 years in more than 50 countries to more than 10,000 people. He is on the teaching faculty of the Program of Narrative Medicine at Columbia University College of Physicians and Surgeons. Narativ has worked with diverse corporations such as the Walt Disney Company, Time Warner, New York Habitat, UNICEF, Radisson Hotels and Twitter. *Powered by Storytelling: Excavate, Craft and Present Stories to Transform Business Communication.* Adapted by arrangement with McGraw-Hill Global Education Holdings, LLC, from *Powered by Storytelling: Excavate, Craft, and Present Stories to Transform Business Communication.* Copyright © 2018 by Murray Nossel. 256 pages, ISBN 978-1-2600-1190-6.

Introduction

Tibetan Buddhist monks excel at concentration. They tell a traditional tale about focus called "The Lion's Gaze": When you throw a ball to a dog, it chases the ball. But when you throw a ball to a lion, it keeps its gaze on you.

When we tell a story, our Lion's Gaze is on one thing: connecting with our audience. If you were at a sales meeting, your gaze would be to connect with the other sales reps about the sale that changed your life. A leader's gaze is to connect with his or her management team through a story about why the business exists.

Connection is where the transformation of business communication happens. In other words, the effectiveness of your communication is commensurate with the depth of your connection. And nothing makes that connection better than the story you tell.

In the Narativ method, stories are created in three phases:

- **Excavating**: Generating your story ideas.
- **Crafting**: Shaping your story elements into a classic story structure.
- **Presenting**: Performing your story for an audience.

Stories don't live in a vacuum, however, and while you're learning about storytelling, you'll also be introduced to a larger framework of communication analysis into which stories are set.

To tell stories successfully, we need to understand a little about why stories connect and a lot about how to build that connection through listening and storytelling.

Let's begin by looking at the basic principles of the Narativ method:

Principle 1. Humans are hardwired for story. Story is the brain's way of helping us make sense out of our lives, of creating coherence out of randomness and chaos. Most of our experience, our knowledge and our thinking is organized as story.

There is a network of brain cells that are involved with storytelling. When they fire, they wire together more tightly and efficiently. Telling stories is a way of strengthening those connections in the brain. The point is, storytelling is a skill that can be developed, a muscle that can be strengthened.

Principle 2. Everyone has a story. Whether you think your story is not important or urgent enough, or whether you think that other people in your company are the storytellers, something has happened in your life that would make a great story. We simply have to know how to excavate for these events.

Principle 3. Everyone can learn to tell his or her story better. Your storytelling abilities will only improve with time and practice, but if you excavate and craft your story according to the What happened? method, your storytelling can make a quantum leap forward.

Principle 4. Everyone's story will evolve. From the Narativ perspective, a good story evolves naturally, reflecting the reciprocal, mutually influential relationship of listening and telling. A good story is the spark of communication exchange.

Principle 5. Storytelling is every person's access to creativity. The most basic definition of creativity is "the bringing together of already existing elements in a novel or surprising way." Storytelling is the most democratic form of creativity because every human

being has access to it. Your story is your birthright. In learning how to tell your story artfully by paying close attention to specific details, you are always creating something fresh and new.

Principle 6. There is a reciprocal relationship between listening and telling. We cannot tell a story if we don't feel that there is someone listening to us and paying attention. By the same token, we can't really listen to a story when the storyteller is not aware of his or her audience and is instead caught up in his or her own speech bubble. In this most basic sense, there is a reciprocal relationship between listening and telling. This principle lies at the very core of the Narativ method.

The sections that follow outline the steps of the Narativ method. Together, they form the process of excavating, crafting and presenting your story.

Why Story? Why Now?

Why are you choosing to tell a *story* out of the many different ways human beings communicate? And why now? Why is this the moment to tell your story?

There is no right answer to these questions. They are meant to initiate an inquiry into your communication process. You might be telling a story to portray the best way to make a sales call, or to humanize a manager to a team that has faced crisis, or to depict pivotal moments that led to the formation of your enterprise so that new hires know who you are and why you exist as a company.

In answering these questions, you'll discover two consistent components: a rationale for storytelling and a call to action. The more precisely and deeply you are able to answer them, the greater the focus of your storytelling effort will be.

There are common themes and purposes that emerge from asking the questions Why story? Why now? Here are some of them:

- Demonstrate leadership
- Explain a raison d'être and purpose
- Increase collaboration or teamwork
- Generate empathy
- Inspire change
- Resolve conflict
- Humanize or dimensionalize an issue or audience
- Share learning or training
- Celebrate and build culture.

Take a moment to reflect on a work project or initiative, some relational issues within a team or a newly identified target audience. Why would you use story to support that work? And what about this moment in time requires the story to be told? Explore the center and edges of those questions. You will gain greater insight the deeper you probe.

From this starting point, excavation evolves into a process of exploration and discovery. Stories require some digging. They are not ready-made. In fact, viewing them that way diminishes their return. A good example is formulaic training material or a clichéd inspirational phrase. They lack the direction and urgency of Why story? Why now? and the vitality of a good story. Work needs to be done to get to the heart of the matter. There've been no surprises yet. We haven't pushed through any boundaries. This is precisely why we must suspend judgment for a period of time: so that we don't cut short the creative process of excavation and miss out on stories that lie just below the surface.

The obstacles that stand in the way turn out to be part of the creative process itself.

Identify Obstacles to Listening

In Narativ training, listening creates speaking and speaking creates listening. Transformed communication is when you pay heed to the reciprocal relationship between listening and telling.

Speaking and listening influence each other throughout any conversation or presentation. Any shift in one creates a shift in the other. As we seek to connect with our audience — and to maintain that connection — being sensitive to this natural dynamic is essential.

What impedes this flow are, in Narativ parlance, "obstacles to listening." This method prioritizes listening. For successful communication to take place in the time and space allocated for it, we should identify and release any obstacles to listening so that they don't affect the telling.

Let's explore how first we identify obstacles to listening and then how we release those obstacles.

Categories of Obstacles to Listening

As a guideline to approach the listening environment in your organization, consider the following five categories.

External obstacles. Hearing is one component of listening. As the sound and tone of the words enter the body, they cause a wide range of effects. The quality of the sound of a voice can cause feelings in the body. Some voices are musical and soothing, whereas others are harsh

and unsettling. Other hearing obstacles include noises and other sounds, such as traffic, barking dogs, jackhammers, music or whirring air conditioners.

How does what you are seeing affect your ability to listen? If the storyteller looks sad, does that increase the level of attention you bring to his or her speaking? Does it decrease it? What judgments arise from seeing? How does the smell in the room affect your ability to listen?

Physical obstacles. These most often have to do with the body's physical needs: hunger, needing to go to the bathroom, tiredness, physical discomfort or pain, sexual arousal, clothing that's too tight or uncomfortable, rashes, feeling sick or even having a bad hair day!

Internal obstacles. Internal obstacles include thoughts, memories, emotions and feelings. You can have a variety of feelings in an hour, even within a minute, especially if you are upset or sad, or feel extreme happiness or joy. These can be obstacles to listening. Some of these obstacles are invisible to others and often to ourselves.

Psychological obstacles. Judgments of others and ourselves make it difficult to listen and be creative. "I am not good enough." "He is better than I am." "She doesn't know how to tell a story." Opinions or strong beliefs of agreement or disagreement can interfere if the listener likes or dislikes what the storyteller is saying. Opinions about religion, politics or other topics may be obstacles to listening.

Relational obstacles. The relationships we have with people often shape the way we listen to them. At work, there is a hierarchy, and that's a natural and important structure. Bringing awareness to how the hierarchy affects our listening is crucial so that we don't let it influence open listening. This is not to dismiss or undermine necessary power structures but simply to be aware of how our ideas about them affect what we hear. Otherwise, we may not contribute all that we can, or conversely, we may not allow our leaders or subordinates to contribute their best.

When you practice identifying obstacles to listening, you will notice that many of your obstacles have to do with past experiences and memories. One of the reasons we do not suppress the obstacles but just make note of them and let them be is that some of them can be material for our stories. Therefore, identifying obstacles to listening not only paves the way to releasing obstacles but also can potentially lead to identifying an experience or memory that could become a story. So pay attention to your obstacles because your next great story might be hiding in plain sight.

Release Obstacles to Listening

In Monday morning meetings at Narativ, releasing obstacles to listening is at the top of the agenda.

"I'm leaving for California this afternoon, and I have still a number of items to prepare for my presentation, in addition to booking a car. I'm a little scattered. Plus, it's hot out, and I'm aware of what moving through that heat will be like." Katy pauses. "That's it. That's what's in my listening."

The rest of the Narativ team acknowledges her comments with a "thank you." Then the next person speaks.

Releasing the obstacles lets your colleagues know that if you seem distracted or annoyed, for example, it's because of your own preoccupations that have nothing to do with them. This is important if you're in a leadership role because people are watching your responses and often taking them personally. With this practice, you enhance focus on the meeting at hand, enabling a purer strain of attention than one fettered by miscellaneous concerns and issues.

Releasing the obstacles to listening may be used as a general communication protocol before any meeting or conversation, because it provides a quick way to open up communication and create connection, which in turn heightens attention to the matters at hand. However, it is important to understand the roots of this practice. It derives from a component of Narativ methodology called preparing a "dedicated time and space" for listening and storytelling.

Guidelines for Creating a Dedicated Time and Space

What follows are guidelines for how to define a dedicated time and space for listening and storytelling, whether they happen in person or online.

1. Why a meeting? Why now? Just as you must consider why you're choosing to tell a specific story to another person or group of people, you must be able to answer why you're calling a meeting (as opposed to using other means of communication) and why at this particular time.

2. Create a dedicated time and space. Your priority now is to create a space for listening. Remember that listening begins with you. So think of the environment you need in order to listen yourself, and then think of who the listeners in the meeting will be. Make sure that the space will remain private throughout the length of the meeting. Is the room big enough to accommodate everyone? What is the noise level? Has the room been booked for an adequate amount of time? Is there enough light?

3. Manage the time. Let people know that this meeting is going to be timed, and designate a dedicated timekeeper whose role is to make sure that everyone gets the same amount of time to speak, or alternatively, you can dedicate the time proportionally based on the emphasis of the meeting. If storytellers know that their story will reliably end after a certain number of minutes, they will be able to choose which elements of the story are the most important for them to communicate.

4. Identify and release obstacles to listening, and set an intention. When you start the meeting, go around the room and ask people to say what their obstacles to listening are in the moment. Then release the obstacles to listening. For example, if there's a construction crew outside with a jackhammer, close all windows or find another room to work from. Identifying and releasing the obstacles is not meant as suppression or rejection; it's about acknowledging and putting things aside so that everyone can get the most out of the meeting experience.

Finally, set an intention. Setting an intention calls you into a certain way of being, which is not the habitual way you may have of approaching a meeting. For instance, an intention may be one word or one sentence such as "Focus" or "My intention is to listen constructively to what is said in this meeting." By stating this intention, you are indicating to everyone in the group what kind of listener you're going to be for each one of them.

5. Designate dedicated listeners. The role of the designated listener is to listen openly, without judgment. She is also listening for the specificity of what's being said, according to the What happened? method. By designating someone as the dedicated listener, you know that there is someone whose listening you can count on to actively support and shape what you and others are going to say.

6. Instruct participants to tell what happened. Always ask What happened? no matter what the content of your communications. It will transform the way your meetings sound, and affect their outcomes because it will force you to identify and take out what is unnecessary — that is, your opinions, assumptions, interpretations and feelings about a situation. It's an editing tool for you to make your point more quickly and in a more straightforward way.

7. Record and share. Make sure what is said is recorded, whether through precise note-taking or through an electronic device. Designate someone to take notes and to share those notes with everyone.

Remember Your Heritage

Most people have fond memories of their grandparents. The Grandparent Exercise is a storytelling practice that simultaneously breaks the ice and allows people to get to know one another in a substantive manner. It is a powerful way of locating the personal story within a larger historical context in an intimate and emotional way.

There are two roles that are essential to conducting this exercise: the facilitator, who explains and leads the exercise, and the timekeeper, whose role is not only to keep time but also to support the facilitator in creating the listening space for the grandparent stories to emerge.

In this exercise, the group gives and receives the *gift of listening* to each person, and even when there are obstacles to listening, each group member will bring his or her listening back to the person who is speaking.

Participants have three minutes to present themselves as their grandparent. They speak in the first person "I" point of view, tell their name, and somewhere in the course of the story, tell when they were born and whether they are currently alive or have died.

The exercise is not about performance or delivery. It's about the listening, which is the safe container for your story and which will also shape the story that you tell. Once participants start speaking, the listening will take them in directions they cannot predict. Participants have three minutes each to tell their story.

After each story, the facilitator asks the group, "How was your listening? Were there any obstacles?" People may respond, "I was thinking about my story," or "I was thinking about how little I know about my grandparents." The facilitator acknowledges these obstacles by responding with, "You are now aware you have an obstacle because you have spoken it. You have acknowledged that it is there. Now let it go, hit the refresh button as you would on a computer, and bring yourself back to be fully present for the next story." The facilitator then moves on to the next person.

With teams, this exercise provides a means of connecting people to a sense of where they come from and simultaneously sharing that bit of background with their teammates. Liberated from the pressure to talk intimately about themselves, which is horribly uncomfortable for some, participants are nonetheless able to share a deeply personal relationship. For a group, the exercise creates a sense of unity in that having grandparents — whether or not one has ever known them — is a universal

phenomenon. It naturally stimulates our sense of empathy and understanding.

In the context of the Narativ method, the Grandparent Exercise demonstrates that there is a reciprocal relationship between listening and telling; that listening is a gift; that everyone has a story; that everyone is equipped to tell a story; that basic storytelling principles can be applied by anyone; that a story can be constructed with fragments of memory and information; and that however much you protest you can't tell a story, you'll find it's a natural ability of your brain!

Tell What Happened

Telling a story according to the What happened? method means relating the actual events that occurred as they were seen, heard, smelled, tasted and touched. With this storytelling method, judgments, comments, opinions and critiques are excluded, and we instead rely entirely on our powers of factual description to take our listeners on a sensory expedition through the story's landscape. An easy rule of thumb for this method would be to say what actually happened, not what you thought or felt about what happened.

A creative analogy that assists in learning and perfecting the What happened? method is called the What happened? camera. According to the What happened? camera, the following are not facts. The camera cannot see these mental creations.

- **Feelings:** Emotions, reactions and vague beliefs.
- **Interpretations:** Explanations based largely on our own version of things.
- **Judgments:** The tendency to objectify, qualify or characterize someone based on our own proclivity for certain ways of thinking or viewing others.
- **Opinions:** Views or judgments not necessarily based on fact or knowledge; general beliefs.
- **Rationalizations:** Attempts to justify (an action or attitude) with logical reasoning.
- **Commentary:** The expression of opinions or offering of explanations about an event or situation.
- **Internal thoughts:** These include comments that begin "Well, I thought to myself" or "I said to myself." These are preambles to saying what happened. When you use the What happened? camera, you don't need these preambles.

When our feelings and interpretations about events are driving the show, they prevent our listeners from experiencing what happened for themselves. How can you be there when someone else is coloring the facts with his or her interpretation? When only the five sensory details are present, our audience can listen cleanly and openly. It gives space for their intelligence to assess the story's many elements.

Delivering a Wow Moment

A multinational medical insurance company was hit financially because of the negative reviews its customer service department was receiving online and in the media. Sparing no expense, the company brought in expert after expert in an attempt to fix the ongoing problem. Call center employees were given a set of principles that were deemed brand attributes to live by:

- Listen and learn from customers so that the customers' needs are at the heart of every decision.
- Deliver wow moments that matter.
- Always do the right thing.
- Listen to our customers.
- Be courageous and decisive.

Although the branding team patted themselves on the back for coming up with these attributes and principles, employees had no idea how to implement what amounted to a series of abstract concepts.

For the company to become more consumer-centric, the entire organization needed to undergo a radical cultural change in which everyone became a storyteller. "We all need to be storytellers" became the corporate mandate. Narativ representatives went to the call centers and talked to the managers and reps who speak to customers every day. The goal was to elicit their stories and share them widely to help teams be more customer-centric.

Among hundreds of managers in call centers all over the world, one story in particular stuck out. Charlie, a manager, had received an escalated call, which meant that the customer had not been satisfied by any of the customer service responses she'd received so far. This is Charlie's What happened? story:

"It was a Monday night about 5:30, and I was just getting ready to leave work. I got a call from a woman named Mona. She wanted a list of therapists for her husband, Henry.

'What kind of therapist does he need? What condition does he need to be treated for?'

Mona responded, 'My husband is crazy, and he needs help. He's been diagnosed with sleep apnea, but he refuses to get the machine.'

As I was talking to her, I could hear him in the background, 'If you're talking to the insurance company, hang up. It's $1,200 for a machine I'm never gonna use.'

I asked, 'Why is he so resistant to getting a CPAP machine?'

She said she needed to go into a different room to talk. 'His father died of cancer while on a respirator. This machine looks like a respirator to him, and he's not gonna get it.'

I said, 'I have sleep apnea too, and I have used a CPAP machine for many years. And I'm still here.'

Mona said, 'You know, I really want you to talk to my husband. I want you to tell him what you're telling me.' She put him on the phone.

Henry told me that the Packers were playing the Bears and that I was taking him away from the game. First thing I said in response was, 'I'm a Bears fan.'

Henry said, 'Well, that's not a good start. I'm a Packers fan.'

I took a breath, and I told him that Reggie White, who was an all-pro defensive player Hall of Famer, died from sleep apnea five years after retiring from professional football.

Now Henry took a breath and said, 'I can't ignore this.'

Oh, and by the way, his CPAP machine was covered 100 percent, so it wouldn't cost him anything. He said he would get the machine on one condition. 'You have to say, Go, Pack, go!'

I said, 'You know what? If this will help you, absolutely: Go, Pack, go!'"

For businesses, a What happened? story promotes the mission and goals of a company in such a way that they are graspable and memorable and powerful. When Charlie shared his story with fellow call center employees, he embodied those values and goals, and everyone immediately understood what it meant to "deliver wow moments" and "listen to customers." They saw that they could actively create a more customer-oriented culture.

By saying what happened and detailing the facts of your experience, you can bring yourself and others into a clearer picture of events without clouding their listening with the language of emotions. This brings our communication forward, allowing emotions their place but not allowing them to tangle up what we want to say. Notice the distinction here: we allow the emotions to come up; we identify them; but then we release them and don't allow them to direct us.

Find Your Ending

The success of a story depends largely on its structure. Through the What happened? method, you plot out the details. At that point, your story is simply a succession of What happened? moments. To become a satisfying story, those moments will have to be shaped into three parts: beginning, emotional turning point and ending.

Every story has an arc. Ending a story can be likened to landing a plane. Like the pilot who must know how to descend, precisely where to land and come to a full standstill, the storyteller must guide the audience toward the conclusion and bring the story to a significant end. In between is the flight itself, and though no one likes turbulence, a bumpy ride does make for a better story. Just so, your story will be more captivating when you've identified your emotional turning point.

Where to begin. If the very first sentence (or two) of your story captures our attention, then we, your listeners, will follow you wherever your story takes us. Take the lead, know where you're going and we'll go with you. In fact, we'll want to go with you. A strong beginning is always a What happened? beginning.

With your first line you can choose to drop us right in the middle of the action. Being dropped into the middle of a story sparks our curiosity because we are not given a context. We do not know quite what is going on, and the mystery of it makes us want to know what happens next. Example: "My wife turned around and picked up the phone. 'It's for you. She says she's a headhunter.'"

The emotional turning point. In traditional dramatic structure, a conflict or obstacle arises that the main character somehow has to overcome or resolve. It's what everyone's silently anticipating when you begin a story, and it will be the surefire way to make your message or meaning stick.

Conflict connotes your struggle to achieve your goal. It can just as easily be funny, touching, moving or violent. Remember, we want to see transformation in your story. Something changes; you as the lead character transform, even if it is a subtle change. Conflict is inherently dramatic.

When structuring your story, moments of conflict are turning points — the places where the story changes direction.

Ending. As you are excavating and crafting your story, the ending may not be immediately clear. That's okay. Although sometimes you are dead sure of where you want to end, in most cases the ending emerges from the story-creation process. The important thing to keep in

mind is that you are seeking an experience in which the emotions of your conflict are released. That will give you an ending that delivers, that lands and that recapitulates the rationale for your story in one short moment.

Connect With Your Audience

From the moment you ask the questions Why story? Why now?, you have begun thinking about your relationship with an audience. Every subsequent step in Narativ's method is oriented toward optimizing your creation of a connection with your audience.

Having excavated your story and crafted a beginning, emotional turning point and end, you are ready to present. The best way to learn how to present is to do it. Offer people your story. Then ask them if they are willing to listen. If the answer is yes, then you are bound into a listening and storytelling contract. What follows are guidelines and principles for presentation.

Connect to your body. A story lives in your body. Your body remembers your story, and therefore your body is an instrument of telling. As part of your preparation for telling, it's important to search your body for tension that may interfere.

Connect to the space. In presentation, you are always working with *proprioception*, which is defined as the instinctive perception of the position and movements of the body. To begin, think about the space in which you might tell your story. Allow yourself to begin to inhabit that space mentally. Often when we present, we tend to cling to the podium like a barnacle. There is a certain mythology about presentation and standing in the front of the room with little movement — as if that's the only way to hold everyone's attention! Break free of that restriction. The room is yours to use, and how you use it plays a role in how you connect with your audience. Every choice you make is about commanding attention.

Identify and release obstacles to listening. Reapply the technique of identifying and releasing obstacles as you prepare for presentation. These include obstacles you might encounter in the room itself: Is it too hot or cold? Too bright or dark? You have to take in all potential obstacles and release them so that you are not caught off guard by your reactions to them when you begin to tell your story. You also want to minimize listening obstacles for your audience.

Presentation is being present with your body and story onstage. *Connection* is what we're aiming for. Consider these presentation rules of thumb:

1. **Before you begin speaking**, connect to your body, establish your feet firmly on the ground, breathe naturally and remember the story in your body.
2. **Maintain eye contact with your audience**. Throughout the presentation, establish individual eye contact with five or six people.
3. **Slow down**. If you talk too fast, you'll lose your listeners. This applies to most people: slow down the tempo even if it feels unnatural. This is where practice and preparation are crucial.
4. **Pay attention to volume**. If possible, present without a microphone. But make sure that the people in the back row can hear you.
5. **End with confidence and poise**. Allow your story to conclude with a final standstill. Stay poised and keep eye contact with the audience as you allow the effect of the story to wash over them.

Now share your story. Connect with your body. Connect with your story. Connect with your listeners.

Keep listening to the stories that are told to you as a result of telling yours. Let those stories permeate the fabric of your being and that of your business. Enjoy the ripple effect that you will experience as a result of sharing your stories with others and listening to theirs. Allow yourself and your communication to be transformed.

Do Big Things

The Simple Steps Teams Can Take to Mobilize Hearts and Minds, and Make an Epic Impact

by Craig W. Ross, Angela V. Paccione and Victoria L. Roberts

THE SUMMARY IN BRIEF

Based on 25 years of empirical data across as many industries from companies of all sizes, *Do Big Things* decodes a once mystifying formula — a pattern of thinking and behaving that teams have utilized in all arenas to overcome extraordinary challenges and deliver big outcomes with team members who have their whole heart in it. With this summary, your team can replicate the powerful and sustainable framework that enables team members to inherently practice the traits you know are essential to delivering transformative outcomes.

The seven steps in the Do Big Things (DBT) Framework put a tangible road map at your fingertips, so your team can use every interaction to model the thinking and actions needed to succeed in today's pressurized workplace. In clear, logical discussions, the authors explain each part of the framework with experienced insight and illuminating examples from the real world so you can seamlessly implement it with your team.

IN THIS SUMMARY, YOU WILL LEARN:

- To model the self-awareness, emotional courage and integrity necessary to bring your best to every interaction.
- To demonstrate the empathy and transparency necessary to activate and bring out the best in others.
- To function with an enterprise mindset, so, as one team, you can connect across the business with other teams to deliver shared objectives.

Teams That Do Big Things

Is your team equipped to deliver big things? A word of caution: Many who have gone before you into uncharted territory have mistakenly thought that the key to their team's successes (survival!) was a matter of equipping themselves with a new structure, software, process or rearranging where people sit or dine. Most of those teams have not been heard from again. Their work was at best marginal and, therefore, forgotten.

That's because it is not merely how your team is structured or the equipment and resources in your hands that you'll need for success today. It's something more — much more.

Teams are increasingly desperate for knowing *how* as humans they'll achieve the *what*. We're functioning in what the U.S. military coined a VUCA (volatile, uncertain, complex and ambiguous) world. The disconnect is obvious: Employers are pulling employees together, calling them a team, giving them a directive and expecting them to deliver results quickly.

But such teams can't. The way teams came together before won't work in today's intense, fast-changing world. When organizations fail to grasp the wisdom that the method for teaming successfully has changed, their approach can look like the antiquated change model depicted below:

- Announce the new initiative the company needs to meet lightning-quick changes in the market.
- Form teams and assign people to roles.
- Tell people what to do and give them half of the resources needed to do it.
- Identify who is to blame for missed deliverables, milestones and budgets.

This common approach never gives teams a chance to do something significant. In moments of fatigue, as people are shuffled from project to project while enduring new demands, it's easy to think the bosses have gone mad. They can see what needs to get done yet can't find a way to get the team to operationalize the new vision.

Is Your Team's Whole Heart in It?

It's clear that there's a new requirement to succeed as a team today. The solution is refined and raw, sophisticated and practical, genius and basic, elegant and simple: It's heart. The ability for teammates to be at their human best and become bigger than anything they face — this is what many teams are starved for.

Teams significantly increase their odds of achieving big things when their whole heart is in it. Defined, this is the point at which the members of the team fully commit to bringing their full self to the team and its efforts to ensure successful outcomes — unconditionally. Now, with the personal integrity of each team member in action, the purpose of the team transcends personal position, ambition and recognition.

This whole heart is what collapses the idealistic into the realistic. Teams that possess it passionately own their plan to deliver on the big thing in front of them. These are the teams where people speak straight and remain optimistic when the data say they shouldn't — because they know what they are capable of and what's possible.

The Do Big Things Framework

The Do Big Things (DBT) Framework is the method teams practice (whether they know it or not) to transform how they think and act together so they can deliver transformative outcomes. The DBT Framework provides the language teams use to transform and quickly elevate their power and effectiveness. It's how everyone on the team aligns to a powerful and singular focus necessary to achieve the big objective in front of them — and deliver the greatest impact to the business while seizing the opportunity to be better human beings along the way.

The DBT Framework doesn't require any of us to change who we are. Instead, it activates and amplifies the brilliance we already possess. The work of doing big things does not require *doing* more; it is a method for *being* more.

This wisdom is one of the primary reasons why the DBT Framework is so powerful: Its mechanics are always turned on, and always available to us. Here are the seven steps of the DBT Framework:

1. **Commit** to the human imperative. Identify and align as team members to the human thinking and actions essential for delivering the business imperative. Often born from a sense of caring for one another, this is the transformative manner in the way team members perceive each other that sets the stage for values to be put into action.
2. **Embody** success (and leverage failure). Team members personify the spirit of the success they seek while they pursue their lofty objectives. When excellence is who we are (rather than what we will be someday), even the hardships we encounter make us better and stronger as a team.
3. **Choose** to make three decisions: contribute, activate and connect across the business. Each team member decides to bring their best to every situation and bring out the best in those with whom they interact. Then, together, they choose to partner across the business to deliver shared objectives.
4. **Exercise** your barrier-breaking authority. The team determines what stands between them and success — both real and perceived. Then, by controlling what they can control, team members act upon their inherent authority to choose their response in daily situations.
5. **Focus** on what matters. The team uses the *3 Mind Factors* to concentrate on and deliver what causes big things to be achieved: the relationships and teamwork necessary to succeed.
6. **Energize** around a shared reality. Team members should address issues with a similar frame of mind, enable people to better tell the truth and function with authenticity. This step facilitates the needed skills of adaptability and accountability required to do big things.
7. **Mobilize** hearts and minds forward. Empower the team to own their role in delivering a stronger future. Use questions that mobilize hearts and minds forward, so everyone internalizes and delivers the team's business imperative.

The DBT Framework is how each team member can be accountable to that responsibility. By using the DBT Framework, we move beyond talk about what behaviors are important — and get busy with the how.

Teams That Flatline

In order for the DBT Framework to enable your team to truly make an epic impact on the business, it's critical that beliefs about how to best develop teams are checked.

What does your team believe is the best way to develop the thinking and actions necessary to do big things? For certain, the end of teamwork (as we know it) is at hand. Actually, it's been over for quite some time. How we teamed together before isn't effective in the turbulent times of today.

Teams rarely flatline and fail because they lack technical skills. Far more often, the catastrophe that occurs can be traced to outdated beliefs about what's required to develop the team's ability to effectively work together.

To develop the team, you must develop the *whole* team. Culture change occurs as the members of the team, armed with greater shared awareness and consciousness, move through daily interactions, repeating and reinforcing their new skills. Natural accountability to elevated norms takes places as individuals sense that everyone else is changing.

This often results in accelerated improvement, as every interaction drives stronger behaviors. This is another reason why the DBT Framework is so effective: It provides a holistic method for accomplishing systemic change in the team.

In order to succeed, speed and efficiency must be combined with team members' collective skill of adaptability. The planning required to do big things is more critical

than ever, and it must include steps to equip those executing the plan with the ability to adapt to conditions that are unpredictable when the plan is conceived. And what's necessary for teams to be able to adapt? Organizations are rightly focusing on empowerment, the buzz word of this era. However, empowerment is only a part of what's necessary for teams to adapt.

When team members develop greater emotional and cognitive plasticity together (and every step in the DBT Framework supports in accomplishing this), they build the capability to adapt in a way that sticks. Increasingly, the team then stays focused on the overall plan or objective while also being able to adjust or modify their thinking and actions in that plan when they make discoveries.

Growth is caused by teams that grow stronger. When team members are intrinsically motivated and know they will be better and stronger as individuals and as a team when they reach the finish line, inspiration occurs more frequently. This causes them to grow, which means the organization will do the same.

Step 1:

Commit to the Human Imperative

The practice of effective teaming begins with identifying, aligning and equipping team members with the ability to model the thinking and actions essential to success for that unique team. That's why committing to the human imperative is the first step in the DBT Framework.

Defined, the human imperative is this: Team members identify and align to the specific thinking and the inherent behaviors necessary to deliver their business imperative. This is the act of bringing the best of humanity into the work you do. In other words, has your team answered this question: Who do we need to be as people — together — to succeed as a team?

Committing to the human imperative means the team incorporates into their business plan how they will be accountable for putting those behaviors into practice. No one can predict human behaviors until the team determines which human behaviors are a priority. Until your team's human imperative has been defined and committed to, you can predict that the thinking and behaviors of your team will be unpredictable. And this behavior can and should be expected.

No team can do big things by being passive with the human qualities we all know are essential for success. You can dramatically speed up the development of the trust your team needs by going first: Be the one who cares even more.

It's important to note that caring for a teammate doesn't mean you have to be friends with them. Caring means you still believe each teammate has worth as a person, and therefore, it's valuable to protect and amplify their value.

In this way, the human imperative is a moral imperative. As teammates care about one another more, the resulting behaviors transform the team.

How to Determine the Team's Human Imperative

When your team commits to a unique human imperative that they identify, the team is reinforcing a reason to believe they will succeed. Here's how effective teams do this, and so can you.

After you turn off the computer, facilitate a discussion with the team using questions from three specific categories. These questions work because they tap into something that matters to us all:

1. **Thinking** of the human imperative: How do we want to operate as a team that can do big things? What behaviors as a team do we want to represent us to the rest of the organization?
2. **Feeling** and experiencing the human imperative: What has been your experience on teams that function with tremendous confidence even though the job in front of you is huge?
3. **Doing** and delivering the human imperative: What specifically does the teamwork necessary to do our big thing look like in action?

Committing to the human imperative and doing big things better frees people to optimize their strengths. Team members are elevated beyond personal motives, and the entire team gains a nearly unstoppable power, in no small part because their top talent stays on the team.

Step 2:

Embody Success (and Leverage Failure)

Teams that possess confidence that they can achieve big things feel that way because they utilize a process to team effectively. That's what the DBT Framework is: a step-by-step approach to thinking and actions designed to enable the team to do big things in all circumstances.

Teams that do big things don't wait for success to act like a success. They act like a success first because they have or quickly create a reliable teaming process to give them the confidence they need.

To learn how likely your team is to embody success, it's useful to ask the team this question: What are our primary motivations for succeeding that are top of mind for us? When a team is predominantly exposed to extrinsic motivators, team members are conditioned to develop an external locus of control. If this is the case for your team, act quickly.

How to Leverage Failure

Big objectives are big for a reason: They're complex, almost always entail significant amounts of change and test a team's strength in ways that are often underestimated at the beginning. Things rarely go as planned. Therefore, the best time to measure a team's ability to embody success is to observe its response in failure. When you embody success, even in times of trouble, you look like everything is going according to plan.

The teams that do big things don't blink, retreat or assume a defensive posture when a mistake is made. They possess an accountability reflex: an ability to quickly adapt to unplanned situations, respond effectively and leverage the failure.

The magic of this reflex isn't created when failure occurs. What makes the difference and determines the type of response your team demonstrates is what the team did early on, long before any failure was experienced. Specifically, development steps are accomplished that create the conditions for team members to be transparent, demonstrate ownership of their responsibilities, stay focused on solutions and mobilize themselves and others forward.

Intrinsically motivated teams won't be seen succumbing to fits of rage, defeatism, blame or other self-defense tactics. Instead, their emotions center on trust, particularly of the most important sort: trust of self and each other.

Step 3:

Choose to Contribute, Activate and Connect Across the Business

Every profession has seen teams flatline and slide away forgotten. Equally true, the past is full of remarkable teams, in all arenas, that didn't have exceptional talent or leadership yet still found a way to succeed in big ways.

What's the common denominator? What is it those teams do, regardless of talent and leadership levels, that enables them to do big things? Nearly every team that's achieved something extraordinary had team members that made three specific decisions. And in doing so, they amplified the leadership and talent they had, which put them in a far better position to succeed.

The 3 Do Big Things (DBT) Decisions enable team members to cut through the noise and do what's right and best for the team. Once teams are enabled to make the 3 DBT Decisions, a large volume of those decisions are made more effectively, quickly and in ways that improve a person's ability to do what they want to do: Demonstrate the greatness they have within them.

The Contributor Decision

Choosing to bring your best to the situation you're in is making the choice to give yourself. It's selflessness in action, knowing you're a part of something bigger than you. For many, this decision is the act of determining that you won't compromise your values — that you will be true to yourself and live authentically. This is when you resolve to be who you know you are, where you put your whole heart into the matter at hand.

The Activator Decision

Choosing to bring out the best in others means you're making the choice to activate their greater potential. It's a decision that begins with an understanding that others have stored or unrealized greatness. This sort of belief is in high demand in workplaces today, as it is a powerful mechanism to ensure the team becomes far greater than the sum of the people on the team.

The Connector Decision

The choice to partner across the business is the collective decision by the team to form a broader team that delivers a shared goal. It's a decision that communicates to others certain beliefs: We are confident in who we are as a team. We won't play a zero-sum game. We are stronger together. This decision requires an enterprise mindset in which the team can see its role in the larger organization.

Your Most Important Role

What's the most important role you play at work? Is it an individual contributor? A manager? Executive? The finance go-to? A project management guy?

The most critical role you play is teammate. When a majority of team members embrace this mindset, the research shows that the team sets the conditions for

optimizing its collective talents. Team members impact the business far more, and they elevate their personal contributions (and, ironically, usually elevate their careers, too).

To be certain, then, the 3 DBT Decisions are not roles. They're decisions. Delivering on your functional role is the responsibility of your job. Yet, it is the duty of each teammate, regardless of role, to use their power to bring their best, bring out the best in others and ensure the team is connected to the whole.

Step 4:

Exercise Your Barrier-Breaking Authority

Step 4 in the DBT Framework — exercise your barrier-breaking authority — is powerful because it quickly translates into action what so many teams know in their guts. When a team is disciplined in identifying what stands between them and success and concentrates solely on what it can control rather than what it can't, success comes faster. And it's a far more fulfilling process for all involved.

The Barriers to Success

Your team will break through barriers much faster when it can see and understand them. Therefore, teams that do big things ask important questions, such as the following: Are we focused on what the business most needs us to influence? Can we identify what's between us and success? Are all team members equipped to take effective action?

Here are three steps for teams to take to begin breaking through the barriers they face:

1. Name the barrier. Discuss whether a barrier is real, perceived or symptomatic. By naming it, the team better understands a shared reality and is enabled to focus on what matters.
2. Address real barriers by identifying the thinking and actions themed across all of the barriers.
3. Focus on what you can control and rewrite the team's narrative. Identify the necessary thinking and actions to do big things. Partner with others in the organization who can support your team in influencing processes and decision-making.

Regardless of the type of barrier, in order to succeed in these three steps, the members of the team must then exercise their barrier-breaking authority.

Authority: Take It or Leave It

As teams work toward their business objective, conditions and circumstances appear that present themselves as barriers: obstacles that restrain or obstruct the team from progress. This is when teams that do big things model this truth: Each person on the team possesses and exercises their barrier-breaking authority.

This isn't, of course, the authority to make strategy, planning, budgetary or other decisions. That's largely determined by roles people have on the team. This barrier-breaking authority is formed in the wisdom that we are all autonomous beings and therefore can make the human decision to do our best, regardless of our circumstances.

By exercising your barrier-breaking authority, your team is free to do what you've wanted to do all along: deliver great work. The next step then, is to focus on what matters most.

Step 5:

Focus on What Matters

How do we focus on what matters? Oddly enough, the answer is the same as the answer to the question, "How do we focus on those things that distract, hopelessly stress and disconnect us?" That sounds strange, but it's true. The solution, therefore, is not for us to change our brains; it is to train our brains to do what we want them to do instead of what our brains want to do.

Mind Factor #1: The Mind Can Only Focus on One Thought at a Time

You can do different things at once, such as walk, chew gum and have a discussion with another person. But facts are facts: As you move through the day, your mind can only focus on one thought at a time.

We may be able to physically do multiple things at once, but we only hold one concentrated thought at a time. And when we continually switch from one focus to another, it saps the attention needed for full and concentrated engagement.

Mind Factor #2: The Mind Cannot Avoid a *Don't*

Our brains are wired to scan our surroundings for risks. Constantly and often unconsciously, we are searching for threats to our well-being. This wiring, however, comes with an ironic twist: When we identify that which can cause us harm, we focus on it.

The brain can't resist thinking about the "don't" messages it receives. The very thing we don't want to think, say, feel or do occurs with a frequency triggered by how distracted and stressed we are.

Ultimately, teams that do big things are far more productive because they stay focused on what they want instead of what they don't want.

Mind Factor #3: The Mind Goes Toward Its Focus

Since we can only focus on one thought at a time, when the brain receives new information, it checks it against the current beliefs in our frame of reality. "Does this information fit in my truth?" the brain asks. If not, it has a tendency to quickly dismiss the new information.

When teammates meet another team member who holds different beliefs, perspectives and experiences, a tragedy occurs: The difference of ideas (which the company desperately needs to succeed) slides to judgments about each other. And suddenly, really good people with big hearts begin to care less about one another. Trust, collaboration, communication — the behaviors we all know are essential to succeed — disappear.

But these teams can get their whole heart back in it. Teams committed to the human imperative can do so quickly as long as they're equipped with a method to better master their focus. With the 3 Mind Factors, team members are better enabled to deliver the imperatives rather than letting their brains deliver something far more dreadful: a team that flatlines.

Step 6:

Energize Around a Shared Reality

No matter whether for profit or not, education or government — teams that consistently do big things have an undeniable ability to frame a shared reality and then approach events, issues or problems in a common and energizing way. In other words, it's less about what these teams do. It's how they do it that makes the difference.

Your brain has established neural pathways, mechanisms by which information travels, that with repetition become deep grooves of thinking. The result is an autopilot effect: You don't have to think much about what you're doing.

As a result, the behaviors of team members become predictable due to the formation and reinforcement of neural pathways in the brain; repeated focus results in replicated thinking that drives the same behaviors.

When members of a team default to outdated or destructed neural pathways, the focus — and therefore thinking and actions — drives unhealthy conflict due to always following the same lines of concentration. And to be certain: A team that can't process and exchange information together can't work together.

Teams that are high achieving have constructed distinct and powerful norms when it comes to how they process information together. Specifically, they establish similar neural pathways together that are productive and effective at navigating and aligning the team forward far more collaboratively. Collectively, the intelligence of the team, along with its ability to work together, measurably increases.

This is when a phenomenon occurs. As team members focus forward together, it translates into the experience of expanding and bigger energy. As a result, rather than developing a narrative or way of thinking that diminishes the team's effectiveness, a team can purposefully stimulate and energize itself in seconds. Now, individually and collectively, people are elevating the best of who they are in a new, shared reality.

The Power of a Shared Reality

In teams that do big things, at some point in the team's maturation, something clicks. They move from pitting realities against one another and leave behind old frames of the way things used to be. And they form, see and function from a reality they created together. Most often, this occurs when there's a frequent focus on a shared objective or motive.

Teams that do big things can make an epic impact. They know that changing and elevating behaviors is not an intellectual exercise. It's the business of the heart. Teams that bring only intellectual energy to their efforts will increasingly struggle in today's data-rich world. It doesn't matter so much what any of us see; it matters more how we experience what we see together. The more meaning we have in our work, the more energy we have for our work. The more meaning we have when we're together, the more meaningful the impact we make together.

Step 7:

Mobilize Hearts and Minds Forward

Teams with their whole heart in it ultimately succeed because they take great care to manage their focus and the direction of their energy. Therefore, they are compelled to take action and mobilize themselves

forward. This means that, individually, teammates use their self-awareness to summon the emotional courage necessary to actuate their potential. The team then comes together and puts in motion a forward-focused energy that has the power necessary to achieve the significant objective in front of them.

A team's ability to succeed today is directly correlated to a team's ability to cocreate an image of where they're going and how to get there.

Teams that are serious about achieving their objectives execute brilliantly on the seventh step of the DBT Framework. The fact is there are a lot of ways to mobilize hearts and minds, including telling inspiring stories, appealing to a shared world view and leveraging what motivates others.

There is only one technique, however, that enables you to leverage any of the methods listed and make certain that an intrinsic response is activated within teammates. It's a fact: The human mind cannot resist a well-timed or well-phrased inquiry. The moment any of us hear or think of a question, our focus is concentrated on the thought that was triggered by the question. And whatever direction your focus goes, so does your energy.

It's not enough for just the leader to ask questions. If teams are going to do big things, then every team member must be equipped to ask the types of questions that mobilize hearts and minds forward.

Teams that masterfully execute are those whose members find more meaning in their work. Their hearts and minds have been mobilized. This is accomplished by asking higher classes of questions that activate a greater consciousness.

Is Your Team Ready to Do Big Things?

You can effectively predict how well prepared your team is to do big things by measuring the level of technical and aligned capabilities the team possesses in proportion to how much the team's whole heart is in the matter at hand. The device to do this is the Team Heart Quotient (THQ), which measures the essential elements that contribute to teams that Do Big Things as compared with teams that have only heart or only high capability — or teams that lack either one.

At this moment, your team is one of four types of teams:

1. **DBT Teams**: Capable of sustained, robust and regularly improving results. Teams are aligned with strong technical skills, *and* they have the ability to put into practice essential whole-heart behaviors, including emotional courage, empathy and a one-team approach.
2. **High-Performing Teams**: Capable of short bursts of high performance. The team has top talent that is aligned, *yet* team members too infrequently have their hearts and minds mobilized. Consequently, the team is at a high risk of being overwhelmed by negative human behaviors in the working environment.
3. **Heart Attack Teams**: Capable of small spurts in results. Such teams possess a lack of skill or aligned talent, *yet* they demonstrate huge amounts of heroic courage, passion and commitment.
4. **Despondent Teams**: Capable of only mediocre outcomes, at best. This team lacks skill, or the talent they do have is not aligned, *and* they are generally disheartened. Team members often conceal reality by focusing only on what they will do someday with little attention to how they will effectively improve.

The THQ assessment equips teams to measure the current state for your team and builds the awareness necessary for your team to take constructive steps forward.

Once your team has assessed where it stands with regard to THQ, it's important to take the next step of improving. And to be sure, no matter where your team is on the THQ assessment, you can improve — and do so quickly.

The most effective way to change behaviors of any team is not by training the team about targeted values, but by equipping teams to use their values to deliver on the human imperative. The difference between these two approaches is subtle; teams that regularly do big things understand that difference.

Management

The Age of Agile

How Smart Companies Are Transforming the Way Work Gets Done

by Stephen Denning

THE SUMMARY IN BRIEF

An unstoppable business revolution is under way — and it is Agile. Companies that embrace Agile management learn to connect everyone and everything . . . all the time. They can deliver instant, intimate, frictionless value on a large scale.

Agile began emerging many decades ago but truly took off in the software-development industry. Sparking dramatic improvements in quality, innovation and speed to market, the Agile movement is now spreading quickly throughout all kinds of companies. It enables a team, a unit or an enterprise to nimbly adapt and upgrade products and services to meet rapidly changing technology and customer needs. And the process is applicable anywhere — companies don't need to be born Agile.

Filled with examples from every sector, *The Age of Agile* helps readers master the three laws of Agile management, embrace the new mindset, overcome constraints, make the entire organization Agile — and more.

With this breakthrough approach, even global giants can learn to act entrepreneurially. Their future depends on it.

IN THIS SUMMARY, YOU WILL LEARN:

- The three core characteristics of the Agile mindset and management.
- Key behaviors for achieving Agile management at scale.
- The trap of shareholder value and why it's incompatible with the Agile mindset.
- Why Agile strategy focuses on the future rather than past performance.

THE COMPLETE SUMMARY: **THE AGE OF AGILE**

by Stephen Denning

The author: Stephen Denning is the author of six business books on leadership, innovation, leadership storytelling and Agile management. From 1969 to 2000, he held many management positions at all levels at the World Bank. Since 2000, he has worked as a consultant and speaker for scores of Fortune 500 companies and government agencies. He leads the SD Learning Consortium, in which firms are sharing insights on the ongoing transition in making their organizations Agile.

PART I: AGILE MANAGEMENT

More Value From Less Work

Thousands of organizations have made a fundamental discovery: Business success in the 21st century increasingly depends on becoming as nimble as the rapidly shifting and unpredictable context in which they find themselves. As a result, Agile management is now spreading to every kind of organization and every aspect of work.

Agile management is about working smarter rather than harder. It's not about doing *more work* in less time; it's about generating *more value* from *less* work.

But what exactly is Agile? What does it mean for an organization to embrace the Agile mindset?

When you hear the word "agile" or "nimble," you might think about a squirrel or a ballet dancer or a champion soccer player. You probably wouldn't think of a large organization — big, unwieldy, clunky, slow, out to make money from you and fundamentally unfriendly. You generally don't think of organizations as being nimble because generally they're not. And yet Agile organizations are not only possible. They do exist.

Organizations that have embraced Agile have three core characteristics:

1. **The Law of the Small Team**
2. **The Law of the Customer**
3. **The Law of the Network**

Agile means embracing fundamentally different assumptions. For traditional managers, the process usually isn't comfortable. It isn't easy. At the outset, it feels wrong. It's like learning a foreign language with a different grammar. It is only over time and through actual experience and practice that Agile becomes second nature and automatic. This is not about "implementing Agile tools and processes." Ultimately, Agile is about understanding and interacting with the world with a different mindset.

The Law of the Small Team

Picture this. It's 1997 and you've just had a great idea: a slim hand-held device that's small enough to slip into your pocket and that can perform multiple functions at the touch of a fingertip. It will serve as a portable telephone, an address book, a map, a navigation system, an airline boarding pass, a music or movie player, a television set, a camera, a flashlight, a dictation machine, a stopwatch, an alarm clock, a translation machine, a remote control, a repository of the world's newspapers and magazines, a library of thousands of books and more.

But how to bring it to reality? Well, it's 1997 and so you apply the best management practices of the day. First, you spend a couple of years winning support for the idea's feasibility and persuading the strategy committee of a major corporation to design, build and market this amazing new device.

After finally getting this approval, you pull together a huge team of designers and engineers and spend another couple of years developing detailed specifications for the device with a timeline to deliver and integrate its various components. You then recruit hundreds of thousands of engineers and developers to build the device. You

also hire tens of thousands of managers to supervise and control them to ensure that they deliver according to the plan and on schedule.

The result? Many years and billions of dollars later, you find that your device is still far from being ready for the marketplace. The technical problems are unending and seemingly exponential. Coordination between units is a massive headache. There is acrimonious finger-pointing about who is responsible for the technical problems and the delays.

Sadly, management decides that your project must be canceled. That's because a real-life competitor — Apple — had by 2007 developed a similar product, having brought it "from scratch to market" in just 18 months at a fraction of the cost of traditional management practices.

How was that possible? Apple designed and built a relatively simple physical device — the iPhone — that was developed in an iterative fashion in short cycles and steadily upgraded. Instead of *scaling up* the organization to resolve a complex problem, Apple *scaled down* the problem into tiny bite-size pieces that small independent teams could deliver in an iterative fashion with direct feedback from customers.

The Law of the Small Team is simple. It's a presumption that in a VUCA world, big and difficult problems should — to the extent possible — be disaggregated into small batches and performed by small cross-functional autonomous teams working iteratively in short cycles in a state of flow, with fast feedback from customers and end-users.

What exactly are the practices that make up the Law of the Small Team? Although there is no "one size fits all" and no universal "best practice," management practices have a striking family resemblance. The main characteristics are

- Work in small batches
- Small cross-functional teams
- Limited work in process
- Autonomous teams
- Getting to "done"
- Work without interruption
- Daily standups
- Radical transparency
- Customer feedback each cycle
- Retrospective reviews.

The Law of the Customer

In 1539, a Polish doctor, economist, mathematician and part-time astronomer named Nicolaus Copernicus published a paper he had been working on for some years. The paper explained a strange idea: The earth revolves around the sun. His idea flew in the face of common sense. Everybody knew from direct evidence of their own eyes that the sun revolves around the earth. Copernicus was saying, "Forget common sense. Forget what your eyes are telling you. Forget what everyone believes. Common sense is wrong. The earth revolves around the sun."

The publication of Copernicus's theory began not just a rethinking of astronomy but an inexorable process of inquiry into the entire organization of society, including the rights and privileges of the individuals who happened to be in charge of the Roman Catholic Church and of the monarchies that asserted power by divine right.

A Copernican Revolution in Management

Under the Law of the Customer, the practice of management is currently undergoing an equivalent transformation in the way organizations understand, and interact with, the world. The earliest and simplest articulation of the law came from Peter Drucker in 1954: "There is only one valid definition of business purpose: to create a customer... What the business thinks it produces is not of first importance — especially not to the future of the business and to its success. What the customer thinks he is buying, what he considers 'value,' is decisive — it determines what a business is, what it produces and whether it will prosper."

Drucker's proposition was a radical departure from the common sense of the day. Everyone knew that a business was in business to make money. Support for the view of money-making as the sole purpose of a business steadily gathered momentum in the latter part of the 20th century, despite Drucker's insight.

Meanwhile, changes in the marketplace since 1954 were steadily reinforcing the validity of Drucker's insight and the embryonic Law of the Customer. Deregulation, globalization, the emergence of knowledge work and new technology all made inroads. Competition increased. The pace of change accelerated. Knowledge workers became central to generating the innovation needed to create and retain customers. To top it off, the Internet transformed everything.

An epochal change in the commercial center of gravity thus occurred: Power in the marketplace shifted from seller to buyer. For firms to be successful, customers had

to be not only satisfied, they had to be *delighted*. New technological capabilities meant that it became possible to deliver instant, intimate, frictionless value at scale. Once that became possible, as shown by firms such as Apple, Amazon and Google, it also became *necessary*.

Instead of giant corporations standing as the solid center of the marketplace making money out of passive consumers who float by and are manipulated, the living customer with mercurial thoughts and feelings is now the center of the commercial universe. The customer is the sun, and organizations orbit around it. It's a Copernican revolution in management.

Now, the customer truly *is* number one. If internal systems, processes, goals, values or culture are getting in the way of making that a reality, they must be changed.

We see certain characteristics in firms that have achieved post-Copernican performance:

- There is a shared goal of delighting the customer.
- Top management takes responsibility for ensuring enthusiasm for delighting the customer throughout the organization.
- The firm aspires to be the best at what it does.
- Everyone in the organization has a clear line to the customer.
- The firm ensures it has accurate and thorough knowledge of the customer.
- Staff members are empowered to make decisions.
- The firm's structure changes with the marketplace.
- Relationships are interactive, vertically, horizontally, internally and externally.
- Back-office functions are aligned to serve the customer.
- Value for customers must be monetizable for the organization.

The full gains from post-Copernican management come when the whole organization is operating under the Law of the Small Team and the Law of the Customer. How is this possible? It is to this set of issues that we turn.

The Law of the Network

The network model of organization is key to making the whole organization Agile. A network is a group or system of interconnected people or things. An organizational network is a set of teams that interact with and collaborate with other teams with the same connectivity, interaction and passion as they do within their own small team.

An organizational network is founded on the Law of the Small Team. But it requires more. Each team needs to look beyond its own goals and concerns and see its work as part of the larger mission of the collectivity.

To the conventional management thinker, large, efficient networks are an oxymoron. They are not managerially possible. Big organizations require authority-based hierarchy. It's not even worth thinking about anything different.

Yet over the last 15 years, we have seen examples of large and efficient organizations operating as networks in the world of Agile. These examples include Riot Games, Spotify, the Network Management unit in Ericsson and the Developer Division at Microsoft, all of which have more than 1,000 people collaborating on large, complex tasks in networks of Agile teams, rather than in pyramidal hierarchies.

What Makes Networks Work

While we still have much to learn about the functioning of large networks, we can make some strong hypotheses as to what it takes to make them work:

The network has a compelling goal. In the case of Agile management, the goal flows from the Law of the Customer: the naturally inspiring goal of adding value to customers. Once that obsession is shared throughout the organization, it matters less *who* is delivering the value. What's important is the *fact* of delivery.

The network comprises small groups. "Successful movements," says John Hagel, the director of Deloitte's Center for the Edge, "are all organized around small, local action groups, who work together to achieve impact in very different contexts. These action groups are united by a loosely coupled network that enables them to seek help from others and to observe and learn from the diverse actions of each group what actions can achieve the greatest impact."

The groups have an action orientation. These groups are about putting ideas into practice, not about abstract knowledge or even ideas for the sake of ideas themselves. These groups are about changing the world in a direction that the participants think is better in an important way.

The network is the sum of the small groups. The network doesn't *contain* the small groups; rather, it *is* the sum of the small groups. The small groups are not groups *within* the organization; conceptually, they *are* the organization.

The network's legal framework stays in the background. The legal aspects of an organization still exist.

But in a network, the substantive decisions are taken by the competence-based network. If that is not the case and the organization becomes a hierarchy of authority rather than a hierarchy of competence, then the network ceases to be a network: It has regressed back to a bureaucracy.

Implementing Agile at Scale: Microsoft

Agile values are alive and well in the Developer Division of Microsoft. The division consists of about 4,000 people, working in hundreds of teams, each team having 10 to 12 people and working in three-week sprints. It ships a range of products and services, including Visual Studio, Visual Studio Team Services, Team Foundation Server and TypeScript. The division is not only implementing Agile practices for itself, it is also promoting them for others at Microsoft.

But the Agile transformation journey has been anything but a straight path from A to B. Introducing the practices of sprint planning, backlogs, daily standups and retrospectives was only part of the challenge. More important — and difficult — was the shift in mindset for all involved.

Here are some of the keys that group program manager Aaron Bjork believes are needed to make Agile happen at scale.

Get the right balance of alignment and autonomy. The goal at Microsoft is to have alignment at the top and autonomy at the bottom. The leadership team is responsible for the rules of the road. This includes clarifying the roles, the teams, the cadence, the vocabulary and the limits on the number of quality problems a team can have. The team has autonomy in terms of how they go about doing the work in both planning and implementation. Within the overall framework, each team can take a different approach.

Master the role of the Agile manager. What happens when a team fails to deliver what is expected in a sprint? A manager doesn't monitor a team's burndown chart of things to do. It's vital that people understand why they are doing the practices and then taking responsibility for the value that is meant to come with them. If the daily standups aren't working, then be a grownup. Make a change! That's where autonomy comes in.

Ensure continuous integration. In principle, all the teams are "working in the same branch." What that means is that each of the teams is branching their changes in a program called Git. But the teams don't work in a silo by themselves for three weeks and then hope it all comes together. They come together all day, every day. If a team breaks the build, it fixes the build immediately.

Recognize the team is the product. In software, the product life cycle is shortening. "In traditional accounting," says Bjork, "the business asset is the product. But more and more, in practice, the asset is a team that is capable of delivering products. The team has a longer lifetime of generating value than the product itself. That's a big shift in focus."

From Operational to Strategic Agility

While most organizations implementing Agile management are still preoccupied with upgrading existing products and services through cost reductions, time savings or quality enhancements for existing customers (i.e., operational Agility), they need to realize that the major financial gains from Agile management will flow from the practice of Strategic Agility — that is, generating innovations that create entirely new markets by turning noncustomers into customers. Strategic Agility is the next frontier of Agile management.

Strategic Agility occurs in two main ways: either as a by-product of operational Agility or as an explicit initiative to generate market-creating innovation.

By-product of operational agility. At Spotify, Discover Weekly was a feature intended to solve a known problem with an existing product: the difficulty that existing users were having in locating music that they would truly love, in Spotify's vast library of millions of songs. Discover Weekly not only solved that problem for existing users, but the innovation was so successful that it brought in tens of millions of new users and became, in effect, a brand in itself. In some countries, Discover Weekly playlists are better known than Spotify itself.

Market-creating value proposition. Market-creating value propositions involve a shift in thinking from the known to the unknown — from existing products to new products — and from existing users to nonusers of the firm's products. This, in turn, means redefining how needs are being met and, in the process, discovering value for both customers and noncustomers from elements that lie outside current thinking, both within the firm and within the industry.

It also means a change from thinking of the outputs of the organization to considering outcomes for the customer or end-user. "Instead of thinking of your company as providing a particular type of product or

service — electric power, health records management or automobile components," writes PricewaterhouseCoopers consultant Norbert Schwieters, "think of it as a producer of outcomes. The customer needs to get somewhere, so you're not a car company; you're a facilitator of that outcome. The house is cold, so you help make it warm, possibly without supplying the necessary fuel . . . Customers, in turn, are making fewer purchases to accumulate physical things and more purchases to achieve outcomes, convenience and value."

Changing the Organizational Culture

For most organizations, the shift to Agile management and Strategic Agility means a change in organizational culture — perhaps the most difficult thing that any organization can attempt.

In 1998, when Curt Carlson became president and CEO of SRI, it was practically bankrupt. It had been established in 1946 as a research institute headquartered in Menlo Park, California. The trustees of Stanford University formed SRI as the Stanford Research Institute, a center of R&D and innovation, initially to help support economic development in California and then the world. It is now an independent company.

Over the next 16 years with Carlson as CEO, SRI and its organizational culture were transformed. SRI tripled in size, became profitable and created many world-changing innovations. One of its best-known successes was Siri, the personal assistant on the iPhone.

How did SRI become a serial innovator? Carlson summed up what made the difference in changing the vision, organizational design and spirit at SRI.

"First, you need a few really good partners who have the skills, values and credibility required," he says. "People who know what to do and who have the perspectives and skills that you are missing. You must have at least one partner; you just aren't smart enough by yourself."

"Second," he says, "change happens in logical steps. There must first be agreement on the need to change. When you initially go into an enterprise suffering from challenges, people say, 'What's the need for change?' Until you have established the need, they are not ready to move. When people see the need, they then ask, 'What's the vision?'"

"Third, once you have a shared vision, people start asking, 'Okay, I get the need and the vision — what's the plan?' It's need, vision and plan, in that order."

"Fourth, a focus on early adopters. Even if people generally agree with you, most are naturally cautious. You need to find the 5 to 10 percent who will be your early champions to help you establish the principles and prove them out."

Then, "fifth, the language you use is critical," Carlson says. "I never used demoralizing and misleading words like 'culture change,' or 'work harder' or 'fail fast' in my discussions with SRI staff. Rather, I talked about making a bigger impact, working smarter and learning faster. I talked about the specific things we needed to do to be successful. To be heard and understood, you can only have two or three big actionable themes that are repeated every time. Otherwise people don't hear or understand you."

PART II: MANAGEMENT TRAPS

The Trap of Shareholder Value

The real world of business is the world in which factories are built, software is developed and real products and services are designed, produced and sold that make a real difference in customers' lives. Real dollars of earned profit show up on the bottom line.

The real world of business differs from the stock market. In the stock market, investors assess the resources and activities of a company today. Based on that assessment, investors form expectations as to how the company is likely to perform in future as well as how much value the firm will return to its shareholders.

The best managers are seen as those who meet expectations. It takes a dedicated chief executive to do the hard, long-term work of undertaking innovation in an increasingly competitive marketplace populated with unpredictable customers. It's much simpler, easier, personally safer and more lucrative to boost the stock price by cutting costs to enhance the apparent short-term performance in the firm's quarterly earnings, or to use financial engineering to extract value for shareholders.

In fact, a CEO of a public company has little choice but to pay careful attention to the stock market, because if the firm's share price falls markedly, accounting rules require that it be classified as a good-will impairment. Auditors may then require the company to record a loss of capital. Even more worrying, activist hedge funds may launch campaigns to oust the management and put in place executives who are more "shareholder friendly."

Thus, most executives perceive themselves to be under continuous pressure to maintain a high stock price.

The Error of Shareholder Thinking

By March 2016, *The Economist* could proudly declare that shareholder value thinking is now "the biggest idea in business." That may be so, but it is also "the error at the heart of corporate leadership," according to two distinguished Harvard Business School professors — Joseph L. Bower and Lynn S. Paine. Maximizing shareholder value, they write, is "flawed in its assumptions, confused as a matter of law and damaging in practice." Over decades, shareholder value theory has not only failed on its own narrow terms of making money for shareholders, but it began destroying the productive capacity and dynamism of the entire economy.

Today, symptoms of economic malfunction are everywhere. A large pharmaceutical company systematically keeps buying other companies, cancels their drug research and uses the resources to buy still more pharmaceutical companies — until the pyramid scheme abruptly collapses. A major news organization turns a blind eye to sexual harassment to protect short-term profits. A global auto manufacturer uses a software device to enable its diesel-driven cars to circumvent environmental regulations.

Financial resources are being diverted from needed investments in innovation. A brilliant study by economists from the Stern School of Business and Harvard Business School compares the investment patterns of public companies and privately held firms. They found that, keeping company size and industry constant, private U.S. companies invest nearly twice as much as those listed on the stock market: 7 percent of total assets versus just 4 percent.

Contrary to what the academic economists had predicted in putting forward the theory of shareholder value, compensating executives with stock had made them less entrepreneurial for the firm, not more. As a result, the economic recovery from the Great Recession of 2008 was undermined and the ability of firms to innovate was restricted.

The pressing question for Agile leaders at all levels of the organization is to figure out how to protect Agile management from the noxious consequences of shareholder value thinking. One obvious option? Just say no! Some CEOs have already spoken out. Alibaba CEO Jack Ma has declared that "customers are number one; employees are number two, and shareholders are number three." Paul Polman, CEO of Unilever, has denounced "the cult of shareholder value."

Sadly, though, most public corporations have yet to respond to the call. One reason is that they have succumbed to the siren call of the most appalling mechanism of finance engineering of them all: share buybacks.

The Trap of Share Buybacks

In 2014, economics professor Bill Lazonick presented the business world with astonishing news: Many major public corporations are engaged in buying back their own shares to an extent that constitutes stock-price manipulation on a macroeconomic scale.

Once firms began in the 1980s to focus on maximizing shareholder value, the actual capacity of these firms to generate real value for the organization and its shareholders began to decline as cost-cutting, dispirited staff and limited capacity to innovate took their toll. Thus, the C-suite faced a dilemma. They had promised increasing shareholder value, and yet their actions were systematically destroying the capacity to create that value. What to do?

They hit upon a wondrous shortcut: Why bother to *create* new value for shareholders? Why not simply *extract* value that the organization had already accumulated and transfer it directly to the shareholders (including themselves) by way of buying back their own shares? By reducing the number of shares, firms could, through simple mathematics, boost their earnings per share. The result was usually a bump in the stock price — and short-term shareholder value.

The pressing challenge for Agile leaders is how to deal with continuing pressures to shift resources from investment into share buybacks. The answer lies in recognizing that going along with these pressures is a choice, not a necessity. Amazon, Unilever and Berkshire Hathaway have made clear to investors that they won't be playing the shareholder value game. Instead of being punished for ignoring the short term, these firms have been rewarded with strong investor support.

The Cost-Oriented Economics Trap

"The numbers give us no choice," the CFO declares. "It's obvious that if labor costs in another country are very much lower, it will be cheaper to outsource the work there, even if the workers there are somewhat less productive."

Agile managers in public corporations are often confronted with such declarations. But where do the CFO's

numbers come from? And what are their underlying assumptions? To prevail in such settings, Agile managers need a certain amount of understanding of financial accounting and its tools, the assumptions underlying the numbers and their relationship to Agile management.

Here, as in other areas, what's key is the management mindset. A mindset that is set on extracting value from a corporation for the shareholders will come to different conclusions from the numbers, compared to a mindset focused on creating monetizable value to customers.

Take the decisions of U.S. public corporations on issues of offshoring over the last several decades. In analyzing proposals, firms must go beyond rudimentary cost calculations focused on the cost of labor and, instead, consider the total cost and risk of extended international supply chains over time.

"Many companies that offshored manufacturing didn't do the math," said Harry Moser, an MIT-trained engineer and founder of the Reshoring Initiative. "Often what firms find is that whereas the offshoring price is perhaps 30 percent less than the U.S. price, all these other costs add up to more than 30 percent. If they are willing to recognize all of them, then they can see that it may be profitable to bring the work back."

Why did so many smart managers make the same mistake? It's not a lack of mathematical capability. Their decision making was driven by the rush to generate short-term profits — or at least appear to be generating them — so as to raise the stock price.

The Trap of Backward-Looking Strategy

Traditional strategic planning efforts entail massive data gathering and analyses, as every conceivable facet of the competitive landscape is explored. But because there is no data on the future, the data gathering is inevitably about the past, from which extrapolations of the future are made. The comfort that is gained from detailed analysis is thus inherently backward-looking.

The widespread adoption of information-based strategy in business, built on data from the past, helps explain the frequent outcome of strategic planning exercises to do "more of the same." It also helps explain why firms consistently missed disruptive innovation. It could hardly be otherwise when firms pursued information-based strategy built on data from the past.

In Agile management, the idea that competitive advantage can be located has given way to the realization that competitive advantage has to be continuously created. Strategy is not a place — it's an activity. In Agile management, strategy recognizes that the future cannot be discovered solely by studying mountains of data based on the past or by probing what competitors might be doing. There is a recognition that in a world of rapid technological change, the future structure of the industry will almost certainly be different from the current one.

The central task of strategy in Agile management is to answer the following questions: How will customers meet their needs in the future? What are the larger needs that actual or potential customers have, only part of which are addressed by current products and services? What approach can our organization take to help meet those needs in a profitable fashion? What benefits will flow from this as compared to costs? Can we do this better than any competitor? How can risk be managed?

A proper approach to strategy in Agile management means emancipating strategy from the sole province of top management and implementing a truly inclusive process in accordance with the Law of the Network. Ideas can come from anywhere, and the insights of the entire organization — and beyond — are mobilized in an effort to imagine and influence the future. Rethinking business strategy for the 21st century means remaking the notion of management itself.

In the emerging age of Agile, the dynamic focuses on human beings creating delight for other human beings. When an organization — or a society — is populated by people with this mindset, it can be at one with itself, at one with those for whom the work is being done, at one with those who are doing the work and at one with the wider society in which it operates.

The Star Factor

Discover What Your Top Performers Do Differently — And Inspire a New Level of Greatness in All

by William Seidman and Richard Grbavac

THE SUMMARY IN BRIEF

In every company, a select few produce more, sell more and deliver better results. These stellar performers consistently outshine their peers — and achieve more than most would believe possible. If only these people could be cloned! *The Star Factor* delivers the next best thing: a unique system for unlocking their wisdom, transforming that knowledge into actionable steps and helping other employees internalize these new attitudes and behaviors, bringing much-needed change to the whole organization.

The Star Factor and its proven Affirmative Leadership methodology helps executives, managers and trainers tease out the attitudes, behaviors and actions that form the core of their stars' performance. You'll discover how to turn their own words into a learning program that can be personalized for each employee, how to create global programs that feel like local change initiatives, and how to make the learning stick to create a leadership-rich environment.

IN THIS SUMMARY, YOU WILL LEARN:

- How to identify your star performers, using three simple questions.
- Techniques to train coaches to guide learners to convert that knowledge into applied, practical learning.
- Ways to reinforce learning with group discussions and other techniques.
- How to turn isolated employees from anywhere on the organizational chart into influential leaders.

Follow Your Stars to a Bright Future

What would it mean to you and your organization if everyone became as good as your star performers? Everyone would be aligned in working toward something important, a compelling collective purpose. Everyone would believe that their teammates had the commitment and skills to achieve it. Organizations filled with this kind of energy are great places for their people and for the bottom line.

Affirmative Leadership is a scientific, proven methodology for creating leadership programs that are based on each company's own unique strengths and needs. Companies who follow the step-by-step process will develop extraordinary organic leadership throughout their organizations.

The Science Behind Affirmative Leadership

Affirmative Leadership succeeds where other programs fail because it is based on the synergy between new developments in neuroscience, technology and the new science of positive deviance (the study of people who dramatically outperform their peers).

In traditional approaches to leadership, executives and senior managers set the bar for performance. The science of positive deviance suggests a very different and more effective approach. It says that in any group of people, some consistently and systematically outperform others. These are the stars.

Stars' attitudes, thinking and behaviors are different. These people drive the success of your company out of all proportion to their numbers. They're not only great at their jobs; they have a profound, compelling sense of purpose that is always aligned with a desire to improve the world for other people. And they get things done. They are your stars: the source of the knowledge, wisdom and passion the Affirmative Leadership program uses to transform your organization.

The Affirmative Leadership Methodology

Affirmative Leadership is developed and implemented in four phases that have been used in hundreds of companies with tens of thousands of people in all parts of the world with great success:

Phase 1 — Discover: First, a company efficiently and reliably identifies its stars and invites them to participate in a three-day workshop where their purpose and qualities are articulated.

Phase 2 — Prepare: The project team prepares the star wisdom for transfer to others by creating a learning program consistent with the neuroscience of learning.

Phase 3 — Launch: Coaches meet with their learning group of potential Affirmative Leaders and begin teaching them in a six-hour workshop.

Phase 4 — Guided practice: For four to six months after the workshop, learners complete weekly practice exercises that require practical application of Affirmative Leadership.

When an organization develops Affirmative Leadership in many roles and locations, the organization itself changes, becoming that idealized place to work which we call a "culture of greatness." When all critical roles in an organization are filled with Affirmative Leaders, people's shared purpose and trust in each other's mastery combine to create a superior culture and extraordinary

performance. Organizations that are bursting with leaders achieve performance levels beyond what people currently can conceive of as possible.

Reach for Your Stars

Picture the people in your company who consistently shine at what they do and inspire others. They go by many names: top performers, starts, rainmakers, bright spots or thoroughbreds. Nothing gets between these people and achieving their mission, whatever the circumstances or situation. They are your stars and the source of the knowledge, wisdom and passion the Affirmative Leadership program uses to transform your organization.

Social Scientists and Stars

Social scientists now know that there are positive deviants — what we call "stars" — in every group, company and industry. They are the people who consistently and systematically outperform others. They have figured out how to succeed, even in situations or environments others find daunting, and outperform others facing the same issues.

Research shows that these people not only behave differently but actually think differently about their jobs than others do. They have a different mental model, a perspective that makes them more passionate about their work and better at it, too.

Many people believe stars are just innately more talented or skilled. Yet stars' thoughts and behaviors, whatever their fields, tend to fall into certain very consistent patterns that can be identified and taught to others.

Organizational Change

When organizations need to change but believe they don't have the expertise to do it successfully, they have three choices. They can hire experts, bring in consultants or use their own stars. A company's own stars are immediately available, inexpensive, culturally aligned and incredibly knowledgeable. They are admired by everyone and know how to get things done. They are already your go-to people when change is needed. This is because stars are admired, reflect the best of the culture and enjoy a reputation for reliability.

Every company has some stars, and these people are always critical to improving performance. Even when a performance improvement initiative is to create something completely new, there may not be anyone who has experience with all aspects of it, but there are always stars in closely related areas.

Your stars are already Affirmative Leaders and, as such, disproportionately drive the success of your company. They hold most of its tribal wisdom and are consistently the most successful and more respected people in it. You can use their sense of purpose — and the esteem in which they are held — to inspire others to learn from them and create a leadership-rich culture.

Discover and Describe: The Detective

It is possible to get the stars to articulate what drives them, and then to explain their knowledge and wisdom so others can learn from them. The process, which we call Wisdom Discovery, requires some detective skills to dig beneath the surface and get to the unconscious competence.

The Wisdom Discovery process searches for the following four things from the stars:

1. A clear statement of their true purpose in their role (the higher Purpose).
2. A big-picture view of the steps or phases necessary to achieve their purpose (the Path to Mastery).
3. A deeper definition through principles of what greatness looks like in each of the steps (details of Mastery).
4. The activities that build the habits necessary to achieve greatness in the role (Learning Tasks).

These elements, organized and worded according to the latest neuroscience of learning, become the foundation for coaching others to become great in their role.

Compelling Purpose

The first part of the process is to have the group clearly articulate its purpose by creating a concise purpose statement. Tips for writing a great purpose statement include

- Use power words.
- Keep the finished statement to about 250 characters.
- Use the words the participants use.
- Tell the real story.

After the teams have finished their statements, they present them to the whole group. Eventually, the facilitator will collect the key ideas and re-sort them into a concise and powerful statement. This Purpose statement is the foundation for all that follows.

Path to Mastery — The Big Steps

The Path to Mastery is made up of phases, or Big Steps, that present a clear, sequential overall approach to building

attitudes, skills and capabilities. These Big Steps allow those being coached to focus their attention on manageable chunks without being overwhelmed.

This list of Big Steps provides a clear, high-level view of the milestones on the way to achieving the larger goals. Keys to effective Big Steps include

- Include six Big Steps at most.
- Use first person statement such as "I am…"
- Focus on the state of what we want to be at the end of the step.

Principles are the stars' articulation of what is supposed to change and why. Before others can follow the Big Steps, they need to understand these Principles, using the language of the culture. Once people understand the Principles, they can clearly see their path to greatness, understand why they are on it and fully embrace the Big Steps.

Transform for Brilliance

Company transformations also require the ability to see and realize potential. In Affirmative Leadership programs, several different people must have the vision and skill to transform the raw data from the Wisdom Discovery session into learning programs that produce great leaders.

This happens in stages. First, the facilitator and project manager convert the raw learning experiences from the Wisdom Discovery session into engaging learning tasks. Next the project manager works with management to prepare the measurement systems and tools that will track success. Finally, the facilitator transforms managers into great coaches by showing them how to teach others to embrace the star wisdom as their own.

Converting Raw Experiences into Effective Learning Tasks

Neuroscience has shown that the most effective way to learn and retain what you've learned is a result of short, frequent bursts of mental and physical repetitions of a key attitude, concept or behavior. Six to eight repetitions of the same idea, over a short period of time, create new neural circuits and new habits.

To create an effective Learning Task, the facilitator must 1) create Learning Tasks that will help develop the attitudes and behaviors described in the Principles, and 2) design six to eight mental and physical activities that teach or reinforce the desired attitude, concept or behavior for each Learning Task.

Training Coaches

People learn faster and expert content sticks better when they work together in a structured Learning Group led by a trained coach. The coach's job is to guide the group to interact with the starts' content and each other in ways that are consistent with the newest neuroscience of learning. Coaches drive alignment with the Purpose, application of the Principle, adaptation of the Learning Tasks, discussions about the application of the learning experiences and intense reflection about the learning.

Before anyone can develop into a great content coach, they must first understand and embrace the higher purpose of coaching others to greatness. The Leading Group Learning session gets the coaches to begin to embrace Fair Process as a basic value and a way of dealing with all people in their lives. When combined with the knowledge of how people think and learn, the results are predictable and positive.

Motivate the Rest to Be Like the Best

We know now that one of the best ways to motivate people to accept change is to present that change in ways that increase listeners' dignity and honor. This mindset, focused on respect for the listeners rather than top-down authority, is known as Fair Process. Fair Process gathers input and makes decision-making visible. The leadership team would make sure everyone knew their suggestions would be compared with those of other groups and considered seriously. Fair process stresses participation and lots of communication.

Motivation 3.0

The first component of Motivation 3.0 is a sense of Purpose — the social good which gives work meaning. Purpose is what makes some people love to get up in the morning and meet the challenges of the day, converting a job into a vocation. The second component of Motivation 3.0 is Mastery. Many people resist striving for a greater Purpose because they don't believe they are good enough and can't see a path to achieving Mastery. People will work hard to achieve Mastery only when they have a compelling Purpose and believe they can achieve it. The third component of Motivation 3.0 is Autonomy. People like to have control over their work and their environment; they resent interference from others. Being in control is a powerful motivator.

In sum, providing people with a great vision of a higher Purpose and showing them the path to become Masterful are key ingredients to creating an autonomous and responsible workforce.

The Neuroscience of Learning

The value of Fair Process and the new sciences of motivation significantly increase when combined with the latest neuroscience research on learning. It shows that positive imagery and written or verbal affirmations cause the release of the neurochemicals that increase openness to new ideas and learning speed.

Related studies have shown that putting positive images and affirmations in writing transfers neural resources from the portions of the brain associated with fear and resistance to the portions of the brain associated with a sense of control and empowerment.

The concepts and language of the stars' Purpose, Path to Master and Principles are the foundation for Motivation 3.0 and for using the neuroscience of leaning — all three become the basis for the positive images and affirmations and the intense motivation for all learners to become as good as the stars.

In the Launch Workshop, the facilitator and coaches will guide the Learning Groups to Read/Discuss/Praise/Anchor and thereby reflect on all the elements of the stars' wisdom. This amounts to

- **Read:** Focus on respected expert content that is positive and affirmative in nature.
- **Discuss:** Discuss that content with a group of peers in an open, accepting environment.
- **Praise:** Visualize themselves in those positive terms.
- **Anchor:** Write down their visions of greatness to make the vision real for them.

The use of Read/Discuss/Praise/Anchor may seem to be a simple group discussion of an objective statement, but it's actually a sophisticated methodology for developing intense motivation for performance improvements. By the end of the Launch Workshop, the learners have a very strong conceptual framework for their Purpose and know how they are going to achieve their Purpose and what Mastery means.

Principles: Defining Greatness in the First Big Step

Imagine how motivated you would be if you had the opportunity to spend quality time with the top people in your field. This is the sensation that learners have as they work on the Principles. Principles are the accumulated wisdom of the stars, the things that the stars know that others need to know to be great in their roles.

By focusing on the Principles, the Affirmative Leadership Launch Workshop drives greater depth of understanding, commitment and motivation. Also, Learning Groups establish stronger interpersonal bonds during the discussion of the Principles, because they're discussing what the stars meant and how the principle applies to real situations.

By the end of the Principles review, most of the learners experience a startling physiological change. They look more pensive, as though they have already developed significantly greater self-awareness, changing from passive participants to highly motivated learners.

Own Your Own Learning

Self-directed learning is directly related to leadership. Because self-directed learners are more proactive and effective at defining and executing their own leadership development programs than passive learners, they are better at becoming great leaders and at dealing with the constantly changing, increasingly complex world. Self-directed learners become great leaders more quickly than passive learners, and great leaders are always self-directed learners.

Passive learning is particularly poor for leadership development, yet, most leadership training programs use a passive learning process. Among the most important aspects of being a leader are being proactive, energetic and taking responsibility for your own and the organization's growth. Passive learning designs and media teach leaders to be passive, just the opposite of the attitudes and behaviors shown by great leaders!

Becoming Self-directed Learners and Leaders

In order to become self-directed, potential leaders must experience what psychologists call an "unfreeze" that challenges them to re-examine their learning habits, opening them to the possibility of thinking and acting differently. Applying Fair Process to the learning process is a particularly powerful way to unfreeze people from passive learning and motivate the development of the new habits of self-directed learning.

The neuroscience of learning and mass customization is used to transition these now unfrozen learners to be full self-directed learners. The bigger picture perspective on all of this science is that self-directed learners and great leaders are thoughtful, frequently reflecting on what they are doing and why they are doing it.

Humans are at their best when they are deeply motivated to achieve something greater than themselves. When people have this motivation, they work incredibly hard to become great at what they do. Great leaders are motivated this way and inspire others to have similar feelings. The Launch Workshop is a powerful step toward something of great value for any organization: a culture where everyone is a self-directed learner and a great Affirmation Leader.

Learning to Lead

When people take control of their own learning and consciously practice emulating the stars, their goals, reactions and behaviors change. The leader that is inside each person emerges.

Working on Each Big Step

The group repeats the Do-Discuss-Anchor for each set of tasks in each Big Step. Each task builds on the previous task within a Big Step, reinforcing the earlier learning while becoming progressively more demanding and sophisticated as the sequence builds more leadership attitudes and skills.

Each incremental Learning Task and Big Step expands and reinforces the earlier learning, driving deeper internalization. The coaches play an important role in managing this developmental sequence. At the end of each big step, the coaches review their group's recorded learning and determine if the learner is ready to advance to the next step.

Keeping the Momentum Going

Neural conflict between established old habits and developing new ones becomes an outright barrier to progress after about six to eight weeks of the program. New habits are not yet established, and old ones are still there.

The Midpoint Checkpoint meeting is designed to address the neural barrier and has three objectives:

1. Boost commitment by the learners and the coaches to the program.
2. Quickly identify and adjust to any issues that emerge from the session.
3. Introduce the next level of self-directed learning, called "meta-learnings."

The first part of the Midpoint Checkpoint is a discussion of the Learning Group's progress to date. The Midpoint Checkpoint closes with a discussion about the meta-learnings and how they can make the difference between great and mediocre leadership.

Distribute Globally, Act Locally

Scaling has two elements: easy, inexpensive delivery to large numbers of people and significant impact. Most organizations are so intimidated by the costs of large-scale programs that they focus attention primarily on the cost aspects of a program and less on achieving the desired impact.

Persuasive technology makes using Web meetings considerably easier and more effective. By using persuasive technology as part of the Web meeting, learners absorb the content more quickly and internalize it more completely with less effort and expertise from the facilitator. The combination of Web and persuasive technology increases the effectiveness of the learning while decreasing the cost.

Basic Scaling Infrastructure

When companies use direct managers as the coaches, the process tends to be the most cost effective. In Affirmative Leadership, these managers are taught to become coaches with skills that include co-facilitating the Launch Workshops and monitoring progress.

An entire Affirmative Leadership program can be done over the Web, reducing travel costs. The coaches and learners still get personal interaction with other learners, especially if there are video feeds.

The persuasive technology plays an important role in ensuring the impact and lowering the cost of training the trainers and ultimately in developing great Affirmative Leaders. They quickly learn to be great Affirmative Leader trainers and become models for their students.

Extraordinary Scaling

Once the coaches are fully motivated and trained to lead their Learning Groups, the costs of scaling decrease sharply without any decrease in its impact. As soon as the infrastructure is in place, all an organization really needs to do is conduct the Discovery Workshops and put the results into the coaching system. From that point on, the system takes over, and anything can be completely and quickly implemented.

Any new initiative or program can go from Discovery to globally scaled in less than two weeks, with minimal expense. The Affirmative Leadership infrastructure enables organizations to achieve the long-desired goal of scaling; extremely effective, fast and inexpensive Affirmative Leadership for anyone, anywhere, even if there are thousands of potential leaders.

Experience a Real-World Executive Program

This section is a detailed real world example of how Comptech developed leaders and changed its culture. We chose Comptech because its experience is typical of what many companies experience when facing significant market changes that demand better leadership. The Comptech example shows how executives can and will be active participants in their own development if a program's content and the process are consistent with the participants' self-images as executives.

When tablet computing drastically cut into Comptech's dominance of the server, desktop and laptop computer market, its executives needed to do something fast. Comptech needed a leadership development program that would quickly grow a large group of new leaders who could lead the transformation to tablets.

Wisdom Discovery Workshop

The content of a leadership development program had to come from internal sources and reflect Comptech's unique situation to be acceptable to the participants. After the group agreed on their Purpose statement, it dove into creating their path to mastery (the Big Steps), the major capabilities a transformational leader needs to develop.

As the stars reviewed the Big Steps, a consensus emerged that they would be equally useful to any Comptech executive anywhere and should be used to develop every executive and potential executive in Comptech. The stars' enthusiasm for the best practices and willingness to be coaches were indicative of their strong engagement with and commitment to Affirmative Leadership.

Launch Workshop

During the Launch Workshop phase of the process, the participants were paired up to discuss greatness in leadership at Comptech, using the Purpose statement that had been drafted. With the coach's leadership, the entire Learning Group discussed greatness. The candidates appeared to be thrilled by the opportunity to discuss their ideas about greatness in CompTech leadership with peers and record their perspectives. They said this was the first time they'd been asked to explicitly think about the meaning of greatness in their roles, and they appreciated the insights they got from each other.

The Learning Group realized that being able to tell a compelling story would improve their abilities to articulate their Purpose. The group was asked to identify two people outside of Comptech who are great at telling a compelling story and why. They liked the idea of using something outside of their business as an example but also thought they needed something related directly to Comptech — so they modified the assignment. By this time, coaches and group participants were completely engaged. The Comptech candidates were self-directed learners and were becoming Affirmative Leaders.

Unleash the Suppressed Energy of Frontline Managers

Organizations are increasingly aware of the importance of the Frontline Manager (FLM) as the glue that connects the work of an organization to its strategy. FLM leadership programs, developed and implemented using the Affirmative Leadership model, convert highly transactional managers into great transformational leaders without sacrificing operational excellence.

Wisdom Discovery

Wisdom Discovery for FLM Affirmative Leadership programs has some particular challenges. First, it is often more difficult to identify FLM stars than senior managers or executives. There is greater resistance to giving those who are identified the time to participate, and FLMs tend to be less articulate about their roles than people higher on the organizational chain, thus requiring additional probing by the facilitator.

On the other hand, once a group of star FLMs breaks through to talking openly about how they really think and what they actually do to make difficult situations consistently successful, there is a release of energy that is quite astounding to them and to others, including their bosses.

An FLM who was good at his craft but not at leading a team or working with other departments couldn't model team leadership or interdepartmental cooperation and integration. At both DigiAd and LocalPower, the FLMs were very nervous about participating in a workshop in which they'd have to talk a lot. Few of the LocalPower FLMs were used to speaking in public. There was considerable concern about the possible demands of the Wisdom Discovery Workshop.

While the STLs at DigiAd had all come from sales and were more verbal, they also indicated that three days of intellectual discussion was a sharp departure from their norm. But when the facilitator asked, "Why do you love your work?" the floodgates opened and all resistance fell

away. Talking about why they loved their work was both tangible and exciting.

Launch Workshop and Guided Practicum

While there was some concern about the willingness of the FLMs to openly discuss crucial management issues, the Launch Workshops generally went smoothly, even though they involved people from several remote locations. Overall, the launch and follow-through for Big Steps 1,2 and 3 went as expected.

Perhaps the most important indicator of the effectiveness of the program was that most of the learning groups in both companies asked to continue meeting indefinitely. The groups had formed such a strong and useful bond, and valued the process so much, that they wanted to continue it, even though the Affirmative Leadership programs were officially over.

These examples of Affirmative Leadership programs for FLMs illustrate the importance of the FLM's role and the opportunity organizations have to add capabilities.

Drive Cultural Change With Individual Contributor Grassroots Leadership

Individual contributors (ICs) embody an organization's culture. ICs are generally not thought of as leaders because they do not sit high on the organizational chart. However, their in-depth experience with the real work of an organization gives them the insight and opportunity to identify and lead significant innovations.

DigiAd

DigiAd was a seller of yellow-page advertising space that was transitioning to offering integrated print and digital advertising solutions. The DigiAd executive team recognized that their sales and service people needed to adopt completely new attitudes and behaviors as well.

Identifying the stars for DigiAd's programs was relatively straightforward. The stars were highly respected sales and customer service representatives who had demonstrated a passion for the customer centricity program and at least some success either selling to or servicing the more complex digital solutions.

As the DigiAd exemplars worked on defining their Purpose statement, there were excellent discussions about the importance of passionate commitment to customer centricity, in-depth knowledge of the digital offerings and the skills of closing sales or resolving customers' issues.

There is a point in all IC programs when learners convert from being tactical, transitional ICs to becoming Affirmative Leaders. For most of the DigiAd salespeople, this transformational moment came during the fourth Big Step, "Relationship Building."

Results

The measurable results support the impact of IC Affirmative Leadership on the productivity and culture of the organization. The DigiAd Sales Representative certification program reported that 98 percent of the sales reps displayed the desired customer-centric attitudes and behaviors. This translated into a doubling of the sales of digital products. By the end of the Affirmative Leadership program, the DigiAd executives knew that 100 percent of their salespeople had the same attitudes and behaviors as their top performers.

Living in a Culture of Greatness

Leadership is ultimately about producing results, and these are just some of the many examples of how Affirmative Leadership changed organizations. Respect and Fair Process pervade everything in the program. Similarly, Purpose, Mastery and reflective learning are overtly and covertly everywhere. All three are explicitly used in the Wisdom Discovery, Leading Group Learning coach training, and Launch Workshops. In hundreds of small ways, Affirmative Leadership subtly creates a culture of greatness.

Affirmative Leadership programs immerse participants in a new way of learning and leading that gradually, seamlessly and very naturally becomes a new way of being. We say the Affirmative Leadership approach efficiently, and with surprisingly little effort from participants, creates a culture in which every person aspires to and achieves greatness. Everyone becomes as good as the very best.

Challenges for Tomorrow's Executives — Final Advice From the Father of Modern Management

THE DEFINITIVE DRUCKER

THE SUMMARY IN BRIEF

Peter Drucker, widely regarded as the father of modern management, gave Elizabeth Haas Edersheim unprecedented access for the 16 months prior to his death. At Drucker's request, Edersheim spoke with him about the development of modern business throughout his life and how it continues to grow and change at an ever-increasing rate.

Peter Drucker is credited with inventing the discipline of management. He wrote 39 books that have been translated into dozens of languages. Drucker is also known for single-handedly counseling the chairmen of GM and Ford, advising the president of the World Bank and the CEO of GE and reportedly telling Margaret Thatcher to privatize the entire British mining industry.

The Definitive Drucker captures his visionary management concepts; applies them to the key business risks and opportunities of the coming decades; and imparts Drucker's views on current business practices, economic changes and trends — many of which he first predicted decades ago.

Delivering keen analysis and revealing insights into business, *The Definitive Drucker* is a celebration of this extraordinary man and his life work, as well as a unique opportunity to learn Drucker's final lessons on how to strategize, compete and triumph for the long term.

IN THIS SUMMARY, YOU WILL LEARN:

- How to succeed in a Lego world, where the business organizations are pieced together, pulled apart and reassembled.
- How to determine whether your customers' perception of value aligns with your own.
- How to innovate like GE, as well as when to abandon fundamental assumptions before they derail the company.
- How to structure a successful collaboration.
- How to invest in people and knowledge for your organization.
- How the CEO sets the tone for a company.

Doing Business in the Lego World

The staid world of business has been turned upside down by a silent revolution. Change came gradually and predictably to businesses in the period following World War II through the early 1990s. But then the revolution struck, taking place on five fronts:

1. Information flew. Since the expansion of the Internet, information travels instantaneously. In the globally integrated economy, management must make decisions at all hours of the day and night.

2. The geographic reach of companies and customers exploded. Companies and their customers now have an astounding geographical reach. Even small firms can scour the world for resources.

3. The most basic demographic assumptions were upended. To managers, the biggest effect of demographic changes is that new populations with new demands drive societies, markets and workplaces.

4. Customers stepped up and took control of companies. Customers are engaged with companies in ways that would have astounded Henry Ford or Thomas Watson.

5. Walls defining the inside and outside of a company fell. These days, a company draws on capabilities outside of its own walls in ways that would have been unheard of just a few years ago.

Drucker observed that we are now in another critical moment: the transition from the industrial to the knowledge economy. We should expect radical changes in society as well as business.

The Lego World

The management world is flat only if you take an industrial perspective. If you just want the lowest cost, the capabilities exist virtually every place in the world to get the lowest cost. But if cost is not your only concern and you recognize that the industrial world has given way to an information- and knowledge-driven world, you will see that the world is not flat and that Indiana and India are not interchangeable. Indeed, the ability to put together and connect the pieces in different ways and with the customer all the time defines an enterprise's performance.

In the 21st century, businesses exist in a Lego world. Companies are built from Legos: People Legos, Product Legos, Idea Legos, Real Estate Legos and so on. Everything is visible to everyone all the time. These pieces are constantly being put together, pulled apart and reassembled. In an organization, we can connect individuals' strengths, minimizing their weaknesses. And across organizational boundaries, we can connect strengths of each corporation and provide the customer with far greater value than can any single enterprise.

Dell is a classic example of a Lego manufacturer. It has configured its offering so that customers can custom build computers to meet their individual needs. Michael Dell claims that the firm's important capabilities are the management and integration of information and the ability to quickly build a computer to a customer's specifications. Dell's Product Legos include anything from processor and memory capacity to screen size. However, Dell's recent performance underscores the need to constantly reconfigure in the Lego world. Michael Dell has stepped back and is shifting the Legos and the consumer connections, as the requirements have changed.

In the retailing arena, Amazon exemplifies the Lego

Doing Business in the Lego World

(continued from page 2)

approach; it connects with other vendors that have expertise in making everything from textbooks to toys.

A New Solution Space

The most significant trends affecting business transcend all companies and all industries. Business as we know it is disappearing. Companies aren't selling products; they're selling experience. Relationships have gone far beyond the roles of buyer and seller. According to Drucker, there are no longer competitors, just better solutions and more choices that can be put together in more ways. Companies focused on competitors are focused on the past, not a future full of technological and demographic opportunities.

The evolution of cell phones into instruments capable of doing much more than handling voice communication — capturing and transmitting still and moving digitalized images, connecting with the Internet, even functioning as a TV — not only means serving a wide range of consumer needs, but also guarantees that customers will upgrade to a new device frequently because they want the latest version with new and enhanced capabilities.

Implications for Managers

One of Drucker's talents was his ability not just to see trends but also to shed light on their implications so that managers could act on them. According to Drucker, there are three consequences of the silent revolution:

1. Financial markets now value knowledge more highly than they value hard assets, underlining the emergence of the knowledge economy. Drucker noted the developments that drove this shift to soft assets — intellectual property, patents and connections. Old companies, such as Boeing, were being revalued as their physical assets took a backseat to their knowledge, relationships and ability to connect. Innovative companies such as Google, Yahoo! and craigslist were launched in cyberspace with very little in the way of physical assets, providing services that had never existed before.

2. The U.S. economic engine is facing the gravest threat of the past 100 years: the need for corporations to be strategic collaborators rather than unilateral superstars. America's institutions are designed for the individualism of an industrial economy, not a Lego world. However, the game has changed. Americans will have to play as equals, something that's not easy when you've spent a good part of the century as the undisputed No. 1.

3. Strategy has become a crucial ongoing activity for management, not simply an annual planning exercise. Strategy has to move and be refined at a speed comparable to what used to be called tactics; it has to be in real time. You don't have six months, or even three months, to create a master plan.

As Drucker maintained for more than 70 years, businesses are the critical engine of a thriving and sustainable society that values individuals and rewards achievement, with management effectiveness the determining factor in keeping the engine running. Business isn't just business. It's the economic engine of democracy. ■

The Customer: Joined at the Hip

On paper it seems like the most obvious notion: The customer is in the driver's seat. And yet few organizations, busy with all they are doing inside their own walls, are truly focused on the outside world of the customer. If you are in business, beware. The silent revolution of technology and demography has given each customer his or her own handy remote control.

Everything has changed about your customers and your relationships. You've never had as many people around the globe to reach. Customers aren't just in the driver's seat these days; they're gassing up the vehicle, doing some of the service and controlling a fair amount of the traffic on the road.

Connecting With Your Customer

When Drucker talked about the customer, he had four classic themes that he came back to repeatedly. He asked every one of his clients:

1. Who is your c*ustomer*?
2. What does your customer consider *value*?

After long discussions answering those two questions, he would then ask:

3. What are your *results* with customers?
4. Does your customer *strategy* work well with your business strategy?

Rethinking the answers with Drucker changed how the clients thought about the businesses they were in. Southern Pipe, a regional plumbing company, redefined its customer; instead of serving contractors alone, its branches began serving local communities and homeowners as well.

Customer Versus Competitor?

In this networked world, your customer often turns out to be a competitor as well. In some cases, your product may be packaged with others and sold as an integrated unit. Those sales may increase your revenue

(continued on page 4)

The Customer: Joined at the Hip

(continued from page 3)

but decrease your brand identity, because the final product may not carry your brand.

It is becoming increasingly difficult to tell friend from foe. In the online business world, the line between competition and cooperation is especially blurred and constantly changing. In our new world, where relationships have proliferated, the customer you are ultimately serving can change from transaction to transaction. The question needs to be asked again and again.

Does Your Customers' Perception of Value Align With Your Own?

In this data-rich world, firsthand emotional intelligence still matters. That is why, on any given day, you may find Procter & Gamble president and CEO A.G. Lafley in the kitchen of a Venezuelan housewife or walking around in the most dangerous parts of Sao Paulo and Rio de Janeiro, Brazil, to see firsthand how consumers are buying and using P&G products. The analysis can be delegated, but not the customer contact.

How do connectivity and relationship influence value? Beyond the significance of the product itself, the value perceived by a customer increasingly depends on his or her relationship with the company and control of the end result. That has remained true even as face-to-face interactions have given way to cyberspace transactions.

Sumerset Houseboats boosted online sales dramatically by more directly engaging the customer in the process of building a boat. In the 1970s, Sumerset was a neighborhood company, and locals would come in daily to see their boats taking shape. When Sumerset's online business took off, it wanted online customers to have the same opportunity as locals. Today, Sumerset customers go online to customize the plans for their boats and to view photos of their boats being built. This is a way to empower customers and create a sense of community. ■

Innovation and Abandonment

Nobody was better at defining and helping companies capture opportunities than Drucker. He often said, "Tomorrow is an opportunity." For Drucker, if you don't understand innovation, you don't understand business theory. Starbucks exemplifies what he considered to be true innovation. Beginning with a single store in 1971, Starbucks grew to more than 12,000 locations in 37 countries in 2006. Starbucks didn't just offer a better cup of coffee than the average restaurant; it delivered instant community — a shared experience. Much of Starbucks' innovation has to do with marketing, not product, and it is fundamental, not incremental.

Creating Your Tomorrow

Drucker wrote about innovation for decades — long before anyone heard of Starbucks, or even the Internet. It fascinated him. By the Vietnam War years, he was predicting that technology would change everything about the way we do business. Drucker felt that finding a balance was crucial to business survival. "You can't throw everything out, or you'll have anarchy," he said. "You can't hold on to everything, or you'll die."

Drucker understood from personal experience the difficulty of innovating for the future while hanging on to the past. In 1935, he left London to make his first trip to the United States. He'd decided then and there to leave Europe. "America," he wrote, "was starkly different from Europe. In America, people were looking to tomorrow. In Europe, they were trying to re-create yesterday."

When discussing innovation with businesses, Drucker had four basic questions:

1. What fundamental assumptions do you have to abandon to create room for innovation?
2. Do you systematically seek opportunities?
3. Do you use a disciplined process for converting ideas into practical solutions?
4. Does your innovation strategy work well with your business strategy?

In many organizations, innovation is stymied by excessive loyalty to the old products and to the old ways of doing things. Drucker put it this way: Most companies hang on to the business they have and are hugely reluctant to loosen their grip. This prevents them from innovating and determining their own destiny. Kodak built a legendary film business, but it finally had to abandon this mainstay in order to invest talent and resources in the digital imaging business.

How Innovation Enables GE's Longevity and Valuation

GE is innovative to the core, has outperformed the overall market and has adopted a Druckerian approach to innovation. The company was founded on technological brilliance and has developed into a huge global technology conglomerate. From 1995 to 2005, GE grew 7.9 percent per year, at almost three times the profit margins of 10.2 percent of the average net profit markets.

GE has innovation in its DNA. It evolved from the legacy of its founder, Thomas Edison — not only a brilliant inventor but also a customer-driven innovator. He sounded

(continued on page 5)

Innovation and Abandonment

(continued from page 4)

a lot like Drucker: "I never perfected an invention that I did not think about in terms of service it might give others."

As GE found out early on, no company is immune to changes in the environment. GE was almost bankrupt a year after its founding, during the panic of 1893 when central power stations could no longer afford to purchase new materials. To survive this crisis, the company completely changed its strategy, shifting to an innovative focus on solving customer problems. However, Edison was not as good a manager as he was an inventor. He was asked to leave by J.P. Morgan, who replaced him with professional managers.

Despite the near disaster, GE remained focused on its products and created a culture that encouraged innovation. Drucker worked with every GE CEO from Gerald Swope through Jack Welch, helping them create an innovative culture that challenged the status quo. ■

Collaboration and Orchestration

Peter Drucker's vision of collaboration remains immensely relevant today. He believed that to give your customers what they need, you must follow two rules: play to your strengths and collaborate with other players — sometimes those you consider competitors.

Three Drucker Questions

When discussing collaboration and orchestration with businesses, Drucker was known to ask three groups of fundamental questions:

1. What are the goals of your collaboration? What are the shortcomings of the traditional business model? What are the needs that it leaves unfilled? And what is the prize a collaborative business model could deliver?

2. How should the collaboration be structured? What will be your front room? What does your company do best? And what organizations or individuals are best at the other activities necessary to fill your customers' needs?

3. How do you orchestrate and operate a successful collaboration? What is the best way to set up your enterprise to be agile and cost-effective and to work with your backroom partners as one well-orchestrated whole? Can you manage down the risk that the partnership will backfire or be derailed by competitive issues?

Drucker on Collaborations

To succeed in the Lego world, you must collaborate. You must tap into resources outside your organization — no business can isolate itself. Drucker identified the following characteristics of successful collaborative organizations:

1. A reputation as a place to work that attracts the best and the brightest.
2. A flexible, easily adaptable infrastructure and a highly variable cost structure.
3. Pragmatic political and logistical solutions that convert potential adversaries into allies.
4. Influence that flows from setting industry standards that shape the expectations of end users.
5. Identification with their local communities through holistic branding.

As you consider these three groups of questions for your company, imagine you are just now leaving college and setting up your company from scratch. That's Drucker's way of looking at the viability of a corporation — if you weren't in this business, would you enter it today? And if so, what would it look like?

Structuring a Collaboration

The first step in structuring collaboration is to identify your company's front room, which Drucker defined as your strength, or the activity that is most important for you to do — that which stirs your passion and shows off your excellence. Everything else is your back room. One of Drucker's famous quotes is "The only thing you have to do is marketing and innovation."

In the traditional model, a business would add to its front room an array of ancillary activities needed to meet its customers' needs. The quality of those activities might not have been first-rate, or the activities might have been relatively high-cost, but the company had to have them in place to meet customer needs. The level of communication and coordination needed to team up with another organization made any approach impossible for most companies.

In the new world, however, you can eliminate many of these ancillary activities and do a better job of meeting customer needs via collaboration. Collaboration is not just an option but an imperative in the new world. It is critical that you do only what you do best, that you eliminate or minimize your back room by teaming up with another organization. With the greater transparency typical of the new world, the customer sees everything and knows your flaws and strengths. And you can con-

(continued on page 6)

Collaboration and Orchestration

(continued from page 5)

nect to and use someone else's front room, thereby better meeting customer needs and streamlining your operation in the process.

Technology Collaboration

In the world of high technology, the classic example of collaboration is Linux, an open-source operating system. It has revolutionized the way software is made and has emerged as a powerful model of successful decentralized collaboration. Linus Torvalds wrote the beginning, or kernel, of the operating system in 1991 and made it available to everyone, inviting others to improve on it. His front room is the original kernel and the decision authority built into the software to accept changes. The back room is executing all the changes.

As the collaboration has expanded, more of the review process has been delegated and automated, but the fundamental idea remains the same. Top tech competitors such as IBM and Hewlett-Packard work together with distributors such as Red Hat on setting development priorities, offering their programmers' time on projects and protecting Linux from potential intellectual property claims. The tech companies, in turn, make money not from selling the operating system, but from selling services and software around the system. Thus everyone (with the exception of other operating system creators such as Microsoft) benefits from this cooperative ecosystem of global technology talent. ■

People and Knowledge

Drucker stressed that businesses, including nonprofits, always had to put people first — employees and customers, as well as shareholders and stakeholders. According to Paul O'Neill, the former Treasury secretary, retired CEO and chairman of Alcoa and a former Drucker student, a test of an organization's potential for greatness is whether every person in that organization can say yes to three questions every day without any reservation or hedging or stopping to think:

1. Are you treated every day with dignity and respect by everyone you encounter?

2. Are you given the things you need — education and training and encouragement and support — so that you make a contribution?

3. Do people notice that you did it?

Investing in People and Knowledge

People are the business. They are your front room, your connection to others and to the customer. They are your knowledge and your access to changing opportunities and resources. Drucker said, "What differentiates organizations is whether they can make common people perform uncommon things — and that depends primarily on whether people are being placed where their strengths can perform."

Given this dynamic, it is critical to constantly ask five Drucker questions:

1. Who are the right people in your organization?
2. Are you providing your people with the means to achieve their maximum effectiveness and contribute to the organization's success?
3. Do your structure and processes institutionalize respect for people and investment in human capital?
4. Are knowledge and access to knowledge built into your way of doing business?
5. What is your strategy for investing in people and knowledge?

Building Knowledge Into Business

In Drucker's writings, he did not separate knowledge from people. He wrote about the knowledge worker, about applying knowledge to what the knowledge worker does and about the real impact of information. Every enterprise must build knowledge into its value proposition, harnessing knowledge in every aspect of the way it does business.

In order to do this, you must ask if knowledge and access to knowledge are built into your way of doing business. For example:

1. Is knowledge built into your customer connection? Building knowledge into the product or service a company takes to market increasingly creates real value for customers. For example, an "intelligent" oil drill that bends its way to extract more oil from the pockets of underground oil formations commands more than twice the price of a standard drill.

2. Is knowledge built into your innovation process? Simply to remain competitive, the organization must continually scan related fields for changes that could affect its competitive landscape.

3. Is knowledge built into your collaborations? Collaborations are often the product of shared objectives and knowledge. In this age of the Internet, collaboration is more important than ever. The Internet is the perfect medium for sharing information and creating online communities, both of which enhance knowledge.

4. Is knowledge built into your people and knowl-

(continued on page 7)

People and Knowledge

(continued from page 6)

edge management? Perhaps the most direct use of knowledge within an organization is to build its own capabilities. From Drucker's perspective, this ability to apply knowledge to knowledge will be the critical factor in productivity moving forward. The challenge is in sorting through and prioritizing the knowledge.

In the new world of the knowledge worker, attracting and retaining high-talent people is at least as important as anything else a company does. "The first sign of decline of a company is loss of appeal to qualified, able and ambitious people," Drucker says. What attracts them is work that is truly interesting and the chance to make a contribution that is truly significant.

But as highly skilled and independent professionals, knowledge workers are highly mobile. Despite their migratory nature, the knowledge organization invests in them and seeks to retain them by fostering an excellent working environment — a culture that respects and values them as knowledge professionals and that sets them up to win.

Google's 10 Golden Rules for Knowledge Workers

In early 2005, Drucker commented on Google and how powerful online communities were and would be, and how managing these more autonomous workers to be productive and innovative is a challenge. Eric Schmidt, CEO at Google, commented that the team at Google has more in common with professional basketball players than with traditional workers. In his view, there are 10 golden rules to operating the business:

1. Hire by committee. Everyone's opinion counts.

2. Cater to their every need. As Drucker says, the goal is to "strip away everything that gets in their way."

3. Pack them in. Almost every project at Google is a team project.

4. Make coordination easy. In addition to physical proximity, all Googlers e-mail a snippet once a week to their work group describing what they have done in the last week.

5. Eat your own dog food. Google workers use the company tools intensely.

6. Encourage creativity. Google engineers can spend up to 20 percent of their time on a project of their choice.

7. Strive to reach consensus. "We adhere to the view that 'the many are smarter than the few' and solicit a broad base of views before reaching any decision."

8. Don't be evil. "Much has been written about Google's slogan, but we really try to live by it, particularly in the ranks of management."

9. Data drives decisions. At Google, almost every decision is based on quantitative analysis.

10. Communicate effectively. Every Friday, Google has an all-hands assembly, allowing management to stay in touch with what knowledge workers are thinking and vice versa. ■

How People Make the Difference at Edward Jones

The investment firm Edward Jones was one of Drucker's last clients, and he consulted with it as late as April 2005, at the age of 95. The relationship started in 1980. Over the years, Drucker met regularly with Edward Jones management groups to discuss questions raised by the team. He sometimes jokingly referred to himself as an "insultant" who had the pleasure of "scolding clients and getting paid for it" rather than a consultant, based on his habit of challenging prevailing assumptions.

Edward Jones has quietly built one of the largest, fastest-growing retail brokerage networks in the world, with more than 9,000 offices. Central to the company's success is finding the right people for the organization. Jones "looks for people with passion, confidence, independence and a belief in doing what's expected. We like to hire people who understand and can embrace our 'unfashionable' approach to investing." In many ways, Edward Jones epitomizes the knowledge organization that liberates its people to pursue its mission.

For information on the four types of knowledge strategy, go to: http://my.summary.com

Decision Making: The Chassis That Holds the Whole Together

According to Drucker, "A decision is a judgment. It is a choice between alternatives. It is rarely a choice between right and wrong. It is often a choice between two courses of action, neither of which is provably more nearly right than the other."

For that reason, it takes smart decisions and execution to traverse the new landscape, even with a strategy or map. That means the right colleagues, right collaborators and strong customer connections — everything that helps spur innovative thinking. Drucker called this the

(continued on page 8)

Decision Making: The Chassis That Holds the Whole Together

(continued from page 7)

chassis — the organization's ability to make well-informed decisions about what needs to be done and its resolve to get it done. He was passionate about management effectiveness — setting priorities, managing time and making effective decisions. His internationally best-selling book *The Effective Executive* is very much about getting the right things done. The days of the gray-suited micromanager hovering over his employees' desks are over.

Decision Making: The Right Risks

Certainly, risk taking has always been in the nature of business. Companies that took greater risks made it harder or riskier for their competitors to keep up with them. Today's greater uncertainty along with a smaller room for error mean that decision makers confront even more risk. Managers need to move forward while taking the *right* risk, not necessarily the *least* risk. This involves making decisions at the right level of the organization and having a disciplined, fact-based process for evaluating alternatives, making decisions and acting upon those decisions. ■

The 21st Century CEO

In the last years of his life, Drucker focused like a laser on what had increasingly fascinated him — the role of the CEO. As corporations grew more unwieldy, worldwide competition sharpened and customers and shareholders became more litigious, Drucker rightly saw CEOs as more important than ever. They had to provide leadership — strategic leadership, moral leadership, human leadership — and balance. Today's rate and magnitude of change leave little room for leadership error.

Drucker believed that the CEO role was the next area of management research. Good or bad, the CEO sets the tone for an organization, its mission and culture and its actions and results during his or her tenure. As a consultant and adviser, Drucker worked with hundreds of CEOs and observed a remarkable diversity of leadership personalities in action, from Jack Welch at GE to Frances Hesselbein, head of the Girl Scouts of America.

When exploring the role of CEO, Drucker defined three characteristics unique to that leadership position:

1. A broad field of vision and the ability to ask and answer what needs to be done.

2. His or her thumbprint on the organization's character and personality.

3. The influence he or she has on people — individually and collectively.

The CEO Brand

Every CEO, whether at a small family company or a multinational, leaves an imprint.

For example, at Campbell Soup Co. there was the Dr. John Dorrance era — when condensed soup was invented and introduced to the mass market — and condensed soup remains the identity of the company today. The James McGowan era saw Campbell expand into key ingredients. The William B. Murphy era was defined by the company expanding internationally, and the Doug Conant era is known for revitalizing the business.

As the CEO nurtures and forms an organization's personality, inevitably his or her own personality, or brand, rubs off on the place. Drucker saw this thumbprint as being of the utmost importance to the next generation's leading organizations. He wrote, "In the next society, the biggest challenge for the large company — especially for the multinational — may be its social legitimacy: its values, its mission and its vision."

Each of Us as CEO

What can the self-managing knowledge worker learn from these three characteristics — vision, organizational personality and influence — as CEO of his or her own career? Maintaining a broad field of vision requires having a sense of where you are going and what you are building. Organizational personality or brand is about knowing yourself and what gives you passion. Finally, the knowledge worker is influenced by and influences others. We are influenced by the CEO — the premier role model who lives the purpose, values and principles of the organization.

Successful careers are not planned, they are managed. Each of us is a CEO. The way we manage our careers — switch from company to company, or become consultants or contractors, or start our own businesses — will be the next revolution.

Peter Drucker has left our physical world but kept his promise to "be there" — his influence is embedded in our management past, our management present and our management future. ■

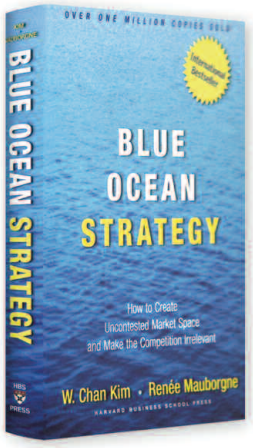
Navigating the Oceans

How to Render Business Rivals Irrelevant by Creating New Market Space



Review by Chris Lauer

Published more than two years ago, Blue Ocean Strategy *remains an international best seller in 2007. This groundbreaking book continues to influence business leaders around the planet. Since its publication in March 2005, it has been translated into and published in a record 32 languages. This is the all-time record for a book published by Harvard Business School Press. The book is a* Wall Street Journal *and* BusinessWeek *best seller. It has also received numerous honors, including* Fast Company*'s Best Books of 2005, Amazon.com's Top 10 Best Business Books of 2005 and* Strategy + Business*' Number One Strategy Book of 2005.* Blue Ocean Strategy *was also chosen as the Best Business Book of 2005 at the Frankfurt Book Fair.*

Endless battles on the high seas of the marketplace have made the ocean of competition a bloody mess. Competitors fight for market share with similar tactics in familiar regions of this blood-red ocean.

An alternative to the scene of this murky melee is a "blue ocean" where no competition exists to challenge a company's strategic moves. In their best-selling book *Blue Ocean Strategy*, business experts W. Chan Kim and Renée Mauborgne help companies navigate toward blue oceans with a clearly rendered map. Complete with valuable new research and dozens of success stories, this straightforward guide to modern business strategy succinctly describes how companies can chart a course for unexplored regions in the market.

The authors not only describe how a variety of modern companies have been able to create profitable business models based on the pursuit of uncharted waters, they also show executives how to pursue a logical strategy that can take them there.

BLUE OCEAN STRATEGY
by W. Chan Kim and Renée Mauborgne
Harvard Business School Press, Copyright © 2005, 240 pages, ISBN 1-59139-619-0

Kim and Mauborgne help company leaders sail to blue oceans with lessons learned from successful companies profiting from the creation of new market space. The strategy the authors unfold explains many recent industry-shifting business phenomena, including Cirque du Soleil's spellbinding success, the dominance of Australia's [yellow tail] wines and the innovations that fueled the rise of Southwest Airlines. By charting the strategic factors that help these businesses thrive, the authors demonstrate a framework of actions that create new sources of value for a company's customers. They also show how blue oceans can be extremely profitable for those who choose this counterintuitive strategic path.

Throughout *Blue Ocean Strategy*, the authors show executives how to create a "strategy canvas" that plots a company's offerings according to its value to customers. The strategy canvas also helps company leaders compare their offerings to those of competitors. Lastly, the strategy canvas demonstrates how a new type of competitor can create market space in places missed by those competing for the same sources of value year after year.

Australian Wine

The authors point to Australian wine producer [yellow tail] as a clear example of a company that has successfully created its own blue ocean. When the company entered the wine market, it faced competitors on its own terms. By picking middle ground between the price points of premium wines and jug wines, [yellow tail] chose a new path to profitability. The company also chose to buck tradition by

"One way a company can reconstruct the realities of its marketplace is to look across alternative industries for clues about where the blue oceans currently exist, the authors write."

jettisoning the usual wine label copy boasting of historic vineyards and wine medals. Instead, labels on [yellow tail] bottles feature a simple kangaroo.

The company paid no attention to the haughty habits of wine aficionados. Instead, it went after those who like to drink other types of alcohol. These potential wine consumers demand less challenging flavors, so [yellow tail] built a sweet, fruity wine to suit their needs. In addition, those with more expensive tastes enjoy its lower price.

Kim and Mauborgne describe how [yellow tail] refused to struggle with rivals on the same competitive battlefield where thousands of other wine companies with vague product differences fight for market share. The company rose to prominence with only two offerings: a Chardonnay and a Shiraz. To the chagrin of wineries in California, France and elsewhere, [yellow tail]'s Chardonnay quickly became the most popular white wine in the United States.

With a no-nonsense wine in a crowded marketplace, [yellow tail] created its own blue ocean. The company's fresh perspective on wine consumption and its attention to consumers previously ignored by wine companies opened up new market space beyond the doldrums of the status quo.

Charting a Path to Blue Oceans

In *Blue Ocean Strategy*, the authors describe a variety of ways for companies to profit by breaking boundaries and thoughtfully exploring new domains. Their fresh ideas about innovation offer businesses new paths to success. One way a company can reconstruct the realities of its marketplace is to look across alternative industries for clues about where the blue oceans currently exist, the authors write.

Often, companies in various industries serve the same purpose for consumers. By looking at the similar functions that companies in disparate industries serve, a company can gain vast insight into better ways of serving its customers. Kim and Mauborgne write that "the space between alternative industries provides opportunities for value innovation."

For example, NetJets was able to create new territory in the marketplace by simply evaluating alternatives to its own industry and then finding a solution that serves customer needs. Over the past 20 years, NetJets has created a blue ocean with its concept of fractional jet ownership. By offering its customers one-sixteenth ownership of an aircraft, the company opened up an entirely new industry that provides business travelers with an alternative to the costs and inconveniences of trips on commercial airlines.

NetJets helps frequent air travelers eliminate expenses, time and hassles from their trips by offering the advantages of smaller airplanes, smaller airports and convenient planning. Building on these benefits, NetJets opened up a multibillion-dollar blue ocean. The authors explain that companies find new market spaces to dominate when they become aware of the factors that cause buyers to choose alternative industries.

Curves' Middle Road

Companies can also find blue oceans by looking across strategic groups that pursue similar methods within the same industry, the authors write. Texas-based woman's fitness company Curves created a blue ocean by examining two different parts of the fitness business: large health clubs and home exercise programs. By focusing on the best elements of both of these industries, Curves was able to offer women an alternative to previous choices.

Curves gives women the specific elements of a fitness club they enjoy most, such as a group environment and a female-friendly fitness program. The company also eliminates the high costs, mirrors, men, food, spa, pool and locker rooms women can live without. Kim and Mauborgne point out that Curves offers women the time savings, lower costs and privacy of home fitness programs found in videos, books and magazines. This middle path between strategic groups has become a billion-dollar blue ocean for the franchise.

Apple Sails Into Clear Waters With iTunes

The authors also present other paths to reconstructing market boundaries. These include looking across the entire chain of buyers for an offering, looking across complementary offerings, looking across functional or emotional appeal to buyers and looking into external trends that will shape the buying habits of future consumers.

By reviewing a situation over time, companies can identify future trends to create a new blue ocean. For example, Kim and Mauborgne describe how Apple observed the popularity of illegal music downloading software, such as Napster and Kazaa, and created a legal response to the new demand for digital music. Apple identified the trend and imagined its logical conclusion. With the launch of iTunes in 2003, Apple was able to capitalize on the versatility of its iPod players and the downloading habits of a new generation of music lovers.

The Big Picture

Blue Ocean Strategy not only presents ways to reconstruct market realities with proper planning, but it also offers specific ways a company can create a new, individualized strategic plan. The authors show managers how to master a visual tool of the strategy canvas. Any organization can get a better look at the big picture surrounding its offerings to consumers by drawing a strategy canvas plotting the strategic profile of the company, an industry, current competitors and potential competitors. This graphical representation of a company's offerings shows leaders how much of the company's resources are being placed into various competitive factors. It also illustrates how these investments might be rearranged to produce a blue ocean.

The authors explain that blue oceans are found when a strategic profile contains three distinct, complementary qualities: "focus, divergence and a compelling tagline." One company that embodies all three of these qualities is Southwest Airlines. For example, Southwest focuses on friendly service, speed and frequent point-to-point departures. The company's point-to-point flights among mid-sized cities make it unique among airlines operating through hub-and-spoke systems. "Cheaper, faster, no-frills flights" is the type of tagline that resonates with customers.

Visualize Open Water

Kim and Mauborgne outline a four-step process for visualizing a blue ocean of opportunities:

• The first step is drawing a clear picture of the company's current strategy on a strategy canvas. This diagram plots the company's points of differentiation on a low-to-high chart that indicates where the company stands on a variety of factors. Comparing the line formed by these points with the lines of other businesses shows a company where it needs to change its strategy.

• The next step is exploring the six paths to creating a blue ocean. By observing the advantages of alternative products and services, a company can determine which elements of its business need to be kept, discarded or changed.

• The third step is creating a new line on the strategy canvas that describes the endpoint: where the company wants to be when the waves of change have settled. This vision will be clearer once insights, feedback and observations are assembled during the fieldwork that happens while the various paths to blue oceans are explored, the authors write. Customers, competitors' customers and noncustomers can enhance the dialogue that will create the best future strategy.

• The final step to visualizing a blue ocean involves communicating the new strategy within the company to align stakeholders with it. The authors point out that company executives should spread the word by distributing a single-page description of the company's old and new profiles. The single page is essential for easy comprehension and comparison. Kim and Mauborgne explain that success requires the company to support only company projects and operational moves that help it execute the new strategy.

" ... blue oceans are found when a strategic profile contains three distinct, complementary qualities: 'focus, divergence and a compelling tagline.'"

Counterintuitive Thinking

Many of the suggestions offered in *Blue Ocean Strategy* are counterintuitive and contrary to advice from other strategy experts. When Kim and Mauborgne describe ways to expand a company's blue ocean, they write that existing customers are not the only stakeholders who should be considered. A company must also look at noncustomers. Instead of focusing on customer differences, the authors write, a company searching for a blue ocean must also look at the "powerful commonalities in what buyers value."

That is how Callaway Golf created a blue ocean. The authors explain how the company was able to expand its market to include sports enthusiasts and country club members who had never taken up golf. By looking at how nongolfers perceived golf, the company was able to grow its business beyond seasoned players. Callaway researched its noncustomers and found that those who were not playing golf at their country clubs had something in common: They thought hitting a tiny white ball with the small head of a golf club was too difficult. The small-headed golf clubs that once dominated the sport required more intense hand-eye coordination than most nongolfers could master. This difficulty was the reason most novices never pursued the sport.

Callaway responded to this problem by creating the Big Bertha: a golf club with a giant head that made it easier for players to strike the ball. Callaway's Big Bertha became a best seller because it helped new players hit the ball with ease, drawing them into the sport with better scores. Big Bertha drivers also appealed to seasoned players. By looking at the commonalities of nonplayers, the authors write, Callaway found a way to create new demand by noncustomers while enticing seasoned players to switch to its new offering.

Get Your Ducks in a Row

According to the authors, there is a specific sequence in which a blue ocean strategy must be built. The process starts with asking the right questions in the right order.

This allows companies to land upon a commercially viable blue ocean idea. The authors conveniently provide readers with the most effective sequence for the questions that must be asked.

First, the authors encourage companies to ask whether there is a compelling reason for customers to buy an offering. If the answer is no, then company planners must rethink what new product or service customers would buy. If the answer is yes, they can move to the question of price. If the price works, the cost of producing the product or service must be considered. The final question examines the difficulties of adoption. Once adoption hurdles have been addressed, the blue ocean idea is ready to be rolled out.

Execute, Sustain and Renew Change

Moving away from the status quo toward a blue ocean can be difficult for companies, but Kim and Mauborgne offer many tips for overcoming limited resources, doubtful employees, low motivation and political opposition. Although the degree of each of these organizational hurdles depends on the company, the authors explain that success requires overcoming each obstacle. The leadership required to achieve this involves another counterintuitive approach. Instead of fighting each of these forces with massive responses, the authors write that successful leaders must conserve their resources by "focusing on identifying and leveraging the factors of disproportionate influence in an organization."

For example, when facing the cognitive hurdle of a company that is mired in the status quo, the authors offer two effective techniques that can change the mindset of an organization. The first way to shift mindsets entails directly presenting employees and superiors with the worst operational problems.

The second way to get employees and leaders to quickly switch their thinking away from the status quo is to encourage them to meet with disgruntled customers. Direct customer contact and town hall meetings can lead quickly to breakthroughs.

In the last part of their book, the authors offer organizations ways to sustain and renew blue ocean strategies. To stay afloat in a blue ocean, they write, a company must create barriers to imitation. These barriers include patents, legal permits, strong brand images, huge economies of scale in purchasing and loyal followings.

Blue Ocean Strategy offers readers a plethora of ideas from a history of strategic moves spanning a century and involving 30 industries. The authors combine new research and case studies to form a valuable strategy guide that has been embraced by business leaders around the globe. By describing the concept of blue oceans in basic terms and compelling stories, Kim and Mauborgne have created a blueprint from which forward-looking leaders can realize the rich possibilities of uncharted waters. ■

The Demand for Blue Oceans

Across the globe from Germany, an article in the Malaysian newsmagazine *The Star Online*, claims that the deputy prime minister of Malaysia is a big fan of *Blue Ocean Strategy*. The article features a photograph of Deputy Prime Minister Datuk Seri Najib Tun Razak reading a copy of the business strategy book by W. Chan Kim and Renée Mauborgne.

The article, which appeared in the March 18, 2007, edition of the newsmagazine, explains that the deputy prime minister liked *Blue Ocean Strategy* "so much that he ordered 30 copies for members of his staff."

In the article, Malaysia's deputy prime minister describes the business concepts found in the book as "getting business opportunities by thinking out of the box, and creating a demand for something that was not there before."

The authors: W. Chan Kim is The Boston Consulting Group Bruce D. Henderson Chair Professor of Strategy and International Management at France's INSEAD, the second largest business school in the world, and an advisory member for the European Union. Renée Mauborgne is an INSEAD Distinguished Fellow, a professor of strategy and management and a Fellow of the World Economic Forum. Together, they have written for the *Wall Street Journal,* the *New York Times* and the *Financial Times*. Their *Harvard Business Review* articles have sold more than 500,000 reprints. They were selected for Thinkers 50, the global ranking of business thinkers, and *The Sunday Times* (London) called them "two of Europe's brightest business thinkers." They split their time between New York and Fontainebleau, France.

THE SUMMARY IN BRIEF

To stay on top, companies need to do more than just tread water—they need to grow. And that means that their employees need to develop and improve their skills at the same pace. Increasingly, managers are being encouraged to improve employee performance through effective coaching, but few of them have the time or the knowledge to do it successfully.

A Manager's Guide to Coaching comes to the rescue. Brian Emerson and Ann Loehr have spent years showing top companies how to develop their most promising employees. Now in this helpful manual they guide managers through every step of the coaching process, from problem solving to developing accountability.

To complete any task, we need three things to be as successful as possible: Aptitude, Attitude and Available Resources. Attitude is the most vital component of the equation and it must be a key focus of every manager.

Clear, practical and straightforward, ***A Manager's Guide to Coaching*** will help all leaders coach employees, colleagues, and themselves to excellence.

IN THIS SUMMARY, YOU WILL LEARN:

- The best method to combine Aptitude, Attitude and Available Resources to increase your level of success.
- How to apply the W.I.N. B.I.G. Coaching Formula to get more from others.
- The essential tenets of coaching and why they work in any situation.

Getting the Best from Employees

The desire to "be more" drives us to be better at what we do and who we are. Thus, some managers have been told to "stop managing and start coaching." A coach is someone who helps another person reach higher effectiveness by creating a dialogue that leads to awareness and action.

The Success Equation

For any task, Aptitude + Attitude + Available Resources = Level of Success:

- Aptitude includes know-how, skills and capacity; it is more than innate talent.
- Attitude is drive, confidence, focus, determination, need, desire, fortitude and inspiration.
- Available Resources are tools, equipment and time.

In the equation, Attitude is the keystone. As managers, we see the need to focus on Aptitude and Available Resources; managers are often willing to train people in new skills or throw more money at the problem. Attitude is perhaps the most vital component in the entire equation, and focusing on it is a manager's business imperative.

Let's look at the relationships among these components of success:

1. Improved Attitude can compensate for deficiencies in Aptitude or Resources. Athletes who have suffered an injury but upped their determination and grit get highly successful results. When faced with a lack of Aptitude or Resources, people will often "dig deep" to find the extra determination they need to win in a big way.

2. A decrease in Aptitude or Resources often negatively affects Attitude, which can further hinder the Level of Success. Shifting Available Resources can directly affect Attitude. The same holds true with Aptitude. When an employee lacks the skills and ability to complete a task, their confidence and level of frustration will probably also be affected.

3. The converse of the above is not true — a negative Attitude does not decrease the level of Aptitude or Resources. Say Ariana, a highly successful employee, hears that downsizing will eliminate her position in the next 9-12 months. These rumors change her Attitude; Ariana's drive, confidence and focus may be negatively affected by the situation, decreasing her level of success. Her dip in Attitude does not lower or change her Aptitude or her Available Resources.

If you think you don't need to be coaching as a manager, think again. If you don't, chances are that talent will go elsewhere. The cost to replace an employee is higher than you might think — up to 1.5-2 times their annual salary. And there's a good chance that the new employee will not even work out!

Most of the time, when people quit their jobs, they are not leaving an organization; they are leaving their manager. People want to be developed. Gen-Xers (born after 1965) and Gen-Yers (born between 1981 and 1995) consistently cite "the opportunity to develop" as one of the key indicators of job satisfaction. Developing employees means increasing the employees' Aptitude and Attitude. The Attitude component is best developed through coaching.

The question, then, is not "Why should I waste my time and resources by focusing on coaching?" The real question is, "How can I not waste my time and resources?" The answer: "By focusing on coaching."

Using This Book to Coach Successfully

The difference between an average manager of people and a star manager lies in the ability to move people to higher levels of success when something is affecting their Attitude. At that point, coaching helps employees clarify what they really want to achieve and how to achieve it. We have seen the shifts that occur in people's lives as a result of coaching; it helps people "be more"—more successful, more productive and, finally, more alive.

This book can be used in a number of ways to help you get the biggest return on your coaching investment:

- To learn how to successfully coach employees and colleagues;
- To give to employees to kick-off and support (not replace) the coaching, when your time is limited;
- For groups or teams as they grapple with a particular problem;
- To coach yourself through different situations.

The What, Why and When of Coaching

Managing others is a big job that often comes with many thankless duties and responsibilities. Nowadays, in addition to managing, managers are expected to develop their employees. An effective manager needs to know how and when to use the tool of coaching and when to pick another, more appropriate tool.

To diagnose which situation calls for which tool, a manager needs to know

- What the tool of coaching actually is and does;
- Why it works and belongs in a manager's toolbox;
- When and when not to use the tool;
- How to effectively use the tool.

Let's look closer at the What, Why and When of coaching.

What Is the Tool of Coaching?

Employees need coaching when they are experiencing problems with the Attitude (motivation, confidence, energy, focus, determination) component of the Success Equation.

Good indicators of a coaching situation are things like

- When a person is experiencing trouble completing a job that they should already know how to do (i.e., there is not an Aptitude issue);
- When a person has gotten themselves completely wrapped around the axle about a certain situation; or
- When a person needs help dealing with the frustration they experience because they do not have the resources needed to complete the task at hand.

Managers should use coaching when an employee has the skills and ability to complete the task, but for some reason they are struggling with the confidence, motivation, drive or bandwidth to deal with the situation in as effective a manner as possible. How does a manager use coaching to develop employees in these situations? Let's break it down.

- **Dialogue.** In a dialogue, both parties seek to understand how the coachee is blocking their own success. They are not trying to prove, teach or motivate the other to do something.
- **Helpful.** There must be a genuine concern to see the employee succeed. Managers are so used to fixing problems that they often don't put themselves in the role of helping other people fix it for themselves; it takes trust.
- **Awareness.** People learn more when they figure things out for themselves, so a coach does not try to "fix it." Coaching is not the direct transfer of skills and knowledge; that is teaching. Rather, it involves helping another person gain the confidence, motivation and drive to complete the task at hand.
- **Action.** After a coaching dialogue, the coachee will do something differently, shift the direction of a goal or try a new approach to their situation.

Why Does Coaching Work?

Coaching works because it focuses on Awareness and Action. These two key tenets in Emotional Intelligence have quickly become recognized as one of the most important predictors of success. Emotional Intelligence is knowing and managing your own buttons and triggers as well as knowing and managing how you push the buttons of others. Research has shown that the best and most successful employees learn how to recognize, manage and harness the power of the emotions that drive them.

Think of a dashboard in a car. If the dials and digits didn't tell you the car was getting low on gas, why would you put more gas in it? If we are not aware of the impact of our actions, thoughts and feelings, then we have no reason to take action and start behaving any differently.

We are willing to venture that 9 times out of 10, when an employee is having an issue at work in which they are not being as productive as possible, it is not because they do not possess the specific skill set to get the job done. Coaching not only helps an employee discover for themselves the things that are in their way but also leads them to action, which is essential.

Coaching Versus Therapy

Coaching is not therapy. Therapy examines and tries to deal with or remove the impact of the root causes of people's "issues." Coaching looks at a person's motivation, focus, confidence, or chutzpah and gets them to figure out how they will deal with that to be successful.

There is a basic rule in skiing—where you focus is where you go. In therapy, you will focus on the trees—those things that keep the trail from being as wide and obstacle-free as possible. In coaching, you might glance at the trees, but the job of coaching is to keep you focused on the ski run.

Both Martin Luther King, Jr. and Nelson Mandela led people whose emotions of anger and fear could have blocked their effectiveness. Both tapped into those emotions and said, "That's an OK tree to have on your slope, but what do we have to focus on to get us down this hill in the best way possible?" Neither man ever asked the people who looked to him not to feel those emotions.

When to Coach and When Not to Coach

Recognizing when and when not to coach is just as important as learning how to coach. If an employee lacks the skill to complete a task, it is not the time for coaching; their problem relates to Aptitude. If an employee faces external obstacles, such as too few Available Resources, changing market conditions or ineffective vendors and partners, it

is not the time for coaching. Coaching is needed when employees' Attitude keeps them from being effective. They currently lack the motivation, focus, chutzpah, confidence or commitment to complete the task at hand.

Ask yourself if an employee's problem is about Aptitude, Attitude, or outside factors like Available Resources. If it's Aptitude, find a way for them to learn the needed skills. If it's outside factors, it's tricky. They may need some coaching and some teaching. If it's about Attitude, coaching is the right tool for the job.

If it seems that your questions about Available Resources reflect no problem there, ask the employee something like, "It seems that Project XXX is causing you a lot of angst. What would need to be different for you to say it was going smoothly?" or "Fill me in on how you are doing with XX; what's working and what's not?"

How to Coach and W.I.N. B.I.G.!

Next, we take all that we discussed so far and outline our W.I.N. B.I.G. coaching formula.This part is filled with tons of tips and practical suggestions to help you develop your flair and finesse when coaching.

The Coaching Process

The Coaching Process has three steps:

1. **Determine Coachability.**
2. **Build Awareness by asking questions.**
3. **Move the coachee to take action, and then hold them accountable to their commitments.**

Questions are the backbone and lifeblood of a coaching dialogue. Questions help the employee discover for themselves what it is that they need to be doing differently to stop hindering their own success.

Coaching Questions

It is possible for a coach to do nothing more than ask questions during a coaching conversation. To be effective, you can't tell a person how to feel; you can't give advice on motivation; you can't suggest that the person strengthen their backbone. This dialogue is created not by telling, but by asking.

There is a big difference between questions and coaching questions. Coaching questions open a dialogue—they are like keys that open doors to answers and possibilities for people. The keys allow people to look inside "rooms" and discover solutions and strengths that they may have never known existed. To ask good coaching questions, stay curious and focus on these five suggestions:

1. Keep them open.
2. Keep them advice-free.
3. Keep them short and simple.
4. Keep them thought-provoking.
5. Keep them forward-focused.

Let us look at each of these.

Keep Them Open. Closed-ended questions elicit an answer of "yes" or "no," or at best one or two other words, such as "good," "fine" or "OK." They don't lead to a dialogue, let alone Awareness or Action. Starting questions with words such as "will," "did" and "have" will likely lead you into a closed-ended question. Try to rephrase those questions to start with words such as "what," "who" and "how." "Did you check all of the requirements?" becomes "Which of the requirements most concerns you?"

The resulting open-ended questions require the responder to elaborate. They help create a fuller picture and raise awareness. Not only do they elicit better information; they might also help the employee think through an aspect of the situation that they would not have otherwise.

Keep Them Advice-Free. One of the biggest traps that managers who are learning to coach fall into is the old "advice disguised as a question" snare. They know they have to ask questions, but they don't let go of their need to fix it and give advice. They want to take the problem away from the employee and solve it. This doesn't work.

Advice disguised as a question often starts with, "Have you tried…?" or "Why don't you…" or "What if you …?" Very rarely are questions that start like the ones above met with an "Oh, my gosh, that's exactly what I should do. Why didn't I think of that!?" Better questions are, "What's the best solution to this in your mind?" and then "What would it take to make that happen?"

Keep Them Short and Simple. The most powerful coaching questions are often the shortest. The art of coaching is not asking magnificently complex questions but staying curious about what is going on for the employee and really listening to what they are saying. If you are busy composing your next brilliant question, then you're not listening!

Questions of 5-10 words often work best. They typically come from a place of curiosity, are too short to be advice and keep the coach focused on the employee. The short

question "What do you want?" sparks more thought than "In the end, if it could go perfectly in your mind, how would you like everything to work itself out?"

Keep Them Thought-Inspiring. Imagine teaching someone to kick a soccer ball. Asking them, "Are you keeping your eye on the ball as it comes toward you?" will elicit a "yes" or "no" that doesn't help them see the situation in a new light. However, asking a questions like, "As the ball comes toward you, which way is it spinning?" or "Do you see more black or more white on the ball as it approaches?" will help them to look at the situation differently and ensure that they are keeping their eye on the ball. Similarly, it's better to ask, "What are the times your team has the lowest energy?" Or, "If your team was a TV show, what would it be?" is better than "Is your team getting along?"

Keep Them Forward-Focused. One way people's Attitude is affected is by replaying past events. As a coach, you want to help the employee step back from the events, learn from them and then focus forward. It's like the skiing example: Where you focus is where you go.

People often need to express emotions before they are ready to look forward. That's understandable; people need to complain before they can create. Let them do that for a few minutes, but don't let them get stuck in the venting.

If an employee says, "The meeting I just ran was a fiasco… details, details, details," you as a manager could ask things that stay stuck in the past: "What happened then? Did you have the handouts of the project plans?"

Forward-focused questions would be, "How do you want your meetings to run? What do you need to do differently for that to happen?" To keep people forward-focused, avoid questions that begin with "why," e.g., "Why did you do that?" These questions put people on the defensive, which shuts them down. "Why" places you in the role of inquisitor and judge, not in the role of collaborator and coach.

Rather than ask, say, "Why did you do that?" try "What were you hoping to gain?" Forward-focused why questions are almost always advice disguised as a question: "Why not go to him and say …?" or "Why wouldn't you…? Our advice is, why not just avoid them altogether?

The W.I.N. B.I.G. Coaching Formula

There is a simple, six-step process you can follow to Build Awareness and Move to Action called the W.I.N. B.I.G. model.

The first three Build Awareness; the next three Move to Action.

1. W-onder about Root Cause — Discovery
2. I-nvestigate Wants — Visioning
3. N-ame Possible Solutions — Problem-solving
4. B-uild a Plan — Action
5. I-nsure Action — Accountability
6. G-ive Affirmation — Validating

We will look closer at each of these.

1. W-onder about Root Cause — Discovery. Busy managers may think, "I'm not paid to wonder. I'm paid to know." But Wonder is the first step of successful coaching. Start by getting curious. You know this employee can do good work, so what's going on? Is it a motivation problem? Don't judge it; just be curious about it. Ask curious questions in a way that makes it fun, not scary.

Good questions for this stage are

- How does that really affect you?
- If you were watching this on TV, what would you say was really going on?
- What's underneath all this?

Be curious and playful until you have gathered enough information about the feelings and the root cause, and then move on to stage two — Investigate Wants.

2. I-nvestigate Wants — Visioning. The more clear you are about what you want from a situation, the more likely you are to get it. The goal of this stage is to help your employee investigate what they really want. Good questions are

- What do you want?
- How would you like people to describe you as you resolve this?
- What would success look like?
- If you could use a magic wand to recreate the scene, how would you want it to look?

Spend a few minutes getting the person to focus on how they want "to be" as they go about doing what it is they want "to do." Give the person space and time to figure it out for themselves. If they feel stuck, just ask another open-ended question about their desired outcome. The bottom line is, the employee knows. Deep down, we all know what we want. If you get an "I don't know" to one of your questions, respond by saying, "That's fine; make it up."

3. N-ame Possible Solution — Problem Solving. There is a definite reason why this stage of W.I.N. is called Name Possible Solutions and not Name the Solution. The goal of this stage is to help the person become aware of the multitude of possible solutions. You should help brainstorm during this stage, but don't be attached to your ideas. Be OK with the person rejecting your suggestions. You want them to build on your idea so that it becomes their own, more-improved version. Ask questions like

- The 85-year-old you is looking back at this situation. What do you say to do?
- What are some ways to make that happen?
- What do you have to do to get where you want to go?
- How would Bill Gates tell you to solve the problem? Oprah?

Asking follow-up questions is key. Try, "That's a great idea; what's another?" Do not settle with just one solution. When you have a few solutions, ask questions like, "What would be the effects of your favorite solution?" and "Which option gets you closest to what you want?"

In this phase, name possibilities, and brainstorm!! You can be as wacky and wild as you want. Assume Vernice wants some work taken off her plate to bring balance and productiveness to her life. There are no stupid or silly answers. Vernice could just go home at 5:00 p.m. no matter what. She could auction off some of her work on eBay. What about getting an intern/college student? Or hire her grandmother! At the end, you could ask her which option gets her closest to what she wants.

4. B-uild a plan — Action. Now you can get down to the details. To get specific action steps, ask questions like

- What steps do you have to take to get there?
- When will you do that?
- What will you have to say no to in order to make this happen?

As you'll notice, your questions start to get more specific and, to a certain degree, closed-ended at this point.

As your employee is creating their plan, help them to make it SMART: Specific, Measurable, Achievable, Realistic, and Time-specific. So if an employee responds, "To make it happen, I'd have to make five sales calls a week for a month…" challenge him, "Great. Could you make nine calls a week?"

5**. I-nsure Action — Accountability.** Ask specific questions like, "How will I know?" and "How will I know if you need a nudge?" It can be great to follow up these questions with a conversation about what you should do if the person doesn't follow through on their commitments, e.g., by asking, "If you don't follow through, how should I help get you back into gear?"

When you remind them, do it compassionately and frankly. You don't need to cajole, threaten or beg.

Set up an accountability structure with your coachee.

Check in after a few days or weeks. Here are some good questions to get the ball rolling when you follow up:

- How would you summarize the work/effort so far?
- What's working well? What are you thinking of altering?
- If you were to do this again, what would you do differently?
- What can I do to be supportive as you move forward?

Eventually the employee becomes accountable to themselves, not you. This is called empowerment.

6. G-ive Affirmation — Validation. The final stage can be used anywhere during the coaching conversation but especially at the end. Take the time to Give Affirmation and acknowledge their hard work and their desire to grow and change. An example would be to say, "I have no doubt you can do this. You're determined and persistent. I know there's a lot to this, but your energy is contagious, and others are going to get on board." Just say what you know is true about that person. Then take a few seconds at the end of your statement and "let it land."

Once you know the W.I.N. B.I.G. model, you can coach in any situation. Keep it light and easy. It takes time and practice, but it's worth it when your coachee hits a home run and moves forward in life!

The Tenets of Coaching

Coaching is a dance of give and take in which everyone has their own style. Some basic tenets are common to coaches, regardless of their style. They fall into three groups: Coaching Mindset, Coaching Actions and Coaching Tricks of the Trade.

Coaching Mindset

1. Believe in Potential. Believe fully that the coachee can handle the situation more productively and efficiently with less stress. Many managers talk about how good a certain employee or team is in a specific situation, e.g., "Oh, but when the pressure is on, she can really kick it into high gear." Or, "He is at his best when he's focused on landing a major deal." Believe that your employee can be at their best in every situation.

2. Be Unattached. Set aside your own solutions, trusting the coachee to find the best solution to their own problem. The coachee may reject your ideas. That's entirely OK. If an employee responds to your idea, "I don't think I could do that…," don't respond like a typical manager: "Sure you could." Instead, try, "Well, what could you do?"

3. Don't Know and Don't Fix It. Let go of the need to know the answers or provide a solution. You don't even need to know anything about their issue to coach them. Help the coachee believe they know everything they need to know to find the best solution. If an employee says, "I think we need to start from scratch," a typical manager might say, "That's not possible. We'll have to make this work." A better coaching question is, "Great. What would that look like, and how would it affect the project timeline?"

4. Keep it Light and Fun! Adults learn best when they're having fun and being interactive. Creativity is a great tool for solving problems. Jokes, songs, games and movement can add to coaching. You may suggest that you take a walk around the block as you discuss the problem. Or if a coachee says he doesn't know what to do next, you could say, "Me either. Let's play a game. Starting with 'A,' let's name possible things you could do for each letter of the alphabet, no matter how silly it sounds."

5. Stay Curious. Curiosity is underrated in the workplace. Remain curious and unattached, listen without judgment, ask questions and don't tell the coachee how to fix the problem. If a coachee is feeling overwhelmed by a project, a typical manager might say, "Let me break it down for you," but a coach would ask, "What has hung you up the most?"

6. Trust Your Gut. Listen to your gut reactions, act on them and let the coachee examine his own gut instincts. If a coachee reports, "The numbers look good for this project, but my gut tells me not to do it," follow up with, "What is your gut telling you to do?"

7. Build Awareness Before Action. It is difficult to accomplish the task without a good process. If an employee says his workload is overwhelming, a typical manager would ask, "What are you going to do about it?" To build awareness, a coach would ask, "What do you think is causing the work overload?"

Coaching Actions

8. Mirror. Spending countless hours working on a project, an employee often gets too close to a situation to see clearly what's going on. To uncover any blind spots, hold up a "mirror" to the coachee, explaining what you see in the situation. Then let the coachee interpret the data.

An example would be, "I've noticed that whenever you head up a project that deals with Hector's department, you have a hard time getting it off the ground. Is there a connection there?"

9. Listen. Focus 100 percent on the coachee's words, emotions and body language. Notice what they're not saying — the ideas between their sentences. See if their body language contradicts their words.

Ask the next question based on what the coachee said, e.g., when an employee says, "I need more training on this topic," you could respond, "Your eyes lit up when you said that you'd like more training. Your voice sounded excited about the idea."

10. Create Space. Prepare for the coaching session; clear the area of all physical distractions, but clear yourself mentally as well. If you need to, take a few seconds to clear your head or stretch your legs. When you come back, enter with a focus and close the door.

11. Validate. Acknowledge what the coachee is going through and what they have accomplished. Point out something that you appreciate that the coachee may not see in themselves.

A coach might say, "I know how hard you worked to get to where you are today. You committed to a plan, you stuck to it and you asked for help. Your tenacity is inspiring others."

12. Ask. Ask open-ended questions that empower the coachee to find their own answers. Trust your questions. Even if you think you asked a bad question because the coachee didn't like it, it may be the perfect question for the coachee to mull over later.

13. Feedback. Give specific feedback regarding the coachee's behavior and its effects. Be specific, and speak in a matter-of-fact manner. Typically, the coach then asks the coachee to create an alternative behavior to create an alternative effect.

14. Celebrate. Acknowledge what the coachee has accomplished, and help them find a way to mark the achievement. It doesn't have to be a splashy event. Some people want an announcement at a staff meeting or a mass email. If the coachee does not know how they want to celebrate, give them some suggestions until they get excited about an idea.

Coaching Tricks of the Trade

15. Bottom Line. You or the coachee summarizes the situation in a few words or two to three sentences. Get to the heart of the matter. Say an employee says she's having problems with a co-worker named Rachel. Ask her, "So, bottom line, in two to three sentences, what is the issue with you and Rachel?"

16. Word Choice. Use positive words that motivate, and point out "red flag" words that a coachee uses that may prevent them from moving forward. Suggest "sometimes" when you hear "always," "some people," not "everyone," "rarely" over "never" and "won't" in place of "can't." Avoid entirely the words "why," "should" or "can't."

17. Story Shift. Someone may have told their story so many times that they think it's the absolute truth. Be matter of fact and concise when naming a story; don't judge it or give it any more importance than other perspectives.

A coachee may say, "We're screwed … there's nothing we can do to get out of the situation." Shift the story by saying, "Wow. What would President Lincoln tell you to do in this situation? Indiana Jones?"

18. Coach the Person. Keep the focus on the coachee, not someone else involved in the situation, because the coachee can't change other people but can change their reaction to them.

Imagine an employee says, "Tim didn't let me give my ideas for the new systems design at today's meeting." Your response would be, "How did you react to that?" If you hear, "I kept quiet; he didn't want to hear from me anyway, so why bother?" Then redirect: "Let's look at you, not Tim. What was the effect of you being quiet in the meeting?"

19. Deal with Resistance. Keep asking questions in a detached manner even when a coachee refuses to look at an issue another way or feels that they do not need coaching. Manage your own buttons so that if the coachee pushes them, you'll still be able to focus on them 100 percent. If a coachee says, "This is a waste of time," ask,"What would have to happen for it to be a better use of your time?"

20. Address Fears. Help the coachee objectively see fears that stop them from moving forward. Often, the coachee then sees how illogical the fear is and moves past it. Imagine an employee says he can't take a promotion because he's not ready. Ask him, "What would be the worst thing that could happen if you took the promotion now?" Repeat as they respond.

21. Create Vision. Help the coachee determine their vision of where they want to be in two to five years. If they can't achieve their vision with you, they will move or R.I.P. (retire in place), losing all motivation. Say a coachee tells you, "I see the organizational vision, but I don't see how my work makes much difference." You could ask, "What would it look like if your work was making a difference?"

Conclusion

We recommend that you practice one tenet at a time until you feel you have mastered it. Then choose another, and practice it until it comes easily. Eventually, these tools will all feel like second nature.

Your employees may not be able to articulate the details of their dream or vision yet; they may not have even thought about it at all. So give it time and don't rush it. Keep asking open-ended questions, and allow them the time they need to conceptualize it. Remember, they'll be much more dedicated and excited at work if you help them achieve their goals. And you'll be more successful if they're more successful.

A New Way to Think

Your Guide to Superior Management Effectiveness

By Roger L. Martin

Roger L. Martin is Professor of Strategic Management, Emeritus, at the University of Toronto's Rotman School of Management, where he also served as Dean (1998–2013). In 2017 Thinkers50 named him the world's number one management thinker. He has published twelve books, including When More Is Not Better and Playing to Win (with A.G. Lafley). Martin is a trusted strategy adviser to the CEOs of many global companies. A Canadian from Wallenstein, Ontario, he holds a BA from Harvard College and an MBA from Harvard Business School.

Rethinking Ineffective Business Models

In ***A New Way to Think: Your Guide to Superior Management Effectiveness***, author Roger L Martin ends his book by discussing two different people he once spoke to: one was a business practitioner and one was an academic. These two professionals defended the often repeated trope that it is better to have a superiorly executed mediocre idea than a poorly executed superior idea. Martin tried to convince these people that their thinking was incorrect. His core reason is that with a well-executed mediocre idea, that best one can achieve is mediocrity. He was unsuccessfully able to convert their thinking, and they maintained their perspectives. His intent in this book is to prove that ineffective models are a serious problem and that when a model does not offer the results expected that the model should be examined and not just its execution.

Martin considers a model to be a promise that if the model is used effectively, certain results will inevitably follow. Too often, however, he sees models failing people and businesses. These failed professionals, he claims, then proceed to blame the execution of that model rather than consider the effectiveness or reliability of the model itself.

In this book, Martin points out 14 different models prominent in the workforce that he believes are inherently flawed. He then lays out a model for each that is more promising in his mind. His main concern is that people do not stay married to models that are ineffective. Therefore, he encourages his readers to try out his models and only keep what works for them and their businesses. He believes that if people continue to work and refine these models, the "practice of management will advance."

Martin understands that he is asking something big of professionals when he urges them to switch away from old, trusted models. He acknowledges that there is both inherent risk and difficulty in switching the way things are done. Part of this is because the whole process of models is automatic. Another reason is that it is not possible to prove an idea analytically before it is carried out. As such, if a professional is looking for proof before acting on a new idea, new ideas will never be implemented because the proof just will not be there. To overcome this, he believes that people need to work through a model logically and try to determine if it stands up to logic. If it does, then practitioners ought to attempt to find ways to gather data only

on those ideas that pass the logic test. Martin states that since many managers are trained as scientists, they are looking for the right idea. He does not believe there are right ideas. He merely looks for better and worse ideas.

The first model Martin takes on concerns competition. He says that "it's not corporations that compete" as is often believed to be the case. Rather, he states that it is the products and services the company provides that compete. Because of this, Martin believes that the true competition does not occur at the highest levels of the company. Rather they occur at what is often the lowest levels of an organization - where the customer actually purchases the product or service. According to this new model, the whole company should work to support those on the front lines. This new model says that customers are not so concerned about which company produces a product; rather, they are concerned with finding the product that best meets their needs. This mindset reframes competition because the competitors are no longer two large corporations but rather two specific products. This model also draws respect to the opinions of those employees on the front line and focuses less on hierarchies that are more concerned with "optimizing the use of their existing resources and capabilities."

Martin says that the existing model turns complex organizations into hierarchies whereby information goes to the people at the top who then make the decisions because they are believed to have the most information. The people at the top, however, are quite removed from the actual places and moments where people make purchases. Instead of focusing at the top of the hierarchy, Martin believes that each level should become a customer of the level below it, and the whole organization should be centered around helping those on the front lines most effectively meet customer needs.

Another model that Martin questions is one of familiarity. In his book, Martin uses Instagram's change in logo as an example as questions why successful companies embark on radical rebranding initiatives. He believes the answer to this question is that most modern companies believe that a competitive advantage is not sustainable in a world where things change as quickly as they do today. Therefore, companies believe they have to be constantly changing to stay competitive. Martin believes this is a false model and that it has led to some serious losses for companies. His belief is that in regards to customers, "the familiar solution usually trumps the perfect one." His new model asserts that instead of adapting, companies should be focused on making sure consumers do not have to make choices, that consumers' consumption habits should be automatic.

Martin uses psychological principles such as processing fluency to come to the conclusion "that the mind loves automatically more than just about anything else." Martin sees this as being especially important in the tech world, and he uses examples from the aforementioned Instagram as well as Facebook and MySpace. MySpace was the number one social media site in 2003 and became the most frequently visited website. Ultimately, however, it failed and could not compete with Facebook. He believes part of this is because users could create their own webpages on MySpace. The results of this was that there was no uniformity of design. Furthermore, MySpace cluttered the site with ads and allowed ads for indecent services that sometimes jarred users. Also, the company added many new disparate features going so far as to add a karaoke feature. The result of all of this was that customers were never sure of what to expect when they visited the site or of what might come next. This was in stark contrast with Facebook that attempted to create a uniform experience across the site, and who, when developing its app, was very careful to make sure the app experience was nearly identical to the website experience. Using the Facebook website was a predictable experience, and because of that, Facebook thrived.

Later on in the book, Martin tackles the model of how knowledge workers are organized in a company. He believes companies too often organize knowledge workers in the same way they organize manual workers, and this is not effective. The failure of the current model, Martin says, can be seen as companies end up hiring many managers who they then have to lay off when times get lean. He claims that times will inevitably become lean because businesses hire for their most intense times. This process, he claims, not only hurts individuals as they lose their jobs but it hurts companies as well.

Martin claims that most companies make two mistakes when it comes to managing knowledge workers. First, they attempt to structure their knowledge workforce in the same way they manage their manual labor work force. This involves individual workers repeatedly doing the same job every day. The second problem he sees companies make is in viewing knowledge as something that follows an employee rather than something that can be transferred the way manual skills are transferred. This is the existing model. Martin's new model is centered around the idea that knowledge workers should be organized around projects and not around jobs. He sees knowledge workers as being employees who manufacture decisions. He calls their workplaces decision factories. These decision factories are very expensive.

When knowledge workers' duties are centered around jobs, individual employees have specific jobs or tasks they are charged to handle. Typically, this means that during some times, employees are quite busy and productive while at other times, they spend large amounts of time just checking emails or drafting memos when work slows down. Nobody wants to be seen as having nothing to do. While this is what typically happens, the old model assumes that knowledge workers will complete the same amount of output each day which he simply believes is not the case. He claims that knowledge work typically centers around projects, and as such, knowledge positions should be project based, and when one project slows down, full-time employees then can be moved to other projects.

Martin claims that in manual work, heuristics are often used whereby different employees can complete the same job. He acknowledges that sometimes creating these heuristics is more difficult in knowledge work as many different decisions often need to be made, but he also believes another problem is that employees are not likely to want to create algorithms by which other people could complete their work because they fear it

> . . . employees need to embrace knowledge advancement and the creation of knowledge algorithms that can help others."

could leave them out of a job. He believes that part of this solution is to look at how professional services firms organize their workers. They typically put people on projects, and then when one project is done, they move that person to another job.

In this model, employees are not tied to specific jobs but rather they move where they are needed. This helps companies because most have more knowledge workers than they need, and this would allow them to work with more efficiency. Once this change has been made, he believes that employees need to embrace knowledge advancement and the creation of knowledge algorithms that can help others.

Following along with how businesses allocate talent, Martin also addresses how companies treat and approach talent. Around the end of the 19th century, businesses started to largely be run by managers who worked for those who provided capital. This resulted in companies that were fraught with tensions between investors, labor, and unions. As time progressed, further concern arose when investors' and managers' interests started to be in opposition to each other.

Martin believes that this model has resulted in talent acquiring more benefits than the capital providers acquire. Because top end talent is so crucial to any organization, top end talent's compensation has skyrocketed over the years. This skyrocketing cost has led to the belief that money is what top talent is most concerned with. Martin does not believe this to be true. Yes, in regards to hedge funds who destroy companies, investment bankers who promote bad investments to line their own pockets, and CEOs who skew the apparent value of a company in order to sell it, there is a primary monetary motivation, but he believes that for most strong talent, money is not the primary concern. Martin believes that for these top performers, feeling special is what is most important.

Martin uses numerous examples to illustrate this. One of these was a global account manager for a company that Martin was corunning. This man, Giles, approached Martin asking for paternity leave. Martin told him that at his level, he could have whatever he wanted. Martin was confused when Giles walked away looking Sullen. Martin realized that he had treated Giles as a member of a group. It was one of the highest ranking groups, but still, he did not treat him as if he were special. Martin then goes on to mention multiple examples of the highest level of talent in the sports world who are most interested in being treated special and as if their opinions are valued.

To help talent feel special and to both attract and retain this talent, Martin gives three rules. The first is that companies should never dismiss the ideas of those who stand out. These people have developed their skills to the highest level, and while it is not mandatory that all of their ideas are adopted, they should be considered. This will help the talent to feel respected. Second, Martin says it is important to never block the development of these individuals.

Finally, he encourages people to never pass up an opportunity to praise these people, not in trite, generic ways, but in a manner that is specific to them and their contributions. Because they will not ask for praise, the challenge is to spot moments when they need it and to provide it in a personal and sincere manner.

Martin starts out his book by stating that the chapters can be read in any particular order. Each chapter addresses an old model and then offers an alternative model. Because of this, readers can jump to sections that pertain to their specific situations and needs. While three old models and three revised models have been presented here, Martin addresses fourteen in total. He breaks these fourteen models into four categories: context, making choices, structuring work, and key activities. They pertain to diverse topics including innovation, the role of strategies, the design of innovation, capital investment, and mergers and acquisitions.

Martin does not posit that his models are the best that can be developed and that companies should stop everything they are doing and adopt them as is. Rather, he advocates that companies consider the models that apply to their unique situations and then test them out and see if they work. He believes that these models can be improved upon to create even better and more accurate models. None of this growth can occur, however, if professionals and organizations stick rigidly to the models they use even when they have proved ineffective. The greatest challenge Martin poses to readers is to reconsider their own models and whether they produce the results desired.

How To Leverage Individual Performance For Company Success

ACTION COACHING

THE SUMMARY IN BRIEF

Today's changing business environment has left a void in many organizations between the needs and goals of a company's greatest asset — its people — and those of the organization itself. Changes of leadership and vision, corporate mergers and acquisitions and constant upgrades in the role of technology all contribute to an incongruity or gap between a company and its people that can wear the company down at its very core if nothing or no one intervenes.

Consultants David L. Dotlich and Peter C. Cairo have created the perfect intervention program in Action Coaching. This method provides organizations and their coaching-minded leaders with the knowledge and tools required to evaluate problem situations, mediate effective solutions and align the needs and behaviors of employees to the organizational imperatives of their companies.

Their plan includes a number of powerful and consciousness raising tools to employ in your company's next coaching effort. Among them:

- ✓ A clear definition of Action Coaching, and a host of reasons for its effectiveness.
- ✓ An eight-step Action Coaching plan — from determining what needs to happen and establishing mutual expectations to evaluating the progress of both individuals and organizations after the initiative.
- ✓ A detailed discussion of motivation, including the identification of motivational patterns in employees and common motivation-related pitfalls you should avoid in coaching.
- ✓ A discussion on conflict, and how it can actually help individuals and organizations meet their goals and needs.
- ✓ A list of barriers to personalizing leadership, and how to overcome them.

Does your company have difficulty moving its employees through organizational or market-mandated changes, or aligning individual performance for company success? Turn the page and learn how to bridge the gap.

ACTION COACHING

by David L. Dotlich and Peter C. Cairo

— THE *COMPLETE* SUMMARY

What is Action Coaching?

Action Coaching is the process that fosters self-awareness and that results in the motivation to change, as well as the guidance needed if change is to take place in ways that meet organizational needs. It's a synergistic concept — to develop change in an individual in such a way that your company's business goals are positively impacted in conjunction with the individual's personal development. There are four essential elements of Action Coaching that help you foster personal development to the benefit of your organization:

1. **Self-awareness is linked with business results.** The individual's need to change is reconciled with the organization's perception of the need to change very early in the process — usually during the first or second meeting.
2. **An action plan is put in place.** Action Coaching plans set both a list of specific work-related tasks and milestones that track development. The client then documents progress in each matter, along with the coach's recommendations on that progress.
3. **Level of achievement is set based on organizational need.** The coach sets one of four goals for the client — self-awareness, performance improvement, performance breakthrough, or transformation — to match the need of the organization.
4. **The process is structured and provides proven tools.** Action Coaching combines a formal strategy, tactics and explicit goals to facilitate a logical, orderly coaching process for the benefit of clients and their people.

Differentiation

Action Coaching differs from traditional coaching in several key areas:

- **Relationship.** Traditional methods of coaching follow a therapist-patient relationship, whereas Action Coaching relationships are firm business relationships.
- **Approach.** Action Coaches follow specific strategies and action plans tailored to specific individual needs and geared toward performance breakthroughs. Traditional methods tend to be unfocused in both approach and interaction, using one-size-fits-all methods rather than individualized processes.
- **Focus.** Traditional coaching focuses on personal insights rather than actions; individuals rather than the greater whole. Action Coaching translates insights into actions with organizational results, coaching in the context of environmental goals and obstacles to change. ■

Why is Action Coaching Effective?

While Action Coaching's linkage of individual and organizational concerns and its differentiation from traditional coaching sound good in theory, its true effectiveness can only be fully surmised when the process is put into practice. There are four crucial elements in the process:

Eye-opening perception. People tend to believe something is true about themselves or their workplaces, then selectively find examples of their beliefs to use as evidence to support their viewpoints. Action Coaching uses a variety of techniques to jar people out of this self-fulfilling behavior, open their eyes to the reality of their situations and push them toward change and growth.

Emphasis on doing. Although there is much to be learned from seeing things differently, people need also to act on their changed perceptions. Action Coaching relationships involve a contract between the coach and the person being coached to take solid, well-planned actions and ensure accountability, even after the coaching program is completed.

Recognition of complexity in the business world. Action Coaching functions as a form of support when individuals struggle with such business issues as redefining the customer service chain, changing a company's

Why is Action Coaching Effective?

(continued from page 3)

culture, and interacting with others in the decision-making process. These "adaptive" issues require people to become more comfortable with new ways of leading and working. Action Coaching provides the feedback, information and reflection required to let people lead in new environments.

Tailor-made for transitions. Action Coaching gives people the forum to express concerns over transitions, allowing them to also receive feedback on their transitional progress and advice to navigate around roadblocks that hamper their ability to change effectively. ■

Are You an Advocate?

Ten years ago, Honeywell, Inc., set up an award program for employees who were superior developers of people, in order to encourage executive development at the managerial level. Because the company recognized that development occurred through relationships between employees and managers, it requested nominations for the awards. What it discovered was that everyone knew who was the best at developing their staff — that Mary in finance was a brilliant trainer, Don in marketing was a terrific coach, etc.

These "developers" were quiet advocates of coaching within their organization; they led by example, regardless of Honeywell's coaching or training policies. Likewise, you, as an insider in your organization, can fill roles that coaching consultants cannot. Your example, combined with expertise from outside the company, can put Action Coaching into practice, to meet organizational and individual objectives and develop a culture of constant improvement.

Eight Steps of Action Coaching

The Action Coaching process consists of eight steps:

1 **Determine what needs to happen and in what context.** It is important to determine both desired behaviors and the larger context in which those behaviors will need to happen. This may require initially focusing beyond a problem or developmental need, in order to understand why the problem or need is of concern to the team or the company. Context can also be shaped by organizational issues, such as succession planning, transition or an organizational skill deficiency. These issues must be recognized as ones that can drive a coaching effort, and must be addressed in advance of their occurrence, whenever possible.

Action Coaching through Transition

The new president of Levi-Strauss needed coaching assistance to help shape an agenda, a vision and the team he inherited, and to help him receive feedback. Action Coaching supported his efforts in all of these topics and helped facilitate the transition into his new position.

2 **Establish trust and mutual expectations.** You must clarify the purpose of your coaching effort, as well as what your client hopes to receive as a result. Be sure the individual you are coaching understands the purpose of the effort, as well as the steps in the process.

Although there are many methods you can use to implement this step, one particularly effective one is a process called "deep listening," which consists of five key components:

- **Open-minded hearing.** Do not talk when the client talks, either out loud or to yourself (turn off your "internal monologue").
- **Appreciative inquiry**. Reflect on the other person's tone, feeling and mood by restating his or her essential message and pressing gently for further clarification ("You must have been frustrated at that point." "That must have been difficult for you.").
- **Paraphrasing**. Restate the point to move the discussion forward and to give the speaker the chance to improve, correct or add to his or her statement.
- **Confirmation of reality.** Demonstrate that the person's logic is understandable and grounded in experience, and that you empathize with him or her.
- **Self-disclosure.** Open up to the person, sharing relevant experiences you have had, or that someone else has had. As much as possible, discuss how you or someone else made the same types of changes the client is contemplating.

3 **Contract with the client for results.** In order for Action Coaching to be most effective and efficient, a formal written and oral understanding must be reached between the coach and the client. Both must be held accountable for achieving specific, measurable goals, taking into consideration organizational needs, as well as any personal issues that may affect the ultimate outcome of the process.

You may have to confront or challenge your client to make a meaningful commitment. Here are some techniques you can use to get a solid pledge from the client:

- **Concretize reality.** Provide concrete evidence (usually feedback) that proves the problem is real or that the organization is definitely moving in the direc-

(continued on page 4)

Eight Steps Of Action Coaching

(continued from page 3)

tion you're discussing.

- **Transfer ownership.** When clients blame "the system," challenge their excuses and help them take ownership of their role, then find options to explore improvement.
- **Stop the action.** When the client exhibits the problem behavior with you, stop the interaction immediately and discuss what's happening.
- **Call to action.** Stop all discussions and rationalizations and ask the client, "What are you going to do about it?" This will move the conversation from awareness to action.

4 **Collect and communicate feedback.** Your effectiveness as a coach depends largely on your ability to gather and share feedback; this feedback moves coaching from a passive to an active experience and motivates people to take action. You must assess how the client affects those around him or her, via various methods of collecting data (interviews, surveys, etc.) and communicate that back to him or her. Keep in mind a general rule of thumb: The more complex and ambitious the goal level, the more feedback that is required. Consider also that feedback does not simply consist of relaying that which you have heard or collected; you also must help the client digest and deal with perceptions that might be surprising, even shocking.

5 **Translate talk into action.** You and your client must then determine a course of action based on the collected feedback. Your action plan should consist of the following:

- **Review and reset goals when needed, making sure your goal level is connected to the business results the organization wants to achieve.**
- **Explore different action paths to meet those goals, identifying specific tasks to perform and obstacles to avoid.**
- **Identify the required resources.**
- **Set a deadline for achieving your goals.**
- **Discuss the organizational impact these goals will have on the client's business.**

6 **Support big steps.** To change long-held attitudes and behaviors, managers need different types of support. You may be required to monitor meetings, be a sounding board for ideas, conduct advisory sessions or bring in other resources to help in the coaching effort. Your support as a coach can mean the difference between achieving an increment of awareness and making a performance breakthrough.

Role-playing

Role-playing can be very effective in supporting the actions your client must take; it gives the client the opportunity to test the waters and see how a new behavior or method works. Some role-playing methods you may want to consider are the following:

- **Role reversal.** You play the client, acting out his/her behavior or mindset, and let him/her see the situation from a different perspective.
- **Worst-case scenarios.** Construct a situation in which your client's worst fears are enacted. Rehearsing disasters and extreme situations takes some of the fear out of taking a certain action.
- **Videotape.** Record your client in action and play it back to him/her at a later time. Stop the tape at key points and ask probing questions that elicit thoughtful responses: "What was going through your mind then?" "What were you trying to accomplish?"

7 **Foster reflection about actions.** Encourage your clients to stand back and look at their situation from many different perspectives — those of their customers, peers, direct reports and bosses. Ask probing questions to foster that reflection, whether in a general forum or a series of specific situations.

Experiment with several techniques to spur reflection in your clients, including the following:

- **The values check.** Encourage the client to think about what's really important and meaningful in work and life in an effort to determine and discuss what the client values most.
- **The obstacles review.** Focus on what stands between the person and his or her goals to increase motivation.
- **The Vietnam model.** General Gordon Sullivan once recalled how commanders in the Vietnam war learned to ask three key questions in the heat of battle to allay their anxiety and decide upon a course of action: What is happening? What is not happening? What can I do to influence the action? Reflecting on these three points will keep clients from being frozen with anxiety or indecision.
- **The journal.** Suggest that clients keep a journal that details their reactions, feelings and ideas. Provide feedback on their journal entries or determine whether the things expressed in those entries result in concrete actions.

8 **Evaluate individual and organizational progress.** At the conclusion of the process, assess the person's

(continued on page 5)

Eight Steps Of Action Coaching

(continued from page 4)

performance level using both "hard" measures (revenue numbers, customer feedback, productivity increases) and "soft" ones (change of environment, satisfaction levels, perceptions, etc.). This assessment should provide both a snapshot of the new, improved employee and an impetus for continued improvement. ■

Coaching for Individual and Company Performance

As an Action Coach, you must constantly appraise the behaviors of your clients, as well as the business requirements affected by those behaviors. You must be able to first identify the client's behavior, then determine the impact that behavior has on others, and assess the behavior's link to an organizational or business requirement.

This requires coaches to think and assess on two distinct, yet connected, levels: the personality level and the organizational level.

The Personality Level

At the personality level, you must analyze the behavior of the client, and determine whether it is a productive or unproductive one. Some common unproductive personality types include:

- **The Egotist.** While every leader requires a healthy ego, Egotists take the measure to an extreme — self-centered and self-aggrandizing, they overvalue their capabilities and have trouble accepting other people's points of view. To coach an Egotist, determine the reason for the Egotist's behavior: perhaps an organizational change has occurred, or maybe he or she is simply overcompensating for a lack of self-esteem.
- **The Cynic**. Cynics tend to micromanage projects, discourage learning and development, and have a problem trusting others. To coach a Cynic, you'll need to differentiate between healthy skepticism and demoralizing cynicism, and determine the impact such behavior is having on the business goals of the client's organization. Cynicism can also be a marker for frustrated idealism — another path for you to explore as a coach.
- **The Worrier**. Worriers doubt their own abilities, have a deep-seeded fear of criticism and making mistakes, and often resist change in any form — a serious threat to many organizations. Begin your coaching of the Worrier by finding out just what your client is afraid of. Talking about and dealing with that fear through action can provide you with the basis for a serious improvement.

The Organizational Level

At the organizational level, you must take a look at the business requirements set forth by your client's organization and determine the level of coaching required to best meet the challenges those requirements present. Some common business requirements that can require coaching include:

- **Reconciling paradoxical situations and issues.** Unproductive behaviors often stem from the common yet maddening paradoxes at the heart of many organizations — the incongruity of meeting short- and long-term goals; the push for delivering results while maintaining values; the contradictions involved in developing your own resources versus outsourcing them. Coaches must have a handle on the frustration and dysfunction inherent to such an operational circumstance, and be able to address unproductive behaviors accordingly.
- **Making innovation and creativity happen.** In a knowledge-based world, management must find new ways of bringing out their people's best, most creative ideas, while at the same time balancing organizational needs for order and control. Coaches must address an atmosphere that includes fear of innovation as well as an embrace of the risks that innovation fosters.
- **Adapting to new roles or levels.** People often have difficulty adjusting to new positions. CEOs and other top executives frequently complain about resistance or inflexibility in their managers, some of whom have moved into management from more functional positions. Add to that general stubbornness the extremely fast-paced changes imposed upon companies by the Internet and other technologies, and you have an equation for organizational disaster. Coaches must be aware of the challenges transitions bring about in organizations, and the alienation and distrust many people feel when adapting to new roles, positions or cultures. The gap between the organization's expectations and the individual's behaviors must be closed; it is your job as coach to move the employee toward a desired action and possibly toward transformation. ■

Providing Motivation for Change

In a perfect world, people would automatically stop exhibiting and practicing unproductive behaviors and respond to organizational needs and imperatives. They would foster creativity because the organization would offer them some incentive to do so, and everyone would be more self-aware and change oriented.

But people are more complicated than that; they require motivation to change. Thus, coaches must figure out what motivates individuals and appeal to those aspects when attempting to link behavior to motivational goals. Organizations sometimes ignore the issue of

(continued on page 6)

Providing Motivation for Change

(continued from page 5)

motivation altogether in an effort to get their people up to speed, a circumstance that makes coaching those people an even greater challenge.

For example, a number of years ago, the CEO of Honeywell mandated that his top executives — who, like the CEO, were experienced engineers — learn about the science of human behavior in an attempt to make them more effective at their jobs by establishing better relationships with people. The executives were suspicious of the motives of the CEO and, while they followed their leader's directive, they did not or could not take the lessons learned to heart or use them in developing better relationships in the workplace.

What the CEO lacked in his directive was motivation. Taking the command-and-control method of issuing an order and expecting results did nothing to motivate his executives out of their long-held stance toward behavioral science, and into a new, more understanding frame of reference. He paid no attention to the executives' individual needs and motivations and, thus, was unable to effectively change their behavior.

Three Patterns of Motivation

Professor David McClelland of Harvard University identified three patterns of motivation in his groundbreaking research on the topic:

- **Achievement.** Achievement-motivated individuals want to be recognized for a job well done, and are driven by the desire to excel in their careers. They are motivated by challenge and are not moved by empty praise or undeserved promotions.
- **Power-Control.** Individuals motivated by power or control have a desire to shape others and have an impact on other people and the environment. They tend to build bases of influence within the organization, but also create distrust and envy among those not in that influential base, including those who work for them. They also are likely to be uncomfortable or even obstructive in team situations.
- **Affiliation.** People who exhibit this pattern are motivated by a need to be liked, achieving satisfaction in their relationships with others. They are typically well liked in the workplace, but not respected (or, consequently, feared).

Understanding each pattern's traits and manifestations will help you identify them as a coach, and can lend weight to efforts to foster a greater motivational climate with your client. ■

Common Motivational Mistakes

Be careful that your coaching effort addresses the correct motivational issues at your client's organization. Sometimes, the motivational "gap" you recognize between a client's behavior and organizational needs is not the gap that requires closure. Some common mistakes in this area are as follows:

- **The career gap.** In this instance, you attempt to close the gap between who someone is and where he or she wants to be in his or her career. Ignoring organizational requirements, you help the client develop marketable skill sets rather than ones that allow him or her to lead more effectively. To avoid this mistake, you must balance the needs of the organization with those of the individual, distinguishing the skills the client wants to develop from those that the company needs him to develop.
- **The bias gap.** In this instance, you attempt to close the gap between who someone is and who your personal bias dictates a client should become. Both you and the client misperceive what will truly contribute to the client's value to his team or department, thanks in part to some observation or misbegotten analysis you have performed. To avoid this mistake, talk to others about how your own attitudes and needs may be affecting the goals you set for the client.
- **The organizational trend gap.** In this instance, you attempt to close the gap between who someone is and an illusory business requirement, mistaking a trendy trait or ideal for an actual organizational need, and leading the client down an erroneous corrective path. To avoid this mistake, get plenty of feedback and direction from management in order to avoid making incorrect assumptions about needed traits or qualities.
- **The peer pressure gap.** In this instance, you attempt to close the gap between who someone is and the new behavior everyone wishes he or she would develop. Sometimes, people exhibit behaviors that others consider irritating or obnoxious, although those behaviors have no real impact on business results. As a coach, you must learn to focus past those inappropriate or unpopular behaviors, unless they do have an impact on a team or business. Project how the person might better meet a business requirement by changing a behavior, and how that change might help the person better fulfill his or her role in the organization.

Coaching One-to-One

Coaching can be messy, particularly early in the coaching effort, when issues are not always clear, goals seem contradictory, and the manner in which to begin the effort is not readily apparent.

In order to better understand the client's situation and help you proceed toward a useful solution, consider the following questions up front:

1. **Where did the assessment of the person originate? His boss? The individual himself? Other sources? What behaviors led to these perceptions? What is the intention behind the person's behaviors?**
2. **What are the effects of the person's behavior? Are there negative repercussions for the person and others?**
3. **What are the reasons for the person's behavior?**
4. **Is the person aware of the behavior?**
5. **Is the behavior intentional?**
6. **Is it a "why" issue — a matter of principle?**
7. **Is it a "what" issue — a habit or workstyle preference?**
8. **What is the organization's objective in helping the person change?**

Range of Reactions to Coaching

Enthusiastic people are, of course, easier to coach than those who react negatively to the prospect of receiving coaching. In fact, there is a whole range of reactions to coaching; different people receive instruction and assistance in a different way. Your approach is thus affected by that reaction and the initial relationship that results from it. You can usually gauge your client's reaction as one of the following:

- **Enthusiasm.** The client understands the need to adapt to a changing workplace environment; he or she may, however, have overly ambitious (sometimes-unrealistic) expectations for the results of your coaching effort.
- **Curiosity.** The client asks a lot of questions, but needs more information before forming a firm positive or negative impression of coaching.
- **Skepticism.** The client requires convincing before he or she buys into the coaching process.
- **Denial.** The client denies anything is wrong; to this end, he or she may blame others or the organization, may get defensive, and may be offended that the organization thinks he or she needs help.
- **Concern or Fear.** The client sees coaching as some sort of black mark or punishment. He or she is afraid of what it means and immediately distrusts the coach and the process.

Overcoming Fear of Coaching

Many current AT&T employees joined the company years ago, searching for the safety and security of working for a large organization. These days, however, the company needs its people to try new things and take significant risks — such as Action Coaching — and many veterans are simply not up to it.

To get these people past their fears to become more coachable, they must transform their negative energies — fear, anxiety, and doubt — into positive energies — enthusiasm, excitement and commitment. They must be encouraged to articulate their worst fears. This helps them recognize and address these fears, breaking the spell of anxiety and opening them up to new possibilities. ■

Combating Resistance

The speed of the coaching process slows in direct correlation with the level of resistance from the client. If the client is receptive to learning, the process can be carried through to a positive conclusion in relatively short order. If the client is resistant to coaching, it is nearly impossible to move forward with either speed or ease.

To fight off resistance to coaching, follow a few simple rules to set the client at greater ease:

1. Create a supportive environment. Don't rush to judgment based solely on the data you have accumulated before you know what the issues are. Establish an open communication with the person, providing feedback that indicates you understand what the client is saying.

2. Establish a neutral tone. Do not act like a boss or manager when dealing with people, even if they are your direct reports. Try to foster a warm, caring interaction, in which you demonstrate that you have their best interests at heart.

3. Adapt to the person's needs. Do not impose behaviors and goals on your clients. Instead, adapt the coaching process to the client's agenda and connect it to the organizational agenda for that client. Solicit feedback to determine whether the client feels you are trying to force something on him or her; if this is the case, isolate the issue and discuss it. The trick is to alleviate resistance while still moving clients forward, in the direction that will benefit both them and the business.

4. Favor practice over theory. While theory has its place in the way we approach coaching, having an overreliance on theory can alienate your client — conversations about conceptual frameworks will only help your client so much. Be pragmatic, concrete, and realistic about what is possible.

5. Establish clear boundaries. Discuss ground rules from the very beginning of your coaching effort, to allay any fears the client may have about self-disclosure or privacy concerns. Avoid questions about confidential matters when at all possible.

Coaching Conflict Management

The corporate push toward team building instills in many companies a sense of collaboration, yet few seem to recognize the positive aspects of conflict. In fact, conflict is essential for productive collaborations and only becomes a problem when it is spun into personal vindictiveness or hostility. Its enigmatic nature makes conflict difficult to define, but from the coaching perspective, three components emerge:

Perceived incompatibility. Individuals feel their goals, rewards or values are incompatible with someone else's. Coaching can help test this perception and suggest new ways of viewing conflict so that goals aren't incompatible.

Emotion. Emotion makes conflict difficult to manage. Managers often feel that they cannot "constructively" handle conflict with employees, because they are so concerned about what others will do or say in the grip of their emotions. Coaching sessions give people the opportunity to vent those emotions in a safe venue, giving them greater opportunity to analyze their conflicts effectively.

"Conflict is essential for productive collaborations."

The win-lose situation. Some people attempt to defeat others in a conflicting situation, rather than arrive at a solution that benefits both parties. Coaching gives them opportunities to find "win-win" options, to view the conflict from the "adversary's" perspective.

Dealing With Conflict

Conflict issues can bedevil coaches; you must help your clients learn to handle all types of people in a wide variety of situations in which conflict is an issue. The following techniques may help you deal with tricky conflict issues:

- **Get to the source of the problem.** Encourage clients who can't handle conflict to dig deeper, to discover and address the core issues of their problem (fear of confrontation, incompatibility with group dynamics, etc.).
- **Convince people of what's at stake.** Illustrate how conflict avoidance negatively affects work performance — when they realize how it prevents them from achieving their best, they are usually motivated to resolve the situation.
- **Encourage them to take the other person's point of view.** Coaches can help clients take a step back and find empathy for the other person's issues — to get down to the reasons why their "opponents" are acting or reacting in the manner they are.
- **Find out whether they're listening to each other.** People tend to tune one another out, in an effort to win an argument. Coaches must facilitate dialogue to help their clients actually listen to the other side. What is the other person really angry about? Is either party really hearing and understanding what the other side is saying?
- **Bring others into the process, when necessary.** Bringing an eyewitness into a conflict often helps calm things down. The new person offers a fresh perspective and can clear up misinterpretations faster and more credibly than the involved combatants. ■

Personalizing Leadership

Leadership can be coached, but it cannot be taught as a skill set or behavioral group. Effective coaching personalizes leadership, matching an individual's leadership beliefs and behaviors to the way in which an organization wants him or her to lead.

Self-awareness is key in personalizing leadership. When people are out of touch with their own feelings, values, needs and weaknesses, they sometimes "act out" those issues in the workplace, in ways that alienate, disappoint or anger others. Self-awareness, combined with an ability to read the organizational environment, implement a strategy and sell a vision of the future make leaders who and what they are; failure to address these points often requires third-party coaching to wade through and correct them. Some ways in which these issues are manifest include:

- **The leader isn't perceived as authentic.** In trying to fulfill a leadership role, some people feel they need to embody particular traits that are not true to their own personalities. Their employees pick up on that, and view them as phonies. Coaches must identify the behaviors that seem false and help clients understand why they act in an unauthentic manner.
- **The leader isn't perceived as empathetic.** Leaders sometimes have difficulty connecting with or understanding their people. Coaches must first get those leaders in touch with who they are, then get them in touch with who their people are.
- **The leader is thrust into a role for which he is unprepared.** What helps people excel functionally as workers does not always translate into leadership qualities. For example, the best sales reps do not always make the best sales managers — there are different skill sets needed for each, although when most organizations look to fill managerial slots, the first place they look is the rep pool. Coaching helps these people transition into new roles by helping them figure out how to use their beliefs and abilities to be the best leaders they can be. ■

THE SUMMARY IN BRIEF

Companies everywhere say that they're making efforts to become more inclusive, but what exactly does that mean? Are they going far enough in their efforts to make workplaces more inclusive, innovative and productive by introducing ideas and perspectives in a more representative way?

In ***Ally Up***, you'll learn how to turn diversity, equity, and inclusion into more than just buzzwords. With 85% of corporate executives and board members in the U.S. being comprised of white men, diversity in corporate leadership and throughout companies everywhere has never been more important or relevant.

So, are new corporate policies enough? Not quite. They're missing allyship, which will allow leaders to understand systems of inequality in the workplace and promote more inclusive and higher-performing teams.

IN THIS SUMMARY, YOU WILL LEARN:

- How to create a work culture that promotes diversity, equity, and inclusion and acts on those values every day.
- How to be more inclusive with your hiring practices, including attracting the right candidates, onboarding, and building teams.
- How to put diversity, equity, and inclusion into practice into your everyday work life.
- How to lead by example when it comes to DEI efforts and start before you're an 'expert'.

Introduction

We can all be allies in the workplace. But to do so, we must first commit to standing up for others and speaking out, even when it's uncomfortable for us to do so. It's about being open, honest, and transparent in each of our relationships with others. It's about working together to achieve a common goal of acceptance and equality so everyone can thrive together in a truly collaborative and inclusive workplace.

We must all have a willingness to lead uncomfortable conversations to make the world a better place. It's time to take action and do the hard work it will take to become an ally for a more diverse, equal, and inclusive workforce.

Creating a Culture That Promotes Diversity, Equity, and Inclusion

Many large companies want to be seen making diversity and inclusion a priority, so they hire someone to solve all their internal and systematic problems, while granting them no power to make change.

This is one example of how a company with good 'diversity' policies can have no real allyship. You can have the absolute best diversity officer in the business instituting the best practices, but without a culture that promotes allyship, you've solved nothing. Without allyship, nothing changes. Without a willingness to change and learn and do better, everything stays the same.

As the research and stories in the following sections reveal, we're still a long way from creating cultures that promote true diversity, equity, and inclusion, no matter what their branding and marketing tells you.

Diversity Values are Devalued

It's time for those of us who are not from marginalized group to step up, step forward, and participate in making the changes that need to be made in tech and other STEM fields. The dependence on creating ERGs without committing to systemic improvements has stifled the tech industry because it displays a false sense of progress.

Women make up 57% of the U.S. workforce as a whole, but only 26% of the technical workforce. Black, Latina, and Native American women make up 16% of the U.S. workforce and hold only 4% of tech jobs. Meanwhile, only 10% of tech executives are women.

To transform these metrics, we'll need to go well beyond token changes or lip service to take real action in bringing equity and allyship to the workforce, especially in the tech sector. But what does that real action look like, and how can we go beyond those token changes that are so easy to fall into over real change?

The Working-Over of Working Moms

Did you know that statistically, mothers and fathers are actually more productive than childless employees? But women see a 4% decrease in pay per child born or adopted compared to a 6% jump in income for dads. This is often known as the 'fatherhood bonus.' Dads need to talk to other dads about prioritizing time with kids, regardless of the parent's gender. Get there, dads; your partners need you at the frontlines. Please. Women are drowning in work as they struggle to get equal pay while providing for their families and making time to be mothers.

Meanwhile, there's a huge divide between how employees think the COVID-19 pandemic will affect inclusion and how company leaders think the pandemic will affect inclusion. We need to bring these two visions into line.

How Employers Can Build More Inclusive Work Cultures

Psychological safety is the number one predictor of success in the workplace. For DEI (Diversity, Equity, and Inclusion), this means examining your current teams. Are they inclusive? If a candidate walks into your office, are they seeing themselves represented? Are they talking to employees who can answer their questions about how someone like them can expect to be treated? Do you have non-gendered bathrooms?

ERGs are a good starting point, but they only work if the buck doesn't stop with the group. Senior leaders need information to address noninclusive practices happening under their watch.

Building Communities for Social Justice

Social media is the second hardest place to teach social justice issues. The first is in the workplace. People often come into social media conversations ready to fight, as they find themselves 'waking up' to systemic racism for the first time and wanting someone to blame.

Let your diverse team members lead on these issues, and support them with all the passion in your heart. Self-educa-

tion is absolutely critical to allyship and effective advocacy. Political values have less to do with who supported social justice initiates in the group than you might think.

If you even lightly suggest people examine their own biases when they use racist or misogynistic tropes to talk about people they don't like who share those identities, you will likely receive aggression in return. Even people who call themselves allies have work to do on their self-education and social justice understanding.

Hiring with Inclusivity

Who can speak about racism? And when, and with what authority, is white supremacist thinking keeping people oppressed? Oppressed groups have been fighting for their human rights for generations, and if they had the power to free themselves, they already would have. They don't, and we know that. People who benefit from these systems need to do the work to dismantle these systems, because our voices are louder by the nature of these systems of inequity. You don't have to know everything, you just need to start making it a priority to understand and learn. To continue your education in allyship, you need to surround yourself with diverse teams, allow them equity in their career endeavors, and support their growth with inclusive policies and practices on the job.

Attracting the Right Candidates

Improve your job descriptions. Use welcoming language, be genuine, and be better than other companies hiring for the same position. Enable diverse and multidisciplinary teams working on algorithms and AI systems.

Promote a culture of ethics and responsibility related to AI. Practice responsible dataset development for your AI model, and establish policies and practices that enable responsible algorithm development. Establish corporate governance for responsible AI and end-to-end internal policies to mitigate bias.

We have a skewed perspective on the 'best possible candidate' based on the systems that we don't see. Systems that shut people out wholesale to the detriment of companies seeking exactly the skills and experience these people have. Let people decide for themselves what's important, and show more ways for folks to bring their most authentic selves to work and build community with other coworkers who share their interests.

Onboarding

Onboarding and orientation are not the same thing. The HR Department does the onboarding for 36% of companies, and a pleasant onboarding experience makes 69% of employees more likely to stay with a company.

You should have policies and practices surrounding your onboarding that can take a new employee from off the street to insider. They shouldn't vary wildly based on managers. Keep onboarding throughout the first year. Onboard people in the context of their whole lives. If they need help finding schools for their kids, places to worship, or places that cater to dietary restrictions, you can promote inclusion by supporting them as whole people outside of their work duties.

Building Teams and Tracking Performance

Hire for great teams, not just stars. Studies across multiple industries prove stars are only stars on their home team. Build teams for charismatic interactions within and without the team for success; psychological safety is a crucial factor in successful teams. Personality tests like DiSC are great tools, as long as there's room made for cultural diversity and individual differences that a lot of times these tests don't account for.

Some conflict can actually be productive when managed by an effective leader and not just swept under the rug. If you need to use NDAs, make sure that their impact is to protect trade secrets and not to silence employees who are being victimized or oppressed. Use data to track performance, not biases and assumptions. Recognize how much biases may already be impacting the career trajectory of marginalized team members, and manage against that.

Diversity, Equity, and Inclusion at Work

Women and people of color are graduating from top universities at greater numbers than men for the first time in history. Women make up more than half of the U.S. population and yet fluctuate on average between holding 5-6% of the CEO positions. And to be clear, every one of these CEOs is a white woman. What's happening here?

Whether the bias is intentional or not, the following sections are all about why you shouldn't let the harmful narrative of a 'pipeline' impacting hiring sway you from your allyship goals.

Handling Day-to-Day Operations

Quotas aren't always effective. They can lead to people

engaging in their worst impulses. The goal should be truly representative workplaces, not just hitting quotas. Don't only try to hire more diverse workforces to prove you care about diversity. Work on the inclusiveness of your culture so the people you hire don't immediately have terrible experiences with you and leave.

No amount of performative allyship will positively impact a toxic workplace. Do the real work, or expect that nothing will change and watch it go badly for your bottom line. Bias has an enormous impact. As little as a 1% bias against women can lead to the skewed representation we see at the top of companies today.

Trusting Team Members

Survey your team by holding focus groups. Use your inclusion team to track your progress, and share with everyone your findings and plans to do better. Every time you need to correct someone on your team, you need to praise them five times as often. Praise should be as specific and public as possible. There are a lot of great benefits to practicing call-ins in the workplace.

In the U.S., only 36% of employees have trust in their employers. This is a profoundly concerning trend, considering that trust is the backbone of any successful organization—successful in the traditional sense of company growth and bottom line, but also successful in terms of creating a culture of ethics and equity.

The first key to building trust is establishing common ground and common goals. Lack of trust comes from one party believing that the interests of another party are not aligned with their own, even if they are presented as being one and the same. If you can build alignment in your goals, not only for the business success of your company but for its moral success as well, you'll begin to build real and powerful trust. Trust is crucial to team success.

Leading by Example

Spotting a diamond in the rough when it comes to talent is a skill you will need to develop, especially if you are a start-up and want to win the war for talent. Building a strong and inclusive culture will attract members of URGs and help you build a more diverse and talented pipeline.

Millennials are 50% of the workforce, and care more about the company's values than compensation. There is no leadership 'how-to' for never messing up on issues of diversity and inclusion. You can fail with authenticity and model how to do better and still be considered an awesome leader.Use your hiring committee as hiring consultants and make informed decisions on hiring. Stop hiring strictly from your network.

Conclusion

You can fight for equality. You don't have to wait for permission. You don't have to wait until everything else is perfect. You can get started while you're in progress. You don't have to change everything all at once, you can change one thing every day, every week, every month and still be in the fight for equality. Don't go slowly out of fear of messing up.

Build the world you want to live in. Build bridges and longer tables, not walls and VIP lists.

Di Ciruolo has a degree in Anthropology from Georgia State University. She is a white-Hispanic, queer woman living in Boston, Massachusetts where she graduated from the foster care system as a young adult. After aging out of the foster care system, Di struggled to find stability, spending time homeless in Atlanta, Georgia. She now owns a consulting business teaching inclusion and advocacy in the workplace, with classes available at diciruolo.com. She is the Head of Inclusion at Jambb in Boston. She volunteers on several inclusion projects especially expanding access to tech education for children in foster care and is a space-maker and semi-reluctant public speaker.

THE SUMMARY IN BRIEF

"Amp it Up" was a popular LinkedIn article whose main premise was that organizations have considerable room to improve performance without making expensive changes to the talent, structure, or fundamental business model. The advice was to keep playing your game but amp things up dramatically. Raise your standards, pick up the pace, sharpen your focus, and align your people. You don't need to bring in reams of consultants to examine everything that is going on. What you need on day one is to ratchet up expectations, energy, urgency, and intensity.

That article triggered thousands of responses online and a flood of incoming requests to learn more about the Amp It Up philosophy. Author Frank Slootman wrote ***Amp It Up: Leading for Hypergrowth by Raising Expectations, Increasing Urgency, and Elevating Intensity*** in order to summarize his convictions, observations, and beliefs about how to lead a mission-driven high-performance company and share them in an efficient, scalable way. Whether you are CEO or a leader at any level, whether at a startup, a big company, or a nonprofit, you can engulf your organization with energy, step up the tempo, and ***Amp It Up***.

IN THIS SUMMARY, YOU WILL LEARN:

- How to raise your standards.
- Why your culture and people should be aligned.
- How to sharpen your focus.
- Why you need to pick up the pace.

Raise Your Standards

Make Your Organization Mission Driven

Being on a mission is a visceral experience, not merely an intellectual one. When your organization has a well-defined purpose, you feel it down to your bones. You feel energized when you start the workday, and you feel good about whatever progress you've made toward the mission when you shut down for the night.

Being on a mission unlocks the X factor: an intangible that can drastically elevate performance as people set out to achieve greatness–together. It makes your working life not just more productive but also more fun.

Conversely, you're not on a mission if you feel like you spend most of your days checking off trivial to-do items, passing the buck to other people, reading and forwarding email, and covering your ass so you won't get in any trouble.

Showing up every day at a "good enough is good enough" company is the opposite of fun and energizing. Just trying to get through each day is a depressing way to spend a career. And if most people at your company feel that way, the enterprise is in grave danger.

A clear purpose was common a few decades ago, but these days more and more companies are fuzzy, if not hopelessly confused, about why they exist. The mission clarity that used to be the norm has now become more of an exception–which gives leaders who get it right a competitive advantage.

There are three criteria for a great mission: big, clear, and not about money.

- **Big**: It massively exceeds in scale and scope what any company has tried to do in the same space.
- **Clear**: More defined and intense missions are easier for everyone to focus on.
- **Not About Money**: Financial targets are milestones along the way to your true mission of bringing good things to the world and improving the lives of customers and employees.

How to Nurture the Mission

Once you have your mission in place, you get everyone to embrace it and make it real through four key areas: applying focus, urgency, execution, and strategy.

Focus: If people don't focus on the mission, they are not really on a mission. We concentrate our resources and bandwidth on the mission, and we avoid distractions. That takes discipline.

Urgency: Time is not your friend. Time introduces risks, such as new entrants. The faster we separate from the competition, the more likely we are to succeed. Urgency is a mindset that can be learned when it doesn't come naturally.

Execute: Missions must be executed via an organized, orchestrated, and resourced set of activities. We have no chance of accomplishing it without a drive for world-class execution, which includes high standards and efficient use of resources.

Strategy: Strategies don't change day-to-day, only when there is a demonstrably better way to do things or if something isn't working, unrelated to execution failure. Everyone needs to feel confident that our strategy is in line with the goals of our mission.

Mission driven is not just about what you believe, it's how you make decisions every day about your time and effort and resources. It's about delivering on your most important promises, not racking up style points. It's about making choices during every meeting and every interaction. Grinding away toward your mission, day in and day out, will absolutely pay off.

Align Your People and Culture

Hire Drivers, Not Passengers

To be amped up, you have to hire drivers, not passengers, and get the wrong people off the bus. Passengers are people who don't mind simply being carried along by the company's momentum, offering little or no input, seemingly not caring much about the direction chosen by management.

They are often pleasant, get along with everyone, attend meetings promptly, and generally do not stand out as troublemakers. They are often accepted into the fabric of the organization and stay there for many years.

The problem is that while passengers can often diagnose and articulate a problem quite well, they have no investment in solving it. They avoid taking strong positions at the risk of being wrong about something.

Passengers are largely dead weight and can be an insidious threat to your culture and performance. They inadvertently undermine the mojo of the organization. They sap the animal instinct and spirit you need in business to thrive.

> Drivers, on the other hand, get their satisfaction from making things happen, not blending in with the furniture.

Drivers, on the other hand, get their satisfaction from making things happen, not blending in with the furniture. They feel a strong sense of ownership for their projects and teams and demand high standards from both themselves and others. They exude energy, urgency, ambition, even boldness. Faced with a challenge, they usually say, "Why not" rather than "That's impossible."

These qualities make drivers massively valuable. Finding, recruiting, rewarding, and retaining them should be among your top priorities. Recognize them privately and publicly, promote them, and elevate them as an example of what others should aspire to.

That will start waking up those who are merely along for the ride. Celebrate people who own their responsibilities, take and defend clear positions, argue for their preferred strategies, and seek to move the dial.

Getting the Wrong People off the Bus

When hired as a new CEO, at any level of a company, the first order of business is sorting out the valuable people from the dead-weight. Then you have to do what Jim Collins described in ***Good to Great*** as moving the wrong people off the bus and putting the right ones on the bus, in the right seats. In that order.

Parachuting into a new company or business unit is hard. Everybody is on edge, waiting to see what you're going to do. But you can't let anxiety slow you down from immediately assessing your people.

Don't surrender to the temptation to go into wait-and-see mode, hoping that time will reveal everyone's true value. You need to make things happen, not wait around and hope for the best. You have to practice sizing up people and situations with limited and imperfect information–because that is all you are ever going to get.

If you don't act quickly to get the wrong people off the bus, you have no prayer of changing the overall trajectory. We often believe, naively, that we can coach struggling teammates to a better place. And sometimes we can, but those cases are rarer than we imagine. At a struggling company, you need to change things fast, which can only happen by switching out the people whose skills no longer fit the mission or perhaps never really did in the first place.

The other advantage of moving fast is that everyone who stays on the bus will know that you're dead serious about high standards. The good ones will be energized by those standards. If others start looking for greener, less-demanding pastures because they don't want to meet those standards, that's fine too.

This philosophy may come across as harsh. But what's even harsher is not doing the job you were hired to do as a leader. If you can't find the backbone to make necessary changes, you are holding everyone else back from reaching their full potential. Leaders who do not act will soon find out that their leadership is in question.

Finding the Right People

Getting the wrong people off the bus is only half the challenge. The other half is finding and recruiting the right people for the right seats, which is much harder. This is not a process that can be rushed. The cost of a misfire in time, money, and reputation is huge. Leaders are expected to have well-developed networks, the ability to recruit, and the sharp critical eye to judge talent.

It's hard to maintain an active recruiting posture. That is often the reason why we tolerate mediocre performance–because it is so hard to relaunch a recruiting effort. We want to always have a list of prioritized candidates for each critical role. Candidates who we would seek to engage as needed.

It starts with knowing who is in the field, how well they are regarded, and keeping tabs on their ongoing status. Have some sort of ongoing relationship until the time comes to actively engage.

Do not rely on acute sourcing tactics such as recruiters and LinkedIn. You will only see the active job seekers, who are unlikely to be the candidates you really want. In high growth companies, functions and individuals can easily get overrun, as the expanding needs of the organization exceed their capacity. So you must staff ahead of need. Recruiting never stops.

Ultimately, leaders are only as good as the people they surround themselves with. Once you get good at both hiring and firing, you are well on your way to great results and a thriving career.

Align Culture with the Mission

Culture matters more than you think, and it is not optional. A strong culture can greatly help organizations and become an enduring source of competitive advantage. But a weak culture can easily destroy organizations from within.

An important question here is, to what aim do you direct your culture? All platitudes and high-minded principles aside, the culture needs to serve the mission of the enterprise. While there is nothing wrong with good intentions, we need to align the culture with the mission.

Culture is not about making people feel good, per se, it's about enabling the mission with the behaviors and values that serve that purpose. It is essential that leaders grab a hold of culture and start driving it to a desired state. Culture can become a force multiplier, but it doesn't just happen with good intentions.

Sharpen Your Focus

Put Analysis Before Solutions

Business tends to be "solution centric." We spend most of our time discussing solutions rather than diagnosing problems. We race to conclusions about what's wrong and what to do about it. We pattern match, reacting to situations based on our individual experience rather than studying the specific situation in front of us from a broader perspective.

It's easy to be irrationally confident in our judgment and anxious to move forward with implementing solutions. But if we are wrong in understanding the problems, our solutions won't work. It behooves us to slow down and critically examine situations and problems before settling on an explanation, never mind a solution.

This requires intellectual honesty–the ability to stay rational and set aside our biases and past experiences. Consider the full range of possibilities, not just the first one that jumps out at you. Seek council outside of your direct environment.

Align Incentives for Customer Success

Declare and constantly reinforce that customer success is the business of the entire company, not merely one department. This means that when a problem arises, every department has a responsibility to fix it. Everyone's incentives should be fully aligned with what's good for customers.

Customer grievances are best solved by establishing proper ownership, reducing internal complexity, and removing bureaucratic intermediaries. The product developers and salespeople who work directly with a customer should never surrender responsibility for that customer's well-being, which directly affects their career progress as well as the company's results. That way, everyone's incentives are aligned.

Pick Up the Pace

Ramp Up Sales

There's no simple answer to when to ramp up sales, but there are additional questions that can help to draw a conclusion:

- Are you happy with your current sales productivity metrics? If not, how can you improve productivity before adding more sales headcount?
- Are you happy with the metrics of your lead generation pipeline? If not, how can you improve it?
- Are you being realistic in your timeline of sales targets? Are you projecting too much too soon, or too little too late?
- Are you being aggressive enough and thinking big enough to outpace your competition?
- Is your sales team buying into your targets and timeline? Are they owning the goals and fully committed to hitting them?

Trying to staff a whole sales team prematurely is a very common managerial mistake. So is failing to figure out what distinguishes top sales performers from weak performers before ramping up headcount. And so is hesitating to invest major resources to scale up your sales effort after all the conditions are in place.

Putting gasoline into a car's tank won't matter if the engine isn't working. Likewise, you can hire all the salespeople in the world, but they won't pay off until you've figured out your product, your market, your demand and lead generation systems, and the kinds of selling motions that will convert prospects to customers.

If you have a sales force that's stuck in the mud, ask lots of questions to figure out what's wrong. Then take bold steps

> Your mission as a leader is to figure out how to hand on to your early-stage dynamism and avoid the lethargy of mass and bulk.

to mitigate the problem as soon as you understand it. You can't simply take a "wait and see" posture.

You have to aggressively manage nonperformance, cut headcount if appropriate, or add headcount wherever you have the highest probability of converting sales potential to sales yield.

Grow Fast or Die Slow

"Grow Fast or Die Slow" is the title of a 2014 study by McKinsey & Co that examined thousands of software and services companies between 1980 and 2012. It concluded that growth trumps everything else as a driver and predictor of long-term success.

The study found that when evaluating a young company, growth matters even more than profit margin or cost structure. Increases in growth drove twice as much valuation increase than equivalent improvements in profitability. No correlation was observed between cost structure and growth.

Relatively few leaders make growth as big a priority as it should be. One major reason is that too few leaders truly grasp the importance of growth. They have the misguided belief that their mission is to reach profitability as quickly as possible, and that growth can follow profitability. But that shows a misunderstanding of how value is created and how investors think.

Once a start-up begins to show profits, investors conclude that either it doesn't know how to invest in further growth or that it has run out of growth opportunities. They won't expect profitability yet; investors know that growth is a ferocious consumer of resources.

It's often impossible to assess the true limits of growth. It's not just plugging numbers into a formula; it requires human judgment and insights. That's why we have to keep leaning into it.

Leaders should focus on challenging the assumptions that add up to the current growth model. Very often, challenging those assumptions will lead you to conclude that your growth target is too conservative.

When in doubt, push the model to set a more ambitious target. It is better to ratchet up growth expectations and fall short than not even reach for it. Behavior is informed, if not driven, by expectations.

Fast growth separates great companies from their competition. You can psychologically leave everyone else in the dust when you outstrip their growth rates by considerable margin. It's intimidating and demoralizing to your rivals. Growth tends to slow down when you are starting to become well penetrated and saturated.

Most companies lose their original scrappiness as they get bigger. But the most valuable leaders are those who can combine the scrappiness of a start-up leader with the organizational and diplomatic discipline needed in a big company.

Those who can scale up or down as required. Those who can set aside experience when necessary, apply first principles, and think through situations in their elementary form. Your mission as a leader is to figure out how to hang on to your early-stage dynamism and avoid the lethargy of mass and bulk.

The Amped-Up Leader

Amp Up Your Career

Are you happy with your upward progress in your career? Could you go faster? Probably. Most people manage their careers in a haphazard fashion, jumping from role to role as new opportunities pop up.

Being more purposeful about your career can amp up your forward momentum. The most common reasons for career stagnation (or worse, self-destruction) can be instructive.

As professional people, we are products. So try to product manage yourself. Develop your product through education, training, and experience. Your resume is your shingle. Buff and polish it. Make sure it carries some punch. In this marketplace, the question isn't whether you're qualified; it's whether you're better qualified than other candidates.

A rigorous academic education is necessary to develop liter-

acy, numeracy, and general capacities to learn, observe, and analyze. But this degree doesn't need to be from an elite, Ivy League, or otherwise name brand school.

Further, it's popular to go back to get an MBA after a few years in the workplace. Yes, an MBA from a good university looks good on a resume but there can be a huge opportunity cost to getting an MBA and not only from the salary you'd be giving up for two years. Your time away from your field will put you behind on experience compared to your peers. Education matters some, but experience matters more.

The longer you are out of school, the more employers will favor meaningful experience over more education. Grad students are much less attractive than people who can point to a record of tangible achievements at a company. So think twice before pulling the trigger to get any kind of master's degree.

Aptitude Matters Most

Aptitudes are your God-given talents, whatever you are innately good at. Employers can give you experience, but they can't give you aptitude. Experience can help reveal your aptitudes, but hiring managers often don't try hard enough to understand and discern them.

If you are light on experience for a role you want, redirect the conversation to aptitudes. Why would you be great in this position? Smart managers will usually pick someone with less experience but more aptitude. But bad managers become hung up on checking off the boxes on experience, in a futile attempt to minimize career risk to themselves. They make safe choices, not optimal ones.

Hiring decisions are always fraught with risk and uncertainty. Extremely well-credentialed people can crash and burn in short order. That's why many hiring managers will trust their gut instinct on someone light on experience but strong on aptitude and potential. In those situations, personality often breaks the tie. People who are hungry, humble, and express a "can't fail" level of determination are often a good bet.

One often neglected skill set that can boost your career is your ability to communicate well, in both speaking and writing. An efficient, get-to-the-point writing style will help you at every stage of your career.

The spoken word is another big deal for anyone on the management track. Your career can easily stall out if you can't speak well, or at least competently, in front of groups large and small.

Career Doldrums and Career Killers

Sometimes your career may get stuck at a certain plateau, no matter how hard you've been working to move up. For good people, career doldrums are usually a function of not being in a growing industry and/or a thriving company.

In companies and industries that are dynamic and on the move, people with talent often get promoted even before they are fully ready for the new role. But if you find yourself in the opposite situation, you will have to take initiative to change the trajectory.

When asked what makes a great CEO, people expect a series of adjectives such as intelligent, charismatic, collaborative, eloquent, and so on. Of course the answer isn't so simple.

There are many different paths to superior outcomes in business. You will have to find your own path, one that suits your temperament, disposition, and natural aptitudes. Don't try to copy or emulate other leaders. That will only slow down the process of finding your own path.

Instead, make the most of your unique aggregate of experiences. Apply those experiences, and the insights discussed in this CEO guide, to become a truer, more honed, more effective version of who you already are. Finding your own path, however long it takes, will unlock your personal power.

At the end of the day, great leaders at any level have great outcomes. You can be the most empathetic, charismatic, and popular leader ever, but none of that will matter if your business falls short. And when it does, there will be nowhere for you to hide.

No one will care about your legitimate explanations, let alone your excuses. No one will care about the unlucky breaks that were completely beyond your control. It isn't fair, but it's the world we live in, the world we have to accept as leaders.

The good news is that if you persevere over long periods of time, if you focus intensely on delivering value for your customers, and if you build a disciplined culture for your employees, it will all pay off in the long run. You will drive great outcomes for your organization and reap the rewards.

It's hard to beat any leader who combines great resolve, persistence, mission focus, and clarity about what is and is not important. It's hard to beat any leader who truly amps it up.

Snowflake CEO Frank Slootman is one of the tech world's most accomplished executives in enterprise growth, having led Snowflake to the largest software IPO ever after leading Data Domain and ServiceNow to exponential growth and the public market before that. In Amp It Up, he shares his leadership approach for the first time.

Army of Entrepreneurs

Create an Engaged and Empowered Workforce for Exceptional Business Growth

by Jennifer Prosek

THE SUMMARY IN BRIEF

Imagine the benefits to be gained from a pool of employees who act as if they own the business: greater motivation, increased productivity and a supercharged desire to succeed. As a young entrepreneur who turned a small PR business into a highly successful, international communications firm, Jennifer Prosek has experienced firsthand the power of instilling an "owner's mindset" in every employee.

With innovation driving the new economy, your company's people have never been more important. But old management models don't truly encourage the entrepreneurial thinking needed for success. In *Army of Entrepreneurs*, Prosek presents an easy-to-follow action plan any company — large or small — can use to build a workforce dedicated to generating new business, creating breakthrough products and services and sustaining growth.

With your own Army of Entrepreneurs, every employee becomes a powerful force for growth within the organization.

Don't go it alone. This clear, replicable roadmap is an invaluable guide for any business owner or manager.

IN THIS SUMMARY, YOU WILL LEARN:

- How to motivate, train and reward your employees.
- How to provide everyone — from interns to executives — with the skills and support they need.
- How to evaluate and refresh the program over time for continuous results.
- How to initiate a simple but effective incentive program that gets every member of the team actively involved in generating new business.
- How to develop internal training programs that foster an owner's perspective with a focus on how the business works, where the profits come from and how to identify new opportunities.

Introduction

An Army of Entrepreneurs (AOE) is an internal force of committed employees. It is a structure and a mindset that enables a business to grow beyond the founder, owner or CEO. Each person develops an "owner's mindset" and becomes a powerful force for growth within the organization.

PART I: TAKING A NEW APPROACH TO BUILDING YOUR BUSINESS

Suppose I told you that the smallest professional action on your part could result in a lifelong payday. Suppose I told you that your rank in the company, the terms of your pay package or the vitality of your social network didn't matter. Do this one, basic action and you get the check. Would you try?

The answer is yes. I already know that. Because what I've just described to you is a system I call Commission for Life™, and it became the first building block of my new management model — the cornerstone of an AOE.

Not only would you try, but everyone in your company — from the interns to the executives — would try.

Introducing Commission for Life

My task was to figure out how to get my staff at CJP to make better choices, ones that would benefit them as well as the company. The answer I came up with was to create opportunities for them to make more money, either by taking on new responsibilities or earning a commission. I developed what I call the Commission for Life program, where the employee who sets up a successful new business meeting — that's it, just sets up the meeting — gets 5 percent of the revenue from the account for the life of the business as long as they remain with CJP.

Why does this very simple incentive work? Because it encourages employees to align their own financial and professional goals with the company's growth and success. If they help the company grow, they see a direct and substantial benefit. And while Commission for Life was developed in a privately held small business, the construct can be applied to any company, big or small, private or public. Although awarding literal cash commission may not be possible in all situations, the idea is to create an incentive that keeps on giving across the employee's career at the company and aligns the individual's goals with the company's goals. It's the nudge you need to change the behavior. ●

Creating a Core Culture

I have found four key elements to be the critical steps in the creation of a strong corporate culture: authenticity, commitment to people, commitment to the business and continuous effort. Attention to these foundation elements allows the kind of culture in which the AOE can grow and thrive.

Step One Is Authenticity

Your first step, if you are to build a culture supportive of an AOE, is to demonstrate that no matter what has come before — in this job or in other jobs — you are for real. You are serious about your commitment to creating an Army-ready culture. You believe it, you are

Rebecca S. Clement, Publisher; **Sarah T. Dayton**, Editor in Chief; **Andrew Clancy**, Senior Editor; **Amanda Langen**, Graphic Designer; **Chris Lauer,** Contributing Editor

willing to live and breathe it and you want, expect and trust that everyone in the company will do the same. In other words, you must make the system into a star.

How do you make this authenticity pitch read authentic? Here are three key tips:

- **Work hard at it yourself.** Nothing kills a culture faster than CEOs and managers who fail to live by their own rules.
- **Adopt transparency and honesty in all aspects of the business.** If what you really want is to empower your people to be entrepreneurial in their thinking and in their actions, you must give them what the entrepreneur naturally has: knowledge of what's going on in the company.
- **Strive for over-communication.** When you're trying to create a culture of entrepreneurialism, you can never communicate too much.

Step Two Is a Commitment to People

The treatment, care and training of the human beings are critical to the culture's success.

How do you show your commitment to people in your organization? Try the following:

- **Institutionalize celebration.** In an AOE environment, successes are noted, celebrated and set as standards for continued excellence.
- **Offer professional development.** It is unreasonable to demand excellence without providing the tools necessary to achieve it. One of those tools comes in the form of training.
- **Encourage autonomy.** Commit to trusting your employees to do their jobs, even when it seems they are wandering outside the lines of their job descriptions.
- **Provide challenge.** Complexity is not a barrier to success — it is an inspiration to action.

Step Three Is a Commitment to the Business

Ultimately, it is all about the success of the company. Attention to people, attention to authenticity, all must be in service to the ultimate goal: the growth and achievement of the firm. This is why we're all here. This is what will make all our efforts worthwhile.

What can you do to make this happen?

- **Present financial rewards that match contributions.** Individual success must be tied to company success.
- **Insist on deal-breakers and zero-tolerance.** If you're committed to creating a system that trains and nurtures star performers, ethics must be an ongoing commitment.

Step Four Is Continuous Effort

When you are building a corporate culture, your work is ongoing. You are always looking for ways to improve communication, improve training and provide more challenge. You are constantly evaluating the strength of the culture and what it may need next to continue to provide the right environment for your AOE. ●

Thinking Entrepreneurially — Even If You're a Big Company

There are several important reasons to foster entrepreneurial thinking in your ranks, reasons that explain why an AOE system is valuable to big firms and small ones. To stay successful, your company needs to:

- **Support innovation.** A company that does not constantly innovate is dying. A classic example is the General Motors Corporation (GM). GM was once synonymous with the American Dream. It embodied all the things America was proud of: manufacturing prowess, a popular and reliable product, a fair and loyal employer. But it also came to symbolize something else: a company that could not change. If there were good ideas popping around in the ranks of that company, the firm was too hamstrung by its old processes and policies to turn them loose and let them soar. Without a way to foster and nurture innovation from within, GM underwent a painful, public decline. The problem is that GM could not embrace innovation to keep its products in line with changing consumer tastes and the changing economy.
- **Keep in touch with your customers.** When did GM start to slide? Many business historians trace the decline to when the company began to lose touch with its customers. Throughout the country, tastes were changing. Brands like Toyota were moving into the consumer consciousness. Issues of affordability, reliability and energy efficiency began to loom large for buyers. But many analysts say GM didn't appear to notice. It just kept pumping out more big, gas-guzzling roadsters that had long been its mainstay. It was as if the company was blind to changes in the marketplace.
- **Retain top employees.** Successful employees are always thinking. Often they are the individuals who are coming up with new ideas and new ways to improve the business. Any manager should care deeply about keeping these top performers since they may be crucial and valuable rainmakers. One way to

do that is to nurture and reward the innovative, entrepreneurial spirit many top performers share.

- **Be faster.** An AOE is a key way a company moves quickly. It puts more minds to work on the process of innovation. Because the cornerstone of the concept is empowering your staff to take action, it cuts down on the time it takes for an idea to become a reality.
- **Be global.** No business today can be hemmed in by physical location. We must all be able to do business around the world. If you want to do business globally, you must be willing to relinquish the old command-and-control style of business. A global business happens in a variety of cultures, across a variety of time zones. Calling upon your employees to take responsibility for making their jobs work is part of the AOE system. They need to look outward and adapt. That is what makes for success in the global marketplace.

PART II: DEVELOPING AN ACTION PLAN

Here's how I trained my people at CJP.

As the firm grew and I was feeling overwhelmed, I wondered why all my clearly intelligent colleagues were not stepping up and doing the work I knew they were capable of. That's when I asked myself whether we had trained these employees and explained what we wanted them to do to be successful at our company.

The answer was no. We hired smart people and left it up to the informal training method — daily interactions between managers and employees — to clue them in as to what they had to do to succeed. That wasn't working for me and I was sure it wasn't working that well for the rest of the firm either. Nobody likes to have to guess. It is much less stressful to be told concretely: This is the path to success.

Four Elements of a Successful Employee

So I created a path. The catchy phrase I use is "Grinder, Minder, Binder, Finder."

- **Grinder.** The key attribute of a Grinder is efficiency. The Grinder juggles many balls in the air and seeks to amaze others with his or her ability to get a job done efficiently, effectively and profitably. Grinders know no rank. You can find them at every level of the organization. Even top brass are expected to do a great deal of grinding. For all, the message is this: Take on a healthy workload and juggle those balls.
- **Minder.** A top-notch Minder is a skilled people person. This is the individual who is good at managing both people and projects. Minders are organized, communicate well and tap into their Grinder skill set to be efficient and organized. A Minder is a person everyone in the company wants to work for and with. While being a Grinder may be considered an inward-focused effort, a Minder looks out to others and focuses on what needs to be done to support, guide and inspire them to succeed.
- **Binder.** A Binder builds on the Minder's people skills and takes them one step further, looking for ways to strengthen the bond of individuals to the company. A Binder is a whiz at client relationships, building the trust and fluid communication that makes clients or people want to keep their business with companies. A Binder is always alert for ways this relationship can be enhanced and tended, never taking it for granted, never assuming the business is "already won."
- **Finder.** Everyone in the company, from summer intern to CEO, must consider him- or herself a Finder of business. Finders are great listeners, constantly evaluating what they hear for potential business opportunities. Finders are also trend spotters, seeing the opportunity before it's publicly acknowledged. Finders create opportunity for the firm, either by bringing in new business, expanding existing business, or generating ideas for new products and services.

Training the Troops

The first step a company must take in creating its Army is to set up a system of basic training. In the "real" Army (the United States Army) that means taking the group of recruits to a remote training camp for 15 weeks and schooling them 24/7 in skills needed for combat. Since that's not possible in the business world, the alternative is to set up a system of mandatory, scheduled, high-profile training sessions. These are not the optional brown-bag lunches a traditional HR department might host for a discussion of business topics. These are professional workshops designed to train and inspire your staff to more proactive functioning.

The four boot camp workshops are:

1. **Teaching the Business.** This workshop will be the one that most resembles a traditional classroom experience. You will be walking your group through some business basics and establishing a common vocabulary. The goal of the workshop

is to get your team onto the same page of business understanding.

2. **Hunting for New Business.** In this workshop, you'll teach your employees the art of identifying and pursuing new business opportunities. In short, you will teach them to hunt for new business.
3. **Advanced Hunting.** In "opportunistic" hunting, you focus on your potential opportunities: your friends, family, neighbors and acquaintances. After opportunistic hunting has been mastered, it's time to move on to the next level. I call this "strategic" hunting, or strategic lead generation, which is more targeted. Strategic lead generation comes from analyzing the business' current footprint and determining where the natural extensions are.
4. **Intrapreneuring.** Lead generation is terrific, but there are more ways to contribute to the bottom line of a business than generating new opportunities. In addition, in any business, it is important to ensure that client retention and customer service are your first priority. That is the art of being a great intrapreneur — nurturing your existing business to its highest return. In this workshop, growing from the inside will be the focus. Content for this workshop should remain focused on the internal opportunities that can be spotted and exploited.

Short and Targeted Workshops

The workshops are designed to be short and targeted. Think two hours, although that's a recommendation, not a rule. Think short, intense training sessions rather than the occasional day-long marathon.

The goal is to get your staff thinking about these issues all the time. If there's too much time between training, it allows the impact of your teaching to wear off.

Recruiting and Retaining Talent

One way to hire smart is to never do it in a panic. This means creating and nurturing a constant pipeline of potential candidates. You may not need an individual right away, but you need to know that person now. Knowing who is out there and fostering an early relationship is the way you can make the right match at the right time.

Here's how to create a great pipeline:

- **Talent-spot constantly.** Recruiting requires an ongoing commitment from senior leadership and a programmatic approach.
- **Engage the staff in talent spotting.** It's important to open the talent-spotting process to the rest of the company. Encourage them by setting up a paid referral system for bringing in top talent. Your best talent spotter may be out there just waiting for you to acknowledge his or her talents.
- **Be creative in job creation.** One way to build a pipeline for full-time employees is to create ways for promising young staffers to get a taste of your company on a part-time basis.
- **Don't hire only in flush times.** Staff numbers should not be an economic indicator for your firm — up when times are good, down when they're not. The right staff is what drives your company forward, and that's doubly important when the economy is struggling.
- **Measure your results.** Like any other effort, recruiting needs to be measured to determine what's effective and what's not.

After the Hire

The tough job of recruiting isn't over when the offer is accepted. It just moves to the next stage: ensuring the new hire sticks. Here are three ideas:

- **Allow for an adjustment period.** Your entry-level hires will embrace the Army model faster than those who are seasoned and experienced. Your more senior hires will require time to adjust to the Army model, which can sometimes be dramatically different from their former environment. You need to understand the process of adaptation to your model and manage your own expectations.

More Than Just Bright Ideas

An Army of Entrepreneurs (AOE) does more than just generate good ideas. It becomes the eyes and ears of the company out in the marketplace. In a firm that is old-fashioned and top down, employees may not speak up when they see their employer veering off track. In an AOE environment, they are encouraged to speak up. What do you see out there in the marketplace? In what areas are we, as a company, succeeding? In what areas are we losing to competitors or to changing client/consumers tastes?

Your Army is your connection to what's going on outside your office. Years ago, focus groups and market research would have been paid to provide feedback. Today, you need information faster and from a wider variety of sources. Empowering your employees to do this work is not just smart, it's crucial.

- **Be transparent with existing staff.** One of the ways a new hire succeeds is when he or she is embraced by the existing staff. When I make a hire, I announce it. When I make a hire that might be controversial (such as during a tough economic period), I address that directly. I encourage people to talk to me about their concerns.
- **Get feedback from the employee.** Not only do we ask our new hires how they're doing, we also encourage them to share their experiences.
- **Consider retention a business priority.** It is not enough to have talented people flowing into your firm; you have to make them want to stay, integrate into your Army and serve. That means part of your recruiting strategy must extend to what happens next. ●

Using Technology

Communications technology enhances entrepreneurial behavior and when used well, it also becomes a critical point of differentiation. If I were to look at two companies, both with an AOE strategy, I could tell you which one was going to be more successful based on the implementation of communications technology. Technology, from my perspective, is all about the movement of information.

For our business, the most critical use of technology revolves around our ability to communicate with one another. Certainly, we all use the standard-issue technology around e-mail and cell phones. But to make the Army hum, we take our use of technology up a notch and tap into new media options.

One of our primary tools is the blog.

Blogging Is a Critical Technology Option

Former Sun Microsystems president Jonathan Schwartz wrote an article for *Harvard Business Review* about his experiences titled "If You Want to Lead, Blog." Among his observations:

"Blogging lets you participate in communities you want to cultivate — whether it's your employees, potential employees, customers or anyone else — and leverage your corporate culture competitively."

Technology as a Business Tool

Communicating is critical, but, ultimately, we need the AOE to move from conversation into action. Technology plays a critical role in the execution of the company's day-to-day efforts. Consider:

- **The importance of social networks.** For entrepreneurial companies today, social networks play a huge role in success.
  - **Project spotting.** This is the exercise of taking existing clients and developing a project they didn't know they needed.
  - **The value of technological sophistication.** Finally, technological expertise is something an AOE can use as a marketing tool. CJP managers are frequently panelists on discussions of technology in the business world. ●

Measuring Success

The key to smart measurement is knowing what to measure. Your initial benchmark process needs to gather and assess your current metric systems. What do you currently measure? Most companies measure revenue and profits on an ongoing basis. What else are you collecting data on? Are you regularly surveying for client satisfaction? For employee engagement? Are there other, less obvious measurement processes going on throughout the company? For example, are there awards given by different departments or managers? These are, in and of themselves, measurement processes; you should know about them and their history. These are the tools that will tell you where you are at the start of your process.

What follows is a list of elements that must be measured in an AOE environment. Alongside the traditional elements, such as revenues and profits, be sure you are measuring:

- **Pipeline growth.** One of the key benefits of building an Army is your team's ability to generate new business. Every business owner knows that a strong pipeline is the key to overall success; it helps guard against the feast/famine business cycle.
- **Product innovation.** If you've been effective in your communication during training, your staff should be coming up with new ideas — and new products on a regular basis, with energy and enthusiasm. You should be able to see a swift up-tick in the overall volume of new business ideas.
- **Assignment size.** At our firm, we benchmark the size of the client contract when it comes in, and then again one and two years later.
- **Employee satisfaction.** The Army model should improve employee satisfaction across the board. When you measure for employee satisfaction, you get a preview of your firm's financial future.

- **Participation in Army activities.** The AOE system opens up a new set of opportunities for staffers and you need to keep tabs on how many of them take advantage of that change. It's not enough to keep track of the volume of new ideas. You need to be aware of how many of your staffers are offering them up.
- **Customer satisfaction.** It should stay the same or increase under the AOE model. If it drops, you know you've got a problem. Staffers are too focused on entrepreneurial pursuits and they're neglecting their "day" jobs.

Officer Training

Every army needs officers. One of the key elements of success in an AOE organization is the selection and training of managers. These are the people who will be your voice as your company grows. They will be the ones to communicate the need for entrepreneurial thinking and action to staff every day. They are the ones who will take your thinking and make it happen.

What to Ask of Managers

There are key factors that managers must embrace to be successful in an Army of Entrepreneurs. You need to:

- **Be a good boss.** Bob Sutton, professor of management science and engineering at Stanford University, found that there are evidence-based ways to be a good boss, even in tough times when managers may be called upon to do tough things, such as cut budgets and staff. The key, he says, is to act in ways that both protect the company performance and preserve human dignity by being predictable, promoting understanding, being willing to give up some control and being compassionate.
- **Understand the role of money.** Money motivates many people. Money also makes people happy.
- **Avoid being a robot.** There's good research to indicate that a little emotion on the job is a good thing. Some emotions have a positive place in the successful firm. These emotions are appreciation and autonomy.

Innovation — It's a Management Discipline

Many people consider innovation to be the result of the free flow of ideas. But Esther Baldwin, of Intel Corp., is on a mission to reposition the idea of innovation as a management discipline. Baldwin launched the Innovation Center in Shanghai, China, and pushed to reposition innovation not as a happy accident, but as a task of everyday managers. Innovation, she says in an interview with *MIT Sloan Management Review*, is not about brainstorming. It is the result of measurable, manageable activities. Her advice on how to manage for innovation:

- **Use technology tools, such as databases, to capture employee ideas.** Managers need to supply technology tools to support ideas and find them larger platforms throughout the company.
- **Encourage employees to communicate with each other.** A great idea isn't just something you bring to your direct supervisor and hope for the best. Use chat rooms, video conferencing and social media to encourage greater sharing.
- **Be prepared for initial resistance from traditional innovators.** It's important to enlist these existing innovators in the expanded innovation process.

Maintaining Momentum

Momentum is not just a way to keep a program on track; it's a critical strategy to keep your most talented individuals in your ranks and working hard.

There is a web of activities and processes that combine to keep the energy level high. Three critical areas are compensation, morale and communication. These are the linchpins to maintaining forward momentum. The key is to keep the idea alive on a daily basis and not let the program fizzle out before it's had a chance to succeed. You need your people to stick with you and stick with the program.

Compensation, Morale and Communication

- **Compensation.** There are two basic types of compensation: traditional (cold, hard cash) and psychic (the elements of your new job that may not be entirely tangible but have a huge impact on how you feel about your work life). Both are vital to maintaining momentum. Both play critical roles in motivating and sustaining an AOE. Both must be present to ensure a stable, motivated workforce.
- **Morale.** An AOE that works well together and respects and enjoys one another is one that produces better results. Creating opportunities for team members to get to know and like one another should be part of your business strategy. The company that regularly facilitates ways to get to know people personally and professionally will function better.
- **Communication.** To keep the momentum going, you must communicate in ways that inspire your

Army. Without communication, your hard work can fall apart in a matter of months. Communication provides clarity and allows everyone to understand the forces at work inside and outside the firm. ●

Managing Disaster

A study by A.T. Kearney looked at businesses that wound up in bankruptcy and found that, in most cases, the economy was not to blame. "The root of insolvencies is often strategy. Managers often react too late and again lack strategic foresight. Enterprises are paralyzed; although the crisis is omnipresent, it is often underestimated and counteractive measures are taken too late," says Robert Ziegler, vice president, A.T. Kearney Middle East.

When businesses fail to embrace a smart long-term strategy, the worst eventually catches up with them. They float along during strong economic times and when the tide goes out they are stranded. They may think the economy is to blame, but the Kearney study shows that's not the case.

Top Reasons for Insolvency

Top reasons for insolvency include incorrect strategy/investment decisions, a cost structure that is too high, insufficient liquidity, and belated or inconsistent response of management. Other reasons include value chain dependency, management conflicts, and conflicts between workforce and management. Sometimes, but less often, insolvency is caused by outside forces, such as an economic or industry crisis.

And yet, even armed with that information, we do not see companies stepping forward with an AOE response. How do companies respond to financial woes? Kearney found the top responses are freeing liquid capital, seeking cooperation from customers or suppliers, cost reduction, and taking debt and equity capital measures. Other strategies include seeking better strategic alignment, staff reduction and communication enhancement. Some companies go outside for help, seeking outside consultants or support from public subsidies.

The most useful AOE tactics — communication and process improvement — are buried on that list. While businesses are learning that innovation is a critical strategy, many are missing the opportunity to use Army strategies to combat economic woes. ●

PART III: PUTTING IT ALL TOGETHER

To call IBM a giant is an understatement. It looms large both in physical size and in impact on the global business world. So what is it doing as an example of AOE thinking? It is a classic example of how good can come to a company when a leader brushes off the naysayers and taps the Army to do its best work.

In 1990, IBM was the second most profitable company in the world. But it was in trouble. As the market for its mainframes was drying up, the engine that had fueled the company's growth was stalling out. Starting in 1991, the company began losing money, bleeding nearly $16 billion over three years.

Lou Gerstner, who joined IBM as CEO in 1993, turned the company around. And he did it, in part, by embracing a radical idea: empowering his Army to make decisions.

Gerstner did not take the most ambitious decentralization route, the breakup of IBM into a collection of independent units. But he did look for ways to decentralize the decision-making process that was impeding the company's growth process. While critics said this would result in chaos within the company, Gerstner opted to tap the talents of his workforce.

Restoring the Line Manager's Accountability and Ownership

Among his efforts: He restored the line manager's accountability and ownership. He charged his senior managers with redesigns and gave them the power to make sizable changes. The charge to the senior managers signaled the change throughout the company. It would no longer be the case that decisions would be held up in committees at the company's Armonk, N.Y., headquarters. Line managers were to make decisions, and they would be held accountable for them.

This was just one of the many changes Gerstner instituted at IBM, but it was also one of the most lasting and impactful. By 1994, IBM was back in the black. While the job was not finished, the turnaround was clearly in progress. The naysayers were wrong. Empowering individuals to make decisions — even in a company as large as IBM — can have dramatic positive results. ●

How To Build A Profitable E-Commerce Strategy

B2B

THE SUMMARY IN BRIEF

For anyone involved in the world of business, these are wild times. Companies are gearing up to use the Internet to create new ways of doing business. For many, this will mean redefining themselves and carving out new roles. The Internet is changing whole industries from the manufacturing to the service sector. And it is all happening at break-neck speeds.

In this summary you will learn what it takes to build a profitable e-commerce strategy from scratch whether you are currently a brick-and-mortar operation or are an upstart with a new business model. Here's what you will discover:

- **Fundamentals of B2B E-Commerce.** The amount of business being done on the Internet is big and getting bigger. With the Web as the foundation, businesses are finding new ways to forge partnerships and make a profit. Old supply chains and partnerships have to be changed and renegotiated for the Web.
- **Relationships Are the New Focus.** Relationships are at the heart of any B2B e-commerce strategy. You will find yourself forging fluid partnerships in order to enter the marketplace quickly and maintain a competitive advantage once there.
- **Best Practices.** Already, the B2B scene is seeing the emergence of best practices for success. You will learn what they are, how they work, and how to apply them to your B2B venture.
- **Essential Technologies.** Creating a credible B2B presence requires that you obtain the services, applications, and software needed to operate effectively. You will see how to create the infrastructure to support sales, marketing, and service. The result will be a customer-centered enterprise delivering content, products and services quickly, efficiently and profitably.
- **Changing Organizational Thinking.** As a B2B e-commerce enterprise, you have to reinvent yourself over and over as e-commerce matures. To do that, you must create a corporate culture capable of changing as the need arises.

Fundamentals of B2B E-Commerce

In these new times, with new rules and new players, business-to-business e-commerce will be the main underpinning of a company's strategy, operation and technology systems. E-commerce replaces traditional supply chain and distribution network models that have provided the materials, services and products for companies. Those who want to succeed must build a strategy that ensures them a position in the new e-commerce world.

Skeletal Beginnings

Fortunately, most companies already have at least the skeletal beginnings of an e-commerce business already in place. That foundation is your internal computer network, which is a key component of any future business-to-business e-commerce system. Your internal network likely includes an **Intranet**, which is an internal proprietary site created for effective collaboration and information sharing by company employees. Through it, employees share computer resources and data and communicate via email. Your company may also already have in place an **Extranet**, which is a section of your network accessible to partners or vendors outside the company who may have a need for the information.

Portals

Intranets and extranets are only a small part of B2B e-commerce, but serve as a starting point. As e-commerce matures, companies will need to create or use portals as gateways. Portals are the work spaces of the future where people will go for information specific to their jobs. If you expect to become a participant in e-commerce transactions, you will need to create or use portals with content that attracts other participants. For example, industries will begin seeing specific portals which gather and organize industry information. Those needing that information will return again and again.

Portals that provide information about specific industries will rely on **infomediaries**. Portals purchase, package and deliver content while infomediaries create, package and sell that content. For example, infomediary ZDNET.com creates computer and software-related content for their own site and sell that same content to others who need it.

Defining B2B E-Commerce

Business-to-business e-commerce consists of business transactions conducted over public or private networks, including transactions that use the Internet as a delivery vehicle. Financial transfers, online exchanges, auctions, delivery of products and services, supply-chain activities, and integrated business networks are all examples of B2B e-commerce. Business to Business e-commerce is already an oversized monster with a big appetite for growth. By the year 2004 the B2B marketplace will top $2.7 trillion, according to Forrester Research.

Digital Markets

Procurement systems are one of the first successes of the B2B market. Using the Internet to share information about products and services cuts the cost of procurement. Many business procurement processes can easily be adapted to the Internet. In fact, some functions that were very expensive when human interaction was required can become inexpensive when the need for a live person to perform the service disappears. Some B2B procurement solutions include using an online travel agency to arrange business travel, an online computer store to customize and purchase computer hardware and software, and online payroll services for payroll and 401(k) payments. As time goes on, procurement services will become more centralized, allowing business customers to make one stop for payroll processing, shipping, office equipment purchases, credit services, travel arrangements and investment planning.

Fundamentals of B2B E-Commerce

(continued from page 2)

Another emerging e-commerce marketplace is the **B2B exchange**. A B2B exchange is a place where suppliers, buyers and intermediaries congregate and offer products to one another using a predetermined set of "rules." Eventually, the B2B exchange will provide a fully automated business exchange for partners looking for products, geographic locations and buyers. The exchange itself may take a commission for each successful match much as a broker does or charge a membership or referral fee. Examples of B2B exchanges are Plasticsnet.com and VerticalNet.com.

Another type of e-commerce marketplace is the **auction.** Typical auction sites require you to register your company, agree to the rules, supply credit information, and specify shipping preferences. You may have access to automated bidding software that lets you set price limits. You are then ready to place a bid. If your bid wins, you receive e-mail confirmation and your account is charged. A variation is the reverse auction, in which the buyer posts what he or she wants and the seller responds.

Supply chains are also moving online. For example, Ford and Oracle have announced they will create a huge e-business supply-chain program to coordinate more than $80 billion in annual purchases from 30,000 suppliers into a single system. Companies that have already invested heavily in coordinating supplier and business partner activities into supply chains see that using the Internet can lead to even greater savings and efficiencies since all the information the partners need can be available instantly. ■

A New Focus

In the ideal world, business-to-business e-commerce systems would be self-service systems providing everything the participating business needs. There would be a seamless transition from sign-up through sale, transaction and delivery of the goods or service. In reality, e-commerce enterprises still have to build relationships. Trust, value and performance still count.

Branding is another crucial aspect of any e-commerce relationship, whether it is a consumer oriented or a business-to-business company. A B2B company will pay great attention to building its brand within its market segment.

Marketing is another area companies must focus on. One marketing tool B2B firms have borrowed from business-to-consumer companies is the affiliate model. Affiliate programs pay a commission to a Web site that refers a buying customer. Another tool is the customization of the information a customer views when visiting a B2B Web site. ■

Innovation in Action: B2B Best Practices

The B2B market is an extraordinary one — so many opportunities and so little time. One segment of the market that is particularly worried about B2B competition are the traditional brick-and-mortar companies afraid of upstarts building new online business models from scratch. To compete, brick and mortars have begun migrating to the Internet.

Take traditional retailer Staples. Its online presence, Staples.com, boasted $94.3 million in revenues in 1999 and quarter-to-quarter growth of 80 percent. Although its brick-and-mortar revenue of $7 billion dwarfs its online revenue for now, Staples demonstrated that moving online is possible and profitable. Staples did it by creating a separate operating division. Its strategy is to grab substantial market share in the small business and SOHO (small office/home office) market.

Successful Dual Crossovers From B2C, Brick-and-Mortar Industries

Some firms manage to enter the Internet B2B market as dual crossovers. They come from a business-to-consumer, brick-and-mortar background.

Take, for example, the highly successful online travel firm Travelocity.com. The company started as an intranet for American Airlines. From there, the company began including travel agents from around the world in an extranet. Its back-end system links agencies, companies and suppliers in the travel industry. Its entry on the Web initially focused on consumer travel. Today, it is expanding to include a new focus on the business traveler.

Also crossing over from the business-to-consumer model to a business-to-business model is online auction giant e-Bay. It has the tools, methods and clients to become a dominant player. With the world's largest personal on-line trading community, it has an established brand, and can pair buyers, sellers and suppliers fast. By shaving a portion of the revenue from each transaction, e-Bay is one of the few profitable companies on the Internet.

(continued on page 4)

Brick-and-Mortar Advantages

Companies with successful off-line operations have a considerable advantage over new entrants into their markets when moving online. These include:

- **Existing market share**
- **Brand recognition**
- **Back-end infrastructure in place**

Innovation in Action: B2B Best Practices

(continued from page 3)

Other entrants to the B2B e-commerce game are strictly Internet-based operations. These include VerticalNet, a business exchange. The company has over fifty sites that are destinations for information about industries. Each is a community offering specific content, services and products for participants. Its long-term plan is to take a portion of each transaction it facilitates, but currently most of its revenue comes from sponsorships and advertising. The company also features direct and reverse auctions, web storefronts and content licensing to generate income.

Best Practices

Here are some best practices that can be gleaned from successful B2B e-commerce companies:

- **Think Fast, Work Fast.** The ability to think and work quickly is essential to successful e-commerce. Agility is crucial.
- **Partnerships Are Essential.** Successful B2B e-commerce companies don't go it alone. Instead, they rely on partnerships for help with marketing, strategy, industrial development, sales and distribution.
- **Leverage Existing Relationships.** By leveraging existing relationships, B2B firms can penetrate new markets and seek out new business opportunities. Companies can migrate, for example, from delivering travel information to consumers to delivering travel information to business travelers.
- **Go International Early.** As it becomes more difficult to grab market share in the United States, consider the advantages of going overseas. There is an advantage in being first.
- **Understand Supply Chains.** Those who understand how the supply chain works in their industry already have a model for getting to online markets quickly.
- **Leverage Your Brand.** If you have a developed brick-and-mortar brand, you have an immediate advantage online. You don't have to spend millions developing brand recognition.
- **Multi-Headed Business Models.** Don't use one business model when several will work better. Many successful B2B operations have models that include exchanges, sponsorships, advertising and content licensing. More is better.
- **Build the Base First, then Leverage It.** First create a base of business clients and partners, then leverage them by introducing new products and partnerships or extend your site's reach through other portals or partner sites.
- **Add Value.** Partners will remain loyal and customers will keep coming back if you continually add value and improve the site.
- **Be Prepared to Spend Money.** It can be expensive to enter and keep a strong position in emerging B2B markets. Make sure you have enough cash to sustain yourself through periods of intense competition.
- **Ditch Old Market and Development Programs.** Sequential, long-term market planning and testing cycles are history. Integrate market research, testing, prototyping, and awareness programs from the start.
- **Develop Your Own Practices.** Evolving in real time is a challenge. But remember, while speed can kill, staying put is a guarantee of failure. ■

MeetChina.com

MeetChina.com is an e-commerce portal dedicated to facilitating business-to-business trade with Chinese manufacturers. Already it has over 15,000 electronics manufacturers planning to offer goods through the service. The site will offer cultural, financial, and work-practice advice for organizations planning to use China as a resource in their manufacturing activities. With support from the Chinese government, the portal is poised to reap the benefits of a market worth $195 billion and growing.

Building Alliances

Few firms can do it all in the e-commerce business. From marketing to hosting the site, developing a B2B organization requires forming strategic partnerships. This is especially true when experienced staff is in short supply. Whether the need is for funding, development, marketing or support, partners are involved in almost every phase. Partners can be used to outsource tasks, to assist sales, and as financial participants in the business.

The paramount principle behind developing effective partnerships is to recognize that the relationship must be win-win. In addition, speed is crucial and has a major impact on partnerships. Fast, smart partnering can produce results quickly, scaring competitors and creating unstoppable momentum. In general, the speed at which partnerships are being formed has accelerated as agreements become standardized for specific partnerships such as affiliate programs and content licensing.

Finding Partners

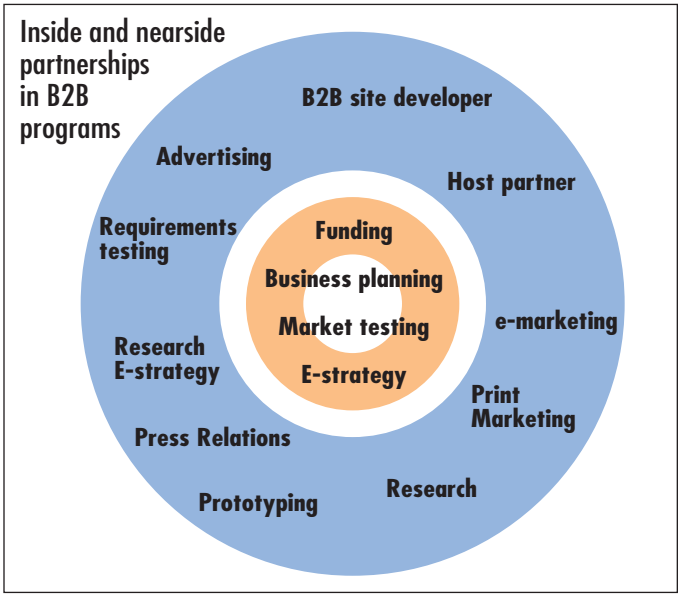
A major obstacle in the search for appropriate partnerships is the limited size of the experienced **Internet**

(continued on page 5)

Building Alliances

(continued from page 4)

gene pool, those individuals who have the skills and talent to guide companies into the unchartered waters of B2B. Premium talent commands premium prices, if it is available at all. Firms wanting to move fast therefore have to partner and outsource like crazy. Those who partner find themselves succeeding while others flounder.



Finding the right partners means hiring an Internet B2B dream team. Different partners are needed for different phases of development. You need to develop a partnership network with **inside** partners for the development and execution of your business strategy and **nearside** partners for extending reach and market penetration. Finally, your network should include partners to assist the execution of your business model without day-to-day contact. These partners include associations, distributors and the media.

Next, develop clear goals to orchestrate the partnership strategy, including creating realistic scenarios. A typical 9-month plan might look like this:

- **Perform market research** (30 days)
- **Develop business plan** (30 days)
- **Select development and marketing partners** (30 days)
- **Specify systems to be used** (45 days)
- **Develop the systems** (60 days)
- **Implement the systems and rollout site** (30 days)

Measuring Partners

Partnerships need monitoring and measuring. You can't afford to just measure revenue and customer acquisition and ignore the partners who are making it happen. Nor can you afford to keep those partners who aren't contributing much value to your venture.

The inside partnerships are easy to measure, since there tends to be a lot of contact. Nearside partners are harder to measure, but their activities can have a profound impact on timing of new products and their acceptance in the market. Their activities need tight coordination. If you can, tie their compensation to success or failure and measure their performance against predetermined goals and schedules, such as time to market, cost performance, flexibility, market value, market perception of company (for PR partners), and customer acquisition and cost.

If partners don't measure up, you must be willing to fire them. They don't belong in your network. Comprehensive legal agreements drafted in plain language will make it easier for partners to understand their obligations and to fire a non-performing partner. ■

Selecting B2B Applications, Services and Software

Determining what to build and how to build it is a major concern for new B2B e-commerce companies. The applications, services and software you choose must be designed with the user of your site in mind. People who are enjoying a site (i.e. are getting useful and relevant information for the job) are likely to stay, and having people stay is what e-commerce is about. When they do leave, getting them to come back for more becomes crucial. To accomplish this you must make the site both relevant and compelling.

An ideal site:

- **Is the first stop for your service or product.**
- **Is extremely relevant to the visitor's business needs.**
- **Provides service or products in a way that increases brand loyalty.**
- **Allows for a customized experience so the customer is unlikely to go elsewhere.**
- **Accommodates the customer's need**s.

To create such a site, you must start at the core and work out. The first layer of your system is your intranet, which forms the core of your internal communications. Every intranet includes a TCIP/IP computer network, an electronic mail server, client e-mail software, a Web server, a browser, perhaps a chat function, and an FTP, or file transfer protocol, system. Together, these tools facilitate communication within the company and serve as the foundation of your system.

The second technology layer may be an extranet, which allows outsiders access to some parts of your

(continued on page 6)

Selecting B2B Applications, Services and Software

(continued from page 5)

electronic system. Back-office systems also play an important role in many companies. These systems can include financial, inventory, order-entry, and human resource systems. When integrated into an extranet, those who need access to the information back-office systems contain can get the information they need quickly and directly.

Hosting Firms

You don't have to build an entire computer network full of servers to host your B2B e-commerce site. Hosting providers now offer the best options for most firms entering the B2B market. The costs associated with creating a dedicated data center along with rapid obsolescence have helped make hosting services the first choice for most enterprises.

Some Internet Service Providers (ISPs) have grown beyond providing Internet service and now offer at least limited Web hosting for individuals and businesses. However, full-fledge hosting firms can provide the bandwidth e-commerce sites need as well as the ability to accommodate growth. They also provide twenty-four hour per day access to sites.

A recent entrant to the field is the application service provider, or ASP. ASPs provide both Web hosting and the software businesses need to run their firms via the Internet. Companies no longer need to have software installed on individual desktops, but can use software available on the ASPs servers through the Internet.

You must create a security system for your e-commerce site. Most B2B firms allow some level of public access to their internal systems. Examples include credit card processing and data collection. These contacts need to be secure and private. Technological features like firewalls and routers guard the system and control the traffic. ■

Essential E-Commerce Technologies

In order to understand just how open and powerful the Internet has become for e-commerce applications, it helps to understand the components. The framework for the Internet was started in the late 1960s when the Department of Defense funded a network of computers to connect researchers, government workers, and defense contractors. The computers needed to communicate with one another even though they were manufactured by many companies. A set of protocols, or rules for communication, were developed that allowed the computers to connect. Eventually, this lead to the creation of the TCP/IP protocol still in use today.

Today the Internet is a huge collection of networked computers around the globe. Each computer on the Internet has a unique name, known as the domain name, and each system has an extension that describes the general function of the organization using it. Domain names fit into one of six categories: *com* for commercial organizations, *edu* for educational institutions, *mil* for military, *gov* for government, *org* for miscellaneous organizations and *net* for networking organizations.

The Internet can be used to send and receive electronic mail, browse sites, transfer files, access newsgroups, chat and send instant messages, confer, search for information, and send bulk e-mail. Perhaps the most popular Internet software is the browser, which allows people to reach the content of remote sites.

Security

Since the Internet is essentially a system of connected computers with access to each others, security is a major concern. Computers connected to the Internet may contain sensitive information its owners want to keep private while allowing access to information that can be shared.

There are several security systems available to lessen the impact of the problem. One security measure is to encrypt data that is sent between computers to keep it safe from unauthorized snooping. Encryption software encodes data so it can only be read by the sender and the recipient. Authentification software then is used to verify that the sender and receiver are who they say they are so that the transaction can take place. Messages can also be checked to be sure nothing was added or deleted along the way.

Firewalls prevent unwanted users and data from getting into corporate networks. Companies considering B2B e-commerce must pay attention to the development of firewalls. With the use of proper security systems, you will be able to handle credit transactions.

Generating Web Content

While the World Wide Web has been around for a few years, until recently getting content formatted in a way that could be read by the browsers used by those surfing the Web depended on converting the content using HTML, or Hypertext Markup Language. Today a new language has arrived on the scene, XML.

XML is the standard that is linking Web and database activities. It allows individuals visiting a site to query a database for information. The information is then found and displayed in the visitor's browser. XML understands

(continued on page 7)

Essential E-Commerce Technologies

(continued from page 6)

the context of a request. For example, a visitor could ask for a list of all conferences where Mike Cunningham is the speaker. The request is then processed by looking through the files for all conferences featuring Cunningham as the presenter.

With XML, data can be sorted and arranged according to the need of the individual requesting the information. This means catalogs, article archives and other databases can be repackaged for different users many times over. To sum it up, businesses that use XML to create e-commerce sites can:

- **Reuse and repurpose information quickly and efficiently.**
- **Reduce maintenance costs.**
- **Design flexibility into the system.**
- **Share information easily inside and with business partners.**

As the Internet matures, companies that want to enter e-commerce will find more and more software that simplifies the creation of Web sites and manages the content. Online catalogs, searchable archives and other databases can be organized to individualize each visitor's experience to his or her needs. ■

Architecture and Infrastructure: Designing a B2B Business

Moving into Internet territory requires a whole new mindset. The new corporate assets are flexibility, integrity, continuous pursuit of value, creating a sustainable advantage, and staff and customer loyalty. But designing a B2B business is more than putting up a Web site. It changes aspects of your organization. Whether you are building a new company or revamping an old one, take some time for planning.

The easiest way to plan a B2B e-commerce business is to create a plan that integrates and includes a go-to-market strategy. The process should begin with a meeting that includes all groups involved in creating the business plan. The purpose of the meeting is to build consensus.

Next, create the go-to-market plan. It should include:

- **Marketing plan and tactical actions**
- **Press plan and tour**
- **Introduction to existing and new clients**
- **Pricing and packaging information**
- **Site traffic promotion**
- **Introductory offers, if any**
- **Partner programs**
- **Internal promotion and explanation**
- **Validation of the business model**
- **Internal communications**
- **Product development and release schedules**

Sales and Distribution Plan

The approach you will take to the development of sales and distribution plans for your B2B depends on whether you are a start-up or an established company. Existing enterprises already have operations and channels to protect (while new enterprises don't) and must take care not to cannibalize those existing channels. If you redesign existing systems, you must do more than make minor improvements.

New sales channels will rely heavily on changing the way the current business model is working. Therefore, you will need to start by doing a total review of current market conditions. Keep the following points in mind when revising or modeling new sales strategies:

- **How will you access business partners?**
- **How will you reduce distribution costs?**
- **How can you increase revenue per employee?**
- **What is the cost of acquiring new clients?**
- **How can you cross-sell to existing market segments?**
- **How can you provide as much self-service as possible?**

The electronic sales process offers many opportunities to improve the quality, speed and cost of bringing purchasers to a decision. Build in features that keep customers who come to your site on the site. Some tech-

(continued on page 8)

How Channels Are Changing

Here is a quick look at how e-commerce is changing old ways of doing business:

Old Channels	New Channels
Brick-and-mortar distributors	Web distributors and catalogs
Manufacturer's reps	B2B exchanges
Value-added resellers	Information on the Web
Direct sales	Web sales
Geographic distributors	Geographic distributors with Web support
	Self-service sales
	Partner development centers on the Web

Architecture and Infrastructure: Designing a B2B Business

(continued from page 7)

niques to keep surfers engaged include a self-guided tour of your product or service, as well as self-service sales. If you can get a buyer to make decisions about getting more information about the product, follow it with a demonstration, references and self-configuration.

A key to creating effective self-service sales tools is gathering enough information about the buyer to tailor the sales presentation to his or her needs. One B2B e-commerce firm that does this well is bizbuyer.com. Within the first ten to fifteen-minute session on the site the following actions have occurred:

- **Customer has approved legal agreements.**
- **Customer has provided a profile.**
- **Customer has provided a detailed description of needs.**
- **Bizbuyer.com has distributed the information to its partners.**

The customer then begins receiving on-line quotations from the first three vendors that meet the customer's needs, and is free to contact the vendors directly.

Marketing

It's not enough to have a great system in place to close the sale once the customer arrives at your site. First you must drive him or her there. Customer acquisition costs must be calculated and included in your marketing plan. Acquiring customers is a major issue in developing an e-commerce business.

There are several effective ways of driving traffic to your site. The first is an infomediary approach. Customers want quality content and will return to your site if you provide it. Crafting a strategy for acquiring content is essential. Content can be obtained from existing sources like a company magazine or licensed from other publishers or aggregators.

Once you have content, the next challenge is to keep it fresh and up-to-date. Every strategy should also include using e-mail and bulletin boards. Another technique is to provide customers with a free service or application that is useful, requires registration, and will make them want to return. Examples are online training, project management centers like shared document storage or calendars. B2B companies with cash to burn can also acquire customers through the purchase of competitors. Finally, proper pricing will help you acquire market penetration.

If there is one marketing method at which the Internet excels, it is one-on-one marketing. The technology available allows you to provide customized versions of information and products. Take advantage of it. Every B2B needs to design its customer database to become a **customer relationship management database**. In other words, the data you collect must be available to help everyone who interacts with the customer to customize that interaction. This is integrated Customer Relationship Management, or CRM. Use it. ■

Changing an Organization In Real Time

Preparing a company for dramatic changes is not easy. Being ready for change and making it happen are two different things. Getting a company to commit to embrace the current turbulent business climate is an ongoing management challenge. Attitude is pivotal. But cultivating a can-do culture without terrorizing staff and managers is a balancing act.

How do you manage to get everyone aboard when changes are happening at incredible speeds? It requires that you make everyone aware of the impact the changes will bring to the organization, that they be included in those changes, that there is true collaboration and involvement in the changes. In particular, there must be candid discussions of what will happen as a result of the new business processes being rolled out. Outline the game plan, explain why it makes sense and what the consequences of inaction are. Once the organization had chosen a path, those who will be included must be given the straight facts. Keeping secrets can result in key staff departure at a time the company needs them most.

Relationships

One problem with business relationships is that many organizations keep them in place too long. Relationships that have worked well for years may not work in B2B e-commerce. To guard against staying bound in a relationship too long, take stock of the relationship regularly. Don't just measure the relationship by what the partners have done for each other in the past. Since much of B2B success depends on having the right partners, some tactical introspection is required.

Start the analysis by drawing a map of who us in your business network. Then determine how those relationships can be leveraged to reduce steps, cut costs, and improve the effectiveness of the processes for which they are responsible. If you find that the current business model isn't working, it is time to end relationships and form others that allow you to compete in the marketplace. The B2B market is changing in real time, and you have to change with it. ■

Expand Your Market Without Abandoning Your Roots

BEYOND THE CORE

THE SUMMARY IN BRIEF

Growth is not a choice: It's an imperative. But the risks are substantial. Only a quarter of all growth initiatives succeed, and three-quarters of the top business disasters of the past five years involved growth initiatives gone terribly wrong. Yet in spite of these dismal odds, some companies experience growth rates that are three times as high as the average over extended periods.

In his previous book, Profit from the Core, *strategy expert Chris Zook revealed how the most enduring growth performers succeeded by focusing and building around one or two well-defined, dominant cores — and how otherwise well-positioned firms sabotaged their growth by prematurely abandoning their core in pursuit of the next "hot" topic. Now, based on extensive research on the growth patterns of thousands of companies worldwide — including CEO interviews with the top 25 growth performers — Zook argues that in order to continue to grow, companies must eventually expand* beyond *the core.*

What You'll Learn In This Summary

Zook's research shows that the best companies fuel sustained growth through carefully planned "adjacency moves" — expansion into areas away from, but related to, the core business. *Beyond the Core* shows managers how to:

✓ Determine when and whether adjacencies make sense, depending on their company's competitive situation.

✓ Evaluate which growth initiatives to pursue, which to avoid, and which to abandon.

✓ Discover their firm's ideal "adjacency pattern": a repeatable formula that will enable quick execution of a series of successful growth moves.

✓ Decide what types of organizational structure, reporting relationships, and decision processes will support adjacency growth.

The Adjacency Challenge

If businesses have a primal urge, it is the need for profitable growth. That growth is the source of value creation to shareholders. *Beyond the Core* focuses on the question of how to expand a core business into adjacent areas in a way that is profitable and contributes to the strategic objective of expanding, defending or redefining the core business. The intention of this summary is to identify the most universal success factors and provide some ideas that management teams might find useful in improving the odds of an inherently risky undertaking.

Pushing out the boundaries of a core business is one of the most difficult management challenges. The typical odds of success are low. Managers have a built-in bias to underestimate and under-prepare for the ultimate complexity of these moves. Stock price swings and volatility are driven strongly by perceptions about adjacency expansion. And a large proportion of CEO departures occur in the presence of adjacency expansions gone wrong. Yet, in spite of these risks and penalties, the movement into adjacencies is the way that businesses ultimately find their next wave of profitable growth, without which they eventually stagnate and may even decline.

The Decision for Today's CEO

In my interviews of CEOs for this book, I started by asking what they believed were the key events in the development, shaping and growth trajectory of their company. Invariably, they listed key adjacency moves among the most defining events. Andy Taylor of Enterprise Rent-A-Car pointed to the decision to move from leasing cars into renting cars to dealerships, which triggered the business Enterprise has today. Tom Stemberg, founder and chairman of Staples, the lead office products retailer, talked about the movement from retail stores into distribution to small businesses, which spurred a sequence of adjacency moves that reshaped the company. Bob Norton of FTD florists emphasized how critical it was to make an adjacency move with the introduction of FTD.com, which allowed the company to link directly to customers to supplement its network of links between florists and defend its core against new competitors. These types of difficult, sometimes even agonizing growth moves punctuated the historical timelines in the minds of each CEO.

Wal-Mart Vs. Kmart

Consider the following example of how a growth strategy can go awry. In 2002, Wal-Mart became the largest company in the Fortune 500 and the most respected company in the United States, while Kmart drifted into bankruptcy. Both companies opened their first store in 1962. The history of Wal-Mart is one of methodical movement into adjacencies such as Sam's Club, electronics and Mexico, one by one. The history of Kmart is strewn with adjacency expansions gone wrong, from books (Walden) to sporting goods (Sports Authority) and even to a chain of department stores in Czechoslovakia. These failed adjacency moves sapped the strength of Kmart at exactly the time it was under a blistering attack to its core from one of the toughest competitors on earth.

The Promise of Growth

The promise of growth lies in methods that allow you to decide correctly, to tilt the odds in your favor, and to control the cost of failures when they inevitably occur. The examples, data and frameworks analyzed in *Beyond the Core* can help managers make and manage adjacen-

The Adjacency Challenge

(continued from page 2)

cy decisions better.

But CEOs facing decisions about major investments in new growth initiatives and pushing out the boundaries of their core business into new territory are right to be concerned. When my team examined the top 25 business calamities (other than Internet companies) of the period from 1997 to 2002, we concluded that a failed strategy to grow into a new adjacency around a once-successful core business was a critical factor in 75 percent of these disasters.

Defining the Adjacency Strategy

Jack Welch, regarding where he looked for growth within GE, commented, "Expanding into adjacent businesses is the easiest way to grow. By challenging the organization to continually redefine their markets in a fashion that decreases their share opens their eyes to opportunities in adjacent markets."

Profitable growth is the wellspring of most value creating in business, and our focus for growth is on adjacency strategies. These strategies have three distinctive features:

1. **They are of significant size, or they can lead to a sequence of related adjacency moves that generate substantial growth.**
2. **They build on, indeed are bolted onto, a strong core business.** Thus, the adjacent area draws from the strengths of the core and at the same time may serve to reinforce or defend that core.
3. **Adjacency strategies are a journey into the unknown, the true extension of the core, a pushing out of the boundaries, a step-up in risk from typical forms of organic growth.**

Understand the Distance of a Growth Move From the Core

A recurring theme of successful adjacency growth is the importance of understanding the distance of a growth move from the core, one indicator of risk and movement into the unknown. We find that companies continually underestimate how much they do not understand, taking on risks and future obligations that are greater than they may have realized. A second theme of successful adjacency growth is the importance of understanding the true strength of the core to support new growth. Again, we find that companies sometimes overestimate the ability of their core business to support new growth.

Not surprisingly, we also found that more than 40 percent of non-retirement CEO turnover was in the presence of a major adjacency move that had gone wrong or that was highly controversial. Tom Stemberg of Staples notes, "Adjacency expansion is one of the two toughest decisions I faced as a CEO, the other being the creation and retention of the best possible management team."

Three Truths

The following three truths reappeared over and over in our study:

1. **Adjacency expansion is successful only if it is built around the strongest cores that have potential for leadership economics.**
2. **The best adjacency expansion strategies have a repeatable characteristic allowing the company to build an adjacency machine that continually creates more growth opportunities of a similar nature.**
3. **The best place to look for adjacency opportunities is in the strongest customers.** It is not in the search for hot markets, the next big deal, or in corporate studies. Your customers' potential adjacencies become your own potential adjacencies. ■

Successful Moves

What are successful adjacency moves, and why are they so important? An adjacency move could take many forms:

✓ *A shift from a flagging product business into services*, like the creation of IBM Global Services that rescued the company.

✓ *A foray into a major new customer and product arena building on the strengths of a core business*, like the repeatable adjacency formula that Nike developed to enter sports, from running to basketball to golf.

✓ *The leveraging of a core asset to create a totally new business*, like the creation of the Sabre reservation business by American Airlines.

✓ *Migration into new geographic adjacencies*, like the string of acquisitions by Vodafone, which transformed that company from a small, local wireless operator in the United Kingdom to the world leader in cellular phone services.

✓ *The addition of major new product lines to a distribution network*, like the Lloyds Bank strategy of applying retail techniques to its branch bank network, thereby adding products from mortgages to insurance, and reversing its position from one of the worst to one of the best performing banks in the world.

For Additional Information on how Lloyds Bank revitalized itself through adjacencies, go to: http://my.summary.com

Playing the Odds

In looking at adjacency expansion moves, my research team and I combed the literature, and conducted our own independent analysis to understand as completely as possible the odds that major growth initiatives would truly drive a new source of sustained, profitable growth. We found, in our own data as well as in the secondary data, the success rate to be only about one in four. *Just 25 percent of investments in growth initiatives, most of them true adjacency expansions, created value and added to growth.*

The average success rate for new products is about 30 percent; for startups, below 10 percent; for joint ventures, about 20 percent; and for related acquisitions, about 30 percent. Studies of these initiatives span a wide range of methods and quality of data, but all show how hard it is to find and execute on new sources of growth in a company.

The unpredictability of the market can taint every adjacency move. It is important to focus on the controllable dimensions of adjacency expansion moves that can either lower the cost of failure or increase the odds of success.

The Pressures for Adjacency Moves

A somewhat surprising finding in this study of the search for profitable growth is the extent to which pressure to make adjacency moves exists across the gamut of business situations. It is felt by strong leaders who are gushing cash, and have opportunities hurtling at them from all directions, as well as by companies whose industries are in decline, or are falling hopelessly far behind competitively, and who wonder if they should make one final attempt to leap to a new lily pad.

Strong leaders in robust markets epitomize the epithet of Sun Tzu: "The more opportunities I seize, the more opportunities multiply before me." Strong core market growth can actually heighten anxiety about finding future sources of profitable growth to maintain such exceptional momentum.

Strong leaders in weak core markets face a different dilemma. Organic expansion plus "close-in" adjacency moves might not be enough to satisfy their investors' aspirations — or their own. However, one company's adjacency is another company's core.

Paradoxically, leadership businesses have the most to lose in adjacency expansions. Their valuable core franchises would be put at risk by major forays into the wrong adjacency or by premature abandonment of the core as an investment vehicle. And this risk is compounded by the abundance of temptation: The strongest businesses with cash to invest have opportunities brought to them every day. During discussions of adjacency expansion, Sir Christopher Gent, CEO of Vodafone, remarked that CEOs should be judged by the opportunities they decline as well as those they accept.

At the other end of the spectrum are businesses in weak competitive positions or collapsing core markets whose management would like nothing better than to jump to a better position, even a different business. However, the data show that few weak followers — in fact, only about 5 percent — materially change their positions over time. ■

Turbulence

Another situation in which adjacency expansion tempts management teams is when an industry is in turbulence. Turbulence can take a variety of forms. One form is when an entire sector that has been protected from the full pressure of competition suddenly has its protective shield removed. An example is the deregulation of public utilities in the United States in the 1990s, when company after company rushed into adjacencies ranging from telecommunications to global expansion to financial hedging.

A second form of turbulence is the rare, but stressful, situation of the *melting core*. A core melts down when the industry or market itself is in rapid structural decline. What happened to the typewriter industry with the advent of word processors is an example. The magnetic tape industry's giving way to optical storage is another, and the photographic film industry's encounter with digital imaging is a third. In each of these situations, companies like Imation (in storage) or Polaroid and Kodak (in photography) have faced strong pressure to find adjacent moves to serve as stepping stones to a more stable future.

For Additional Information on learning the six adjacency vectors, go to: http://my.summary.com

Repeatability for Successful Growth

Repeatability is the essence of mastery and control. "Relentless repeatability" was a phrase used by golf legend Ben Hogan to describe the driving force behind his professional success, and it is an apt term for one of the most critical elements in the growth of companies, the discovery of a repeatable formula to drive profitable growth.

Mastery at the customer level and control over competitive dynamics are the keys to earning profits in business. Focused companies that have a strong or dominant

(continued on page 5)

Repeatability for Successful Growth

(continued from page 4)

core and that hit on a repeatable formula for extending their strength to new arenas are the breeder reactors of business. About two-thirds of the most successful, sustained-growth companies studied in depth for this book have one or two powerful, repeatable formulas, "adjacency machines" that generate waves of new growth over time.

These singular moves, like atoms connecting to form molecules, can be combined into a series of interlocking moves. Sometimes there is an opportunity to make a series of similar single-adjacency moves, like Vodafone's serial acquisitions of local providers to build a global wireless network. Other times, there is an opportunity to create a sequence of moves of various types that truly redefine the core business.

Root Causes

Three critical factors, potentially the most important three root causes of sustained and profitable growth, coexisted in at least 18 of the 25 companies we studied. The results of our studies could be boiled down to these three elements:

1. Each company had a strong core that constituted a stable and suitable launching pad for a sequence of growth initiatives beyond the core.

2. These companies hit upon a repeatable formula for adjacency expansion that generated strong economic and competitive benefits in its repeatable application.

3. These companies' formulas were, 80 percent of the time, built around specific and deep insights about customer behavior that could be replicated in different products, segments or circumstances with high odds of success and profit.

Only about 15 percent of the adjacency formulas were based on clear scale economics of production in the build-out of a network. Fewer than 5 percent of the cases of repeatable adjacency expansions were situations of unique business models, or capabilities, that could be applied over and over to new competitive arenas.

The Competitive Advantage

Finding a repeatable method of moving into new adjacencies, one after the other, has several clear benefits, each of which contributes to competitive advantage:

- **Learning curve effects:** A repeatable model allows an organization to be built around it, creating an adjacency machine with its own processes that can move down a learning curve in repeated application.
- **Reduced complexity:** In our discussions of Procter & Gamble's ability to consistently outgrow its industry, CEO A.G. Lafley emphasized that "complexity is the bane of a large organization. It strangles growth. It strangles everything." Repeatability allows fewer organizational variations.
- **Speed:** Speed is essential to growth. Doubling the speed at which an adjacency succeeds has a material impact on the growth rate of a business that is constantly attacking new areas surrounding its core. Repeatability dramatically lowers cycle time relative to the practice of shifting gears from one area to another.
- **Strategic clarity:** Clarity of communication about the growth strategy affects investor and employer confidence. The ability to describe a repeatable approach, constantly adapted to a range of new conditions, has a powerful influence on investors and employees. STMicroelectronics CEO Pasquale Pistorio has repeatedly emphasized strategic clarity: "I now believe that any good strategy must fit on a single page, emphasize the clear competitive advantages, and show how that can be used over and over again."

Understand Details and Their Execution

- **Ability to "drill down":** For many businesses, the key to growth comes from a *drilling down*, that is, an understanding of the details of the business and the execution of them.

These benefits are the hallmarks of companies that are the most successful at expanding themselves through a repeatable method. Repeatability can create a sizable competitive barrier.

(continued on page 6)

Nike Vs. Reebok

A remarkable study in contrasts of repeatability versus non-repeatability is the story of the competitive battle between Nike and Reebok. In 1990, the two companies had uncannily identical financials. Nike's revenues were $2.3 billion; Reebok's were $2.2 billion. Nike's operating income was $481 million to Reebok's $300 million. Both companies were almost entirely focused on athletic shoes, with Nike focused more on performance athletes, while Reebok's focus was somewhat more diffuse. Both had well-known brands. By the end of a 10-year period, the companies' fortunes were quite different. Nike's market capitalization had increased by 380 percent while Reebok's had shrunk in half. Nike had a clear strategy apparent to all constituencies, consisting of a repeatable method it had developed and refined over the decade to attack one sport after another. Reebok's path was a mystery to those covering the company.

Repeatability for Successful Growth

(continued from page 5)

Mining Customer Insights for Repeatability

Throughout the CEO interviews we conducted, we constantly heard the refrain that not only does everything start with the customer, but also that the CEOs were constantly finding that their organizations did not really understand the customer's needs, behaviors, frustrations, categories and situations as well as the CEO thought they should. Furthermore, every time they invested the resources to get closer to the customer, they often found new sources of growth — sometimes organic growth in the core, occasionally a new vector of adjacency growth, and, sometimes, even the basis of a repeatable formula.

Pasquale Pistorio of STMicroelectronics agrees: "I insist that we keep total humility about customer knowledge. Almost all of our major new sources of growth have come because of this. When we have diverted to ideas not driven by the customer, like the ST personal computer chip or the PC graphics, we found we did not succeed, because we were not close enough to the customer and could not drive the speed of innovation fast enough without that intimate knowledge."

Throughout the case studies, more than three-quarters of the most successful companies had a repeatable formula, and three-quarters of those that did built the formula around insights related to customer behavior and customer segments. The key insights underpinning all these successful, customer-centric growth formulas originated from a relatively small number of ways to look at customers' needs.

The Primary Lenses

There are five primary lenses for looking at a core customer base in search of new forms of profitable growth. These lenses each uniquely focus on the following five dimensions:

1. Customer Economics and Profit Drivers: One of the most powerful ways to identify potential adjacency opportunities is through the detailed understanding of the cost and profit economics of key customers. Companies can create expertise in this capability by building organizational skills that allow them to understand the full economics of the customer's business drivers as completely as the customer does. A company may develop a deeper understanding of the customers' most vexing problems than the customers themselves have.

2. Customer Share of Total Spending ("share of wallet"): On average, share-of-wallet adjacencies — that is, the selling of highly related products to customers you know intimately — have the highest success rates among adjacency types. Building growth on proven and tested customer behaviors regarding multiple purchases is still one of the best strategies.

3. Customer Life Cycle of Events and Purchases: One way to identify the potential for share-of-wallet adjacencies is to look across the life cycle of the purchases of an individual customer, searching for linkages among purchases that create a chain of adjacency expansion opportunities. Rapid prototyping, testing the key behavioral assumptions rigorously, and then responding rapidly to proven success are key.

4. Customer Segmentation: Segmentation can create new opportunities either by identifying new geographic or customer segments to attack using the direct model, or by taking an existing segment and subdividing it to achieve greater customer focus.

5. Customer-Based Product Regimens: Some of the most difficult growth environments for business, like the world of consumer products inhabited by Procter & Gamble, may force companies to rise above their conditions and to push the boundaries of techniques to mine new adjacencies. P&G's ability to consistently find major new growth opportunities from deeper and deeper detailed customer knowledge holds lessons for all. Many of its approaches to turn its repeatable stream of customer insights into true moneymakers today involve open-market innovation, whereby a business unit fills in missing capabilities by looking outside its walls into other units in the company or by looking outside the company. ■

Evaluating Adjacency Moves

Adjacency moves are business journeys into the unknown. The most successful growth companies, like Dell, Vodafone, Lloyds TSB, P&G and Staples, insist on the most rigorous criteria for deciding what to pursue, and especially what not to pursue. While all the companies looked at a lot of data, each had a relatively short list of clear, agreed-upon criteria that the company determined were right for it.

Take, for example, Vodafone. To deal with the constant series of major forks in the road, Vodafone has honed a decision process that pays particular attention to three dimensions: the potential for leadership economics and market control in the new adjacencies, the robustness of the potential profit pool, and a clear sense of the relatedness of the adjacency to a strong existing core.

Deciding How to Decide

The average strong core business has typically 80 to 110 possible adjacent moves surrounding it at any one time. Perhaps the firm actually evaluates 15 to 20 of these per year. Deciding how to decide is crucial in order to avoid mere expediency, excessive complexity,

(continued on page 7)

Evaluating Adjacency Moves

(continued from page 6)

or excessive decisiveness. The best companies have honed their criteria and processes for adjacency decisions to a military precision. The most successful companies at adjacency expansion also have some of the most restrictive criteria.

One common attribute across most companies with the most evolved decision processes for growth is experience with periods of both strong success and disappointment. Another factor at play is the explicit recognition that rationality in human decision-making is inherently imperfect. The companies best able to pursue growth opportunities are aware of the need to impose rules and structure on their own decision-making process.

Three Success Factors

● **Success Factor One: The best adjacencies build on and reinforce the strongest cores.** Relatedness to a strong core is the most powerful and reliable engine of value creation by pushing out the boundaries of a business. Lord Ian McLaurin, chairman of Tesco, describes how his company's method evolved: "The key to our model was 'Keep it simple, stupid.' We knew we were a supermarket and only invested in things that we could prove our customers really wanted. The same list came up all the time, like petrol, coffee shops, greater freshness, or easy parking. So, we decided to invest all of our money in these areas in improving the model or extending it into new areas."

● **Success Factor Two: Drive adjacencies toward the most robust profit pools.** A profit pool is different from a market. A profit pool evaluation is designed to embody the size of the industry, its current and potential profit dollars, and the extent to which those earnings could cover the cost of capital for the leading players. Some industries, like the airline industry, have decade-long histories of not earning their cost of capital, with the exception of companies with highly specific ways to segment the market, lower their costs, and create profitability. The prism of profit pools is the way to view the fundamental attractiveness of a market, given its size, growth rate, economic structure (capacity conditions and competitive conditions), and customer alternatives.

● **Success Factor Three: Insist on the potential for leadership economics.** The decision to make a major investment to push out the boundaries of a core business into an adjacent area requires a clear view of the reinvestment and cash requirements in the future. If you do not have the potential to ever achieve economics equivalent to the leader, then you may be constantly outinvested or put in a position of having to match the leader's investment to achieve lower returns. The true power of leadership economics resides most often in the ability to generate higher margins through lower costs. Studies at Bain & Co. have found that 80 percent of the difference between a leader's profits and those of a more distant follower is due to unit cost levels.

When all three adjacency success factors hold at once, new, profitable growth usually is worth pursuing, given organizational capacity to execute.

Common Pitfalls in the Evaluation of Adjacencies

Several pitfalls in accurately evaluating growth opportunities were highlighted repeatedly in the CEO interviews and our other research. A more rigorous decision process can help a business executive avoid these and other common pitfalls:

● Mistaking a large market for a large profit pool.

● Failing to understand how tightly the profit pool is controlled by a competitor.

● Misunderstanding the root cause of market power, thereby defining leadership in the wrong way.

● Underestimating how today's competitive dynamics will shift tomorrow's profit pool.

(continued on page 8)

For Additional Information on how to assess the distance of an adjacency from the core, go to: http://my.summary.com

Mapping the Profit Pool

In mapping out a profit pool, it is first necessary to decide on the definitions and boundaries of the relevant markets. These could be defined by geography, stage in the value chain, current owner, product, end user, time phase, channel, or distance from the relevant core business. In addition, it is important to think about what constitutes profit. Is it pure dollars, or is it dollars earning more than the cost of capital? Is it potential profit under a new economic model? Just asking these questions of a growth initiative can be quite clarifying. Once the definition has been decided on and information has been assembled, it is worth considering the full range of profit pool effects that come into play:

- ✓ **The direct profit pool entered by the adjacency move.**
- ✓ **The impact of the adjacency move back on potential profitability of the core business.**
- ✓ **The impact of the core business on the adjacency.**
- ✓ **The option values of the move in creating further opportunities.**
- ✓ **Profit pools of customers, suppliers or complementary products.**

GE Capital

At GE Capital, the tremendous success of past acquisition-driven growth was becoming a less likely growth engine of the future, given the increased costs and scarcity of the right acquisition. The company recognized that it had unrealized potential in its core and embarked on a major program of training, tools and measurement systems that it called Find, Win, Keep (FWK) and later evolved to a program called Core Customer Connectivity (3C). The result was a booster rocket in its 25 operating units that fueled another wave of growth in the core. If you have a major, full-potential gap, consider a high-intensity initiative to bridge the gap, creating the platform for the next wave of adjacency expansion, rather than chipping away.

Evaluating Adjacency Moves

(continued from page 7)

- Not doing adequate homework on relative cost position across competitors, thereby underestimating the true economic strength of the leader.
- Falling prey to the tyranny of incremental economics and, in doing so, dismissing the importance of leadership economics in reinvestment.

Overarching these specific areas of potential failures of decision-making is what I term the *tyranny of apparent strategic rationale*. In certain situations, this creates an enormous pressure to act, even if the numbers do not add up. Untested assumptions about customer buying preferences are other sources of siren songs, which have led many companies into massive and costly adjacency moves that they have subsequently had to unravel. Assumptions about customer bundling or competitive mimicry can also be powerful enough that they compel management teams to forgo the usual analysis and concept testing. This has proved to be a dangerous route. ■

For Additional Information on a few more practical insights into adjacency strategy analysis, go to: http://my.summary.com

Executing Adjacency Moves

Most organizations inhibit growth. Why? They are often set up to protect the status quo, but growth is not about the status quo. Organizations tend to become more complex and more internally focused over time; each can stifle growth. The strongest core businesses have the muscle to retain their best people, as probably they often should. Yet the gravitational pull of the core can stem the flow of talent to new opportunities. The opposite response of creating such a magnetic pull in the new, "hot" adjacency that it depletes or distracts the core can be equally harmful. These natural tendencies of organizations need to be managed if a company is to achieve sustained, profitable growth.

CEO Insights

The CEOs interviewed for this book returned over and over to organizational factors that they believed had shaped success or failures in their experience:

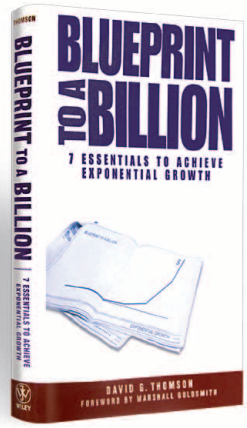
Michael Dell says, "The unique structure of our organization makes it especially easy for us to move into new customer or product adjacencies. We have developed a formula for this that we apply over and over again, from reporting relationships to the transparency of our financial reports."

Tim Eller, CEO of Centex Homes, the major home builder with the best record of sustained, profitable growth, speaks of his company's organizational process: "Our new adjacencies always report to the CEO at the start in order to make sure that they get the proper care and feeding and to give us a chance to figure out the best long-term organizational solution. We spend enormous attention on the way that we later shift the business to become more tightly linked to the core, while trying to maintain enough autonomy.

Andy Taylor, CEO of Enterprise, also stresses the importance of organization: "We have spent a lot of time working on how to organize ourselves in ways that keep the adjacency tightly linked and controlled by the core, but do not stifle independent thinking. We start new businesses in our strongest three markets first. I attend all business updates on our learning in the new business. We believe that adjacencies must have the best and the brightest, and we have learned that if we do that, we can keep accountability like we do in the core business. We want the accountability to be no different than in the rest of the business."

Consider the fact that virtually all of the CEOs went out of their way to stress the organizational challenges of adjacency expansion.

Beyond the Core



Adjacency expansion is a specific method to achieve growth. It is different from market growth, from diversification, from venture capital, from cost and price cuts, from combining with your main competitor, and from programs to improve the loyalty of current customers. Yet, adjacency expansion is what CEOs today identify as the primary way they hope to achieve their next major wave of new growth. As we have seen, the potential is great to create value from well-executed moves that push out the boundaries of a strong core business. ■

BLUEPRINT TO A BILLION

THE SUMMARY IN BRIEF

Microsoft, Google, eBay, Staples, Genentech, Starbucks, Nike and Harley-Davidson … these are just a few examples of an elite group of companies that have managed to turn billion-dollar ideas into billion-dollar businesses. What did these and other high-growth companies do to achieve such a goal? What blueprint do they follow to produce such results? Based on three years of in-depth research, this summary provides a quantitative assessment of the success pattern common across a distinct group of 387 "Blueprint Companies" that went from an initial public offering since 1980 and achieved $1 billion in revenue. They represent America's highest growth companies; they uniquely achieved exponential revenue growth and returns.

This summary is not about one unique company, its innovation and the financial returns it achieved. It's about the quantifiable, success-based pattern — independent of economic cycles or industries — that winning companies follow to produce the performance many admire and desire to emulate. These Blueprint Companies are known not only for their innovation, but also for their exponential revenue and returns — growth irrespective of economic or business climate.

It's about how you can use seven common essentials to better your business, organization, team or yourself and produce exponential growth. It's about taking the actions that matter while avoiding the pitfalls.

The bottom line is not about the coolness of the brand, the positioning of the business, or the pedigree of the CEO. Those can be important inputs; however, it is exponential revenue growth that makes a great company — so long as the management team ethically seizes the opportunity that it creates to achieve profitability, maintain positive cash flow, and produce high return on capital.

In addition, you will learn:

- ✓ ***How to create and sustain a breakthrough value proposition.***
- ✓ ***Why it is important to exploit a high-growth market segment.***
- ✓ ***Why "Marquee Customers" shape the revenue powerhouse.***
- ✓ ***How to leverage alliances to break into new markets.***
- ✓ ***How to become the master of exponential returns.***
- ✓ ***Why the management team is important in achieving growth.***
- ✓ ***How to build a board comprised of essential experts.***

BLUEPRINT TO A BILLION

by David G. Thomson

— THE *COMPLETE* SUMMARY

The Blueprint Thesis

The odds are one in 50 that an idea becomes a business, one in 20 that a funded business sees an *initial public offering* (IPO) and, finally, one in 20 that a public company achieves $1 billion revenue. The odds of turning an idea into a billion-dollar business, then, are one in 20,000! A long shot. Nevertheless, we chase this dream. We want to be among the few winners.

What does it take to become a billion-dollar company? The answer came from a quantitative and fact-based analysis of America's fastest growing companies.

The Blueprint Companies have a simple but definable characteristic: They not only grew fast, they exhibited exponential revenue growth. Exponential growth is super-compounding. It describes companies that can double revenue every year.

When the 387 Blueprint Companies are compared to the 7,454 American companies that went public since 1980, they represent 5 percent of these companies and account for 56 percent of employment in 2005 and 64 percent of market value! (The list of Blueprint Companies is available at www.blueprinttoabillion.com.)

Significant Insights About Blueprint Companies

By first looking at the financial patterns of Blueprint Companies and defining the actions required to create their financial impact, it is possible to reverse engineer the behaviors and skills required. Like a rocket, these companies need to be on the right flight trajectory and have the speed to break the pull of gravity — to escape being a mediocre, low-orbiting projectile. The *exponential* revenue growth curves have these three parts:

1. A variable runway. The *time to the inflection point* was highly variable from the founding year to the inflection point. For instance, Google went from its founding to the inflection in two years while Cisco took seven years to get to that point. In an extreme example of a lengthy timeline to the inflection point, Fifth Third Bancorp had its beginnings in the middle of the 19th century.

2. An inflection point where revenue breaks out into an exponential trajectory.

3. Variable growth rates to $1 billion revenue that follow a four-, six- or 12-year trajectory. ■

Create and Sustain a Breakthrough Value Proposition

Whether the industry is chemicals, clothes, technology or financial services, Blueprint Companies have a big idea. It's an idea with legs: a set of breakthrough capabilities that delivers high value to customers. These capabilities come in the form of breakthrough products, breakthrough services or breakout levels of new value.

These are value propositions — clear statements of the tangible benefits a customer gets from acquiring and using a company's product or service.

Essential #1: The Blueprint Value Proposition

Every Blueprint Company had a compelling value proposition. All were founded on the delivery of a breakthrough set of customer benefits that went far beyond mere improvements to existing products and services. They may not have reinvented the proverbial wheel, but they have come close, delivering breakthrough products and services better, faster and cheaper than what existed previously.

It requires more than a breakthrough product. The product innovation has to be aligned with the needs of the outside world. When the product is good and the environment is ready — that's when a breakthrough innovation becomes a breakthrough value proposition. Blueprint Companies create breakthrough value propo-

CHRIS LAUER – *Senior Editor*
REBECCA S. CLEMENT – *Publisher*

Create and Sustain A Breakthrough Value Proposition

(continued from page 2)

sitions by asking these three critical questions:

- **What market segments are we addressing?** Blueprint Companies can create new markets, redefine existing markets or optimize mature markets. But in each case they are aligning their contribution to the unmet needs of the outside world. Genentech created a new market in biotech products, Starbucks refined an existing market, and JetBlue has invigorated a mature market.
- **Who are our targeted customers?** Blueprint Companies see *people* on the other side of their products. They design their products or services for their customers. Michael Dell used to bring customers up to his dorm room at the University of Texas where he developed his latest computers and from there developed his company.
- **What benefits are we delivering?** Blueprint Companies also recognize that there are two kinds of benefits: functional and emotional. For JetBlue, the functional benefits include on-time arrival and departure, nonstop flights, and a choice of flight times. The emotional benefits include enjoyment, comfort, and peace of mind.

The best Blueprint Companies fall into one of the following three categories:

1. Shapers of a New World (57 percent of the Blueprint Companies) truly create a new market for their products and services. These companies include eBay, Amgen, Medtronic, Cisco and Genentech. This category also includes companies, such as Broadcom, that arrive just in time to fill a critical gap, unlocking new worlds of services and products.

2. Niche Shapers (33 percent of the Blueprint Companies) are companies, such as Starbucks and Harley-Davidson, that followed the *Shapers of a New World* with products or services that redefined a specific market segment. Another type of market niche is one that offers an alternative to the incumbent.

Redefining the market in the context of an established market can be achieved by fulfilling an unmet need with a highly differentiated service or product. The company must offer higher-order benefits such as superior capabilities or emotional benefits not found with adjacent market peers.

3. Category Killers (10 percent of the Blueprint Companies) optimize a market by attacking the existing incumbents with a better-faster-cheaper value offer. These companies include AutoZone, Best Buy and Home Depot.

Creating Breakthrough Customer Benefits

Blueprint Companies deliver more than functional benefits. They deliver intangible benefits with high emotional value. Offering customers higher-order emotional benefits creates strong customer loyalty. The higher a company goes from functional to emotional benefits, the greater the value and the better the margins. What a company offers is assessed by users for its functional benefits and its emotional benefits. Providing emotional or intangible benefits results in customers giving "permission" to providers as they endorse these broadening benefits. ■

Create and Sustain Exponential Revenue Growth

Exponential revenue growth is the distinguishing characteristic of Blueprint Companies. Creating and sustaining exponential revenue growth are often the hardest part of building a business. It's not so difficult to find great teams who knew how to spend and investors who knew how to invest. Developing markets, customers and alliance partners, however, is the much more challenging part. Blueprint Companies have found these three common essentials of revenue-building:

- They exploit high-growth market segments.
- They build deep relationships with their best customers.
- They develop alliances.

Essential #2: Exploit a High-Growth Market Segment

Opportunities exist in many industries. Fresh industries such as biotechnology and Internet retail spawned multiple Blueprint Companies in the 1990s. Still, industries such as specialty stores generated the highest number of Blueprint Companies with 18 firms.

Specialty stores are omnipresent retail chains that sell anything from tire jacks and spark plugs in one case, to office supplies in another, to kitchenware in a third. There has been a revolutionary proliferation of these retailers in the last decade and it is not only due to smart marketing and an inflow of consumer dollars. It is also part of a technological revolution in companies, product scanning, satellite-sent data and real-time tracking of inventory that has made massive retailing possible.

Technology also plays an important role in the distribution and supply chain of the niche housewares players. "If you can operate with 20 percent less inventory or 60 days less manufacturing time, that is huge leverage," says Howard Lester, Chairman of Williams-Sonoma. ■

For additional information on specialty retail stores, go to: http://my.summary.com

The Big Picture: Lessons From America's Top Markets

Powerful lessons can be derived from what top leaders have shared about why certain industries form the

(continued on page 4)

The Big Picture: Lessons From America' Top Markets

(continued from page 3)

backbone of the Blueprint Company set. Here are five:

1. Most of the Blueprint Companies are growing in mature markets, not newer industries such as Internet retail.

2. Top Blueprint Companies used best management practices and technologies to stay close to their customers.

3. Exponential revenue growth requires multiple product lines or service offerings.

4. Blueprint Companies partner with suppliers to lower cost for product delivery and product differentiation.

5. Import the talents and lessons from adjacent industries.

Essential #3: Marquee Customers Shape The Revenue Powerhouse

Customers can be more than customers. The best of them can serve as an extension of your sales force. These "Marquee Customers" are customers who shape the company by testing and deploying the product, recommending the company to their peers, and simply by providing exponential revenue growth on a per-customer basis. For example, eBay's top customers are part of a feedback system that helps shape eBay's new services. These top customers are also a powerful word-of-mouth sales force to attract other customers.

The underlying driver for corporate exponential revenue growth is exponential revenue growth within each of these customers. Maximizing customer life-cycle revenues is fundamental to achieving exponential revenue growth per customer.

Deep Relationships With Valued Customers

It is not just about the number of transactions a company completes. It is not even about just selling hard. Rather, *it is about securing deep relationships with a limited number of valued customers who become the rising tide for exponential growth.* To be sure, they will not account for all revenues. However, at Blueprint Companies, these deep relationships account for a disproportionate share.

These are the Marquee Customer relationships — like the booster stage on a rocket going into orbit, they supercharge growth. Marquee Customers are people or companies with such sparkling reputations that their glow extends to whomever they do business with. They give companies credibility and instant status — sort of like having Michael Jordan dropping by your driveway to shoot hoops with you.

Marquee Customers help companies in three ways:

1. Product Consumer. They test and deploy the product. If the product is deficient, they will say why. If the product is good, they will place an order.

2. Value Proposition Shaper. They co-develop the value proposition. They can tell you if your value proposition is good for them, regardless of how good it seems to you. Marquee Customers help the management team shape the business. Therefore, the choice of which customers to sell to is critical to early execution of the company's strategy.

3. Lighthouse Reference. They serve as a reference and sell to peers. Like a lighthouse, they draw attention to up-and-coming companies by offering recommendations and references to their peers in the same way you would tip a friend off to a good painter or plumber.

Marquee Customer buyers not only give Blueprint Companies "instant credibility," they increase their revenues dramatically. Joe Scarlett, CEO of Tractor Supply, describes his company's Marquee Customer relationships: "We have a small percentage of customers who are not only important but very loyal to us. This small percent of customers accounts for a significant percentage of our business." These customers come back time and time again.

Marquee Customers are not just adequate engines of revenue: They help Blueprint Companies become revenue powerhouses. The more effort a company puts into becoming a revenue powerhouse, the greater the chances of getting to $1 billion revenue.

Start by Securing a Customer Beachhead

Blueprint Companies find a customer champion that buys their product for the first time. Once they gain their beachhead, they quickly begin to develop their long-term relationship with their Marquee Customer that, in turn, shapes them and their success.

They do this by uncovering a latent or unmet need by asking many questions. They identify an innovative solution to that unmet need. Providing a unique solution for an unmet need can provide a unique win-win opportunity for them and their customer.

Finally, Blueprint Companies do not just look for a transactional sale; they fulfill a higher-order need and in this way maximize customer revenues over a period of years.

Capture the Mind of the Customer

Blueprint Companies not only act differently than slow-growth companies, they also think differently. They are truly guided by a mission. They have a "big picture" that motivates management, electrifies the brand and excites customers. Capturing the mind of the customer adds significant value to why they will want to do business with a company for the long haul. It underscores:

- A compelling emotional benefit.
- A road map of new services or products to come.
- The company's potential to serve a "greater good."

What is remarkable about the big ideas of Blueprint

(continued on page 5)

For additional information on how Cisco developed a Marquee Customer philosophy, go to: http://my.summary.com

The Big Picture: Lessons From America's Top Markets

(continued from page 4)

Companies is that they are synthesized into a simple, crystal clear concept that is aligned with a higher-order benefit that encompasses functional and intangible benefits. These intangible benefits create permission from customers to rapidly extend and add new products or services and importantly provide endorsement to other customers.

Find Your Marquee Customer

Executives often underestimate the time needed to develop deep customer relationships. Comparing this cycle to the product-development cycle, which can be much shorter, can be a reality check for managing priorities and lead times.

Marquee Customers are regarded as the thought leaders of the industry. They are not necessarily the largest, but they are regarded for their innovation and problem-solving skills. They may be identified either by the name of the company or a leader's reputation within a company.

You can also look for these customers among industry giants that drive or set industry-leading standards. Their commitment to a supplier is the testament required for others in the community to follow their lead. For example, being a supplier to Wal-Mart is a testament that these companies are of a price, quality and supply-chain standard worthy for others to consider.

To access Marquee Customers, try to become friends of their friends. Determine who their advisers are. Get to know them and ask for a recommendation. Go to professional associations in order to meet their executives.

Blueprint Companies developed deep relationships with Marquee Customers so that their customers became their best sales force.

Customer Life-Cycle Revenues

Blueprint Companies created exponential revenue growth with these customers using the following set of variables that maximized customer life-cycle revenues:

- **Product scalability.** This variable describes the size of the initial product sold — small or large. Because the customer has a choice of which size to buy, marketing and sales can influence this decision.
- **Revenue per unit.** Independent of size, revenue per unit is critical if the price per unit is low. Then, volume is more critical in order to generate the revenue required. The ability of the sales force to negotiate the best price per unit is critical to maximizing gross margins.
- **Number of customers.** The ability to attract and retain customers varies depending on the value proposition, target market and effectiveness of the sales force.
- **Frequency of purchases per customer.** If companies have low-priced products, then along with a high number of customers, high frequency of purchase is important to generating high revenues.
- **Number of new product extensions.** Maximizing a company's portfolio of products or services increases the number of customers and the revenue per customer.
- **Geographic coverage.** Companies need a diverse geographic coverage to increase the number of customers served or increase the revenue per customer.
- **New lines of business.** Companies expand into new lines of business to grow revenue or create pull for their core business.

Essential #4: Leverage Big Brother Alliances for Breaking Into New Markets

The complement to a Marquee Customer relationship is a "Big Brother-Little Brother" alliance relationship. These alliances, in which a bigger company helps a smaller one, provide credibility to the Little Brother, give it market intelligence, and lead it to Marquee Customers. It is a two-way street. Big Brothers also need Little Brothers to help them remain on the cutting edge of innovation.

Building new businesses requires assembling a host of new capabilities such as manufacturing, emerging technologies to complement the core value proposition, channels to market, geographic expansion, and systems integration. Certain companies require speed and flexibility in order to access the capabilities of others. Creating alliances requires less capital commitment and risk than do acquisitions — a big advantage when a company lacks scale and management capabilities.

Blueprint Companies abound in Big Brother-Little Brother relationships: Microsoft had IBM; Siebel had Microsoft and Andersen; eBay had AOL; Genentech had Eli Lilly; and Yahoo! had AT&T WorldNet. What do these relationships have in common? In each case, the Blueprint Company, the Little Brother, created a company-shaping alliance with an established Big Brother, an industry giant. This relationship helped the Little Brother get on its feet and enter a trajectory for $1 billion in revenues. Similarly, the Big Brother benefited in a significant way from its Little Brother, often in its help in solving a critical strategic or operational challenge.

This alliance pattern remained unchanged across boom-and-bust economic cycles. Little Brothers and Big Brothers *need* each other. Blueprint Companies leverage their success by forming successful alliances.

Getting Alliances Right

In an era of rapid market evolution, do the following to create a well-structured alliance agreement:

- **Choose the right agreement.** It is not always desirable to invest in a formal contract before the value of the partnership is clear to both parties. Choose an agreement

(continued on page 6)

The Big Picture: Lessons From America's Top Markets

(continued from page 5)

acknowledging uncertainty and nature of contributions.

- **Avoid granting exclusivity — but always push for exclusivity.** Hedge your bets by relying on multiple partners. Allow market forces to define de facto exclusivity.
- **Use equity to encourage mutual performance.** Contrary to popular belief, equity does not guarantee performance. Think of equity as an incentive one may pay out in the long run if the partnership is effectively executed.
- **Commit business unit heads along with the CEO of the small company to champion the alliance.** Senior executives on both sides should be champions of the alliance. Their names should be written into the agreement.
- **Have an exit strategy that includes triggers based on performance or market conditions.** This should include how assets and intellectual property created during the partnership will be distributed. There are three typical evolution paths: Buy the company, buy the intellectual property, and grow together or grow apart.

Scale Alliances Based on Success

In order to increase the odds of success, many Blueprint Companies institutionalize their successful alliances so that other companies can participate. In 1998, for instance, Siebel launched a formal alliances program modeled after its Big Brother alliances with Microsoft, Andersen (now Accenture) and IBM. The program featured a comprehensive set of technical and marketing programs that enabled new partners to develop and promote their products in conjunction with Siebel Systems. The alliance program was divided into three categories:

1. Consulting Partners. Siebel's partnership with Andersen Consulting established the standards for their program. The program enabled partners to provide services to customers in terms of systems integration, consulting, training and process re-engineering.

2. Software Partners. Independent software companies were given the right to provide Siebel customers with software applications and products that inter-operate with Siebel software.

3. Platform Partners. Providers of hardware, database and operating systems were certified to offer joint benchmarking, timing, sizing and configuration with Siebel. ■

Seizing the Opportunity to Create Exponential Returns

Essential #5: Become the Masters of Exponential Returns

A fairly common management behavior suggests that allocating more resources toward developing and introducing products will solve innovation problems. This often leads to directing too much investment. The technology industries serve to illustrate what it takes to create the highest value per company. To achieve such high market values relative to other companies in other industries, they were cash-flow positive early and sustained this positive cash flow to $1 billion revenue.

Shareholder value is maximized by three factors: high revenue and revenue growth, high return on invested capital (that significantly exceeds the cost of capital) and the sustainability of those factors.

The Financial Profile of the Blueprint Masters

Blueprint Companies implemented a process for executing, measuring key financial and customer metrics as well as providing the incentive to their organization to achieve exponential returns. The group of industries that delivers the highest market value at $1 billion revenue is high technology, which includes hardware, software, peripherals and semiconductors. These industries are not the most numerous in the Blueprint list of 387 companies, but the high-tech companies are the most highly valued by shareholders.

Here are four key principles to creating superior value that can be learned from their success:

1. Create attractive gross margins early. Blueprint Technology Companies not only achieved margins in excess of 60 percent early in their history, but remained at that level throughout their journey to $1 billion in revenues.

2. Contain expenses to achieve more than 20 percent earnings before interest, taxes, depreciation and amortization (EBITDA).

3. Become cash flow positive early.

4. Utilize incremental gross margins to self-fund incremental investment.

Delivering Shareholder Returns

While a firm's return on invested capital guided its market valuations, another perspective of market valuation of Blueprint Companies found that average shareholder returns were proportional to the revenue trajectory followed. In fact, companies that achieved $1 billion in four years averaged 87 percent annual growth in market value. Those that reached it in six years averaged 41 percent annually. Those that reached $1 billion revenue in 12 years averaged a market value increase of 21 percent annually.

Essential #6: The Management Team — Inside-Outside Leadership

Among Blueprint Companies, "dynamic duos" drove many of the star-performing companies. These are two individuals who worked tightly together to build the firm from dreams to $1 billion in revenue.

(continued on page 7)

Seizing the Opportunity to Create Exponential Returns

(continued from page 6)

One of the pivotal essentials that enables the other essentials to be executed is a strategic leadership pairing in which one leader (or team) faces *outward* toward markets, customers, alliances and the community, with the other leader (or team) focusing *inward* so as to optimize operations. Think of Blueprint Companies such as Microsoft, eBay, Yahoo! and Tractor Supply where the inside executive is typically the chief operating officer and the external-facing executive is the chief executive officer. Together, they manage forward and innovate continuously, whether in product or marketing innovation. They make swift decisions and quickly correct their mistakes. Most important, they have complete trust in and respect for one another.

These dynamic duos are not just colleagues or even just friends. They have a remarkable chemistry between them, built on a very high level of respect and trust. They benefit from having complementary skills and talents.

Leadership characteristics that distinguished the inside-outside pairing include consistent communication about the company's direction and priorities; consistent values, particularly during defining moments; problem-solving skills; and having a passion to address customers' unmet needs.

Breakaway Marketing Leaders

Blueprint leaders are superb communicators. They possess the personal chemistry, even charisma, that lets them bridge the gaps between alliance members, Marquee Customers, community leaders and important investors.

Outside-facing CEOs are highly exploratory — particularly with relationships and creating opportunities. This forward-thinking style is critical to proactively developing Marquee Customers and Big Brother alliances, securing the right board members, and evangelizing the company's vision to employees and the community. This leader affects the forward-thinking approaches of the person whose role is focused more primarily on the inside, who is responsible for innovation leadership.

Breakaway Innovation Leaders

While the dynamic duo is evangelizing customers, conceiving a brilliant marketing strategy and managing the business, a third critical leader, typically the founder of the company, focuses more on the product rather than on outside relationships. These third leaders are often highly creative, with a broad range of interests. They have a need for innovation because they have a passion for extremely creative inventions. They work with others, but mostly because of a mutual interest in the subject. Rather than personal charm or charisma, they often use brilliant new ideas and the lure of exploration to keep their teams working together.

Company founders often assume this leadership role. They are pivotal in shaping the innovation-based value proposition, creating and leading the core engineering team and contributing to the fundamental principles on which the business model is based. They serve to provide a consistent trajectory of innovation aligned to the company's core value proposition.

These leaders provide an important link to customers, partners and markets in terms of getting product feedback from them. As corporations grow with new employees, these product-centered innovators act as a critical adhesive element by spurring the team on to higher levels of innovation.

More Key Roles in Blueprint Management

No single CEO can possibly keep all of the essentials in motion without help. In fact, the successful corporation is much more like an *ecosystem* than a cult of personality or personalities.

Blueprint Companies need steady-handed managers who bring stability to the enterprise. These individuals exhibit control, discipline and predictability.

It is not true that most Blueprint leaders had previous experience working in smaller companies. Of the top companies, the inside-outside leaders came from varied backgrounds. It is also not true that the founders rarely stayed with the company all the way to the $1 billion revenue mark. In addition, Blueprint founders are not the same breed. They came from all walks of professional life — from college dropouts to college grads, from small company leaders to large company leaders.

Essential #7: The Board — Comprised of Essentials Experts

Blueprint boards are not packed with investors. Blueprint Companies recruited customers, alliance partners and other Blueprint CEOs on their boards, and that makes a big difference. Board composition is a reflection of the execution of the essentials.

In order to understand the structure, top companies that were on the four-, six- and 12-year trajectories were sampled under the assumption that these boards probably had many customers and investors represented on them.

Of the four-year companies, 60 percent had an alliance partner on the board and 30 percent had customers. This ratio was reversed for 12-year companies.

A consistent set of big-name investors did not show up on these boards. The same firms were often seen, but rarely the same partner. Instead, the CEOs from other Blueprint Companies were represented time and again.

Cross-board relationships between Blueprint Companies can occur for strategic reasons. At the high point of the Internet, Tom Stemberg recruited eBay's

(continued on page 8)

Seizing the Opportunity to Create Exponential Returns

(continued from page 7)

Meg Whitman to join the Staples board.

The boards were quite balanced in terms of structure. The average size was nine with customers, alliance partners, community leaders, and CEOs from other large companies counter-balancing the investors and management team. ■

Linking the Seven Essentials

Blasting into orbit is similar to what Blueprint Companies experience as they hit their inflection points and stretch skyward in growth. While the rest of us tend to simplify the picture and observe the graceful trajectory of rising revenues, inside the company critical, high-pressure decisions are constantly being made. The decisions at this stage — the value proposition, early customers, the leadership team — are critical to determining the difference between becoming a *growth company* and becoming an *exponentially growing company that achieves $1 billion in revenue.* These decisions are the g-forces (multiples of the force of gravity) that can hold back management — challenging them to build the company fast and furiously enough to achieve "escape velocity."

Most companies experience slowing growth as they get bigger. This tends to pull them back to Earth. If the company is going to make $1 billion revenue, then it has to start with a surprisingly high growth rate. A company that expects to reach revenues of $1 billion in just four years, for instance, must have an approximate compound annual growth rate of 110 percent. For six years, the growth rate must be 65 percent — and for 12 years, 30 percent.

The linkage of the seven essentials provides a growth boost, like the second stage of a rocket pushing the space shuttle in orbit. When you put the essentials together, they are more than the sum of their parts. Linking them, in fact, creates the dynamic "1 + 1 = 3" effect that accounts for exponential revenue growth and cash flow. Executing all seven essentials with average or above average performance can make the difference between being a growth company and being a Blueprint Company.

The linkages that differentiate Blueprint Companies — exponential revenue growth and exponential returns — can be described as follows:

- **Link the big idea with markets and Marquee Customers.**
- **Link the company's resources to the front line.**
- **Establish a board of essentials experts.**
- **The innovation leader leads the development team and links them to the value proposition (the big idea).**

A High-Performance Culture

It is important to step back from all the strategic, financial, leadership and governance issues around Blueprint Companies and consider the company culture implications. Such high-performing organizations can be extremely challenging to work in. Terms such as "performance focus," "bottom-line orientation," "accountability," "making the numbers" and "aggressive management style" may have a positive ring in the business sense, but can come at a high human cost: personal and mental health, shortened job tenure and strains on family life. To be frank, there are a few Blueprint Companies that had reputations for rapidly turning over teams if they failed to meet the numbers.

This is concerning, because most of us need some sense of belief that the place where we work is a "good" or "great" place to work. We also want the enterprise to be a success, largely because success is the best form of personal satisfaction and job security.

Fortunately, as can be seen with many Blueprint Companies, the best corporate cultures are ones with a high-performance focus *and* a nurturing environment. ■

Talent and Leadership

The primary growth challenge will come more from the constraints of recruiting, developing and retaining the best leadership and talent that a company needs than it will from financial constraints. Business talent will become even more mobile and, given the acceptance of virtual teams, will become even more accessible to employers around the globe. Therefore, companies are compelled more than ever to strike that right balance between employee satisfaction and financial performance.

In today's flat world, that means recruiting innovative and talented employees not just locally but globally. The ability to recruit and retain the very best talent a company would need is both a high priority and constraint — now and in the future.

How to Compete in a Copycat Economy

BREAK FROM THE PACK

THE SUMMARY IN BRIEF

Everywhere, products are being commoditized, services are being imitated, and traditional barriers to market entry are collapsing. You can't survive on "me-too" products, services and business models, and the ever-popular "all things to all people" approach will fail you every time.

To sustain a competitive advantage in today's "Copycat Economy," you must break from the pack. Companies that break from the pack take customers far beyond mere satisfaction. These companies tend to go beyond the mission statement to a "higher cause." They build a pipeline of cool, compelling products and always manage to stay way ahead of their industries.

This summary captures the essence of bestselling author and business professor Oren Harari's advice and tips for competing in a Copycat Economy. The summary details how "Commodity Hell" demands that companies differentiate themselves from their competitors, how to dominate your own marketplace, and how to be the leader of a company that breaks from the pack.

In addition, this summary will describe the following:

- ✓ ***Ten Compulsions Guaranteed to Keep You Mired in the Pack.*** *Face the things that keep you stuck in the pack and plunge you further into the spiral of Commodity Hell.*
- ✓ ***The Power of Calculated Reinvention.*** *Learn how Madonna and Willie Nelson offer lessons for jumping in front of the pack.*
- ✓ ***Building a Culture of Disciplined Lunacy****. Find out how curious, cool and crazy companies do the things it takes to stand out and succeed.*
- ✓ ***Why Davids Beat Goliaths.*** *Discover why companies like Google, Whole Foods and JetBlue actually achieve greater success than their much larger rivals.*
- ✓ ***A 12-Step Recovery Program.*** *Gain a perspective on the kinds of personal leadership that you will need to demonstrate to inspire people to do extraordinary, break-from-the-pack things.*

BREAK FROM THE PACK

By Oren Harari

— THE *COMPLETE* SUMMARY

The Never-Ending Race to Succeed

In every industry, a very small number of organizations are fast, fit, healthy and clearly at the forefront. They are followed by a few pretty good wannabes nipping at their heels. These groups are clearly ahead of "the pack" — that large, undifferentiated bulk of companies of all shapes and sizes that don't stand out and don't draw the kind of positive attention from customers and investors that they'd like.

Anyone Can Break Away

Any organization can successfully bust loose in any direction from the round-and-round-we-go pack mentality, but the bad news is that in a global free market, the pack is bigger than ever before! The pack grows, more players run earnestly, the racers constantly check each other out, and they mimic each other's movements.

The result is the Copycat Economy, an arena marketed by "me-too" mimicry and lots of commoditized products and services. As a leader, helping your organization stand out and win in a Copycat Economy is the most important strategic challenge you will face.

In business, frontrunners frequently fall behind and fail. So don't panic if your organization is currently stuck in the pack. You can break from it. You can overtake today's lead dogs.

Welcome to Commodity Hell

Vending Supply, Inc. (VSi) is one of the premier designers, manufacturers and distributors of children's stickers and temporary tattoos. "We brought stickers to the forefront of cool," said CEO Robert Winquist.

Then all the major players started copycatting VSi and VSi had to compete on price. Winquist said, "Today VSi is three times more creative and three times more efficient than we were 10 years ago. That means we're nine times better. But our margins are one-fifth what they used to be three years ago. What's going on?"

Welcome to Commodity Hell. Or more accurately, welcome to the Copycat Economy, where everyone has access to the same resources and talent, where the Web is the great equalizer, and where the market's twin foundations are imitation and commoditization.

Two principles keep companies trapped in the pack and snared in the Copycat Economy, and make up the most challenging double whammy affecting an organization's competitiveness and very survival:

1. The inevitability of perpetual imitation

2. The commoditization of everything

Commoditizing the 'Good Enough'

As more competitors rush to make incremental improvements of products and services, they get commoditized at a higher level, which leads many customers to conclude that "good enough" is really good enough.

It used to be that if customers didn't pay a premium, they'd have to accept low quality in return. In the Copycat Economy, that's not true.

The Causes of Commodity Hell

1. The Irrelevance of Time and Distance — Imitation can come from anywhere in the world, at any time.

2. The Rise of Glass House Transparency — Secrets, proprietary information and closed-door management systems don't have the competitive edge they used to because new technologies have the capabilities to create total transparency.

Welcome to Commodity Hell

(continued from page 2)

3. The Customer as Superpower — Customers are now capable of reducing any well-promoted, well-packaged market offering to a bare-bones commodity.

4. Cost-Crushing Technology — New and existing technologies allow for radical cost-cutting and operational efficiencies, which, in turn lower barriers to entry and create more players competing in the pack.

5. Mobs of Competitors — In industry after industry, a fragmented playing field means an ever-growing number of competitors and a harder challenge to break free of them.

6. A Zeitgeist of Irreverence — Customers and competitors are irreverent, creating dissatisfaction with the present.

Accepting the Challenge of the Copycat Economy

Consider the payoff of breaking from the pack: A clear differentiation from competitors; rapid, sustained and real growth; higher margins; higher stock prices and market caps; boosts in market buzz; more customer loyalty; an optimistic and creative work environment; easier sales and marketing; and an agile, aggressive infrastructure. ■

How to Lose

Faced with the twin plagues of commoditization and imitation, business leaders reflexively resort to 10 courses of action that plunge their companies further into Commodity Hell.

1. The Compulsion to Cut Costs

To be sure, cost-cutting efforts are useful and necessary, but only when part of a well-executed growth strategy. By itself, the frenzy of cost-cutting is often a self-defeating compulsion.

In early 2006, Ford — mired in deteriorating market share and "junk bond" status — announced another big restructuring plan.

But will this unleash a fresh wave of capital, innovation and employee commitment necessary to design, manufacture and deliver sexy, high-quality "gotta-have" cars with superb after-sale service? If the answer is yes, Ford will rock. If the answer is no, the savings will be illusory.

2. The Compulsion to Cut Prices

Desperately lowering prices to keep customers from bolting decimates a company's margins and trains customers to wait for another round of price cuts before buying. When one competitor copies the other's price-cutting sales promotion, both fall prey to the Copycat Economy.

3. The Compulsion to Improve Current Products and Services

If you want to survive in the pack, improving current products and services is a must. If you want to thrive beyond the pack, it's not enough.

The compulsion of "incrementalism," or making minor product enhancements that are not coupled with any breakthrough growth strategy, appeals to a manager's aversion to risk.

4. The Compulsion to Concentrate on Marketing and Sales

The track record of sales and marketing initiatives is, at best, mixed. Despite our love affair with sales and marketing, their impact in a Copycat Economy is cloudy and often turns out nowhere near what we hope it will be.

5. The Compulsion to Get Bigger

The benefits of bigness — scale, scope, synergy and cross-marketing — are genuine. Nevertheless, the impact of these benefits has been grossly misunderstood and overestimated.

The key predictors of corporate success and shareholder value are not the size of a company's tangible assets, but the size of its intangible assets like its speed in execution and customer care, its culture of constant innovation, and its mobility and agility in capitalizing on fresh, fleeting opportunities.

To predict who's going to break from the pack, look at who's got the quickest adaptivity and imagination, not who's got the biggest numbers on the balance sheet.

6. The Compulsion to Control

More than a few managers still instinctively buy into the compulsion to control. In the short term, tightening controls and increasing pressure might indeed uncover some inefficiencies and get people to hustle out of sheer fear.

Short-term financials might actually improve. Yet in the long run, such autocracy kills risk, initiative and personal accountability.

7. The Compulsion to Ask Customers What They Want

The compulsion to ask customers what they want can leave you reactive and fossilized. Breaking from the pack requires you to lead customers to a place they didn't ask to go and didn't know existed.

Market leaders who break from the pack pull the customer to new places. They take some chances that push them past their market research.

Before Starbucks, how many consumers would have assured Howard Schultz they would stand in line to

(continued on page 4)

How to Lose

(continued from page 3)

spend $4 for a cup of coffee in a paper cup?

8. The Compulsion to Embrace Organizational Fads

When a company gets mired in the pack, nervous executives sometimes resort to adopting well-accepted, well-known in-house development or assessment programs that have to do with "total quality," "diversity," "conflict management" and such.

9. The Compulsion to Use Legal and Political Force to Protect Your Business

If companies rely on legal and political force for competitive advantage, they are doomed. Lawsuit and protectionism strategies drain a company of resources, money, vision, and the urgency to challenge and reinvent itself in the face of new technological and competitive realities.

A company that is serious always proceeds "as if" there is no "protection" anymore because, ultimately, there isn't. Feed your lawyers and your lobbyists, but don't compulsively let them determine your strategy.

10. The Compulsion to Do Anything as Long as You're Doing Something

Many businesspeople respond to the Copycat Economy with manic bursts of action, such as acquisitions, divestments, restructuring, downsizing, outsourcing or new alliances. It doesn't matter whether there's any strategic discipline, due diligence or follow-up execution, as long as action happens.

Sometimes a leader gives up any pretension of knowing what to do. "Do whatever it takes to get the numbers Wall Street wants" becomes the message. When a company goes down this track, the inevitable setbacks begin and the dysfunctional actions are accelerated at a frenzied rate. ■

Enacting Reinvention

Here is what you must do to execute the Madonna Effect and the Willie Principle.

1. Take those small, in-the-distance trends seriously.
2. Be willing to regularly challenge what made you successful in the past.
3. Be willing to change long-time suppliers and disrupt current supply chains.
4. Don't become paralyzed by the fear of going too far.
5. Listen to the crazy customers.
6. Take underserved markets seriously.
7. Take emerging demographics very seriously.
8. Don't be panicked by finicky investors.
9. Have the courage of your convictions.

The Madonna Effect and the Willie Nelson Principle

Whether or not you're a Madonna fan, there's no denying the fact that, as an artistic enterprise, she's been spectacularly successful. What is her secret?

Madonna's brand relies on crossing over from mainstream to the margin and showing everyone else how to do it, too. She reinvents herself by keeping her antennae attuned to the culture, norms and behaviors that interesting fringe groups are currently experimenting with.

Jeffrey Katzenberg, the former head of Disney Studios and DreamWorks Animation, described Madonna this way: "She is always evolving; she never stands still. Every two years she comes up with a new look, a new way of presenting herself, a new attitude, a new act, and a new design. And every time it is successful. There is this constant genesis." That is the protean mantra that applies to any business that wants to break from the pack over the next decade.

The essence of the Madonna Effect is, "Don't just respond to your customers; lead them."

The Willie Nelson Principle: Jumping in Front

Willie Nelson and Waylon Jennings pioneered a major transformation in country music: "Outlaw Country." Willie and Waylon were key forces in reconciling hip and redneck musical interests, thus restoring a rawness to country music and leading a new explosion of popular interest in the format.

In the late 1980s, Willie was asked about how he and Waylon "knew" that their leadership on "outlaw" music would be so successful. In what could be the most important quote in this book, here is his reply:

"Being a good leader is finding a bunch of people going in one direction and jumping in front of them. That's what I did. I saw all these things happening, so I called Waylon and we came down to Austin and acted like we started the whole thing. We didn't start nothin'. It was going on."

Willie and Madonna paid attention to the oddball but interesting stuff that was "goin' on" — stuff that was available to anyone who paid attention to it. ■

Curious, Cool and Crazy

In today's hypercompetitive environment, organizations that break from the pack are curious, cool and crazy.

(continued on page 5)

Curious, Cool and Crazy

(continued from page 4)

Curious

Curiosity has three components: audacity, a "yes" culture and passion. If the strategic direction of your organization can be described as willfully daring, calculatingly bold and deliberately adventurous, then you're on the right track.

A corporate culture of "yes" sends a complex but clear message to every employee to "go for it," even if it challenges what was done in the past. Passion is the fuel for curiosity. Breaking from the pack is heavily dependent on leaders and employees who are passionate about what they're doing and what they might accomplish.

Cool

What you do, what you make and how you do it all must be perceived and experienced as cool by your employees, customers and investors. Anything that resonates with innovation and imagination — anything that is counterintuitive, controversial and delightful — is cool.

Crazy

"You can't proceed in a calm, rational manner," said Jack Welch to *The Wall Street Journal*. "You've got to be out on the lunatic fringe." In the world of business, today's lunacy is tomorrow's conventional wisdom, while today's conventional wisdom is mired in the Copycat Environment.

At the end of the day, organizations need a very healthy dose of purpose and precision. Passion for purpose without passion for precision yields corporate recklessness and irresponsibility, while passion for precision without passion for purpose yields conformity and stagnation; there must be a balance.

The EMBER Model

To make your organization curious, cool and crazy, employ the EMBER model. As you weigh a course of action or decision, ask yourself:

1. (E) Does it make us *extraordinary?*
2. (M) Does it *matter* to customers?
3. (B) Does is *break new ground*?
4. (E) Does it encourage *evolvement*?
5. (R) Is it *real*?

If the answer is a firm "yes" to each of these questions, then your decision could ignite your business like oxygen to an ember in the fire.

Final lessons: Winners do strategy on the run; intangibles are more important than tangibles; and it's gotta be fun. ■

For additional information on the EMBER model, go to: http://my.summary.com

Dominate or Leave

In today's Copycat Economy, you must choose your markets, products and customers very carefully, then go in with tremendous creative and productive force until you dominate the arenas you've selected. The implications are twofold: One, don't enter any space you're not prepared to dominate. Two, once you figure out what you will dominate, exit everything else. Period.

One Size Doesn't Fit All

"One-stop-shopping" should be eliminated from corporate strategy sessions; the phrase is diabolical, making otherwise sensible executives salivate with infantile glee. Their eyes glaze as they visualize hordes of customers. However, to challenge the famous *Field of Dreams* dictum, if you keep on building it, they probably won't come. And then you're stuck with a big stadium.

Apart from those darn customers who insist on making their own decisions, there's another reason why "one-stop-shopping" is a fantasy. No matter what your consultants and investment bankers tell you, you can't be great in everything, you can't do it all, and if you try to do it all, you'll wind up with a big diversified menu of undistinguished "me-too" products and services, while dominating nothing.

Why Davids Beat Goliaths

David Google doesn't dominate Goliath Microsoft. Google dominates search. David Whole Foods Market at $4.7 billion doesn't dominate Kroger at $60 billion. Whole Foods dominates natural foods. The $1.6 billion David JetBlue is miniscule compared to the $16.6 billion United Airlines. Yet while JetBlue was growing in leaps and bounds without megamerger, United's sizable debt, cost-inefficiencies and mismanagement threw the company into bankruptcy.

The Goliaths above aren't "bad" companies. There's nothing inherently negative about size and diversification as long as they remain true to the spirit of dominance. The companies that dominate don't dominate because they got big. They got big because they dominated.

The Seven Steps to Dominating

1. Choose to dominate — whether part of a start-up or a leader of an established business, the first step is to choose dominance over size.

2. Be a laser, not a floorlamp — your growth strategy should be laser-like: simply stated, easy to convey, highly concentrated and precisely focused on the area you'll dominate.

3. Make sure the laser is exciting — concentrate your efforts on a compelling and intriguing growth area.

4. Be willing to subtract — you must prune things

(continued on page 6)

Dominate or Leave

(continued from page 5)

down before thinking about domination.

5. Choose metrics that dominate — profitability, organic growth, customer retention and retention of top talent.

6. Ensure that your organization's talent and skills stay dominant — choose the best people with the greatest talent and the best fit with your mission, and then nurture and invest in them.

7. Build a dominating culture — figure out what it takes for your corporate culture to be powerfully dominating internally and built for dominance externally. ■

Put the Pieces Together for a Higher Cause

Mission and vision statements are good things to have. But to break from the pack, a company would be wise to strive for something bigger than a mission and deeper than a vision. A company must define a cause.

A central idea or cause will be essential if you want to have any sort of success in a Copycat Economy. But to improve your odds of truly breaking from the pack in a sustained way, you should consider going a step up, to a *higher* cause. A higher cause is about somehow bettering the lot of human beings. A higher cause can serve as an organization's strategic beacon, market brand and organizational "soul."

Six Steps to Help Your Organization Find Its Higher Cause

1. Ask the deep questions about your organization.
2. Concentrate your attention on the horizon.
3. Rearrange the pieces to make a big difference.
4. Don't let anyone else define coherence, authenticity and revolution/evolution for you.
5. Enlist champions.
6. Learn to synthesize. ■

Build a Defiant Pipeline

To stay ahead of the pack, you can't rely on one product, even if it's a home-run product. You must develop a pipeline of continuously emerging products that defy — and visibly transcend — the "me-too" value of whatever is currently being offered in the market by rivals and by the company itself.

Strong pipelines allow companies stuck in the midst of crowded mass markets to differentiate themselves. A strong pipeline allows companies to survive and thrive under seemingly impossible circumstances.

The 10 Commitments to the Defiant Pipeline

1. Always be cannibalizing.
2. Become an anthropologist with your customers.
3. Be a NASCAR racer, not a basketball player.
4. Be a magnet for the crazy three percent of customers.
5. Be a magnet for the crazy three percent of employees.
6. Be a magnet for the crazy three percent partners.
7. Become a pipeline for design.
8. Target new terrain.
9. Think broadly, act narrowly.
10. One more time: Dominate or *Leave*. ■

For additional information on the power of the pipeline, go to: http://my.summary.com

Take Your Customer to an Impossible Place

How do you take your customer to an impossible place? Fortunately, for you, there's no quick fix answer to that question — if there were, it would be copied instantly, sending you right back to Commodity Hell.

Here are five steps that will help you lead your customers to an impossible place.

1. Lead institutionally
2. Lead with profound authenticity
3. Lead with genuine caring
4. Lead with turbo speed
5. Lead with the individual customer in mind

Seven Quick Impossible Questions

Here are seven quick, simple questions you should be continually asking yourself and your team from the perspective of your customers.

1. How *easy, hassle-free, fast and fun* is it to work with this vendor — before *and* after the sale?

2. Does the vendor really, truly *listen* to me? *Seek my input? Understand me* and the challenges and opportunities in my life (or my business)?

3. One a *personal* level, how *responsive, caring, empathetic* and *concerned* is the vendor toward me? Do I feel taken care of when I deal with this vendor?

4. Does the vendor know me (or my business) so well that he or she can *anticipate* what I might want and need before I do?

5. How effective is the vendor in devising a *fast, creative solution* to my *real* problems and *unique* needs?

6. Can I *trust and count on this vendor* to continually

(continued on page 7)

Take Your Customer to an Impossible Place

(continued from page 6)

come up with great ideas for me (or my business)?

7. When I get involved with this vendor as a corporate customer, is my *work distinctly better*? Is my *business distinctly better*? Or, if I'm an individual customer, is my *life distinctly better*? ■

Take Innovation Underground

Today there is a group of companies whose executives devote their *primary* attention to their corporate undergrounds. The secret to success of these companies is that they are ruthlessly hyperefficient in their underground operations and supplier relationships.

There is a constant innovation in their processes and systems that allow them to continually and creatively shrink their costs and cycle times. Because the innovation occurs underground, far from the eyes of the customers, it's not directly experienced by customers except at the end point: lower prices, convenience, reliability and fast service. To get your best shot to break from the pack, you must demonstrate as much *obsessive innovation for the underground* as you do for your company's above-ground product development, design, marketing and customer service. ■

Consolidate for Cool

In a Copycat Economy, you'll need to employ new and rigorous standards for consolidating with other companies. There's nothing as fast and sexy as a high-profile merger to quickly inflate your numbers and show that you're a "bold, can-do" leader. However, most mergers and acquisitions fail.

How to Consolidate for Cool: Accessing the Intangibles

Here are the kinds of intangible elements that your prospective merger or acquisition needs to aggrandize if it is to help propel the new company in front of the pack: Knowledge, talent, imagination, speed and agility, foresight, the desire to be a renegade and inspirational leadership. ■

Eight Reasons Why Mergers and Acquisitions Fail

Why does the typical merger or acquisition fail?

1. Fantasy logic.
2. Delusional projections.
3. Absurd overpaying.
4. Obsession with the top line.
5. Lousy due diligence.
6. Crummy customer consequences.
7. A naïve belief in easy integration.
8. The dinosaurs mating syndrome.

You, the Leader of the Pack: A 12-Step Recovery Program

To add some serious value to both your organization and your career prospects, you will need to move beyond nostrums. You will need to get down to the bare-knuckles basics of leadership. This "12-Step Program" is designed to put you on the path to success.

Step 1: First, Admit You're a Commodity

You will be wise to admit that in a Copycat Economy, whatever your organization is doing and providing today is right now becoming imitated and commoditized, and, therefore, will inevitably require significant change.

Step 2: Take a Risk on Risk

We fear the negative consequences of risk, even when we're dissatisfied with the status quo. We fear the negative consequences of risk, even as we ignore the even more negative consequences of staying the course. We need to reassess risk and then take a prudent risk on risk.

Step 3: Set 'The Way'

Establish a concise, urgent, and inspiring direction for your company. Define "The Way" for your organization. The Way has two components: path and tone.

Your path must buck some conventional wisdom and strive to rewrite some industry rules.

Tone is the climate, the mood that expresses your organization's values and soul.

Step 4: Believe that Customers are More Important Than Investors and Employees

You must be able to convey to people that the prime purpose of their jobs and investments is to help make customers very, very happy.

Peter Drucker always said that the only reason for a company's existence is to create and serve customers. Many business people seem startled by this notion. However, no matter how much resistance you receive, you must lead with the premise that all else follows from your success with the people for whom your company exists.

Step 5: Unleash Talented Maniacs

Break-from-the-pack leaders continually scour the landscape not for people who can "do the job," but for

(continued on page 8)

You, the Leader of the Pack

(continued from page 7)

maniacs who, without being asked to, will transform their jobs on behalf of the team, not their own egos.

You must provide these talented maniacs with the training, development, information technology and other resources so *they* can figure out how to best reconfigure their jobs to achieve your organization's objectives.

Step 6: Rev Up Your Base

Open the Windows: Help people open their windows and look at the world outside their jobs. Expose them to the same eye-opening information you have, and discuss it candidly. People get on board when they see for themselves the reasons that are inspiring you to change.

Open the Doors: Keep your planning and decision-making processes as transparent and inclusive as possible. As a leader, you must take the lead not only in setting "The Way," but also in including others in business analyses, strategic conversations and operation problem solving thereafter.

Start Driving: Once leaders have clearly articulated The Way and have opened windows and doors, it's time to challenge people to get on or off the bus because it's time to put the operation in gear and step on the gas.

Step 7: Get Personally Engaged

Great leaders delegate liberally, but they stay engaged: They *personally* remain in touch with employees to learn their perspectives. They *personally* stay involved with critical issues, not only so their decisions aren't made in a vacuum, but also to use their power to help their people achieve big goals. They *personally* immerse themselves in seeking the truth.

Step 8: Lead From a Glass House

Leaders always function from a glass house, where their actions and attitudes are visible to everyone around them. The glass house effect is so pervasive that it makes people draw conclusions about the leaders themselves. When the leader's words and deeds match, the leader's credibility and influence go up.

Step 9: Honor a Minimal Number of Priorities

The fewer priorities you have, the more likely you'll be able to honor them, and the more likely you can achieve the breakthrough results necessary. Any plan with more than five "priorities" usually winds up prioritizing nothing.

Step 10: Team Up With Aliens

If you want breakthrough knowledge, leap outside the walls of your industry whenever possible. You'll gain even more insight and power when you go beyond observing and partner closely with talented aliens outside your industry who don't come to the table with the mindset and history that's considered conventional in your business. Encourage as many of your people as possible to see the value in alien knowledge and partnership.

Step 11: Lead from the Middle

Don't Wait for Orders: Initiate Solutions: Executives desperately need fresh ideas and initiatives. They don't want people just to come up with a great idea and then toss it upstairs. They want their midlevel leaders to create solutions.

Focus on the Customer's Needs: One of your safest bets is to let the customer drive your imagination. Figure out ways to make customers more delighted and loyal.

Do It Without Asking: Think like a businessperson, not as an employee. Don't ask for permission to take action. Working independently, develop big goals that will address some big gaps, and then start with small and meaningful steps toward your goals.

Don't Let the Career Skeptics Get You Down: If you're ever challenged, explain your actions on sound business principles and then continue to act without asking for permission.

Don't Give Up Even If They Want You To: If you do get orders to stop, don't automatically roll over and play dead. If you feel strongly about your cause, stay true to it.

Step 12: Know When to Hold, Know When to Fold

One of the most important and honorable attributes of a great leader is to know when to stay and when to exit. Knowing when to hold and when to fold is an act of reality and integrity.

Breaking from the pack in the relentless Copycat Economy is no small feat. You have the capability to help your organization break into the lead. Make yourself one of the leaders in the effort to break from the pack. ■

Creating Authentic Teams For High Performance at Work

BRIDGING THE BOOMER-XER GAP

THE SUMMARY IN BRIEF

Today's workplaces are dominated by two generational groups: Baby Boomers and Generation Xers. The Boomers now hold top management and policy-making positions, while the younger Xers have just recently entered the world of work.

Unfortunately, both groups view each other with suspicion. Boomers tend to believe the stereotype that Xers are slackers, loners and self-absorbed. Xers think Boomers are incapable of adapting to technological and social change. Both stereotypes are false, and those who manage Boomers and Xers must learn how to dispel the myths. What is true is that each group sees the world through a different lens.

In this summary you will learn how to help Boomers and Xers in your organization overcome their stereotypical thinking and bridge the actual differences that do exist.

What You'll Learn In This Summary

✓ **Building Authentic Teams:** Authentic teams let Xers and Boomers work together by allowing them to see, appreciate and accept their differences. Once they do, intergenerational teams will work together effectively while retaining their individuality. You will learn how to take your team through difficult but predictable stages as it becomes a high-performance team.

✓ **Supporting Authentic Teams:** You will learn what a team leader needs to do to let an authentic team do its best work. Authentic team leaders know when to make decisions and when to let the team take responsibility.

✓ **Authentic Problem Solving:** You will learn exactly how a team should go about determining what it wants to accomplish and how it will implement objectives designed to get it to the goal.

✓ **Managing Conflict:** You will learn why intergenerational conflict exists and how you can defuse it.

Baby Boomers and Generation Xers at Work

"The old-timers won't change" and "the kids won't work" are fighting words. The attitudes behind the words represent a serious threat to workplace effectiveness. If we want to retain our position as global business leaders, we need to capitalize on every asset we have. Our greatest asset, and potentially our greatest Achilles' heel, is the American worker.

Two age groups currently dominate the world of work: Baby Boomers born between 1945 and 1962, and Gen Xers, born between 1963 and 1982. Both groups eye each other with suspicion. Boomers believe Xers are slackers with little work ethic, while Xers believe Boomers just don't get technology.

Boomers have difficulty taking a stand on issues, often attempting to bridge the generational differences between their parents and their children. To Xers, those behaviors seem to reflect ambiguity and lead to a perception that Boomers simply never take a stand on anything. Xers have responded by taking strong stands on even minor issues, behavior which certainly isn't ambiguous.

A New Version of the Protestant Work Ethic

As Boomers reach higher levels of authority, the values of their parents become dominant. Boomers grumble about younger workers' work ethic much as their parents grumbled about long hair and short skirts. As Boomers climb the corporate ladder, they are beginning to demonstrate the belief that "work is its own reward," and that the motto "live to work" describes their attitude. The Xers' motto can best be described as "work to live."

Another significant difference between the two groups lies in their perception of the appropriate place loyalty plays in the workplace. Boomers grew up with the belief that if you took care of your employer, he would take care of you. Xers have seen that, in practice, loyalty may not be a two-way street, as they observed the jobs of their parents downsized, right-sized, process reengineered, and eliminated. In fact, one recent study showed that only 25 percent of employees today consider themselves truly committed and plan to stay two or more years. One third don't plan to stay even that long, and a full 39 percent plan to stay, but only because they are "trapped" with no other options.

This lack of commitment is hard for Boomer managers to accept. Faced with unprecedented high turnover rates, managers find themselves continuously recruiting and training new employees. Given issues of loyalty and commitment alone, organizational survival is at risk. Commitment plays a major role in an employee's willingness and ability to be fast and flexible on the job. Ultimately, it is people who make or break the organization. Without a willing work force pulling together to fulfill the organization's mission, dysfunction is the logical outcome. If Boomers and Gen Xers continue to

(continued on page 3)

A Different Kind of Loyalty

Gen Xers have strong feelings of loyalty to family and friends. They were the first generation of children to come home after school to an empty house because both Mom and Dad were at work. Xers have vowed to make it different for their own children. They take time off to get children to the doctor. Xers know there is another job just around the corner and that no job should come before family and friends. Xers are very loyal, but not to their company. That relationship is one of service rendered for dollars paid. For Xers, putting family first means being there. Period.

Generation X members look at work as a necessary evil. Work itself is not a reward. If work can be fun, it can be tolerated. And the very thing that makes work "fun" for Xers is problematic for Boomers. Xers love technology, speed, and continuous change. They want to multitask. They play video games to relax.

Baby Boomers and Generation Xers at Work

(continued from page 2)

move in separate directions regarding commitment, corporate dysfunction will get worse.

The Evolution of the Baby Boomer

The formative years for the Boomers range from 1955 to 1975. The older Boomers were shaped by the Vietnam war in ways their fathers weren't by WWII. They lost their innocence — and their respect for authority. They questioned the wisdom of decision-makers, adopting the phrase "Never trust anyone over 30."

The youngest Boomers had a different coming of age experience. The draft ended before they were old enough to be eligible, and by the time it was seriously under consideration again during Operation Desert Storm, they were too old.

Gen Xers know nothing of the experiences and lessons of their parents' generation. They have grown up to be independent and self-sufficient. Equal rights became something they took for granted as they entered the work force, taking advantage of the benefits won by Boomers.

Xers believe as a group that men and women have equal employment opportunities and should share in household and child-raising efforts. These attitudes impact the Boomer managers for whom these young people now find themselves working. If the baby gets sick, Mom or Dad will stay home to care for her. Unlike Boomers, where women often stayed home to care for the sick child because she made less and was primarily responsible for family-related problems, the responsibility falls on both.

For Boomers a second income was often a luxury. For Xers, that's not the case. Many work for the benefits (such as health insurance), finding that their take-home pay goes principally for child care. Boomer managers rarely understand this reality. Nor do they understand that a father might be the one to stay home. The Xer who calls in to say he will be at home with a sick child is simply taking his turn with the kids. But to his Boomer boss, this guy just became a slacker and is thrown into the deep end of the Gen X stereotype pool. ■

For a look at how one company mismanaged a generation Xer, go to: http://my.summary.com

Research Yields Three Conclusions

If you want to bring Boomers and Xers together in the workplace, you must take to heart the conclusions reached by the researchers:

✓ Boomers are team-oriented and willing to subordinate personal goals to those of the group, while Xers are both team-oriented and honoring of personal goals. Simply forcing Xers to conform to group values won't make for good teams.

✓ Boomers are here to stay, and hold the majority of policy-making roles, and will remain on the job for a long time to come given the lower numbers in the Xer generation work force.

✓ Tolerance must be exercised at work, and each generation must recognize what it is the other has to offer. Boomers bring to the table experience, a sense of group values, and a long-term perspective. Xers bring a focus on the present, a high-tech proficiency, and a balanced view of work and life.

Once you recognize these realities, you can begin to develop managerial strategies and organizational structures that will support Boomer and Xer values while integrating members of both groups into effective teams.

Studies Outline Xer and Boomer Characteristics

Today's workplace relies on teamwork to succeed. Yet if the participants in those teams don't buy in, business may be creating self-defeating organizational structures. They may be building teams for people who don't like teams. Given preconceptions about Xer and Boomer behavior and values, it would be easy to conclude that Boomers value teams while Xers value individualism.

Two recent groundbreaking studies shed light on just how each group feels about teams.

The first study used 189 Baby Boomers and 209 generation Xers from six public and private organizations. The study measured how the participants viewed teams and teamwork using the Team and Organizational Behavior Inventory. The researchers expected to find that Boomers valued teamwork more than did Xers. That was not the case. In fact, the results showed that Xers actually were significantly more team-oriented than Baby Boomers!

The second study was designed to test the question "Are Gen Xers more individualistic than Baby Boomers, despite their stronger team orientation?" This study used the Individualism-Collectivism Scales to determine how individualistic survey participants were. It measured competitiveness, solitary work preference, self-reliance, supremacy of group interest, and supremacy of group goals. The results show that Xers scored significantly

(continued on page 4)

Studies Outline Xer and Boomer Characteristics

(continued from page 3)

higher in individualism. This was most apparent in the following responses:

1. A group is most productive when its members do what they want to do, rather than what the group wants them to do.

2. A group is most efficient when its members do what they think is best, rather than doing what the group wants them to do.

3. A group is more productive when its members follow their own interests and concerns.

The two studies yield a single statement that can easily change the direction of team building, management, and human resource development for the next two decades. That conclusion is:

Generation X is significantly more individualistic AND significantly more team-oriented than the Baby Boomer generation. ■

A Different View of Teams

To bridge the boomer-Xer gap, you need to develop a different kind of team. The current model holds that effective teams are based on common ground and similar interests. The new model, called the "authentic individual-based model," holds that the most important element in team building is how each contributing member is uniquely different from all other members. Although both models aspire to the same end — highly effective teams whose members work well together — they differ in how that end is achieved.

The Traditional Team

The traditional model for team building is based on the following assumptions:

1. Human behavior is subject to certain "laws" of group dynamics and specific directions.

2. These laws and directions are normative, being better than others. For example, democracy is better than autocracy.

3. Because norms exist, it is possible to define categories of behavior and determine whether individuals exhibit these behaviors.

4. Those that do not conform to the norms are not maximizing their full potential and can be trained to do so.

5. A group must adopt certain preferred behaviors such as openness, trust and cooperation before they can function effectively as a team.

Thus, the traditional approach emphasizes common values and objectives. Group cohesion is an important value, and maintaining supportive interpersonal relationships is often as important as accomplishing team objectives. This model has been successful because it fits well with the views held by members of the Boomer generation and their parents.

The Authentic Team

Authentic teams have their origins in Gestalt psychology. Gestalt emerged in the early 1960s as a strong counter to traditional psychotherapy and the idea that someone is either mentally ill or mentally healthy. It is instead based on the personal growth model. Organizational experts began in the 1970s to see applications of the personal growth model to organizations. The term "authentic teams" grew out of this movement.

The authentic team supports the right of each individ-

(continued on page 5)

Traditional vs. Authentic Team Characteristics

1. **Traditional:** Interdependence is the key value.
   Authentic: Individual autonomy is the key value.
2. **Traditional:** Experimenting with new process behaviors is preferred.
   Authentic: Increasing awareness of existing behaviors is preferred.
3. **Traditional:** Good work is a result of good working relationships.
   Authentic: Good working relationships are the result of doing good work together.
4. **Traditional:** Appropriate behavior is determined by conformance to team norms.
   Authentic: Appropriate behavior is determined by individual choice within each situation.
5. **Traditional:** Responsibility and rewards are best viewed in terms of team effort.
   Authentic: Responsibility and rewards are best viewed in terms of individual effort.
6. **Traditional:** Values conflict resolution.
   Authentic: Values conflict management.
7. **Traditional:** Attempts to empower others.
   Authentic: Recognizes only self-empowerment.
8. **Traditional:** Values being "open."
   Authentic: Values being "upfront."
9. **Traditional:** The effective team leader/coach puts the welfare of the group before his or her own.
   Authentic: The effective team leader/coach looks to his or her own welfare first.

A Different View of Teams

(continued from page 4)

ual member to hold separate values and to base commitment to team objectives on those values. Each person's uniqueness is valued.

From a starting point of differentiation, the team then explores ways it can work together effectively. Authentic teams encourage participation at levels that are comfortable for members. On an authentic team, there may never be equal levels of participation among members at any one point in time. Over time each member will participate in his or her own way at a level that supports a desire to continue to be part of the team.

Conflict is seen as natural and constructive, and is managed rather than resolved.

A Different Team-Building Paradigm

To build an authentic team, every member is encouraged to become more appreciative of how each team member differs from the others. Once individual team members are clearly differentiated, team construction occurs through developing connections between members. The team will more likely be effective than one that is homogenous, provided that everyone on the team is equally clear about and committed to attaining the team objective.

One distinct advantage is that authentic team members can work in isolation, in small group configurations, or as a total team, depending on the task at hand. Members can also enter and leave the team without disrupting it.

Two American sports illustrate the difference between the traditional and the authentic model. The National Football League (NFL) is a prototype of the traditional model. Players are almost anonymous; eleven men dress alike, wearing masks. Each player knows his role. Sacrifice for the good of the team is highly valued, and almost every score is the result of players collaborating in a precise and orchestrated fashion. Football mirrors the corporate ethics of the 1950s; centralization, division of labor, doing what you are told. The biggest supporters of the NFL are Baby Boomers.

The National Basketball Association (NBA), on the other hand, operates as an authentic team. While basketball is a team sport, the NBA recognizes and celebrates individual contributions. There is a spirit of rebelliousness in the NBA that doesn't exist in the NFL. In basketball, individual performance is what the fame is all about. Doing whatever it takes to win is the approach. The NBA is far more in line with the values of Generation X. ■

Building Authentic Teams

A new organizational structure must emerge that allows different generations to work together efficiently. Work teams are the means by which the workplace of the twentieth century will evolve into the workplace of the twenty-first century, and authentic teams are most likely to do so successfully.

In 1965, B.W. Tuckman identified four fundamental phases of team building: forming, storming, norming and performing. This framework can be applied to building authentic teams as follows:

Forming. A work team is a collection of individuals who have come together for some shared purpose. Yet each member may not know why he was asked to join, or how it will benefit him. At this stage in the creation of an authentic team, it's crucial to let members know what's in it for the individual. A team made up of Boomers and Xers will work better if members clearly understand the personal benefits of being on the team.

Storming. It is the make-or-break stage of team success. The development of individual team members consumes considerable energy at this phase. Interpersonal conflict will be at its highest. Many members will be happy to see the team go at this stage. Yet it is during this phase that the group becomes a team. Rewards

(continued on page 6)

How One Team Made it Through Storming

At one work site, a strong and decisive leader had supervised the group. The new team members had a history of not getting along and of letting the supervisor mediate disputes. After the creation of the new team structure, the supervisor continued to believe he should resolve any problems. Fortunately, someone from the human resource department was assigned to support the development of the team. The advice over and over again was that the supervisor could resolve the conflicts, but then the team couldn't expect to grow. They were told the choice was theirs to make.

Tough decisions continued to be made by the supervisor, and conflict predictably increased. Finally, the members agreed to try to work through a conflict themselves. They struggled, and tension increased. Then a breakthrough came, agreement was reached, and the team took a significant leap toward high performance. Team members learned two important lessons. First, they were able to manage conflict on their own, and second, they learned that managing conflict made them stronger and better able to handle conflict the next time it occurred.

Building Authentic Teams

(continued from page 5)

won't come until this phase has passed. Team members must be encouraged to be aware of and responsible for the behavior they use with one another and the consequences of that behavior. They must also learn that conflicts must be solved by the group, not the leader.

Continue to hold team meetings on a regular schedule. Let team members get to know each other as individuals. Each member must realize that he or she is a unique contributor to the team's success and that personal success is part of overall team success.

Norming. You will know that your team has reached this phase when:

- **Discussions focus on issues, not personalities and opposing points of view are respected rather than rejected;**
- **Team members seek solutions rather than just talking about what is wrong.**

The norming stage is where true synergy begins. The whole becomes greater than the sum of its parts. Generational differences become team strengths. At this stage, it isn't unusual for a Boomer or an Xer to venture into a previously avoided task.

Performing. For authentic teams, this phase represents a new environment in which each person is willing and able to contribute his or her best to achieve team objectives. Perhaps the most remarkable attribute of team members at this phase is their ability to see each other as unique individuals without characterizing anyone by age, gender, race or religion. No Xer is determined to be of lesser value to the team by a Baby Boomer peer, and vice versa. There are disagreements and conflicts, but these are never personal. ■

For a case study on building authentic teams, go to: http://my.summary.com

Supporting Authentic Teams

Building authentic teams is only the beginning. They must be supported by the organization to endure. Recognition and reward for team effort and success are critical. Rewards should reflect individual, team and organizational achievement. All three must be considered.

Two other factors play an important role in team management: the role of the coach or team leader, and managing the changing membership of an ongoing team.

The Coach: Every team needs a coach. Whoever the coach is, his or her main role will be to assess the team and its members' ability to handle decision-making on their own and encourage the gradual assumption of more independence.

Train coaches first. Give them the tools needed to teach and develop the team. You must also offer coaches a clear idea of how they will spend their time once the team is working independently. Encourage them to work themselves out of a job.

Changing Team Membership: The team you put together today probably won't be made up of the same people next year. Companies change, work changes, people come and go. Team membership will change. Unfortunately, if that change means that every team has to start from scratch, most of the productivity benefits gained in the forming and storming stages will be lost.

The traditional team development process calls for the team to revisit its mission and guidelines each time a new member comes aboard. Fortunately, that isn't necessary for an authentic team. It already values diversity among its members, and integrating a new member is much easier. He or she can remain an individual and still become a member of the team. ■

The Authentic Approach To Problem Solving

If you want to create an authentic team, you'll need the right problem-solving tools to do the job. One of these is the **"prerequisite tree,"** which is taken from the Theory of Constraints.

The Theory of Constraints

The Theory of Constraints is a management philosophy developed by Eli Goldratt in 1994. One of its basic principles is that there are only a few variables, or constraints, preventing a system from achieving its goals.

One of the most important premises is that a system's behavior is governed by an underlying conflict. All undesirable effects observed in the system are the result of the compromises adopted to manage the conflict. In other words, if problems exist in a team, it is because some conflict has not been resolved. In teams made up of Boomers and Xers, that conflict is often their differing views on the world of work.

The Prerequisite Tree

The **"prerequisite tree"** is a tactical problem-solving tool based on the Theory of Constraints. The prerequisite tree works especially well with intergenerational teams because addressing all *individual* resistance is viewed as an essential step to achieving *team* objectives.

To build a prerequisite tree, a team will first identify the obstacles that prevent a goal from being reached, then determine intermediate objectives to address each

(continued on page 7)

The Authentic Approach to Problem Solving

(continued from page 6)

of those obstacles. It then builds a tree based on these intermediate objectives.

For example, at one company, an intergenerational team used a prerequisite tree to solve an excess inventory problem. The company provided replacement parts to customers worldwide. The problem was that some of its excess inventory was obsolete, while at the same time, there was a shortage of the right inventory parts.

A team was assembled to solve the problem. One objective the team identified was **to reduce slow-moving, surplus and obsolete inventory.** Everyone on the team identified obstacles, and then intermediate objectives to overcome those obstacles.

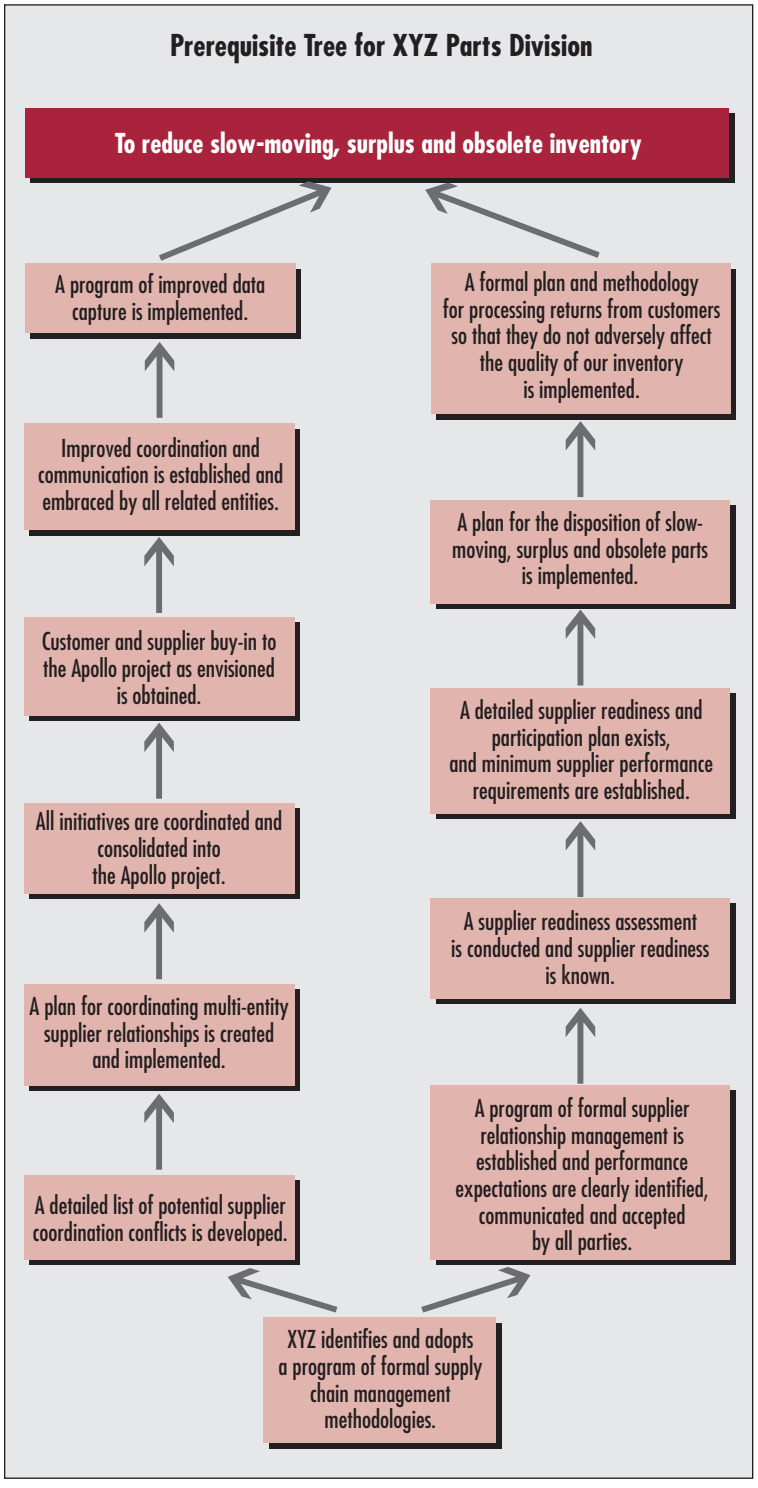
For example, one obstacle was: "Relationships with

(continued on page 8)

Building a Prerequisite Tree

There are six steps to constructing a Prerequisite Tree. They are:

✓ **Define the team's goal.** Team members need a clear understanding of what they are trying to accomplish. There must be agreement by everyone on the team that the goal is vital and that accomplishing it will benefit both the organization and members of the team.



✓ **List obstacles to implementing the goal.** The team creates a list of obstacles to meeting the goal, and continues the list until no one can come up with any additional obstacles. Obstacles are categorized as either related to implementation, as reflecting policies or procedures that will have to change if the goal is to be met, or as personal obstacles faced by team members.

✓ **Determine intermediate objectives to overcome obstacles.** The team next comes up with solutions to each obstacle. These become the intermediate objectives. For example, if lack of expertise is an objection, training is the solution. Training becomes an intermediate objective.

✓ **Map the intermediate objectives implementation sequence.** At this juncture, the team has a list of intermediate objectives that, if accomplished, will eliminate all obstacles to achieving the team's goal. Task four is to organize these into a linked plan.

✓ **Assign intermediate objectives to team members.** Assign each intermediate objective to a specific team member. He or she has responsibility for meeting the objective. The team must also identify resources needed to meet the objectives and set timetables for completing them.

✓ **Execute implementation plan.** The plan is a living document and can be altered as you go along. If done properly, it will be a reasonable estimation of how implementation will take place.

The Authentic Approach to Problem Solving

(continued from page 7)

many of our suppliers are informal and not well defined as to performance expectations." The corresponding intermediate objective was: "A program of formal supplier relationship management is established and performance expectations are clearly identified, communicated and accepted by all parties."

The finished tree is shown on page seven.

For another case study of a Prerequisite Tree, go to: http://my.summary.com

Working With the Adversary Relationship

When the goal is to develop positive team attitudes and behaviors, collaboration is the long-term objective. Collaboration creates synergy. Synergy is what separates a team from a group. Synergy means that the whole is greater than the sum of its parts. Team members working together actually create energy.

Unfortunately, there are many adversary relationships in the workplace. Whether based on prejudices or on real differences about core issues, adversarial relationships stand in the way of developing team synergy. Generational conflict has the potential to become adversarial. A Boomer may think Xers don't value hard work, while the Xer thinks Boomers are stuck doing things the way they were done 30 years ago.

The best way to avoid adversarial relationships is to prevent them from forming. Take care not to play one group against the other. Focus on rewards rather than punishment, for example. And never compare one generation member to another. Don't, for example, react to an Xer messing up by comparing her unfavorably to the typical Boomer. Don't dehumanize anyone. Finally, make sure everyone has work to do that is meaningful.

What do you do if preventing an adversary relationship is impossible? Take the following steps to stop the conflict from getting worse:

1. Both groups must decide that they want to change the relationship.
2. Once they decide to change, bring in a facilitator.
3. Clarify positions after both sides acknowledge that they have a right to different views.
4. Redefine roles in light of current conditions. Each party lists its wants and concerns.
5. Develop a contract between the adversaries. This provides the parties with a clear list of what each can and cannot do or say to the other. ■

Retaining Generation Xers

In looking at salient factors most critical to retaining Generation X employees, six categories emerge. These are:

Work Environment: Xers are individualistic and appreciate casual attire. They also appreciate the ability to personalize workspace.

Work Content: Money isn't as much of a motivation as is interesting work. Xers will leave for a competitor if they think the work will be more fun, challenging and interesting. You must make work fun and allow Xers to make decisions.

Growth Opportunities: Xers expect to be promoted based on their performance, not on their seniority. They don't expect to "Pay one's dues," if they've already proven that they can do the job. Xers also appreciate training opportunities.

Compensation and rewards: Xers want to be rewarded individually as well as for team accomplishments. They also appreciate nontraditional benefits that benefit their daily life. They want to be rewarded frequently and don't like waiting for a yearly bonus.

Organizational Culture: Xers want their organization's culture to reflect their values. They want to work for companies that don't demand long work hours and family sacrifice. They won't tolerate a threatening work environment.

Working Relationships with Manager and Co-Workers: While Xers place a high value on autonomy and independence, they also need supportive working relationships to balance the isolation. Mentoring, for example, which is both supportive and individual-oriented, works particularly well. On the other hand, Xers will resent — loudly — any attempts to micromanage their work. ■

For a look at Boomer and Xer characteristics, go to: http://my.summary.com

Boomer Manager Loses Xer Over Game

When a small but very effective high-tech company began expanding, it hired a young Boomer to manage a workgroup made up mainly of Xers. On his first day on the job, the Boomer called his staff in and laid out some ground rules. He told the staff that he wanted them to remove any computer games they might have on their work computers. One of the Xers mumbled "Whatever," and walked out of the room and the organization. He had another job within three days while it took the Boomer six months to find a replacement.

Bring Your Human to Work

10 Surefire Ways to Design a Workplace That's Good for People, Great for Business and Just Might Change the World

by Erica Keswin

THE SUMMARY IN BRIEF

As human beings, we are built to connect and form relationships. So, it should be no surprise that relationships must also translate into the workplace, where we spend most of our time! Companies that recognize this retain the most productive, creative and loyal employees, and invariably seize the competitive edge.

Paying attention to the effects people have on one another other is key to developing a winning culture where people perform at the top of their game. *Bring Your Human to Work* shows that the most successful leaders actively form quality relationships with their employees, honor fundamental human traits — authenticity, openness and basic politeness — and apply them day in and day out.

Author Erica Keswin distills the key practices of the most human companies into advice that any business leader can use to build a "human workplace." The lessons in *Bring Your Human to Work* foster fairness, devotion and joy in the workplace. By bringing your human to work, you can design a workplace that is genuine, aligned, true to itself — and just might change the world.

IN THIS SUMMARY, YOU WILL LEARN:

- How to honor relationships in your organization.
- To embrace sustainability and make work practices intentional.
- To find the right balance between technology and human connection.
- Inspiring stories of companies that put gratitude to work every day.

Introduction

Many CEOs, entrepreneurs, managers and employees around the country have realized that, in light of the digital deluge occurring around us, we all need a more human workplace. People are no longer willing to accept work as a soul-crushing, Dilbertesque, cubicled nightmare.

Bringing your human to work is not rocket science, but that doesn't mean it's easy. It takes hard work and discipline. It requires honoring relationships in everything we do — creating our values, running meetings, deciding who we hire, using technology, choosing whom we partner with, and evaluating and rewarding talent.

It's about putting technology in its place in order to build strong relationships and about inviting technology to the table, making good use of everything that can create a more human workplace.

Honoring relationships is the theme that brings everything a human workplace stands for together. What does this mean, on the ground, in your particular company? And even if you get it right, will all this human business help the bottom line?

According to the American Institute of Stress, $300 billion is lost in our economy every year to stress. Imagine the human impact we could make if we could get that money back. Or, better yet, if that stress hadn't happened in the first place. By working human, we can begin to literally cut our losses and cultivate a more human world.

There are 10 surefire ways to approach the challenge of the human workplace, depending on the needs of your company and your stage of growth. Prepare to change the way you do business.

Be Real

Speak in a Human Voice

In order for a human company to flourish, it has to be genuine, aligned and true to itself. A real company actually flaunts its humanity; it doesn't hide it.

Here are three ways smart companies are bringing their human to their brands by being real.

Know your brand's values. The thing about values is that they are hard at work, calling the shots of your business, even when they are implicit. That's why it's so important to make our values seen and heard.

The ride-sharing market is worth billions and was originally dominated by Uber. Then along came Lyft, a San Francisco–based ride-sharing company identified by a glowing pink moustache on the front dash. How did they manage to break into the space?

They let their values drive them, that's how. Lyft emphasizes human connections. Lyft's mission is "to reconnect people through transportation and bring communities together." It sounds lofty, but a mission has to be. Like any strong brand, Lyft knows that developing and embracing core values is the way to manifest that mission, however aspirational it may be. Their official core values apply to passengers, drivers and employees alike:

- Be yourself.
- Create fearlessly.
- Uplift others.
- Make it happen.

Speak in an authentic voice. Once a company knows who they are and what their values are, that

Rebecca S. Clement, Publisher; **Sarah T. Dayton**, Editor in Chief; **Ashleigh Imus**, Senior Editor; **Kylie O'Connor**, Graphic Designer; **A. Imus**, Contributing Editor

identity must be shared with customers, employees and the world. This is a company's voice, and like all voices, it must be heard. In order to breathe life into a brand, companies need to confidently broadcast what that brand stands for.

Telling stories — personal stories, professional stories and brand stories — is the perfect vehicle for expressing the truth of your company's brand. Stories are free, are always available and are such a core part of our human DNA that they automatically make us feel good. Especially when they're true.

Best of all, when a company brings true stories to light, the culture becomes more attentive to stories, and it's a virtuous cycle. Leaders and managers learn to keep their eyes and ears on what's most important: the real experiences of real people.

Empower employees to be brand ambassadors. "Engagement" is what happens when an employee is in front of a customer. What happens when no one's looking? Should companies provide a script, guiding an employee's response based on values and voice? No way. That would be inauthentic and the opposite of a human interaction. Instead, employees need to be educated, mentored, supported, rewarded and then empowered — it is up to them to bring their human to work with your mission in mind.

Since a core value at Lyft is to uplift others, it is up to employees to actually do this important heavy "lyfting." One of the most incredible stories is about a driver who picked up a passenger on Valentine's Day and handed the passenger a card that read "Be My Valentine." The passenger started crying. The driver pulled over, turned the meter off and talked with her, and when she seemed ready, the driver took her to her destination.

A few weeks later a friend of the passenger wrote to Logan Green, Lyft's CEO: "Your driver saved my friend's life." Apparently, that passenger was contemplating suicide, and that human touch made her reconsider.

There is nothing in an employee handbook that could have instructed someone to have the heart and mind to reach out and help customers in this way. Except maybe, "Bring your human to work."

Play the Long Game

True Sustainability Is a State of Mind

Not long ago, the word "sustainable" conjured images of recycling tree huggers, people who were so focused on saving the planet and its critters that they lost sight of us bipeds. Today, the concept of sustainability has evolved to include all the inhabitants of the earth, and a human workplace is about creating an ecosystem of sustainability for all of us.

Sustainability is playing the long game, and playing the long game is not easy. Not only is investing in the future the right thing to do for the world and your company, but top talent is also looking for companies that are willing to embrace sustainability.

Playing the long game requires changing the way we think about everything.

Make work practices intentional. To stay ahead of the curve — to play the long game — we must craft vital, intentional work practices that account for the complexity of people's real lives. Let's start with the ground-level, employee experience and the way we ask people to spend their days. Top talent is demanding a more human schedule. So what does that look like?

Technology has made certain aspects of progress look so easy. Much of our work can be done virtually, but what happens to our company culture when we're texting from home or from the local Starbucks? We have to be strategic in our flexibility.

Raytheon, an innovator in defense and cybersecurity solutions, implemented a popular program called the 9/80, which allows employees to work nine-hour days and get every other Friday off. This way, employees can "take care of personal business, see family, travel, take a dance class and have a life outside of work."

Diversify and include. The data is clear: Studies reveal that truly heterogeneous teams (think age, race, gender, sexual orientation, work experience, technical expertise and level of education) are more accurate and accountable than homogeneous ones.

EY is a global professional services firm with 250,000 employees in over 150 countries. It was named number one on DiversityInc's 2017 Top 50 Companies for Diversity list. Karyn Twaronite, global diversity and inclusiveness officer at EY, says, "We understand that [aligning with sameness] feels easier, faster, but we want and expect our people to lean into bumpy and to try to explore differences on their teams."

"Leaning into bumpy" is what it takes to effect change as we aim to bring our human to work. Challenging assumptions, creating new paradigms — this is important, impactful, bottom-line work. And it's personal. Consequently, we are bound to have personal, emotional — bumpy — reactions all along the way. Instead of letting the bumps throw us off, we must lean in and learn.

Enlighten your supply chain. On April 24, 2013, a five-story commercial building in Bangladesh called the Rana Plaza collapsed. More than 1,100 garment workers were killed and over 2,000 were injured. The prior year, factory fires in Pakistan and Bangladesh killed 350 workers and left many disabled. These tragedies, along with a list of similar tragedies, led consumers to demand transparency from the garment industry.

These days, it's not just the garment industry that is under careful scrutiny for its humanity. Now, instead of caving to consumer pressure, companies are wearing their transparency on their sleeve, touting their corporate responsibility as part of their offerings. This makes for good business. In everything from toys to food, glasses, shoes and more, companies are seeking ways to shine a light on their supply chains as part of what they're selling and who they are.

Once you change your state of mind, you will see that the long game is the only game in town. A long-game state of mind means honoring all the relationships connected to our business — not only the people we work beside at the office every day but also the people, animals, land and natural resources affected by what we do.

The Sweet Spot

Finding That Special Something Between Tech and Connect

These days, technology plays a supporting role in pretty much everything we do and especially in how we communicate. Our communication options for making ourselves heard are dizzying, but they are not all created equal.

We need to think of how we communicate as being along a continuum. Today, we have quick-exchange platforms such as Snapchat, WhatsApp, IM and text messaging on one end, email kind of in the middle, snail mail further down the line, and at the very end, the old-school reliability of picking up the phone, walking across the hall or even hopping on a plane.

To figure out which mode of communication is best, it's important to think about what you are trying to convey. As a rule of thumb, match the medium to the message. The higher the stakes, the more we should invest. In any given situation, ask yourself, "What is the best medium of communication to honor this relationship?"

We must understand the trade-offs and how to find the sweet spot between tech and connect. If we let technology serve as a stand-in for real, human relationships, we miss the point. Big time. Digital discipline is important for all of us to practice, personally and professionally.

High-Tech for Human Touch

Walking up to the ticket agent at the airport was once a routine (and even exciting) part of the travel experience. Back in the day, this was a time to exchange pleasantries and amp up the excitement of a big trip. More recently, this interaction has gone the same way as too many customer service experiences and now feels stiff, rushed and sometimes even hostile.

As a result, when JetBlue introduced self-serve kiosks, some customers loved how these slick ATM-like machines helped them save time and avoid an unnecessary trip to the counter. Others, though, flustered and frustrated by having to print their own bag tags and check themselves in, felt like they were witness to the utter demise of civilization.

Joanna Geraghty, JetBlue's executive vice president of customer experience, has set out to please both types of customers. Her goal is to automate those features that don't require a personal touch by using self-serve kiosks for check-in and bag tagging, so crew members have more time to identify the people who really do need (or simply want!) the help, thereby deepening those connections.

This means that crew members have more time to help passengers by doing things like grabbing coffee for an overtired mother and ensuring that customers in need of wheelchairs get the extra TLC they require to make it safely to their gates.

For companies looking for ways to improve performance and the bottom line while looking for balance in their embrace of technology and customer engagement, JetBlue is a powerful example of using technology wisely and well.

Mind Your Meetings

Honoring Relationships with Purpose, Presence and Protocol

Each year, we waste an estimated $37 billion on unproductive meetings, with executives spending up to 23 hours of their work week in meetings.

It is interesting to note, however, that most people still believe that meetings are fruitful, and they don't want to give them up. After all, humans do love to connect. This means that the problem might not be with the number or length of meetings but, rather, with the fact that most

meetings don't respect people's time, leaving them feeling fatigued and, worse still, abused. All too often, our meetings don't honor relationships.

Meetings, almost by definition, are our opportunities to make those connections that are good for people and great for business.

Have a purpose. When you call people together, it's up to you to honor the relationship you aim to build. Before sending that invite, ask, "Is this meeting really necessary? If so, what is its purpose?" Meetings are most useful when they are linked directly to a company's values, which then trickle down into preferences and ways of working. If your company values a meticulous process over quick-and-dirty decision-making, then schedule think-tank-type gatherings periodically, and let go of the more aimless status meetings.

Be present. When it comes to meetings, like it or not, we must curate connection and add a little cruise director to our manager mentality. You don't have to hire a magician to grab your employees' attention. Even simple efforts and little tweaks work, too. Centro, a digital advertising firm in Chicago, begins each meeting with a simple round-robin check-in, asking each participant to share a bit about how she or he is feeling. This allows people to be present by addressing where they are emotionally as well as physically.

Create protocols. The good news is that there are many ways to set protocols for a meeting. You can send a checklist of "pre-work" to give the meeting context. You can send a clear agenda, with enough advance notice for everyone to read and reflect upon it before the meeting, which is a great way to engage introverts. You can also assign someone to keep time against an agenda, making sure the meeting stays on task.

Well-Being at Work

Finding the Human Side of Wellness

It's not difficult to make the argument that providing a path to wellness is just plain human. The *Harvard Business Review* reports on a study of organizations with highly effective wellness programs. These organizations have a 9 percent turnover rate, while organizations with ineffective programs have a 15 percent turnover rate.

What does it mean to have a "highly effective" wellness program? The authors of a study by the Health Enhancement Research Organization believe such programs focus on "social, financial, spiritual and mental wellbeing." That is to say, since we're bringing our human to work, our whole human selves need to be kept in check, not just our cholesterol.

One exemplary company personifies well-being in everything it does — in its mission, its values and its own wellness. Vynamic is a Philadelphia-based consulting firm that specializes in healthcare. The goal of its CEO, Dan Calista, is to build the healthiest company in the world. Most clearly, the Vynamic website says, "Healthy culture is our business strategy."

One of Calista's most foundational well-being initiatives is also his most radical. He allows consultants to choose their projects and their locations, instead of the more conventional "go where the job is" and "do what you're told" approach of most (if not all) other consulting firms.

By allowing his employees to have a say in choosing their projects, Calista is honoring his most important relationship — the one with his employees — and building kindness into the very fabric of the company.

About five years ago, Laura Pappas, one of Calista's consultants, approached him about her growing interest in the field of wellness coaching. Sensing an opportunity and wanting to encourage his employee, Calista invited Pappas to pursue that interest and even offered to pay for her to become a Certified Health Coach (CHC).

Having an on-site coordinator of health and care makes it clear to everyone that Calista means business in his commitment to well-being. From healthy snacks to treadmill desks, ergonomically correct chairs and special LED lights, Pappas now covers all the wellness bases for Vynamic.

Vynamic and Calista have also been recognized for one of their most important and influential programs, called zzzMail. The zzzMail policy eliminates work emails between the hours of 10 p.m. and 6 a.m. and on the weekends. That's one doozy of a protocol!

Calista's entrepreneurial wisdom has been good for his company's business. In 2017 Vynamic's revenue was $24.5 million, placing it in line with similar-sized consultancies, which is darn impressive.

Give Back

You've Got Nothing to Lose, Only Inspired Employees to Gain

Giving back, volunteering, embracing the idea of corporate responsibility — these concepts are top of mind at companies big and small, and there is mounting evidence to support this wave as a strong business practice.

A recent study by Bain & Company showed that "inspired" employees are 225 percent more productive than "engaged" ones and three times more productive than those who are "disengaged." It's a beautiful thing, the way offering ourselves to others sharpens our focus and gets our wheels turning.

Giving back can be as simple as donating a portion of one's proceeds or product to the needy, or it can entail multiple organizations with large coordination efforts. Here are 10 specific ways to give back:

- Build giving back into your company values.
- Offer your specialty to a community that needs it.
- Go local: Connect with the community in your backyard.
- Do it your way: Give as an individual.
- Give as a group: We're all in this together.
- Leverage technology to amplify impact.
- Involve the whole family.
- Give on location.
- Include your virtual team in the give-fest.
- Wait and see: Give when so moved.

For example, Mack Weldon followed the "wait and see" strategy. In 2012, when the super-cool, online-centric men's underwear and clothing company Mack Weldon ("the Apple of underwear," according to the Huffington Post5) was initially launched, founder and CEO Brian Berger knew he wanted to weave giving back into his business. Still, he wasn't sure exactly how he wanted to do it.

On the one hand, Berger was just starting out, so the company couldn't really afford to start giving away free stuff. Berger didn't want to just dive into an approach he didn't feel truly connected to, either. So Berger and Mack Weldon waited.

In March 2017, Mack Weldon Recycles — "easy and effortless" — was born. Berger's authentic solution to the social impact opportunity was for Mack Weldon to partner with a third-party apparel and textile recycler called Community Recycle, a Philadelphia-based company whose objective is to keep all apparel and other soft goods out of landfills and send it to communities in need. Don't worry, the underwear itself is not recycled (that's just wrong). It's only the cotton that's recycled.

This is how it works: When customers place an order, Mack Weldon sends their wares in what they call a "two-way drawer" (drawer, get it?), which can be returned with up to 45 pounds of underwear or anything else from their closet at no cost to the customer. Upon receipt, Mack Weldon sends the used goods off to Community Recycle to be transformed and given a new life.

Berger's give-back strategy is a win-win-win. It helps customers rid their closets of old clothes, while helping them feel good about purchasing from the company. The program has already kept 11,241 pounds of apparel out of landfills. This is equivalent to a reduction of 65,197 pounds of carbon dioxide emissions and a savings of 12.2 million gallons of water and 72 trees. And, importantly, it supports Berger's goal of making Mack Weldon a profitable, growing enterprise.

Disconnect to Reconnect

Where There's a Will, There's a Way

Human beings need a break. They need time for their minds to wander aimlessly, to enjoy one another's company, to sleep in or to do nothing. Neuroscientists have confirmed this, showing that allowing our brains to take a break from the constant stimulation of productivity benefits us in many ways.

A so-called "social vibe" is what we humans need. Right? But how we resist! A recent survey from the employer-reviewing site Glassdoor identified that the average U.S. employee who receives vacation and paid time off (i.e., 91 percent of full-time employees) has taken only about half of his or her eligible vacation in the past 12 months.

While it's true that some people and some industries just skew toward high-octane work habits, we all wrestle with a certain problem. You guessed it. Project Time Off reports that "as internet adoption goes up, vacation usage goes down." The report continues, "America's culture of busyness has been driven in large part by connectivity, so much so that the Pew Research Center determined nearly half of office-based workers say that email has increased the amount of time they spend working."

Our technology, as incredible as it is, is keeping an already workaholic culture more tethered to our roving desks than ever. In a culture where we check our phones an average of 47 times per day, even a little disconnection is a lot to ask for.

Here's the good news: Where there's a will, there's a way. The first step is to incorporate disconnection into the company values. Next, be sure everyone does it — staff, managers and executives. Finally, don't disconnect on the sly. Celebrate the joys that come from disconnecting!

Encourage employees to go home without supper. While many Silicon Valley companies boast about their many and varied on-site restaurants or dining options, Slack, the fast-growing messaging connection platform, has taken a different approach. The motto that hangs on a sign in Slack's San Francisco headquarters reads "Work hard and go home." The idea is that if you don't serve dinner, it's more likely your employees will leave the office to have dinner with family and friends.

Send friendly reminders. One of Google's product managers reports that when he hits 20 days of unused vacation, he receives a reminder from the human resources department instructing him to take some time off. Seriously. He continues to receive a "nudge" every 10 days or so until he actually takes a vacation.

Leave loudly. Robbert Rietbroek, CEO of PepsiCo Australia and New Zealand, implemented "Leaders Leaving Loudly" to ensure leaders felt comfortable going home and to get them to announce it to their teams. He says, "For instance, if I occasionally go at 4 p.m. to pick up my daughters, I will make sure I tell the people around me, 'I'm going to pick up my children.' Because if it's okay for the boss, then it's okay for middle management and new hires."

Space Matters

Curating Connection Starts with the Water Cooler

If you want to get the most out of the people in your company, pay attention to space. A survey by Steelcase discovered that only 11 percent of workers surveyed were highly satisfied with their work environment. And we know what happens when workers are unsatisfied! On the other hand, an office environment that fosters connection can raise employee productivity by at least 25 percent.

Since the human company curates connection, that is how we should consider our space. Here are some tips from companies that have done just that.

For example, Anthony Casalena, CEO of web-design company Squarespace, enlisted A+1, a design firm in New York City, because he wanted the company space to reflect his belief that "design is not a luxury," which also happens to be their number-one corporate value. Casalena also wanted the new space to "line up" with his company by reflecting the way his employees worked — equal parts wild collaboration and intense solitude — a working style that architect Brad Zizmor referred to as a "binary state of being."

At Squarespace, nobody has a private office now, not even Casalena. However, people still need to do quiet work, so the entire exterior wall of the three-floored space is wide open, bright and quiet, available for everyone to use as they wish. All the common spaces — the conversation pods, conference rooms, etc. — are nestled into the interior space. As employees move closer to the exterior and closer to the light, the office provides more private space for working in quiet mode.

A design decision like switching offices for common space might not sound like much, but the experience is powerful and speaks very clearly to a culture of transparency, community and intentionality. This is evidently a place that both values the power of solo concentration while still honoring relationships.

Take Professional Development Personally

Empower Employees to Be Their Best Selves

The human workplace must take meaningful, on-the-job education seriously, whether it's related to a person's job description or not. Leaders must take it upon themselves to help their employees connect with the right opportunities. Then, instead of focusing on one or maybe two annual conversations, they must build development into the culture, the operations and the ongoing dialogue, tailoring experiences to actually fit their talent.

In the human workplace, leaders and managers know that one of the best ways to foster an employee's loyalty and engagement is through showing a genuine interest. We can't throw a bunch of professional development options out there and hope people find something that suits them.

We need to slow down, pay attention to the individuals on our teams and make them an offer they can't refuse. Everyone is different and has different needs. Remember, there is no cookie-cutter model to employee engagement!

Ask. So how do we get started? Just ask your people what they want! Ask employees what they want to learn and how they want to learn it. If they aren't sure, they will be thrilled to give it some thought and get back to you.

Receive. Your very own workforce is an untapped wealth of knowledge, skills and insights that other people in your company will no doubt enjoy. After asking employees how they themselves want to develop, try asking them what

they'd like to offer to their colleagues. By trading knowledge, you are creating a network of people all taking their professional development personally — together.

Coach. More and more companies are offering coaching to employees at every stage in their career. While it might seem counterintuitive to offer coaching to employees who already seem qualified for their jobs, offering additional support says, "I care about you and your happiness." Having truly happy, actualized people on your staff is a great retention strategy. And coaching helps every employee develop — professionally and personally.

Say Thank You

It's a Human Thing to Do

The question of "how to be grateful" is so big these days that an entire industry has sprung up. Globoforce is a successful company devoted to helping companies find their own way of expressing gratitude. Saying thank you is the right thing to do, and just as Globoforce's CEO Eric Mosley makes clear, "The simple act of recognizing employees has a proven impact on your bottom line."

Let's look at some powerhouse brands that honor relationships by putting gratitude to work, broken down by Who, When and How.

Who. Everyone Can #Soulitforward. Offering gratitude is everyone's job. Receiving it should be everyone's opportunity. One of fitness company SoulCycle's values is "show gratitude." Soul Cycle defines gratitude as "We give thanks to our riders, our staff and each other. We are humble and remember it takes a village."

CEO Melanie Whelan and her employees express gratitude through their very cool (and contagious) pin program. Employees are "gifted" a package of pins after a year with the company, with each pin representing one of Soul Cycle's 10 core values. There's a "We Get Dirty pin" (i.e., every single employee is responsible for the day- to-day operations), a "Culture of Yes" pin (i.e., everyone is committed to saying "yes" to riders and doing whatever it takes to satisfy their desires) and an "Embrace Change" pin.

When an employee sees anyone embodying any of the company's values, he or she is encouraged to #Soulitforward — give the person a pin, and share with the recipient how the actions were inspiring and emblematic of the values. Giving thanks in this systematic way creates what Whelan described as "an ecosystem of celebration of core values."

When. Every Morning at 9 a.m. It's important to infuse your calendar with a culture of gratitude. This can be done in a variety of ways — by establishing regular feedback sessions and by developing good daily habits.

Indagare, a boutique, membership-based, travel community founded in 2007 by Melissa Biggs Bradley (Indagare's CEO) and Eliza Harris, holds regular, daily gratitude sessions. Harris says, "At 9 a.m., we grab whoever is around for our morning gratitude practice." The folks at Indagare take turns around the room, as each person is invited to offer one thing for which they are grateful and one wish of happiness to another person.

As Harris conveyed, "What we've discovered is it's the most delightful way to start the day when you see how people's faces light up when they're saying what they're grateful for."

How. Lift Employees to New Heights. JetBlue manages to safely shuttle over 38 million people from one place to another every year. But customers aren't the only ones getting a lift from JetBlue. Employees also get a "lift" that comes in the form of recognition for a job well done.

When crew members feel inspired, they can nominate one of their peers, their direct reports or even their boss for upholding the JetBlue values in some remarkable way. The person nominated is rewarded immediately with a gift card of their choice. The key to this program is saying "thank you" in real time.

It seems so simple. We should all do it. Every day. Just say thank you. It's good for people, great for business and, along with the other strategies for bringing your human to work, just might change the world.

Bringing Out the Best in People

How to Apply the Astonishing Power of Positive Reinforcement

by Aubrey C. Daniels

THE SUMMARY IN BRIEF

What motivates people? What encourages employees to work to their fullest potential, not just for a short while but for the long haul? Many managerial fads promising quick fixes have come and gone, but none have approached the success experienced by organizations that have employed Dr. Aubrey Daniel's ground-breaking motivational methods. *Bringing Out the Best in People* provides the latest and best motivational methods currently in use at such major companies as Xerox, 3M and Kodak.

Applying scientifically-based behavioral stimuli to the workplace while also making it fun, celebrated behavior analyst and nationally known expert and author on performance, Aubrey Daniels, describes practical, precise, data-oriented methods to help you implement a management system that will maximize the long-term performance of every aspect of your company. He also helps you attain a clear understanding of human behavior so you, too, can bring out the best in your employees and achieve results that are measurably superior. By identifying what reinforces the people in your company and skillfully managing those reinforcers, you can attain the kind of *individual* performance that adds up to great *organizational* performance.

IN THIS SUMMARY, YOU WILL LEARN:

- How to create effective recognition and reward systems in line with what today's employees want.
- How to stimulate innovation and creativity in new and exciting ways.
- When to apply reinforcers — and how to tailor them to meet individual employees' needs.
- A powerfully positive system for gaining maximum performance from every employee.

THE COMPLETE SUMMARY: **BRINGING OUT THE BEST IN PEOPLE**

by Aubrey C. Daniels

The author: Aubrey C. Daniels, Ph.D., is the president of Aubrey Daniels & Associates Inc., a management consulting firm that helps companies solve problems in productivity, quality, cost and morale. One of the foremost speakers and writers in the human resources field, Daniels has instituted his performance management system at more than 200 organizations in the United States, Canada, Mexico, Great Britain, France and Italy, and has worked closely with such noted clients as 3M, GTE, Rubbermaid and Honeywell. Daniels is also the founder and publisher of *Performance Management* magazine.

Preface to the Second Edition

All of us must stay in tune with behavior analysis as its applications change the world and are, in turn, changed by the world. The use of behavior analysis must not be allowed to become a business fad and, as such, suffer the vagaries that have affected other worthy business initiatives that have come and gone. Behavior analysis is not a good idea to be tried for a while and then cast aside for some other good idea. It is a science that explains how people behave and the influences that affect that behavior. It cannot go away anymore than gravity can go away and it cannot be ignored as long as people continue to be the most important element of every organization. In a changing world, the science of behavior must remain the bedrock, the starting place for every decision we make, every new technology we apply and every initiative we employ in our efforts to bring out the best in people.

PART 1: THE PERILS OF TRADITIONAL MANAGEMENT

Very few managers use systematic, scientifically-based management methods to bring out the best in people at work. Most try a variety of management approaches until they find one they like. But even when that approach seems to work, they don't know exactly why it did or why it works sometimes and not other times.

Conversely, the approach used here is based on more than 80 years of research in human behavior. The body of knowledge is called *behavior analysis*. The application of these scientific findings to the workplace is called *Performance Management*. Once managers understand the principles of Performance Management, they can create the right environment and conditions to bring out the best in performers today, tomorrow, next month and next year.

Most senior managers are not particularly impressed with one-time performance improvement in a job, office or factory. They know that things occasionally get better. They get interested when things improve and continue to improve.

Organizations such as Eastman Chemical Co., Allied Systems, 3M Dental, Blue Cross/Blue Shield of Alabama, BP Amoco and Preston Trucking Co. (featured in Robert Levering's book, *A Great Place to Work*) have used Performance Management and thrived on its methods for more than a decade. Other organizations have had the same experience.

Delta Faucet Co., for example, began applying Performance Management techniques almost 20 years ago. "Delta has had nothing but better years, every year," Don Ginder, retired vice president of human resources, stated. Today, Delta leads the faucet industry in America and has begun exporting its products to Japan.

Performance Management is not a one-time management solution to a single problem at work. It provides a precise way of analyzing work and implementing a management system that will not only address the problems associated with inadequate performance, but will lead to practical ways to maximize performance in every aspect

of the company's business. Because Performance Management is a precise, data-oriented approach, the solutions can be replicated in the same or similar settings and even extended to new settings with similar results.

A Most Practical Approach

Because Performance Management focuses on understanding behavior, we are able to tell what works and what doesn't simply by looking at the effect any intervention has on the behavior of people. Did the behavior increase or decrease, change or stay the same?

Performance Management uses scientific methods to change behavior. At first, a scientific method for managing behavior may not sound practical for line supervisors and managers, but in reality it is the most practical way to manage people.

Using scientific methods to manage behavior includes: precise specification of what we want to improve; the development of a baseline of current performance against which we can measure progress; and then a precise intervention and the evaluation of its impact on performance. This is no more than we would ask from any change in any other business process.

Management by Common Sense Is Not Management at All

Contrary to popular belief there isn't too little common sense in business, there's too much.

The alternative to commonsense knowledge is scientific knowledge.

1. *Commonsense knowledge is acquired in ordinary business and living, while scientific knowledge must be pursued deliberately and systematically.*

No special effort is required to obtain common sense. As a matter of fact, you can't stop it. It occurs just from the fact that we are alive. No wonder it's so plentiful.

On the other hand, scientific knowledge requires a special effort to acquire.

2. *Commonsense knowledge is individual; scientific knowledge is universal.*

The biggest problem with so-called common sense is that it is not really common at all. It's drawn from personal experience and, as such, is as different as our lives. When someone asks, "Why didn't you use your common sense?" he or she is really asking, "Why didn't you do what I would have done?" The fact is that when you use common sense, you always do what makes sense to you.

Scientific knowledge goes beyond the individual to look for that which is applicable across all situations.

The Challenge of 'Stretch' Goals

I hope by this time your company has discontinued the practice of setting stretch goals.

Stretch goals reduce the probability of success because they are too difficult, maybe even impossible, to attain. Depending on how far your performers are stretching, the probability of success may be less than 50 percent. No business can survive these days by reaching its goals only 50 percent of the time.

3. *Commonsense knowledge accepts the obvious; scientific knowledge questions the obvious.*

This is probably the most distinguishing characteristic of the scientific mind versus the ordinary mind. Common sense always says, "Of course," while science asks, "Why?" In other words, the commonsense person always has an answer. Before science entered the picture, common sense told people that the sun came up, the stars came out at night and the earth was flat.

Science eventually taught us that none of these things were true even though for centuries people conducted their affairs according to these common beliefs.

4. *Commonsense knowledge is vague; scientific knowledge is precise.*
5. *Common sense cannot be counted on to produce consistent results; application of scientific knowledge yields the same results every time.*

This is the most compelling reason for people in business to abandon common sense and to seek scientific explanations to problems involving human performance in the workplace.

6. *Common sense is gained through uncontrolled experience; scientific knowledge is gained through controlled experiment.* ●

PART 2: THE ASTONISHING POWER OF POSITIVE REINFORCEMENT

A retired maintenance superintendent was called back to a Chrysler plant to train new employees involved in the manufacturing startup of a new car. He was one of several people who made a presentation to plant management about the new product and the production training process.

He introduced himself by saying, "I'm Don F. and many of you don't know me, but I retired from this plant several years ago. Since I retired I've had a lot of time to think about my career here. I started as a mechanic in the maintenance department and after sev-

eral years became maintenance superintendent for the entire plant. As I thought about those days, something bothered me. Of the hundreds of employees that I supervised and managed, I can remember the names of about 30 that I would classify as 'no good.'

"I can remember the names of about the same number who were 'outstanding.' That's 15 to 20 percent of everyone I managed. What really bothers me is the remaining 80 to 85 percent who came in and did their jobs every day. They were the most responsible for my success in the plant and I can't even remember their names. I hope when you retire you don't bear that burden."

Bringing out the best in people requires that *all* performers get the right consequences every day. We shouldn't ignore poor performers, but if we are to have a high-performance organization, we can't ignore the good performers either.

The More Immediate, the Better

Consequences that are immediate and certain are very powerful in governing behavior. For example, if, when handling caustic chemicals, performers know a small drop on the skin will produce an immediate and painful blister, it will not be a problem to get them to wear gloves.

However, performers who handle lacquer products that may cause cancer and/or possible nerve damage with prolonged exposure may not consistently wear protective gloves. In fact, many don't wear them at all.

Reinforcers Are More Effective than Rewards

The immediacy factor explains the difference between a reinforcer and a reward. You should remember that a reinforcer provided immediately for a behavior has much more effect on that behavior than a delayed reward.

Because a reward is usually in the future, there is always a degree of uncertainty associated with it. Those offering the reward may withdraw it or change the conditions necessary to get it. The performer might not be able to meet the conditions, could die or otherwise not qualify for the reward. People typically respond more predictably to small, immediate, certain consequences than they do to large, future, uncertain ones.

The consequences that cause people to do their best every day occur every day. Yet experience has shown that most organizations spend more time, energy and money providing consequences that occur when employees get sick, retire or die than on the ones that occur every day.

This has enormous implications for every firm. It means that bonuses, profit sharing, retirement benefits and similar forms of compensation are future, uncertain consequences and, as such, do not bring out the best in people every day. These incentives are necessary, but not sufficient, to maximize performance. Certain forms of compensation facilitate performance better than others. However, compensation alone will not do the job of maximizing performance. Only effective and frequent positive reinforcement can do that.

No-Fault Performance: Change — Not Blame

When you understand how consequences influence performance, you realize that finding fault with people for inappropriate performance is unproductive and unfair. They are simply behaving in a manner consistent with the consequences they are receiving now and have received in the past.

The role of leaders in every organization is not to find fault or place blame, but to analyze why people are behaving as they are and modify the consequences to promote the behavior they need.

This approach to management does not overlook poor performance. Nor does it seek to use only positive reinforcement to attempt to create some type of unrealistic, utopian organization. Quite the contrary.

The management system we should create employs all of the consequences appropriately and skillfully to stop problem performance and promote the kind of behavior that supports the organization's goals.

The ABCs of Performance Management

The first step when attempting to change the way people perform is to *understand why they are currently behaving the way they are.* We now know that people do what they do because of the consequences they experience following their actions. Therefore, it is helpful to discover what antecedents are setting the stage for the behavior to begin and it is necessary to know what consequences are causing the behavior to continue.

The ABC (Antecedent-Behavior-Consequence) Analysis is a simple method for systematically analyzing the antecedents and consequences influencing a behavior. This analytic technique will allow you to understand behavior from the other person's perspective, even when it appears to be unproductive, irrational or self-defeating.

Antecedent: Something that comes before a behavior that sets the stage for the behavior to occur.

Behavior: What a person does.

Consequence: What happens to the performer as a result of the behavior.

Once you view performance in terms of ABC, you will be able to develop solutions to performance problems that you may never have attempted in the past.

In the ABC Analysis, consequences are classified on three dimensions:

1. *Positive* or *negative*. This dimension answers the question, "Is the consequence positive or negative from the *perspective of the performer?*"
2. *Immediate* or *future*. Here we want to know, "Does the consequence occur as the behavior is happening (immediate) or some time later (future)?"
3. *Certain* or *uncertain*. This dimension expresses the probability that the performer will actually experience the consequence.

Understanding and managing consequences is the most effective way to improve performance.

PART 3: THE SCIENTIFIC APPROACH TO LEADERSHIP

The importance of pinpointing *active behaviors* was made clear by Dr. Ogden Lindsley. In 1965 Lindsley developed the "dead-man's test" which is: "If a dead man can do it, it isn't behavior; and you shouldn't waste your time trying to produce it."

Yet much of what we typically track in quality and safety violates the dead-man's test. "Zero defects" and "days without a lost-time accident" are prime examples of popular goals that violate the dead-man's test. Dead men never have accidents and they never produce defective parts.

Like behaviors, results can also be more precisely pinpointed. In 1978, T. Gilbert developed a test for determining if you have an accomplishment. He called his test the "leave-it test." The leave-it test works this way: If you can leave it behind when you walk out of the office or plant, it is a result. If it's something you take with you, it is not. For example, safety awareness cannot be left behind at the end of the day and therefore would not meet Gilbert's definition of a result.

Safety awareness, better communication and increased teamwork are not pinpointed results, and effort spent trying to produce them may consume considerable financial and personnel resources, generating little value to the organization. These phrases are descriptions of a problem and, as such, represent only a beginning. You must pinpoint the desired result more precisely if you are to solve problems reliably and efficiently.

Behaviors and results define performance, and you need both to run an efficient and effective organization. So how do you pinpoint?

Precision Pinpointing

Pinpointing means being specific about results and behaviors. It requires *precise descriptions* of results and behaviors that are *observable, measurable* and *reliable*.

- **Observability.** *Seeing is believing*. In the final analysis, business has to be interested in results and behaviors that can be seen. Pinpointing observable results is relatively easy. The problem of observability comes up when we try to pinpoint behavior. Factors that affect behavior but are not observable, such as thoughts and emotions, are not the province of management. We can't expect line managers, or anyone for that matter, to delve into the inner feelings of others. The good news is we don't have to. You can manage yourself and others very successfully by limiting yourself to pinpointing behaviors you can see and hear.
- **Measurability.** Many people, when faced with these characteristics of good pinpoints, immediately complain that these criteria (especially measurement) will limit the pinpoints they can identify. This is not the case.
  The fact is, if something is happening it can be measured. Every behavior can be measured in terms of frequency or duration, or both. Even when something is not happening, it is being measured. The measure is zero. Some things may not be worth measuring, but if it is important, it can be measured.
- **Reliability.** When two or more people can observe a behavior or result and come up with the same count or measure, you have a true pinpoint.
  Have you ever heard someone described as "friendly" by one co-worker and then described as "aloof" by someone else? They are either observing or measuring different things or their measures are not reliable.
  Refining observations to the point of reliability is an important skill in pinpointing. We may start with a pinpoint that is not totally reliable but, as we use it, measure it and discuss our observations, we can refine it until it becomes more and more reliable.

The Effective Use of Measurement

In business, measurement is used to solve problems and to help the company perform better, but one of the most frequent uses of measurement is to identify performers who aren't measuring up. Based on the measurement, negative action is usually taken to correct the performance problem. No wonder employees avoid measurement whenever they can. It's no fun being identified as the problem.

The purpose of measurement in a Performance Management system is different. Rather than using measurement to find problem employees, *measurement is used to enable employees to do better*, which, of course, should help the company perform better.

PART 4: TURNING GOOD INTENTIONS INTO HIGH PERFORMANCE

Noted quality expert W. Edwards Deming advised us to eliminate goals altogether. Deming had observed how, in actual practice, goals and standards limit performance. He said that people who are capable of more reach their goal level and stop. In other words, performers typically give only what is asked for, even when they are capable of more.

What Deming saw in many organizations was that the majority of people attain goals in order to escape or avoid the consequences of not meeting the goals, rather than attaining or exceeding their goals as a means of receiving positive reinforcement.

Understanding the True Nature of Goals

Goals are antecedents for either reinforcement or punishment. If people are punished when they fail to reach a goal, they will reach the goal only to avoid the punishment. On the other hand, if people reach their goals and receive positive reinforcement, they will not stop when they get to the goal but will continue to perform at their best knowing that more positive reinforcement will be forthcoming.

The belief that goals improve performance interferes with the effective use of goals. If goals are set but there are no consequences for either success or failure, the goals will produce no improvement and will ultimately be a waste of time.

A textile sales organization in New York used a goal-setting process called *targeting* with their salespeople. This process consumed several months of management time each year. It involved the sales manager sitting with each salesperson, reviewing every account and setting sales targets for each season.

When asked how many targets were met each season, the most common response by far was, "about 75 percent." The actual data was available but was not routinely reviewed. When results were examined for the previous season, it was discovered that only 8 percent of the targets had actually been met! Management was shocked. They were sure the data was wrong. The next step was to look at the data from the season before and that showed that goal attainment was only 11 percent.

Management had mistakenly assumed that good participative goal setting would surely produce improvement.

Goals Get Results (a Management Myth)

When Deming encouraged management to eliminate goal setting, he was really calling for the *elimination of goals as they are currently used.* However, goal setting does have the potential to contribute to improved performance if used correctly.

Very clearly, the purpose of setting goals should be to increase opportunities for positive reinforcement.

If this is the purpose, *we should want many, not few, goals*. And, contrary to common sense, the best mistake to make in goal setting is to set the goals too low. The reasons for these techniques may be obvious by now:

1. If the goal is low, it increases the probability of success. If the goal is reached *and success is celebrated*, the motivation to do even more the next time is increased.
2. If goals become the antecedent for positive reinforcement, then the more goals you have, the more occasions for positive reinforcement.

The mistake that is most commonly made when setting goals is associated with the word *challenging*. The concept of "challenging goals" usually causes managers to set fewer goals and to set them too high. Fewer goals, harder to attain, equals very few opportunities for positive reinforcement and reward.

The fastest way to change individual behavior is to set small goals, reinforce effort and celebrate attainment. Remember, positive reinforcement accelerates the rate of improvement. The only way we can achieve dramatic improvement in anything is with lots of reinforcement.

Compensation and Performance Appraisal

The first thing to do to improve the effectiveness of compensation and appraisal systems is to pinpoint the results and behaviors needed from every job. While this seems like a formidable task, it pays dividends. This is also the first step in Performance Management.

The best job you will ever have is one where you know how you did at the end of every day. The ideal performance appraisal is one that is done every day. It is certainly not practical for management to measure performance every day, even if measures are available. However, if performance can be monitored by the performer, it is possible to get the benefits of daily measurement without the high cost of management time.

PART 5: REVITALIZING THE WORKPLACE

It's the responsibility of a company's executives to determine the desired organizational results. Once this is determined, the executive should define, within limits, which behaviors will be reinforced as a means of obtaining those results.

This task is value-driven. It answers the question: *"What are acceptable and unacceptable ways to get results here?* Is it results at any cost? If not, what are the limits? How are they determined? *What are our guiding principles and values?"*

Although values are not usually stated in pinpointed terms, doing so is the only way you can ensure that your organization lives by them. Concepts such as honesty, teamwork, innovativeness, concern for people, customer service, commitment to quality and so on can be defined in behavioral terms. In fact, if you can't define your organization's values in terms of specific behaviors, they will be practically useless in helping you accomplish your mission.

The ultimate purpose of developing a mission statement is to determine which results to reward and which behaviors to reinforce. (Listing the behaviors and results that will not be reinforced and rewarded is an equally useful exercise when a significant shift in behaviors and results is being attempted.)

After determining organizational results, the task of determining organizational values and their associated behaviors is the highest priority of executive management. This task should come before all other executive responsibilities, including those that directly affect profit. The executive cannot exercise true financial responsibility if profit is attained by behaviors that are self-serving, wasteful or repressive — not to mention illegal, unethical or immoral.

Increasing Creativity and Managing Change

Years ago, a plant manager at a manufacturing plant in Florida was asked, "What do you make here?" "I don't know," he replied, "I've only worked here a year and a half, and it takes us two years to make one." He was only being halfway facetious. The plant made the first guidance systems for satellites, and unreliability and failure to meet production schedules were serious problems.

Walking through the plant, you could see rows and rows of desks where engineers worked. To illustrate some of the problems of managing such an operation, the plant manager stopped and pointed down one of the rows. "See that man?" he asked. He was pointing to an engineer who was racked back in his chair blowing smoke rings at the ceiling. "How much do you want to bet that if I go up and ask him what he's doing, he will say, 'I'm thinking.' And how much do you want to bet that just as soon as we go into production, he will be the one running down the hall waving a change order. And if he does, I'm going to fire him."

Managing the Creative Process

He was venting his frustration at managing the creative process. Like many people, he thought creativity was a "mind thing," not a "behavior thing." Of course, he was stymied because you cannot manage someone else's thinking. That the engineer was not thinking about work-related issues concerned the manager, but he had no idea how to confirm or refute this concern. One thing he could have done was to ask the engineer to make a list of what he was thinking about that day, how the items on the list related to the problem or project at hand and a list of next steps to take to complete the task. If he had done that, the manager would have had some behavior to work with.

Too many managers hesitate to interrupt the solitude of "thought workers," like engineers, because they are afraid they might interrupt the creative process. To them creativity is a fragile and mysterious process. Many managers, even those in charge of research laboratories, have said that you can't manage creativity. Indeed, you can't manage creativity until you define it behaviorally, but once you do that, you can apply positive reinforcement to accelerate the behaviors that enhance creativity daily.

The fact that behavior is variable means that some things are selected by reinforcement to be repeated and some are not. Variability in behavior that is strengthened will lead to new behaviors that, in turn, produce new results, innovative products or unique services. In delivering a service or manufacturing a product, we usually don't want variability. We want consistent quality. Therefore, it is important for managers to identify when variability is valued and when it is not. ●

Epilogue

The Performance Management approach is value-laden. Values come from behavior. They are statements about desirable behavior patterns that a group seeks to promote. To the extent that values can be pinpointed, they are much more achievable in any group, whether at home, at work or in society in general. Let's examine some basic values.

Honesty. Honesty means that everything is above-

board. There are no hidden agendas. The stated purpose of asking for a certain behavior or performance is clear to everyone.

Integrity. Performance Management teaches that a manager should carefully follow up to make sure that the consequences match the antecedents. This is the basis for trust. The follow-up is to make sure that what the company *says* will happen after a certain behavior or performance *does* happen. This might be a positive consequence following good performance or it might be a negative consequence following a poor performance. Either way, the credibility and integrity of the company are on the line. This is how the value of *integrity* is promoted by Performance Management.

Equality and Respect. The Performance Management approach implies a certain equality and respect in the way we approach another human being. The basic assumption in the approach is that most behavior is learned from consequences in the environment. Therefore, we conclude that there are logical reasons for the behavior of others: They act the way they do because they have *learned* to act that way. Looking at behavior from this perspective, we are less likely to be judgmental in our estimation of others.

Justice. In a larger sense, the value of *justice* is also implied and promoted by Performance Management. Justice means that each person gets what he or she deserves. This is certainly what justice means in the courtroom sense. In Performance Management, this is what we say about managing people: *Those who perform well should get more reinforcement and rewards than those who perform poorly.*

Self-Esteem and Personal Growth. Reinforcement and rewards that are earned lead to higher self-esteem and personal growth. Earned recognition and rewards increase performers' feelings of confidence and competence. These performers have visible evidence that they add value to the organization. Confidence leads to an increase in initiative and a willingness to try new ideas. What organization can't profit from that?

Peace of Mind (Personal Security). By pinpointing for people exactly which behaviors are wanted and the nature of the consequences for those behaviors, you encourage calm, well-thought-out decisions and stress is reduced. When the relationship between behaviors and consequences is not clear, when people do not know how to earn positive consequences or how to avoid negative consequences, confusion and stress is the result.

The Golden Rule. When positive reinforcement becomes a way of life in the organization, with reinforcement going from boss to subordinate, peer to peer and peer to boss, adversarial relationships begin to disappear. People begin to treat each other as they would like to be treated.

Managing the Nintendo Generation and Beyond

Workplace reinforcement has changed little in the last 50 years. However, reinforcement in everyday life has increased dramatically and will continue to do so. To work effectively with the younger generations, a must for management will be an in-depth understanding of reinforcement and its effects. Indeed, even now, reinforcement skills are at least as important as technical job knowledge in capturing the discretionary effort of the Nintendo Generation and beyond. The ability to design high rates of reinforcement into the workplace will be the key to high and sustained performance for the work force of tomorrow.

Performance Management in a Nutshell

Performance Management focuses on the here and now. It is not an abstract, convoluted management principle with limited applications. *It is a precise scientific approach that works.*

There are no tricks or gimmicks. Unlike motivational theories, you don't need to delve into your workers' deep-seated feelings, anxieties or motives. Performance Management requires no psychoanalysis or role-playing. You don't need to find out what kind of childhood your performers had, what their birth order was or how they were raised.

Since everyone operates under the same laws of behavior, applying these universal laws in a positive, effective way will bring about the behavior changes you are seeking in employees — whether you manage two people or 20,000. ●

Bringing Strategy Back

How Strategic Shock Absorbers Make Planning Relevant in a World of Constant Change

by Jeffrey Sampler

THE SUMMARY IN BRIEF

In *Bringing Strategy Back*, strategy expert Jeffrey Sampler cuts through the clutter to reveal exactly why the usual tools of strategy are so sorely out of sync with our needs: windows of opportunity close far faster than they once did, many of these opportunities are smaller than they once were, growth rates are uneven across markets, and today's competition is more asymmetrical than ever. The upshot for managers is that they need to reorient their approach to absorb the shocks and surprises that strike at a moment's notice. Only then can strategic planning reliably play its part.

Leaders all around the world at organizations of any size and type will benefit by shedding their obsolete notions about strategy and becoming more resilient. *Bringing Strategy Back* rises to the challenge and presents a new prescriptive model. It introduces four "strategic shock absorbers" that enable leaders to build resilient organizations that can withstand even the most unexpected global turbulence. Based on the author's in-depth research in the world's most tempestuous markets, the model delivers several must-have qualities that interact and work together in an ongoing process: Accuracy, Agility, Momentum and Foresight.

With this new framework, *Bringing Strategy Back* shows how to be prepared and proactive, rather than reactive, even when the future is uncertain.

IN THIS SUMMARY, YOU WILL LEARN:

- Why strategy is more important than ever for your business.
- Groundbreaking strategies from businesses in India and Dubai.
- The four Strategic Shock Absorbers and techniques for how to use them.

Introduction

In business we equate great strategy with great performance. Our heroes are the bold movers and shakers who can shift on a dime when it matters most and bring the entire organization with them.

But this type of behavior is the exception rather than the rule. More often than not, strategic change occurs exclusively in reaction mode. Sales are slipping, and market share is declining. Profitability is worsening. Disruptive competitors enter the fray and dethrone incumbents. Only then do we find that we are able to break the strategy mold and make bold moves quickly. But, having waited, these are often ill-fated attempts born of desperation, and they frequently fail or arrive too late to turn the tide.

The root cause is a dusty and broken process. In many cases, strategic planning does not work because the tools we use are seriously out of date. The five-year strategic planning horizon, for example, is a surviving relic from the previous age. Few today can plan five months ahead (not to mention five years), and so strategies die on the vine. As a result, executives in fast-changing industries are abandoning strategy altogether at a time when they need it the most.

One-size-fits-all, long-range planning and prediction models have all but been laid to rest. Where does this leave us? How do we bring strategy back and make it an ongoing process? The challenge is to make strategic planning proactive and preemptive as a matter of course. That type of fast, fluid approach requires a mind shift, to be sure, but it also requires a new set of tools.

In recent decades both India and Dubai have experienced massive growth and transformation. Because strategy planning in India and Dubai needed to be modified under conditions of extremely rapid growth and dramatic transformation during this time, they present highly relevant case studies for Western organizations that need to learn the lessons of strategic change. The turbulence India, Dubai and other high-growth regions faced then (and continue to face now) have since become a global contagion. Turbulence and turmoil, expansion and contraction, growth and decline: all of these in rapid succession are the norm everywhere.

For this reason, we need strategic planning today more than ever. With executives fully occupied responding to seismic shifts, surprises and bumps in the road, it is crucial to have tools to simplify the task. The challenge for organizations is to somehow develop the capability to absorb everyday bumps and shocks in order to maintain operating speed and adjust strategy as the global environment continues to change.

Like many of the management innovations of our time, the way forward begins with a solution from a different domain. It is retooled and translated here for the management space. Bringing strategy back is no small matter, but it is both possible and necessary.

Strategic Shock Absorbers

Cars have brakes so that we can drive faster. Similarly, cars have shock absorbers to enable speed. Before shocks, a car's frame would bend or break if it hit a bump at high speed. Shock absorbers enable cars to go fast and maintain their speed.

For executives, operating in a business environment that is extreme and unfamiliar is a lot like driving down

a winding English country lane in very heavy fog. They cannot see far ahead. Perhaps there is a deep rut in the road or even a meandering cow. Driving under these opaque conditions, the reflexive response is to proceed slowly and almost feel your way along. Yet, this is not an option in business — the competition is too intense. Companies need to absorb the impact of unexpected events without slowing down or destabilizing the entire organization.

With constant change the norm, having a fast reaction time is crucial. There is a clear and convincing rationale for this. First, even small shocks have a cumulative effect. Companies are made up of a complex web of associations. They are global and multinational; connected in myriad ways to customers and employees; and they operate in an ecosystem where partners and competitors may be one and the same. With this interconnectedness, surprises that hit one part of a business or ecosystem can affect other parts in ways that are difficult to predict. The bigger the shock, the greater the potential for throwing off a destabilizing effect in multiple parts of the business.

In addition, there are always new bumps just down the road a piece. When you cruise over a pothole and continue without regaining control, it becomes more difficult to swerve to avoid the sheep standing in the road or to veer around whatever obstacle arises next. In other words, stability is the exception rather than the rule. Companies need a means for adapting to environmental changes without slamming on the brakes every time. When the world is in chaos, strategy needs to be adaptive in order to be effective. The solution is Strategic Shock Absorbers.

Why Strategic Shock Absorbers?

Why Strategic Shock Absorbers? Because the capabilities that are part of this integrated framework allow companies to move quickly and fluidly, even amid massive turbulence. In addition, like the mechanism in cars, Strategic Shock Absorbers *oscillate*. They allow companies to move with the environment, contracting inward and expanding back again as conditions on the ground evolve. For example, as companies experience bumps in the road, the Strategic Shock Absorbers call for lean operations that enable speed and precision. Then, when the environment stabilizes, they expand — empowering people and preparing them to gear up for growth and new options.

Strategic Shock Absorbers put people at the center of the process as opposed to at the margins. Yet, in times of extreme change, organizations just as frequently need to limit people's involvement. This is where the oscillation comes in. Resources and options contract when surprises hit — because compression creates clarity. Later, resources and options expand again when we have clarity around the strategic plan. Knowing when to compress and expand is part of the art of management. It is discretionary as opposed to mechanical — but the Strategic Shock Absorbers act as an expert guide.

There are four Strategic Shock Absorbers that work together in an integrated way and form a discipline that can be generalized to suit the needs of almost any organization regardless of size: Accuracy, Agility, Momentum and Foresight.

Accuracy delivers on-target forecasting; enables granularity and specificity.

Agility delivers speed and flexibility in terms of strategic options.

Momentum delivers continuity and minimizes disruption to the organization.

Foresight delivers capability for sense making and scanning the external environment.

Accuracy: Creating Order and Transparency

Although Pizza Hut and other YUM! brands (including KFC and Taco Bell) continue their march overseas, it is arguably more notable that Pizza Hut also managed to grow in the United States even following the 2008-09 recession, when many of its competitors remained flat at best. Their secret sauce had everything to do with creating a discipline of accuracy around knowing themselves, their priorities and the changing competitive environment.

They put together a strategy to reach secondary cities in rural markets — cities that their competitors moved out of or passed over. The management of YUM! made their distinctive location choices not on the number of people in a city, as others had, but on the restaurant-to-people ratio. Beyond targeting hamlets that were dramatically underserved by national concepts, YUM! did their homework in these markets and made adjustments to their business model and value proposition. They cut their asking price on menu items across the board. They also simplified their online portal. Next, they honed in on what franchise owners needed to succeed. In short, Pizza Hut got the price-value equation exactly right for owners as well as customers. That's strategic accuracy — finding growth opportunities and focusing on them. YUM! used this same strategy to dominate in rural markets across China.

Internally, the Accuracy shock absorber delivers a clear-eyed understanding of one's capabilities and performance

gaps. Externally, it leads to a precision awareness of the competitive environment. To get there, we will look at several implementation tools: decision triggers, management by majlis and developing a strategic wedge.

Decision Triggers

Imagine you are idling at a busy intersection in Mumbai, waiting for an opening to inch out into the rush of traffic. In this environment you need a rule to guide your actions. This is what a decision trigger is — a rule that dictates actions and decisions. Individuals act faster because information is focused and compressed. In this case, the decision trigger may be, when you spot a small opening in the line of traffic, move quickly to seize it before it is too late. You would not pause to ask your passengers if they agree with the decision. By the time the question can be asked, the window of opportunity will be shut tight. This simple decision trigger allows you to proceed when you spot a rare change to move ahead in Mumbai traffic.

The same idea applies within companies. Decision triggers limit options and create transparency and clarity around when and how to act. They are particularly useful in complex, chaotic environments where decisions must be made quickly without a lot of discussion. Compressing resources and activity around key actions equals speed.

Decision triggers put a clear stake in the ground in terms of creating a strategy that is simple and powerful so that people throughout an organization can make decisions that align with broad objectives. The most salient benefit of having clear decision triggers is the efficiency it creates in terms of enabling people to understand what matters most to their organization. That type of internal transparency yields not only engagement but also accurate, speedy decisions.

The Majlis System

Another means of achieving accuracy by internal transparency is illustrated by Dubai's "management by majlis" system. Majlis is a type of decision-making process not unlike an informal town hall meeting. The Sheikh has a majlis weekly, and anyone from street vendors to billionaire businessmen can attend. Through the cascading intelligence that occurs with this process, information moves freely and informally across the country from one circle to the next. It is a very organic and efficient system.

Management by majlis creates transparency. Options are compressed because qualitative core values are widely recognized by everyone. In ruling a country or running a company, there are too many moving parts to have it any other way. The majlis becomes a way to structure unstructured strategic planning — it makes implicit priorities explicit. By design, decision triggers are formal planning tools, whereas majlis is the catalyst for formalizing the corresponding deliverables. By bridging the formal and informal elements of management, Strategic Shock Absorbers deliver accuracy.

The Strategic Wedge

Strategic wedge opportunities are low-cost, low-risk strategies that allow companies to enter a market quickly and remain under the radar for a time. They are small enough to allow for flexibility and enable accuracy in terms of fit, but they are solid enough to learn from and build on. With this model, if your initial projections prove to be wrong, you can pivot in a new direction because you are not locked in based on a sizable investment.

With a strategic wedge, the initial move provides the toehold and market intelligence. To leverage that, simply look around for any direction to grow. The small size of a first move enables a certain amount of optionality, but building on that requires managers to be opportunistic — always scanning the environment. They need to be ready to use their position to adapt, as opposed to having one firm plan and sticking with it.

Wedging opportunities expand the use of resources in search of opportunities.

Agility: Seizing and Repeating Opportunities

In the face of uncertainty around the world, companies need to be in a position to react quickly to conditions in flux. They need agility.

Constant Adaptation

A primary ingredient of agility is the ability to respond quickly to challenges in the environment. Constant adaptation is one way to make that happen. In terms of how to achieve constant adaptation, there are two ways to consider: frequent planning cycles and the corporate concierge.

Frequent Planning Cycles: Established financial planning is time consuming, costly and largely obsolete in today's fast-moving world, where the window available to make crucial decisions is compressed. Focusing on performance goals that are months or years away creates tunnel vision, making it impossible to respond to important signals from the market. Agility entails a fast, flexible response to the external environment.

The Indian automaker Mahindra & Mahindra is an organization that takes frequent planning to new heights. They have honed their capability to change on the fly because they have compressed their planning cycles into a monthly exercise. This is not the way GM, Ford or even Toyota is set up to operate. But at Mahindra & Mahindra, constant adaptation (not just a readjustment of a five-year plan) is a way to respond to a changing world. They compress the time from idea to action.

The Corporate Concierge: Without a way to capture ideas and trends, organizations that are large and dispersed can suffer when information escapes without a trace because there is no existing process to capture it.

The corporate concierge — a compression tool that optimizes relationships with external partners (customers, suppliers and vendors) — puts more power into each interaction by centralizing knowledge and channeling it up the chain of command. Creating a corporate concierge — a single point of interaction for dealing with outside companies and analyzing key intelligence — improves competitiveness by channeling important information to the right places. It is also a powerful catalyst for cross-pollination, helping to create synergies between business units and building bridges across silos.

Making Strategy a Bottom-Up Process

Strategy has traditionally been a process driven from the top down. A few senior executives in the strategy department are charged with looking into the future and developing a plan. Everyone else sees the plan in its polished form when it's past the point of no return. But it is the people who witness the specter of change (and experience it firsthand) who are best equipped to plan a response. These people often reside at the lower tiers in the organization — closest to the front line.

When was the last time you heard a CEO present a new strategy and finish like this: "Now tell me everything you think is wrong with this. Help me poke holes in it." This seldom occurs in the West because designing strategy is considered to be a reflection of a CEO's intellect, and it becomes a measure of his or her success. Thus, a challenge to strategic direction is taken as a personal affront.

Yet in many rapidly changing environments around the world, the exact opposite occurs. In Dubai, for example, this type of sentiment is common: "We know this strategy is about 90 percent correct, now let's share it within the company and get some feedback." They know from experience that getting a strategy right on their own will take twice as long — and the market will have moved on. It is built into their process to get input from the employees who are closest to frontline customers.

Bottom-up strategy is an expansion tool. It calls for empowering many more people to get involved in strategy creation, and it opens up new options.

Momentum: Speeding Past Shocks and Surprises

No matter how ardently an organization tries to anticipate them, surprises — from global economic turmoil to unforeseen upstart competitors — occur. What is of vital importance, however, is developing the capability to absorb shocks and maintain momentum without destabilizing the entire company.

Companies absorb shocks and retain their momentum when they have two elements in place. First, they focus on the end versus the means, and, second, they create intellectual buffers.

Mastering the End Versus Means

Achieving results in a permanently turbulent environment requires a focus on the end goal — and watching to see if it has shifted — as opposed to institutionalizing the one best way to get there. Focusing on the ends, not the means, is a compression capability that is common within the technology space. It is about homing in on the result or objective that is most critical to success and toeing the line there, because everything else may change as the environment shifts. When everything else is changing, that overarching end goal, along with an organization's core values, remains the guiding light.

Intellectual Buffers, Not Physical Buffers

It is impossible to absorb the bumps and surprises that materialize without losing momentum when every last man, woman and personal computer is already operating at full capacity. How can companies run lean and still form fast and agile responses to bumps in the terrain? The best way to manage this dilemma is by replacing traditional physical buffers — inventory and slack resources — with intellectual buffers.

Intellectual buffers are ways that an organization can build up intangible advantages that lead to better decision making: management innovation, creative ideation, more effective communication and smarter strategic thinking. This is achieved when companies can effectively leverage people at the same time that they bring better technology and communications to bear.

Active Think Tanks: A common type of intellectual buffer, active think tanks are a brain trust of functional specialists — people from both senior and junior ranks — who conduct a type of scenario planning. They meet regularly, often informally, to discuss what moves to make if various future events come to pass. More specifically, they consider implications and suggest responses to disruption before anything actually occurs. They look at resources to develop, markets to target, and they monitor the wider industry environment.

Active think tanks overlap and work in tandem with an organization's regular management team — which, in balance, may be too occupied driving the current strategy to speculate about future events and appropriate organizational responses. As a result of this type of intellectual buffer, when "surprise" events do materialize, a company is much quicker to respond because they have proposals and first-response scenarios at the ready.

Managing for the end result (compression) and building intellectual buffers (expansion) are two ways that organizations can absorb bumps in the road without sacrificing momentum. As with the other shock absorbers, this one, too, depends upon the judgment of managers. It is the manager's judgment around when to compress and when to expand that makes all the difference.

Foresight: Getting Ahead of Change and Chaos

Foresight, the fourth and final Strategic Shock Absorber, is about seeing bumps and opportunities in advance and having contingency plans at the ready. Foresight is also about seeing the present for what it is and being prepared to respond to the changing external environment. As the competitive terrain within an industry inevitably shifts, strategic plans need to do the same at a commensurate pace.

Strategic Assumptions, a compression tool, guides companies to focus on the archival information that indicates whether a plan can succeed. Alternate Strategies is an expansion tool that focuses attention on seeing what is new and next, as opposed to measuring interim progress toward a goal that will very likely shift before you can achieve it.

Strategic Assumptions

Strategic Assumptions systematizes something that is almost universally overlooked: the original context of an idea. Individuals who do strategic planning in most organizations are smart people with their eyes fixed on the future, yet they frequently fail to capture this original context. That is, they neglect to identify and track what the environment looked like (or what the future environment was expected to look like) when the idea was conceived. Preserving the all-important original assumptions allows executives to determine whether a strategy remains applicable months or years later. It provides clarity around whether the plan still has a chance to succeed or if it should be scrapped altogether.

Alternate Strategies: Scanning the Periphery

One simple and underutilized means of identifying the next best strategy is by scanning the periphery. The idea is to systematically sweep for opportunities that are adjacent to your own. These adjacencies come in many forms. Concept adjacencies, for example, are incrementally new ideas designed to suit your existing market, such as when towel maker Welspun expanded their business by producing sheets and rugs. But there are numerous other adjacencies to consider. Physical adjacencies are a chance to adapt an existing idea for a different locale. Business model adjacencies deliver an existing idea in a new way (going from retailing to e-tailing). Domain adjacencies lift an idea from one domain and transfer it into another (using a solution created in manufacturing to deliver health care, for instance).

The Foresight shock absorber moves in the same fluid way that the others do — compressing, expanding and moving back again. In this case, the shock absorber illustrates the cyclical nature of oscillation and the need for constant adaptation. We design a strategy and track the strategic assumptions that are associated with it. Then, when the context changes, it is time to put an alternate plan into place (based on new strategic assumptions).

Execution: Shock Absorbers in Action

Harnessing the properties of the Strategic Shock Absorbers creates important new options for executives managing through chaotic change. And the power to truly transform an organization comes not from contraction and expansion alone but from the two modes working together.

DLF's Strategic Shock Absorbers

India's independence and the creation of Pakistan in 1947 caused large numbers of people to cross borders and

settle into areas which were hitherto uninhabited in India. Entrepreneur Chaudhury Raghuvendra Singh saw this as both a business opportunity and a chance to provide a necessary service to the uprooted masses flooding into the country. Today, only a handful of people realize that it was Singh who built the up-market residential colonies of Delhi years before he started Delhi Lease and Finance, better known today as DLF.

With footprints at more than 30 locations, DLF is a dominant player in the Indian real estate market. As of March 2014, the company had 3 million square feet of leased retail space across the country. DLF needed all four Strategic Shock Absorbers to secure their position as a landmark company navigating the turbulent terrain of the Indian economy.

Using their foothold in the residential colonies of New Delhi as a classic Strategic Wedge, DLF systematically expanded their business over the last quarter century. They spread out across multiple verticals (or business units), with their strongest segments being office space, housing developments and retail leases. Building office space was DLF's foremost venture, followed by housing projects in 1982 and community shopping centers in 1989. Shopping malls and organized retail space came into the picture in 2002.

These initial businesses, first created using a strategic wedge, set the stage for much more growth to come. From there, DLF became expert at spotting opportunities adjacent to their native space. Scanning the periphery and entering into joint ventures allowed DLF to expand outward more recently — into hotels, special economic zones (SEZs), local infrastructure and leisure development.

DLF also manages to execute compression strategies, minimizing information and time, in service of efficiency and speed. In order to guard against property risks, DLF managers across the board abide by their decision trigger for securing property: The cost of acquiring land must be less than one-tenth of the selling price. This decision trigger is an imperative within DLF, and every employee recognizes its importance. It helps them manage risks and restrict potential losses caused by fluctuations in land prices.

Another way DLF compresses time and information (and other resources) is by adhering strictly to their minimum debt strategy. Since its inception, DLF has grown by utilizing its development earnings and not merely its wealth of land reserves.

Through oscillation and the art of management, the Strategic Shock Absorbers enable speed — but speed is not enough. The final two elements we will examine are control and innovation.

Driven By Values

The role of shock absorbers is to provide options for maintaining speed. Yet, accessing that advantage requires sound judgment. Good judgment is not something that is easily taught, but we can use parameters to guide our choices. How? By using values as a GPS.

Companies accustomed to operating in fast-moving markets are the ones more apt to rely on values to steer strategy. Values and a culture that appreciates them are the most important tool of all for making strategy agile and creating a foundation for the Strategic Shock Absorbers. Because values remain a constant backdrop, they enable companies to decode a changing environment.

Values Dovetail with Competitive Advantage

Arvind Mills is a company established in 1931 to cater to the demand in India for fine and superfine fabrics. At the time, the textile industries of the U.K. and its Indian dominion were interlinked by necessity because most regions of India were colonized by the British. As a result, almost all of the high-quality cloth available in India was manufactured in Britain by modern power looms and mills, and imported.

That began to change during the recession of 1929, when Mahatma Gandhi championed the boycott of imported fabric by Indians under what was known as the Swadeshi Movement. With that, the Lalbhais family, founders of what came to be known as the Arvind Mills, saw an immense opportunity. They reasoned that the demand for imported fine and superfine fabrics, which were now being boycotted, could be satisfied if they were manufactured in India by Indians.

The Lalbhais set up the most modern integrated cloth mill of the time in Ahmedabad, India. It was one of the few mills that incorporated all the facilities, from spinning and weaving to dyeing, bleaching, finishing and mercerizing. Raw cotton fiber could be spun into yarn, woven into cloth, dyed with the color of choice and finally finished as per requirements, all at one place with the help of modern equipment. Hence, Arvind's core value of quality above all was born and became the basis for their competitive advantage, then and now. Every strategy that Arvind adopts is ultimately in service of that value.

Creating a Culture Where Values Matter

In order to benefit most from values, they must be clearly communicated and widely apparent internally and externally. Next, values need to be top-down. But values also need to be bottom-up. Looking through a grassroots

lens, values create a positive ends-versus-means dynamic, enabling people to understand bottom-line priorities and act accordingly.

All of these things point to people as being more important then ever. You can teach someone rules and give them tools, but values are ingrained. They require a different type of buy-in that comes from within. As an organization's internal GPS system, values are the stabilizing mechanism that enables shock absorbers to deliver their benefits.

Management Innovation From Fast-Moving Markets

India has had to deal with chaos and unpredictability for decades. Its approach to strategy, as a result, is highly proactive. The only way to succeed amid chaos is to stay one step beyond chaos.

In contrast, Western corporate strategies are traditionally more reactive. Companies change tack when sales, profits or stock prices are down; when there are new competitors; or when employees begin to leave. The trouble is that these are all trailing indicators.

Indian companies have become adept at picking up leading indicators so that they can change strategies positively and proactively rather than defensively and reactively. Indian approaches to shaping and executing strategy share common elements that together add up to their own unique contribution to management innovation.

Values Enable Coordination: In managing through complex, uncertain, high-speed change, it is critical that organizations have a common lens through which to interpret the changing environment. For Indian companies, values provide that common lens. Values in the Indian context are not decorative adornments but rather decision-making touchstones and reference points.

Absorbing Change Without Losing Momentum: Being able to absorb change without losing momentum is a matter of focus and endurance. Indian companies have a willingness to take a hit and carry on, and this is increasingly necessary for all companies.

Developing Foresight and Anticipating the Future: In Indian companies, changing course is seen not as failure on the part of strategy but as a natural and positive part of a continuous process of strategy development and implementation.

Executing with Accuracy: India is a rush of people and of business coming from every conceivable direction. We've seen that to make a move successfully in this type of environment requires incredible accuracy. This applies internally as well as externally. The Indian companies studied demonstrated that one of the fundamental elements of accuracy is for an organization to understand itself. In order to have quick decision making and immediate reactions to changing conditions, strategy must be transparent. This requires decision triggers.

Reacting with Agility: Lessons learned from Indian companies indicate that agility requires three things happening consistently and simultaneously: a willing interaction with the environment, accurate processing of all available information, and the ability to make decisions and take actions based on these.

Formalizing the Informal: Bringing both formal and informal elements to the planning process is not new, but what is different is the manner in which the Strategic Shock Absorbers act as an adaptation and integration mechanism between the two. In many ways, the Strategic Shock Absorbers formalize the informal in order to clarify opportunities and accelerate change. Informal communication, ideation and feedback are ongoing inside an organization; however, without these tools, ideas and expertise get lost or are very slow to filter up to senior management.

The advice given here will make a positive difference only if individual leaders put a stake in the ground and make an effort to customize the approach to suit their own business. On a personal level, this requires asking the question, "What type of leader do I want to be?" Abandoning the old mode of strategic planning requires the courage to adopt a new gestalt. It may appear risky, but the bigger risk is in not pushing against the norm and choosing to remain the same.

THE SUMMARY IN BRIEF

In ***Building Corporate Soul: Powering Culture & Success with the Soul System™,*** Ralf Specht provides a framework that allows leaders to act immediately for the long-term benefit of their businesses. The Soul System™ gives answers on how to approach this seismic shift by giving away practical and reality-tested approaches that enable leaders to maximize the impact of their workforce. In doing so they will gain the broad acceptance of society as a whole— winning the hearts of their stakeholders on an emotional level and convincing their minds on a rational basis.

This book summary provides the means by which leaders can inspire their people to do what they did not believe possible, not by some magic potion but through a framework driven by courage to challenge the conventions of how to create value sustainably in extraordinary times.

IN THIS SUMMARY, YOU WILL LEARN:

- How to move beyond current thinking and create an environment where business goals are understood.
- How corporations can 'walk their talk,' going beyond words to truly embody their vision and culture.
- How to turn a company's purpose into a real means to an end.
- How every leader can ignite or re-ignite the corporate soul in their firm.

Introduction: The Soul Index

Building Corporate Soul is not looking at the absence of soul. It celebrates companies that have been successful at building—or in some cases re-building—it. At a time when purpose seems to be the flavor of the day in discussions about corporate leadership, this book aims to provide a framework for how to take purpose to a higher level: corporate soul. If you are able to build corporate soul, the rewards to your company are huge.

Corporations in many sectors and cultures are taking every effort to achieve it-at every level and every day. They are united in how they ensure a solid understanding of the company's direction and how they leverage key principles of behavior that make a difference for the thousands of people who give their very best for "their" company day in and day out.

The Soul Index is a global ranking that identifies companies across a wide range of sectors that have corporate soul. In researching the quantitative studies available that identify the performance of companies in terms of their brand strength, their brand impact, their employer brand qualities, and their ability to create employee satisfaction, a correlation emerged between the business success and the level of employee engagement and satisfaction and their appreciation for their company's CEO. The companies featured on the Soul Index speak the language of success based on a clear system of the key elements of the Soul System: a shared understanding and corresponding shared behaviors.

As the Soul Index proves, making the effort to build and maintain corporate soul provides significant value and growth. So how can a company find and build its corporate soul? And then how does a company ensure its soul grows and thrives?

The Corporate Soul

Corporate soul is the ultimate currency of success. It is a function of aligning both corporate understanding and behavior around a purpose that is inclusive to all stakeholders-by "simply" ensuring that all three levels are a shared property of the firm and its people.

That shared purpose allows a company to develop a shared understanding of what drives that company and its people, as well as the corresponding shared behaviors that reflect that shared understanding.

As a result, shared understanding and shared behaviors are inextricably linked in building the soul of a company and its brand. If corporations walk the talk-meaning that they behave on the basis of shared understanding--then you find companies with soul. As the social philosopher Charles Handy said, "The companies that survive longest are the ones that work out what they uniquely can give to the world, not just growth or money but their excellence, their respect for others, or their ability to make people happy. Some call those things a soul." This was a new perspective that Handy introduced in his 1989 book *The Age of Unreason.*

Until then, a different view had been predominant in the world of business. Handy, who has been rated among the Thinkers 50, a private list of the most influential living management thinkers, was one of the first who understood that soul might also be a relevant attribute when it comes to corporations.

The Soul System™

The Soul System is a framework that enables business leaders to assess the level of corporate soul that their firm has. The shared aspect of the three dimensions of the Soul System allows companies to measure their achieved levels of understanding and behavior on the basis of the firm's purpose across all areas of the business-internationally or domestically, across different departments or across different leadership levels.

To develop corporate soul, making a shared purpose the guiding principle for the entire company is critical. You accomplish that by defining the different elements of the Soul System for your company. At the core of the Soul System sits that all-important shared purpose--it represents the heart of everything your company does. Surrounding that core are four key elements-vision, mission, values, and spirit-that build shared understanding.

Creating the Soul System is not just a task for top management. It is a company-wide project that never ends. It is not a straight line. Even the companies that do extremely well in this space have lost their way at times. In start-ups this can happen when the founding generation leaves. In established companies, management changes often include the risk of losing the way. Few companies recognize that they have lost their soul-and then they start to look at it as a detour on their way forward. They find a contemporary way to give the soul back to their company, which often allows them to make giant leaps in business success during

the next few years. Companies that implement the Soul System methodology and create "their" Soul System all have one thing in common: a shared understanding of the forces that drive their success and the shared behaviors that express that understanding. And they all are ready to be on the journey for the long haul.

Purpose Meets Soul

Purpose gives us direction, motivates us, gives reason for our existence. It also helps us make decisions -big ones and small ones. Merriam-Webster differentiates between the various words that are synonymous with purpose: Intention, intent, design, aim, end, object, objective, and goal all mean what one intends to accomplish or attain. What makes purpose different, though, is that it "suggests a more settled determination." While purpose is important for individuals, it has been recognized more and more that it is critical for business success, too.

Without purpose at the heart, there is no chance for soul to develop throughout the entire company. Like Harvard Business School professor Ranjay Gulati discovered in his work on start-up companies, "There's an essential, intangible something in start-ups-an energy, a soul. Company founders sense its presence. So do early employees and customers. It inspires people to contribute their talent, monev, and enthusiasm and fosters a sense of deep connection and mutual purpose. As long as this spirit persists, engagement is high and start-ups remain agile and innovative, spurring growth. But when it vanishes, ventures can falter, and everyone perceives the loss-something special is gone."

Understanding the Soul of Your Company

The Soul System can get into full swing when all elements of shared understanding—mission, vision, values, spirit-and the corresponding shared behaviors are completely internalized by everyone in a company. A company's culture is a manifestation of its corporate soul. The shared behaviors that drive that culture are either true to the soul of the firm-or not. In both cases, understanding your company's soul is key. Why is that important and what makes it so difficult?

Successful start-ups develop their culture beyond the leadership spirit very naturally, as they are often driven by the sheer motivation to do things differently. Airbnb's CEO Brian Chesky is famous for his quote, "Culture is simply a shared way of doing something with passion." But as simple as it sounds, it is one of the most difficult things to achieve when a company grows beyond the founding partners.

Lead with Soul

The larger your company becomes, the more challenges will be around the corner to ensure the soul of your company stays healthy. Your first twenty associates will get it from the horse's mouth every day and reinforcing the soul of the company will be a natural thing. But then, if your product and your business model are sound, the company will grow and you will need to establish larger leadership structures.

Nurture the Soul Ecosystem

Souls are very sensitive. Individual souls, but also collective souls, as in the soul of a company. As with individuals, companies go through ups and downs. The resilience of their organization is a testament to the ecosystem of all the players inside the organization and the stakeholders outside the firm. The shared behaviors inside the company allow new employees to "get it" fast-actions speak louder than words, and the behaviors display what gets rewarded, ignored, or destroyed inside an organization. LEGO is a prime example of a firm where that ecosystem got out of balance and then subsequently restored, which helped the company rise to greatness again.

This true self differs from company to company, but the principle remains universal since we are all human beings. Whether we work as an accountant, as an engineer, as a pilot, or as a chef-it's those principles of behavior that human beings have fostered over thousands of years.

Promote Soul Drivers

Promotions are a very powerful tool. Not only do they have the ability to increase employee morale beyond the individual who is being promoted, but they also are a credible sign to everyone else that career progression is possible internally. Plus, promoting individuals from within the organization who are ready for the next step often makes more sense than finding someone from the outside to both do the job and fit the culture of the company. Yet very often it is so much harder. In 2018, Michael C. Bush, CEO of Great Place to Work®, and his colleagues Jessica Roman and Chinwe Onyeagoro shared their experience based on a survey of over 400,000 US workers. The title says it all: "How You Promote People Can Make or Break Company Culture."

Soul drivers are a rare species— identifying them is really

critical when you are on your way to building a company with soul. Once your organization has been able to find them, make sure they are being nurtured and given the opportunities to grow. They are definitely worth it.

Reward Soul Supporters

Whether your company is an international enterprise or a domestic business, there aren't many corporations these days where every member of the workforce stems from the same gender or ethnicity. In other words, don't expect that everyone else has the same perspective on what is going on at your firm. To state the obvious, soul supporters can come from anywhere with any kind of background or orientation.

To develop soul supporters, it is critical for global companies to really understand the drivers of outperformance when building successful teams. The numbers indicate that more and more firms are understanding this, but the level still remains low for now.

Hire Soul Makers & Grow Soul Leaders

It goes without saying that when you want to ensure that your company maintains the corporate soul that has made it so strong, you want your people to know how to hire soul makers-the right talent that will live up to that soul. That means finding people with good or strong emotional intelligence— which is the capability of individuals to recognize their own emotions and those of others, discern between different feelings and label them appropriately, use emotional information to guide thinking and behavior, and adjust emotions to adapt to environments. This is a critical factor when it comes to hiring people and developing people- but it hasn't been a priority for many companies so far.

Identify Soul Allies

As a matter of course, corporations are maintaining partnerships with other organizations-whether these are mere sponsorship arrangements or commercial activities such as creating joint venture entities or other forms of collaboration. A multitude of criteria is usually applied when it comes to forming these partnerships: Do we have successful shared experiences with one another? Do we share the same passions? Is this an opportunity to expand our business network? Can I trust the other partner? Do they apply a great level of creativity in their dealings? Do we share the same vision?

Create Soul Followers

Too often, the connection that a customer has with a company or brand is not a human-to-human interaction. Instead, it feels like a machine-to-human interaction. The principle behind the success of leaders with their internal stakeholders and their external stakeholders, too, is human-to-human interaction. When strategic clarity and emotional intelligence connect, interactions become effective, connections become stronger, and a loyalty emerges that has the power to drive long-term success, both for the company and its customers. Corporate soul can become tangible inside and outside the corporation.

Ralf Specht is a visionary business leader and creator of the Soul System™, a framework that aligns value-creating employee action with broader corporate strategy through shared understanding & shared purpose. As a founding partner of Spark44, he was the architect of an innovative, industry-first joint venture with Jaguar Land Rover which he grew to a global revenue of $100+m and 1,200 employees. Previously, he consulted with global companies and brands for more than two decades with McCann Erickson.

Building a Values-Driven Organization

A Whole System Approach to Cultural Transformation

by Richard Barrett

THE SUMMARY IN BRIEF

The responsibility of leaders is to enhance, harness and direct the capacity and energy of their people toward virtuous and valuable ends. To achieve long-term success, the organization needs to have a solid foundation built on principles and values that act as a center of gravity. In business, you get what you target, design, measure, provide incentives for and are passionate about. This applies equally to principles and values, which need to be nurtured and directed through an effective whole-system approach and values-management framework. This is exactly what *Building a Values-Driven Organization* provides.

The tools, ideas and framework found in this summary can help any leader who is committed to a values-based approach and long-term sustainable success.

Richard Barrett shows how business is learning to develop a more integral or holistic approach to organizational evolution. In addition, he offers a reminder of the importance of values-based decision making; the need for leadership training programs that build full-spectrum, self-actualized leaders; and the urgent need to create a global cadre of master practitioners of whole-system change to support leaders in creating a values-driven future for business, society and humanity.

IN THIS SUMMARY, YOU WILL LEARN:

- How to build a values-driven organization.
- How the process of values management can be used to support continuous improvements in organizational performance and develop long-term sustainability.
- How new leaders can become new agents of change.
- How leadership can become the key to cultural transformation.
- A blueprint for whole-system change.

THE COMPLETE SUMMARY: **BUILDING A VALUES-DRIVEN ORGANIZATION**

by Richard Barrett

The author: Richard Barrett is the managing partner of Richard Barrett and Associates. One of the world's leading thinkers on building values-driven organizations, Barrett is the author of the best-selling book *Liberating the Corporate Soul*. He has carried out cultural values assessments for more than 600 organizations in 35 countries in the past eight years and works closely with CEOs of major organizations around the globe.

Introduction

The concept of whole-system change is based on the work of author Ken Wilber. Whole-system change can best be explained by referring to a modified version of Ken Wilber's Four Quadrant Model. (See chart below.)

	Internal	External
Individual	**Personality** Personal values and beliefs	**Character** Personal actions and behaviors
Collective	**Culture** Group values and beliefs	**Social Structures** Group actions and behaviors

Figure 1-1 The four quadrants of human systems

As individuals change their values and beliefs, their actions and behaviors change. When a critical mass of individuals changes their values and beliefs in the same direction, their collective actions and behaviors also change. For this to happen, there must be a parallel shift in all four quadrants.

Engineering parallel shifts in the four quadrants within a group structure, such as an organization or any human system, is called "whole-system change." Whole-system change begins with a shift in the personal consciousness of individuals and ends with a shift in a group's actions and behaviors.

Values Management

The purpose of values management is to actively measure and monitor the values and behaviors of an organization so that we can continually adjust the culture to sustain high performance.

As a change agent, it is vital that you understand what levels of consciousness and what worldviews different segments of the executive and employee population are operating from if you are going to successfully design and support the leaders of an organization in managing a whole-system transformation process.

The Seven Levels of Consciousness Model

Seven well-defined stages can be distinguished in the development of personal consciousness. Each stage focuses on a particular existential need that is inherent in the human condition. The seven existential needs are the principle motivating forces in all human affairs. Individuals grow in consciousness by learning to master the satisfaction of these needs. Individuals who learn how to master all seven needs without harming or hurting others operate from full-spectrum consciousness. They have the ability to respond appropriately to all of life's challenges.

Here are the seven existential needs that constitute the seven stages in the development of *personal* consciousness (from most developed to most basic):

- **Level 7: Service.** Leading a life of selfless service.
- **Level 6: Making a difference.** Making a positive difference in the world.
- **Level 5: Internal cohesion.** Finding personal meaning in existence.
- **Level 4: Transformation.** Finding freedom by letting go of our fears about survival, feeling loved and being respected by our peers.
- **Level 3: Self-esteem.** Feeling a sense of personal self-worth.

Level 2: Relationship. Feeling safe, respected and loved.

Level 1: Survival. Satisfying our physical needs.

The "lower" or basic needs, levels 1 to 3, focus on our need for physical safety and survival as well as our need for emotional safety and self-esteem. The "higher" needs, levels 5 to 7, focus on our "spiritual" needs — the need to find meaning in our lives, the need to make a difference in the world and the need to be of service.

Individuals who focus *exclusively* on the satisfaction of the lower needs tend to live self-centered, shallow lives, subconsciously or consciously dominated by the fears of the ego.

Individuals who focus *exclusively* on the satisfaction of the higher needs tend to lack the skills necessary to operate effectively in the physical world. They can be ineffectual and impractical when it comes to taking care of their basic needs. We say they are not "grounded."

To be successful in the world we need to learn how to master the satisfaction of all our needs so we can operate from full-spectrum consciousness.

The Seven Levels of Group Consciousness

The seven stages in the development of personal consciousness also apply to the development of group consciousness, where "group" is defined as a collection of individuals who share a common physical heritage or a common purpose (culture of meaning).

Groups grow and develop in the same ways as individuals — by successfully mastering the satisfaction of their needs. The most successful groups are those that develop full-spectrum consciousness — mastery of the needs associated with every level of consciousness. They are able to respond appropriately to all of life's challenges.

Here are the seven stages in the development of *group* consciousness:

Level 7: Service. Caring for humanity, future generations and the planet.

Level 6: Making a difference. Cooperating with and forming alliances with other groups.

Level 5: Internal cohesion. Aligning group members around a shared vision, mission and values.

Level 4: Transformation. Involving group members and giving them a voice in decision making.

Level 3: Self-esteem. Creating order, performance and effectiveness that engenders respect and group pride.

Level 2: Relationship. Building harmonious internal relationships that create a sense of belonging.

Three Key Insights

Here are three key insights on building a values-driven organization:

1. A cookie-cutter approach to the design of cultural transformation programs in organizations, where one size fits all, does not work.
2. Cultural transformation will work only if it is part of a whole-system change process.
3. Cultural transformation will succeed only if the leadership team is committed to this work.

Level 1: Survival. Establishing conditions of financial stability and safety for group members. ●

The Cultural Transformation Tools

Cultural transformation tools (CTT) have been used in corporations, government agencies and nongovernmental organizations since 1997. They have also been used in schools, classrooms, religious institutions and communities.

The success of CTT is due to their ability to provide a detailed road map for the evolution of consciousness of an organization or any group of individuals that share a common heritage or purpose. In some instances, the objective of using the tools is cultural transformation, and in other instances the purpose is to build a values-driven organization.

Cultural Values Assessment

The CTT cultural values assessment (CVA) is used to identify and measure the *personal values* of the individuals who make up the organization, the *values of the current culture* of the organization as perceived by the members of the organization and the *desired culture values* of the organization as expressed by the members of the organization.

At the heart of the CTT technology is the concept that all values and behaviors can be assigned to one of the seven levels of consciousness. If you can identify the values and behaviors of a group of individuals, you can measure the consciousness of the group by mapping their values to the seven levels of consciousness model. ●

Mapping the Values of Organizations

When mapping the values of organizations, researchers have learned four things:

1.Organizational culture is the new frontier of competitive advantage, particularly in circumstances where talent is in short supply.

2. **Organizational cultures can be changed either by changing the leader and/or through whole-system change.**
3. **The intangible assets of an organization, such as culture, have a significant impact on the share price of a company.**
4. **Whatever you focus on and measure gets done.**

Ultimately the culture of an organization is a reflection of the personality of the leader or the personalities of the leadership group. Therefore, organizational transformation always begins with the personal transformation of the leaders. Individual values assessments and leadership values assessments play a significant role in helping leaders to change their behaviors.

Full-spectrum consciousness is the natural pathway to long-term success. Research shows that full-spectrum organizations are the most successful. ●

Mapping the Values of Individuals

One of the best ways of raising the awareness of the members of the leadership group to the importance of values alignment is to provide them with their own personal profiles from the cultural values assessment. They are able to see, firsthand, their own top personal values, the values they see in the organization and the values they would like to see in the organization. They are also able to compare their results with the overall results of the leadership group.

Individual Values Assessment

The individual profile when used on its own for coaching purposes is called an individual values assessment (IVA). An individual goes online and picks 10 values/behaviors that represent who they are, 10 values/behaviors that describe how their organization operates and 10 values/behaviors that describe how they would like the organization to operate.

The IVA is an invaluable coaching instrument. It helps people understand with clarity what is working and what is not working for them in the culture of their organization and clarifies individuals' feelings about the organization.

The gap between the current and desired culture values enables people to see what is working and what is not working for them and what they would like to do about it. The gap between personal values and current culture tells an individual to what degree he or she can bring his or her whole self to work. ●

Merging Cultures and the Importance of the Values of the Leadership Group

Mergers that occur between companies with similar values and levels of organizational consciousness have the greatest chance of success. The least successful takeovers are those that involve companies that operate from lower levels of consciousness taking over companies that operate from higher levels of consciousness.

Here are three hard-and-fast rules about organizational cultures and leadership groups:

Rule 1: An organization cannot operate at a level of consciousness higher than that of the personal consciousness of the leadership group.

Rule 2: The culture of an organization either is a reflection of the personal consciousness of the leadership group (conscious and subconscious) or is inherited from previous leadership groups.

Rule 3: In general, most organizations operate with a "default" culture because it arises unconsciously; the culture is not managed, the culture is not monitored and the culture is simply recognized as "the way things are done around here." ●

Leadership: The Key to Cultural Transformation

In his book *Good to Great* Jim Collins states that the first job of a new leader is to get the right people in the right seats on the bus and that this is absolutely fundamental to building a long-lasting successful company. The right people are those who display what he refers to as level 5 leadership. Collins' level 5 leaders are those who display full-spectrum consciousness.

The Seven Levels of Leadership Consciousness

There are seven well-defined levels of leadership that correspond to the seven levels of organizational consciousness. Each level is presented with the leadership focus point:

Level 7. ***Wisdom/Visionary***: Service to humanity and the planet.

Level 6. ***Mentor/Partner***: Strategic alliances and partnerships, mentoring and coaching.

Level 5. ***Integrator/Inspirer:*** Developing a strong cohesive culture.

Level 4. ***Facilitator/Influencer:*** Adaptability, continuous renewal and learning.

Level 3. ***Manager/Organizer:*** High-performance systems and processes.

Level 2. ***Relationship Manager/Communicator:*** Relationships that support the organization.

Level 1. ***Crisis Director/Accountant:*** Pursuit of profit and shareholder value.

Each level of leadership corresponds to the satisfaction of the needs of the organization at the corresponding level of consciousness. Leaders who learn to master the needs of every level of organizational consciousness operate from full-spectrum consciousness. Research shows that these are the most resilient and successful leaders because they have the ability to respond appropriately to all internal challenges and external threats while taking full advantage of opportunities to grow and develop.

Focus

The principle focus of the lower levels of leadership consciousness is on creating a financially stable organization with a strong customer base that has efficient systems and processes.

The principle focus of the transformation level of leadership consciousness is to promote a climate of continuous learning and employee empowerment so that the organization can be responsive and adaptable to changes in its internal and external environment and continuously develop new products and services.

The principle focus of upper levels of leadership consciousness is to create a vision, mission and values for the organization that builds internal and external connectivity through strategic alliances and makes a contribution to society. ●

Whole-System Change: The Context for Cultural Transformation

Values alignment and mission alignment together create group cohesion.

For whole-system change to occur, there must be a parallel shift in personal alignment, structural alignment, values alignment and mission alignment. All four relationships must change in the same direction for the group to experience a shift in consciousness. When all four relationships change in the same direction, the group finds a new level of internal stability and external equilibrium at a higher level of consciousness.

Cultural Entropy

Cultural entropy, which is the proportion of energy in an organization consumed by nonproductive activities, occurs when there is a lack of alignment between the four quadrants. Cultural entropy is inversely related to resilience. When cultural entropy is high, resilience is low. When cultural entropy is low, resilience is high.

There are four causes of cultural entropy:

• *Lack of personal alignment* occurs when there is a lack of alignment between the stated values of individuals and their behaviors, particularly among the leadership group.

• *Lack of structural alignment* occurs when there is a lack of alignment between the stated values of the group and the behaviors of the group as reflected in the rules, regulations, structures and systems of governance.

• *Lack of values alignment* occurs when there is a lack of alignment between the personal values of individuals and the collective values of the group and a lack of alignment between the values expressed in the current culture and the desired culture.

• *Lack of mission alignment* occurs when there is a lack of alignment between the sense of purpose or mission of employees or their prime motivational drivers and the collective sense of purpose and mission of the group. ●

The Framework for Whole-System Change

The framework for whole-system change can be divided into two phases: preparation and implementation.

The Preparation Phase

There are eight steps in the preparation phase:

Step 1(a): Cultural transformation tools values assessment. The first step is to carry out a company-wide values assessment to identify employees' personal values, perception of the current values and their desired culture values. This is known as the baseline assessment.

Step 1(b): Business assessment. In developing the compelling reasons for change, it will be important to include the business case for change as well as the cultural case for change. Usually, the business case for change is blatantly obvious from the financial results of the organization or key performance indicators such as employee retention, market share and customer satisfaction.

Step 2: Create vision and mission. The vision and mission statements should be concise, inclusive and easily memorized.

Step 3: Choose values and select behaviors. The results of the cultural values assessment provide

significant insights as to what values leaders, managers and employees consider important.

Step 4: Evaluate organizational resilience. Examine the long-term sustainability of the organization by carrying out a baseline evaluation of the organization's resilience. Find ways to enhance the organization's ability to withstand shocks and anticipate risks — find ways to build its adaptive capacity.

Step 5: Develop compelling reasons for change. There must be a clear understanding among the executive population, managers and staff why the organization is embarking on a whole-system change process.

Step 6: Survey of worldviews and drivers. Identify the worldviews and key drivers of the employee population.

Step 7: Develop an Implementation Strategy. Make the vision, mission, values and behaviors pervasive throughout the culture. There are three major components to the change process: personal alignment, group cohesion and structural alignment.

Step 8: Develop objectives and key performance indicators. Measurement matters.

The Implementation Phase

Here are the steps of the implementation phase:

Step 9: Structural alignment. Reconfigure the systems and processes of the organization so that they align with the vision, mission, values and behaviors of the organization.

Step 10: Leadership values and behaviors assessment of the senior executive group, coaching and action plans. People with deeply ingrained limiting beliefs should be assigned a personal coach. Those who cannot adjust will leave, often under their own volition.

Steps 11,12,13: Personal alignment programs with the executive population, group-cohesion programs in intact teams of business or functional units and subunits and leadership values and behaviors coaching with the executive population. These three programs (personal alignment, group cohesion and individual coaching) reinforce each other in bringing about a shift in the individual and collective behaviors of the executive population.

Step 14: Values awareness program. At whatever level we stop the cascade of the personal alignment and group-cohesion programs, we replace it with a "values awareness" program and cascade it through the rest of the organization. ●

The Importance of Values-Based Decision Making

Over time, the human species has developed five modes of decision making. The difference between each mode of decision making is the source and emphasis we give to meaning making. There are five sources of meaning making: instincts, subconscious beliefs, conscious beliefs, values and intuition.

Instinct-based decision making takes place at the cellular level and is founded on learned DNA responses, principally associated with issues of survival.

In ***subconscious belief-based decision making*** we also react to what is happening in our world without reflection, but on the basis of personal memories rather than cellular (DNA) memories. In this mode of decision making, action also precedes thought. The action is often accompanied by the release of an emotional charge.

If we want to make rational decisions, we have to leave behind subconscious belief-based decision making and shift to conscious belief-based decision making. What allows us to make rational decisions is the pause we insert between meaning making and decision making. We are using beliefs based on our past experiences to design our future experiences.

To create the future we want to experience, we have to shift from conscious belief-based decision making to ***values-based decision making***. The question we need to ask when making a decision is the following: "Is this decision rational, and is it in alignment with our values?" A decision that is not in alignment with your personal values lacks authenticity. You cannot create personal or group cohesion by making decisions that lack authority and integrity.

The shift from values-based decision making to ***intuition-based decision making*** is for many a bridge too far. However, it is not a bridge too far for the more evolved leaders in an organization — those who have developed full-spectrum personal consciousness. Intuition allows us to create a future based on the emergence of being. When we create the conditions that allow our minds to tap into the collective mind-space, our intuition informs us of what wants or needs to emerge.

It is important for individuals and organizations to shift from belief-based decision making to values-based decision making. They should try to eliminate subconscious fear-based decision making. To create a values-driven organization requires us to constantly focus on our individual and collective values. One way to do this is to practice values management. ●

Values Management

Values management is the process by which an organization actively measures, monitors and responds to its causal indicators of performance in such a way that it adjusts its culture and way of being to sustain high performance (outputs) and meet its objectives (outcomes).

To continually sustain high performance, four conditions must be met:

- **Personal alignment:** The alignment of an individual's values and beliefs with their actions and behaviors.
- **Values alignment:** The alignment of an individual's values with the group's values.
- **Mission alignment:** The alignment of an individual's sense of purpose, mission or drivers with the group's stated purpose or mission.
- **Structural alignment:** The alignment of a group's values and beliefs with their actions and behaviors as codified in the collective rules, laws and processes of governance.

The process of values management enables us to measure the degree to which the four conditions are being met and how close they are to prime. Prime represents the healthiest possible state of the causal performance indicators commensurate with sustained mission assurance taking into account the levels of consciousness of the executive and employee populations.

When the four quadrants are in alignment, the organization is as close as it can get to prime and cultural entropy is minimized. ●

Integrating Appreciative Inquiry

Transformation is seen to happen when people have new, meaningful conversations they have never had before, either one-on-one or in small groups.

The process of whole-system change creates a number of opportunities for transformational conversations: when the leadership group revisits or develops a new vision, mission and values for the organization; when the individual and collective values assessment results are debriefed with the leadership group; during the leadership group's discussion on their core motivations; and during the leadership group's discussion on core business.

These types of conversations clarify and align the intentions of the leadership group. Another important conversation that needs to occur is translating the espoused values of the organization into specific behaviors that reflect the organizational context. *Appreciative inquiry* is one of the best technologies available for this task.

Future Evolution

Appreciative inquiry structures and focuses the conversation, and just like the cultural assessment, it gives employees and other stakeholders a voice in defining the parameters that will guide the future evolution of the organization. It focuses on enhancing what is working rather than dwelling on what needs to be fixed. It affirms and builds on what is positive and strong about an organizational culture — what gives it life. ●

Integrating Resilience

The seven levels of consciousness model, with the insights it provides on values alignment, cultural entropy and full-spectrum sustainability, is an essential framework for evaluating the cultural resilience of our organizations and institutions. Blending cultural transformation tools (CTT) and a whole-system approach to cultural transformation with resilience and adaptive-capacity-building techniques is essential for creating long-term resilience.

What has become clear is that the emergent systemic risks that organizations face cannot be reliably identified within the current silo mentalities that exist in our organizations, nor are silos suitable for managing resilience programs.

Organizations of all types are migrating mission-critical business processes to information technology platforms that can be accessed from anywhere in the organization. Managing and maintaining these systems require a culture of cooperation, coordination and collaboration across all parts of the organization.

The Role of Culture

The concept of values management is a timely innovation that allows organizations and institutions to monitor their cultural resilience by regularly monitoring their operating values and identifying high levels of cultural entropy. Wherever cultural entropy is high, resilience is low.

If a comprehensive resilience baseline diagnostic is not performed initially as part of a whole-system change effort, the cultural diagnostic needs to include some form of risk and resilience survey.

This survey, together with the cultural values assessment, should be used to identify areas where cultural entropy and significant risks combine to create resilience "hot spots." Scenario-based tabletop simulations that explore these hot spots can be used to help organizations test existing decision-support and collaboration processes under complex event consequences. ●

Integrating the EFQM Excellence Model

An example of a whole-system approach to organizational transformation was developed by the Centre for Integral Excellence at Sheffield Hallam University in the United Kingdom. The approach brings together the European Foundation for Quality Management Excellence model (EFQM) and the seven levels of consciousness model in an integral, whole-system, evaluation process. The model incorporates a continuous learning feedback loop that promotes innovation and continuous improvement.

The basic principle of the EFQM excellence model is that there are many approaches to achieving sustainable excellence but that in general: *Excellence Results with respect to Performance, Customers, People and Society are achieved through Leadership driving Policy and Strategy, People, Partnerships and Resources, and Processes.*

Integrating EFQM and CTT

A key learning from recent research is the significance of the relationship between improving processes and a whole-system approach to cultural transformation.

There are significant similarities between the areas for improvement identified by the EFQM assessment and CTT assessment — employee issues: employee commitment, employee recognition; and employee fulfillment and performance issues regarding information sharing and accountability (empowerment). ●

New Leaders, New Change Agents

To move into the mind space of values-based decision making, we must be willing to let go of some of our beliefs. This process is called *self-actualization*. In this process, the "self" that is actualized represents the soul-self; the self that is able to transcend the conditioning of the enculturation process; the self that frees us from the beliefs of the past that we accepted without thinking because we wanted to belong, and be respected by our peers; the self that is a composite blend of the positive beliefs held by the ego and the values held by the soul.

Self-actualization leads to freedom because it loosens the bonds of enculturation. We become free to choose our own path, our own way of being — a way of being that may be different from that of our parents and our peers. We can only do this in a democracy or a governance structure that respects individual differences; a structure that accepts and is comfortable with diversity; a structure where everyone has a voice and where different beliefs are celebrated as long as they do not undermine the stability of the whole.

During the process of self-actualization our minds change. The ego-based drivers that dominate the lower levels of consciousness evolve into the soul-based drivers that dominate the upper levels of consciousness. Instead of focusing on our ego-based personal survival, relationships and self-esteem needs, we focus on our personal soul-based needs — finding meaning in existence, actualizing that meaning by making a difference in our world and, finally, when making a difference becomes a way of life, entering into the realm of selfless service.

Master Practitioners of Whole-System Change

For those who are leaders, your challenge is to recognize that the impact you have on the world depends on your ability to grow in consciousness — to become a full-spectrum leader. You will need to seek out master practitioners of whole-system change who can support your endeavors.

For those who are practitioners, your challenge is not only to grow in consciousness, but also to equip yourselves with an understanding of the models and tools that allow you to design and customize integral approaches to whole-system change to support the leaders you work with in creating a positive future for their organizations and the communities that they serve. ●

Social Constructionism

The theoretical basis for appreciative inquiry rests on the concept of social constructionism. The underlying beliefs of social constructionism are that reality is formed through conversation and storytelling, that language and communication facilitate meaning making and that knowledge is generated and passed on through social interaction. In its basic form, appreciative inquiry is a formalized process for designing powerful conversations.

You Can Learn from the Habits of Visionary Companies

BUILT TO LAST

By James C. Collins
and Jerry I. Porras

Visionary Co.	Comparison Co.
3M	Norton
American Express	Wells Fargo
Boeing	McD. Douglas
Citicorp	Chase Manhattan
Ford	General Motors
General Electric	Westinghouse
Hewlett-Packard	Texas Instruments
IBM	Burroughs
Johnson & Johnson	Bristol Myers
Marriott	Howard Johnson
Merck	Pfizer
Motorola	Zenith
Nordstrom	Melville
Philip Morris	RJR Nabisco
Procter & Gamble	Colgate
Sony	Kenwood
Wal-Mart	Ames
Walt Disney	Columbia

THE SUMMARY IN BRIEF

You are about to look at the results of a landmark study that will change the way you manage.

Authors James Collins and Jerry Porras spent six years studying exceptional companies — visionary companies — to see what accounts for their success.

What are visionary companies? They are the premier organizations in their field, firms that have a long record of having an impact on the world. Ford. Sony. Procter & Gamble. Merck. Motorola. Johnson & Johnson. These are companies that have distinguished themselves as a special and elite breed of *institution*. And, with an average founding date of 1897, and stock-return performance of fifteen times the general market since 1926, they are companies that have stood the test of time.

Collins and Porras surveyed hundreds of CEOs to find out which companies they most esteemed. They chose eighteen, and then researched them deeply. They charted their growth, ran numbers on them, analyzed their cultures, and identified key moments in their corporate lives.

They also compared each to a carefully chosen competitor from the same founding era. Their goal: to uncover the underlying factors that helped the visionary company outperform the competition.

As the box to the left shows, the comparison companies are not dogs. Most are still in business and have done well. But not as well as the visionary companies, which have shown they can bounce back from adversity and stay at the top of the heap year after year.

What Collins and Porras discovered will work for you today, whatever your job or level. You'll learn to view yourself as a "clockbuilder," to preserve the values that set your company apart from others, to set audacious goals, to experiment freely, and much more. And you'll know these concepts have value, because they come from the same playbook that has helped visionary companies soar for decades.

Take an Architectural Approach

Suppose you read of a person who could tell the exact time just by looking at the position of the sun or stars. "It's April 23, 1996, 2:36 A.M."

Wow, you'd think. What a remarkable person. Yet wouldn't it be more remarkable — and useful for the world — if that person built a clock that anyone could refer to, even after the clockmaker had died?

Having a great idea, or being a charismatic, visionary leader is like "time telling." Building a company that's healthy long after the visionary leader is gone, or after the great product is passé, is "clock building."

Visionary companies have clock-building managers whose greatest creation is the company itself.

Tyranny of the 'Or'

Great companies can hold paradoxical or contradictory ideas.

For instance, they can be conservative at the core yet progressive in their actions; they can invest for the long term and still expect short-term results; they can have high quality at a low cost; they can plan seriously yet move fast when opportunities arise; etc.

In short, they aren't tyrannized by either/or thinking. For them, it's not A *or* B; it's A *and* B.

No Great Ideas at HP

Visionary company founders take an architectural approach to building their firms. They concentrate first on the organization's systems and values, then on products.

In fact, you don't need a great product idea to begin. William Hewlett and David Packard of Hewlett-Packard, for instance, had no product in mind when they got together in 1937. They just wanted to start a company together. "We did anything that would bring in a nickel," said Hewlett. Early products included a bowling foul-line indicator, a clock drive for a telescope, and a device to make a urinal flush automatically.

None of these products went anywhere, but the two persisted until they figured out how to build a firm that could pump out great products.

Likewise, Masaru Ibuka didn't have a single product in mind when he launched Sony in 1945. The company survived selling heating pads.

Myth of Charismatic Leaders

Though many visionary companies have had high-profile leaders like Henry Ford or Sam Walton, charismatic leadership is not necessary for success. 3M, for example, has never had a charismatic CEO.

The best leaders, charismatic or not, make it a point to develop managers and processes. In their view, the firm is not a vehicle for products or personalities; products are a vehicle for the company.

Looked at in that light, Walt Disney's greatest creation wasn't *Snow White* or Disneyland, it's the Disney Company and its ability to make people happy.

Motorola vs. Zenith

Paul Galvin, Motorola's founder, didn't dream about making battery eliminators for radios, its first product. He dreamed foremost about building a great and lasting company. He did that by developing people. He encouraged dissent, discussion, and disagreement, and he gave people freedom to make contributions. He set challenges and gave people responsibility to achieve them.

Zenith, a competitor of Motorola's, was lead by the charismatic Eugene F. McDonald, Jr. The brilliant McDonald moved the company for three decades through the force of his personality. But he gave no thought to management succession or promoting individual initiative.

After McDonald died, Zenith never regained the energy and spark he provided. Compare Zenith with Motorola today, and you'll see how much more valuable clock-building leaders are than time tellers.☆

Ideals Drive Visionary Organizations

Decades before "values statements" became popular, George Merck II said, "[We] are workers in industry who are genuinely inspired by the ideals of advancement of medical science, and of service to humanity." Former Merck CEO P. Roy Vagelos echoed the ideals years later: "Above all, let's remember that our business success means victory against disease and help to mankind."

Merck has long used its values to guide its actions. For example, it once developed a drug called Mectizan to cure a Third World disease known as "river blindness." While it hoped to sell the drug to government and relief agencies, the return on investment would be small.

When it came time to sell Mectizan, however, no one bought it. So Merck gave the drug away to the millions who needed it.

Why give away a drug it took years to develop? It was, of course, good public relations that could pay off down the road. But it was also because the company has never forgotten George Merck's words: "We try never to forget that medicine is for people. It's not for the profits. The profits follow . . ."

Such statements are part of Merck's core ideology — the values and sense of purpose that go beyond just making money.

Merck has lived by its ideals for generations. Competitor Pfizer, in contrast, didn't mention ideals until the late 1980s. Indeed, a former Pfizer CEO once said, "So far as is humanly possible, we aim to get profit out of everything we do."

Core Ideologies

Visionary companies have core ideologies. These are basic precepts that say, "This is who we are; this is what we stand for; this is what we're all about." These aren't just words but vital, shaping forces.

Like Merck, visionary companies tend to be more ideologically driven than profit-driven. For them, profit is like oxygen — necessary for life, but not the point of it.

This attitude, paradoxically, can pay off in greater profitability. Asked whether he started Marriott Corporation to create an empire, J. Willard Marriott, Sr., said no. He wanted to give friendly service to guests, provide good food at a fair price, and work hard to make a profit to create more jobs — in that order.☆

Ideological Clash: HP and TI

When David Packard addressed a group of managers in a management-development program in Hewlett-Packard's early days, he didn't talk about techniques, policies, or numbers. He talked about values. "You can . . . see people who are interested in money and nothing else, but the underlying drives come largely from a desire to . . . do something of value." A statement by a recent CEO, John Young, shows that Packard institutionalized this sentiment: "If we provide real satisfaction to customers, we will be profitable." HP also aims to satisfy itself — to manufacture equipment that advances science and improves the welfare of humanity.

In contrast, the corporate goals of Texas Instruments are all financial. For TI, bigger is better — even if it means making low-quality products or those that offer no technical contribution. For instance, it got into things HP wouldn't touch, like low-end digital watches.

There's little question that HP's ideals, including its respect for employees, have helped it outperform TI over the long haul.

Recipes for Success

Sample the core ideologies of these well-built companies:

Nordstrom: Service to the customer above all else, hard work and productivity, continuous improvement, excellence in reputation, and being part of something special.

Procter & Gamble: Product excellence, continuous self-improvement, honesty, and respect and concern for the individual.

Wal-Mart: To provide value to customers, to buck conventional wisdom, to work with passion and commitment, to run lean, and to pursue ever-higher goals.

An ideology consists of two ingredients: core values and purpose.

Core values are the organization's enduring tenets and guiding principles — the things that can never be compromised for financial gain or expediency.

A value can usually be boiled down to a simple statement. Procter & Gamble co-founder James Gamble said, "When you cannot make pure goods of full weight, go to something else that is honest, even if it is breaking stone."

Visionary companies generally have just a few core values that are unique to them. You'll need to come up with your own based on what you believe deep in your bones.

Purposes are your organization's fundamental reasons for existing beyond making money. They are broad and enduring. For example, Robert W. Johnson founded Johnson & Johnson "to alleviate pain and suffering."

Purposes are not about specific products or services. The Disney Company doesn't exist to "make cartoons for kids," for example. It exists to "use our imaginations to bring happiness to millions."

To come up with a purpose, ask: What is our reason for being? What would be lost if we ceased to be?☆

Preserve the Core; Stimulate Progress

Every visionary company needs a core ideology (see page 3). But that's not enough; visionary companies couple ideology with a relentless drive for progress that impels forward movement in everything but the core. As Sam Walton pointed out, "You can't just keep doing what works one time, because everything around you is always changing. To succeed, you have to stay out in front of that change."

Don't confuse core ideology with noncore practices or products. As an example, IBM began to ignore its "three basic beliefs": respecting employees, making customers happy, and working hard to do things right. It emphasized mainframe computers, blue suits, and white shirts — none of them core values. That may be why IBM has stumbled lately.

Wal-Mart's core belief "exceed customer expectations" is permanent and unchanging. Having greeters at the front door is a practice that can change. Boeing's core value, "being in the leading edge of aviation; being pioneers" is permanent. Building jumbo jets is a practice that can change.

Whatever your business, strategy and tactics, operations, culture, and products must change over time. The only thing that shouldn't change is core ideology.

Finally, this drive for progress — to go farther and do better — is an internal force. Visionary companies don't wait for the external world to say "it's time to change." They practice self-criticism daily. They make sure they change well before the world forces them to change.

Bruce Nordstrom, talking about the Nordstrom retailing chain's lavish service, said, "We don't want to talk about our service. We're not as good as our reputation. . . . You just have to do it every time, every day." That self-imposed discipline guarantees constant renewal.☆

BIG, HAIRY, AUDACIOUS GOALS

Use BHAGs to Surge Ahead

A great way to stimulate progress is to set big, hairy, audacious goals (BHAGs, pronounced "bee-hags").

Consider Boeing in 1952. Its workforce had dwindled from a peak of 51,000 during World War II to 7,500. To survive, it knew it had to get into commercial aviation. But airline companies viewed it as a firm that built good bombers, period.

What to do? Commit to a challenging goal: Build a jet for commercial use. The penalty for failure? Perhaps the end of Boeing.

But it didn't fail. It developed and built the 707, bringing the commercial aviation world into the jet age.

In contrast, Boeing competitor Douglas Aircraft, precursor to McDonnell Douglas, stuck with propeller planes and took a wait-and-see attitude regarding commercial jets. It finally introduced the DC-8 in 1958 but never caught up to Boeing.

Boeing has a history of setting BHAGs. When Eastern Airlines said it needed a jet with precise specifications, Boeing took on the challenge.

The plane had to land on runway 4-22 at La Guardia Airport in New York, a notoriously short runway. This jet also had to be able to fly non-stop to Miami without refueling, seat six abreast, and hold 131 passengers. All in all, most agreed, this was an impossible task.

Boeing met the challenge with its 727. It succeeded because, once it got going, it had no other choice. Such goals, by the way, are always aligned with a Boeing core value: to be on the leading edge of aviation.

Clear and Compelling

A good BHAG is clear, compelling, and serves as a unifying focal point. It engages people by reaching out and grabbing them in the gut. A good example: General Electric's goal to be number one or two in every market it's in.

GE competitor Westinghouse, in contrast, has had vague goals like "market leadership, focused growth, total quality," and so on — nothing that stirs the blood.

Commitment and Risk

The goal alone can't stimulate progress. You need to show a high level of commitment to reaching it. That sometimes involves a great deal of risk. Walt Disney invested most of his company's resources to create *Snow White* in 1934, for instance. People called it "Disney's Folly," believing no one would care to see a full-length feature cartoon.

That movie succeeded, of course, but the naysayers were back at it when Disney proposed creating the radically new kind of amusement park we now know as Disneyland.

Compare Disney with Columbia Pictures, which did little that was bold, visionary, or risky. It turned out a few good movies in the 1950s and 1960s, but it was run by people who saw themselves "first, last, and always . . . as investors, not managers." Columbia was sold in the early 1980s, just as Disney roared back to life.

Finally, a good BHAG can transcend the leader and take on a life of its own. Wal-Mart's Sam Walton, for instance, set a goal he knew would outlive him: to become a $125 billion company by 2000.☆

BHAG Guidelines

- A BHAG should be so clear and compelling that it requires little or no explanation.
- A BHAG should fall outside the comfort zone. It should require a heroic effort.
- A BHAG should be so bold and exciting that it will continue to stimulate progress even if leaders disappear before it's achieved.
- A BHAG should be consistent with a company's core ideology.

Great Places to Work — for Some

Visionary companies must be great places to work, right? Not necessarily. If you "fit" with the core ideology and demanding standards of a visionary company, you'll do fine. If not, you'll be ejected like a virus. There's no middle ground.

For example, if you don't want to crusade for quality at Motorola — even if you work in the lunchroom — you won't last long.

The Nordstrom Way

Retailer Nordstrom presents a good case of "cultism" — using practices that create an almost cult-like environment around ideology.

For example, heroic stories about "Nordies" delivering great service abound at the company. So do reminders on the wall, cheering, and chants of affirmation.

Those who fit adhere zealously to the core ideology (extraordinary service to customers) and get lots of positive reinforcement. Those who don't flounder and leave.

Nordstrom also draws strong lines between those who are inside and outside the organization. It portrays "inside" as something very special.

Not Really Cults

Nordstrom, of course, isn't really a cult. It just indoctrinates its employees strongly and expects a tight fit to its ideology. Also, true cults often revolve around a charismatic leader. Cult-like companies bow down to their ideologies, not a charismatic leader.

Further, while Nordstrom employees are controlled and disciplined, those without an entrepreneurial spirit and initiative will fail.

Indoctrination at P&G

Procter & Gamble is another cult-like visionary company that uses many techniques to enforce the behavior it wants. These range from a strong dress code and open offices to the famous rule that no memo should be longer than a page.

P&G also controls information tightly. Employees, for instance, can't work on airplanes.

Such practices work. Employees take great pride in their work, and the firm has rolled over competitors, like Colgate, that don't instill the same sense of ideology and elitism.

What You Can Do

To get these beneficial effects, build an organization that preserves ideology in specific ways. The following send a consistent set of reinforcing signals that indoctrinate people and create a sense of belonging:

- Training programs that have an ideological as well as practical slant.
- On-the-job socializing.
- Promoting from within.
- Penalties for breaching ideology.
- Constant emphasis on corporate values and heritage, and tales of heroic deeds in the line of duty.

Such mechanisms pay. Cult-like cultures built around an ideology let you turn people loose knowing they'll do things the company way.☆

IBM and Burroughs

IBM has been cult-like since its inception, when founder Thomas Watson set out to create an organization of "dedicated zealots."

Watson instituted strict rules of personal conduct, encouraged marriage, and forbade alcohol. He hired young, impressionable people; set up training programs to indoctrinate new hires; and promoted only from within. He also created IBM-managed country clubs so IBMers could socialize with each other.

These and other practices resulted in a company filled with ardent believers in the IBM way.

Competitor Burroughs, on the other hand, once had a technical edge over IBM. Yet IBM pulled ahead at key moments in the evolution of the computer industry.

Why? In part because Burroughs had no "indoctrination" center, nor did it try to impose tight discipline. Unlike IBM, it did not have a clear self-identity or elitist attitude.

USE HOME-GROWN MANAGEMENT

Here's a surprising fact: Of the eighteen visionary companies studied, only four times — in a combined 1700 years! — did one of them go outside the firm for a CEO.

Consider General Electric. Business people rightly revere Jack Welch as one of America's strongest business leaders. GE has soared under him.

Was Welch "new blood" brought in to stir up a drowsy giant? No. Welch joined GE directly after graduate school, and he worked there for twenty years before becoming CEO. Welch, like *all* his predecessors, came from deep within the firm.

GE has a history of "change agent" CEOs who have delivered extraordinary returns while leading the firm. In this stellar group, for instance, Welch places only fifth out of seven in average return on equity. (Of course, no one will argue with his 26.29 percent average ROE!).

Visionary companies like GE develop, promote, and carefully select managerial talent from inside the company. That helps them preserve the ideals they believe in and ensure a long line of quality leaders. And as the GE story shows, there's no inconsistency between promoting from within and stimulating significant growth and change.

What does all this mean for you? Whether you are CEO or a department manager, ask yourself who could step into your role and how you could help develop that person. Succession planning is a key to long-term high performance.☆

Pounce on Opportunities

Visionary companies make some of their best moves by experimentation, trial and error, opportunism, and sometimes by accident.

Lucrative Accidents

Johnson & Johnson, for instance, primarily made antiseptic gauze and medical plasters around the turn of the century. When it received a complaint about skin irritation from certain plasters, J&J began including a can of Italian talc to soothe the skin.

Customers started asking for the product, and the firm introduced Johnson's Baby Powder. Its success prompted J&J to get into the consumer market, a shift that eventually became 44 percent of its revenues.

A different kind of accident led Marriott to airport services. In 1937, J. Willard Marriott discovered that customers at one of his restaurants near Washington's Hoover Airport bought meals to carry on flights.

Marriott paid a visit to Eastern Air Transport and arranged to deliver prepackaged lunches directly to departing airplanes. Successful, Marriott convinced American Airlines to join in, and Marriott Corporation eventually supplied airplanes at more than one hundred airports.

Like Evolution

Accidents often add to the revenues of visionary companies. Such unplanned progress is like evolution — it begins with small incremental steps that sometimes grow into unexpected, large-scale opportunities.

Or wither early. Either way, evolution requires many experiments. As Darwin himself said, "Multiply, vary, let the strongest live, and the weakest die." Johnson & Johnson to this day tries new things often, keeps what works, and discards the rest. Discards, however, can act as fertilizer. R.W. Johnson, Jr., said, "Failure is our most important product."

Think of evolution in terms of a tree. You add new branches through experimentation, but you prune away dead branches quickly. That allows successes to flourish and makes room for more experiments.

Variation at Wal-Mart

While Wal-Mart may look like a finely engineered machine today, it's really the result of many experiments and accidents.

Take Wal-Mart's "people greeters" — the kindly gentlemen who meet you at the door of a Wal-Mart store. Sam Walton didn't think this up; it came from a store manager in Louisiana who was having trouble with shoplifters. The experiment proved effective and became standard practice at all stores.

A Wal-Mart executive explains the branching and pruning philosophy: "We live by the motto, 'Do it, fix it. Try it.' If you try something and it works, you keep it. If it doesn't work, you fix it or try something else." Like all visionary companies, Wal-Mart makes sure any practice fits with its ideology.☆

Where to Begin

Five lessons for stimulating evolutionary progress:

1. *Give it a try, and quick!* Do, adjust, act, move.
2. *Accept that mistakes will be made.* Dump flops fast, but remember: You can learn much from failure.
3. *Take small steps.* Small experiments can be seeds that grow into large strategic shifts.
4. *Give people the room they need.* A measure of autonomy and decentralization can lead to the increased quantity and variation of product ideas.
5. *Put mechanisms in place.* Leadership "tone" isn't enough. To ensure a constant stream of innovation, use concrete methods.

How 3M Succeeds Every Day

Minnesota Mining and Manufacturing began life poorly. Its initial idea, to mine corundum, failed, and the company searched desperately for something to do. 3M settled on sandpaper and grinding wheels, which kept it afloat.

Such troubles led an early CEO, William McKnight, to insist on diversifying. But rather than chart the course himself, he built an organization that would continually change based on the initiative of employees.

McKnight hired good people, let them alone to do their work, and encouraged experimentation. The result was many unplanned, successful products. For example, 3M employee Dick Drew was visiting an auto paint shop when he saw a problem to solve. Two-toned paint jobs had become popular, but shops had trouble separating the two colors.

Drew went to work and came up with a solution: masking tape. Five years later, he used his experience to develop Scotch tape. Note that 3M hadn't planned to get into tape, now a huge part of its business. It was an outgrowth of the organization McKnight created.

That legacy lives today in a number of mechanisms that foster profitable experimentation:

- **The 15 percent rule.** Technical people can spend up to 15 percent of their time on their own projects.
- **The 30 percent rule.** Each division is expected to generate 30 percent of its annual sales from products and services introduced in the previous four years.
- **Technology sharing awards.** An award for those who share new technologies with other divisions.
- **Genesis grants.** Internal venture capital to develop prototypes and market tests.

Is it any wonder 3M recently topped $13 billion in sales?☆

Never Rest

Visionary companies don't ask, "How well are we doing?" They ask, "How can we do better tomorrow than we did today?" This question is a habit of mind and action in the best companies. It requires constant self-criticism and investment in the future — for a race with no finish line.

Continuous Improvement

Visionary companies are demanding of themselves. Listen to J. Willard Marriott, Sr.: "Discipline is the greatest thing in the world. Where there is no discipline, there is no character. And without character, there is no progress."

In such companies, continuous improvement, a current buzz phrase, is nothing new. William Procter and James Gamble used the concept in the 1850s, and David Packard used the term as far back as the 1940s.

Continuous improvement isn't a fad at visionary companies; it's institutionalized in ingenious ways. For example, in the 1930s Procter & Gamble already had excellent people, products, and marketing muscle. How could it avoid complacency?

CEO Richard Deupree approved a proposal to create a brand-management structure. This allowed P&G brands to compete as though they were from different companies. If the marketplace can't supply competition, why not create it yourself?

What You Can Do . . .

If you're helping build a company, department, or team, ask:

- What "mechanisms of discontent" can I create?
- How am I investing for the future?
- Do I build for the future even in the midst of downturns?
- Do my people understand that comfort is not the goal — that super results take hard work?

This structure made it impossible for any brand to rest on its laurels.

There are numerous ways to "stimulate discontent" with the status quo; see the box to the right.

Long-Term Investment

Besides seeking continuous improvement, visionary companies invest heavily in the future. The authors' research showed that visionary companies consistently invested more in new property, plant, and equipment as a percentage of sales than all but a few comparison companies. They also paid less in dividends, opting to reinvest the money.

In specific, they spend more on human capital. Merck, 3M, P&G, Motorola, GE, Disney, Marriott, and IBM have all made significant investments in "universities" and education centers. Motorola, for example, requires each division to spend 1.5 percent of its payroll on training.

Visionary companies also spend more (and earlier) to bring in new technologies, management methods, and industry innovations. Merck, for instance, embraced a TQM process back in 1965, and Disney bought new film technologies as competitors dithered about their usefulness.

Pay Now or Pay Later

Citibank has outperformed the Chase Manhattan Bank by investing in the long term. Citibank invested in the following areas before — often long before — the Chase: merit pay, management training programs, college recruiting programs, automated teller machines, credit cards, and foreign branches.

Pinching pennies doesn't help you become a world-beater. Boeing, for example, has always shown a willingness to "reach out to tomorrow," while McDonnell Douglas has worried more about the short-term implications of its investment opportunities. As a result, it has abandoned new-generation jets and ceded the future, for now, to Boeing.☆

To Improve, Create Discontent

To excel, the best companies often use "discomfort mechanisms" to combat complacency and stay vibrant. Here's how a few visionary companies create discomfort:

Merck consciously yields market share as its products become unprotected commodities. This forces it to innovate.

Motorola has also used an "innovate or die" technique. It has been known to cut off mature product lines that still account for significant sales volume.

Boeing uses a process called "eyes of the enemy." It assigns managers the task of developing strategy as though they worked for a competitor and wanted to wipe Boeing off the map. What weaknesses would they exploit? What markets could they invade? Boeing then figures out how it would respond to each threat.

Nordstrom ranks a person's sales per hour and compares them with peers. Nordstrom expects ever-better performance; there's no ultimate goal.

Hewlett-Packard also ranks employees relative to peers. Managers argue with each other over the rankings of their people until they reach consensus. Thanks to this uncomfortable process, no successful manager can coast.

HP also has a policy against taking out any long-term debt. The pay-as-you-go policy requires powerful boot-strapping innovation and self-discipline. More remarkable, HP expects 20 percent growth year after year.

Wal-Mart uses a "beat yesterday" ledger that compares store sales figures to the exact same day in years past. Standards thus rise year in and year out.

More Than Vision Statements at Ford

These days, companies spend large sums and many hours to come up with vision statements, mission statements, values statements, objective statements, and so on.

These can be useful, but they are not the essence of a visionary firm.

The essence lies in the translation of its core ideology and drive for progress into the fabric of the organization. It can be seen in goals, job design, strategies, tactics, pay systems, cultural practices, building layouts, etc. In short, the essence infuses everything the firm does. It envelopes employees with messages so consistent and reinforcing that no one can misunderstand the firm's ideology or ambitions. Each element is aligned with ideology and aims.

Alignment at Ford

Ford, a visionary company that has had its ups and downs, turned itself around in the early 1980s.

Reeling from red ink, Ford paused in 1983 to redefine itself. Out of the process came Ford's "Mission, Values, and Guiding Principles" (MVGP), a remarkable document that explicitly put people before products and profits. It also emphasized quality, employee involvement, and customer satisfaction.

Ideology and Aims into Reality

Many companies have created such documents and then let them gather dust. Ford, however, dramatically translated the MVGP into reality.

For example, Ford instituted statistical quality control. It forced suppliers to install quality programs of their own. It created employee-involvement programs, participative-management programs, and a satellite TV system to communicate Ford news to employees.

It also negotiated a profit-sharing clause with its union labor, which linked workers directly to the company's success.

World-Class BHAGs

Further, Ford used big, hairy, audacious goals. It formed a group with the mandate to develop a completely new, world-class car. It invested heavily in this goal by providing a $3.25 billion budget. The result — the Taurus/Sable — is now the best-selling car in the U.S.

In hundreds of ways, big and small, Ford translated its core ideology, as embodied in the MVGP, into daily practice. As a result, all company practices, programs, communications, etc., work together harmoniously within the context of its core ideology and overall goals.☆

But I'm Not the CEO!

There's still a lot you can do. For example, you can apply most of the principles in this summary to your work area, however large or small. You can be a clock builder, for example, by thinking about what processes you can use to solve problems rather than jumping to solve them yourself.

And if your organization does not have an ideology, create one.

A manufacturing manager said, "I got tired of waiting for those on top to get their act together, so I just went ahead with my people. We now have a very distinct set of values here in my group, and we manage by them. It gives my people a greater sense of meaning in their work."

You can also use BHAGs at any level or "try a lot of things and see what works." It'll make you more effective and your job a lot more interesting.

Six Steps to Visionary Alignment

We hope you begin to discover your core ideology and set lofty goals. That's only the beginning; you need to weave them into the firm's fabric.

1. *Paint the whole picture.* One program, strategy, speech, or symbolic gesture isn't enough. Visionary companies employ a variety of signals and actions that continually reinforce the core ideology and stimulate progress. A visionary company is like a great work of art — magnificent in detail, with all elements working together in concert.

2. *Sweat the small stuff.* People don't work in the "big picture." Little things make an impression, like the business cards Nordstrom gives all its sales people. This says, "We want you to be a professional."

3. *Cluster, don't shotgun.* Put mechanisms and processes in place that reinforce each other. Ford, for instance, used statistical quality control *reinforced* by involvement programs *reinforced* by participative management programs *reinforced* by promotion criteria based on these skills. Clustered practices deliver a powerful punch.

4. *Swim in your own current.* Look to your internal compass for guidance, not the standards, trends, or fads of the outside world. Don't ask, "Is this practice good?" Ask, "Is this practice appropriate for us?"

5. *Obliterate misalignments.* Your workplace may be littered with inappropriate practices that go against your core ideology or impede progress. Don't forget: The only sacred cow is core ideology. Change anything else.

6. *Abide by the universal requirements.* These are your core ideology and a drive for progress, and an organization designed to preserve the core and stimulate progress.

BHAGs, cult-like practices, and evolutionary growth are all ways to preserve the core and stimulate progress. But they aren't the only ways, so be creative. Tomorrow's visionary companies will employ methods not yet thought of.☆

Business Chemistry

Practical Magic for Crafting Powerful Work Relationships

by Kim Christfort and Suzanne Vickberg

THE SUMMARY IN BRIEF

Ever wonder what it is that makes two people click or clash? Or why some groups excel while others fumble? Or how you, as a leader, can make or break team potential? Based on extensive research and analytics, plus years of proven success in the field, *Business Chemistry* provides a simple yet powerful way to identify meaningful differences between people's working styles.

Who seeks possibilities and who seeks stability? Who values challenge and who values connection? Authors Kim Christfort and Suzanne Vickberg will help you grasp where others are coming from, appreciate the value they bring and determine what they need in order to excel. It offers practical ways to be more effective as an individual and as a leader.

Imagine you knew how to create a work environment where all types of people excel, even if they have conflicting perspectives, preferences and needs. Suppose you could activate the potential benefits of diversity in your organizations.

You don't have to leave it up to chance, and you shouldn't. Let *Business Chemistry* guide you in creating great chemistry.

IN THIS SUMMARY, YOU WILL LEARN:

- The meaning of Business Chemistry and the strategies that support it.
- The four Business Chemistry types and how to help them thrive in the workplace.
- Tips for working with both similar and opposite types.
- To use Business Chemistry to develop both individuals and teams.

THE COMPLETE SUMMARY: **BUSINESS CHEMISTRY**

by Kim Christfort and Suzanne Vickberg

The authors: Kim Christfort originally joined Deloitte as a systems analyst and now heads the Deloitte Greenhouse team in the United States, a group that delivers interactive experiences expressly designed to shift thinking, activate teams and accelerate breakthroughs. Suzanne Vickberg began her career focused on health psychology research and program evaluation, then shifted her focus to organizational culture and employee engagement, which she practices at Deloitte.

The Power of Chemistry

Chemistry. A powerful word used to represent that magical *something* that can exist between people — and not just the romantically inclined.

In most cases its presence is obvious but mysterious. It is hard to know exactly what's behind it. It's just there. Of course, chemistry is also a branch of science that explores what matter is made of and how those ingredients interact, combine and change.

Chemistry is a huge factor in business. Once you start looking, its presence or absence is noticeable everywhere. With that colleague you seek out when you want to riff on a new idea versus the one you avoid because he's so difficult to work with. With the client who will work with no one but you, versus the one you can't seem to click with. With the teams that achieve outsized success, versus those that churn and churn and never make progress.

We often consider the great chemistry in these situations to be something we either have or don't. But what if, instead, we viewed it as a discipline, one that explores the elements behind human interactions and how they might be brought together to minimize explosions and maximize positive outcomes? What if we took a scientific view of the art of business relationships?

Decades of studies have shown that empathy is integral to effective human connection, and recent research further demonstrates links between empathy and leadership performance, as well as commercial success at the organizational level.

Working style is essentially your personality manifest in a business setting. It's a composite of how you process information, make decisions, connect with people, and a multitude of other facets that reflect your unique perspective.

To cultivate empathy, you need to recognize differences for what they are — useful signals about an individual's perspective and the building blocks of powerful working relationships. But in order to fuel that magical chemistry of great business relationships, you need gem-grade empathy. That requires going beyond simply acknowledging differences and building understanding, to acting on that knowledge.

The mission of Business Chemistry is to provide a simple, practical way to identify meaningful differences between people's working styles; to grasp where others are coming from, appreciate the value they bring and determine what they need in order to excel; and finally, to offer ways to act upon that information in order to be more effective as individuals and as leaders.

Let's start by learning the four Business Chemistry types: Pioneers, Guardians, Drivers and Integrators.

Pioneers Value Possibilities and Spark Energy and Imagination

The essence of the Pioneer in one word is "possibilities." Pioneers love imagining what could be, and don't hesitate to reach beyond the status quo. Expressions like "What if…?", "Picture this…", "Yes, and…" and "Why not?" are music to a Pioneer's ears and often are lead-ins to lively brainstorms.

They have little regard for rigid structure and an almost allergic aversion to details. That agenda the

team put together so painstakingly? Don't expect the Pioneers to follow it. Their thinking can be non-linear and resists constraint. But give them a juicy, open-ended challenge and a whiteboard, and they'll be formidable idea generators.

Don't expect Pioneers to stick to any one task or activity for long. They tune out and are easily distracted.

Pioneers are very comfortable with risk and are likely confident that their inherent adaptability will carry them through, regardless of where they land. For a Pioneer, it's more important to expand upon what could be than to analyze why it can't be, because for Pioneers there is rarely such a thing as a dead end.

The Problems With Pioneers

All that energy and passion can be great, but it can come across as frenetic chaos. A Pioneer jumping from topic to topic, often without warning, can be perceived as scattered, erratic and unfocused.

Pioneers tend to be really comfortable taking risks — not because they've calculated probable outcomes and impacts and are consciously accepting those as costs of action, but simply because *it feels like a good idea*. This confidence in their own intuition as the basis for risk-taking can make Pioneers appear reckless.

Ultimately, even the best idea is only as good as its execution, and here's where Pioneers get the most criticism. Their strong dislike of rules, process and pragmatic realities sometimes makes them come across as impractical and unable to get things done.

The Promise of Pioneers

In spite of the fact that people report Pioneers are the most challenging type to work with, there is an almost universal appreciation for their value on a team.

Pioneers often provide the spark that ignites others' creativity. Their out-of-the-box thinking and "insanely creative ideas," as one executive aptly described it, catalyze innovation for teams and organizations. When a team is backed against a wall, Pioneers are the ones who see a window or suggest a ladder.

Pioneers' adaptability and flexibility are seen as a real asset in times of rapid change. Their boldness and ability to pivot make them effective on the front lines of disruption, rapidly formulating response options while the organization catches up in the trenches.

Not only willing but eager to step up into leadership roles, Pioneers are more common in the C-suite than any other type. They are often captivating individuals, social and networked.

Guardians Value Stability and Bring Order and Rigor

One word to represent what the Guardian values is "stability." A Guardian knows it's essential to forge a solid foundation before building anything skyward. And when it comes to how the Guardian does things, many aspects of their working style serve to establish and maintain such stability. They're methodical, careful, disciplined, meticulous and exacting.

Spontaneity? New environments? Ambiguity? A Guardian will likely say "no thanks," because spontaneity, newness and ambiguity all threaten stability. When they simply *must* embark on something new, Guardians seek to first understand as much as possible.

Guardians are most comfortable when the waters are calm and no big waves are rocking their boat. And they themselves often serve as anchors.

Guardians tend to be introverted and reserved, both socially and emotionally. You won't usually find a Guardian at the center of a large group of colleagues, and they don't need to be in charge. Instead, they often contribute in other, less out-front and obvious ways.

The Gripes About Guardians

Because of their reserved nature, others sometimes complain that Guardians are tough to get to know. Guardians are also viewed as sticklers for the rules. They tend to think rules are there for a reason, and it's certainly not to break them.

People also complain that Guardians are stuck in the status quo like tractors in a field of mud. As the pace of change quickens everywhere, some see Guardians as unable to free themselves and adapt, and wonder if they, perhaps, like being stuck in the mud.

The Gifts of Guardians

People value the Guardian's commitment to follow-through. They know they can count on a Guardian to do what they say they're going to do and to be accountable. People describe Guardians as dependable, responsible, persistent and loyal.

People also appreciate Guardians for keeping them out of trouble. Because they're less likely to embrace risk, Guardians will often insist that proper due diligence be conducted when other types might skip it. There's also something to be said for the Guardian's organizational skills and their attention to detail. Someone has to be paying attention to these things!

Let's say you're really good at coming up with outlandish ideas — no one is more creative than you! But if your success depends on making those ideas a reality, a Guardian can help. Guardians are known for their realism and practicality, which can be a great balance for creativity.

Drivers Value Challenge and Generate Momentum

Ask people the best thing about Drivers, and a clear theme emerges: They get stuff done. Even when it's difficult. Especially when it's difficult. Because if you had to capture the spirit of Drivers in a word, it would be "challenge."

Drivers love a challenge, and they love to challenge. They are focused and competitive. To get the results they want, Drivers will calculate the shortest possible path and stay on course despite whatever, or whoever, gets in their way. This directness infuses everything they do, from the way they make decisions to the way they interact with others. They like to get to the point.

Drivers are not the warmest and fuzziest of the types. They don't mince words and they don't sugarcoat. Expecting small talk? Drivers see it as a waste of time. No clear agenda? Come back when you have one. Vague ambitions? Intuitive conclusions? Emotional interpretations? Good luck with that.

Drivers are logical, technical and quantitative. They want data and structure. Try to engage them without these things, and they have no qualms voicing their displeasure.

There are two subtypes of Drivers: Commanders and Scientists. Commanders are the take-charge, more extroverted type. Scientists are the cerebral, more introverted type.

The Difficulties with Drivers

Drivers are impatient and don't particularly value social niceties. Add to that their single-minded focus and direct speaking style, and it's not surprising that Drivers often come across as blunt and abrasive.

Drivers are quite focused, but this can look like "tunnel vision" to those who view the world from a broader vantage point.

Drivers tend to want to be leaders and strive for advancement and achievement. They think second place is for losers. Drivers like to know how they measure up and how they can move on up.

The Deftness of Drivers

Drivers possess a unique combination of originality and pragmatism, which helps them to translate vague visions into actionable strategies. They'll make sure discussions are grounded in facts, without getting bogged down in too many details. And while their straight-shooter style might occasionally offend, it also gets the truth out quickly. Sometimes you need someone who can call out the elephants in the room — and volunteer to subdue them.

Drivers are particularly good at making tough choices. More than anything, Drivers are great at getting results. This is perhaps why they are the second most prevalent type in the C-suite (after Pioneers). As leaders they channel the energies of the rest of the team into productive progress toward goals.

Integrators Value Connection and Draw Teams Together

Connection — that's what it's all about for Integrators, and connector is the role they often play on a team. Sometimes an Integrator is focused on creating connections between people and other times on connections between ideas. Either way, Integrators like working on teams more than toiling away in solitude. They're trusting and they forge deep relationships — beyond networking or teamwork — getting up close and personal to form real friendships with colleagues.

Integrators are great listeners and observers, too. They pay close attention to what's being said and can often sense even unspoken emotions and reactions. And then they take others' feelings into account. They consider it a worthy goal to reach consensus, getting everyone on the same page without leaving anyone out.

There are two subtypes of Integrators: Teamers and Dreamers. Teamers are more extroverted, and Dreamers more introverted. Teamers are outgoing, perhaps best defined by their relationships with others. They place a high value on traditions and loyalty in relationships — if you've got their back, they'll have yours.

Dreamers are typically defined more by what's happening in their head and their heart, which makes them a bit more elusive than the Teamer. Dreamers are reserved, particularly around new people, listening and observing more than talking. During that quiet time, Dreamers are processing what's happening in the moment and what it means, reviewing how things have happened in the

past (particularly what's gone wrong), considering what might happen in the future, and tracking how others in the room are feeling and reacting.

The Issues with Integrators

One of the most common criticisms of Integrators is that their diplomatic style makes it difficult to know where they stand — "Do you love my idea or hate it? I can't tell."

While Integrators are busy considering everyone else's feelings, they don't always get the same courtesy. Instead, they're accused of being overemotional and oversensitive. People complain they often have to worry about hurting an Integrator's feelings and that it's exhausting to have emotions in the mix at work.

One of the reasons for the Integrator's indirect style is their aversion to conflict, and some people see this as a real problem. People sometimes also see Integrators as being overly inclusive and taking too long to make decisions because they're trying to make sure everyone is on board.

The (Social) Intelligence of Integrators

If two people are standing on opposite banks of a river and need to accomplish something together, a bridge might be a good idea. Integrators often serve as that bridge. Their ability to see both sides of an issue, combined with their diplomatic skill, makes Integrators well suited to the roles of mediator, facilitator and peacemaker.

The Integrator's specialty is asking people for their input, opinions, thoughts, suggestions and reactions. The bottom line is, people feel understood when someone really listens, and they start to trust the listener.

Integrators have an uncanny knack for connecting ideas that others might not connect, and for recognizing context others might not see. Say your newly formed team needs to complete a complex project, but it's unclear who's in charge. An Integrator is likely to be the one to suggest that the solution might be found in how ants collaborate without a leader.

Pioneers in Hell: How to Stop Killing Their Potential

Let's discuss how to create an environment where each of the four Business Chemistry types can excel.

To meet the needs of Pioneers,

- Allow time for free-flowing discussion and idea generation.
- Brainstorm and whiteboard on the spot.
- Keep an open mind. Even if you can't say yes, try to avoid saying no.
- Provide options for where, when and how to work.
- Position them to do what they love, and explain how more mundane tasks enable them to do so.

If you are a Pioneer, here are a few suggestions regarding how you might flex to fit just a bit better into an environment where people might not seem to acknowledge the full extent of your creative genius:

Stick with it. While Pioneers are often thought of as visionaries, people sometimes complain that they struggle to stick with an idea long enough to make it a reality. If you're a Pioneer, try breaking your idea into smaller execution chunks, and celebrate the achievement of each one (Pioneers love a good party) before launching into the next "new" phase.

Make the new seem old. Your love of novelty isn't equally shared by everyone. Indeed, some people are quite suspicious of ideas that seem totally new or foreign. Instead, they're more comfortable with what's familiar. To reach these people, emphasize what's not new. This will likely feel counterintuitive to you, but it can get people comfortable with your idea more quickly.

Take a breather. A common complaint about Pioneers is that their high-energy, put-it-all-out-there, talk-to-think style can be overwhelming and can crowd out other voices. Pioneers often aren't even aware of their verbal steamrolling, so simply making a conscious effort to let others get a word in edgewise can help.

Guardians in Hell: How to Stop Killing Their Potential

To meet the needs of Guardians,

- Provide pre-work, data and information in advance of a discussion or decision.
- When a change is required, acknowledge the potential domino effect on the details Guardians care about, and explain why the change is needed.
- Provide clear expectations, including what success looks like.
- Offer workspaces that provide permission to be alone, control over the environment, sensory balance and psychological safety.
- Acknowledge the value of the Guardians' work, which often involves more invisible tasks that keep the trains running on time.

- Pipe down and listen up so Guardians have a chance to process and don't need to fight to enter the discussion.
- Ask Guardians to help solve any potential problems they identify.

If you're a Guardian, you don't have to sit around waiting for someone to fix the situation for you — there is plenty you can do yourself:

Dip a toe in. Some people will assume that if you don't share your thoughts, you have no thoughts. They'll judge you as disengaged, not leadership material or even as being not too bright. If you're not yet ready to share an opinion, you can still contribute to the conversation by asking a question.

Be a positive force. Guardians are great at spotting mistakes, identifying the cracks that make an idea impractical, and foreseeing what might go wrong with a plan. This is a valuable role to play, but people won't always love you for it, because it feels like a downer. Try strategic optimism on for size. This practice involves envisioning the best possible outcome and then planning up a storm to make that happen. Both involve planning — the Guardian's specialty — but the tone is quite different and is likely to impact those around you differently.

Open up just a little. While everyone has a right to privacy, keeping to yourself can make others feel like you're not interested in them. Plus, it reinforces the stereotype that Guardians are boring. If people never have a chance to learn the interesting things about you, what other conclusions can they draw?

Drivers in Hell: How to Stop Killing Their Potential

To meet the needs of Drivers,

- Time-box socializing time, make it optional or explain why it's valuable.
- Explain what you and others want and why you want it. (Drivers may miss subtleties.)
- Provide ways for Drivers to measure their success.
- Offer practical workspaces where Drivers won't be disturbed more than necessary.
- Don't overreact to the Driver's brusque style.
- Be clear, concise and confident.

If you are a Driver, maybe you feel frustrated about some of the ways in which your work environment or the people on your team seem to be interfering with your progress. Here are some things you can do about it:

Be nice. If you work with people who aren't Drivers (and who doesn't?), a little bit of nice can go a long way toward getting what you need from them. It's not that you should avoid telling the truth. Rather, spend a moment thinking about how what you're about to say might make someone else feel, and whether there's a way to say it that would make it easier for that person to receive.

Get a second opinion. If you're baffled by how people respond to you, it might be a good idea to ask someone for help. One CIO worked with an executive coach after receiving poor reviews from his team. The coach asked the CIO to re-enact a typical interaction on film. When he watched himself, the CIO was shocked. "I'm making such an angry face," he said, "I had no idea." The coach also pointed out that the specific words he used made him sound accusatory and judgmental. They practiced communicating the same message substituting different words.

Get a sidekick. Just look at the leadership ranks of many Fortune 500 companies to see examples of leaders of all types teaming with others who complement their skills. For Drivers this can be particularly powerful — not only because they can rely on that individual to round out their edges and fill in their gaps but also because that person is optimally placed to provide the second opinion.

Integrators in Hell: How to Stop Killing Their Potential

To meet the needs of Integrators,

- Support Integrators in their desire to help others, and reward them for doing so.
- Provide opportunities to work in teams.
- Help Integrators see the meaning in their work.
- Spend time connecting.
- Use technology to make virtual teams and meetings more personal.
- Enable them to socialize issues and gather info from stakeholders.
- Be nice and say thank you.

If you're an Integrator who works on a team or with a leader who understands and can provide what you need to thrive, then you are very lucky, indeed! If you're an Integrator who's not so lucky, there are things you can do yourself to make things a better fit:

Accept trade-offs. While it's great to have everyone on board with a project or decision, getting there is both time-consuming and labor-intensive, and it's not necessary in every case. So take some time to determine whether a particular project or decision requires everyone's buy-in, or whether speed is more important, because it's difficult to attain both.

Make a decision already (and stick to it!). Research shows that second-guessing decisions — looking too hard for the very best option rather than a good-enough option — leads people to feel less committed to that decision and less satisfied with it. So, Integrators, go ahead and do what you do before making a decision (gather input, consider the people implications and so on), but once you've made a decision, popular or not, try to stick with it.

Toughen up. Integrators are the most likely type to sense others' emotions and to be concerned about how they make others feel. Remember that others aren't always as naturally attuned to people's feelings as you are. Try to put their behavior in context. Is it likely that they're purposely trying to offend you? Or is it more likely that their focus is simply elsewhere?

Creating Powerful Relationships with Colleagues, Customers and Everyone Else

Let's address how your type impacts the ways in which you should flex to best work with others.

Flex is a funny word, because it can mean seemingly contradictory things — to bend and stretch but also to tighten and contract. The concept here is that sometimes you need to tweak your style to adjust to other people's needs, while also being true to yourself.

When it comes to one-on-one relationships, how you go about flexing, and how challenging it's likely to be, depends on your type and that of the other person.

When You've Got Too Much in Common

You may think that when you're working with someone who's the same type as you, you're on easy street. But like-type pairs can quickly find themselves in trouble.

If you find yourself in a situation with someone of your same type, your goal is to flex but not to get closer to the other person's style. Instead, you want to get a little bit further away.

If you're a Pioneer working with another Pioneer, try to bring things back down to earth. After you've enjoyed some time brainstorming cool ideas, focus on developing actionable next steps so the path forward becomes clear.

If you're a Driver working with another Driver, while debating an issue, avoid tunnel vision by bringing up context or the human implications to get a broader view. Otherwise you may end up driving a bus together with no one else on board.

If you're an Integrator working with another Integrator, temper your shared desire to explore all alternatives, and settle on a direction. If there's an elephant in the room, address it, even if it's uncomfortable.

If you're a Guardian working with another Guardian, challenge yourself to ask whether the current way of doing things is really the best way to reach your goal. Avoid fixating on unknowns, and instead focus on what is necessary to move ahead.

When You Need to Flex Just a Little

What about the types with whom you share some traits despite your differences? Here are some tips for how to flex.

If you're a Pioneer working with a Driver, go ahead and bring your out-of-the-box ideas; Drivers like to explore, too. And feel free to spar a little; you're both likely to thrive on it. But don't lose sight of logic or practicality. Pie-in-the-sky isn't going to work here, and ill-considered risks will likely not be embraced.

If you're a Guardian working with an Integrator, the Integrator shares your distaste for confrontation, so make sure any issues that need to be discussed are surfaced and not ignored. Be patient with discussions that may seem tangential; an Integrator's way of thinking through an issue may be more roundabout than yours.

If you're a Driver working with a Guardian, you may need to access your reserve tank of patience. Like you, Guardians thrive on facts and data, but they're likely to need more of both than you are, and they'll probably take longer in considering them. Be prepared to continue reviewing the details even if you've already reached a conclusion yourself, and don't attempt to take shortcuts.

If you're an Integrator working with a Pioneer, you both value working closely with others. You may also enjoy thinking big together, but don't forget to address critical details, something neither of you is likely to do naturally.

You might need to pick up the pace, as Pioneers like to move quickly and they may feel impatient with your tendency to consider things more thoroughly.

Putting Business Chemistry to Work on Your Teams

You now have a variety of options for flexing to individuals of different types. That will take you a long way, but what if you're dealing with multiple people at the same time? How do you go from focusing on the needs of one to addressing the needs of two, three or maybe even four types at once?

How to make a team effective usually involves asking a series of questions to help leaders take a step back and consider the issue in a different way.

1. What kind of environment do you have today? Ask yourself, "Does our team's culture or way of working enable all types to thrive?" This is important because you can add all the diversity you want to a team, but if it's set up to work in a way that's more accommodating to some types than others, you're likely to get inconsistent performance.

Here are some questions you and your team members might ask yourselves:

- Do you typically dictate all aspects of a project? Or do you define what needs to happen and then set team members free to determine how they accomplish it? Pioneers, in particular, crave more freedom and autonomy, and your approach here is likely to impact them most.
- Are roles and expectations crystal clear? These answers may be particularly relevant for Guardians, who perform best when they have clarity.
- Are those expectations also set high? Drivers sometimes feel held back by what they see as the subpar performance of others.
- Is your door open? *Really* open? Integrators thrive when they can forge real connections with people.

2. What's your team's goal? Depending on what a team is trying to accomplish, certain types might add extra value. Need meticulous, high-quality work? A few extra Guardians might be a good idea. Looking for lots of big ideas? More Pioneers might be important. Need to navigate some tricky political waters? Maybe an Integrator-heavy team is what you'll want. Have a big goal to reach in a very tight time frame? You might benefit from including more Drivers.

Yet, it's important to recognize the complexity involved in reaching most any goal, which means it would rarely be ideal to have a team heavily dominated by just one type.

3. Who are your primary stakeholders, and what's their perspective? Sometimes it's easiest to work with those who are just like you. In those cases you get each other, and things feel good because they go smoothly. For this reason, a like-type team or individual may be effective when working with an important stakeholder.

Other times what stakeholders most need is a perspective that's different from their own. Your team's client might be a big-picture thinker who needs help sorting through the details of an implementation plan. Or they might prefer to avoid conflict and want some support in making the right decision, even when it's unpopular with others. In these cases, a different-type team or individual may bring more value, but only if you can offer a different perspective in a way that's palatable to the stakeholder.

4. What's the current composition of your team? There are many factors to simultaneously consider when choosing team members — like their knowledge, skills and experience; who's available when; what the budget is; the balance of gender and other types of diversity; and a multitude of other complicating factors. So even if you wanted to select your team based on their Business Chemistry types, in most cases it would be a real challenge to do so.

Instead, carefully assess your team's composition in the context of the issues just explored above, and then actively manage it by making adjustments to how your team works.

Whether your goal is to turn difficult relationships around; to manage your boss or your reports more effectively; to influence and connect with clients, customers and stakeholders; or to tap into the unique strengths of different people, Business Chemistry can get you there.

Like a hidden pattern revealed, once you've become aware of Business Chemistry, you'll see it everywhere.

And therein lies the magic.

MORE SV CONTENT ON MANAGEMENT

Summary: *Flex* by Jane Hyun, Audrey Lee. The authors present lessons on "flexing," which is the art of switching leadership styles to more effectively lead people who are different from you. *Flex* offers a proactive strategy for managers to navigate and leverage diversity effectively.

Webinar: *How to Lead Yourself, Your People and Your Organization for Extraordinary Results* by Jacqueline Carter. In this *Soundview Live* webinar, Jacqueline Carter offers a radical yet practical solution: To solve the leadership crisis, organizations need to put people at the center of their strategy. They need to develop managers and executives who lead with three core mental qualities: mindfulness, selflessness and compassion.

THE SUMMARY IN BRIEF

After reading this book, business owners will understand how to plan, improve and grow a successful business faster by focusing on what's important, and entrepreneurs will learn how to improve their business strategy. By working smarter and not harder, motivated individuals can increase their business revenue and free up their time to enjoy an easier life.

Successful networking business owner, Paul Arnold, wrote ***Business Strategy Success Principles: An Action Plan to Grow Your Business and Enjoy an Easier Life*** to teach entrepreneurs and small business owners how to operate focused, strategic, and efficient businesses by applying 20 essential principles. The first four parts of this guide include fundamental strategies for new or experienced business owners, while the last three parts are intended for established business owners looking to implement new strategies in order to take their businesses to a new level of success.

IN THIS SUMMARY, YOU WILL LEARN:

- How to plan, improve, and grow a successful business faster.
- How to improve your business strategy.
- How to work smarter and not harder.
- How to increase business revenue and free up time to enjoy an easier life.
- How to operate focused, strategic, and efficient businesses.

Introduction

Launching a new business and finding success can be a difficult task. As entrepreneurs, we often reach a point where we feel stuck. Our business becomes stagnant; we lose motivation and cannot grow our business as fast as we would like. This guide will help you understand how to grow your business faster by focusing on what is important. You will learn how to improve your business strategy to become unstoppable. By working smarter and not harder, you are able to grow your business revenue and free up time to enjoy an easier life.

Part 1: Your Plan

Should I? Do You Have A Solid Business?

The first step to improving your business is to understand why businesses fail and don't fall into one of these five traps:

1. No need in the market
2. Not enough capital
3. Not the right team
4. Competition
5. Price

Understanding the top reasons businesses fail can help you learn valuable lessons to position you and your business for a greater likelihood of success.

Why Do This? Plan Your Destination

Your mission statement defines your business, your business goals, and strategies to achieve objectives. You want to define what the ultimate goal is that you want to achieve.

Your vision statement describes the desired future position of your company. Your vision is the ultimate goal of what your business will accomplish. It can be combined with a mission to state the business purpose, goals, and values.

Your business plan helps you stay focused in accordance with your mission. At least once a year, revisit your business plan and determine if your business has changed or if it is time to change and adapt to the market.

Who? Know Who You Want

The first step for your value-adding business is to create or update your business plan. You need to examine and understand your ideal client. Create a picture of the person most likely to purchase your product or service. The business plan is an exercise to clearly define your product and your target market. You want to define where you will market your product or service. The more specific you can be in identifying your target market, the more successful you will be.

What If? Know Your Business

What makes you different? What makes your business different? SWOT stands for Strengths, Weaknesses, Opportunities, and Threats. If you can invest a lot of time and thought into a SWOT analysis before you market and grow your business, it will save you a lot of grief later.

Be Smart And Scale Plan Your Business

You need to scale your business by examining where you are today and understanding where you want to get to. Start by focusing on small, measurable goals. Make sure your goals are SMART. SMART stands for Specific, Measurable, Achievable, Relevant, and Time-specific. If you are not ready to scale your business, then wait longer until you can fulfill your orders. While it is important to take advantage of opportunity, your brand and reputation will suffer if you are not positioned for success and don't scale properly.

How Much? Know Your Numbers

Once you know where you are at now, then you need to know where you want to be next in one, five, ten, and twenty years. Forecasting your business revenue is important so that you can develop your operational and staffing plans to help make your business a success. Including your budget and projections in your business plan will help you avoid expenses in the future. Incorporating aggressive projections can be inspiring as you see what that would do for the bottom line of your company.

Part 2: Your Brand

Who Are You? Your Brand Is Everything

One of the most important factors of marketing your business is the K-L-T factor of your product or service. Is your product or service something that your customers can know, like, and trust? If you cannot achieve all of these three fundamental pillars, you will have difficulty marketing your product or service. It is critical that your product or service brand is tuned into the important frequency of WII-FM: What's In It For Me! If nothing ben-

efits me directly, I am not likely to spend my hard-earned money to purchase your product or service.

Where Are You Online? Improve Your Brand

Brand is everything. Revisit your marketing material, logo, and brand to see if it can be improved. Your brand should be unique and reflect the quality and strength of your business to your potential customers and clients. People cannot buy a product or service if they don't know about it. Review your SEO, i.e., search engine optimization. You want to improve the search results that direct traffic to your website. You may also consider creating a click funnel to create familiarity with your brand. Make your brand relevant and current. Check your social media presence for consistency and professionalism.

Part 3: Your Purpose

Your Why What Is Your Purpose?

Your current and future state of being is manifested in your head and will be determined by your thoughts, feelings, and desires for your future life. Your mindset is critical to determine your success in life. By seeking your passions, you tell the universe to attract them into your life. If you fall off the rails from your desired goal, change the direction of your life to get yourself back on track.

Your Vision Creating Your Vision Board For Your Personal "Why"

A vision board is a collection of images and words that inspire you; it is a tangible inspiration for where you are going. Illustrate your goals and dreams as a visual picture. It includes statements with the images as valuable affirmations of your goal. Your objective is to manifest a tangible representation of where you are going in life.

Part 4: Your Communication

Know Your Customer Strategic Sales

We can break the general population into four main distinct personality types. By understanding the four personality types, you can use the appropriate marketing strategy and communication to appeal to these individuals. By including elements that attract all four personality types, you increase your sales opportunities.

What Do You Do And Why Should I Care? Build Relationships

As a sole entrepreneur starting to market your own business, you should be able to demonstrate your value proposition in a short and concise manner. At this point, you should have the information you need to create your one-minute presentation (OMP.). You not only want to communicate the essence of your business in solving a problem but you also need to build rapport and trust with your ideal prospective client by using some specific relationship-building techniques.

Part 5: Your People

Dream Team Build Your Team

One of the greatest challenges successful business owners face is time management. Once your business takes off, it becomes more difficult to manage all the sales, admin, marketing, and accounting. By building the right team, you can delegate tasks to people better at doing certain things then you are who also provide great ideas to improve your business.

Right Surroundings Improve Your Network

You are like the five people you spend the most time with. If you want to improve your business and make more money, why not hang out with people who are already achieving that? Try to find a business coach or accountability partner. Find a millionaire mentor who has already achieved success in their business and is living a comfortable life. Choose your mentors wisely; evaluate the alignment of their skills with what you need to improve on to achieve greater success in your business.

Part 6: Your Pivot

Change Direction Six Steps To Pivot And Remain Profitable

What I would like to share with you next is how most successful Fortune 500 companies successfully deal with change and evolution—the six steps they use to stay profitable and maneuver in a new direction while minimizing risk:

1. Plan the framework for execution
2. Outreach and collaboration with key players
3. Key elements and strategy matrix

4. Current and future states and risk
5. Monitor and take action
6. Evaluate, assess, and explore

Part 7: Your Strategy

Get Rich Make More Money

Focus on that which is generating the most revenue for your business. On the flip side, stop wasting time on activities not generating revenue where you feel you are spinning your wheels. Take time to identify the three most important revenue-generating activities for your business and focus exclusively on them. By thinking outside the box, you will differentiate yourself from your competition and have unlimited success opportunities. By identifying your niche target market and ideal client, you can focus your sales and marketing activities for your perfect client.

Take It To The Next Level Raise The Bar

If you can acquire larger customers, you can work smarter, not harder. Once you have identified the big fish, who will change your life and your business, you can develop a specific marketing strategy geared toward this potential client. The more specific you can be with your target market, the better. If you can do business with a high-quality business owner, it opens the door to more opportunity. Improve your network to create the dream business you desire in life.

Zen Business Keep It Simple

It is now time to apply decluttering to your business. Look at all the projects and organizations you are involved with and reevaluate the effectiveness they are having in your business.

Pick the three most profitable marketing and sales strategies you have in your business and focus on them.Start focusing your business on either those clients who are profitable to you or those clients who you want to spend your valuable time with. Spend your time with those who are going to help your mindset and your business become better.

Agree To Succeed Say "Yes" To Opportunity

Try something that feels uncomfortable to grow. The things you are uncomfortable with are the things that will take you and your business to the next level. Trust your gut. If it is something that you feel may open a new door, make a new connection, or create a new opportunity, then why not say "yes."

Live The Dream Have Fun

Do the work that you enjoy. Activities you don't like to do may be fun and enjoyable for someone else. We need to be honest with ourselves and understand our strengths and weaknesses. You want to do that which you are good at and assign the other tasks to someone else, such as a virtual assistant. If you can get to where you are having fun in your dream business, then you are at the ideal place.

Conclusion

It is now time to work more on your inspiration by protecting your mental health. So, listen up, Superstar, you can do this! Get your business unstuck and launch it for success! This higher level of vibration is where you can think and believe; be the successful entrepreneur you are destined to become! Own your truth and live your dream!

Paul Arnold has worked for over thirteen years in retail sales in a financial services role. In addition to advocating for small businesses, Arnold owns Business Club, which supports small business owners with mindset, and runs online educational and networking events including Adapt and Overcome Innovation & Change Strategy Summit. As a certified financial planner, business analyst and scrum master, Paul Arnold's passion for small business entrepreneurship and mindset motivated Paul to write his first book Business Strategy Success Principles.

Titans of the Sky

The World's Two Largest Airplane Manufacturers Battle for Market Dominance

Review by Stephen Wolter

There probably aren't many journalists who understand the aircraft manufacturing industry better than John Newhouse does. Twenty-five years ago his book *The Sporty Game* examined the high-stakes business environment that exists in the manufacturing and selling of large commercial aircraft, commonly referred to as LCAs. A quarter of a century later, that book is considered a classic about the airplane business.

Now, in *Boeing Versus Airbus*, Newhouse focuses on the intense competition between the world's two largest manufacturers of passenger airplanes. He says the business of selling LCAs is an unsteady one at best and that predicting long-term winners in the industry is difficult, especially when fortunes seemingly change overnight.

BOEING VERSUS AIRBUS
by John Newhouse
Published by Knopf, Copyright © 2007, 254 pages, $26.95, ISBN 1-4000-4336-0

The Big Two Emerge

In the prologue and first two chapters of *Boeing Versus Airbus*, Newhouse provides a brief history of how the LCA industry evolved over the last three decades, leading to the current situation in which just two manufacturers compete with each other.

During the 1970s and early 1980s, the business of commercial airplane manufacturing was divided among four companies, three of which were located in the United States: the Boeing Co., Lockheed Aircraft Corp. and McDonnell Douglas Corp. Of these three established companies, Boeing reigned as the market-share champion.

At the same time, on the other side of the Atlantic Ocean, a much smaller and relative newcomer to the industry was starting to make its mark. European-owned Airbus Industrie entered the airplane sweepstakes with the A300, while Lockheed and McDonnell Douglas were instead developing a pair of ill-conceived and almost identical wide-body airplanes. But when airlines showed a preference for the A300, Airbus could no longer be ignored by the big boys. After more than 35 years of successful production, Airbus announced in March 2006 that it would gradually phase out the A300 (as well as the A310) final assembly in response to market demand for its newer aircraft.

Airbus' Curious Makeup

To understand Airbus is to understand its unusual corporate makeup. Airbus is owned by a publicly traded corporation known as EADS — the European Aeronautic Defense and Space Co. Newhouse isn't shy about calling EADS a "curious and badly flawed structure." Curious indeed.

Initially, Airbus began as a consortium of four European national aircraft corporations, with representation from Britain, France, Germany and Spain. In 2000, three of the four partners joined in a united commercial enterprise and became part of EADS, which was based in Paris.

Today, about 22 percent of EADS is owned by DaimlerChrysler. The Spanish and French governments also own a part of EADS. British Aerospace — now BAE Systems — is not part of EADS, but it owns 20 percent of Airbus.

It gets even more complicated — or flawed — considering that although EADS owns Airbus, nearly 80 percent of EADS's revenue comes from this one subsidiary. And while EADS has two co-chairmen, one French and one German, their oversight of Airbus is minimal. Newhouse describes disgruntled Airbus staffers who wonder why EADS is even necessary to the aircraft manufacturer, as Airbus acts mostly as an independent company.

At the start of the 1990s, Airbus held only 15 percent of

the market, compared to Boeing's whopping 62 percent. But the '90s were a decade of change, and by century's end, it was Airbus who would be the new industry leader. McDonnell Douglas and Lockheed were no longer players, and Boeing, through a number of management changes that affected its corporate culture, made a series of mistakes that cost the company its spot as the world's top commercial airplane manufacturer.

But Airbus' reign as No. 1 was short-lived. Almost as quickly as it made it to the top of the hill, the company faltered, and just within the last two years, Boeing has repositioned itself as the industry's primary force. Newhouse predicts that for now, Airbus will not be able to compete with Boeing unless the European manufacturer sheds the unwieldy managerial structure that currently intertwines it with EADS.

Rivalry Stories

After the initial two chapters, it becomes apparent that the book's structure lacks a single narrative arc. Instead, each individual chapter resembles a self-contained story that addresses a particular aspect of the Boeing/Airbus rivalry. Newhouse even abandons a linear chronology, choosing instead to shift between the present and the past, depending on the topic at hand. Some readers may find this method of storytelling too jarring for their tastes, but anyone with more than a passing interest in the aviation industry should not be dissuaded by Newhouse's decision to forsake a straight chronological history. His book sheds a great deal of light on an industry that is complex, risky and gigantic in its economic impact.

"Airbus' reign as No. 1 was short-lived. Almost as quickly as it made it to the top of the hill, the company faltered, and just within the last two years, Boeing has repositioned itself as the industry's primary force."

The first rivalry Newhouse describes concerns the back-and-forth argument the two companies have engaged in over the issue of government subsidies — an argument that has waxed and waned for more than 15 years. Both Presidents George H.W. Bush and Bill Clinton took up the issue of subsidies on Boeing's behalf in the early 1990s. Boeing, along with the then-still-solvent McDonnell Douglas, claimed that Airbus operated with an unfair advantage that came in the guise of hefty European government subsidies.

In 1992, a deal between the United States and the European Union was reached that limited Airbus' government aid to no more than 33 percent of the development costs of any new airplane. Boeing's leadership, according to Newhouse, wanted a lower percentage, but privately accepted the agreement as progress toward a level playing field.

In 2004, however, Boeing decided to make subsidies an issue again. Picking a fight over subsidies at this particular time puzzled many within Boeing's management. Newhouse describes several theories as to why Boeing would want to revisit an issue that had seemingly been laid to rest more than a decade before. One theory is that by having to defend its subsidies, Airbus' attention would be diverted from development efforts of a plane that could compete with Boeing's new 787, due for release in 2008.

Another theory is that Boeing believed Airbus would be severely weakened if government subsidies were reduced, something Airbus could ill afford as it was heavily involved with its own major development project, that of the new A380 Superjumbo, soon to be the world's largest passenger airplane.

But Henri Courpron, who at the time was president and CEO of Airbus North America, believed that Boeing's intent had nothing to do with positioning for industry dominance, or with trying to gain an advantage in the head-to-head airplane development projects the two companies were concurrently engaged in. Rather, he saw Boeing's move to challenge Airbus' subsidies as politics, pure and simple. Courpron believed Boeing was attempting to win political sympathy as it steadily lost market share to Airbus.

Whatever the reasons, Newhouse views Boeing's attempts to cut Airbus' subsidies as a mistake on the part of Boeing CEO Harry Stonecipher. For one thing, opening a debate on Airbus subsidies encouraged Airbus to make counterclaims that Boeing often benefited from technology developed by NASA. While not packaged in the form of a direct government handout, the technology was nevertheless a benefit.

As the debate over subsidies continued, a weariness seemed to settle in on both companies. By the time Newhouse's book went to press, subsidies had become an issue between government bodies, with no resolution in sight, or as Newhouse puts it, "not much was happening other than talks about talks." One Airbus executive privately told Newhouse he hoped that some sort of deal could be made between the two companies, so that they could just get on with the business of making airplanes.

Building the Planes

The two companies manufacture products that are physically enormous and technologically complex. Newhouse provides details and histories about the numerous planes Boeing and Airbus have built over the years, but thankfully his technical descriptions of individual planes are never

such as to be incomprehensible to the layperson. Instead, he focuses on the economic significance each plane has on its respective company, and what market niche the plane is intended to fill.

In the early 21st century, the two planes that consumed the bulk of development were the Boeing 787 and the Airbus A380. It is the A380 that has perhaps caused the most controversy in the industry within the last decade — not because Airbus has created an inferior plane, but because it may have overestimated the market demand for a plane that will carry 550 passengers.

The VLA Market

The idea of building a new, very large airplane, or VLA as they are known, was discussed in the early 1990s by both companies. Airbus, having established a strong position in the single-aisle market, now considered moving into VLA territory. The company was under the impression that Boeing was making its greatest profit from the jumbo 747, Boeing's crown jewel for almost 40 years. But Newhouse writes that Airbus was wrong, and that in fact the 767-300, a midsize plane, was Boeing's most profitable aircraft. Nevertheless, plans to develop a new superjumbo plane at Airbus advanced, and as it did, doubts among the industry's major players grew about whether or not the airlines really needed or wanted this plane.

Meanwhile, Boeing devoted its energy to the new 787, nicknamed the Dreamliner. Rather than trying to improve on its own VLA — the durable 747 — Boeing developed the 787, a midsize plane intended to fly long distances, but one that will avoid landing in hub airports. It is clear that Newhouse believes Boeing's investment may turn out to be the big winner.

The Airbus A380 will be able to carry twice as many passengers as the 787 — more than any plane in history — but it is designed to land at hub airports, where most passengers will be forced to change planes. Newhouse believes the industry may be ready for a new type of air travel, with ticket buyers welcoming the promise of fewer hassles — such as missed connecting flights and lost luggage—that the 787 will bring.

Still, Newhouse reminds the reader that longtime industry watchers remember when the same criticisms currently aimed at the A380 — lengthy turnaround times, time-consuming loading procedures, lack of airports that can handle such a large plane — were also directed at the 747 before it took to the skies. Yet the 747 changed modern air travel, according to Newhouse, in part by making it available to more people and helping to lower ticket prices.

The A380, which recently made its first flight to the United States, has nevertheless caused Airbus a great deal of worry. Last summer, the company announced a six- to seven-month delay in the delivery schedule for the plane, the second delay in as many years. Airbus has had to pay tens of millions of dollars in penalties for these delays, but it still contends that the market will support its new superjumbo.

Leadership Ups and Downs

Although Newhouse does not identify a dominant figure for either company — no Jack Welch, Lee Iacocca or Bill Gates — he devotes a lot of ink to creating portraits of the leaders of the two airplane manufacturers and showing how they affect their corporate cultures. Throughout the respective histories of Boeing and Airbus, Newhouse finds the mindsets at both companies swinging back and forth like a pendulum: both Boeing and Airbus alternate between aggressiveness and complacency, caution and arrogance.

Much of one chapter is devoted to the tale of how Boeing absorbed its former rival McDonnell Douglas in 1997, when Boeing was reeling from production problems. As Newhouse writes, Boeing lost money in 1997 even though it was a peak year for its airplane sales and as it was winning the battle for market share with Airbus.

At Boeing's helm during this time were CEO Philip Condit and President Ron Woodard, both of whom assumed their leadership roles in the 1990s. Although these two executives may have been as competent as any senior managers in Boeing's history, according to Newhouse, both caused the company the most damage, in part through the decision to pursue a merger with McDonnell Douglas.

That merger was viewed as a disaster by many within Boeing's commercial division who feared an unhealthy influence from the new acquisition. And sure enough, Boeing people were alienated almost immediately after the deal was completed, thanks to Harry Stonecipher, the McDonnell Douglas CEO during the merger (and later, the Boeing CEO who renewed the subsidies battle with Airbus). McDonnell Douglas had manufactured the underwhelming DC-10 wide-body, among other commercial products, but was mainly known for its work on military aircraft.

According to Newhouse, in his new role as a Boeing executive, Stonecipher was viewed

"Throughout the respective histories of Boeing and Airbus, Newhouse finds the mindsets at both companies swinging back and forth like a pendulum: both Boeing and Airbus alternate between aggressiveness and complacency, caution and arrogance."

by longtime Boeing employees as someone "who made no distinction between Coca-Cola or soap and Boeing's bread-and-butter product." That bread-and-butter product, of course, was the commercial jet airliner, but Stonecipher, blunt and impatient, tried to change the corporation's culture by shifting the company toward military aircraft production.

The whole story of the merger and its resulting revolving-door leadership makes up the portion of the book that most resembles a corporate soap opera. Stonecipher, who retired in 2002, was brought back 15 months later as CEO to guide the company after Condit was fired. But in early 2005, Stonecipher himself was forced out because of an "improper relationship" with a Boeing female executive. Although Newhouse puts Stonecipher in the category of a Jack Welch — in terms of management style — it appears his lasting notoriety will be limited to the airplane industry.

As for Airbus, its leaders assume more of a faceless role in Newhouse's narrative. Yes, there are key figures such as Jean Pierson, who retired as Airbus CEO in 1998 after 13 years of leading the company, and who remains legendary in the business. But for the most part, the Airbus executives take second billing to the company as a whole, with its strange corporate structure and the planes it manufactures. The A380, the plane that will determine so much of Airbus' future turns out to be a more dominant character in the story than most of the people.

What's most intriguing in Newhouse's description of the leadership at Boeing and Airbus is how each company's attitude ebbs and flows with its respective fortune. "Arrogance has changed camps now," Pierson tells Newhouse. The former Airbus CEO is referring to how his company took its newfound leadership in the early 21st century for granted. And Courpron echoes these sentiments when he says, "We failed to manage being No. 1."

Regarding the Boeing leadership of today, one anonymous executive working for a Boeing supplier tells Newhouse, "They don't know what they don't know. And there's no passion. They would be just as much at home with Procter & Gamble making soap."

No matter who's on top of this ever-changing, always-intense competition, it's almost certain that the leadership of these two companies will be second-guessed, criticized, despised and occasionally even praised. Both Boeing and Airbus are simply too enormous to escape from the strong opinions of the industry watchers. And with businesses as big as these two, *everyone* is watching.

The Continuing Competition

Newhouse's book is not without its flaws. As mentioned earlier, his decision to leap back and forth between the present and the past can be disconcerting. You may find yourself flipping to previously read pages in an effort to keep track of who's who at the two companies. And an early chapter devoted primarily to the airline industry (as opposed to airplane manufacturers), though interesting in itself, has much less to do with Boeing and Airbus than the rest of the book does. Still, there's no denying that Newhouse knows his stuff when it comes to the aircraft industry, and his book conveys a tone of authority throughout.

As for the continuing competition between the two rivals, Newhouse sees some potential dangers as Boeing increases its outsourcing of manufacturing to Asia. He wonders if Boeing can continue to fulfill responsibilities to its customers if it loses touch, over a period of years, with the methods and procedures that go into making an airplane.

As for Airbus, Newhouse believes its core problem goes beyond whether it will be able to compete with Boeing's 787, or whether the A380 will flop, and hinges on whether or not the company will be able to break free of its confusing corporate structure, with too many figures in authority in too many different places. If it can, Newhouse predicts Airbus will one day recover from its current downturn, proving a worthy opponent for Boeing. And this, Newhouse writes, will serve only to help airlines, engine makers, suppliers and passengers, all of whom benefit when these two companies are strong and competitive. ■

The author: John Newhouse is the author of eight previous books, including *Cold Dawn* and *Europe Adrift*. His most recent book, *Imperial America: The Bush Assault on the World Order*, was published in 2003. During the 1980s and early 1990s, he wrote about foreign policy for *The New Yorker*. Newhouse has served as assistant director of the U.S. Arms Control and Disarmament Agency, and later served as senior policy advisor for European Affairs in the U.S. State Department during the second half of the Clinton administration. Newhouse lives in Washington, D.C.

Strategies and Practices for Turning Conflict To Synergy in Organizations

CAPITALIZING ON CONFLICT

THE SUMMARY IN BRIEF

Are you looking to enhance your organization's creativity, improve decision-making, foster learning, and elevate the performance of your people and systems? In short, do you want to optimize performance? If you do, you must first find a way to create an environment that minimizes workplace conflict and integrates resolution strategies into management systems. Only by preventing or minimizing, bringing to the surface, and resolving conflict can you unleash the full power of the organization. This summary will show you how your company can create a comprehensive, organization-wide effort to resolve specific conflict events with proven strategies and practical tools.

What You'll Learn In This Summary

To manage conflict, you must:

✓ **Recognize** that conflict is inevitable, and that there are ways to minimize its impact.

✓ **Create and maintain a trusting environment** in which all the parties involved in a conflict have the information they need and believe conflict resolutions can be win-win solutions.

✓ **Avoid policy-driven conflict** by creating policies that are fair, necessary and understood by those who must follow them.

✓ **Hire and keep the right work force** by balancing your organization's needs with those of employees so that you have the right size work force that is full of the right people for the job.

✓ **Identify and surface conflict** so that it can be effectively dealt with.

✓ **Understand the difference between disagreements and conflicts** so that more problems can be resolved earlier and easier.

✓ **Develop an alternative dispute resolution system** that is right for your organization.

Managing Conflict

Managing workplace conflict to optimize organizational performance is not easy. Conflict is ephemeral and dynamic, and ad hoc actions and imposed solutions won't do the job. They might settle the immediate dispute, but they won't do anything to minimize future conflict. Optimizing organizational performance requires more. Conflict is inevitable, and managers must plan for it.

Types of Conflict

There are two types of workplace conflict. They are:

● **Substantive or Cognitive Conflict:** This involves interpretation of company strategy, disagreements over the use of resources, and what policies should be implemented. Conflicts involving substantive issues can create productive synergy, producing a whole that is better than the sum of its parts as employees work together to solve problems or exploit opportunities they could not handle as individuals.

Unresolved substantive disagreement often escalates, leading to more conflict and organizational paralysis or warfare among factions that support differing approaches to doing business.

● **Personal Conflict:** Often called affective conflict, this form revolves around personal relationships. Typical conflicts arise from different belief systems, views on social issues, and personal concerns. Personal discord can have two sources. It can arise when functional strife is not resolved or is resolved in a way that is perceived as unfair. Personal discord can also arise from the personalities of the people in the organization. People are not the same, and their differences can cause conflict. Race, gender, religion, ethnic background as well as stress and other environmental factors can lead to conflict. In some cases, personal strife can erupt into personal warfare. For example, what started as a dispute over a pay increase escalates into a lawsuit for constructive discharge.

What Causes Counter-Productive Conflict?

To get to the heart of conflict, you must examine the entire system. For example, work assignment processes, pay policies, retirement programs, and grievance procedures are all subsystems of the larger system. Each has its own purpose. But each also affects other parts. Pay policies affect retirement income, and work assignment policies affect pay. Feedback loops appear; changes in one part of the system influence another and loop back to the original. This happens, for example, when management chooses to address high absenteeism by assigning more overtime. The increase in overtime can loop back to make absenteeism worse because employees are overworked or can afford to be absent. ■

What Is Workplace Conflict?

Workplace conflict is a dynamic process that reflects a difference or incompatibility among two or more parties. Examples include:

- ✓ **a supervisor and a worker's different perspectives on the worker's performance.**
- ✓ **a group of managers who have a heated argument about budget issues.**
- ✓ **a co-worker who believes another worker is harassing her.**
- ✓ **a union and an employer locked in a bitter labor dispute.**

Some conflict is productive and necessary. Properly managed, conflict can lead to constructive exchanges of ideas, improved decision-making, and personal growth. But conflict's darker side can lead to low morale, reduced productivity, excessive turnover, and legal costs.

Three Causes of Conflict

The proximate cause is the direct cause of an event. It is the most likely immediate explanation of a conflict. It usually appears among the people involved and is the obvious trigger. It may, however, be a manifestation of a more basic problem elsewhere in the organization. For example, if two managers refuse to communicate or cooperate in any meaningful way, the proximate cause might be that they don't like each other and have a personality conflict.

Contributing causes are factors or conditions that surround or contribute to a conflict. Contributing causes can be conditions that set the climate in the organization or intermediate causes in a sequence of events from the root cause to the proximate cause. A contributing cause to the managers' inability to cooperate might be that they have offices in different cities, and the company doesn't have an effective communication system between branch offices.

The root cause is the most basic reason for a conflict. If the root cause of a conflict is eliminated, it can prevent the conflict from occurring. The root cause of the managers' conflict is that the company has a zero-sum bonus program, according to which the offices compete against each other, and if one manager wins, the other loses. It might not be in their financial interest to cooperate.

Management's Role

Managing conflict can be a little like herding cats. If you focus on one, others break out. The cats seem more influenced by things that you don't understand than by those that you do. You try something, and it does more harm than good. Fixing one problem causes another.

Effective conflict management is more than just solving problems. It is a complex management undertaking that requires holistic and systematic thinking. In fact, one important management paradox is that resolving conflict often does more harm than good. Aggressive managers might find it difficult to allow any counterproductive situation to exist without their intervention. They want to fix whatever is broken.

In many cases when the conflict is between two employees, managers who intervene may solve the immediate problem, but create an entirely different one. The workers might decide that they can't be trusted to resolve their own problems, and lose confidence, and an escalating cycle of dependence ensues. The manager will find himself or herself having to resolve more and more conflicts as the workers conclude they can't resolve them without help.

When should management intervene? It should intervene when management itself is a party to the conflict, when the conflict is between workers who can't or won't resolve it, and when circumstances make it clear that resolution without management intervention is unlikely. This does not mean that management should go boldly in and impose a solution. The workers who are part of the problem must help resolve it. Management must also consider the system implications and all possible causes, rather than just the symptoms. Ultimately, the fastest way to resolve conflict is to go slow.

Managing Conflict Is More Than Resolving Conflict

Resolving a conflict is a reactive, backward-looking effort to address a particular event. Managing conflict, on the other hand, is a purposeful, holistic journey that considers both the past and the future and attempts to minimize conflict and its negative effects. Managing conflict requires that managers:

- **Clarify Expectations:** Most workers want to do a good job, but often don't know what management really expects.
- **Provide a Role Model:** Knowing what to do is one thing, and knowing how to do it is another. Employees may need to be taught how to do their jobs, and there is no greater teaching method than role modeling.

Management can't be expected to simply ignore workplace conflict and hope it will go away. Despite the risk that taking action will breed more or different conflict, there are actions that management can take to manage conflict effectively and limit its counterproductive effects. Managers must manage conflict using a

(continued on page 4)

Resolving Conflict Causes New Conflict

Much of the conflict between employees and management is about employee needs and expectations; how employees will be treated and how much they will be paid. When employee expectations aren't met, conflict often results. Paradoxically, employer actions that resolve these issues can cause more conflict.

Abraham Maslow's hierarchy of needs — ranging from lower-order existence, such as a wage employees can live on, to higher-order self-actualization needs, such as challenging work — helps explain this paradox. Meeting lower-order needs shifts the conflict to a higher-order need. As one need is satisfied, another need surfaces. It follows that in higher-performing organizations where lower-order needs have been resolved (that is, pay, benefits and working conditions exceed basic employee needs), conflicts rise to the next level.

Management's Role

(continued from page 3)

broad strategy that includes:

- Minimizing the overall level of counterproductive conflict.
- Causing suppressed conflict to come to the surface.
- Ensuring effective resolution of counterproductive conflict.
- Learning from dispute resolution and applying that learning to further minimize conflict.

Providing Dispute Resolution Processes

When the time comes for management to step into a conflict, it must provide a process that is designed to resolve that conflict. This process must correct negative behavior and provide a satisfactory solution that all parties can accept; provide a framework for preventing similar conflicts from surfacing later; let the parties work effectively together in the future; and be cost effective.

When management resolves conflict effectively, workers learn that the environment is safe to discuss conflicts in the open. If the company also provides ongoing training in appropriate conflict resolution for everyone, not just those who are involved in conflict, future conflicts will be more amenable to appropriate solutions. ■

Managing a Trusting Environment

Trust is the unwritten and usually unspoken contract that allows each of the parties to a transaction to believe in the honesty, integrity, reliability and justice of the others. Trust is demonstrated through the parties' behavior toward each other. When employees don't trust coworkers or management, they feel a need to protect themselves, and win all they can. Employers who don't trust workers will create rules for every contingency, and micromanage the work force. This leads to a work environment characterized by resistance to management initiatives, refusal to cooperate, unhealthy cooperation, and may even lead workers to use formal win-lose dispute resolution processes, such as lawsuits.

It may be obvious that a trusting environment is productive while a mistrusting environment is counterproductive, but what can management do to change the dynamics? To break a cycle of mistrust, management must become trustworthy. It can do so by articulating a set of core values that reflect high moral and ethical standards. These core values must serve as management's guiding principles in both word and action.

Creating a trusting environment also requires management to be consistently truthful with employees.

Types of Power

Power is the ability to make things happen. There are three types of power in the workplace. These are:

✓ **Coercive power:** This is the power to force another's cooperation without willing agreement. For example, management has the coercive power to force workers to perform their jobs according to the employer's directions and to discipline workers who don't comply.

✓ **Utility power:** This is the power to buy what it wants. Management controls material and financial resources, and can bestow rewards to influence behavior.

✓ **Collaborative power:** This is the power to use the hearts and minds of all parties to accomplish common goals. Employees don't have much coercive or utility power, but they do have significant collaborative power. They have the information, skills, knowledge and capacity to get things done and to work with others.

Management should only use coercion as a last resort. Use collaboration first, then utility power if collaboration fails. Collaboration builds trust two ways. First, collaboration tends to result in a decision that benefits all parties. Second, collaboration uses the traits that build trust: openness, sharing and respect.

Managers should not withhold important information or make getting information cumbersome. Willingly discuss all relevant, nonconfidential issues. Don't be afraid to say, "I don't know," if that is the truth. Management must also be willing to speak with one voice.

A trusting environment is one in which power is used fairly. All parties in the employment relationship — managers, supervisors and subordinates — have some degree of power. Management, of course, has the greatest power. This does not mean, however, that it should be exercised. ■

Avoiding Policy-Driven Conflict

Your company's employment policies probably cover a wide range of issues affecting the employer-employee relationship. Formal policies may appear in manuals, employee handbooks or labor contracts, while informal policies are reflected in the myths that abound in your organization. Policies are part of the glue that holds an organization together.

There are three types of policies. The first, allocation

(continued on page 5)

Avoiding Policy-Driven Conflict

(continued from page 4)

policies, guide resource distribution and rewards. Behavior policies establish the company's expectations for personal conduct and clarify what happens if those standards are ignored. Finally, mixed policies attempt to induce desired behavior indirectly. A policy that sets bonus levels based on production levels is a mixed policy: It allocates salary dollars and shapes behavior at the same time.

Policies can cause conflict. Instead of causing desired behavior, they can create workplace discord. One of the primary causes of policy conflict is a sense of loss of control that may be experienced by those who have to abide by the policies that are put into place. Although most workers understand that working for someone else means losing some control, they nevertheless want to keep as much freedom as possible. The more rigid the rules, the more loss of control workers feel.

Policies that are perceived as unfair also cause conflict. Policies that don't conform to generally accepted norms in comparable work environments are often viewed as unfair. For example, a policy that prohibits all personal use of e-mail may be outside the norm and will be seen as unfair. Behavioral policies that are punitive can cause conflict, especially if they aren't enforced evenly throughout the organization. Policies, such as pay for performance bonus programs, often cause conflict unless they are carefully structured to encourage healthy competition and avoid bias and manipulation. Policies that are applied selectively or which require a manager to make a judgment call as to whether the policy has been violated can lead to conflict.

Reducing Policy-Based Conflict

You cannot prevent all policy-based conflict. Instead, you must implement policies that respond to differing interests, avoid exacerbating differences, and facilitate effective resolution when conflicts emerge. To reduce potential conflict, you must:

- **Avoid Creating Unneeded Policies:** Most employees understand what behavior is acceptable in society and what is not. Spelling out the details will seem demeaning to those who would never do what is unacceptable, and won't do anything to mold the behavior of those few who can't or won't conform to accepted societal standards.
- **Derive Policies From Core Values.** Your organization's core values are guiding principles that drive behavior and decisions. Values tell managers and employees how they should act as they go about company business. Make policies consistent with core values.
- **Involve Employees in Policy Implementation.** Collaboration helps balance the competing interests that employees and employers have. When they are involved in the implementation of new policies, the parties understand each other's concerns better.
- **Provide Fair Administration.** Policies must be fairly enforced.
- **Provide for Dispute Resolution.** Inevitably, there will be conflict over company policies. If policies have a dispute resolution procedure built in, much of this conflict can be resolved early and quickly. ■

How to Effectively Introduce New Polices

If you plan to introduce a new workplace policy, you would do well to heed this advice: Let workers know about the policy before you put it into effect. For example, if you plan to implement a no-smoking policy, letting workers know well ahead of time allows smokers to adjust both physically and psychologically to the change. Smokers could modify their habit or even seek smoke cessation help well before the restrictions become reality.

Policy changes can be communicated:

- ✓ **Through small groups or one-on-one.**
- ✓ **Voice mail announcements.**
- ✓ **Via written announcements on the company's e-mail system or in memo form.**
- ✓ **Through training programs.**

Manage Change Effectively

People often see change as a confusing jungle, fraught with danger and conflict. Business as usual is more comfortable. To make change an effective tool rather than a source of conflict, organizations must understand the underlying processes that allow change to occur.

Change occurs when a **change driver** (a person or group) identifies the need for change, develops a vision of what can be, and uses initiative to make the vision reality. Change drivers can be managers or employees. The **sponsor** is the person or group with the power to make a change reality through allocation of necessary resources. **Implementors** are the individuals or groups who are responsible for putting change plans into action. **Targets** are the employees or groups who are expected to change. Their behavior determines whether the changes being implemented will stick or fade away.

Conflict typically emerges when a company is in the middle of changing. This is because the comfortable equilibrium of the old way of doing things has been disrupted

(continued on page 6)

Manage Change Effectively

(continued from page 5)

but hasn't yet been replaced by a new stability. Targets are the most likely source of conflict, as they strive to maintain the comfort of the status quo. You have two options for dealing with resistance: You can force change by using power and authority to overcome resistance or you can work with the targets to gain their support.

Causes of Resistance

Resistance exists in all workplaces. It may be passive, reflected in reduced productivity and low morale. Or it may be active, with workers refusing to comply, engaging in sabotage, or filing lawsuits. The best way to deal with resistance is to minimize its occurrence. To do so, managers must understand its causes.

One cause is substantive disagreement over a change. It occurs when employees believe their work life will be negatively impacted. There may be nothing you can do about substantive disagreements other than to explain why the change must be made. Resistance also occurs when workers misunderstand the facts. The remedy is to let workers share in as much information as possible.

To counter resistance, don't surprise workers. People need time to adjust to unwanted change. When feasible, give workers a role in formulating change. This can be done through informal discussions, formal surveys, focus groups or committee work. Make sure that supervisors explain why change is necessary and how the change will benefit the worker, division or company. ■

Hiring and Maintaining The Right Work Force

In poker, you play the cards you are dealt. But in the workplace, management can deal itself the proper complement of employees who are right for the organization and for whom the organization is right. When this happens, conflict is minimized. When employees and the organization are not right for each other, conflict will take root and grow. To ensure a good fit, your organization must have an effective employment process and be willing to correct its inevitable mistakes by dismissing people when appropriate and necessary.

Management needs to hire the right number of the right type of employees in order to get an employee complement that minimizes conflict. This requires a strategy that accurately describes the number and type of employees needed and identifies tactics that let managers find and attract workers who meet those needs.

Having the wrong number of employees in an organization often causes conflict. If your company is overstaffed, workers who are not meaningfully occupied develop poor morale and bad work habits. They begin to feel insecure about their jobs. On the other extreme, if your company is understaffed, the pressure and excessive work hours needed to get the job done often cause supervisors to become dogmatic and overly demanding, and employees to become tired and stressed out.

Employment Strategy

A similar dynamic emerges if workers are either underqualified or overqualified for their jobs. Those overqualified feel undervalued and become frustrated, cynical and counterproductive. Those underqualified become frustrated by their inability to meet their employers' demands and rebel against what they see as unreasonable demands.

The answer is to use a strategic employment plan based on the work that needs to be done. Don't worry about just filling the job. Instead, think broadly about how to obtain the talent to do the work required. Consider current workload, predictable business cycles, business plans and anticipated attrition.

Sometimes the employment process fails in spite of

(continued on page 7)

Three Things You Must Include In Your Strategic Employment Plan

To serve as the blueprint for your company's hiring, your strategic employment plan must:

1. Maintain Staffing Flexibility. Staffing needs can be unpredictable. Dealing with uncertainty requires both careful management of the employee complement and the work to be done. The judicial use of temporary employees and outsourcing should be part of your strategic employment plan. Maintain a core group of permanent employees to accomplish the most predictable and stable work and use temps for less predictable work.

2. Maintain the Right Number of Employees. Organizations often hire too few or too many employees. When developing your plan, look for symptoms of over- or under-staffing and adjust accordingly.

3. Establish the Right Hiring Criteria. Develop up-to-date job descriptions that reflect what is being done and what needs to be done. Avoid narrowly defining job tasks. Look for broad qualifications. You may have to provide specific training, but well-rounded workers can adapt to changing needs.

Hiring and Maintaining the Right Work Force

(continued from page 6)

management's best efforts. When someone must be dismissed, the event is traumatic. Terminating employees is also costly to the organization, as it spends time and money justifying its decisions and perhaps defending its actions in court.

If you must dismiss for poor performance, don't do so spontaneously. Even in egregious cases, you can suspend the worker subject to a future, considered final decision. Allow the worker an opportunity to defend himself or herself. Make sure the punishment fits the situation, and is on par with how other workers have been treated in the past to avoid discrimination claims.

Let the employee leave with dignity if possible, by offering the opportunity to resign or to receive a severance package. There will be times when dismissal should be quick and decisive, such as in the case of a worker caught stealing trade secrets or other valuable assets. ■

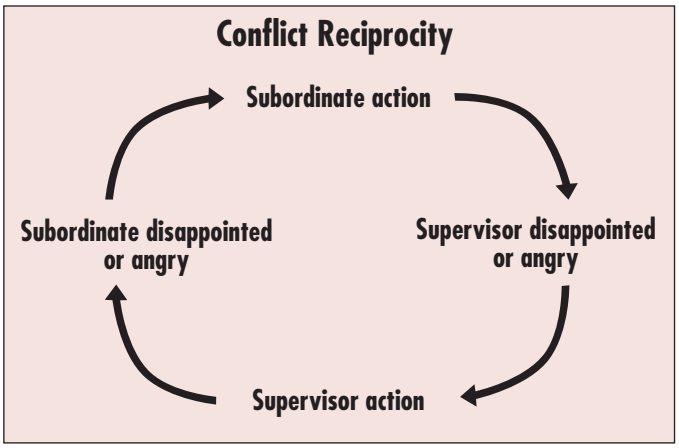
http://my.summary.com



Fostering Appropriate Supervisor Behavior

Supervisors operate in a messy, systemic world in which their personal behavior affects employees and is affected by management systems. They have more exposure, influence, power and responsibility than any other members of the organization. Their behavior has a greater effect on the level and severity of workplace conflict than that of any other group.

Supervisors must learn to control their behavior to minimize conflict. They can do this by creating a mutual-gains climate. To create such an environment, they must consider the interests and needs of subordinates. Sometimes all that's needed is empathy. When supervisors really care, and demonstrate their appreciation, conflict is less likely. They must try to create a collegiate atmosphere in which workers feel safe and secure.

Supervisors who want to reduce conflict need to:

- **Handle rewards appropriately.** Although you may not have authority to handle all aspects of compensation, you can make sure that those aspects of pay and promotion you do have control over are administered fairly. Even saying "thanks" and "good job" convey a powerful message.
- **Communicate Effectively.** Conflict often results from discordance between what the communicator is saying and how it is being said. A supervisor who says she wants input but interrupts continually with her own views isn't communicating effectively. Communication requires that you listen as well as talk.

Understanding Reciprocity

Conflict has its basis in reciprocity, or how the parties react to each other. Negative reciprocity leads to a downward spiral while positive reciprocity leads to improved relationships and minimum conflict. Systems thinking helps explain reciprocity and how supervisors can use it to minimize conflict. Conflict is driven by circles of relationships called feedback loops that are reciprocal flows of influence that are both cause and effect. Supervisors and subordinates are part of the process and each of them influences and is influenced by what happens. Thus, each is at least partly responsible for the actions of the other. Each can cause conflict and becomes a player in a circular, continuous cycle.

Just as the cycle can escalate, so it can de-escalate conflict. A conflictive spiral can be reversed when one party acts counter to the negative influence being received. To reverse a cycle, you must act counter to the influence you are receiving and take action that the subordinate will respond to positively. This requires a leap of faith as you respond to belligerent actions with calm and reason. ■

Dealing With Conflict

Good supervisors, a trusting environment, effective policies, and positive management practices can substantially reduce conflict, but some will remain. Even if conflict isn't apparent, it may exist as suppressed conflict when two or more parties have a grievance but fail to acknowledge the problem.

Although not all conflict needs to be brought to the surface, much should. Often, what is required is that management provide a safe opportunity to talk about concerns. This can include maintaining frequent contact with subordinates, having an open-door policy, and managing by walking around. Managers can also elicit information about suppressed conflict through the use of employee surveys, focus groups, virtual or physical suggestion boxes, an ombudsman and 360-degree perfor-

(continued on page 8)

Dealing With Conflict

(continued from page 7)

mance feedback assessment programs.

Engaging Conflict

Once conflict has surfaced, managers must make a decision. Your response to conflict among employees and between employees and management should differ.

In employee-employee conflict, neither the company nor its management is involved. Instead, the conflict is between co-workers or workers who aren't in a supervisory relationship. The conflict may be personal or work-related. Before you intervene as a manager, you must weigh the costs and risks. Employees often do better if they solve their own problems, and intervention takes time and money. Management should stay out of most purely personal conflict, but may need to intervene when the dispute is job-related.

If management does intervene, it is usually most effective to coach the parties on an appropriate solution rather than imposing one. Only after it becomes apparent that the parties cannot resolve the conflict should managers impose a solution.

If the conflict is between an employee and management, different rules apply. Its basis is in actions and positions taken by management against employees or by employees against management.

Management's role in this type of dispute is to represent the best interests of the organization, and all its workers, regardless of whether its actions will perpetuate or escalate conflict in the short term. For example, management may elect to fire a worker who keeps violating company policies, even if that will almost certainly escalate the conflict. Management's role includes playing investigator, decision-maker, implementor and advocate for the company.

Conflict Resolution Approaches

How a conflict is resolved depends largely on what state the conflict has reached. A disagreement is a state of dissatisfaction. A dispute goes further, as the party contemplates or takes more aggressive action. When differences have moved from being disagreements to becoming disputes, the likely resolution will change.

At the disagreement stage, resolution will likely be by agreement, and be the result of an informal process emphasizing collaboration, focusing on both parties' interests, and be negotiated by the parties to their mutual benefit. Once the matter becomes a dispute, resolution will likely be by settlement in a more formal setting, perhaps involving coercion; focus on positions and rights; and be a compromise or a win-lose solution. Often the resolution requires a third party, like a judge or an arbitrator.

When You Should Intervene

Management should intervene when:

- ✓ The conflict is one in which management has a legitimate interest, such as department budget conflict.
- ✓ The conflict has negative effects on the organization, such as when a personal conflict results in arguments during work, disrupting production.
- ✓ The conflict presents a potential risk to the organization, such as a lover's quarrel that can become a sexual harassment case.
- ✓ There is a power disparity among the parties, such as if there is a personal conflict between a supervisor and a subordinate unrelated to work.
- ✓ There is a request from the parties that management intervene.

To enhance the likelihood of resolving disagreements in ways that minimize future conflict, organizations must use a collaborative, holistic process that:

- **Describes the conflict properly.** Focus on the cause rather than on the symptoms. Understanding the underlying reason may lead to a better solution.
- **Integrates the right people.** If the dispute involves a company policy, those who are in charge of the policy and understand it should be involved in the resolution.
- **Takes a systems view.** Apparent causes may be the tip of the iceberg. Address underlying problems. Separate the facts from the underlying systemic causes.

Dispute Resolution Options

There are alternatives to traditional dispute resolution mechanisms. Alternative Dispute Resolution, or ADR, is an umbrella term that covers a wide range of non-litigious options. These include:

- **Open-Door Policy,** often the first and least formal step in a dispute resolution system. It emphasizes early resolution.
- **ADR Policy**, which establishes dispute resolution rules, provides due process, and often includes protections such as the right to access to evidence, to ask questions, and to help choose the independent decision-maker.
- **Facilitation,** which helps people resolve disputes in an informal setting.

ADR can reduce litigation costs, minimize wasted time and effort, build trust, and otherwise reduce conflict. If an organization chooses to use ADR, it must be sure to create a fair system that doesn't favor management. A comprehensive conflict management system takes time, money and commitment to create and use. Companies that need a more formal conflict resolution method may find that the time, money and effort is well spent once the system is in use. ■

We Model the Change
Page 4

THE SUMMARY IN BRIEF

Despite being perfectly adept leaders, we continue to sign up for change efforts we know are doomed to fail. Given how much money and work goes into these efforts, that failure rate is a terrible shame. Resources are wasted, organizations lose focus, people's lives are upended, and the result is that people and organizations have little to show for their efforts.

In ***Change the Management***, Al Comeaux outlines the behaviors, mindsets, and outdated approaches to change that managers and leaders have and the way they derail lasting change in their teams and organizations. Then, he outlines exactly how leaders can transform their approach to change to foster buy-in from team members, become allies of change, fully align on the problem, and listen to their teams while modeling changes themselves. Leaders will be equipped with a toolset for successfully managing change in their organizations— and a detailed list of habits and behaviors to avoid that can stand directly in the way of real and lasting change.

IN THIS SUMMARY, YOU WILL LEARN:

- Six enemies of change that stand in the way of lasting transformation.
- Four methods for becoming allies of change.
- How to pull employees than push them towards change.
- How to model change in your organization to inspire long-lasting emotional connection and long-term impact.

Introduction

Successful changes in an organization are anything but easy. But there is a path to succeeding at change. Behavioral change requires emotional buy-in from those being asked to change their behaviors. Given the growing body of science pointing to the importance of emotion in decision-making—even in rational business decision-making—it's become clear that the intellectual arguments will only drive so much change, and only for so long.

For change management to work and last—for the energy to be there among those going through the change—we must focus on both the intellectual dimension and the emotional dimension: we must be both smart and have heart.

This is especially true when addressing behavioral change. The reality is that if we want successful, lasting change, we should not try to get people to change their behaviors. Instead, we must get people to want to change their behaviors. The former yields mere compliance; it'll last a while, but usually not for long. The latter is contagious, energy-inducing, and long-lasting. And the difference is monumental.

The best way to drive a desire for behavior change is for employees to understand the what and why of the change, and to see examples of the change itself from certain behaviors by leaders: modeling, listening, asking people to join, and pulling people to change through emotional connection.

This is Not a "They" Problem

We often think our challenges for change programs are 'they' problems, such as problems with middle management or front-line employees. But when it comes to assessing the biggest challenges to change, we need to look at ourselves first. Often, we are the enemies of change—even when we don't realize it. We take every opportunity—whether conscious or unconscious—to get in the way of change.

We're also enemies of change when we think the organizations where we work, the projects we work on, the people who work for us, and the positions we hold make the change a 'they' thing, not a 'we' thing.

Often, we miss the need for change in the first place because of the successes we've had in the past. We try shortcuts that can do more harm than good. Our beliefs are rooted in the 1970s, and we don't realize how outdated they are. We need to change if we want anyone else to change.

The good news? We can, as long as we're willing to overcome the six enemies of effective change.

Enemy #1: Our Own Cognitive Dissonance

Cognitive dissonance is what happens when we're forced to confront our own deeply held beliefs and attitudes. It's the psychological discomfort we get when a value or deeply held belief we hold comes into question. In life, we all try to avoid cognitive dissonance by avoiding discussions about things we might disagree on. In business, as leaders, the more success we have, the stronger the belief that our way of doing things is the universal right way.

We experience cognitive dissonance when we learn we have to get our hands dirty and get personally involved in a change effort. Our people experience cognitive dissonance when they find out that the way we've always done this is not the way we'll do it anymore.

To succeed with change, we have to become aware of our own cognitive dissonance and also be thoughtful and mindful of other people's cognitive dissonance and what they'll have to go through to overcome it. We have to give them someone to follow.

Enemy #2: Our Outdated Ideas About Communications

Outdated ideas about communication are another major enemy of change. We need lots of traditional communication platforms—emails, town halls, focus groups, you name it—and these communications should be 'dripping from the walls.' However, traditional communications are only 10% of the equation. Today, with the advent of new media, people have many more ways to get their information than they did fifty years ago. Communication is now 90% action and 10% words.

Our people—with their cognitive dissonance and access to all kinds of information—are naturally looking for inconsistencies in our 'say:do" ratio because these are potential signs that the change isn't serious. So, what we say and do must always be aligned—especially during change periods. The best way to show we're serious about change is to communicate that seriousness by modeling the change ourselves.

Enemy #3: We Let Inertia Get in the Way

Inertia is an enemy of change. The idea of intertia is based on physics—an object at rest wants to stay at rest unless acted on by an outside force. Overcoming the inertia of

our organizations can be a major challenge. They tend to want to stay the same, maintaining the status quo. It's not that we're lazy, we just allow a range of factors to hold back change. We let 'other stuff,' like the work that's constantly demanding our attention, get in the way of our long-term vision that can help affect real change. New data can distract us, making us uncertain and causing us to drag our feet. A lack of momentum, a lack of urgency, and complacency can all contribute to inertia.

When we aren't clear and aligned about the change and the end-state, the effort can twist in many directions, exhausting our people. The inability for people to digest what's involved in the change can also slow us down. Energy slumps happen along the way, which is why it's important for us to work on the issues that cause our personal inertia, as well as working to eliminate inertia at the organization level.

Enemy #4: Our Belief in Change by Decree

Change by decree is not in line with real values. When we simply tell everyone what the change will be with little room for debate or input, the change is cheap. It won't get people to want to change, which means the change won't be lasting. Ironically, sometimes we have to make changes by decree, such as with acquisitions.

In these cases, we subsequently reach people on an emotional level and get buy-in at many levels on as many aspects as possible related to the post-announcement changes that will come as a result.

Leaders must authentically help others feel ownership of the change. Our people should have a hand in creating the change if we want them to support the change. Our changes must be in alignment with our organization's core values. Core values become a must for organizations of all stripes, and—given that no organizations' values include 'Do as the leader says"—change by decree is never congruent with our values.

Enemy #5: We Live in the Weeds

Getting stuck in the weeds is an enemy of change. As leaders, we need to ensure the trains are running and headed in the right direction, but we don't need to know every aspect of how the trains run. We need to track milestones, understand what things are going wrong and right. Our efforts must be SMART (Specific, Measurable, Achievable, Relevant, and Timely).

But many of our directional outcomes are dependent on whether our people want to change. This requires reaching people emotionally, not just rationally, from the start. Great outcomes come from great inputs, so we need to focus on the right inputs. If we don't reach people on an emotional level, our people will certainly decide on their own how to fill the emotional part of the decisions they must make.

Modeling change is a very good way to reach people on an emotional level and gives them a model to follow through the change.

Enemy #6: How We View People

If we fail to understand our people and what to do with them, they can be an enemy of change. Some people are ready for change before we are. We should get them to help us. Others are too burdened by current processes to switch to new ones. We need to help them with the transition, including by modeling the change behaviors we want to see.

Some team members struggle with ambiguity. We need to help them by setting a clear vision, showing them the way, and patiently answering their questions—as long as we can.

Some people lack confidence. Building confidence in people is important and laudable, but we must also keep an eye on where our time investments are best made. Finally, some people act duplicitously. No matter what job they have, they need to be fired, or they will continue to undermine the change you want to see in your organization.

Reorientation: We Pull. We Don't Push.

To succeed at change, we must pull people through the change, not push them. Pushing is about pushing our ideas onto people, telling them to change. Pulling is about inspiring people to follow us, building infectiousness with what we're doing, engaging people's emotions and touching people's feelings. Pulling is more likely to help people feel ownership of the change; it feels like it's their idea.

The pull mindset leads us to model the change and let our people take it from there, rather than micromanaging how our direction is executed. It can be hard for us to overcome the idea that a boss is the person who tells people what to do. We have to reorient and instead inspire people to do what's needed.

We Align on the Problem

Every member of leadership must know and give the same explanation for why change is necessary. Any distance

between explanations of this 'why' can crush a change initiative. Executives need to explain the same why every time. Yet distance between executives on this is almost universal, unless they work to get it right

Change will impact groups differently, so leaders need room to explain the specifics to their individual work groups. It can't come at the cost of improvising the overall reason for change. Speak in unison when addressing the why for change, and speak in harmony when addressing things from our work groups' angles, always returning to the original 'why' as often as possible.

We Listen

Once we agree on the reason for the change and how we'll tell our organization's story, we must involve our people in the change if we can. Organizations that include their people in change planning are much more likely to be successful than those that have top-down change management approaches.

Listening is critical to change. Although it can be messy, organizations that involve and listen to their people can get surprisingly positive results.

We must also develop a change context that ties into our reason for the change, incorporates our values, and informs how we model the change appropriately. This process ensures our change is not out of line with our values.

What's most important—what will matter most a year from now, long after we've announced the change—is that the outcome was right and fair and not naïve, and that we authentically searched for the right way to bring forth the best change possible.

We Model the Change

Once we have the reason for change down pat, and we know the context for the change based on the reason plus our values, and once we know what the changes will be, it's time to determine how we can model the change. We use the change context to inform how we'll model the change.

If our change context is 'giving it up for the customer' and we're cutting costs, this informs us that we need to give up things as well. Modeling change can come in many forms, including simply supporting a change happening lower in the organization.

But our actions—and our modeling—can look contrived if they're not authentic, if our actions are uncharacteristic of what we actually do. That makes change management an everyday part of our jobs as leaders.

Al Comeaux, a former executive at Travelocity, GE and American Airlines, is a decorated corporate pioneer and global authority on change from inside organizations. His career championing change as a senior leader at uber-disruptive dot-coms as well as established, world-renowned companies—and his 20-year journey researching why so many change efforts fail and what's needed for success—make him one of the world's most forward thinkers on what leaders must do—and how they must think—to succeed at change. In 2019, Al founded Primed for Change, a disruptive new project created to prepare leaders to take organizations successfully through change.

Management: Strategies

Chief Culture Officer

How to Create a Living, Breathing Corporation

by Grant McCracken

THE SUMMARY IN BRIEF

Levi Strauss & Co., the jeans and apparel maker, missed out on the hip-hop trend. They didn't realize that those kids in baggy jeans represented a whole new — and lucrative — market opportunity, one they could have seen coming if they had been paying attention to the shape of American culture.

Levi Strauss isn't alone. Too many corporations outsource their understanding of culture to trend hunters, cool watchers, marketing experts, consulting firms and, sometimes, teenage interns. The cost to Levi Strauss was $1 billion. The cost to the rest of corporate America is immeasurable.

The lesson? The American corporation needs a new professional. It needs a Chief Culture Officer (CCO).

In *Chief Culture Officer*, Grant McCracken, an anthropologist who does training at some of the world's biggest companies, argues that the CCO would keep a finger on the pulse of contemporary cultural trends while developing a systematic understanding of the deep waves of culture in America and the world. The CCO's professionalism would allow the corporation to see coming changes, even when they only exist as the weakest of signals.

Bursting with insight and character, *Chief Culture Officer* is sure to expand your horizons — and your business.

IN THIS SUMMARY, YOU WILL LEARN:

- How to market, invent, sell or simply invest in companies that make stuff.
- Why companies get blindsided by cultural factors hidden in plain view.
- Why businesses need to bring cultural expertise into their executive suite.
- How to run a successful business in the early 21st century.

Introduction

Levi Strauss, the jeans and apparel maker, misses hip-hop. The penalty: $1 billion.

Quaker pays too much for Snapple. The penalty: $1.4 billion.

Facebook claims 7 billion photos as its own. Embarrassment and recantation follow.

These corporations, like most, were bad at reading culture, bad at staying in touch with culture and bad at working with culture. And it cost them dearly.

By "culture," we don't mean corporate culture. And we don't mean "high culture," the world of refined taste. By culture, we mean the world outside the corporation, the body of ideas, emotions and activities that make up the life of the consumer.

It's not that the corporation hasn't *tried* to take account of culture. It's resorted to the advertising agency, designer, consultant, cool-hunter and guru. Worst case, someone says, "Let's see what the intern thinks." (Now a million-dollar decision rests on a 20-year-old.) But culture is too important to be left to an outsider (or a 20-year-old). When there's $1.4 billion at stake, it needs a Chief Culture Officer (CCO).

The corporation has learned many things in the past 100 years. It has mastered most of the mysteries of organizational behavior, operations management, human resources, communication, marketing and finance. Until it masters culture, it makes the world needlessly mysterious and it multiplies risk.

Why Culture Matters

Culture matters for reasons good and bad. First, it is the place to discover advantage, opportunity and innovation. The Four Seasons, Patagonia, Starbucks, Nike, Red Bull, Target, Method Soap — each is a culture play. Each found value in culture. Each *extracted* value from culture.

Second, culture is the breeding ground for cataclysmic change, a North Sea out of which commotion constantly storms. Without a working knowledge of culture, the corporation lives in a perpetual state of surprise, waiting for the next big storm to hit. Without a CCO, the corporation has no way to perform this crucial piece of threat assessment.

Getting Past Guru: Being Steve Jobs

People talk about Steve Jobs as if he were one of a kind. Clearly, he is a remarkable man. When we look at what he's done for Apple, cell phones, digital content, the art of design ... well, he has earned our admiration.

But when it comes to helping Apple navigate culture, Jobs may be less indispensable than we think. With a more systematic approach to culture, many could do what Jobs has done. Let's not be blinded by the "cult of personality." It's good for Jobs. It's good for Apple. It's not so good for the rest of us. We have made ourselves guru-dependent.

Many companies depend on a guru: Apple on Jobs, Virgin on Richard Branson, CBS on Les Moonves, Omnimedia on Martha Stewart, Bad Boy Entertainment on Sean Combs.

Steve Jobs

Steve Jobs' parents sacrificed heroically to send him to Reed College, a small liberal arts school in Portland,

Ore. But he wasn't happy. He couldn't see the point of his studies and, after six months, he dropped out.

Jobs didn't leave Portland and he didn't leave Reed. He stayed on campus as an unregistered student, walking, thinking, noticing. One of the things he noticed was that campus posters were particularly beautiful. A little investigation told him that Reed had a good calligraphy department, and Jobs decided to take a class, his only class. He promptly fell in love with the art form. "It was beautiful, historical, artistically subtle in a way that science can't capture, and I found it fascinating," he said.

When Jobs designed the first Macintosh computer, 10 years later, his Reed training came back to him. And the rest, as they say, is history. Without his calligraphy course, Jobs says, "the Mac would have never had multiple typefaces or proportionally spaced fonts." And, he says, "It's likely that no personal computer would have them. If I had never dropped out, I would have never dropped in on this calligraphy class and personal computers might not have the wonderful typography that they do."

Thanks to Jobs and that course, Apple was unique in the tech space. It cared about beauty. And this gave it a strong connection to the creative community, which, in turn, supplied the corporation with a passionate supportive base. Apple enthusiasts were so dedicated to the brand they helped fund each new Apple experiment, embracing, without much complaint, even the odd Apple failure. Jobs had found a way to connect to the creative community. He had found a way to read culture and speak to it.

Jobs wasn't a CCO, but he certainly acted like one. The lesson: Connect to our culture and we will follow you anywhere. And Apple is now so spectacularly in touch with parts of our culture, it seems almost in control of it.

Someone can act as a CCO not because he or she has studied contemporary culture, but because he or she comes from that culture. Eventually, every CCO has to know about the whole of culture, not just the part of it he or she knows from personal experience. Standards, knowledge, continual learning, the ability to process massive bodies of data and possibility, the ability to spot the crucial development in a perfect storm of possibilities — this, and not intuition, is the work of the CCO. ●

Stealth CCOs

The CCO doesn't yet exist, but there are people who act like CCOs and we can learn from them.

Dan Wieden for Nike

Two Rules of the CCO

The first rule of the CCO is: Talk to anyone who will talk to you.

The second rule of the CCO is: Figure out the thing that makes a person interesting. Usually people don't mind the grilling. After all, we are asking them to talk about themselves. The trick is to find the thing they know best that we know least. And then the trick is to find out what this means to them, how it looks to them and how it feels for them. If there's lots of "found art" out there, there's lots of found anthropology, too. Be opportunistic. Seize every opportunity.

By the mid-1980s, the running boom was giving way to a fitness craze, and Phil Knight, founder of Nike, wanted his company to take part. Knight didn't much believe in advertising, but competition with Reebok was fierce and he had begun to work with a small shop in Portland, Ore. called Wieden + Kennedy. Dan Wieden, Portland native and second-generation ad man, proved to be an essential asset.

It was Wieden who coined the slogan "Just do it" in 1988. Most slogans are about the brand ("Coke is it."). But "Just do it" was imperative, impatient, presumptuous and, well, a little rude. This was not the sort of thing consumers had heard before.

Acting as unofficial CCO, Wieden had looked into the life of the consumer. He saw someone struggling to get off the couch into fitness, someone suffering aches and pains, someone tempted by excuses. In "Just do it" Wieden found the three words that allowed Nike to intervene. Acting as unofficial CCO, Wieden had found a way to help Nike ride the fitness wave.

A. G. Lafley for P&G

When A. G. Lafley became the CEO of Procter & Gamble (P&G) in 2000, the company was a powerhouse.

But the new CEO was not happy. Lafley believed his company was a little slow, insular and self-congratulatory. He wanted to reinvent P&G for the 21st century. "Speed and agility," he said, "matter more than heft."

And this is why Lafley made a pilgrimage to Venezuela. He climbed a steep set of concrete stairs to a cramped apartment to interview homemaker Maria Yolanda Rios. As the *Wall Street Journal* reported, "For an hour, Mr. Lafley sat in the corner of Mrs. Rios' kitchen, where bright yellow paint peeled off the wall, and listened to the young mother. [Rios produced] 31 bottles of cream, lotion, shampoo and perfume and

placed them on the embroidered tablecloth. She has two lotions for her feet, one for her body, one for her hands and another for her face. 'It's her entertainment,' Mr. Lafley said."

It was a telling moment for American capitalism. Lafley was saying, in effect, "These creams and lotions are not what we say they are. They're whatever Mrs. Rios says they are. If she treats them as 'entertainment,' we must treat them as entertainment. Let's stop listening for what we want to hear." The most powerful man in this powerful company was saying, "It's not about us. It's about her."

Lafley insisted the corporation take the larger view. In his book, *The Game Changer*, Lafley wrote, "P&G needed to look at consumers more broadly. It tended to narrow in on only one aspect of the consumer — for example, their mouth for oral-care products, their hair for shampoo, their loads of dirty clothes and their washing machines for laundry detergents."

Lafley disliked the way this approach "extracted" the consumer out of his or her life, focusing P&G on what was important to the company, not the consumer. Lafley said, in effect, *See the whole person*.

This is the role of CCO, to dolly back far enough to see the consumer in his or her life, in his or her culture.

Actually, CCOs move in two directions. They go *inward* toward the consumer more than anyone else in the C-suite. They come to know what these lives feel like to live. But CCOs also move *outward* to capture the bigger picture. ●

Culture Fast and Slow

Homeyness is slow culture. It consists of a set of rules. It specifies our choice of colors, materials, furniture, decorative objects, arrangement, interior design and exterior characteristics. It is the way we take an ordinary space and give it extraordinary powers. It shows us how to turn a house into a home. It is an enduring, deep-seated aspect of our culture.

As a part of slow culture, homeyness is everywhere in our midst and, apparently, everywhere invisible. It shapes Americans' lives but stays below the radar of American experts.

Pity the CCO who ignores it. It is often homeyness that helps decide whether consumers will embrace a new product, how they will use it, what they will use it for and whether this proves a "keeper" for any given American household.

The Challenge of Fast Culture

Fast culture gets the lion's share of our attention. It is so much more visible, vivid, obvious and, yes, fashionable. Slow culture plays the country cousin, less interesting, less fashionable. It is punished with neglect. Think of it this way: Fast culture is like all the boats on the surface of the Pacific. We can spot them, number them, track them. Slow culture is everything beneath the surface: less well charted, much less visible. Slow culture is the lesser known half of the CCO competence. But it is equally important.

Fast culture is now the great challenge for the C-suite. Every corporation is like a fishing boat, pitching on high seas, wave after wave crashing through the wheelhouse. Circuit City, recently deceased, failed to take advantage of the "Geek Squad" trend that helped lift competitor Best Buy to greatness. A couple of years before, Best Buy had purchased Musicland, just as kids were using peer-to-peer file-sharing technologies to download their music from the Web. Some responded, others fell. Some advertising agencies grasped what TiVo meant for their business model; others will never catch up.

Fast culture has many origins and the CCO must monitor them all. New cultural developments can come from the worlds of cuisine, sports, music, fashion, moviemaking, websites and new media. Chefs, point guards, engineers, indie bands, Hollywood producers, bloggers, new presidents — any of these can prove a decisive influence. It's a lot to monitor. To make matters trickier still, we can't merely monitor the most famous of these players. The new technologies make it possible for obscure players to punt their influence in from the margin. And all of a sudden, too. (Take a bow, Jimmy Wales, founder of Wikipedia, Craig Newmark, founder of Craigslist, and Arianna Huffington, founder of the *Huffington Post*.)

Fast culture can open up "blue oceans" of opportunity. It can deliver "game-changing" developments. But it also delivers blindside hits. The CCO who can manage fast culture can earn his or her income for the year by lunchtime … every day. ●

Status and Cool

The status convergence and the cool convergence are central for the CCO. They are now foundational parts of our culture, and the great yin and yang of the Western tradition. Both have passed from absolute currency, but they remain active and formative. It's the CCO's job to figure out how they work, and the framework they provide for our understanding of fast and slow culture. Without this framework,

we're chasing trends.

• **Status Culture.** Why do people never live in the living room? They lavish time and money on this room. Then they seal the room away.

The answer is that the living room represents a status message we want to make but don't want to live. And that's the problem. In a room like this, we're obliged to stay "on our best behavior." How very tedious. We would much prefer to be in the kitchen, where we can "just be ourselves."

Almost no one these days tries to pass as a member of a group more exalted than their own. This fiction (or "status counterfeiting") was common in the 1950s, but these days, it does not interest us at all. For most people, self-presentation is like yard work: We do enough of it to keep the place looking respectable. The idea of devoting much of our concern, most of our income and all of our aspiration to great status performances is over, the ideological antique of another age.

• **Cool Culture.** Cool culture is a much newer cultural force than status. It rose as an attack on status. Cool holds status to be an anxious, craven act of conformity, a needy clinging to convention. Cool scorns status as clueless and dopey. It prefers a more thoughtful self-assembly, intelligent choice in music, clothing and attitude that shows one's autonomy and distance from the group. If status is about standing, cool is about standing free.

By the end of the 20th century, the results were in. The winner was obvious. And the victor was … compromise. For all their intense conflict, the avant-garde and the middle class had achieved a glorious rapprochement. They had fought so long and hard, they now were one. The middle-class world was shot through with avant-garde liberties, encompassing a new latitude of personal expression and a new order of creativity. And the avant-garde discovered that certain kinds of social order, self-discipline and instrumentality were, when all was said and done, obligatory. You couldn't live without them.

Both parties won and lost. The status code would never be the same. Its "anchors" had been permanently loosened. Senior white males were losing their hegemony. Social regulations were in steep decline. Cool had come to accept compromises of its own. Some kinds of self-expression were not to be allowed. Cool also had to accept that personal liberty was probably not going to eliminate social differences or social sameness. A hipster regime was not going to happen.

Cool is an outsider's sensibility now completely internalized, built into every individual and our entire culture.

The larger outcome is clear. Neither cultural constellation will ever seize the day and return itself to its once glorious position. For we are a culture with a third term, a restless creativity. If once we were mainstream and avant-garde, now we are a great wilderness, with thousands of little experiments happening everywhere. Point, counterpoint is dead. The struggle between status and cool is over. We are now a culture overflowing with variety and noise. ●

Producers and Consumers

As the Internet became more robust and well distributed, the corporate world decided to put the world of branding online. Coca-Cola and General Motors wanted to be where the consumers were. But what happened there was a revelation. When corporations made traditional ads and sent them down the chute of a TV show, there really was no clear way of telling whether people liked or even watched them. Only sales figures served as a measure — a very distant and loose measure, to be sure. But with the Internet, you could tell. And when the first websites went up, the numbers came in.

There was a stunned silence in the marketing world. No one could quite believe it. The prevailing assumption had been well steeped in self-congratulation. Big corporations believed people loved them. After all, they had used our brand for years, right? We're part of their family, no? They're going to have to come to our website just to say hi? But no one came. No one cared.

Corporate America, welcome to the new consumer. Brands were discovering they could no longer treat this consumer in the old way, as a simpleton to be talked down to, shouted at, lectured, scolded, bamboozled and browbeaten. In the language of the seminal book *The Cluetrain Manifesto*, the consumer culture now had to be more like a conversation between equals.

Marketing vs. Bud Melman

Fan cultures are especially productive of new content. Consider the case of Bud Caddell. He works as a strategist for a New York-based digital think tank called Undercurrent. That's his day job. But Caddell so loves the TV show *Mad Men*, he decided to contribute to it. He invented a character called Bud Melman, a mailroom clerk at Sterling Cooper Advertising in 1962. And he began to Twitter messages ... in character ... from the mailroom ... from 1962. It's all a little confusing, but here it is in short form: a real person, Bud Caddell, has created a fictional person, Bud Melman, whom he has inserted in the fictional world built by a TV show, from

which he, Bud Caddell, really Twitters.

This is a devotional activity. It measures how much Caddell loves the show. And it multiplies the show, adding a character, a narrative stream and viewer interest. But it made the AMC network uncomfortable. AMC believed that Caddell was not adding, but taking. And it asked Caddell to cease and desist. Caddell's reply captures precisely why fan cultures matter:

Fan fiction. Brand hijacking. Copyright misuse. Sheer devotion. Call it what you will, but we call it the blurred line between content creators and content consumers, and it's not going away. We're your biggest fans, your die-hard proponents, and when your show gets cancelled, we'll be among the first to pass around the petition. Talk to us. Befriend us. Engage us. But please, don't treat us like criminals.

Marketing Is Changing

The world of marketing is changing at light speed. And this is another reason to hire a CCO. If the corporation is now going to talk to consumers, instead of shout or lie, it needs to know how to start and sustain the conversation. This means a nuanced knowledge of the consumer, the many different kinds of consumers out there, and the depths and facets of any individual consumer. It needs to proceed with a new order of intelligence.

As Steven Johnson says in *Everything Bad Is Good for You*, "For decades, we've worked under the assumption that mass culture follows a steadily declining path toward lowest-common-denominator standards, presumably because the 'masses' want dumb, simple pleasures and big media companies want to give the masses what they want. But in fact, the exact opposite is happening: The culture is getting more intellectually demanding, not less." To live in this culture, to profit in this new marketplace, a CCO is called for.

This may require a complete replacement of the marketing team. In the meantime, it will require the presence of the CCO, someone who knows the culture well enough to engage with it, to talk about it and to contribute to it. ●

Building a Secret Sneaker Store

I was standing in front of a convenience store, one of those places that looks like it's got three weeks to live, tops. In the window was a bottle of BBQ sauce and a couple rolls of Bounty, sun-bleached and dust-covered.

I opened the door and, sure enough, it was one of those sad little candy and cigarette operations. There was a guy sitting behind a counter, framed by lotto tickets. Two more guys were sitting on a ratty old sofa. They didn't look up.

But behind the Coke machine everything was perfect, clean and well lit. Racks and racks of sneakers. Shoes as far as the eye could see. A secret sneaker sanctum.

The secret sneaker sanctum is the new model of culture. It's how we do things now. Culture streams here in all directions. Behind a Coke machine in Boston.

Dispersive and Convergent

This is a world with lots of ricochet, lots of players, lots of churn. We've got art, commerce, design, professional sports, the steet, journalism, amateur sports, big business, tiny shops and consumers with felt-tip pens. The culture is both dispersive and convergent. It is fast and it is slow. It's about producers acting like consumers and consumers acting like producers. And, as usual, the corporation is the bewildered little brother, trying desperately to keep up.

Change now courses through our world on purpose. Every institution and many individuals are creating novelty as a matter of course. We have to add to this all the change that happens by accident. As change ricochets around the deck like so many cannons, other events are set in motion. Some of these are as cataclysmic as they are unforeseen. Nassim Nicholas Taleb calls these "black swans," events that are, in a sense, unimaginable, until, like a failure of the banking system, they are incontrovertible.

And this is why there has to be a CCO in place. Only a CCO has the weather maps to keep track of all this information. Only a CCO can know those players as groups and as individuals. Only a CCO can manage a market like this. ●

How-To

Noticing has been taken captive by the academic set. Post-modernists celebrate the *flaneur,* a person who strolls, saunters and loafs, noticing the city to which he or she goes. The idea of a flaneur is so prized, it has become a pose. It is played out in cafés, where we see moody young men scribbling in their Moleskin notebooks (the de rigueur brand of the moment) tormented by their genius and the need to commit illumination to paper. The cost of the pose is high. Some flaneurs are so busy posturing that they don't actually notice very much. And they are so very scrupulous about what they notice, they miss a great deal. Much of the urgent work of noticing goes undone.

Morgan Friedman

I much prefer the more sincere act of noticing that comes from a guy like Morgan Friedman. (No, not Morgan Freeman the American film actor) Morgan Friedman is a guy in his 30s who has created new standards for noticing. No posturing for Friedman, no sitting in a café hoping someone will mistake him for a tortured genius.

When Friedman spoke in New York City recently, he suggested that we actually talk to people. In one of his PowerPoint points, he exhorted us to "ask old people what the city was like when they were young.

"Old people are waiting for you. They spend their days on stoops and cafés doing nothing but remembering. They're the ones at the edge between different worlds connecting them together. Ask them what has changed in their everyday life the most since their childhood. Press them for details: 'The ice-man used to bring us ice once a week' or 'My husband couldn't afford my dowry!'"

While the flaneur is swanning about the city in reveries of self-exaltation, the Friedmanesque observer is running the city down, seizing the opportunity it gives for investigation. In the place of the PoMoPo (the postmodern pose), Friedman wants us to chat up an ancient neighbor despite the fact that he or she is badly dressed and, well, old. (The CCO is interested in everything, even the banal and unattractive.)

What a CCO Notices

There are two steps of noticing for the CCO. First, observe. Then, explain. Noticing is a matter of having nimble eyes and the ability to spot the telling or troublesome detail. Naturally, we want to be discreet about it. People do not like to be observed. But that's our job. The thing is not to stare. Keep the gaze moving. Periodically, it is useful to make the gaze go blank, and turn the gaze inward, to simulate distraction, absorption. But even after we have mastered the art of misdirection, someone will spot us.

The second step, explaining, could just as easily be called speculating. You are not looking for an exact rendering of what happened. Work up a rough sketch with no claims to veracity. This isn't inquiry. It's something more casual than an experiment. It's OK to be wrong. The thing is to engage. ●

Phatic Communication

Phatic communication is designed to show people how we feel. It doesn't have much informational content, but does have lots of emotional and social content. This type of communication helps sustain networks, which require a steady stream of small messages which are:

1. I exist.
2. I'm OK.
3. You exist.
4. You're OK.
5. The channel is open.
6. The network exists.
7. The network is active.
8. The network is flowing.

Philistines

You could be forgiven for thinking the case for culture is irresistible and that it's only a matter of time before every C-suite has a CCO. In fact, there are several parties who refuse or distort the idea of culture. I like to think of them as Philistines, the name traditionally given to enemies of culture.

Enemies in the C-Suite

On his retirement in February 2009, Robert Lutz was the vice chairman in charge of product development for General Motors (GM). Lutz was routinely referred to as the "design czar" at GM. And, indeed, it's clear he cared about design. He was responsible for the development of the Buick Enclave and the Chevy Malibu.

The trouble is, Lutz knew relatively little about the culture. What Lutz knew was cars, and what he liked about cars, by all accounts, was speed. A former pilot in the Marine Corps, he never got over his love of fast planes. In later life, he purchased and flew an Aero L-39 ex-Soviet jet fighter. And Lutz loved muscle cars.

But if we know anything about contemporary culture, it is that GM was out of step. The Japanese owned quality and used it to take away the sedan market. The Germans owned engineering and used it to take away the upper end of the boomer car market. Detroit struggled to improve on both counts, but it was clear that it would never catch up to Japanese quality or German luxury.

There was a competitive opportunity remaining, a place where Americans could beat the challengers. The real chance for Detroit was design, to make cars that vibrate with the cultural moment as deeply and profoundly as they had in the 1950s.

What Detroit needed was a man or woman in every

C-suite who understood what was happening in culture. It needed someone who understood what was happening in the minds of boomers (and why they were so deeply wedded to German cars), in youth culture (when the muscle car culture was back with new and strange differences and why cars like the funny, boxy little Scion were flourishing) and in the life, the heart and mind of the soccer mom (for many of whom the minivan felt like the end of everything — especially their youth and their joy). Detroit needed a senior executive who understood the consumer and the American feeling for mobility in every sense of the word.

And what they had was Lutz. He loved cars for his own deeply personal reasons. He loved muscle cars because they went fast. Lutz was worse than average as a "river captain." It's fairly safe to say that Lutz did not ever grasp the muscle car revival (the one portrayed by Hollywood in *The Fast and the Furious*). He must have revelled in the power and the glory and all that sound. Just as surely, he must have been mystified by the fact that it was being produced, in some cases, by tiny, winged Hondas. ●

Conclusion

Chris Hughes helped found Facebook and elect the 44th president of the United States, Barack Obama, both before he was 25 years old. As one of the three founders of Facebook, he had his own responsibilities. While Mark Zuckerberg and Dustin Moskovitz were writing code and building the infrastructure, Hughes was trying to figure out what Facebook was *for*. How would people use it? Hughes had CCO-like abilities to call upon. He emerged as the "official Facebook explainer: part anthropologist, part customer-service rep, part media spokesperson."

Hughes didn't think Facebook users wanted a virtual Rolodex. (This seemed to be the LinkedIn idea.) He believed the big idea here, the killer app, was *sharing content*. People would use Facebook to distribute knowledge and photographs. And he was right, to the tune of 24 million photos a day. Without Hughes acting as unofficial CCO, Facebook might be yet another online experiment. Certainly, if Hughes were still at Facebook, it would never have declared itself the owner of all the content on the network. The idea was to *share* content, not give it to Facebook.

Hughes helped build My.BarackObama.com (MyBO), a website that put enthusiasts in touch with the campaign and the campaign in touch with them. The party fund-raiser wanted to use the network to raise cash. But here, too, Hughes had a better idea. He suggested supporters be deputized as spokespeople. He gave power to supporters on the ground and decentralized the campaign. It was daring, to be sure, but it made the campaign responsive to local conditions.

Hughes served both Facebook and the Obama campaign as a COO. He had a feeling for the moment, for the opportunity, and he drew these from his knowledge of who the "consumer" was and what he or she wanted.

The First-Generation's Responsibility

Acting as first-generation CCO is never easy. The first order of business is humility. Many people in the C-suite will not get what we do. They will think we mean "culture" with a capital C, as in high culture, museums, art and orchestras. Or they will think we mean "corporate culture." It will be up to us to explain what culture is, why it matters, what we do and how we create value.

We want to help someone in the C-suite solve a problem. We want to show how knowing about culture makes them more strategic and more tactical. We want to make ourselves indispensable, the person who really "gets" the problems that human resources (human capital) is wrestling with. We want to be at the right hand of the CEO when he or she looks into the middle future and asks, "OK, what's our best play?"

The corporation has been keeping culture at bay for a very long time. Our job is to manage its new spirit of openness. The best way to do this is to demonstrate the value of what we do, as when we supply critical intelligence, help answer the big question (what business are we in?), see the significance of shifting technologies, read sudden changes in consumer taste and preference, sift the perfect storm of the economy for opportunity and danger and perform pattern recognition now that pattern recognition is the first order of business.

In sum, we are the first generation and we have to act like one. ●

RECOMMENDED READING LIST

If you liked *Chief Culture Officer*, you'll also like:

1. ***Exploiting Chaos* by Jeremy Gutsche.** One of the best trend spotters in North America reveals that periods of uncertainty actually fuel opportunity, reshuffle the deck and change the rules of the game.
2. ***Multipliers* by Liz Wiseman and Greg McKeown.** The authors teach readers how to become multipliers of talent and people and how multiplying can have a resoundingly positive and profitable effect on their organizations.
3. ***Trade-Off* by Kevin Maney.** Maney shows how almost every decision consumers make involves a trade-off between fidelity and convenience — between the products we love and the products we need.

THE SUMMARY IN BRIEF

The ability to lead with coaching is now not a nice-to-have, it is an essential. Leaders today are navigating ever more complexity that comes from every angle. They are leading across five different generations, all of whom expect different forms of leadership. The commercial and organizational landscape is fast moving and unpredictable, yet they are expected to navigate it with a deep duty of care to customers, employees, the environment, and the regulatory framework, to name just a few of the stakeholders, and still make companies sustainable and profitable. How exactly are they supposed to do this?

In ***Coaching Power: Leading With Coaching to Create Individual, Team, and Organizational Outperformance***, Tom Preston and Luciana Núñez teach people that in order to do this, they need to adopt not just a new mindset or set of learned skills—they need to acquire a totally new way of being as leaders. Whether coaching an individual 1:1, a team, or a group of people, leaders have a responsibility not only to be great coaches to help the people they are working with, but also to help them to develop their own coaching skills to become ever better leaders. This book will equip you with the tools, frameworks, mindset, and way of being to do that, for yourself and for the people you lead and influence.

IN THIS EXECUTIVE BOOK SUMMARY:

- Navigate what it means to be a leader.
- Learn the fundamentals of coaching.
- Discover what makes high-performing teams.
- Uncover how to have the right and effective form of communication with team members.

Your Job As A Coach

The job of a coach today is someone who helps take one or more people from where they are to where they want to be, in life, in business, in their careers, or even in their level of happiness.

Coaching Is a Key Leadership Skill for the Future

The skills that the future will demand of leaders are much more attuned with some of the most fundamental coaching skills. These are: adaptability and flexibility, emotional intelligence, collaboration and team building, visionary leadership, and cultural competence.

Fundamentals First: Leadership in Combination with Coaching

The Fundamentals of Leading with Coaching

There are many views on what constitutes good leadership, so look at leadership through the lens of leadership in combination with coaching. These are defining success, involving others, staying invested, and avoiding the common pitfalls.

Anatomy of a Good Leader

Five characteristics that the best leaders have in common: ability to influence others, integrity, empathy, communication skills, and resilience.

What People Want from Work

Purpose and Authenticity: Leaders need to be able to honestly articulate the purpose of what an organization does in such a way as to be meaningful to the people who work in the organization and those who they serve.

Remuneration: Remuneration might have a higher weighting for people working in a bank than for those working in a green energy company. Many leaders have fallen into the trap that money is the most important and effective tool to deliver what people want from work.

Sense of Belonging: Most people want to learn, to develop, and to grow, personally and professionally. Teamwork, belonging, good relationships, fairness, and fun are all fairly basic human wants.

Flexibility: Post pandemic, people know that working flexibly is effective and liberating and can be effectively combined with being physically present with others.

Coaching Fundamentals

Listening: The truth is that real listening comes about through deep concentration. It requires people to empty their minds and focus on another person and what they are saying. When people are actively listening they are **CALM—in Curious. Active. Listening. Mode.**

Questioning: Asking good questions-Behind good questions is the supposition that the person being coached has the capacity to find solutions when asked the right questions and are then listened to carefully.

Suggestive questioning-As a leader, it is helpful to share their experience and wisdom.

Forward Momentum: How Coaching Can Take You from Reflection to Action

Forward momentum is essential to coaching, for three reasons:

1. It builds motivation
2. It helps overcome resistance
3. Develops adaptability

Check your biases at the door and beware of projection. Adopt a coaching mindset by having the right attitude and mindset as well as the belief that coaching really works.

The Magic of Storytelling: Emotional Leadership

Tricks from the Best

Great leaders never use a conventional communication structure or presentation structure. They also understand that they need to focus on the attitude or the behaviors needed to achieve success, that nobody champions change unless they fully understand the benefit of the change, and they describe how they will measure success.

The Emotional Leadership Flow

Lay out clearly what SUCCESS looks like. Set clear EXPECTATIONS. Give CONTEXT. Agree what are the BENEFITS. Specify how they will MEASURE success.

Beliefs and How They Influence Leadership Styles

Looking at Core Beliefs

It is only through starting to understand your own life story and how that has influenced your beliefs and values that you can start to coach...

Collaboration vs Competition- leaders who believe in collaboration are naturally adept at being team players, and they lead teams in a way that creates a visible sense of collective cohesion and alignment toward shared goals.

Scarcity vs. Abundance- these beliefs are typically shaped by the culture, values, and reality of a family and later as an individual in society around access to money, opportunities, and resources.

Safety vs. Danger- these beliefs are typically more subtle and nuanced than the previous two areas, and they are often a combination of psychological, emotional, and environmental factors.

How Your Life Story IS Your Life Until Challenged

Beliefs are created in two ways. The first is through something you experienced yourself. The second is a belief that gets transferred to you by someone of influence over you at a certain time.

Deconstructing Early Life Influences

One's early life influences their lives forever—until they audit it and decide, as adults, what they want to retain and what they want to let go. It is only through starting to understand your own life story and how that has influenced your beliefs and values that you can start to coach and help others to understand their beliefs and values and how they may help or hinder them.

Using Intuition as a Coach

In the business world there is often a tendency to value logic and reasoning over intuition. People now know that both are equally important.

Intuition can help build:

Emotional Perception- This is how people are capable of picking up on subtle signs such as body language, tone of voice, and facial expressions.

Empathy- Through intuition, leaders that want to be good coaches can sense the emotions underlying someone's words or actions.

Decision Making- Good coaches that understand intuition can help coaches unpack their decision-making criteria.

Social Skills- It helps individuals gauge the emotional climate of a situation and adapt their behavior accordingly.

One-to-One Coaching

Trilogy Questions: The Secret Sauce to Effective Thinking Partnerships

What do I want?

WHAT is going on, what does success look like, what have we done so far, what have we learned.

How will I get it?

HOW follows through with real ease, because a lot of the actions you identified during the previous stage.

Who needs to be involved/When is the outcome expected?

This is all about creating commitment and ownership for next steps in terms of WHO and WHEN.

Beware: "Why" Is a Four-Letter Word in Coaching

Avoid questions that start with "why" because it creates defensiveness and it puts the focus on the past.

The Art of Self-Determination: Deciding on My Way of Being

Beware the Overuse of Humility: As a coach, use authentic praise when it is due as a way to balance someone's humility with their confidence.

Over to You, Coach: People all know that the words they use

with other people matter, yet they rarely audit the words they use on themselves to check whether they are empowering and enabling or an extremely subtle form of self-sabotage.

The Power of Visualization

The Business of Sport: See It, Feel It

Sports coaches train athletes to visualize everything they do before they do it. They can use the same techniques in their day-to-day lives and their work.

Visualizing for Public Speaking: How to Tame Your Performance Anxiety

You can really help people overcome their fears with some good presentation coaching that uses visualization as a core tool. Follow these steps:

Step One: Content- Keep in mind what your audience wants to know, how you want them to respond to the presentation, and how you want them to feel about it.

Step Two: Practice, Practice- Once the script is written, it needs to be practiced over and over again.

Step Three: Visualize- Encourage the presenter to visualize the audience, to visualize their own confidence in their delivery, and to picture the audience showing their attention.

The Importance of Values in Leadership and Coaching

When it comes to coaching, values are of deep importance because a good coach needs to adapt their style and approach to what's important to their client.

Direction: Values provide a moral compass that helps individuals navigate life's challenges and make decisions consistent with their beliefs and principles.

Identity: Values define who individuals are and what they stand for, shaping their self-concept, purpose, and worldview.

Motivation: Values influence motivation and behavior by determining what individuals consider meaningful and worthwhile pursuits.

Personal Branding: Crafting Your Authentic Personal Brand

Having clarity on your personal leadership brand will help you make more meaningful connections with others by being your most authentic self, it will help you amplify your impact by focusing on what matters most to you, and it will help you pave the way to better career choices by defining what you want and what you bring as a leader.

Coaching Leaders to Develop Their Personal Brand Manifesto

Do: Take the time to get to know them, help them connect their values to their achievements, challenge them to be bold and make choices that represent what really matters to them, and encourage them to share with people they know and trust.

Don't: Worry about sounding "proper" or "polished", take shortcuts, and forget about connecting their achievements with the impact that was created in other people and the broader environment.

Redefining Impostor Syndrome

Impostor syndrome refers to a pattern of beliefs where an individual doubts their accomplishments and has a persistent fear of being exposed as a "fraud". When you coach people, eventually the topic of impostor syndrome will come up, and this perspective is that coaching is actually a great vehicle to turn it onto its head.

How do you do that? Acknowledge it. Listen to it. Provide evidence of the contrary. Make a plan and act accordingly.

The regular practice of channeling your self-doubts into fuel for self-improvement will help you:

Embrace Challenges, cultivate persistence, learn from feedback, adapt strategies, and celebrate progress.

The Gray Zones: Coaching, Consulting, Mentoring, and Advice

Coaching is a structured process in which the coach guides a client through a series of questions, and the client finds their own authentic answers.

Mentoring is usually a relationship between someone more experienced and someone less experienced, where the more senior person openly shares knowledge often from a similar career path.

Consulting is a profession in which an expert is engaged in

High-performing coaching teams fully take and accept accountability and ownership for actions that need to be implemented.

helping a client solve complex problems and challenges for which the consultant provides specialized knowledge.

Advising is typically a one-off action, and it can take place in a variety of formats: from peer advice from colleagues or friends in a specific situation, to a mentor providing perspective.

Coaching Teams

Common Traits of High-Performing Teams

- They share a clear vision of collective success.
- They actively foster trust as a performance enabler.
- They are courageous, while remaining respectful.
- They are aligned and act as one.
- They fully take and accept accountability and ownership for actions that need to be implemented.
- They have shared and codified behaviors that support their definition of collective success.

Coaching Your Team

Laying Down the Foundations- the whole team will get behind the importance of "soft" topics that are so important to their ability to deliver on the hard outcomes that will be required of them.

Determining the Team's Strategic Priorities- Once you have laid the foundations with the team, you can then move into working on the future-driven strategic house.

Strategic Thinking

Building Your Strategic House

The Roof of the House: Team Collective Success => The What: This is the purpose of the team within the business.

The Pillars of the Strategic House => The How: Once your vision and goals are established, it's key to get into execution.

Aligning the Main Goals, Key Initiatives, and Capabilities

- Main goal: What does success look like for this strategic pillar?
- Key initiatives: What are the three to five core drivers and deliverables that will get you there?
- Capabilities: What are the mission-critical organizational capabilities that will enable your team and organization to deliver these goals and initiatives?

Stakeholder Influencing

Developing a Stakeholder Map

Hierarchical Stakeholders- Stakeholders above, in differing levels of seniority, those equal to, those below, also in different levels of seniority.

Enterprise-Wide Stakeholders- People or teams across an organization who have any form of interdependency with a team or individual.

Career Influence Stakeholders- Who can influence promotions or who can put people at risk of redundancy.

Client and Target Client Stakeholders- Quite well thought out at the time of the year when budgets are prepared.

Partner and Supplier Stakeholders- For some organizations external stakeholders can be as important to engage with as internal.

Crisis Stakeholder Mapping- Time to think through all those who may be touched by a crisis.

Life Stakeholders- It is also worth thinking about those beyond work that matter to an individual.

The Power of Safe Feedback

Courageous Conversations

Check Your Intent: Really investigate whether the intent is to help, enable, and open them up to possibility.

One-to-One Courageous Conversations: Start by telling

someone what they are really good at. Move onto what you think that they would benefit from doing more of then what you think that they would benefit from by doing less of. Finally, think of anything that they should start doing that they are not doing and what they should stop doing that is unhelpful.

Courageous Conversations in Team Settings: Give the teams unfinished sentences to facilitate their individual one-to-one conversations.

Coaching for Empowerment

Practicing Empowerment: Empowerment Is Not a One Size Fits All Approach: Good leaders know how to do gradual empowerment, adapting the ask and the task to the person and the context, based on their skill and will.

Structuring an Empowerment Conversation:

Step 1: What Does Success Look Like?

Step 2: What Do You Need from Me, and What Do I Need from You?

Step 3: What and Who Do You Need to Know to Be Successful?

Step 4: What's in it for You and Us?

Step 5: How Will We Measure Success?

Great Team Meetings in Any Environment

Here are a few best practices that can help you create an edge to your meetings:

- Be prepared
- Invite the right people
- Focus on co-creation, discussions, decisions, and problem-solving
- Take the time to check in and set the tone
- Make sure the WHAT is clear
- Give a voice to everyone
- Practice C.A.L.M. active listening
- Empower your team
- Gather live feedback
- Follow through

When to Get the Pros In: Hiring External Executive Coaches

External 1:1 Executive Coaching: To Have or Not to Have: Overall, it is recommended for leaders to consider engaging with an external Executive Coach as they near the top leadership levels in their organization.

External Team Coaching: To Do or Not to Do: Generally, for senior or newly constituted teams it is well worth exploring external team coaches that can then be paired with the leaders adopting a coaching leadership style day-to-day.

Keep It in the Family: Ultra High Net Worth Family Coaching: The one time it is suggested only considering the use of an external Executive Coach is for the purpose of coaching Ultra High Net Worth (UHNW) families and within their operating businesses.

Want to Build a Coaching Culture?

Preparation

Picking a few focus points that perhaps are not yet fully formed ways of working that would greatly improve the performance and happiness of an organization is an important place to start.

Formation: The Combination of Training and Practice

In order to instill a coaching culture, there are two phases that need to be formed—coaching skills training and coaching skills practice. Once people are trained in the coaching basics to be adopted, the approach to practice needs to be carefully considered.

A Look into the Future: What Leaders Need to Be Future-Fit

Emotional Intelligence (EI): Emotional intelligence (EI) is the ability to recognize, understand, manage, and influence one's own emotions and the emotions of others.

Digital Literacy and Technological Fluency: Understanding digital tools, data analytics, and AI will be crucial for making informed decisions in a tech-driven world.

Adaptability and Agility: As a leader-coach, you can help your team become more agile and adaptable through: Cultivating a growth mindset, improving decision-making

skills by building practice and muscle, strengthening trust and collaboration in your teams, and encouraging flexibility in their leadership style.

Cultural Competence: Future-fit leaders will need to develop: Self-awareness, openness, curiosity, and humility, knowledge of other cultures, cross-cultural communication skills, and adaptability.

Artificial Intelligence: The Single Most Powerful Force Shaping the Future

The Impact of AI in Business: There are five main areas that are believed will be deeply impacted by AI: Enhanced Decision-Making, Automation and Productivity, Talent Management and Reskilling, Personalization and Customer Experience, and Innovation and New Business Models.

Then What? The Impact of AI in Leadership: Hard skills like data processing will be automated. AI can augment and potentially replace many cognitive aspects of leadership like analyzing data and information.

Soft skills like adaptability will become mission-critical. Leaders will need to be humble about constantly learning from others, open to changing course when needed, able to articulate a clear vision, and deeply engaged with their environment.

The necessities to become an effective leader have developed over time. Recently, evidence supports that leadership will need the skills of coaches to develop and maintain efficient teams. These consist of adaptability and flexibility, emotional intelligence, collaboration and team building, visionary leadership, and cultural competence. People need to be clear on their definition of collective success at any given time, they need to empower people to respond with agility to the solutions they need to find every day, and they need to motivate and engage people while supporting them, providing them with both strategic and emotional leadership in a flexible style that is accessible to the types of people they lead.

Through ***Coaching Power,*** leaders are able to look at themselves and their roles and understand what their title truly means. By learning coaching techniques, people are able to empower their team through various methods and take their leadership to new levels. Furthermore, it helps reassure trust for future generations to thrive in the knowledge that the current issues with leadership are being taken care of today.

Tom Preston has been an Executive Coach for the past 22 years, having founded The Preston Associates, one of the world's leading boutique Executive Coaching firms. Tom has worked with some of the best leaders of commercial organizations across multiple sectors and geographies. Luciana Nunez is an Executive Coach with over 20+ years of international experience as a leader and CEO. Her journey offers her a firsthand understanding on the pressures, challenges, and exhilaration of leading in today's complex business world.

THE SUMMARY IN BRIEF

How many times have you heard someone utter the phrase, "I'm drowning in work"? If you're like most people, it's a frighteningly common occurrence. You're busy and operating at max capacity, yet the flow of incoming work never lets up. You and your team are perpetually overwhelmed and working late nights and weekends become the normal way of operating. It doesn't have to be that way.

In ***Come Up for Air: How Teams Can Leverage Systems and Tools to Stop Drowning in Work,*** author Nick Sonnenberg shares his proven operational efficiency framework that will help you and your team understand how to work together efficiently by knowing when and how to use all of the amazing technology at your disposal. Eliminate thousands of seemingly small inefficiencies at work that add up over time to become major drains on everyone's productivity. It's all possible with the CPR Framework, which helps teams harness the power of new systems and tools to multiply their capabilities, operate efficiently, and embrace the future of work.

IN THIS SUMMARY, YOU WILL LEARN:

- The three domains of the CPR Framework
- How to organize and best use communication at work
- How to implement a four-domain planning process
- Storing resources to protect company knowledge

The CPR Framework

PROBLEM: Most teams are drowning in work because they're using yesterday's methods in today's fast-paced environment. Either they're unaware of modern tools or they lack knowledge around when and how to best use them, which holds them back from streamlining the way they work.

SOLUTION: Aligning as a team on when and how to use each available tool is the best way to remove roadblocks to get work done faster. This alignment can quickly create a more productive, less stressful, and more enjoyable work environment.

The CPR Framework focuses on eliminating the pain points most teams experience by optimizing the three operational areas foundational to every organization: Communication, Planning, and Resources.

Regardless of size or industry, all organizations need to *communicate* (with their team and with external people such as investors, customers, vendors, and partners); *plan* and manage the work that needs to get done; and document all of their proprietary *resources* and knowledge (such as standard operating procedures and processes) to ensure that the business continues to run like a well-oiled machine.

Efficiency in all three of these domains can be boosted with the use of tools. If teams don't know how to use the right tools, in the right ways at the right time, they'll be left drowning in work. Digital tools used in the right ways at the right times allows teams to come up for air. The overarching principle is that knowing when and how to use each type of tool is far more important than the tools themselves.

There are many highly functional tools within each of these categories that effectively do the same thing. The problem is that people are not using them correctly and teams are not aligned on when and how to use each. *This is the primary problem that the CPR Framework solves*.

Defining the tools within the CPR Framework

- Email Tools: used only for communication with people *outside of your organization*
- Internal Communication Tools: used for *communication internally* with team, not managing work (Slack, Microsoft Teams, etc)
- Work Management Tools: *used for getting work done* (Asana, ClickUp, Monday.com, Jira, etc)
- Knowledge Base Tools: used to store information and answers the questions: *Who, What, Where, When, and/or Why?* (Coda, SharePoint, Notion, Confluence, etc)
- Process Management Tools: used to document and optimize recurring processes within your organization, answering the question: *How?* (Process Street, Pipefy, SweetProcess, etc)

These foundational elements are crucial for anyone looking to embrace and implement the CPR Framework.

Part 1: Communication

Today, the value of communication networks is almost incomprehensible. But as technology increases, the number of interactions increases exponentially. This increases the value of the network, but it also creates a whole lot of noise and complexity.

We live at a time where it has never been easier, quicker, or cheaper to communicate with someone anywhere in the world whether that's via an email, text message, phone call, WhatsApp message, Zoom meeting, social media comment, or anything else. The problem is that as the number of interactions increases exponentially, *so does the time required to process them*. But technology itself is not the problem. The problem is that we're using it wrong. *And we have been for decades*. That ends now.

Principles of Efficient Communication

PROBLEM: With so many communication methods available, the modern workplace has become distracting and overwhelming. Messages can be hard to find or go unnoticed, affecting culture and making it difficult to move work along.

SOLUTION: By aligning when to use each type of communication method available to them, teams can limit distractions, reduce the Scavenger Hunt, and free up their time to get work done without all the headaches.

Teams often fail to understand the importance of organizing communication, and this is how the Scavenger Hunt starts. In the moment, we optimize the speed of transfer of information and go for the path of least resistance. But unfortunately, the few seconds saved in the short term end up costing us in the long term.

When you need to find a past message, you're now wondering if it was sent in an email, on Slack, or on a sticky note someone placed on your desk. You need a system for

An obvious productivity hack is to rely on asynchronous communication as much as possible whenever appropriate.

organizing communications at work.

Most organizations are set up in a "push" communication environment, where information is pushed out to you nonstop as a result of optimizing solely for speed. The barrage of incoming information is a distraction that takes teams out of their flow states and away from their most important work, creating one of the largest time sucks seen in companies.

Instead, you and your team need to be able to "pull" the information you need when you need it. When done correctly, you'll still be able to get information sent and off your plate, but it won't cause an immediate distraction to the person you're communicating with. This limits distractions and allows everyone to take back control of their workflow and decide when to communicate and when to focus on work.

A "pull" environment leverages the notion that some times of the day are more valuable than others. Peak times vary from person to person and each individual should focus on their most important work when their brains are at full horsepower. The benefits extend by aligning on when and how to best use asynchronous communication.

An obvious productivity hack is to rely on asynchronous communication as much as possible whenever appropriate. This allows you to reduce distractions, optimize time, and provide a way to easily retrieve information. Asynchronous communication can easily be misinterpreted or misunderstood.

If the communication is straightforward and simple, conducting it asynchronously is a win for everyone involved. But when it's not, it can cause further problems down the line, making it less efficient in the end.

Communication that requires tonality, context, or a personal touch should be conducted synchronously, in real time. Here are a few quick examples of situations when synchronous communication is typically better in a team environment:

- Providing lengthy feedback
- Brainstorming
- Situations that involve many questions or back-and-forth conversations
- Anytime you need to make sure everyone is on the same page
- Sensitive conversations like promotions or terminations

External vs Internal Communication

External communication is when you're communicating with anyone outside your organization, like a partner, vendor, agency, client, or potential new hire. Internal communication is, of course, when you're communicating with people inside your organization.

Separating these two types of communication into the right tool for the right job is crucial for both efficient communication and the retrieval of information. The rule is that email should be used for external communication only, while internal communication tools like Slack and Microsoft Teams should be used for internal communication. This separation is typically the fastest way to alleviate the Scavenger Hunt in most organizations.

Inbox Zero

We've already established that email should be the default method for external communication. But for all the amazing value email provides us, it is one of the most dreaded tools in the modern marketplace. There's an important concept that everyone must understand if they want to regain control of their inbox. Forget everything you've ever heard about email and replace it with this simple definition:

Email is just an external to-do list that others can add to.

Without the right restraints in place, other people can control your time through email. Inbox Zero is a method for managing your inbox that allows you to quickly and easily deal with every email that comes to your inbox.

Getting to Inbox Zero for the first time involves three key steps.

1. Cut out the noise: Use filtering options in your setting to divert unimportant emails from getting to your inbox in the first place.

2. Rip the band-aid off: This involves selecting all emails in your inbox that are older than thirty days and archiving them. By archiving them, they are not gone forever…you'll still be able to access them by using the search function.

3. The R.A.D. System: This is what you'll be using on a daily basis to maintain Inbox Zero. R.A.D. stands for Reply, Archive, or Defer, which are the three actions you can take when an email comes to your inbox.

- Reply: If it requires a reply, reply to it and then archive it. That email has been dealt with and no longer needs to be sitting in your inbox.
- Archive: If you've already responded or they don't warrant a response, archive them.
- Defer: If an email is not relevant now or you don't have time to deal with it immediately, snooze it to a time when you will be more available.

The goal is to always reply, archive, or defer until there is nothing left, or until just a few actionable emails remain, which you will deal with in the near future.

Part 2: Planning

Projects, whether you realize it or not, are a fundamental part of nearly all our lives. They create value out of thin air and make up a significant portion of our economy. But there's a problem. The unfortunate reality is that around 70 percent of projects in the workplace fail.

This happens because most organizations don't have a framework for deciding which ones to focus on and how to work through them in the most efficient and effective ways. There are four components that culminate in a planning framework that is flexible, efficient, and applicable to nearly any industry.

Efficient Meetings

PROBLEM: More often than not, meetings are ineffective, and, at times, completely unnecessary. They're one of the largest sources of inefficiency in organizations, preventing teams from getting their actual work done.

SOLUTION: The cost, frequency, and length of meetings can be reduced through simple techniques like asynchronous communication, agendas, prework, and more. The result is more time for important work and less time spent in unnecessary, unproductive meetings.

The biggest tip regarding meetings is to simply eliminate them. People tend to hop on a call or schedule a meeting every time a minor hiccup occurs and it needs to stop.

There are two ways that can happen:

- Deleting it or never scheduling it in the first place
- Conducting it asynchronously

The first is self-explanatory. The second, however, can be done in a variety of ways. You can cover what needs to be said in a few messages with your internal communication tool. Or maybe it can be covered with a task in your work management tool. The other way is to use video or audio recordings to hold what is effectively an asynchronous meeting.

If a meeting needs to be held, to brainstorm, solve complex problems, deal with sensitive issues, or build culture and rapport with the team, there are strategies you can use to make it shorter, more cost effective, and less painful:

- Keep it short
- Account for breaks between meetings
- Audit the attendees, considering who truly needs to be there
- Assign pre work to get everyone prepared
- Avoid round robin reporting
- Use an agenda
- Assign a moderator and a note taker
- Organize action items
- Track decisions made in the meeting

Making meetings more efficient is one of the quickest wins you can implement. The next components will focus on how to set up your work management tool in the best way possible, which is crucial for team productivity.

Principles of Efficient Work Management

PROBLEM: The information required to move work forward is often spread across multiple tools and places, which is inefficient and frustrating.

SOLUTION: Organizing all work-related information in one purpose-built tool gives everyone access to what they need to get work done, provides unparalleled visibility and transparency, and seamlessly organizes all the moving parts involved in tasks and projects.

Most knowledge workers juggle so many different re-

Most people don't know their true bandwidth because they've never taken into account how much time they spend in meetings and other activities within their role.

sponsibilities from day to day that it can be difficult to remember everything you're supposed to do and all the commitments you've made to your fellow team members. And when everyone has their own way of organizing their work, it only makes it more difficult.

Work management tools are key to facilitate all daily work, manage projects, and plan long-term initiatives. A work management tool is like a to-do list, but instead of a notepad it's an all-encompassing collaborative to-do list in the cloud for your entire team. When used properly, everyone knows what to work on and when.

At the highest level, a work management tool should be used for anything *actionable*. If you want to know something is going to get done, this is the best place to put it. Once work is in the tool itself, all relevant questions, updates, ideas, and thoughts related to that work should then be added to the relevant task, project, or portfolio within your work management tool.

A work management tool is optimized to retrieve work-related information. Anytime anyone needs to get work done, they can hop into this tool and find everything you need–whether that's a critical attachment or information from a team member's work that will help them move their work along.

As you begin using a work management tool with your team, keep in mind this core principle: if it's related to work that is being done or will be done, it goes in your work management tool. It goes in your work management tool if you:

- Have a question about a task
- Want to delegate something
- Have a status update about your work
- Want to capture the state of something
- Need any action of any kind to be taken
- Want to know that it's going to get done

To keep yourself and your team more productive within a work management tool, there are two things you and your team should be doing on a regular basis:

1. Respond to comments so you unblock your colleagues and tasks move along.
2. Organize your own tasks to stay on top of incoming work and keep your to-do list tidy.

Just by doing this, you and your team will get significant value from your work management tool.

Workloads and Capacities

PROBLEM: Most people don't know their true bandwidth because they've never taken into account how much time they spend in meetings and other activities within their role. This results in unrealistic estimates of how much time it takes to do new work and long hours to get everything done.

SOLUTION: Accounting for time spent in meetings and on administrative tasks in the key to calculating your true bandwidth. Once this calculation is done, people can assign themselves a realistic workload and still ensure the highest-priority work gets done.

Sprint planning is the process you'll use to prioritize everyone's time and ensure that progress is being made on those projects while also allocating the right amount of time for everything else. Simply put, the idea is for a team to agree to complete a certain amount of work within a short period of time called a "sprint." The team will work on what needs to happen to move the project forward and agree to complete the highest priority tasks during the upcoming sprint.

Most people assume that they have forty hours of bandwidth every week, but they don't account for time spent in meetings, admin tasks, recurring work essential to their role, and email. As a result, they bite off more than they can chew and at the end of the week, they haven't even come close to getting everything done and they feel underwater. This is the problem that sprint planning solves and it all revolves around a simple formula:

Bandwidth = Capacity - Admin - Meetings

- Bandwidth: time available for new work
- Capacity: the total time you're expected to work (say,

forty hours per week)

- Admin: time spent on administrative tasks and other responsibilities within your role
- Meetings: time spent in meetings

At the beginning of each sprint, which is typically done weekly, you take your *capacity*, then subtract the time you estimate spending on *admin* and *meetings* during the upcoming sprint. This will leave you with your remaining *bandwidth*, which is the amount of time you can dedicate toward new tasks. By adding an estimated number of hours to your tasks, you can then just assign yourself the highest-priority tasks until you've used all your remaining bandwidth. That way, you've given yourself a reasonable amount of new work to do, ensuring you won't be overloaded.

This might seem like an overly simple process, and it is. *The problem is that no one actually does it!* And it's the primary reason why so many people feel underwater at work. Sprint planning has the potential to drastically improve the way you and your team work from week to week and is perhaps the most effective way for teams to come up for air.

Goals and Planning

PROBLEM: Most organizations don't hit their goals. It's not because they aren't capable but because they don't have a system for aligning on what matters most, measuring their progress, and tying goals to the work needed to achieve them.

SOLUTION: Implementing a goal-setting system that enables a team to align on what matters most, track progress in real time, and clarify what success looks like is the key to making consistent progress toward achieving an organization's long-term mission.

Organizations need to have goals to push themselves forward, but more importantly, they need a plan for how to achieve them without taking the time to think through even the most basic questions surrounding them, like:

- How will we know we've achieved the goal?
- How and where are we going to measure our progress?
- What work needs to get done to achieve the goal?

Implementing a clear strategy for setting and achieving goals is one of the best leverage points in any business. Planning strategies improve both efficiency and effectiveness.

One system that works well is called Objectives and Key Results (OKRs.) It's a collaborative goal-setting framework that empowers teams and individuals to create challenging, ambitious goals with measurable results. OKRs provide clarity, focus, alignment, and accountability.

OKRs consist of two components: an objective and three to five key results. Objectives are large, qualitative goals that are then tied to several key results. Key results are quantitative measures that are used to define the success of the objective they're tied to. Measurability is what defines a key result. That is how you gain clarity on whether or not it has been achieved.

With OKRs, the idea is to visualize where you want to be a year from now and consider what needs to happen from quarter to quarter to feel like you've made meaningful progress. This is then put into practice by creating both annual and quarterly OKRs.

Here is an example:

Objective: Improve Financial Health

Key Result 1: increase profit from $10 to $40 million

Key Result 2: increase revenue from $50 to $100 million

Key Result 3: increase annual recurring revenue from $30 to $80 million

Key Result 4: increase LTV:CAC ratio from 1.5 to 2

This is an annual OKR, and you can see how it would make sense to break it down into four quarterly OKRs to make sure consistent progress is made throughout the year. OKRs serve as your north star.

They provide direction on priority, so that everyone at an organization understands what matters most in the given time frame.

Part 3: Resources

As an organization grows, it accumulates information and assets. How to do certain activities, who does what, policies, files, and documents all accumulate over time. This turns into intellectual property (IP) of the company itself. While you might think of IP only in relation to products and services, *the way people operate and how things work is just as important*. Really, IP includes all of the systems, processes, workflows, and assets it takes to run an organization. This "company knowledge" is a living, breathing part of an organization.

The problem is that company knowledge typically lives in

the minds of the people who work there, not the company itself. When they leave, the knowledge goes with them and can cause some serious problems. The R in CPR is all about setting up a system where that information isn't just floating around in people's brains but is strategically stored within the company itself.

In order to put this into practice, company knowledge must be separated into two categories: static and dynamic. Static knowledge consists of facts and information and consists of things like company vision and mission, core values, PTO policies, health care information, style guides, branding assets, client testimonials, and the like.

Dynamic knowledge is used to facilitate work. Things like how to run payroll, onboard a new hire, update metrics, and such. When documented properly, it allows anyone to complete a process regardless of training or experience.

Separating and documenting these two types of knowledge into a knowledge base and a process management tool is the best way to document a company's intellectual property.

The CPR Framework has the potential to change many lives and businesses. It gives you and your team the gift of time and makes you ready to embrace the future of work.

Nick Sonnenberg is an entrepreneur, WSJ Bestselling Author, Inc. columnist, and guest lecturer at Columbia University. He is the founder and CEO of Leverage, a leading operational efficiency consultancy that helps companies implement the CPR® Business Efficiency Membership, which consistently results in greater output, less stress, happier employees, and the potential to gain an extra full day per week in productivity per person. Nick and his team have worked with organizations of all sizes and across all industries, from high-growth startups to Fortune 10.

Competing in the New World of Work

By Keith Ferrazzi, Kian Gohar, Noel Weyrich

Keith Ferrazzi is the founder and chairman of Ferrazzi Greenlight, a management consulting and coaching company that works to transform many of the largest organizations and governments in the world.

Kian Gohar has coached the leadership teams of dozens of Fortune 500 companies. He is a sought-after public speaker on innovation and has been featured on CNBC, NPR, and Axios.

Noel Weyrich has coauthored and edited more than twenty business leadership books and personal memoirs. He divides his time between Philadelphia and New York.

Time to Redefine Success

Keith Ferrazzi, Kian Gohar, and Noel Weyrich are all part of a business think tank, Ferrazzi Greenlight, that teams up with several businesses across different niches to collaborate and co-create ideas for the "new world of work." This group includes business professionals and leaders across multiple niches and talents. Everything recorded in ***Competing in the New World of Work*** is based on the experimental findings within this group, including tracked percentages and market growth.

In many ways, the 2020 COVID-19 pandemic was the kickoff to the concept of working in new ways. Businesses were forced to pivot and make decisions at a moment's notice, which is proof that we can do better for our work environments and teams. The question becomes: Will we continue to do so or slide back into what we believe is comfortable?

The authors of *Competing in the New World of Work* argue that while all businesses have the capability to rise up to the co-creation needed for our future, many will fall back into the "old normal," becoming outdated, and eventually, cease to exist. This book works through the steps to adopting a radical adaptability mindset, building a resilient team, and focusing on an impactful purpose so businesses can not only exist in the future, but thrive to serve their clients and customers in creative and innovative ways.

Radical Adaptability

Keith and Kian, associates of Ferrazzi Greenlight, say, "Adaptation happens to be the one thing that human beings do better than any other animal on the planet. We're not the biggest, we're not the fastest, and we don't have the sharpest teeth or the strongest claws, yet we are the dominant species on earth, thanks to our extreme and relentless adaptability to change."

The reason why disruption (like the COVID-19 pandemic) has been so painful for businesses is because many leaders have failed to adapt their ways of working to the rapidly changing unique demands. However when we decide to take this disruption as an opportunity instead of a nuisance, businesses can actually thrive in the ever changing environments.

Companies responded with more intense collaboration and

Book Snaps™ is a publication of Soundview Inc. • 225 Wilmington West Chester Pike, #2, Chadds Ford, PA 19317 USA. • © 2022 Soundview, Inc. All rights reserved. Reproduction in whole or part is prohibited • Meghan P. Kozak, Editor-in-Chief • Kylie Waytuck, Graphic Designer • Order #FBR0822A

thorough communication. Team members spoke more freely and directly. Red tape was thrown aside to make way for necessary decision making. Doing so encouraged results to flow faster and better than ever before.

At Ferrazzi Greenlight, they launched what they thought would be a short-term research project, Go Forward to Work (GFTW). However, after recruiting several change agents from large companies who all wanted to change the narrative of day-to-day work, this proved to be a more fruitful project to encourage all businesses to concrete and co-elevate in the future.

Before 2020, many companies ignored the results of this project, falling back to what they knew "worked" because they didn't have the need to push forward otherwise. It wasn't until 2020 when every leader in business realized they had to wake up and pay attention. The future of work is now. It's time to adapt to it or get left behind. It's time to adopt radical adaptability.

"The essence of radical adaptability is that it is predictive, proactive, and progressive, very unlike the typical response to change, which is inherently reactive and conformist." It's both a coping mechanism and a transformational mechanism. It is what will bring the future of work to the now of work and allow businesses to grow with it.

Team Resilience

In order to work with radical adaptability, companies need a resilient team that will work well together, even through the rocky roads of disruption. The first step to building this team is to diversify its members and their roles within.

Most traditional teams lack essential collaborative behaviors that would allow them to become effective top-performing teams. Below are some statistics Ferrazzi Greenlight Research Institute found in these teams:

- 74% of team members avoid conflict by not speaking their minds.
- 72% of team members don't believe the team collaborates on the most important business issues.
- 71% of team members report gossip that deflate morale and obstruct honesty, preventing the team from working together as a single unit.

The vital thing missing from these teams? Inclusion. The most high performing company teams are those that work in a space where team members can show up authentically and offer their knowledge to cocreate solutions to the problems at hand. This creates accountability for each other as well as shared responsibility so the team as a whole can come to a creative solution together. "No one is successful until everyone is successful."

To determine how resilient your team culture is, there is a basic diagnostics test to run every monthly meeting: Is the team reaching all of their performance targets? Are team members able to be honest and open in their dialogue? When faced with challenges, are your team members able to build creative solutions together? Do your team members care for each other? Can they ask for help when they need it? Can they change direction and still maintain their goal? Can team members reflect with both gratitude and generosity? And does your team's mindset assume best intent?

If a team is able to co-elevate and commit to each member's growth through adversity, they become morally contracted to lift each other's wins and help when others are struggling.

So how do leaders support a resilient team to ensure that resilience? Keith Ferrazzi, Kian Gohar, and Noel Weyrich suggest the following tips:

- Frequent positive feedback reinforces collaborative teamwork.
- Share your own challenges to encourage teams to share their own fears and canvass solutions.
- Bring in an outside point of view or hire a coach for frank assessments.
- Listen carefully to your team. Show you care about their ideas and opinions.
- Enforce break times for a better work-life balance.
- Hire team members who will reinforce resilience.

Regardless if your company chooses to move forward with a 100% virtual set up or a hybrid of sorts, virtual and forward thinking work is here to stay. In a virtual scenario, the suggestions above should still take place more frequently and with a co creation and foresight in mind.

Future-Proof Your Business Model

Many (most) companies understand that in order to pivot through a collective trauma like the pandemic, adaptability is necessary. However, the question still remains as to how many businesses will continue to adapt post pandemic, and how many will revert back to the work of yester-year. *Competing in the New World of Work* provides a four-step pattern of business reinvention to advance any business in the future. This methodology is an effective way of leveraging your team's foresight and adaptability.

First, zoom out to envision your industry ten years from now. When doing so, ask yourself two questions: "What will our industry look like in ten years' time? And what kind of company do we need to become to succeed in that future?"

Secondly, identify the technologies that are poised for growth. Technology is constantly changing and updating its purpose, and even in industries that aren't traditionally technologically based, tech can be used to leverage certain systems and functions. You might find that you can offer a new service, a new customer experience, or leverage it for customer data. If you can identify at least two or three technologies that might disrupt your industry in the future, you can use them to your advantage

> **Building your communities will create a defense system for your business if anything else gets disrupted along the way."**

and benefit from them before they explode in popularity.

Next, experiment with zooming in. Look within the next six to twelve months and decide which technologies you could experiment with within that time. Make sure these work toward your zoom out (ten year) vision for the company. The goal here is to provide a proof of concept through experimentation, iteration, and deployment. However, it's short enough to not get in the way of any two or three year plans.

As always, plan to pivot. If the experimentations prove to not coincide with your long term vision, then pivot to a new zoom-in project or experiment. As you do so, you'll learn what works and will help cultivate a growth and learning mindset within your teams.

Lastly, create a communities of enthusiastic customers. Technology has the power to transform whole industries within a short amount of time. Therefore, it's critical to go beyond product, service, and tech, and straight to the consumer. Foster your communities. Understand their needs.

Building your communities will create a defense system for your business if anything else gets disrupted along the way. If you look at any successful business, they have had products that no longer exist, a service no longer needed, and tech that has gone extinct. At any point in time, these things can happen and you'll want a strong set of customer communities that will still be there when it happens, helping you withstand any uncertainty.

Business Purpose vs Mission

Perhaps the most important and profound suggestion the authors of *Competing in the New World of Work* give is to supercharge your purpose.

While a company purpose sounds similar to a company mission, it's very different. A mission is all about the how. How a company serves its customer, how it reaches its customer, how it provides for its customer. However, the purpose is all about the why. Etsy's purpose is to "keep commerce human." Johnson & Johnson's purpose is to "alleviate pain and suffering." Disney's purpose is "to use our imagination to bring happiness to millions"

The importance of having and focusing on purpose has never been more important than now. A purpose is what allows companies to shift from offering one product to another. It also encourages new services to grow into existence. As long as a company is still putting its purpose in the forefront and services its customers to meet that purpose, it can grow and change into whatever its customers need it to be.

This is how companies have withstood their disruptions and survived through decades of shifts and pivots with their strategy no matter how many disruptions they've experienced. "Change is happening so fast that there may be times when purpose is your company's single most reliable point of reference, your home port in a storm."

The New World of Work

In the New World of Work, we need to be conscious about how we are moving forward. Change is fast and we will need to adapt. Companies who choose to build their teams with adaptability in mind will be the businesses that will succeed for decades to come. The idea of "going back to normal" is the past. It's yester-year. It's extinct. And any company who falls back into that "comfort" area will find that it's not comfortable at all. It's a road to failure.

Pivoting may feel like a buzzword, but it's the reality of business of the future. Everything changes, from the teams we choose to have in our companies to the technologies available at our disposal. However, if we choose to keep our purpose in mind, business can continue to succeed as long as it changes to continuously meet that purpose, regardless if it still provides the same product or service.

The COVID-19 pandemic forced companies to pivot, change, and adapt quickly. Businesses cut through red tape. They stopped micromanaging. They build collaborative and diverse teams filled with minds from all areas of the business and outside the business. They encouraged their teams to work together to reach the same goals. And through it all, companies have thrived within these pivots.

As the global pandemic weakens and gets closer to an end, so many leaders in business argue that we need to "go back to normal." However, the old normal is not what today needs. It's also not what tomorrow demands. In order to continue moving forward with companies that will withstand the test of time, we need to continue to pivot and adapt.

Our customers demand it. Our society needs it. Radical adaptability, resilience, and foresight is the way of our future, our new world of work.

THE SUMMARY IN BRIEF

Leaders within the professional association and continuing education industry are facing a turning point. As traditional formats for learning and common pricing models continue to fall, new competitors are streaming into the market and creating learning programs that are faster, cheaper, and poised to make larger companies irrelevant.

Throughout the chapters of ***Competitive Advantage***, Tracy King details the hidden internal and external forces that affect organizations, effective education strategies, the powerful foundations for future strategies, how to gain perspective on existing portfolios, and countless other lessons that leaders in the professional association industry will find absolutely essential.

IN THIS SUMMARY, YOU WILL LEARN:

- How internal and external factors can have unintended consequences within an organization.
- How to identify, build, and demonstrate your organization's educational value.
- How to design powerful learning experiences.
- How to make separate elements of your organization work together to turn strategies into action.

Internal & External Forces

Many associations notice something not working in their learning portfolio and respond with a quick fix we hope will buy us time until we have the resources to dig in deeper and analyze the problem and potential solutions.

But because many programs are managed in siloed teams that don't always collaborate or coordinate, we assume that any issue we identify must originate within the program we know. But when we fail to acknowledge that our programs belong to a larger system of learning we offer to our constituents, our 'quick fix' could trigger a cascading failure. Meanwhile, constituents don't recognize the distinction between elements of your organization—they see a failure in one area as a failure overall.

Quick fixes won't solve pain points like insufficient budgets, struggles when managing emerging technologies, failure to confront market changes, or problems implementing innovative changes within your organization.

Your organization needs to identify the root causes of pain points, whether they're resulting from external factors or internal issues. External factors might include market forces, evolving trends like the freelance economy and generational shifts, and industry forces.

Within each challenge is the seed of a solution—the opportunity to transform challenges into advantages. Individuals and organizations that are interested in real fixes rather than quick bandages will discover that this leads them to their essential first step—identifying a new value proposition.

A New Value Proposition

Simply having a portfolio of learning options is not enough. For many industries, members are interested in a trusted source for earning continuing education credits—but they have more options to consider than ever. Professionals are asking—***Why you, why me, why now, why this?***

By asking yourself these exact questions, you can help identify your own value proposition. Most important is to recognize that adults don't want to just go to programs, they want to grow from programs. For your learning portfolio to truly matter, it must lead them to take action that then leads to improved performance. Your value proposition should be defined, not just vague. It should include ways to help your learners reach measurable goals— earning back an hour of their day, becoming more effective leaders, improving financial processes to mitigate risk, etc.

These aren't topics, they're results. Your learners don't want to know what you're going to discuss, they want to know what behaviors or circumstances they're going to be empowered to change as a result of having completed your course or lesson. This can all be summed up with one word— ***transformation***. Your new value proposition for continuing education is transformation. It deals with how your learning portfolio will help learners transform themselves, their lives, and their organizations.

The most important drivers for developing a profitable and sustainable business around your learning portfolio can be divided into three main segments— strategy, portfolio management, and learning design.

Strategy involves incorporating your organization's overall education objectives, the content domain you're dedicated to delivering on, and your plan for meeting those objectives with your education portfolio. An effective strategy encompasses all of your organization's education programs and seeks to position them correctly in the market.

Portfolio Management is all about building your learning portfolio around efficiencies in content development, deployment, and member experience. This should involve coordinating programs to develop learning pathways and aligning talent within your organization with the member experience you want to deliver consistently.

Finally, ***Learning Design*** addresses the critical drivers required to design transformational learning experiences. Producing transformational learning experiences incorporates the best practices of instructional design, those that are most marketable and impactful.

Education Strategy

Where we're at with our work can heavily influence how we see our overall strategy, much like how viewing a natural landscape from different vantage points can dramatically influence our perception of that landscape. It's vital to coordinate our views from the 'trenches' of day-to-day tasks, slightly more elevated viewpoints that let us glimpse a bit of the past and future, and high-flying vistas where we can see our entire company, industry, and market.

In the 'vista view,' it's vital that you have a comprehensive education strategy for your association. Many associations simply create educational content without developing an overarching strategy that guides their decisions. This leads to inefficiencies,

failures, and poorly executed educational strategies.

Your strategy should be led by the following strategy drivers— market intelligence, strategic objectives, target audience, content priorities, program pricing, technology infrastructure, internal partnerships, external partnerships, resource allocation, and evaluation strategy.

For each of these drivers, you and your organization need to review how you rate yourself. Rate a driver as 'red' if you're not doing this at all, 'yellow' if you've taken a few steps towards accomplishing it but haven't mastered it, and 'green' if you're already gaining momentum and mastery at it.

If you rate your Strategic Objective driver as red or yellow, ask what next steps you'll commit to establishing this critical foundation for your organization. What opportunities for alignment with your strategic objectives do you notice that could produce some quick wins for your association? This is the first step to creating a truly effective education strategy.

Setting Your Strategic Foundation

Failing to develop an education strategy can lead to major ramifications, including lost profits, lost momentum lost interest, technology barriers, missed partnership opportunities, and misused resources. Even companies that are making steps toward developing a strategy make common key mistakes.

The first mistake is choosing objectives that aren't measurable. Ambiguous objectives mean you don't have to deliver any bad news about not measuring up, but it also means you're not really aiming for something specific. That results in actions that lack direction.

Another mistake is a sketchy implementation plan, which makes gaining any real traction very difficult. Lack of alignment is a similar issue. Priorities and resources must align, or your organization will be setting itself up for failure. This can also happen when you assign the wrong talent to implement certain tactics.

Finally, failure to follow through is a major issue that can derail your association's strategy. When change feels challenging, or members of your organization are loudly opposed to a new approach, it can derail your follow-through. Then it's easy to end up on a hamster wheel of sorts where your association only talks about change without ever making change.

But even more important than discussing the potential problems that come from failure to operate with a portfolio perspective, it's vital to understand the potential gains of operating within that perspective.

Portfolio Perspective

Just as creating an education strategy requires focus on key drivers by which you can rate your organization, portfolio management carries its own set of key drivers. These are your business plan (including product-level objectives, target audience, content priorities, program format, user experience expectations, budget, pricing structure, marketing goals, and success metrics), portfolio evaluation plan, program policies, learning environment, content calendar, learning pathways, education technology management, and customer service.

Rate all of these drivers within your organization using the same red, yellow, and green metrics we used earlier. From there, you have everything you need to begin strategically leveraging your learning portfolio.

Don't Feed the Silos

Regardless of all the institutional needs, strategies, curriculum, courses, learning designs, or technologies that make up our organizations, the potential of our associations to create meaningful learning and profitable operations doesn't come from any of them. They come from you— the people that make up your association. Allowing talent to become siloed can lead to major problems, and it's a result of not implementing a portfolio perspective. This can lead to persistent siloes, with teams that have their own agendas and act in their own best interests. These negatively impact organizational culture and the member experience. It can also lead to program competition rather than cooperativeness, creating mini-kingdoms where information is less likely to be shared and that experience turf wars, resource grabs, and lack of trust—all resulting in poor decision-making. You'll also experience piece-meal programs, hidden performance issues, inconsistent policies, and sustainability failure.

If you're in the red zone for any Portfolio Management Drivers, begin your efforts by thinking about the role each program in your portfolio will play to advance your strategic objectives. Then craft your portfolio evaluation plan.

Learning Design

Many associations hope for quality learning to happen by sheer luck, but the ability to ensure learning success by design is within the capability of your organization. When you apply instructional design to your learning opportunities, you create learning that offers the three Ms— mean-

ingful, memorable, and measurable.

Meaningful content is relevant. It solves a problem, increases skills, and is something that learners can use ***right now.*** When that content is truly memorable, presented as an experience rather than just information, it's able to create those meaningful effects rather than being forgotten as soon as learners walk out the door. Finally, great learning is designed to meet measurable objectives, so that learners can evaluate their progress over time.

Learning design drivers that you should use to rate your organization are instructional design, competency development, learning evaluation, design process, transformational learning tools, visual design, and SME development. Use these drivers to help create a qualified pipeline for your industry, help professionals upskill and retool to meet changing demands, amplify their professionalism in your industry, define the competencies that will distinguish high performers, and lead the way to a successful and satisfying career through mastery.

Paper Airplane Potential

If people leave a session or course and do nothing, we have failed. Simply presenting information is like placing a stack of paper on the table and asking people to make a paper airplane. Rather, you should be offering fold-by-fold experiences. You and your learners should prototype paper airplanes together, test how different folds result in different flight arcs, and then debrief. ***How could you use airplanes like this? What modifications might you make? When do you think you'll implement this new airplane-folding methodology within your context of practice?***

To maintain your competitive advantage, become the organization that not only provides paper and folding techniques, but offers pathways to folding mastery. Show the way. Be the way.

Pivot Pain

If the results from making changes within your organization are so essential and, in many cases, so obvious, why do so many associations fail to make those changes? Because change is uncomfortable. Pivoting can hurt, because it pushes us out of the routes we're familiar with and forces us to try something new. That brings risk, and with risk comes doubt.

But feeling uncomfortable or doubtful doesn't mean that a change isn't worthwhile. Both external and internal factors can lead to barriers against change, but only by overcoming these barriers can we master our education strategy, portfolio perspective, and learning design. If you want to beat the market to new and uncharted places, you have to step onto the rocket. And stepping on the rocket requires you and your association to sacrifice the familiar for the truly effective.

Strategy to Action

The way you do business in the continuing education market has been disrupted. Acknowledge and accept this. The way professionals develop their careers and access learning resources has changed. To meet these new conditions, you must disrupt the status quo.

Become the organization that sets its strategic goal sites and aligns resources to meet them— creating a runway to reliable profit. Become the organization that maximizes its entire learning portfolio to meet market needs while raising the bar on team collaboration and efficiencies, initiating practices that produce sustainability.

Become the organization dedicated to learning transformation that's vital to workforce development—driving measurable impact. Begin where you are. You've got this!

As Chief Learning Strategist & CEO of InspirEd, Tracy King leverages her more than 20 years in the industry consulting with organizations on education strategy and learning design. She advises associations on how to grow a reliably profitable and sustainable CE business that transforms learners. Tracy specializes in the intersection of learning science and technology. She's a thought leader, invited speaker, author, and DELP Scholar.

THE SUMMARY IN BRIEF

The speed at which markets evolve today impacts the future of your company and the only way to succeed in this fiercely competitive business landscape is to see it as a battlefield, build your weapons, and play to win.

The book ***Competitive Success: Building Winning Strategies with Corporate War Games*** helps businesses deploy the power of War Game workshops to succeed in today's competitive landscape. The pages within guide us to build data-driven strategies through war games, run competitive and strategic analyses, and ultimately create a detailed plan to make a substantial impact.

Having run over 200 successful war games for top Fortune 500 businesses, author Arjan Singh reveals how war gaming gives companies a solid competitive edge to stay ahead. From running comprehensive competitive analysis to scenario planning to detecting early warning systems in business, he offers readers a clear roadmap for businesses to build sustained resilience.

IN THIS EXECUTIVE BOOK SUMMARY:

- Learn how to build and deploy Corporate War Game workshops in business.
- Discover what it takes to achieve success in today's competitive business landscape.
- The strategy behind running competitive analysis to deliver a significant impact.

Introduction

Sure, in business, the battlefield isn't along a front and the stakes aren't life or death, as it is in war. The battlefield in my war game is the competitive marketplace and the stakes are winning. Money, power, and fame are certainly drivers, but a large part of success is the feeling of satisfaction and self-confidence that results from beating the competition and coming out on top. By war gaming, you open your mind to the fact that anything can happen.

You don't want to find out that your strategies are going to get trumped by the competition and you lose millions of dollars. Winning is the whole premise of doing a war game. This book can help you win. If you want to win, keep reading.

Chapter 1: What Is a War Game?

War games are a powerful business tool that can accomplish a lot in a relatively short time, but they need to be aligned to key business challenges to be valuable. War games for business purposes are enlightening and engaging analytical exercises that can lead to truly creative solutions. War games are structured role-playing workshops used to generate insights to help develop and refine strategy. A variety of wargaming workshops are designed to simulate different future competitive environments, but we will focus on the three main types in this book:

- Tactical War Game: How to compete in a specific market against known competitors.
- Operational War Game: Where to compete in a changing market with an uncertain set of competitors.
- Strategic War Game: How the market is likely to evolve with uncertainty around market structure and competitors.
- War games have four main benefits in a business environment because they:
- Create an environment where participants can openly discuss their company's assumptions around the competitive environment and align with their own assumptions.
- Help engage various stakeholders in the decision-making process to collectively achieve buy-in, identify gaps in market knowledge and create a defensible business strategy.
- Highlight the assumptions that market players have about the competition, the market, and themselves, as well as highlight the key differences between the company's and others' assumptions.
- Help assess and anticipate potential changes in markets so that a company can predict what other key players are likely to do.

Chapter 2: Building Winning Strategies

Your market is your war. Your winning aspiration is a goal statement that briefly describes how you'll win your war. It includes your organization's desire, future state, business model, and market. The definition of winning is different for every company. It's based on each company's realities, structure, resources, culture, and history. Once you define your market in the broadest terms possible, you can set your winning aspiration for the war. Winning can be two things:

- It can be aspirational, i.e., where you want to end up. If you're not there, then how do you get there? Are you doing the right kind of activities to bridge the gap between where you are right now and where your aspirations lie?
- Or it could be positional, i.e., holding your top spot. If you're already winning, then how do you continue to maintain your leadership in this space, and continue to be successful?

Calculate your planning horizon. Your planning horizon is how long you're going to engage in the war, or just the next battle. Growth is a huge driver for companies. But there's a big difference between organic and exponential growth. Organic growth can be said as follows: Let's just book the next deal, then the next, and the next, and then we'll kind of go from there. But if you want exponential growth and to have a deliberate vision for the future, then determining your planning horizons (short-and long-term) will help you.

Chapter 3: Core Attributes for Competitive Success

Over my years of consulting, I've noticed a pattern with successful companies that have the right winning characteristics. I call these the ten attributes for competitive success, which you can apply to any industry. These ten characteristics in their entirety make the difference between a mediocre company and a profitable, healthy enterprise. War gaming will help any company or individual attain all of these:

- Embracing and Learning from Failure.

Just because leadership is thinking about the marketplace in a particular way doesn't mean that the competition is thinking of it that way, too.

- Making Quicker Decisions and Fast Execution.
- Thinking Globally, Acting Locally.
- Defining Your Business and Setting Goals.
- Offering a Unique Value Proposition.
- Banking On A Solid Reputation and Ethics.
- Focusing On Customers.
- Learning From the Competition.
- Maximizing Skill Sets and Playing As a Team.
- Innovating to Win.

Chapter 4: How is War Gaming Better Than Traditional Planning?

In war gaming, you start with divergent thinking, create choices, and ultimately you converge. This allows for creative thinking and speculation into all the possibilities. Traditional planning is a very linear process to go through. It doesn't encourage diversity of thought and exploration of all the different opportunities that exist. With traditional planning, leadership starts with assumptions baked in (called historical context) and starts planning as if the status quo will carry on, undisrupted.

Just because leadership is thinking about the marketplace in a particular way doesn't mean that the competition is thinking of it that way, too. Since there is no safe forum for challenging assumptions in traditional planning, leadership ends up being carried away by groupthink. Yet they confirm one another's bias and carry on.

War gaming helps leadership to really challenge confirmation bias. Are you asking divergent questions in the right way, with the aim of narrowing down your choices, or are your choices already narrow? And is your perspective from the outside-in, as if from the competition, or is this just internal thinking, based on the status quo? Are you ready to plan your war game? In the short next chapter, I will walk you through the process of narrowing down your war game to a single core issue.

Chapter 5: How Do I Get Started?

The war game process can be divided into 3 distinct phases: planning, conducting, and reporting. The pre-gaming phase defines the objectives for the game, identifies the companies that will be represented, prepares a Briefing Book, selects and invites attendees, and determines the logistics for the war game.

A war game can be conducted over a day or more depending on objectives and the time available. It can be in person or virtual. War games are concluded with the delivery of a final report, or your Playbook a few days after the event. The Playbook outlines the details of the war game, the insights generated, and the recommendations from the event. This report is circulated to key stakeholders and is used as a guiding document for implementing the proposed actions in business planning that came out of the war game. Each war game must be customized depending on the issues being addressed and the desired outcomes, the companies being represented, and its final schedule.

The first step in planning a war game is to define the key business issues to address and the core objectives of the game. You can start this process by engaging with stakeholders from different departments to formulate the issues to consider and to determine the level of current understanding of these issues.

Your issues can be either long-term/strategic or short-term/tactical. Strategic issues involve changes in your competitive environment, such as regulatory or marketplace. If there is a particular competitor that's eating your lunch by winning a lot of different contracts, or you're planning an upcoming product launch, or anticipate a loss of exclusivity, this is an opportunity to tactically war game from a short-term perspective.

Chapter 6: Identifying Your War Game Objectives

Now we will begin creating your Briefing Book, which you'll use for your war game, distributing copies to each of your teams. The Briefing Book contains information that you'll input by working through each chapter up to chapter 10. At

that point, we get into the war game itself.

War gaming gives insight into three foundational issues:

- How to win (tactical war gaming): When you have a strategy but need to test it.
- Where to play (operational war gaming): When you can see a change on the horizon but aren't sure how to respond.
- What the game will be (strategic war gaming): When you have a lot of competitors, disruptions are coming, and you don't know what your operating environment's going to look.

To know if you're ready, you need to ask yourself these four questions:

- How confident are you in your current strategy? If you feel that your company lacks the confidence to take risks and innovate, and you really want to have a culture where it's OK to make mistakes, then make your mistakes and try things out in a war game environment.
- Can you think strategically and make realistic assumptions? Those two skills are complementary. For strategy, you need to be able to think from a 30,000-foot point of view, or more holistically. This helps you make assumptions based on the overall reality of your industry.
- Can you challenge your assumptions? Can you think strategically and challenge your company's assumptions?
- Are you prepared for change? You also need to be prepared to make changes to your plan based on the results of the simulation.

Chapter 7: Assessing The Field of Battle

To determine where your next battle will occur, you can look at two kinds of risks: event risk and trend risk. Event risks are black-swan events, like a global pandemic or an environmental disaster. These are the uncertainties. Trend risk is based upon the knowns or the events that are happening to an industry, in general, e.g., the US population is aging, and the demographics are changing. For this type of war game, you stress test your strategy by war gaming it.

Map your battlefield. The key drivers are what's pushing the trends along in any given industry. It's not enough to know what the trends are - you also need to know what is behind the trends so you can anticipate different solutions. What are the key drivers of your industry? Which one do you want to focus on right now? Where do you want to do your battle? Because you cannot fight every battle all at once. You don't have the resources. Check inventory before the battle. Having financial resources is one thing, but having the right skill sets is another. Finally, weigh the odds. To know what's at stake on your battlefield, you must look deeper than the surface.

Chapter 8: Understanding the Key Competitors

Understanding your competitors and their perspectives is key to advancing your business forward. Start with sizing up your existing competition. Your competitor's toolkit is their capabilities, weaknesses, and assumptions. What does the competition think about the market? What do they think about themselves? And most importantly, what do they think about your company? The best strategy for any battle is to respect your competition, even if they're small because winning isn't about having the most resources; it's about resourcefulness.

Uncover new competitors and outside forces and identify your current and prospective customers. Finally, take an offensive stance. You don't want to be in a position where you're waiting for things to happen in the market, and then you'll act. This is a reactive or defensive strategy. From an offensive perspective, if you proactively identify actions that your competition is likely to take, you can preemptively strike.

Chapter 9: Analyzing Previous Battles

It's important to examine past battles with your competition and make intentional, strategic choices for the future.

Strategy is done in two different parts: formulation, which is the future, goal-oriented thinking about where you want to be in the future, and execution, which is how you're going to get there. A disconnect between formulation and execution indicates that all you really have are ideas. A lot of companies fail because of this, especially startups.

When you look at past battles, analyzing and reflecting, avoid making snap decisions about what went wrong or right. You might have tried something six years ago and it didn't work out, but that doesn't mean that the same would necessarily hold true today. Laying out the assumptions and ask: What really happened? Why did it happen? What were

When you look at past battles, analyzing and reflecting, avoid making snap decisions about what went wrong or right.

the conditions that enabled that situation and are things different right now?

Document your organizational memory. When you regularly war game for your strategic planning, you have Playbooks that you can refer to. The key is to reflect and war game new strategies as often as possible.

Reflect on your value proposition and your customers. For external reflection, ask yourself: In our previous battles, who connected with our customers more effectively? Could we have helped our customers gain satisfaction or a solution better than the competition? For internal reflection, ask yourself: If we failed our customer in some way, or proved successful, was this due to internal operations rather than comparing ourselves to the competition? Maybe your customer service lines are horrible, there was no follow-through, or you didn't have the right answer. Be intentional in your reflection and reflect on what other companies did as well.

Chapter 10: Gathering Intelligence

Competitive intelligence is where you look behind the surface, or under the competition's skin to understand the bones of their operation. Remember, with competitive intelligence, you must dig deeper.

- The first question you ask your team is, what are we interested in, whether it's an established competitor, emerging competitors, or other entities? Is our interest longer or shorter term?
- The second question you ask is the following: What do we need to know about them? What information is crucial?
- To legally and ethically gather competitive intelligence, rely on:
- Open sources. This is where search engines, like Google, are a great starting point. But you don't stop there at the easily available information.
- Primary research. You need to think outside the box, here. Follow the flow of information. Put the story together with multiple data sets. The most valuable, and the most complicated part.

There are two forms of competitive intelligence: Tactical and Strategic. Tactical intelligence answers questions such as: What are we selling? Whom are we selling it to? How is the competition going to attack us? How do we compete today? What's the competition's product? What's their price? How are they promoting it? What's their distribution? It's about here-and-now business for the short term. Sales and marketing rely heavily on tactical intelligence.

Strategic intelligence is much more future-oriented and answers questions such as: What will the macro environment look like, and how do we prepare for the future? What are the core dynamics of the industry? How is the industry changing? How is the operating environment changing? Which type of intelligence you gather depends on your company's time horizon.

This is the difference between interesting and actionable intelligence. Determining whether intelligence is just interesting or actionable is where the filtration comes in. Private companies generally release a lot less information, but you can still find clues in press releases, trade shows they attend, podcasts, blogs, social media, and other marketing copy. From there, you can gain an understanding of how they're thinking about the market. For private and public companies, you can also try patent analysis, which you can look up on the United States Patent and Trade Office (USPTO) website or find global patents in your search. Finally, put the pieces together by using multiple data sets.

Chapter 11: Assessing Troop Strength

At this point, you're about to move into your war game and will need to think about what resources you have at your disposal. Resources are straightforward: capital, capabilities, infrastructure, or a combination of these three. The softer part of your resources is fundamental to your war game: Do you have the morale to execute your strategy?

Your capabilities are the toolkit of your organization. Your

toolkit differentiates you in terms of how you use the same raw materials your competition has access to in novel ways. Here are a few ways to look at capabilities, but to get you thinking:

- SWOT analysis: strengths, weaknesses, opportunities, and threats.
- Four corners analysis: What is a company currently capable of, what are they currently thinking and doing, and what are they likely to do in the
- Value chain analysis: How your company creates value and understanding the core components of that.
- Business model canvas: What your core value proposition is, how you go to market, connect with customers, and run operations in terms of your systems and processes.

Break your resources down into five categories:

- Financial (how much capital on hand)
- Physical (retail locations, warehouses, and equipment)
- Intellectual (patents and trademarks)
- Human (troops, morale, and skill sets)
- Digital (technology, data, and underlying infrastructure)

Now, line up and survey your troops: Is your team capable or incapable of doing this war game? Going into any battle, you're going to have weaknesses and strengths. Your challenge is to figure out how this informs your strategy. Get a feel for overall company morale. As you organize your teams, you want to balance negative personalities with more positive types.

Now it's time to organize your key stakeholders into teams for your war game, considering morale and skill sets. You will make sure your teams are cross-functional, with balanced personalities as well as balanced seniority. This ensures that there's diversity of thought and that everyone contributes. Every team should be comprised of the following roles:

- Team Lead. The team leader should not be someone who's in a leadership position in the company, because they tend to dominate the conversations.
- Notetaker. This person is the team player responsible for writing down the ideas that come up in the breakouts.
- Timekeeper. You need one within each team, to stay on track during breakouts.
- Team Presenter. For each round, the teams should appoint a different person to present their strategies to the other teams and judges, to give everyone a chance.

Now that your Briefing Book is done, you've taken stock of your resources, and thoughtfully organized your teams, it's time to start creating your Scenario Book by ideating scenarios and tactics for each round of your war game. You can find it in the appendix for this chapter's template or scan the QR.

Chapter 12: Deciding On Scenarios and Tactics

Scenarios explore a range of different future negative and positive options in terms of which way the industry, the marketplace, and the competitive environment could go. Best-case scenarios, of course, get a lot less attention, because nobody questions good news, and worst-case scenarios put everyone into defensive mode.

When most corporations ideate scenarios, everyone automatically thinks about the world ending. But sometimes scenarios could mean that the world is giving you a huge opportunity. The question for you is as follows: Are you and your company ready to capitalize on that?

Scenario planning fits into all three types of war games, but the types of scenarios that you would use differ for each:

- Tactical short-term scenarios help you figure out how to win, more specifically what will impede your ability to execute as you go to market.
- Operational short-to mid-term scenarios tend to be around more issues like your competition and your competitive environment.
- Strategic long-term scenarios are a future look at macroeconomic factors that will affect your competitive environment farther down the line.

For the purposes of war gaming, you go through this twenty-minute, three-step process and quickly build scenarios:

- Step 1: After a few rounds of strategy ask your teams: Based on the external insights that you've generated so far, what would be the most disruptive event in this marketplace? What would be disruptive to our company? What would be disruptive to the other teams? What would be disruptive to key stakeholders in that environment?
- Step 2: Give everyone a Post-it Note and a few minutes to fill it out, and then ask them to stick their notes

onto a wall. With twenty to forty people in the room, you very quickly see themes emerge in terms of what those potential disruptive scenarios might be.

- Step 3: Then you ask the participants to vote, choosing the top two to four disruptive things they see on the wall.

Chapter 13: Conducting the War Game

Running a war game is no easy task, but if done right, you can create a Playbook for a winning competitive strategy. Consider the logistics before entering your war game. Preparing for your war game is just as crucial as the game itself. You want to ensure everything goes smoothly, the teams have fun, and that the outputs generate big competitive wins for your company.

Make sure you have the room confirmed. On each table, have a couple of copies of the Briefing Book available for participants. Make sure you feed people, or you could get tired and hungry players who aren't good for much.

Depending on whether you want to run your war game low-tech or high-tech, this is some of the equipment you might need: Flip charts, Post-its, Pens, Notebooks, Templates (you can copy and use the templates in the appendix of this book), Projectors people can hook up to laptops, Wi-Fi depending on how connected you really want people to be.

A typical in-person war game is conducted over one or two days. Virtual war games are now also very popular as well as they save on travel costs and time. Virtual war games are generally broken into three-hour sessions over a few days to avoid screen fatigue for the participants.

Chapter 14: Moving From War Room to Real World

Competitive success does not stop at a war game, because the war game is basically just your locker room. You can't win the game unless you get out onto the field and put your strategies into play. Your Playbook, and what you do with it, is what differentiates your war game from an educational, interesting workshop to an actionable, winning competitive strategy.

Most companies, after doing a war game, realize that their winning aspiration has evolved. Revisit your winning aspiration. Pick and choose your battles. If the war game answered for you the "So what?" then after your war game, you and your team will answer the "Now what?"

Keep the momentum going with the next steps. Your next steps should be in terms of a timeline: What do you need to do within the next few months then in six months, and then in a year from now?

Conclusion

War gaming is an ongoing, lifelong process. For it to be successful, it can't just be a one-off. Integrate it into your company as part of your culture, with an open, humble, and curious mind, and you will build winning strategies that lead to competitive success. I hope that some of these stories have helped you as you embark on your war-gaming adventure.

Arjan Singh has advised 68 of Top 100 companies in the Fortune Global 500 list in building winning strategies and co-authored Best Practices in Managing Competitive Intelligence Research: For Pharmaceutical and Biotechnology Managers. With over twenty-six years of experience, Singh is an expert in helping companies develop data-driven strategies through war games, strategic and competitive analysis, scenario planning and building business early warning systems that deliver significant impact.

Management

Consider

Harnessing the Power of Reflective Thinking in Your Organization

by Daniel Patrick Forrester

THE SUMMARY IN BRIEF

"Stop, think, and don't do something stupid!" This is the warning Dr. Robert Bea drills into his civil and environmental engineering students at the University of California in Berkeley. Bea wants to dramatize what he terms the inevitable "oh s---!" moments that present themselves — before an actual engineering calamity, like the Deepwater Horizon/BP disaster, happens.

There is an intangible and invisible marketplace within our lives today where the products traded are fourfold: attention, distraction, data and meaning. The stories and examples within *Consider* demonstrate that the best decisions, insights, ideas and outcomes result when we take sufficient time to think and reflect. While technology allows us to act and react more quickly than ever before, we are taking increasingly less time to consider our decisions before we make them.

Daniel Patrick Forrester supplies an arsenal of ideas and solutions that will help leaders solve the right problems. Including interviews with leaders such as General David Petraeus, attorney Brooksley Born, and global investor Kyle Bass, Forrester shows us that taking time and giving ourselves the mental space for reflection can mean the difference between total success and total failure.

IN THIS SUMMARY, YOU WILL LEARN:

- To replicate the behaviors of individuals who formally structure think time and reflection to solve both simple and complex problems.
- To ensure that technology encourages productivity without creating unwanted distractions that consume organizational think and reflection time.
- What it means to create an organizational culture where think time and reflection are part of daily routines.

Introduction: The Space Between Data and Meaning

"Stop, think and don't do something stupid!" This is the warning Dr. Robert Bea drills into his civil and environmental engineering students at the University of California in Berkeley.

There is a hierarchy of communication we all practice, in which electronic and immediate data responses reign far above in-person and more time-intensive, dialogue-driven interaction. Organizations that prioritize think time and reflection benefit by ensuring that workers are focused on solving the right problems that matter to the mission and stability of the organization. Organizations that embed think time and reflection into processes and routines are more likely to generate new ideas, products, services and solutions.

Through more than 100 interviews, I have discovered dozens of ways for you to reclaim what immediacy has taken away: reflection.

It's only when we have context and perspective separated from the actual problem that a new idea can form that might solve it. When, inside your organization, evidence presents itself that it's best to take a step back and reconsider the problem, will you have the courage to force moments to stop, think and not do something stupid? Within the stories that follow you will discover that it can be done. ●

The Human Need for Think Time: Of Business, Interleaving and Oil Spills

Think time is the purposeful elevation of chunks of our work time forged within densely packed schedules. It forces the consideration of core significant impending decisions, outside of cursory overviews and immediate response.

Closely related, but requiring more discipline to achieve, is the state of reflection. Reflection is the deliberate act of stepping back from daily habits and routines (without looming and immediate deadline pressures), either alone or within small and sequestered groups. It's where meaning is derived through reconsideration of fundamental assumptions, the efficacy of past decisions and the consequences including the downside of future actions. It's where space is given for the "totally unexpected" to emerge.

Robert Shumsky, professor at the Tuck School at Dartmouth, believes that technology and automation rapidly force outcomes that may not be the most desirable. "In every company," he said, "I think there is a tendency to believe that if you're moving, if you're doing something immediate (or at least it looks like immediate), then you're doing the right thing." What Shumsky is referring to is an ingrained bias for action.

Admiral Thad Allen was chosen by President George W. Bush to be the new lead for the Katrina response following Michael Brown. He said, "When I went back to my room at night, I had quiet time. I was isolated and had time to reflect. I also used transit time as some down time when I could think uninterrupted." During one helicopter ride, Allen looked out over the devastation. He said, "I had the epiphany that I was dealing with the effect of a weapon of mass destruction used on the city of New Orleans, but without criminality. And up until that point, no one had stepped back and said we are dealing with a different animal here."

Through moments of think time and reflection, Allen reclassified a catastrophic event and reframed it within a new and more effective context.

In the final months of his role as commandant of the U.S. Coast Guard, Allen was yet again tapped to become the point person for the federal government for the unprecedented oil release happening 5,000 feet below the water's surface in the Gulf of Mexico. In this instance, Allen used his fleeting moments of reflection to help him frame descriptions of the aftermath of the Deepwater Horizon oil rig explosion.

What reflection and think time offer are specific and deliberate behaviors that allow for meaning to emerge from the vast supply of data that swirls around us. From dissent and debate to the wild and over-the-top, reflection supplies an arsenal of ideas and solutions to the right problems.

Forcing Think Time: Of Presidential Commutes, Personal Battle Rhythms, and Making Time to Wonder

Abraham Lincoln commuted back and forth between the White House and a cottage at the Soldiers' Home that he inhabited with his family. The Lincolns lived there "usually … from early summer to late autumn," as Lincoln scholar Matthew Pinsker reveals.

For Lincoln it represented a sanctuary. It buffered him from the world of being president. Lincoln purposely created a physical separation between his work and his home life.

General David Petraeus sits within a flow of data that dwarfs anything faced by Lincoln. On a daily basis, he immerses himself for nearly an hour-and-a-half in his "daily brief." The binders that sit on his desk contain reams of analysis, often compiled overnight, which he must consider.

The decisions made by Petraeus and other senior military leaders involve complex national security situations and often have life-and-death consequences. He said, "You have to put down time in. When I was in command in Iraq, I typically fenced an hour a day in the mornings. You'd use it in different ways; sometimes you would catch up on what you hadn't assimilated the previous day. Other times you would use it to think through something coming just over the horizon."

How many CEOs would consider taking up to two weeks away from their families and day-to-day operations and be alone in a cabin in the woods? Since the 1980s, Bill Gates, the former CEO of Microsoft, does just that. In the months before, Gates solicits ideas, papers and concepts from leaders around the company. He then goes off in the woods to read them, vet them and then take action on the ones he saw as having the highest potential. During the week, he bars all outside visitors.

The examples of forced think time within this chapter raise many questions and issues for leaders and managers to consider within their organizations and related to their own behavior:

Control. We can control how we structure the moments that arise and our responses. Like Lincoln, do we dedicate more time to reading and digesting information instead of generating content for others to consume?

Attention. We must come to a conclusion about the consequences of giving only partial attention to top initiatives. One might be that we can only think deeply about one matter at a time.

Hierarchies of communications. Leaders must ask themselves: What value do I place on language and texture that is only accompanied by its verbal expression versus the use of technology that allows for immediacy?

Asynchronous dialogues. Petraeus shows that having many ongoing conversations with people who can do some initial deep thinking for him does not absolve him of owning and mastering new content and ideas.

A meeting with oneself. It is clear that we treat time with our thoughts as a low-level priority. From holding the morning sacred to coming off the field and unplugging for even just an hour, think time can be forced and found.

Reflecting on messages delivered by technology. Lincoln wrote in longhand through multiple iterations before they were transmitted. All of us must ask ourselves: When was the last time I used the save button as I drafted an email?

Thinking Out Loud: Of Terminal Niceness, Intellectual Awkwardness and Real Dialogues

Today, we often enter meetings unprepared. Our time is fragmented and we don't force moments to reflect before we get into the room. We only have cursory conclusions with few meaningful alternatives. We are

often overly polite in discussions, as we are empathetic to other attendees who have also had very little time to think.

Joe Raelin of Northeastern University suggests that there are five levels within true "public reflection." If all are on display, the culture is capable of questioning without alienating and assumptions will routinely come up for reconsideration in the natural course:

Level I: Being. Refers to a deeper awareness of who we are, and our mental models and biases as we enter a dialogue. It creates a climate for reflection within the group and asks that we experience or describe situations, often without our own involvement in them, without inputting meaning.

Level II: Speaking. This involves a collective voice and collective meaning within the group. It attempts to characterize the state of the group at a given time. People in this mode will be observed asking: What social practices is the group engaging in right now? What is emerging in our collective consciousness?

Level III: Testing. An open-ended query directed toward the group as a whole that attempts to uncover new ways of thinking and behaving. One may ask the group to consider its own process or attempt to explore underlying assumptions previously taken for granted.

Level IV: Probing. People within the group make a direct inquiry, typically to one member at a time, to point out the facts, reasons, assumptions, inferences and possible consequences of a given suggestion or action. Probing may attempt to point out inconsistencies in members' reasoning patterns, perhaps helping them to uncover the assumptions.

Level V: Disclosing. Here, people stay within themselves and, at the same time, share their doubts or voice their passions. By disclosing, participants unveil their feelings at a given moment based on what has just transpired or they may present a story to reveal the depth of their experience.

A leader has responsibility for not only finding time to think and forge connections while alone, but to ensure that the organization embraces proven methods to allow dialogue to generate new ideas and explore the downside of a given strategy.

• When was the last time you participated in a moment of true "public reflection"? As the workload increases and distraction abounds, the rare moments of public reflection hold significant meaning.

• What is the supply chain of analysis feeding into the dialogues you and your team are attempting to have? As you read and learn are you simply snacking on content that you scan on the Internet or in a magazine?

• Iterative and deliberate discussions can create the atmosphere for divergent opinions and new ideas to emerge.

• The existence of "terminal niceness" within your organization is a likely sign that debate and dissent are long gone and groupthink is accepted. At the root of this behavior is a culture that can easily miss an innovation or market opportunity. ●

Promoting Think Time: Of Intellectual Freedom, Digital Books and Manly Refrigerators

In many ways, think time and reflection live at the core of what enables a business to thrive.

One celebrated technique employed within Google is the allocation of so-called 20-percent time to its engineers. The company encourages its engineers to spend 20 percent of their work time on "whatever they want." This benefit has been widely discussed as a core component of Google's innovation agenda.

Giving 20-percent time to employees is a powerful example of decentralized decision making. Engineers are trusted with making the decisions surrounding their involvement with maturing ideas that may have little to nothing to do with why Google hired them in the first place.

Whirlpool is a century-old company that made a clear decision to allocate think time in a quest to be more innovative. One key process promoted by innovation author and consultant Gary Hamel has had a profound effect on Whirlpool. It's given rise to differentiated products that would never have been born inside normal business operations. It involves challenging what are called the "orthodoxies" within the company. Orthodoxies are "the strongly held beliefs that Whirlpool has about itself. If they can overturn them or smash them, then we could see a new insight."

A project will only enter the company's innovation "pipeline" if it is screened against this very specific definition: the project must meet a consumer need and solve a problem; there must be nothing like it in the marketplace; the idea has to make money for Whirlpool.

There are many lessons to learn from these two examples, including:

1. Define the sandbox. Both Google and Whirlpool have defined innovation to various degrees. Whirlpool has been more explicit in that its innovation agenda must contribute to making money. You must take the time to define the edges of the sandbox.

2. Idea architecture versus autonomy. The autonomy that comes with allowing people to think about and work on what they want is compelling. Yet self-direction can cause individuals and smaller teams to flounder. Having some structure on top of autonomy helps ensure that there are guideposts and bumpers that gently guide money-making ideas into reality.

3. Language matters. The late Admiral Art Cebrowski once advised me, "You can't expect old language to carry new ideas." As you set out to interpret what think time can mean to your organization, ensure that it is described in new ways that convey what it is and is not. Make it distinct from the daily rhythm and language of the business.

4. Challenging orthodoxies. There must be "safe space" for people to express and offer ideas that get to the root of ingrained concepts the firm has about itself, its marketplace and even its consumer. It's only by granting people the time to step outside of the day-to-day that such a notion can even come into one's mind. ●

Taking a Step Back: From Abusing Email to Exceptional Organizations

Habits and routines rapidly form inside organizations. In the midst of the status quo, institutions rarely step back to re-examine assumptions and behaviors that are inevitably altering the trajectory of their company.

Can you imagine even one day at the office without email? The CEO of PBD, a small inventory management and shipping company, did just that. In 2006, Scott Dockter finally had enough of the barrage of email.

He thought to himself that, at least for one day a week (Friday), staff could get to know each other again and talk face-to-face when possible or connect via phone if they were in different cities. The only exception to the rule was for external email: if a client emailed someone inside the company on that Friday, then a PBD employee could respond.

Email use on Fridays dramatically dropped. In fact, email traffic on other days of the week began to decline as well. They calculated that prior to implementing the no-email rule, employees spent more than half of their workday simply reading and responding to email that was of no real value to serving clients.

Sister Mary Jean runs the SSM Health Care system. She learned about the nationwide, government-sponsored, Malcolm Baldrige National Quality Award Program. The program is led by Dr. Harry Hertz. Hertz says, "Baldrige is really an awareness and thinking tool. It provides a systems-level perspective to thinking and managing an enterprise and more importantly all of its inter-relationships."

The Baldrige process pushed SSM to consider many issues that get lost in the day-to-day operations. What does quality mean? How does the organization's strategy translate into actual implementation? The Baldrige process supplied SSM with a sustained period of introspection.

Employees are given authority for a moment of pause to reconsider what is about to happen for a patient or course of treatment. Sister Mary Jean said, "The person who stops the line is actually congratulated. If, in fact, either a manager or an administrative person does not support the person who stops the line, the manager or the administrative person will be fired."

Time for thinking will not arise unless leaders and managers take deliberate actions to drive new outcomes and models for working. Key areas for dialogue include:

1. Questioning email and putting it in context. Does your company even employ a basic set of policies for use?

2. Discuss responsiveness in your organization. While maintaining high levels of customer service, is it possible to imagine some rules set around response?

3. Openness to outside scrutiny. When was the last time you willingly opened up a function, let alone your whole business, to any level of outside scrutiny?

Let's Digitize Everything

Author Ken Auletta chronicled the day that the Google Books project was hatched and the CEO of the company, Eric Schmidt, first learned of the project. He writes, "Schmidt remembers the day in 2002 he walked into Larry Page's (Google co-founder) office and Page surprised him by showing off a book scanner he had built. It had been inspired by the great Library of Alexandria, erected around 300 B.C. to house all the world's scrolls. Page had used the equivalent of his 20-percent time to construct a machine that cut off the bindings of books and digitized the pages. 'What are you going to do with that, Larry?' Schmidt asked. 'We are going to scan all the books in the world,' Page said. For search to be truly comprehensive, he explained, it must include every book in the world."

4. Encourage system-wide thinking. The complexity of relationships and the translation of strategy to implementation require thinking holistically about the problem.

5. It's okay to "stop the line." When was the last time an employee was rewarded for "flagging" something she saw as likely to harm a desired outcome? ●

Too Big to Think? Of Cassandras and Cognitive Dissonance

In the dizzying run-up to the financial collapse, reflection was seldom to be found. There was a collective failure on behalf of thousands of very smart people, government regulators and millions of homeowners to step away from the lure, temptations and consequences of too-good-to-be-true real estate investing.

One of the most powerful barriers to think time is the rationalizing away of downside risks and unknowns presented in a globalized marketplace. Systematic failure to encourage debate, dissent and push back against poorly thought-out investment strategies nearly led to the catastrophic collapse of banks — along with everyone they do business with. Two atypical thinkers pondered the financial markets with all their increasing complexity and arrived at far different conclusions from the masses and Wall Street market makers.

Attorney Brooksley Born wondered about the emerging over-the-counter (OTC) derivatives market in the late 1990s and concluded that the unknown risks associated with their compounding use might one day have debilitating impacts on Wall Street and average taxpayers. The more she learned, the more she questioned what she was seeing and she issued warnings that no one wanted to hear.

Global investor Kyle Bass and his hedge fund team at Hayman Capital in Dallas immersed themselves in much of the same data as Wall Street's smartest people and reached very different conclusions about the downside risks of subprime mortgages. He concluded that the assumptions underlying the meteoric rise of these assets were deeply flawed. His structured analysis involved stepping away from the herd mentality through debate and dissent; this played a key role in making his investors hundreds of millions of dollars.

Examining their thinking habits and some similarities and approaches related to the near financial meltdown suggests several actions and questions for leaders and managers to consider inside their organizations:

1. Finding and studying cassandras. How would you attract a Bass or Born to join your company? Would you have the ability to detect their unique skills if they existed within your company?

2. Better managing of cognitive dissonance. This means acknowledging that there are viable alternatives to what you see as reality. How does your company formally question business as usual?

3. Learning from and detecting fraud. Fraud is a leading indicator of potential concern with an existing model. What does your company know about detecting fraud, both internally and on the outside?

4. Open-sourcing strategy, even in hostile environments. Seeking feedback with different points of view will ensure you are not rationalizing one direction at the cost of another. When was the last time you shared a contrarian view that was born out of healthy and balanced skepticism, and backed up by facts?

5. The power of doing other things. Our bodies decouple from the office, yet our unconscious minds continue to solve the problems that challenged us the previous day while at our job. How do firms encourage such detachment for improved problem-solving? ●

Rapid Contemplation: Rethinking War in the Middle of War

Once a war has begun, the military bias toward action and defeating an enemy is relentless. There is little time to think about fundamental concepts and foundational elements of a strategy — except if that strategy is failing. In 2005–06, as the Iraq war was being fought, reflection played a key role in turning the tide against a diffused, adaptive, and entrenched insurgency. Under the leadership of Marine Corps General James Mattis and U.S. Army General David Petraeus, a small and atypical group of war fighters and thinkers rewrote the doctrine of counterinsurgency in less than nine months.

The way the Army and Marines rethought counterinsurgency presents many lessons for other organizations to consider. First, there was a willingness to recognize a failing strategy and take top leadership off the battlefield to step back and rethink the approach. Second, structure and methods of the sessions for vetting the new ideas offer novel ways for attacking complex problems — even when time is against you. Finally, when reflection becomes habit we see evidence of a learning organization.

The rebuilding of the U.S. Army/Marine Corps Counterinsurgency (COIN) Field Manual, published in

multiple drafts from 2005 to 2007, stands out as an example of the power of reflection in the midst of unrelenting action. Both Petraeus and Mattis agreed that while in theater in Iraq, it would've been impossible to rethink the manual. Taking these top soldiers off the battlefield to think and recast policy and strategy runs counter to what so many institutions would do under the strain and uncertainty of challenging times.

The creation and rollout of the COIN manual demonstrate agility and resourcefulness while rethinking a failing strategy. Several insights are revealed:

1. Recognition of failing strategies that require new thinking and energy. Managers and leaders often perceived admitting to failure as a sign of weakness; yet doing so can give rise to resetting a problem through new dialogues.

2. Use history as a guide, not the only reality. Who in your company represents the reflective thinker capable of framing the challenges of your organization in a historic lens?

3. Engaged and dedicated senior executives turn moments of reflection into powerful cases for change. What is the last document or strategy you can point to as a "product of reflection" built with all parts of the organization and senior-level involvement?

4. Meta-dialogues help build trust among problem solvers. When things go wrong and new thinking is required, how would you engage outsiders as Petraeus did?

5. Finding evidence of a "learning organization" capable of adapting. What is the evidence your organization is learning and adapting?

6. Management through paradoxes. Paradoxical problem-solving frames balanced views into difficult problems. It consistently pushes people out of their intellectual comfort zones.

7. Atypical players invited to atypical tables. Embracing diverse perspectives during reflective dialogues ensures that strategies are not born inside an echo chamber. ●

Music at a Subway Station

Writer Gene Weingarten of *The Washington Post* wondered what would happen if a very talented violinist playing a 300-year-old, priceless Stradivarius were to don a baseball cap and play in the D.C. subway. Would people stop? Or are we all just too busy to even notice? Weingarten convinced Grammy award-winning violinist Joshua Bell to do just that. Bell played complex pieces by Bach and Beethoven. In summarizing the results of this unique experiment, Weingarten wrote: "In the three-quarters of an hour that Joshua Bell played, seven people stopped what they were doing to hang around and take in the performance, at least for a minute. Twenty-seven gave money, most of them on the run — for a total of $32 and change. That leaves the 1,070 people who hurried by, oblivious, many only 3 feet away, few even turning to look."

It's become the most watched video ever on the *Washington Post's* website — more than 1.8 million views. Weingarten had his own conclusion: "If we can't take the time out of our lives to stay a moment and listen to one of the best musicians on earth play some of the best music ever written; if the surge of modern life so overpowers us that we are deaf and blind to something like that — then what else are we missing?"

Outside the Day-to-Day: From Radical Sabbaticals To Unleashing Reflective Capacity

Sabbaticals and time away from the day-to-day routine are evolving. Such time away reinforces meaningful distinctions between home and work that are now permanently intertwined. Think time and reflection can become a benefit given back to employees for their own use or structured to hatch an idea important to them.

The economic reset has forced millions into moments of involuntary time off, thousands of hours of think time that has likely altered the employee's time horizons for retirement and also the overall work ethic. What new models of work time and down time can be developed to address the human side of the economic reset? How many of these people need real time away from the company to simply recapture a meaningful distinction between home and work? How many have envisioned new ideas for companies they want to start?

Sabbaticals are a benefit that, at first glance, implies just costs. Yet, the benefits to the employee and within the company can be significant. At McDonald's, the sabbatical policy allows loyal and hard-working employees to use time outside the firm to pursue what they want — and in the process they think in a new way about their relationship to the company.

Taking a sabbatical implies much more than time off for an employee. The structure of that time matters. Within weeks and months, employees can be exposed to new places and experiences that disrupt the patterns of

thinking that have built up within the frenzy of day-to-day activities.

Time away from the company can also be powerfully directed at creating new ideas that can positively alter the company's cash flows. This time away from the daily routine represents the atypical application of the "no-break" and "always-on" mindset. ●

Reflection and Extreme Situations: From Commander's Intent to Finding the Middle Ground

Reflection is often thought of as a luxury afforded only under circumstances where time is plentiful and immediacy is at bay. Yet, I have discovered it exists inside situations and settings involving crisis, conflict and entrenched parties.

Within the chaos of war, generals spend a significant portion of their time expressing what is called "Commander's Intent." It's really a thinking tool born after long hours of the commander's reflection time. General Mattis succinctly defined Commander's Intent as, "helping subordinates to understand the larger context of their part of the action."

Commanders sequester themselves and draft communications in order to express their "intent" related to the actions and mission about to be undertaken. Within the chaos of a hostile apartment, the language and ideas presented will echo in the thinking of the soldiers so it constantly informs the many decisions they will make.

In March 2003, Mattis wrote, "You are part of the world's most feared and trusted force. Engage your brain before you engage your weapon … Demonstrate to the world there is 'No better friend, no worse enemy' than a U.S. Marine."

Petraeus's advice reveals that his intentions and guidance can and will take soldiers into situations for which there is no reference point. Self-direction and an individual's thinking will drive key outcomes. He says, "In the absence of guidance or orders, figure out what the orders should've been and execute them aggressively."

The use of Commander's Intent demonstrates that a leader's reflection time can translate into the immediate thinking of their subordinates — even within the chaos of war. When was the last time you created such a clear statement of the intention behind a strategy or project? ●

The Future of Think Time and Reflection: From Sovereign Debt to Subway Performances

Following are five guideposts to look for as you seek to discover reflection in your organization. These guideposts provide evidence that reflection is valued. You can use them to begin some critical conversations:

Guidepost 1: Technology Versus Human Capacity: One of the key villains stealing away time for thinking and reflection is technology. Organizations that question technology's role in the context of routine human behaviors reveal evidence of reflection.

Guidepost 2: Real or Masked Dialogues: Organizations that demonstrate the ability to engage in uninterrupted dialogues that are generative of new thinking will be the most lasting of the century.

Guidepost 3: Dedicating Time for Thinking: Organizations that offer and celebrate think time, both inside and outside the workday, will prove to be the most innovative. Instant decision making often remains a must; but addressing chronic problems and nurturing big ideas can't be done in an instant.

Guidepost 4: Leaders Who Walk the Walk: Building reflection into the habits of an organization will not happen if the senior-most executives don't lead from the front. When leaders force think time into their own routines, others imitate such behavior.

Guidepost 5: Cultures of Dissent and Deep Thinking: When discussion is stilted and cultures can't actually engage in constructive debate, fundamental assumptions are not questioned and the wrong problems get solved. Dissent doesn't indicate one is not a "team player"; it's more indicative of a mind that will not rationalize away dissonance.

Time for reflection is an open invitation to discover what awaits us. The choice is ours: to permanently raise and reward the importance of reflection or simply meander through our next 10,000 emails. The consequences of that choice are also ours. ●

A Best Practice Guide to Choosing, Using and Getting Good Value

CONSULTANTS & ADVISERS

THE SUMMARY IN BRIEF

Everyone in business will need the help of consultants, contractors or professional advisers at some time or other. In Consultants & Advisers, *independent consultant Harold Lewis presents an accessible resource for individuals, businesses and organizations on how to get the best value from the consultants they hire. This summary includes answers to many common questions about consultants and advisers, as well as examples of both good and bad practices. Throughout, Lewis provides a thorough examination of everything involved, from picking consultants to writing contracts to solving problems.*

This summary guides readers through the process of choosing and using consultants so they can secure the help they need and the results they intend. It helps readers avoid mistakes and pitfalls; save time, money and effort; and make the process of working with consultants really worthwhile. It also offers larger companies many lessons about where levels of risk are high, and how poor advice can cause financial loss.

After identifying the kinds of situations in which professional help might be necessary or useful, this summary discusses various ways to obtain help. It also indicates circumstances in which bringing in outside advisers might not be the best course of action.

In addition, this summary:

- ✓ ***Offers a profile of the consultancy and professional services sectors.***
- ✓ ***Describes the basis on which consultants work.***
- ✓ ***Offers insight into the way they view relationships with their clients.***
- ✓ ***Analyzes consultants' fees and expenses.***
- ✓ ***Describes how work specifications can be developed.***
- ✓ ***Offers steps that should be taken when selecting the right consultant.***
- ✓ ***Provides advice on contracting and negotiating with consultants.***
- ✓ ***Describes how to keep the work on track.***
- ✓ ***Offers the factors conducive to successful client-consultant relationships.***

Why Would I Want to Use Consultants?

Every person in business will at some time need professional advice. To make a relationship with a consultant or adviser succeed, the key requirements are confidence, honesty and trust, based on a shared understanding of professionalism and the importance of businesslike delivery. To quote business guru Charles Handy, "If you trust people, they will surprise you. And they will surprise you positively if their interests coincide with your interests."

Business managers use consultants because of the expertise they offer, their independent viewpoint and the resources they provide. Expertise can be defined as specialist skills, deep experience, insight, awareness of best practices, research skills, and creativity. Independence can be defined as a detached viewpoint, impartiality, and unbiased analysis. Resources can be defined as cost effectiveness and cost savings.

First, you need to determine whether you are looking for a consultant or an employee. Choosing one of these options depends on what you will allow this individual to do. Are you comfortable with this person being able to delegate authority, working on one specific task, and taking care of his or her own tax records? If the answer is yes, then you are probably looking for a consultant. If the answer is no, then you are probably looking for an employee.

Alternatives to an External Consultant

Before you seek out a consultant, you need to figure out if your company can do the job itself without resorting to outside help. For example, your in-house staff might be able to handle the job with some additional training, or you might be able to use your company's own internal consultants, which would probably be cheaper. You could also consult a sister organization, a current business partner, a professional institution, a trade group or even the local chamber of commerce. Further, you might look at university and college departments, volunteer advisers, or even Internet discussion groups if you are seeking help.

Your choice not to use a formal outside consultancy process should be based on what you want to achieve, the price of getting it wrong, the urgency of the work, and the relative talent levels of the people who you would be asking to do the work.

When Not to Use Consultants

If you do not have a clear idea of what you want the consultants to accomplish, then you should probably not hire them. There are also a number of wrong reasons to hire consultants. These include: asking for a result that cannot be reached, using the pedigree of a consultant to give cover to an otherwise bad plan, asking consultants to assume risks that should be your own, and thinking that they can save you the trouble of defining policies and objectives. These are all recipes for disappointment.

Make sure that the people inside your company know the reason why you are bringing in outside consultants. Do this in person and not by way of e-mails. Be very clear that they know what the consultants are supposed to do and what help they will need from the company's staff. Don't let a situation develop where staffers are uncooperative with the consultants because they think their jobs are being threatened or outsourced. You have to get staff members to participate in this effort to make it work.

Making a Business Case

There are things you need to do in order to make a business case to bring in consultants. You need to outline in detail the following things: the scope and purpose of the work, the expected results, the proposed

contract basis, estimated costs, a timetable, the benefits derived, possible risks, proposed managerial arrangement, a clear assessment that outside help is needed and cannot be done in house, and an indication of how the consultants' work will be used. Management will then have to decide if the use of consultants is likely to result in a significant return on investment. ■

How Do Consultants Operate?

According to data from 2002, there are more than 400,000 enterprises involved in consultancy and professional services work in the United Kingdom. Categories include civil, business, technical, management and financial. Though the size of a firm may not always be significant when selecting consultants, some businesses find that in general they get the best quality of response from firms that match their own size and scale of operations. However, the fact that a firm is small will not deter large organizations from using its services if it offers valuable expertise in a specialized field. And some corporate clients prefer to obtain their consultancy from seasoned individuals who have acquired a degree of eminence in their professions.

Professional Credentials

Anybody can set himself or herself up as a consultant. How do you determine if a person is really qualified to give you the help that you need? One way to determine expertise is to find out whether the person is a member of a professional organization or not. Professional associations, such as the American Bar Association, may demand that the person engage in several years of study and training before being admitted. Professional bodies may also place responsibilities and duties upon their membership. In short, using a person who is a member of a professional institution should mean that you have some proof of performance, conduct and professional training.

The process of gaining quality accreditation from a quality audit and certification company, such as Lloyd's Register Quality Assurance, requires a substantial investment of effort and time. But this kind of accreditation can open up doors for the consultant and serves as a great marketing opportunity. Keep in mind that no matter what the firm has accomplished, it is still capable of making mistakes. There may also be a whole host of competent consultants who can do the work who have never sought out accreditation.

Professional Indemnity Insurance

Many professional bodies require their members in business as consultants to hold professional indemnity insurance. Clients, in order to protect their interests and to defend against any legal claims that arise out of consultancy work, may require their consultants to be insured as well. Keep this in mind: If there is the slightest chance that the consultant's work can result in injury or death, make sure the appropriate insurance is in place.

Beware of consultants who use the tools of "relationship management" or "strategic account management." Many big management consultancies are very good at serving their own personal agenda by telling clients what they want to hear. Consultants will do everything from arranging impressive meets at their immaculate offices to getting a senior partner to step into a conference call in order to close the deal. There is nothing sinister about this, but you should be aware of this as a client. ■

What Do Consultants Charge?

The two kinds of consultant charges that you will encounter are **fixed prices** (related to a specific task or package of services) and **time charges**. Simply stated, the fixed price for a consultancy service is like the price of a meal at a restaurant. This is fine if the consultant is sure of what the price will be for his or her services. There is an art to this that can only be learned through trial and error. Time charges may be hourly, daily, weekly or monthly. Don't make this an open-ended agreement. You may also find it helpful to define how much time the consultant will be expected to spend on your account. Both fixed price contracts and time-based contracts may include award and incentive fees built into their terms. **Award fees** reward the consultant who meets or exceeds his or her target goals. Other charge options include **percentages**, **value-added**, **quantum**, **retainer** and **conditional** fees.

Fee Levels

No matter what fee basis is chosen, a number of factors will determine the amount your company will pay. Some of these factors are related to specific business conditions, and others are dependent on the services that are requested. Those factors include: competition between consultants, market value of the expertise desired, the consultant's business strategy, level of the consultant's costs, the urgency of the work, complexity of the task assigned, time of work, degree of commercial risk, the location of the work, and overheads.

The consultant fee simply expresses the fact that the firm needs not just to cover its own costs but also to make a profit. The fee usually includes payroll, salary or labor costs, overhead and profit.

(continued on page 4)

What Do Consultants Charge?

(continued from page 3)

In consultancy, a day normally means either seven, seven and a half, or eight hours of billable time, depending on one's business arrangements. Some consultants require their staff to charge either for a full day or a half-day. Time spent on the work usually includes: time spent on work as defined in a contract; time spent on data processing or surveys; meetings with the client; visits to work sites; time spent traveling in connection with the work; and preparation and production of deliverables, including reports, presentations and follow-up work as agreed to by the client. So, for example, a day charged by the consultant might include a two-hour meeting about the work, four hours preparing technical materials, and two hours of travel time between meetings.

Expenses

There are normally expenses that consultants incur on the job. The principle is that the consultant pays for these out of pocket and the client reimburses the consultant when the bill is paid. The main types of expenses for which you may have to reimburse consultants include: travel costs; parking charges; specific office expenses; equipment or supplies purchased or leased; costs of support services; communications, such as data transfer, cell phones, etc.; computing costs; courier services; and printing costs.

Consultants usually expect an advance before any work is started. Down payments help to discourage clients who are time wasters or who might be reluctant to pay for work they don't like. An advance payment of 25 percent is not uncommon. ■

How Should I Specify The Job to Be Done?

Don't approach a consultant until you have a very clear idea of what kind of work you want done, when you want it completed, and the results you want to achieve. The work specification accomplishes two goals: It helps you think about priorities and it helps limit the risk of getting results that you do not want. Be honest about your objectives and don't obscure your true motives.

Producing an effective work specification involves the following sequence of tasks: defining objectives, drawing up its scope and contents, gauging the practical demands of the work, setting a timetable for the work, identifying the right form of engagement, confirming your budget, determining what will be needed to succeed, deciding your critical requirements, assessing risks, taking measures to reduce risks, and putting the work specification on paper.

While clients are unlikely to be in a position to say *how* they want a particular task to be done, they must make it clear exactly *what* they want done. Project management software can help clients trace the critical path through the work and allow them to explore the outcomes of different options. The questions clients must ask themselves at this stage are:

- What are the options for structuring the work?
- What are the resource implications of these options?
- Which tasks will form the core of the work?
- Which tasks are most important for success?
- Can the work be fast-tracked?
- Are there external constraints on the way the work can be performed?
- What risks are associated with the work?

To answer these questions, focus on the following three factors:

1. Setting a Timetable. If you have enough information, try to estimate how much time should be needed to undertake the work. Decide how quickly you need results. Build in contingency margins to allow for possible delays.

2. Identifying the Right Form of Engagement. Most requirements can be met by a clearly defined engagement to undertake a specific piece of work. There are two other forms of engagement when a long-term consultant relationship is likely. The first is to set up a "call-off" contract. This puts in place a mechanism that can respond quickly to an unexpected need for assistance. The second form of engagement is to secure professional services through a retainer, for which a consultant agrees either to spend no less than a defined amount of time on your work or to be available as required.

3. Confirming Your Budget. Try to get a reliable idea

(continued on page 5)

How to Gauge the Practical Demands of the Work

Consultants sometimes complain that clients have no idea how much effort goes into the work. Consider the following points in order to ensure that your view of the work is sensible and practical:

✓ Do you know the resources that will be needed?

✓ If you need a team to do the work, how should the team be structured?

✓ What skills will be required from the consultants and from the people on your side managing them?

✓ Have you commissioned similar work before and did you learn from your mistakes?

✓ What assumptions are you making and are they valid?

✓ Where will the work be done and will new office space and equipment be needed?

✓ Will seasonal or other time factors need to be taken into account?

How Should I Specify the Job to Be Done?

(continued from page 4)

of how much the work should cost. How you use cost information depends on the significance that costs have on your decision. Make sure that the work you want done is covered by the funds that are available. You should also add 10 to 15 percent to your overall budget in order to prepare for things you cannot anticipate.

Determining Your Inputs and What Is Important

Clients have a very important role to play in the success of any project. The consultant may need logistical support in the case of a complex or large-scale assignment. Logistical support may include administrative and secretarial assistance, data processing, access to your office and staff, copying, scanning, printing, and possibly even lab and testing facilities.

Work that has to be done a certain way — for example, to meet legal obligations or health factors — must be spelled out precisely. There might be performance criteria on which a client cannot compromise. Make sure the work specification spells out these points in a way that leaves no doubt about specific demands.

Assessing and Controlling Risks

The possibility that something unwelcome will occur is one definition of risk. What needs to be addressed is how you can write safeguards into the work specification to minimize risks. Prevention and forethought are crucial. When you reach the stage of drawing up the contract, you may want consultants to accept either full or partial responsibility for risks. Most contracts involve a balance of risks between client and consultant.

The following are the most common risks that clients should try to avoid:

- Consultants may be late in starting the project.
- Technical problems may hold up the work's completion.
- Inputs due to be provided by the client or the consultants may arrive late.
- Outputs may not be delivered on time.

To manage these risks, make the start and completion dates explicit in the contract, set targets that are reachable, ensure that you are made aware early of any potential technical problems, stress the need for the right people at the right time, and make sure that the consultants receive on schedule the inputs that are due from you.

Costs may rise beyond the agreed price, and the budget may be spent at a rate that outpaces the work. These risks can be managed by making the consultants bear the risk of cost escalation, requiring accurate monitoring and reporting of the rate of spending, and underlining the need for transparency and openness in timekeeping and accounts.

Resource Deficiencies

Those who do the work may turn out to be inadequate. They may be poor at communicating their results or may be subject to competing work demands. The work could be handed to subcontractors who provide a variable level of performance. The work schedule may face delay if subcontractors aren't paid promptly. These risks can be managed by a properly written work specification that outlines the following: performance standards, knowledge of the people who the consultants will be hiring, competent replacements should the need arise, knowledge about all of the subcontractors the client will be using, information about the consultants' other clients, and a requirement within the contract for consultants to pay subcontractors on time.

Consultants may not deliver the right results, performance may fall below expected quality, or their technical findings may be questionable. These risks are managed by stating clearly what outputs you require, making performance goals mandatory for continued work on the project, and requiring an appropriately detailed technical justification for the consultants' recommendations and findings.

The work specification should include the scope of the work, the consultants' approach and method, a timetable, the deliverables and your inputs. The structure of the work specification should have clarity, balance, a logical progression, comprehensiveness and conciseness. ■

How Do I Select The Right People?

Experience is the best guide when it comes to choosing a consultant or adviser. Look for appropriate credentials and qualifications, but don't necessarily be impressed by strings of letters after people's names.

Identify at least three consultants to approach. When you talk to consultants, make sure that you identify the principals who can make business decisions. Tell them that you would like to give them an opportunity to do work for you, but make sure that they know there is no permanent commitment. Ask specifically for references and follow up on them so that you don't waste time with consultants who have a habit of disappointing their clients.

After you have contacted at least three consultants initially, a follow-up meeting should be arranged. That meeting should take place on their home ground. That way you can take a look at their organization. Does it appear well organized or is it a shambles? How do staffers look? Are they under stress or doing their jobs? Keep in mind that while you are sizing up the consultants, the consultants are sizing you up as well.

There are a number of pros and cons to using consul-

(continued on page 6)

Questions to Consider When Hiring Consultants

Here are some points to keep in mind when trying to determine if consultants are right for the job:

- ✓ Are they good listeners?
- ✓ Do they exhibit a common-sense, down-to-earth attitude?
- ✓ Do they seem as if they want to work for you?
- ✓ Have they done similar work?
- ✓ Can they prove that they can do the work that you've asked them to do?
- ✓ Can they say exactly who would be doing the work that you asked them to do?
- ✓ Would the work be done in house or would they be subcontracting?
- ✓ How do they charge for their work?
- ✓ Do they work for a competitor?
- ✓ How do they assure both quality and value?
- ✓ Are they properly insured for the work?
- ✓ Do you sense that these are people with whom you would be comfortable?
- ✓ Do you feel you can trust them?

Choosing consultants is a job to be done methodically and with careful thought.

How Do I Select the Right People?

(continued from page 5)

tants with whom you have already worked. On the plus side, you know the consultants and the kind of performance you can expect. On the down side, your current consultants may not be able to handle this new assignment, and a younger, hungrier firm may not only bring more to the table, but might offer better pricing. Several points to consider include: Who will give you the better value for your money? Does changing consultants offer practical benefits? And will the new relationship be better than what you currently have?

The best way to answer these questions may be to put the work out for competitive bidding from both current and new consultants.

Going Out to Tender

Keep in mind that inviting bids is much more complicated than getting quotations from two or three tradespeople. If the consultant is doing a job that could damage your business permanently, then you have to put in place a procedure that invites written offers in which consultants set out their approach, work plan, costs, resources and other information.

Writing a proposal is a more time-consuming task than sending in a quotation and can prove expensive for consultants. You, too, will have to spend time comparing different and complicated responses to your proposal. In some cases, for example technical bids, it may be beneficial to split the bidding into two stages. First, there should be a stage of pre-qualification when you narrow the field down to a short list of consultants. Then, there should be a tendering stage when you receive and evaluate submissions from the short-listed participants.

Consider the proposal to be a kind of proxy for the performance of the work. It is the closest that consultants get to providing you with a free sample. Give consultants a structure to follow for the proposal so you can have a consistent basis on which to evaluate their responses.

The proposal should include the following: information about the consultants, their company's experience and background, their understanding of your objectives, their delivery plan, the timetable in which they would undertake the work, their organization of the work, the price they propose and elements in their pricing, how they will resource the work, and details of any subcontractors they plan to use.

First, make it clear to whom the proposal should be delivered within the company. The format of the proposal should be specified, such as CD, DVD or USB media. Specify any limits you have on the proposal, such as length. Note how many copies you will need. There should also be a clear deadline.

A typical proposal structure includes an introductory section, the consultants' approach and methodology, a work plan and timetable, staffing, outputs and deliverables, team and contract experience, and price information. This kind of structure provides you with a checklist to help you understand if consultants have answered all of your questions. It also gives you a guide to specific items of information for which you are looking.

Contract-Related Information

Include the type of contract that you have in mind for the work. The contract should also give the consultant a clear idea as to when the actual work should be completed, the duration of the work, the criteria you plan to use in evaluating the proposals, whether a follow-up will be required, the date by which you will have reached a decision about the outcome of the tendering process, and how long you want the price information to remain valid.

There are two other points that need to be made clear. First, you accept no liability in the costs for preparing the proposal — except in certain fields such as advertising and marketing where the costs can be steep. Second, the information in the proposal is made solely for convenience and guidance. The second point is necessary because it protects you from legal claims down the line.

Should you tell your consultants what your budget is for the project? There are opposing views on that issue. Being told your budget will help consultants gauge the level of

(continued on page 7)

How Do I Select the Right People?

(continued from page 6)

effort they can realistically put into the work. It also encourages consultants to focus their proposals on the scale of the benefits they can offer. Finally, it will reduce the risk of receiving proposals that are either unhelpfully out of scale with the funds available for the work or so widely divergent in their costs as to defy comparability.

There are opposing arguments. Declaring your budget may deprive you of the opportunity to make cost savings. The budget figure might need to be revised once the work starts. Also, revealing your budget might encourage consultants to raise their costs up to the limit.

One way to approach this is to express your budget as a range within which the costs of the work are expected to fall. Another way is to indicate the length of time the job should take. Make it clear that this estimate of time is only put forward as guidance.

Once you have precisely written your work specification and you have a number of proposals in front of you, your first job is to look through all the proposals and check that the points that matter to you the most have been dealt with. A second opinion is useful, and involving three people allows at least the possibility of a majority view. There are times when you might want to engage a consultant specifically to help with the evaluation. Make sure that you choose someone who does not have a personal or business interest in the outcome of the selection process.

Compliance

In most industries, it is customary for evaluation procedures to start with a compliance check. The questions that this check asks include the following: Did the proposal arrive on time? Does the proposal contain all the information requested? Can the consultants fulfill all your requirements? Is the information set out in the required form? Are formal statements — for example, those on health, safety or environmental policies — included? Are other statements that were requested, such as proof of insurance or letters of commitment, included in the proposal?

Where information is missing, incomplete or set out in an incorrect format, you have a choice of either rejecting the proposal or giving the consultants an opportunity to correct their mistakes.

Evaluating Proposals

How do you choose between competing proposals that offer different advantages and benefits? The answer is to adopt a consistent and structured method of evaluation based on a defined set of criteria.

Price is usually the most important factor when determining a proposal's value. It is best practice not to award a contract based on price alone. Price should be viewed as part of a value-for-money assessment. Develop a realistic estimate of costs as part of the work specification.

Draw up a list of criteria you will use to judge the proposals. While price might be at the top of the list, other factors should include the practicality of the proposed work plan, the consultants' skills and experience, how much the proposal shows an understanding of your requirements, and the quality of the proposal. Weigh the importance of each of those factors. One way to judge value is to use the method used by consumer magazines when testing products. First, rate the proposals against qualitative criteria, ignoring price, to identify the proposal offering the closest match to your work specification. Then, bring price into the calculation to determine your "best buy."

Before finalizing your decision, you may want consultants to follow up their proposals with interviews or presentations. When you have chosen the consultants you want to use, ask them to confirm in writing that they are ready to do the work. Once the contract is signed (not before!), write to the consultants who were unsuccessful to thank them for their interest and perhaps explain why you were unable to accept their bid. If you are not satisfied with any of the proposals, you will have to start again. Analyze the reasons why you were dissatisfied. Perhaps the way you expressed your requirements made it difficult for consultants to make an effective bid. Put things right before going out to tender again. ■

What Should I Know About Engaging Consultants?

Have a contract or a letter of engagement in place before the work starts, and agree to this document as soon as practicable after deciding on a consultant. Put things in writing!

If you are asked to sign an agreement with the consultant, read it carefully. Watch out for advance payment plans, interest on invoices not paid on time, any statement that says that price and time estimates are to be regarded as informal calculations, limits on the consultants' liability for the work, automatic annual renewals of the agreement if no notice is given for when the contract will end, and statements that say nothing in the contract document is to modify the standard conditions set out in the agreement. Never sign an agreement that you cannot accept in full.

Types of Contracts

There are three principal options for consultancy contracts: a fixed price contract, a time-based contract, and a call-off or term contract. Payments on fixed price contracts are often made in installments as stages or tasks of the work program are completed. The time-based contract is the cost of the work plus the multiplier applied by the consultant and the agreed expenses. Time-based contracts

(continued on page 8)

What Should I Know About Engaging Consultants?

(continued from page 7)

are more appropriate in cases where there is uncertainty about the value of outputs — for example, research contracts. Call-off contracts are used in cases where a client is likely to require consultancy services on a fairly regular basis, such as a two or three year period.

Contracts follow a logical order: what the first party (the client) will do, what the second party (the consultants) will do, terms of payment, matters relating to the suspension or end of the contract, indemnities, and general matters related to performance. The contract should at least contain the following items: who the contract is between, when the contract should start and when it ends, the work to be performed, the person in your organization who authorizes the work, the outcomes of the contract, a timetable for when work will be completed, the agreed price for the work, expenses that are reimbursable, terms of payment for the work, and specific requirements that must be met if the work is to be accepted as satisfactory. ■

How Do I Keep Track of the Work?

Before the signing of the contract and the start of work, you will find it useful to have a further meeting with your consultants to confirm that the necessary arrangements are in place both on their side and on yours. Make clear to them exactly who will be responsible for giving them instructions and who they are to contact on day-to-day matters. Confirm who on their side will deal with any questions. Remind the consultants of the importance of keeping to schedule and delivering results on time.

Once the work is underway, keep a record of whatever discussions you have with the consultants. Keep in mind that *you* are in charge, not the consultants. Also, few consultancy assignments go exactly to plan. It is one of the penalties of working with people. Look at the results to judge whether you have received value for your money.

Monitoring Performance and Progress

Checking performance is critically important if the work involves a challenging delivery schedule or if it is the first time you have used the consultants. Keeping track of the work is largely a matter of maintaining an effective dialogue with your consultants. The basic questions that you need to be able to answer during the span of the contract include: Are the consultants doing what you asked them to do? Are they delivering on time and keeping to the budget? How good are the results they are achieving? Is the relationship working? Do their bills look reasonable?

Schedule regular progress meetings. At these meetings you should determine the status of the work to date, review the performance of tasks, identify consultant shortcomings, check how the work completed matches the budget spent, get early warning of problems, and learn what matters need your attention. Management reports are sometimes required during long contracts.

While deciding what reports you will need and when, consider the complexity of the assignment, your need for information, requirements for the consultants to maintain an audit trail, and the realities of the work timetable and related decision points.

Why Do Things Go Wrong?

If you suspect a problem, you need to be sure that things really are going wrong, and that the problem is not caused by the way you have chosen to work with the consultants. When things go wrong, there is very rarely a single cause. Even though you have taken precautions, difficulties may emerge, such as the following: You were imprecise in your work specifications, your time span was unrealistic, the consultants do not have complete information and resources, there is bad chemistry between your staff and the consultants, or there is inflexibility on both sides.

To put matters right, make sure that your staff and the consultants are working together. Promote an open working environment. Use regular progress meetings to recognize difficulties and problems. Establish an agreed procedure for resolving differences and concerns. Build a contingency plan to remedy problems. Learn from the experience by analyzing what went wrong.

When the assignment is completed, get a dated and signed final account statement from the consultants. For some organizations, the work may have to be signed off as completely satisfactory in order for final payment to be made. Some consultants want feedback on their work. If the consultants made mistakes, tell them how to improve. If the work has gone well, make a point of writing to the consultants and thanking them. ■

CREATING AND DOMINATING NEW MARKETS

THE SUMMARY IN BRIEF

All business owners dream of creating a new market and becoming the dominant player. The benefits of creating and dominating markets include having time to get it right, being able to make and survive mistakes, achieving greater stock value, and pricing to the market instead of competitive pressure.

New markets, such as those created by Amazon.com and Apple Computer, started with an idea for a market that did not exist before. In Creating and Dominating New Markets, *Peter Meyer offers a guide to owners and managers who want to plan, create and dominate markets but also reduce their risk.*

Within this summary are specific applications and ideas about how to create new markets instead of fighting for a place in established markets.

What You'll Learn In This Summary

✓ **The definition of a new market and where to find them.**

✓ **The most important resources you need to create and dominate new markets.** You'll need time, people and money.

✓ **The role of customers in creating new markets.** New markets are created when a company develops a solution to customers' problems.

✓ **What new markets are available to you.** You can choose one of four paths — involving combinations of new and existing customers and new and existing products — to lead you to a new market.

✓ **Different strategies to manage the risk.** Depending on how well a company understands the customers and products, it can significantly reduce the risk of failure in a new market.

✓ **How to dominate new markets once you have created them.** Credibility and involving the customer in product design can help you dominate a market.

The Mystique and Challenges Of New Markets

New markets are exciting, profitable and forgiving. They provide the thrill of creating something no one has made before. They also lack the competitive pressure that reduces prices in mature markets. The perception that your company can consistently create new markets can also increase the price of your stock.

Dominance in one market can make other competitive markets more forgiving. Large margins and cash flow in a dominant market can provide support for doing battle in a highly competitive market. Being the only player in a market also allows you to make mistakes without losing market share to competitors.

New markets are new to everyone, not just to you. New markets should not be confused with line extensions, such as laundry detergent with added bleach, which only change markets, but do not create new ones.

The best way to create a new market is to look for a customer's problem, not a product. Markets start with a need. Combining that need with a product is how you create a new market.

Common Denominators of New Market Success

When you look at companies that have been successful at creating new markets, you will see some common key elements. The following principles will help you increase your chances of repeated success:

- **Customer-driven markets work better than vendor-driven markets.** Customers will buy what they want, not what you think they want. An online grocery delivery service seemed like a good idea; customers weren't interested.
- **Take the two lower risk paths to a new market: Develop a new product for a known market or take a known product into a new market.** See the article "What New Markets Are Available to You?" on Page 4 for a further discussion of the paths to new markets.
- **Be willing to ignore opportunities to avoid diluting efforts.** Not every opportunity is worth the chase — especially if it drains resources from other initiatives.
- **Start with cross-functional teams and leadership.** Creating new markets shouldn't be left to one function (marketing, for example). No single business function can produce new markets alone. ■

Balancing Resources and Opportunities

In order to create a new market you need three key resources to invest in opportunities: money, people and time.

It does not necessarily take a lot of money to create a new market. The cost depends on the problem you are solving and the audience that most intensely feels that problem. Consumer and pharmaceutical markets are very expensive, while business markets can be inexpensive.

People are even more important than money. Remember that people who excel at initiating markets have different skills than those who know how to improve existing markets. Improving existing markets involves improving details. For new markets, creativity and imagination are more important.

The Importance of Time

Time is the most important resource and greatest expense for creating new markets, and it should be measured by time to market acceptance. The sooner you reach market acceptance, the sooner you can reach market dominance, and the sooner you can move to the next new market.

AOL Gets the Jump on Competitors

In 1993, AOL started to distribute its software on free disks through direct marketing. The company used magazine "out-serts," direct mail, and handouts at book and appliance stores. The plan was to make the software easy to install and to increase brand awareness. A 1 percent rate of response is usually good in direct marketing, but AOL was getting 10 percent. The only question was how long it would take AOL's competitors to respond.

Time was a critical resource for AOL because it protected its market lead. Every day, AOL expected a response from Prodigy or CompuServe, but they were slow to respond. "It was like a blessing from heaven every minute that went by and that didn't happen," said AOL's marketing director.

At the same time, AOL's new users were increasing at a rate that was almost too great to sustain. AOL could only handle a certain number of simultaneous users, and when the total number of users reached 274,000, the system would fail. Time ran out in February 1994, and the service began to fail. There was an uproar as people who were used to getting an immediate response from AOL couldn't get online. But, all the users that AOL had been signing up over the previous months, with the free disks, were not switching to its competitors. Still, that time buffer would mean nothing if it couldn't fix the problem of new members not being able to get online.

Balancing Resources and Opportunities

(continued from page 2)

Time can also be a barrier to competition. If you move swiftly to domination of new markets, other companies have to speed up to your pace to compete.

Know When to Say No

Experience will teach you to recognize failures, learn from them, and move ahead before wasting any more time, money or people on a market that will not work.

It is also critical to balance opportunity costs with resources. By using resources on one opportunity, they are unavailable for another. Instead of jumping from opportunity to opportunity and wasting resources, learn how to pick the right problem on which to expend your resources. ■

It's The Problem That Matters

You do not find new markets. You create them by finding the solution to a problem that people want resolved. In other words, a new market exists at the convergence of a **high level of perceived need** with **a solution that did not previously exist**.

The phrase "did not previously exist" is key. Many managers are trained to sort through pre-existing options for solutions. Managers who create markets look for completely new solutions.

A "high level of perceived need" is also key. Often, products are sold by focusing on the pain of a problem. Companies create pain, make an existing problem seem more painful, or find problems that are already painful to customers.

Eventually, customers will compare one pain with another. If another has priority, your product or service may lose out.

For example, slippery floors in grocery stores can lead to lawsuits from customers who fall and hurt themselves. These lawsuits are painful to the stores. One company developed a no-slip floor coating for grocery stores to eliminate the risk of lawsuits.

Grocery stores, however, did not perceive the pain of lawsuits to be worth the cost of the floor coating. They decided their money could be better spent elsewhere, and the floor coating product did not survive.

The best option is to determine the high priority problems or pain that already keep your customers awake at night. Those are where customers will invest scarce resources.

Choosing the Right Problem

There is always risk in solving problems. Frequently companies pick the wrong problems and their new markets fail.

You have three options to finding the right problem:

1. Anticipate future problems.

2. Create problems.

3. Ask customers about problems.

The most common approach to choosing the right problem is to **anticipate future problems**, that is, to anticipate what will likely hamper the success of your customers. This is appealing because managers are knowledgeable about the concerns of their clients.

In 1977, Chrysler predicted the need for a fuel-efficient van with the walk-through features of a regular van, but small enough to fit in a garage. The company started development of the minivan, despite the fact that there was no market for it, and it worked.

But often, as with the DeLorean, predicting a market before it becomes real produces failure. It is too risky.

Some companies choose to **create and control serious problems**, then provide the solution.

(continued on page 4)

It's The Problem That Matters

(continued from page 3)

When AT&T broke up in the 1980s, Pacific Bell continued to service the telephone line from outside houses to the central office for free, but started to charge for line service inside homes, causing a new problem for customers. Pacific Bell then created a market by proposing the solution of charging a small monthly fee for service on the inside line.

The risks in this strategy are that you may create competitors if the cost of entering the market is low, and customers may refuse to accept your solution to the problem and choose another solution.

The least risky way to choose the correct problem is to **find a problem**. Asking customers — or prospects, if the new market will involve new customers — is the best way to find serious problems that customers are willing to pay to solve. Consistently asking customers "What is the right question to solve?" will eventually uncover a natural focus to products development. The risks are that you might not know what to ask, and you might not like the answer.

Conducting informational interviews is an effective way to pursue this strategy. Do not limit yourself to known customers, especially if you want to develop a new market among new customers. Answers from customers who have chosen not to buy from you in the past can also be very useful.

When conducting information interviews, come prepared with several questions, but only ask two focused questions. Here are some samples of questions that you might choose:

- **What keeps you up at night?**
- **Why should your customers buy from you? Why do they buy from you?**
- **Why do you lose customers?**
- **Where is the next market that this company wants to enter?**
- **If you could wave a wand to solve any problem, which problem would it be?** ■

FedEx: Investing in the Wrong Problem

In 1984, FedEx tried to create a second market of instant document delivery by sending facsimile transmissions across the country for same-day delivery. Unfortunately for FedEx, the technology it had bought for this new market, fax machines, became available to its customers at very low cost. FedEx spent five years and more than $300 million to solve a problem that customers did not rate highly. If FedEx had been willing to accept that it had invested in the wrong problem earlier, the company would have avoided a great loss.

A Solution in Search of a Problem

Webvan is an excellent example of a company that tried to create a new market and dominate it, without addressing a problem that was significant to the customer. The founders identified a new niche — delivery of groceries ordered from the Web. They built the infrastructure, and in an informal survey, target customers indicated they were attracted to the service and valued it highly.

The company was very successful in taking care of the customers. Customers could decide when they wanted their groceries delivered. Webvan provided fresh meats, produce, and high-quality nonperishables. Drivers climbed stairs if it was necessary, and delivery was free if you bought a reasonable minimum. Prices were competitive and ordering was simple. Webvan was treating its customers well, had no serious competition, and it had an excellent infrastructure. Webvan should have had a winning solution, but customers stayed away in droves, and by 2001 the company ran out of cash and closed.

Why? Webvan was a wonderful solution that did not have a problem. The solution made sense to the company, but its prospective customers didn't feel strongly that they had a problem to be solved.

For a chart showing top operational problems, go to: http://my.summary.com

What New Markets Are Available to You?

Working systematically to create and dominate new markets, you can consciously choose one of four paths:

Path 1. A new product to an unknown customer set.

Path 2. A new product to a known customer set.

Path 3. A known product to a known customer set.

Path 4. A known product to an unknown customer set.

Which path you choose will depend on the circumstances of your business, but understanding the path you are on will allow you to avoid distractions and increase your chances of success.

Different Paths, Different Risks

Creating and dominating new markets is easier when

(continued on page 5)

What New Markets Are Available to You?

(continued from page 4)

you start with either products or customers that you know (Paths 2 and 4), but not both (Path 3). Known products and known customers are difficult because you will rely too much on past experience and market knowledge instead of creating a new market. Knowing either products or customers, however, reduces risk because you have some knowledge and experience.

Here are the advantages and disadvantages of the four paths:

Path 1. New product, unknown customer set. The combination of new products and new customers is very exciting because it allows the most creativity. But the challenge of defining customers who have never existed for a product that has never existed makes this the hardest and riskiest strategy.

Mosaic/Netscape Communications succeeded when it created a new market for a Web browser at a time when most potential customers did not know what the Internet was. The company had to create a need for a Web browser and a new product.

One problem with having both unknown products and unknown customers is that you don't know which features to include in your product or service because you are not working on a specific, well-defined problem.

Path 2. New product, known customer set. Working with unknown products but known customers is a much easier strategy because you can go directly to the customers and ask which problems matter to them.

When Edwin Land developed the instant camera for his company, Polaroid, he had a specific customer group in mind: hobbyist photographers. When you know your customers and know what they want, the biggest risk is not being able to provide the product or service to solve their problem. In 1964, AT&T, which had nearly every home in the country in its records, defined customers for a new market of Picturephones. They were never able to make the technology work, and so were never able to create their new market, despite knowing the customers.

Path 3. Known product, known customer set. Managers believe creating a market with known customers and known products is an obvious strategy. Unfortunately this minimizes the risks too much and often ends in a line extension instead of a new market. When VaxGen spun off from Genentech to make a vaccine for HIV in 1995, they did so to get away from the parent company's experience and knowledge of treatments that sell and the customers that buy them. VaxGen did not want to mimic past successes to create a new market.

Path 4. Known product, unknown customer set. Unknown customers and known products is another way to reduce risk. It is not easier than creating a new product for known customers, but this route to building a new market is more likely to succeed.

In the 1980s and 1990s, analog cellular handsets were becoming obsolete in the United States and Europe. Many companies built digital handsets and infrastructure, which was a very expensive and extensive process. Motorola took its cellular phones to developing China where there were millions of unknown customers.

The risk of failure in creating and dominating new markets is directly proportional to your lack of knowledge about the products and markets you are addressing, as well as the tendency to let yourself be defined by your past knowledge. If you can overcome these two challenges and focus on solving the customer's problem, you will be ready to create a new market. You may fail more often than you succeed, but the successes will be well worth the effort. ■

The Role of the Customer

All new markets are risky. Even Cisco Systems Inc., which is known for reading customers and being a market creator and leader many times over for its Internet infrastructure products, has failed. In 2001, the company discontinued an optical router because the market was growing too slowly, and ultimately had to write off nearly half a billion dollars. What appeals to the inventor does not necessarily appeal to the market.

(continued on page 6)

The Role of the Customer

(continued from page 5)

When looking for how to make products appeal to the market there are three strategies:

1. **Shaping the market.**
2. **Predicting the market.**
3. **Asking your customers to help.**

Shaping and Predicting Markets

Shaping the market involves positioning the product so that customers view the need for the product the same way you do. The problem is that your company is usually not the only party positioning and shaping the market. There will be competition in positioning because anyone can try to affect the market, and usually the winner is chosen on the merits of the positioning, not of the product. In addition, customers are seldom willing to let you lead them with positioning.

Another strategy is to **predict the market**, as many companies did in the late 1990s and early 2000s when they anticipated a market for Web-enabled telephones. Companies created cell phones that navigated the Web and sent e-mail. But no one wanted to use their cell phones for surfing the Internet.

Predicting markets is risky not only because no market may develop, but because your timing may be off. Correctly predicting a market at the wrong time is just as bad as predicting the wrong market.

Bring in Your Customers (or Prospects)

The best strategy is to involve customers in creating new markets.

Some visionaries at companies, such as Microsoft and Wal-Mart, have developed ideas for new markets and succeeded without involving the customer. Many people have tried to emulate them, but most have failed because starting with a vision is an extraordinarily high-risk strategy for creating new markets.

Asking customers for help, however, can be difficult because customers do not always know what they want in a new market.

When America Online (AOL) asked people if they needed an online service, customers said no. When customers were offered the opportunity to join an informal group of people to chat, or to have a way to send quick notes to family and friends without having to buy stamps and mail letters, they responded positively. Consumers didn't care about the product. They cared about the effects that the online services could provide. You cannot rely on customers to tell you what product they might buy, but you can rely on them to explain their problems and the solutions for which they are willing to pay.

Funding the New Market Effort

Creating and dominating new markets cost money, time and people. It is important to consider how to generate enough resources to subsidize a new market. One idea is to use an opportunity database that allows you to market more cost- and time-effectively to prospects.

An opportunity database can help fund new efforts by changing how you focus on prospective customers and helping your sales team call on the best prospects first, while avoiding prospects who will not be good customers.

Traditionally, prospects come in randomly, as demand-generation programs, such as advertising, trade shows and direct mail, uncover them. Building an opportunity database is a more systematic approach to prospecting.

First, the database of your customers is mined to identify key common denominators that impact their purchasing decisions. Next, you build a database of prospects that includes all likely prospects in a universe. Based on the research into your own customers, you assign each prospect points according to the value of the opportunity.

The opportunity database allows you to identify prospective customers with the most intense needs — the ones who are most likely to buy and are less price sensitive. By selling more and discounting less to the best prospects and customers, the increased profit can be used to create and dominate your new market without stealing from the current one.

Three Steps

There are three steps to letting customers help build new markets:

1. Make sure that your business understands the problem as the customer sees it. Ask customers about the problems they have, not about products.

2. Find out how prospective customers define success for solving the problem, even if they do not understand the issue itself. As you survey potential customers, common themes will begin to develop about how the problem's solutions are viewed.

3. Quickly bring a product to market that clearly addresses those success criteria effectively. Being first to market is not enough. First to market acceptance is the goal.

Involving the customer increases the cost in time, people and money of entering a new market. It also requires discussing problems without solving them or trying to sell products. But the benefit is the ability to get to market acceptance more quickly. ■

Building and Dominating Markets Through Involvement

After creating a market, your company will not necessarily dominate it. Perrier, the pioneer of bottled water, does not dominate that market.

Pitfalls that can occur after building a market include the good chance that your product will not be 100 percent what your customers want; they might decide they want something else. There is also the possibility that customers will stay loyal to themselves and their needs; not loyal to you as you improve and change the product.

Personal Involvement

One way to avoid these pitfalls is to provide ways for customers to become personally involved in the product, making them active partners in building the market and allowing you to reduce risk.

Having customers involved in defining their own experience is a common denominator among many companies who create and dominate markets. If users can easily adapt products to individual needs that the supplier never considered, even when the supplier uses a sophisticated technology, the customers make the product more meaningful to themselves.

Some products, like LEGO bricks, do not even need technology. Everyone who plays with the plastic bricks and puts them together in his or her own way is self-tailoring the experience.

Start at the Design Phase

Building involvement into products should happen when you start designing products for new markets. Begin by accepting a wider definition of the word product that includes everything that customers experience in their relationship with you and your business, including advertising, handling complaints, and offering support. All of these parts of the product can be tailored to the individual needs of customers.

Involving customers is less expensive in time, people and money if it is built in from the beginning. No matter what your product is, position it to be customer involving. Users will find applications that you never considered that could give you increased sales or create another new market. ■

The Role of Information Technology

Information technology (IT) does not build markets, but it can play a role in creating and dominating new markets by helping to solve the customer's problem.

Customers Don't Always Want More Technology

Even though technology allows you to involve the customer, do not confuse technology with the effect that customers want. The early Palm Pilots were far simpler than the technologically sophisticated Apple Newton, but Palm was able to create the market. Invest in features your customers will use, not in features you think they should have. Do not create a product that is so complicated to install or use the first time that the customer never gets a chance to use it. A key difference between AOL and Prodigy in the 1990s was AOL's focus on a "brainless" installation. People and businesses do not buy what they cannot use, and there is no point in stifling a promising new market because only technically adept people can participate.

Technology as Solution

When Sony made the personal radio, it identified a potential gap between what consumers could have and what they wanted. That potential became a market when Sony used the technology of transistors, which already existed, to create a product to fill that gap. A successful company starts with the potential and applies the appropriate technology, not vice versa.

As you look at technological innovations, do not make the mistake of forgetting the problems your customers are trying to solve. If they can be solved without the latest technology, forget about technology.

For instance, Wal-Mart chose to shut down its Web site two years in a row as it entered its most profitable season, Christmas. Why? Wal-Mart wanted to invest in technology that expanded retail locations and put more merchandise on the shelves instead.

In some cases, you may need technology to help solve customer problems, but not necessarily the newest and fanciest technology available. Focusing on the trendiest technologies may get you funding today, but when trends change, you may get left behind. Choosing comfortable technologies instead can decrease the risk to your plan by letting you save time and money using what you know.

The bottom line is that the key to new markets is solving a problem that customers have, not the technology that is used.

Other Ways Technology Can Help

In addition to solving customer problems, technology can help support your market-creating efforts in other ways.

(continued on page 8)

The Role of Information Technology

(continued from page 7)

For example, IT can be a tool for market creation when a company is expanding geographically. Woman's Hospital in Baton Rouge, La., is using technology to provide fetal monitoring services in remote areas of the state, so that it can provide the service to more women.

IT can also help with market creation by identifying new markets within existing customers. Cisco Systems was already winning eight out of ten sales from the IT functions in its corporate customers. To grow the business, it needed a product that would attract sales from other departments in those corporations.

Cisco developed a software called Metro that enables executives and managers to do all expense reports online. This product helped Cisco reach a new customer base within its corporate customers: general business managers. ■

Using Credibility

New markets must be based on believable and convincing ideas to attract potential customers. There are many ways to add credibility to your new market effort. Some effective methods may seem counterintuitive.

Viral marketing conserves resources because it requires little cost, replicates itself with no effort by the sponsor, and works automatically. As with Napster Inc. or the fax machine, viral marketing creates a situation where the product is so attractive that not only do people want to have it; they want others to have it. The problem with this kind of marketing is that you might lose control of the marketing effort.

Another way to add credibility to your new market effort is to **choose the right customers**, particularly the first customers.

If your first customers are respected in the industry, others will want your product as well. Centric Software Inc. has been creating a market for collaborative manufacturing and supply software for automobile and airframe manufacturers. Having Volvo and United Airlines as initial clients is more useful to them than Hyundai or a third-world airline carrier.

The same is true of investors. If you are supported by risky companies, prospective customers may view your ideas and business as risky.

Production trials are another method to achieve credibility. Even influential customers don't add credibility if they buy out of curiosity, but never use the product.

Laboratory-style trials are usually conducted outside the normal production process. With production trials, the product test is conducted with the users and process that will benefit from them. They allow the vendor to test the product in the real world, and allow the customer to see that it works. Production trials cost a lot of time and money, but a successful trial can significantly reduce time to market acceptance.

Ironically, creating and dominating a market can leave you with no competitors to validate your work or make your company seem more real. However, many users, great investors or influential customers can overcome the need for competitors, so it is not necessary to invite them into your new market. ■

What's Next?

Whether your company is growing rapidly or dealing with belt-tightening and disruption, it is still able to create and dominate new markets. Changes in demographics, growth, recession and dislocation can all increase your chances for success.

Demographics. Always assume that your client base is shifting, especially as the demographics of the market at large are shifting. Nontraditional families are multiplying, baby boomers are aging, and abroad, war and the spread of HIV are crippling economies. All of these changes can create opportunities for new markets as populations develop new needs.

Growth. Many people are overwhelmed by the perception that everyone is creating new markets in a growth period and that there are none left. However, most companies competing to produce the next best thing are product-focused. By focusing on the problems of potential customers instead of products, you will have much less competition. Stick close to customers and work to discover solutions to their two or three top needs.

Recession. Recessions provide opportunity, because there is so much pain. Problems that were not critical during the good times are suddenly more important. Resolving pain is a good place to start creating and dominating new markets.

Dislocation. Dislocation, disruption and consolidation also provide opportunities for new markets. As businesses grow and move, they have new needs. As old technologies are replaced by new ones — though the average level of service stays the same — new opportunities can open up during the transition. Although messaging needs remained constant, a new market for e-mail products was created (at the expense of the old fax technology).

The Bottom Line: Lead With Problems

Though it is still possible to create new markets during periods of recession, rapid growth and disruption, they all amplify the fundamental error of building your new market strategy on a product. If you lead with problems instead of products in all economic climates, you can be assured of plenty of opportunity. ■

THE SUMMARY IN BRIEF

Behind the problems that regularly plague families, teams and organizations are individuals who either can't or won't deal with failed promises. The reason is that they're afraid to talk face to face about difficult but important issues — and as their fear of confrontation prevents them from resolving these issues, simple problems grow into chronic problems.

By learning how to deal with challenging confrontations, you'll learn to avoid the typical, but unconstructive, response of slipping either into awkward silence or embarrassing violence.

Mastering crucial confrontations requires a skill set. In Crucial Confrontations, *consultant Kerry Patterson and executive coach Joseph Grenny join forces with their fellow researchers and trainers Ron McMillan and Al Switzler to help others develop the skills it takes to resolve the most pressing problems, including quality violations, safety infractions, cost-cutting mistakes, and medical errors. The authors write that their research shows that most organizations are losing between 20 and 80 percent of their potential performance because they have not mastered crucial confrontations.*

The skills for mastering crucial confrontations can be learned; the authors of Crucial Confrontations *show you how.*

What You'll Learn In This Summary

- ✓ How to master your emotions.
- ✓ How to describe problems in ways that don't cause defensiveness.
- ✓ How to motivate others without using threats.
- ✓ How to deal with violated expectations without harming relationships.
- ✓ How to talk to your direct reports face to face when they don't live up to a commitment.
- ✓ How to help others want to take action.

What's a Crucial Confrontation?

Sarah, the head nurse at the Pine Valley Medical Center in northwestern Washington, stands frozen as doctors discuss the treatment of an elderly patient. Years of experience have taught Sarah two things: One, the patient probably needed an immediate and large dose of antibiotics, and two, even though the doctors were discussing a treatment that *didn't* involve antibiotics, Sarah would keep her mouth shut.

Years earlier, fresh out of college, Sarah had cheerfully disagreed with the three doctors she had been assisting. They stopped dead in their tracks and looked at her as if she were a cockroach on a wedding cake. In one poignant moment that was forever burned into her psyche, the rules had been made clear to Sarah: Don't disagree with a physician — ever. Now, nearly two decades and hundreds of confirming incidents later, she stands by wondering: Will the doctors do what I believe they should do, or will they come to the same conclusion too late? She *doesn't* wonder if she should speak up. Sarah's expectations weren't met, and in response she has resorted to silence.

Silence and Violence

Staring into the face of a possible disaster, some people are caught in agonizing silence. Rather than speak directly and frankly about the problem at hand, they drop hints, change the subject, or actually withdraw from the interaction altogether. Fear drives them to various forms of silence and their point of view is never heard — except maybe as gossip or rumor.

Others break away from their tortured inaction only to slip into violence. Frightened at the thought of not being heard, they try to force their ideas on others. They cut people off, overstate arguments, attack ideas, employ harsh debate tactics, and eventually resort to insults and threats. Fear drives them to do violence to the discussion and their ideas are often resisted.

We all face crucial confrontations. We set clear expectations, but the other person doesn't live up to them — we feel disappointed. Lawyers call these incidents breaches of contract. What do you do when someone disappoints you? You could choose violence, or you could opt for another choice, like Sarah, and choose silence. But there is a method that falls somewhere between the polar worlds of fight and flight. Mastering crucial confrontations allows you to deal with failed promises, disappointments and other performance gaps.

Unless you step up to and master crucial confrontations, nothing will get better. It will be a skill set, not a policy, that will enable you to solve pressing problems.

If you can't effectively confront violated expectations, you eventually experience massive personal, social and organizational consequences. If you can't deal with performance gaps, you'll either fight or take flight. Productivity will run at half of what it should.

If you learn how to hold people accountable in a way that solves problems without causing new ones, you can look forward to significant and lasting change.

When you confront, you hold someone accountable, face to face. When confrontations are handled correctly, both parties are candid, open, honest and respectful. As a result, problems are resolved and relationships benefit. Crucial confrontation skills offer the best chance to succeed — no matter the topic, person or circumstance.

Learn how to hold crucial confrontations and you'll never have to walk away from another conflict again. ■

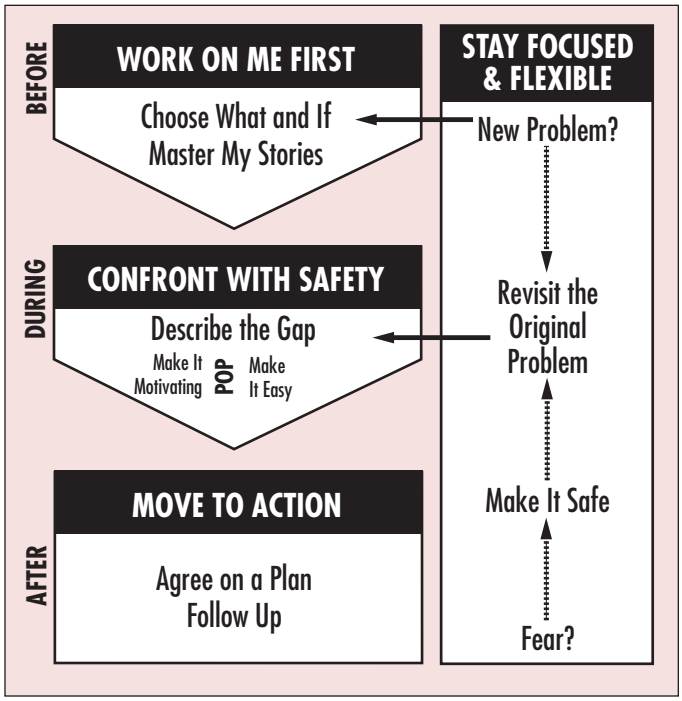
PART ONE: WHAT TO DO *BEFORE* A CRUCIAL CONFRONTATION

Choose What and If

Problems that require a confrontation with another person often leave us with two questions: WHAT and IF. First, WHAT violation or violations do you actually address? How do you dismantle a bundle of problems into its component parts and choose the one you want to confront? Second, you have to decide IF you're actually going to say anything. Do you speak up and run the risk of causing new problems, or do you remain silent and run the risk of never solving the problem?

When problems come in complicated bundles, it's not always easy to know which problems you should address. You have to identify and deal with the right problem or it will never go away.



Learning how to get at the gist of an infraction requires time and practice. Feeling pressured by time constraints and hyped up by emotions, most people miss the real deal. The ability to reduce an infraction to its bare essence takes patience, a sense of proportion, and precision. First, you have to unbundle the problem. Second, you have to decide what has you bothered the most. If not, you'll either end up going after the wrong target or too many targets. Finally, you have to be concise. You have to distill the issue to a single sentence. Lengthy problem descriptions only obfuscate the real issue. If you can't reduce a violation to a clear sentence *before* you talk, the issue almost never becomes more understandable and focused as a conversation unfolds.

Think CPR

To help hit the right target, use the acronym "CPR." The first time a problem comes up, talk about the *Content*, what just happened: "You drank too much at the luncheon, became inebriated, started talking too loud, made fun of our clients, and embarrassed the company." The content of a problem typically deals with a single event.

The next time the problem occurs, talk *Pattern*, what has been happening over time. "This is the second time this has occurred. You agreed it wouldn't happen again, and I'm concerned that I can't count on you to keep a promise." Pattern issues acknowledge that problems have histories and that histories make a difference.

As the problem continues, talk about *Relationship*, what's happening to *us*. Relationship concerns are far bigger than either the content or the pattern. The issue is *not* that others have disappointed you repeatedly; it's that the string of disappointments has caused you to lose trust in them. You doubt their competency, you don't respect or trust their promises, and it's affecting how you treat one another. "This is starting to put a strain on how we work together. I feel like I have to nag you to keep

you in line, and I don't like doing that. I guess my fear is that I can't trust you to keep the agreements you make."

If your real concern is around the *relationship* and you discuss only the pattern of behavior, you're likely to be dissatisfied with the outcome, and you'll have the same conversation again later.

To understand the various kinds of content, pattern and relationship issues that can pop up during crucial confrontations, consider these three dimensions: consequences, intents and wants. Each provides a distinct method for first unbundling and then prioritizing complex problems.

Unbundling

- **Consequences.** Problems are almost never contained in the behavior of the offender. They're much more likely to be contained in what happens afterward. The problem lies in the consequences. When you want to clarify the issue you need to confront, stop and ask yourself, What are the consequences of this problem to me? To our relationship? To the task? To the stakeholder? Analyzing the consequences helps you determine what is most important to discuss.

- **Intentions.** A fellow you work with cheerfully agreed to format a report you created, and then, instead of giving it to you, he handed it directly to your boss. You believe that his intentions were selfish (he was trying to take credit). You've drawn this conclusion as the result of mounting evidence. You've examined the problem, weighed the particulars, and are starting to believe the person's intentions

(continued on page 4)

Choose What and If

(continued from page 3)

are indeed bad. When this happens, the behavior isn't the problem, at least not the big one. What came before the person acted is the problem, at least in your mind. Intentions are the issue you ought to discuss.

- **Wants.** As you begin to unravel a bundle of problems, the list of component parts can grow so large you may not know where to begin. The best tool for choosing from the host of possible problems is to ask what you really want and don't want. And since you're talking to another person, you ought to ask what you want for *yourself*, for the *other person*, and for the *relationship*. If you don't think about all three of these essential aspects, one may take a back seat and you won't solve your most important problem.

The 'If' Question

Just because you've identified the problem you'd like to discuss doesn't mean you should actually discuss it. Sometimes it's better to consider the consequences before deciding whether to bring the issue up.

In organizations, there are reports, goals, performance indicators, quality scorecards, budget variances, and other metrics that clearly show a difference between what was expected and what was delivered. These failed promises represent clear opportunities to have crucial confrontations.

But what if the problems are ambiguous or discussing them could get you into trouble? How do you know if you're *not* speaking up when you *should*? More often than not, going to silence is the prominent issue in most families and companies. Ask the following four questions to diagnose whether you're clamming up when you should be speaking up:

- **Am I acting out my concerns?** You can't hide your real emotions. When you've gone silent, but your body keeps sending out hostile signals or you're dropping hints or relying on sarcasm, you probably ought to speak up.
- **Is my conscience nagging me?** Pay attention to a nagging conscience — it may be indicating a confrontation that you need to step up to.
- **Am I choosing the certainty of silence over the risk of speaking up?** Don't confuse the question of whether the confrontation will be difficult with the question of whether you should deal with it.
- **Am I telling myself that I am helpless?** The problem is less often that others are *impossible* to approach than that we aren't sure *how* to approach them. Know what to say and how to say it.

Speaking Up When You Shouldn't

How do you know when you are speaking up when you *shouldn't*? There are times when it's better not to bring up a problem or at least not to do so until you've done some preparatory work. If you are going to speak up when others remain silent, if you are going to hold people to a standard that differs from that of the masses, send out a warning. Differentiate yourself from others. If you are going to differentiate yourself from your co-workers by holding people to a more rigid standard, don't be smug about it. Set expectations in a way that shows respect for people with different views. ■

Master My Stories

A person's behavior during the first few seconds of a crucial confrontation sets the tone for everything that follows. You have no more than a sentence or two to establish the climate. If you set the wrong tone or mood, it's hard to turn things around.

Imagine that you are part of an overworked, stressed-out management team that is having a meeting when it gets a call from final assembly telling you that the new software IT has just created is not working.

Within seconds, the entire management team is complaining about the unorthodox, selfish, weird software

(continued on page 5)

Fundamental Attribution Error

People aren't all that good at accurately attributing causality. We quickly jump to unflattering conclusions. The chief error we make is a simple one: We assume that people do what they do because of personality factors (mostly motivational) *alone*. Why did that woman steal from a co-worker? She's dishonest.

Human beings often employ what is known as a dispositional rather than a situational view of others. We argue that people act the way they do because of uncontrollable personality factors (their disposition) as opposed to doing what they do because of forces in their environment (the situation). We make this attribution error because when we look at others, we see their actions far more readily than we see the forces behind them.

People often enact behaviors they take no joy in because of social pressure, lack of other options, or any of a variety of forces beyond personal pleasure. For example, the woman stole because she needed money to buy medicine for her children.

Assuming that others do contrary things because it's in their makeup or they actually enjoy doing them and then ignoring any other potential motivational forces is a mistake. Psychologists classify this mistake as an attribution error. And because it happens so consistently across people, times and places, it is called the Fundamental Attribution Error.

Master My Stories

(continued from page 4)

testers. Then they arise as one and march toward the testing department. As the team hustles down the hallway, you learn that the software is supposed to be tested and retested before it is sent to final assembly. The managers are feeling morally superior and are about to create a nasty scene.

The managers rush in and catch the programmers checking out a "cool new Web site with a free game download" and then they snarl at the guilty testers, call them names, threaten them with discipline, and throw a group hissy fit. It takes days for the incident to settle down, and everyone ends up with egg on his or her face.

The Path to Action

As you step up to a crucial confrontation, take care that you don't establish a horrible climate by charging in half-informed and half-cocked. It is never good to abuse, insult or threaten others. To avoid these costly mistakes, you need to work on your own thoughts, feelings and stories.

Understanding the path to action (see illustration above right) will help.

When we see or hear someone do something, we immediately tell ourselves a story about what we saw and heard. The fundamental attribution error (see sidebar on previous page) will often lead us to tell a negative story — in other words, assign a negative motivation to

The Path to Action Model

what we saw or heard. This negative story leads to negative feelings, which in turn guide the way we act in response to the original action.

Effective problem solvers observe an infraction and then tell themselves a more complete and accurate story. Instead of asking, "What's the matter with that person?" they ask, "Why would a reasonable, rational and decent person do that?" By doing this, they ensure that they are confronting a human and not a villain. Humanizing questions help you adopt a situational as well as a dispositional view of humans, thus avoiding the fundamental attribution error.

We must work on our first thought, our first look, and the tone that follows. We must learn to fight the natural tendency to assume the worst of others and engender genuine curiosity to ensure that our first words and deeds create a healthy climate for ourselves and others. When we *tell the rest of the story*, we do just that. ■

For Additional Information on the Six Sources of Influence, go to: http://my.summary.com

PART TWO: WHAT TO DO *DURING* A CRUCIAL CONFRONTATION

Describe the Gap

You've picked out a problem, decided to say something, and considered the possible influences behind it; now you are about to take action. Remember: Almost nobody should believe that he or she has been groomed to solve touchy and complicated interpersonal problems.

A gap is the difference between what you expected and what actually happened. Gaps include missed commitments, disappointed expectations, and bad behavior. A gap is something that is hard or even risky to discuss.

One bad way to begin is sandwiching. To soften a violent blow, you first say something complimentary, next you bring up the problem, and then you close off with something complimentary. "Hey Bob, good-looking briefcase. By the way, do you know anything about the ten grand missing from our retirement fund? Love the haircut."

Don't 'Sandwich'

Most people despise this type of indirectness. It is dishonest, manipulative and insulting. Don't sandwich, play charades, pass the buck, or play "read my mind." Skilled problem solvers carefully describe the gap. They:

- **Start With Safety.** When others feel unsafe, you can't talk about anything. If you can create safety, you can talk with almost anyone about almost anything — even failed promises. If you maintain a safe climate, others will hear and consider what you are saying. Maintain mutual respect and mutual purpose.

If you anticipate how others might assume the worst about what you have to say, use *contrasting*. Predict their erroneous conclusion, explain that their assumption is what you *don't* mean, then explain what you *do* mean. Discuss problems in private, one on one, face to face.

- **Share Your Path.** Gather the facts. Describe what the person did and the result. Share your story, too. Trade "You said" for "I thought we agreed." Swap "It's clear" for "I was wondering if." If you start to share your story and the other person becomes defensive — take away his or her fear. Step out of the content and restore safety.
- **End With a Question.** To close your opening paragraph, end with a simple diagnostic question: What happened? Make this an honest inquiry, not a veiled threat or an accusation such as: "What's *wrong* with you!" Your goal should be to hear the other person's point of view. Listen carefully as the other person answers the question.

(continued on page 6)

Describe the Gap

(continued from page 5)

Your direct report fails to show up at an important meeting and you don't think he missed it on purpose. You have no story. You invite him into your office, safely describe the gap, and end with a question.

"Chris, I noticed that you missed the meeting you had agreed to attend. I was wondering what happened. Did you run into a problem of some kind?"

You take the other person to a private setting, describe the facts (what was expected versus what was observed), and end with a question. And now you are listening to diagnose the underlying cause. By describing the gap, you have started on the right foot and are now ready to diagnose what's causing the problem. ■

Make It Motivating

Myra, an employee who works for you, failed to complete an important quality check. You observed the gap, decided to deal with it, and tried to determine the right problem to discuss. Since this was the first infraction, you've decided to talk about the content: She didn't complete the quality check. You admire Myra, and so it is easy to impute good motive. Now you describe the gap. After your brief and effective problem description, Myra responds.

How Myra responds to your description of the gap will determine what you do next. She determines your path, not you. You'll learn where you're going by diagnosing the underlying cause of the problem. Is it a matter of motivation, ability or both?

Knowing how to bring to the surface and resolve underlying causes requires a great deal of skill. If you miss a single ability barrier, the other person won't be able to cooperate. If you misinterpret the underlying motivational block, you'll be pushing the wrong buttons.

When the other person isn't motivated, we must make it motivating. Here are four things to keep in mind:

- **Consequences motivate.** Motivation isn't something you do to someone. People already want to do things. They're motivated by the consequences they anticipate. And since any action leads to a variety of consequences, people act on the basis of the overall consequence bundle.
- **Explore natural consequences.** Begin by explaining natural consequences. Within a business context, this typically includes what's happening to stakeholders. Stakeholders include other employees, customers, share owners, communities, and regulatory agencies.
- **Match methods to circumstances.** How you choose to talk about consequences depends on the circumstances you're facing. When people simply want to know, explain both what needs to be done and why. When dealing with someone who is pushing back, resist the temptation to jump to power. Search for consequences that matter to the other person.
- **Finish well.** Finally, wrap up the conversation by determining who does what and by when. Then set a follow-up time. ■

Make It Easy

Kyle, a political analyst who works for you, was supposed to write a position paper for an upcoming debate and get it to you by noon, but he didn't. You call him in for a private discussion and describe the gap. He lets you know that he really wanted to do what he promised and says it wasn't his fault that he didn't. The specialist who conducts the statistical analysis was hospitalized with a burst appendix, and she's the only one who understands the data.

In any case, Kyle was prevented from doing what he agreed to do. And then he did exactly the right thing. He immediately called to let you know about the problem, but you were in a meeting across town. He left a message on your voice mail and then tried to track you down. In short, he wasn't *able* to meet his commitment and did his best to let you know. This was definitely not a motivation problem. Kyle needs help removing the barriers he's facing, not a kick in the pants.

You have carefully described the gap and are listening to see if the problem is due to motivation or ability. If the other person is facing ability barriers, it is your job to make it easy. Do this by making impossible tasks possible and nasty tasks less nasty.

Jointly Explore Root Causes

Resourceful problem solvers don't remove barriers all by themselves. They involve others and jointly explore root causes. You should do the same. Take care to avoid jumping in with your own solutions. Empower others by allowing them to take part in diagnosing the real causes and coming up with workable solutions. Ask others for their ideas. Remember the all-important question: "What do you think it'll take to fix this?"

Stimulate the Brainstorming Process

Sometimes the other person won't be able to identify all of the causes of the ability barriers. Jointly explore the underlying forces — include self (they don't have the skills or knowledge), others (friends, family or coworkers are withholding information or material) and things (the world around them is structured poorly). When necessary, stimulate the brainstorming process by offering your own view of what some of the barriers might be.

(continued on page 7)

Make It Easy

(continued from page 6)

Once you have finished identifying and removing ability barriers, "*pop* the question." Check to see if the other person is willing to do what's required once you've taken steps to enable them. Just because they *can* do something, doesn't mean they are willing. ■

Stay Focused and Flexible

You are talking to an employee about missing a deadline and he becomes insubordinate. Your head accountant clams up when you ask her why the end-of-month reports aren't ready. Then she gets angry. What do you do when the person you are confronting strays from the point, screams or sulks?

When new problems emerge, remain flexible enough to deal with them — without getting sidetracked. Each time you step up to a new problem, it should be by choice not by accident. Choose, don't meander.

Example: People Feel Unsafe

When people feel unsafe, honest dialogue comes to a screeching halt. Fear and the resulting silence or violence are the emergent problems. Step out of the conversation, create safety, and then return. Point to your shared purpose. Assure the other person that you care about what he or she cares about. Apologize when necessary.

When people don't deliver on a promise because "something came up," deal with it. Companies that continually allow things to come up without dealing with the breach of promise don't survive very long. Things do come up. You have to be strong and flexible. You have to be able to bend but not break. At the heart of every workable accountability system is the sentence: "If something comes up, let me know as soon as you can." If mistrust becomes a new problem, there must be consequences.

Sometimes a worse problem comes up in the middle of a crucial confrontation. For instance, you're the only female member of a team and you are talking to a co-worker about the fact that he is not performing agreed-upon tasks. During the conversation, he leans too close to you and leers at your body. You try to address the issue with a casual remark, but he says, "Forceful women are a bit of a turn-on."

To deal with this tricky problem, start by announcing the change in topic. "I'd like to talk about what just happened." Next, pick the problem you want to discuss, take charge of your feelings, tell a more accurate story, then describe the gap. "You just made reference to your 'turn-ons,' you moved so close to me that I felt uncomfortable, and your eyes were moving up and down my body. What's going on here?"

When a worse problem emerges, step out of the original problem, leave a bookmark so you'll know where to return, and then start over with the new problem. Once you've dealt with the emergent problem, return to the original issue.

When others become upset, retrace their Path to Action to the original source. Talking about the facts helps dissipate the emotions and takes you to the place where you can resolve the problem. ■

PART THREE: WHAT TO DO *AFTER* A CRUCIAL CONFRONTATION

Agree on a Plan and Follow Up

During a formal review discussion, Barb said to Johnson, her direct report, "During the next quarter I want you to use more creativity. You know, come up with more ideas on your own."

In an effort to be more creative, Johnson did indeed come up with more ideas on his own, just as he was asked to. He also implemented many of his ideas without involving Barb or anyone else. He interpreted the request to be more creative as permission to do pretty much whatever he pleased.

When Barb eventually learned that Johnson had changed the company's entire inventory system and hadn't given her so much as a heads-up, she blew a gasket and told him that he had gone well beyond his authority. He responded by arguing that he was just trying to be more creative and now she was taking him to task for doing what she had asked him to do all along.

The assignment included who was going to do what by when, but the details about the *what* were not clear. She told him to be creative, but that term is far too subjective — an accident waiting to happen.

We create these problems all the time. We finish a perfectly good crucial confrontation and then make sketchy plans that are peppered with vague, unspoken and unshared assumptions.

A complete plan, in contrast, assumes nothing. It leaves no detail to chance. It sets clear and measurable expectations. It builds commitment and increases the likelihood that we'll achieve the desired results. It also enables both parties better to have the next discussion — for accountability, for problem solving, or for praise.

The Solution

The key to making a complete and clear plan, free from all assumptions (and thus improving accountability), is to make sure to include four key components:

- **Who.** Someone's name must be attached to each

(continued on page 8)

Agree on a Plan and Follow Up

(continued from page 7)

task. If a task requires many hands, each person needs to know what his or her part of the assignment is.

- **What.** Barb needed to provide a detailed description of the exact behaviors she was looking for. When you are deciding exactly what to do, don't take the *what* for granted. Ask if everyone has the same characteristics in mind. Clarify details in advance.
- **By When.** Be specific. If you need it before 5 p.m. on Friday, say so.
- **Follow-Up.** Decide when and how you will follow up on what is supposed to happen. When choosing the frequency and type of follow-up, ask these questions: How risky or crucial is the project or needed result? How well has this person performed in the past? How experienced is this person in this area? The two most common methods for checking on progress include scheduled and critical event follow-up times.

Do a *checkup* when you are giving the assignment and are nervous or have questions. You are in charge of the checkup. Use a *checkback* when the task is routine and has been assigned to someone who is experienced and productive. That person checks back. ■

The 'Yeah-Buts'

Many people say, "Yeah, but my situation is *really* tough. These skills will never work for me." These are not belligerent naysayers. They raise the "yeah buts" because they are trying to imagine how the skills of crucial confrontations apply to their world. Here are some of the "yeah buts" of highly reflective people:

1. "Yeah, but I'm nervous about stepping up to my boss and openly confronting her. I could pay dearly."

Solution: If the boss is authoritarian to the core, you need to choose between coping and cutting out. Ninety percent of your boss' defensiveness is avoidable. Help the boss feel safe. Don't become self-absorbed in reaction to his or her selfishness. Use more empathy. Step away from yourself and consider how the problem behavior is affecting *the other person* as well as how it's affecting *you*.

2. "Yeah, but the people I work with are perfectly comfortable violating standards. I don't want to say anything because I don't want to be the odd person out."

Solution: Acknowledge competing motivations. Humanize those who might be leaning in the wrong direction. Say, "I know it's inconvenient to suit up for quick and unobtrusive exams." Then eliminate a possible misunderstanding with a contrasting statement: "I don't want this to come off as an accusation; it's an honest question. Aren't we supposed to (fill in the blank), or are there circumstances I'm unaware of?"

3. "Yeah, but my spouse never wants to talk about anything. He tells me not to worry or not now."

Solution: This pattern is killing the relationship. Talk about the pattern. Acknowledge any complaints the other person may have about what you may be doing to drive him or her to silence. Frame the conversation as an opportunity to solve problems *the other person* cares about. Acknowledge some of the things you've done that might be contributing to the problem. This creates safety. Let the other person pick when you will talk. Try to resolve the issue. Don't try to "fix" the other person.

4. "Yeah, but what do you do when you don't actually see the problem? How do you handle hearsay?"

Solution: Master your own story. Refuse to accept other people's gossip as fact until you gather firsthand information. Observe the problem on your own. Then you can describe the problem in detail.

5. "Yeah, but what if the feedback you want to give could crush the other person?"

Solution: Begin having crucial confrontations about single areas that could use some improvement. Praise the person's willingness, then explain that there is one thing you'd like to see improve. Provide clear, direct and detailed feedback in that area alone. Once the person has improved in that area, pick another problem and work on it. Over time, if the person hasn't been able to improve, you will have earned the right to have the larger relationship conversation.

6. Yeah, but what if a person is totally out of line most of the time but threatens to file a grievance if you confront her, and she could win?"

Solution: Resolve to hold the employee accountable. Meet with human resources and jointly develop a plan. Inform the employee that the action he or she has selected isn't acceptable and will no longer be tolerated. Assure the person that your goal is for him or her to succeed. Describe the relevant natural consequences of the employee's current behavior. Document the discussion. Confront the first infraction immediately and then start down the path of discipline. Don't be held hostage.

7. Yeah, but we're making a break with the past. How do you change the rules in the middle of the game?"

Solution: Confront the past. Without singling anyone out, outline for people the natural consequences of how things have been. Illuminate your general vision of how things are going to be in the future with specific, identifiable and replicable actions. Clarify do's and don'ts. Only after you've clarified your new expectation do you have the right (and responsibility) to begin having crucial confrontations with those who violate the new standards. ■

Death By Meeting

By Patrick Lencioni

Patrick Lencioni is founder and president of The Table Group, a firm dedicated to helping leaders improve their organizations' health since 1997. His principles have been embraced by leaders around the world and adopted by organizations of virtually every kind including multinational corporations, entrepreneurial ventures, professional sports teams, the military, non-profits, schools, and churches.Lencioni is the author of ten business books with over three million copies sold worldwide. His work has appeared in the Wall Street Journal, Harvard Business Review, Fortune, Bloomberg Businessweek, and USA Today.

Copyright © 2007 by Patrick Lencioni • Jossey-Bass

How to Solve Painful Problems in Business

It's a phrase that has been thrown around office buildings for years. "Death by meeting" refers to the lamentation of having to come together to share, discuss, or work on a problem too frequently for the team member's taste. Author Patrick Lencioni used to hear complaints about meetings and find that phrase "understandable and even humorous." Over time, though, he changed his tune. He saw this attitude as "a sad comment on the state of our business culture."

Those who are leaders or managers of organizations "are not paid for doing anything exceedingly tangible or physical, like delivering babies or kicking field goals or doing stand-up comedy." Meetings are where the work is done. In a sense they are the stage, field, or operating room of managers and leaders. Despite this, "most of us hate them." But meetings are essential to the running of an organization. They are critical to decision-making, innovation, feedback, and progress. We need meetings to make good decisions and to lead organizations successfully. Meetings themselves are not the problem.

In ***Death by Meeting: A Leadership Fable About Solving the Most Painful Problems in Business,*** Patrick Lencioni lays out a "contrarian, non-traditional view of meetings" to take "what is now painful and tedious" and transform it "into something productive, compelling, and even energizing." On top of that, organizations that follow Lencioni's guidelines will no longer be wasting "time, energy, and enthusiasm lamenting the drudgery of meetings" like their competitors and will thus gain a competitive edge. Presented in parts as a fable and as direct guidance, Death by Meeting is a path for any manager or leader to find more effective ways to meet with staff and "restore some of the passion" that is sorely missing from these encounters.

The Fable

Casey McDaniel was a modestly successful pro golfer turned entrepreneur with the successful launch of Yip Software, which created lifelike sports video games aimed at adult athletes. Ten years into the company's history, outsiders would observe that the company, who regularly eked out a profit and threw an annual company picnic, could have been far more success-

ful under the leadership of "a more focused and disciplined" person. Staff were "merely satisfied," not thrilled to be part of the Yip team. A major part of the problem was how leadership managed weekly staff meetings. They were "lethargic, unfocused, and passionless."

Eventually, the culture of the entire company began to "mirror those meetings." A "subtle mediocrity pervaded the organization." A new executive surveyed staff and found that morale was low. Lower than anyone realized. This unnerved the other executives and they began searching for answers. CEO Casey landed on a solution. He announced that he was taking the company public so that employees could reap the financial rewards he assumed they were seeking. Unfortunately, he would live to regret this decision.

During the process leading up to the initial public offering, Casey received a call from a leading video game company interested in acquiring Yip. Casey figured this would be a way to get "the best of both worlds." The company's staff would get the financial gains they deserved and he would not submit himself to the whims of a board of directors or the public. Casey offered it to them under three conditions: he would continue to run his company autonomously, he would retain his entire management team, and he would be allowed to keep the Yip name as a separate, wholesome, sports-oriented brand." To his surprise, the acquiring company agreed.

A rep from the parent company's executive team visited the Yip office to observe a staff meeting. Needless to say, he was totally unimpressed with what he saw. Casey received the news that this person would be attending meetings for the next several months, though the purpose was not yet explained. Around the same time, Casey's longtime assistant put in her notice as she was heading to bed rest with a complicated pregnancy.

Casey hired the son of a family friend who was taking a break after finishing grad school to fill in and in doing so, caused an inadvertent turning point. The new assistant was named Will and he was described by all who knew him as "intensely magnetic." He was overly qualified for the job and Casey encouraged him to step up and get involved outside of typical admin duties. Casey had no idea how that suggestion would change everything in the coming months.

After attending a few weekly meetings that were unproductive, boring, and pointless, Will got to thinking that the meetings were the root of Yip's problems. He presented a theory to the executives that meetings are boring when they lack conflict. He suggested that the Yip executives seemed to avoid "crucial conversations" just as they were beginning to get good. They presented dry, straightforward information, often reading directly from a report or data set, and no one was ever compelled to submit a question or challenge a position.

Instead, they should be mining each other's opinions to find where they differ and airing them all out. It should be a "passionate, unfiltered, messy, provocative discussion" that does not necessarily end in consensus. After all, reaching true consensus is highly unlikely. Instead, the leader should make a sound decision after someone has made a compelling enough argument to convince the leader to go with their solution. Once that decision is made, the entire team should rally around it, no exceptions.

Will also suggested a new model for meetings. He said that a once weekly, one-size-fits-all meeting was the wrong way to organize the executive team's time. To the initial chagrin of all involved, Will proffered that having more meetings that were more deliberately planned and executed would make way more sense. From daily five minute check-ins to quarterly off-site reviews, Will laid out a plan to totally revamp Yip's meeting culture and organization. After a bit of a rocky start, the team got into a flow with the new meeting model. Revenues grew, decisions were clear, and the company progressed forward and intact. The Model, as Lencioni calls it, can be implemented in any organization to make meetings meaningful.

Problem #1: Lack of Drama

Lencioni asserts that "meetings are not inherently boring." On the contrary, they should be exciting, and productive, and meaningful. After all, they bring together a group of diverse people to solve problems and create solutions that are directly tied to how they make a living. The stakes are actually quite high and the work being conducted in these sessions is entirely relevant to each participant. It is a perfect scenario for a lively exchange where individuals state their case and reach a conclusion. But instead, they are often tedious, boring, and unproductive. One of the reasons they fall so short of their potential is that most of our meetings lack drama or conflict.

The author draws a connection between movies and meetings. He points out that both are about two hours long yet if asked which they would prefer to do for two hours, most people would jump at the movie and run away from the meeting. Why? "Because screenwriters and directors figured out long ago that if you avoid nurturing conflict in your story, no one will want to watch your movie. And they also figured out that it is during the first ten minutes that they must use drama to hook their viewers, so they are willing to stay engaged for another two hours." We must hook our meeting participants and find ways to inject drama in order to make meetings effective.

Meeting participants need to be "jolted" right from the get go when a meeting is commenced. The leader of the meeting has to set up what is at stake and make it compelling. The leader may need to "illustrate the dangers of making a bad decision," for example or "highlight a competitive threat that is looming." Staff are not expecting a stage set drama "but they're certainly looking for a reason to care." It's the leader's responsibility to give them that reason.

Once the scene is appropriately set, the leader of the meeting must actively look for opportunities to do what Lencioni calls "mining for conflict." When a team of smart people are gathered together to hammer out issues that really matter, it is completely normal and natural for there to be disagreement. In fact, the resolution of those disagreements is what leads to better decision making and "what makes a meeting productive, engaging, even

> In the absence of conflict, resolution is often never found, which can later impact team productivity

fun." In the absence of conflict, resolution is often never found, which can later impact team productivity negatively.

A leader has to actively look for "any important issues about which team members do not agree" and then ensure that the disagreement is hashed out, even if it makes the leader "temporarily unpopular." Over time, team members will become more comfortable confronting issues and working them out. The result will be far better than pretending the problem does not exist. Lencioni says, "I believe far more suffering is caused by failing to deal with an issue directly–and whispering about it in the hallways–than by putting it on the table and wrestling with it head on."

Problem #2: Lack of Contextual Structure

The other major type of problem related to how most organizations conduct meetings is that they lack structure. And the "single biggest structural problem facing leaders of meetings is the tendency to throw every type of issue that needs to be discussed into the same meeting." In an effort to save time, leaders often schedule a regular weekly or biweekly meeting that covers everything possible from sales strategies to budget reports. They do this so that team members can knock it all out at once and get back to their so-called "real work." The end result of such a model is that it "only ensures that the meeting will be ineffective and unsatisfying for everyone."

Should meetings be "informative and quick," "interactive and strategic," conversations about "company culture and people," or just vehicles to "make clear decisions and move on?" Lencioni says all are true. "There should be different meetings for different purposes" and each of them should serve "a valid and important function." Meetings should fall into four different types.

The Daily Check-In is a five minute, standing meeting where key leaders share what they are working on that day to avoid confusion about how to prioritize actions. The Weekly Tactical meeting runs sixty to ninety minutes and begins with a "Lighning Round" where each attendee takes just sixty seconds "to quickly describe what is on their respective plates," which is then used to create an agenda for the meeting. Participants then strive to resolve issues ensuring they only focus on things that are of immediate concern.

The Monthly Strategic is the meeting where leaders get together and "wrestle with, analyze, debate, and decide upon critical issues that will affect the business in a fundamental way." Topics should be limited to only a few and each topic should be given at least two hours to hash out. These are the meetings where participants engage safely in "open-ended conversation and debate."

Finally, the Quarterly Off-Site Review gives "executives an opportunity to regularly step away from the daily, weekly, even monthly issues that occupy their attention, so they can review the business in a more holistic, long-term manner." These meetings should be full of "reflection and discussion" on topics like personnel, culture, strategy, competition, and other broad categories that impact the team and the organization in the long run. These meetings also serve as a means to improve relations between team members and unity among the team as a whole.

When seeing the title of the book, most people assume that Lencioni's book would be about how to have fewer meetings, not more. When they learn that it is actually a prescription for having more, they react negatively. This is because of the damaging myth we have around meetings. We think they are time wasters. And unfortunately, in many organizations that is in fact the case. But the problem is not the number of meetings or how long they are. The problem is that they are organized, led, and managed in the wrong way.

In ***Death by Meeting,*** Lencioni offers leaders a structured approach to meetings that will make them engaging, productive, and informative for all involved. His model promises to reduce wasted time, improve decision making, and bring teams closer together. But that's not all. When meetings are chronically mismanaged, they "exact a toll on the human beings who must endure them." The ramifications of this extend far beyond the business itself. Staff will certainly feel dissatisfied in the immediate term, but they may also end up feeling angry, lethargic, and cynical towards each other and the organization. This bleeds into their personal lives, as well, impacting "self-esteem, families, and their outlook on life."

Lencioni does not exaggerate when he claims that his model for meetings can positively impact us and the lives of our people. Yes, above all leaders have an obligation to the business but in looking out for the business, they can also take care of their people. This will breed a positive feedback loop that improves business to improve the people, which improves the business and so on. When leaders choose to overcome the ugly "death by meeting" condition of their organization they can learn to change meetings into a productive, useful, and even fun part of business and life.

Management: Strategies

The Dream Manager

by Matthew Kelly

THE SUMMARY IN BRIEF

Managing people is difficult. With disengagement and turnover on the rise, many managers are scratching their heads wondering what to do. It's not that we don't dream of being great managers, it's just that we haven't found a practical and efficient way to do it. Until now …

The fictional company in *The Dream Manager* is grappling with real problems of high turnover and low morale — so the managers begin to investigate what really drives employees. What they discover is that the key to motivation isn't necessarily the promise of a bigger paycheck or title, but rather the fulfillment of crucial personal dreams. They also learn that people at every level need to be offered specific kinds of help and encouragement — or our dreams will forever remain just dreams as we grow dissatisfied with our jobs and lives.

The Dream Manager explores the connection between the dreams we are chasing personally and the way we all engage at work. Taking on the growing problem of employee disengagement, *The Dream Manager* explores the dynamic collaboration that is unleashed when people work together to achieve company objectives and personal dreams.

IN THIS SUMMARY, YOU WILL LEARN:

- How a company can become the best version of itself by helping employees become better versions of themselves.
- How to change the way you manage and relate to people.
- How to recognize the dreams of those that you lead.
- How to inspire your people to achieve their visions.
- How to unleash the power of dreams to keep your business going.

The Dilemma

The future of your organization and the potential of your employees are intertwined; their destinies are linked.

An organization can only become the best version of itself to the extent that the people who drive that organization are striving to become better versions of themselves. This is universally true whether the organization is a business, school, government, nonprofit or sports team. To the extent that a CEO, an executive team, and a group of managers and employees explore their potential as individuals, so too will an organization explore its potential.

Disengagement

The problem is that the great majority of people in the workplace today are *actively disengaged*. This is the dilemma that modern managers face. To varying extents, people don't feel connected to their work or the people they work with. No single factor is affecting morale, efficiency, productivity, sustainable growth, customer intimacy and profitability more than this disengagement.

If, on average, your employees are 75 percent engaged, disengagement is costing you 25 percent of your payroll every month in productivity alone. The real cost to your business is, of course, much higher when you take into account how disengaged employees negatively affect your customers and every aspect of your business.

The right people are an organization's greatest asset. We may have acknowledged this truth in theory, but we have not allowed it to sufficiently penetrate the way we manage our organizations and, indeed, the way we manage the people who drive them.

It's not that we don't want to engage the people who work with us and for us. In most cases it seems that we simply have not found a practical, efficient and affordable way to do it.

The Dream Manager

The Dream Manager concept provides a revolutionary way of reversing this crippling trend toward disengagement and demonstrates how organizations large and small can actively engage their people once again, thus creating a competitive advantage of monumental proportions.

BusinessWeek reports that, over the next 10 years, 21 percent of top management and 24 percent of all management jobs across all functions, regions and industries will become vacant. Add to this trend an aging population, a shrinking work force and a growing intolerance for the undocumented worker population that provides much of the unskilled labor in the United States today, and you have a talent and labor crisis of enormous consequences across all disciplines — from the highly skilled to the completely unskilled.

But it is not enough simply to hire the right people. The ability to attract, engage and retain talent will be the number one strategic objective of every successful modern leader and organization.

Purpose

A company's purpose is to become the best version of itself.

What is an employee's purpose? Most would say, "to help the company achieve its purpose," but they would be wrong. That is certainly part of an employee's role, but an employee's primary purpose is to become the best version of him- or herself.

Contrary to unwritten management theory and popular practice, people do not exist for the company. The company exists for people. When a company forgets that it exists to serve its customers, it quickly goes out of business. Our employees are our first and most influential customers.

Finding a way to create an environment that helps employees become the best version of themselves, while at the same time moving the company toward the best version of itself, may seem impossible to many; to others, these purposes may seem diametrically opposed; but in reality, they are astoundingly complementary.

This is the story of how one leader and his executive team set out to transform a business by actively engaging a disengaged work force.

PART ONE: DESPERATION

Something was wrong and Simon Roberts knew it. Meandering slowly through traffic on another cloudy morning, he started wondering where life was going, and his thoughts quickly wandered to his job. It seemed so transactional now, and that left him feeling flat and unmotivated. Simon wasn't a lazy person; he loved a good challenge. But lately he'd found himself disengaging from his work, and that bothered him. Something needed to change — he just wasn't sure what it was, or where to start.

He had joined Admiral Janitorial Services four years earlier because solving problems and working with people were the two things Simon was passionate about.

His business card read "General Manager" but as Simon reflected on the past four years, it seemed he had spent most of his time dealing with recruiting issues. "Lead Recruiter" seemed more accurate since, truth be told, 75 percent of his time was spent dealing with issues directly related to turnover.

Admiral Janitorial Services had an annual turnover rate of 400 percent, just above the industry average. Needless to say, team spirit and employee morale were low.

How Much Is Turnover Costing Us?

"It's costing me a fortune," Greg said as he charged through the door. He never had learned to knock, but then again, he owns the company.

Greg founded Admiral when he was just 17 and, over the past 25 years, he has grown the business from a one-man operation to a small army of around 400 employees.

"What's costing you a fortune?" Simon volleyed, though he knew exactly what Greg was talking about.

"Turnover!" Greg said, visibly exasperated.

Coaches and CEOs

A football coach's number one priority is to attract, develop, nurture, organize and motivate the franchise's talent. Coaches and team owners are intimately aware that the future success of their organization depends on the talent they attract, engage and retain.

Finding and nurturing talent is their number one priority. Why should the priorities of a CEO or manager be any different?

"It's hard to know how much this is costing us," Simon said. "We are having to hire for some positions three times a quarter. And it's not just recruitment costs. Turnover affects morale, efficiency and customer relationships. I've been telling you for 12 months that it's a big problem."

Greg nodded. "I know, I know. It's just that now we're starting to lose clients over it. I had a call from Charlie down at P&G today, telling me we're getting a warning letter putting us on a 90-day probationary period. He says our work has been sloppy and they've noticed a constant flow of new faces, and they feel like things are falling between the cracks."

"I wish a pay raise would make them stay, but I'm not sure," Simon replied. "Let's find out what's causing the turnover. Let's find out why they're leaving."

"How will we find that out? Greg asked.

"We'll ask them," said Simon.

Ask Your Employees

The next morning, Simon and Greg met at First Watch to talk more about their turnover problem. It was a relaxed environment.

"So you're just going to go around and ask them why people are leaving?" inquired Greg, half serious and half sarcastic.

Simon replied, "The employees know things about our business that we don't. We should do a survey and ask them why they think so many people come and go. You'll be amazed at what they'll tell us. Nobody knows the business like those who work in the trenches of it every single day. Ask your employees. They know more than you think."

The Initiative

The number one reason people didn't stay at Admiral: transportation.

"They don't live near where they work. Many don't have cars or even a driver's license, and they're often working at hours when public transportation is either not available or just too dangerous. Would you want to stand around waiting for a bus in some parts of town?" Simon explained to a disbelieving Greg.

"OK, so what do we do now?" Greg asked.

Simon explained, "My team has thrown around a few ideas, including coordinating a carpooling system, but it's too unpredictable. What we need to do is put together a shuttle system to bus our employees from their neighborhoods to the job sites."

"All right," Greg agreed reluctantly, "but if you're wrong …"

Simon cut him off. "No more threats, Greg, because the truth is, I'm miserable the way things are. If we can't get at this turnover issue, you won't have to fire me — I'll quit."

The following week, the shuttle bus system was announced. Three weeks later, it was fully operational. During the day, Admiral would bus employees to and from certain locations in four key neighborhoods, and at night they would bus them to and from their homes.

The results were almost immediate.

One Year Later

Over the next year, employee turnover fell from around 400 percent to 224 percent. Real progress had been made. A record profit had been posted, and Simon and Greg both knew that the reduced turnover was the biggest contributing factor. And the other factors were all derivatives of having addressed the turnover crisis.

It was also interesting to note that sick days were down 31 percent from the previous year and lateness had been reduced by 65 percent.

Simon left a report outlining these results on Greg's desk, and left the office.

The next morning, Greg came into Simon's office with a bonus.

"I want you to know I doubted you at every turn, but the survey and the shuttle bus ideas were great. I actually see the reduced stress among people. It's more enjoyable for me to come to work and, even though at times I can be rude and impatient, I want you to know that I am grateful."

Simon could barely believe his ears.

"I need you to do another survey!" Greg barked.

Simon just about fell off his chair. "You hate my surveys."

"I know. I know. But that was in the past. I hated your surveys when they were costing me money. Now they're making me money. Find out what's next on the list," Greg said.

"What list?" Simon asked, toying with him a little.

"The 'Why people leave Admiral' list!" Greg insisted. "And hire another assistant. You're going to need one. We are going to get to the bottom of this turnover thing and build an extraordinary team." ●

PART TWO: THE INITIATIVE

Simon was determined not to lose the momentum. He called an executive meeting to ask the question … again. "Why do so many people leave Admiral?"

Most just shrugged their shoulders and said, "If we could pay them more, they would stay."

Sandra Anderson was Simon's new assistant and he had asked her to sit in on the meeting with him. Not easily intimidated, she spoke up, saying, "The problem is, they don't see any future in it. It could be a dead-end job, or we could make it a stepping-stone."

Everyone in the room knew that. It was the obvious answer. But the leadership team had become immune to it. It had been overlooked because they believed they couldn't change it.

"These people all have dreams," Sandra explained. "We need to find a way to connect their job today with their dreams for tomorrow. I've been studying the turnover reports all week, and it seems that, on average, we keep an employee for about six months. A year ago, the average was three months. Imagine if we could increase that to three years. That alone would radically transform our whole business model."

"She's right," interjected Simon. "I think we can help our employees build a bridge between their NOW and a better FUTURE. Dreams are the bridge. We need to convince them that this is not a dead-end job, and the only way to do that is to demonstrate that working here can help them get where they want to go."

Dreams Drive Us

Nothing was resolved when the meeting came to an end. Simon trudged back to his office a little deflated. The past year had been filled with great progress, and that had been both fulfilling and exciting. But he knew he was up against another brick wall. This time it wasn't with Greg — it was with the team.

"What are you thinking?" Greg asked, poking his head into Simon's office. He sat down and Simon began to speak.

"If you ask people to talk about their jobs, they usual-

ly reply with a rote answer or a sales pitch they've given a thousand times before, unless they are really doing something that they're passionate about. But if you ask people to talk about their dreams, in most cases you'll see a remarkable increase in their passion and energy."

"So what are you saying?" Greg asked.

"I think Sandra is on to something here. Dreams drive us! We have to find a way to make a connection between people's daily work and their dreams," Simon explained.

Making the Connection

The following week, with Sandra's help, Simon put together another survey.

They called it the "Dream Survey." It was specifically designed to develop an understanding of the employees and their dreams.

"We've asked them about our business, and we've asked them why they think people leave Admiral. Now we need to know what drives our employees," Simon explained to Greg and the rest of Admiral's leadership.

The Dream Survey had only one question: "What are your dreams?"

Some employees wanted to go to college, others wanted their children to go to college. Some wanted a car, others a vacation. What was the most common dream among the employee responses?

Home ownership. More than 60 percent of those who turned in their surveys included the desire to own a home as one of their dreams.

Seeking a Dream Manager

"We need a Dream Manager!" Simon announced.

"Who or what is that?" Greg asked, in a tone that wavered between curiosity and sarcasm.

"A Dream Manager is someone who will help our employees achieve their dreams," explained Simon. "The Dream Manager will meet with employees, discuss their dreams and help them put together a plan to achieve their dreams. Once a month, they can meet with the Dream Manager, assess their progress and discuss next steps. As for finding one, I'm thinking it should be a cross between a life coach and a financial adviser, because most dreams involve a financial component.

"We have to give our employees an opportunity to progress and advance," Simon continued. "When people feel they are progressing, they are much less likely to start looking around for another job. It is when they don't feel that they are advancing that they start to get restless."

"So will the Dream Manager offer career counseling?" Greg asked.

"Once every six months, an employee will have the option to invite his or her supervisor to their monthly Dream Session. During that session, the Dream Manager, the employee and his or her supervisor can discuss a vision for the employee's future — but particularly, what the next career step is and how long it will take to achieve that next step," Simon explained. "They will stay because, for many of them, this will be the first time anyone has ever really sat with them and helped them map out a future. The whole point is that, because of the Dream Manager, the job is no longer dead-end. It becomes a stepping-stone. The Dream Manager Initiative will create a connection between the fulfillment of their dreams and their work."

The Arrival

The following week, Simon interviewed 27 people for the position. Sandra had placed advertisements in all the local job-hunting outlets and the applications had been flowing in.

Sean Evans was the candidate that Simon and Sandra finally agreed to present to Greg as their number one choice. He had a degree in business, had been working as a financial adviser for nine years, had a history of drive and excellence, and his community involvement suggested he was interested in helping people.

Greg took Sean to lunch after a brief get-together with Simon and Sandra. When he returned, Greg announced that he agreed that Sean was the man for the job.

The House

Simon had known from the beginning that it was important to help some employees achieve some big dreams. He knew some early success stories were pivotal to the overall success of the program, because he knew the quicker some dreams were accomplished, the more Admiral's employees would get involved in the Dream Manager Program.

With that in mind, Sean had focused on helping Rita, an Admiral employee, find and buy a house. He was with her at every step in the process, and now it was going to become a reality. In the first few months, there had been several dreams accomplished, but this would be the first big dream to be realized.

Sean had arranged to go with Rita for the closing at the bank, and then Simon and Sandra had joined them to take Rita to her new home. As they drove into the driveway, Sean said, "Well, now it's yours!"

Rita was next to him in the front seat, beaming.

One hundred and thirty-two days after her first meeting with the Dream Manager, Rita was in her new home. With no money down and a monthly payment just slightly higher than her rent, Rita moved into the first home her family had ever owned. Rita became a living, breathing advertisement for the Dream Manager Program.

After Two Years

By the end of the second year, 11 employees were living in new homes they never thought they'd own and more than 100 employees had fulfilled the first dream on their list.

Turnover was down from 400 percent to just over 50 percent in two years.

The profits were staggering.

Greg took Simon, Sean, Sandra and their spouses to the Caribbean for an off-site strategic planning session. It was a combination of work and reward. They spent five days in Antigua. The beaches were beautiful, the weather gorgeous and the synergy among team members and their spouses was extraordinary.

Each morning, they met for breakfast and then took the meeting to Greg's suite.

Profit Sharing

Greg opened the first session by explaining how successful the Dream Manager Initiative had been and how he wanted to give some of the profits back to the employees.

He further explained that he wanted to redistribute a portion of the profits in three ways: by raising wages and salaries, creating a new bonus system and enhancing the Dream Manager Program.

Greg said, "The truth is, we should ask the employees how they think we should enhance the program. We can't underestimate how important it was that the employees got to have a say in the beginning. We shouldn't shut them out now. Let's keep them involved in the process."

"I was thinking the same thing," said Sandra. "I think it's time for another survey."

Sean stepped in now, saying, "We can put together a short report of the ideas we have come up with, ask the employees to comment on them and assign priority to each of them and let them add any other ideas they have."

They had discovered what they had already known, and found it to be as true as ever. There is no substitute for involving everyone in the process. ●

PART THREE: EXPANSION

Since getting back from the Caribbean, everybody had been asking Simon what the team had decided while they were away. Simon explained that they hadn't decided anything, only that they had come up with some new ideas for the expansion and improvement of the Dream Manager Program, and now they wanted to have the employees' input on these new ideas.

The only thing the group had set in stone while they were away was that they needed to reach full participation in the Dream Manager Program as soon as possible. At this point, only 65 percent of employees had been initiated into the program. With Sean's workload the way it was, it would be up to a year before the rest of the employees who wanted to participate were active in the program.

This backlog meant hiring at least one, and maybe two more Dream Managers. But they wanted the other employees' feedback on this, so the full-participation idea was included alongside their other ideas.

More Survey Results

The surveys went out and came back in record time and with a record level of respondents. The overwhelming majority of employees listed full participation as the number one priority of the Dream Manager Program over the next three to six months.

Greg, Simon, Sean and Sandra had come up with some great ideas, but they had missed something that might not have occurred to them had they spent six months in the Caribbean, instead of five days.

The number one request from the employees in the survey was that their children be able to meet with the Dream Manager.

"Our children need a Dream Manager," or similar phrasing, appeared on 71 percent of the surveys returned.

Culture of Dreams

Simon and his team at Admiral were building a culture of dreams. The notice board in the employee lunchroom was now covered with photos and other evidence of dreams achieved.

Each month, when the employees came to headquarters to meet with their Dream Manager, they were encouraged to stop by and check out what was happening in the lives of other employees.

The executive team had been having a series of meetings to discuss a new bonus system.

It had been 11 quarters since the birth of the Dream

Manager Program, and profits every quarter had steadily increased. Greg had been pouring money back into the program, but nowhere near as much as the profits had been increasing, and now he wanted to give back to the employees in some way.

"I don't want this to be a one-time thing," Greg said to the team. "I want us to create a structure whereby a percentage of increased profits will go to the employees every year."

"What did you have in mind?" Simon asked.

The Proposal

"Well, I was thinking we could do three things. First, an across-the-board pay increase for all employees. Next, I thought an annual bonus system based on company and personal performance. In this case, we could allocate a certain amount to each team or department, based on profit, and they could decide how to divide it among themselves. Finally, I would like to start a Dream Fund. A percentage of profits each quarter will go into this fund. Each employee can apply for a grant from this fund for the fulfillment of a specific dream. The managers and employees can vote to say who gets the grants. We could assign categories, perhaps $500, $1,000 and $2,500 to begin with."

The Dream Bonuses and pay increases were, needless to say, a huge hit with the employees, and they provided yet another injection of enthusiasm. Anyone who thought this was going to be a passing fad was now convinced that the Dream Manager Program was here to stay.

Today

Today, five years after the birth of the initiative, more than 98 percent of Admiral employees participate in the Dream Manager Program. Home ownership among employees has tripled in five years, consumer debt among employees has been reduced by 40 percent — and 2,785 significant dreams have been accomplished.

Turnover has fallen from 400 percent to just 12 percent over the five-year period, and Admiral's internal placement program accounts for 70 percent of that turnover. Gross revenue has tripled, and the number of employees has risen from 407 to 742, including 11 Dream Managers. Profits have risen every quarter since the program was initiated.

Once a month, employees meet with the Dream Manager in order to take time to dream up a richer, more abundant future for themselves and their families.

Today, the children 12 years and older of Admiral employees can meet with a Dream Manager once a month to discuss their future and their dreams.

At the last annual dinner for employees, Greg said in his speech, "Why are so many people so amazed by what we do here at Admiral? I ask myself this question all the time. Why is it so surprising to people to discover that if you treat people like people, they respond like people? Dreams are at the core of every person. It is there that our passion for life is ignited."

The temptation is to convince yourself that your employees' dreams are not relevant to your business. That is only true if your employees are not relevant to your business — and if that were true, why would you employ them?

You can ignore people's dreams, but it will be at your peril. You will pay an enormous price if you do. ●

What's Your Dream?

Dreams are invisible, but powerful. Think for a moment of electricity. You cannot see it, but it keeps everything going.

Should you doubt that electricity keeps everything going, turn off the electricity at your office tomorrow! You will find that little if anything gets done and that most of your employees will go home for the day.

So it is with dreams. They are invisible but powerful. You cannot see them, but they keep everything going.

Getting Started: Applications and Tools

You have your own dreams to dream and your own adventures to pursue. Some time today, *drag yourself* away from all that occupies your daily attention and write down your dreams. Make a list of 100 dreams. If you absolutely cannot do it today, at least take a moment to schedule it for tomorrow or the next day. And if you find yourself putting it off, ask yourself why.

Just start writing. Don't place limitations on yourself. Dream and write from that stream of consciousness, as if anything were possible.

As you write your Dream List, here are 12 areas to stimulate a good cross section of dreams: physical, emotional, intellectual, spiritual, psychological, material, professional, financial, creative, adventure, legacy and character.

For the next week, take 10 or 15 minutes each day just to read through your Dream List. Other dreams

may come to mind — add them! You may decide some dreams are not really you, or not that important to you. Delete them from the list if you wish, or leave them there so you can look back in time and see what you thought was important to you.

After one week, go through the list and apply one of the following three categories to each of your dreams: short-term (within 12 months), mid-term (one to five years) or long-term (five years or more).

The next step is to get a Dream Book. Start to write down your dreams and ponder them from time to time so that you don't lose sight of them in the midst of your daily activity.

Changing Expectations

A new breed of corporate loyalty is both possible and necessary. We simply need to change our expectations. No company can keep an employee that doesn't add value and help that company become the best version of itself. Simple economics demands that such an employee cannot remain. At the same time, a company cannot reasonably expect an employee to be loyal if that company's demands and expectations consistently lead an employee to become a lesser version of him- or herself.

The new breed of loyalty will be based upon an understanding between employees and companies of one another's purpose — to become the best version of themselves. Some may scoff and beg this conversation to return to reality — but consider the companies that find themselves on *Fortune*'s elite list of the best companies to work for. Of course they strive for and achieve better than average profits, but if you glance down the list of criteria, you'll discover a list of company initiatives that, directly or indirectly, help employees become better versions of themselves. These companies believe that if they help their employees become better versions of themselves, the company will necessarily become a better version of itself.

Corporate Loyalty

Walk through the hallways of these companies and you will see a highly evolved form of corporate loyalty emerging. These companies understand that if they help their employees achieve their purpose as individuals, the employees will in turn be more passionate about helping the corporation achieve its purpose and goals.

This new breed of corporate loyalty is the clay from which a highly evolved and cohesive type of team can be built and managed. The "us versus them" mentality that has been fostered for hundreds of years in the workplace desperately needs to be replaced by a spirit of dynamic collaboration. This level of collaboration can only be achieved when both managers and employees are convinced that each has the others' best interests in mind.

When a company's culture opposes its employees' purpose (that is, hinders employees from becoming the best version of themselves), the employees will consciously or subconsciously oppose the company's goals and objectives. This in turn will prevent the company from achieving its purpose (that is, becoming the best version of itself). The individual purposes of employees and companies are inseparably linked.

The 21st Century Manager

Many people have been putting together strategic plans for their organizations or departments for decades, but they have never created a Personal Strategic Plan.

Teach people the importance of strategic planning in their own lives and they will understand its importance in the life of your company. The same is true for dreams and goals. If you want to engage employees in corporate dreams and goals, you must first engage them in their own personal dreams and goals.

Dreams provide fascinating insights into what drives people. This is indispensable knowledge for a manager of any kind. Use employee reviews as an opportunity to take an interest in the dreams of the people who report to you.

Take an active interest in the dreams of the people on your team and in your life, encourage them to move boldly in the direction of their dreams and have the courage to share your own personal and professional dreams with them. Over time, the people who surround you will begin to do the same among themselves, and you will witness a new spirit of collaboration — and the unrivaled power of a culture of dreams.

It is a different approach. Different is exactly what is needed in the corporate arena if we are going to engage employees and build dynamic teams. So, don't be ordinary. ●

THE SUMMARY IN BRIEF

This is a book for business owners and executives who struggle to find and keep devoted employees. It's for those companies that want a more engaged workforce and a competitive advantage in hiring, quality, and performance. It's a book for leaders who want to make a case for changing how their organizations hire and treat employees. Because everything in ***Employalty: How to Ignite Commitment and Keep Top Talent in the New Age of Work*** by Joe Mull is anchored in the research and trends of what most employees want out of a job, it's also a useful tool for job seekers and career changers to better understand the conditions to seek out for the highest degree of professional happiness.

But the first thing to understand is that these three factors—an Ideal Job, Meaningful Work, and a Great Boss—work together to create a destination workplace. When they are each consistently present in the employee experience, commitment appears. That commitment, in turn and across a team, produces a multitude of desired business results, including retention, reputation, and revenue.

IN THIS SUMMARY, YOU WILL LEARN:

- How the Employalty model is a framework for creating a positive work environment where companies can attract and retain top talent.
- Employees are demanding a better work experience and want meaningful work, good bosses, and a healthy work-life balance.
- Why companies need to invest in their employees and offer competitive pay, benefits, and flexibility.
- How leaders can create a culture of belonging so their employees feel valued and respected.

Introduction

We are experiencing record-setting job switching and persistent staffing shortages across industries. Fewer people are entering the labor force, more workers are leaving, all while more and more jobs are being added to the economy. All three of these conditions are projected to continue for years.

There's another reason for so much job changing and understaffing across industries: a massive recalibration of how work fits into people's lives. Workers are demanding less suffering at work. They want more time, less stress, and better treatment. More than a decade of record-setting job changing across industries has made one thing clear: employees want a more humane employee experience.

Employalty

Employalty doesn't mean "employee loyalty." Employalty is a portmanteau of the words "employer," "loyalty," and "humanity." Employalty is the commitment employers make to consistently deliver a humane, person-centered employee experience, because that's what leads people to the highest levels of commitment at work.

Employalty is rooted in the idea that people do the best job possible when they believe they have the best job possible. Treat them better than they would be treated elsewhere, and they'll join and stay. When people join, stay, care, and try, every metric you pay attention to in your organization is positively impacted.

Employalty also creates a competitive advantage in hiring. When the people who work for you describe your organization as the very best place to work, you attract a better caliber of candidate looking for their best place to work—and you also keep good people, so you lose less time and money replacing and retraining.

The era of trying to find the best person for the job is over. You must now create the best job for the person.

We know what employees are looking for. Nearly every piece of research published in the last twenty years on attracting, keeping, and inspiring employees has pointed again, and again, and again to three primary factors: commitment appears when employees get to do their Ideal Job, doing Meaningful Work, for a Great Boss.

As we work to create destination workplaces, we must understand that while commitment isn't fleeting, it is both fragile and variable. Each person in your organization has their own internal scorecard.

In 2021, Americans quit their jobs in record numbers. But people weren't just quitting their jobs. They were changing jobs. So, let's be clear: the Great Upgrade as it should be called, has been around for a decade, has increased year over year, wasn't caused by the coronavirus, and is expected to continue until who knows when. This is not a blip or a fad.

Engineering your employee experience to align with the changing needs and values of the workforce isn't just about doing something altruistic. It's a business decision. A strategic one.

Dehumanization is the perception and treatment of people in ways that ignore and diminish their intrinsic worth as humans. In the workplace, dehumanization occurs when workers are viewed solely based on their role or functionality.

But there's one other consequence of dehumanization that may be the most pervasive and harmful. It's the belief by a portion of society that those who would no longer subject themselves to dehumanization at work—and the suffering it creates—are actually of flawed character, a phenomenon called "The Myth of the Lazy".

Perhaps the most loathsome outcome of the Myth of Lazy is that many workers get blamed for the very suffering they endure. Every employee's quest for a job that allows for a better quality of life is also a search for a workplace that recognizes and honors their complete humanity. For some business owners and leaders, this will require a shift in mindset and beliefs.

Ideal Job

If you want the highest level of commitment from your workforce, you must first and consistently commit to them, not just as employees but as human beings.

The radical disparities between what people earn and what things cost today have created suffering for many in the workforce.

After years of limiting pay, where businesses said, If we pay you more, we won't survive, the tables have turned. Now workers are telling businesses, unless you pay us more, we won't survive.

In 2018, leaders at PayPal discovered that many of their employees had a net disposable income between 4 and 6

To attract talent and inspire commitment, you must create the best job for the person.

percent.The CEO set a goal to get employees' net disposable income up to 20 percent, a figure that is often recommended by personal finance experts. Employee turnover at PayPal has been reduced by half, saving millions in staffing costs. Their customer satisfaction has gone up, too.

Note that compensation involves more than just wages. According to the Society for Human Resource Management, the most sought-after employee benefits are flexibility, health insurance, paid time off, retirement, parental leave, and life insurance.

Generous pay translates to a higher sense of duty and a higher level of effort. What sustains it over time, though, isn't the dollar amount. It's the sense of being valued and taken care of.

But a manageable workload is not just about sticking to a forty-hour workweek or implementing a shorter one. It also requires us to manage the workload that employees carry during their allotted work time.

To attract talent and inspire commitment, you must create the best job for the person. What many crave more than just a hybrid or work-from-home schedule is the freedom to figure out for themselves how, when, and where to work.

To begin offering more flexibility to your employees, you'll first want to invite employees into that conversation, so you can engineer ideal arrangements together. If you want to grant employees more autonomy via flexibility, you and the employee will need clarity on individual expectations and outcomes.

Meaningful Work

Since the mid-1970s, a growing number of researchers have been studying the idea of Meaningful Work. What's abundantly clear in study after study is that when we perceive our work as being worthwhile, important, or valued, there is a correlating positive impact on work engagement, employee commitment, and job satisfaction.

To harvest all the commitment that Meaningful Work creates, your organization must ensure people's jobs include purpose, strengths, and belonging.

By 2025, Gen Z and millennial employees will make up 65 percent of the US workforce. Among the highest priorities and most central values of these two generations is the idea that businesses should do more than sell a product and make a profit. They also want their employers to be agents of change.

When your organization demonstrates that it is truly impacting lives in a positive way, you're attending to one of the essential ingredients of Employalty. Your organization's mission must be specific, transformational, and rooted in emotion.

Purpose comes from the emotion that product or service evokes in customers when it's done well. For employees to experience Meaningful Work, you need to broadcast a specific emotional purpose that makes a difference in the lives of others.

Where most companies fall short on purpose isn't in finding the right language. It's that they fail to live that mission in their actions. This happens when decisions aren't driven by the mission. This action—managers consistently articulating how employees' work contributes to the mission—is among the most important in this book.

Another crucial tactic for fostering purpose is creating a culture of ongoing recognition. When employees are celebrated for their contributions, they experience purpose and, thus, Meaningful Work.

The very best recognition "programs" are those that trigger a manager or peer to directly acknowledge a specific and timely talent or contribution that someone made.

Purpose alone doesn't create Meaningful Work. Employees must get to do work that aligns with their strengths.

When we spend most of our time laboring to improve what we're not good at and don't enjoy, motivation decreases. While minimizing weaknesses can prevent failure, research suggests that it cannot inspire excellence.

Employees who are actively encouraged to use their strengths at work handle their workload more effectively, show lower levels of absenteeism, and describe higher job satisfaction.

As leaders, we must install ways for our team members to utilize their gifts. This requires intentionality on the part of the leader and adaptability on the part of the organization. Eschew the belief that, as job roles go, one size fits all. Every person on your team is a unique individual.

Teams play a significant role in whether an employee experiences Meaningful Work. What we know is that, in addition to purpose and strengths, employees derive fulfillment—and therefore commitment—from one more set of experiences that is central to feelings of Meaningful Work. It's a set of experiences that we'll capture in a single word: belonging.

Deloitte's researchers describe belonging as one of the most important issues for attracting, retaining, and activating employees in today's workplace.

According to Jeremy Schmidt, "The companies that are attracting talent show an empathetic and compassionate culture. People want to be treated fairly and equitably and be able to bring their true selves to work. We need to create an environment where everyone can feel 150 percent comfortable to be their authentic selves."

Belonging doesn't just lead people to stay. It's part of the cocktail of conditions organizations must foster to drive employee engagement, and thus higher performance.

When we discuss making workplaces comfortable for all, we're attempting to create an environment where employees don't experience exclusion. Organizations that establish this kind of culture are twice as likely to meet or exceed financial targets, three times as likely to be high-performing, six times as likely to be innovative and agile, and eight times as likely to achieve better business outcomes.

It's not uncommon to discover that someone on the team could be described as toxic. This person engages in back-channel communications, public or private criticism, cliques, keeping score, demeaning or dismissive comments, and pitting people against each other, among other troublesome behaviors that are detrimental and must be addressed.

Research clearly shows that diverse teams drive more revenue, make better decisions, catch more errors, and innovate more often. Team members must feel connected to the people they work with. The employee resource groups that companies have installed are one powerful way to enhance connection and, ultimately, belonging.

Connection also occurs when employees build meaningful relationships with co-workers over time. Connection occurs when team members form more sophisticated relationships with one another.

If you lead a hybrid or fully remote team, it's imperative to innovate in these aspects of belonging. How? We must get people laughing together and learning about each other beyond work topics. Beyond these virtual tactics, the number one recommendation for helping virtual teams form better connections is to try and gather in person at least twice a year.

The third element of belonging is contribution. When the individual talents, ideas, and efforts of team members are known to a team, there is understanding across the group of how that person is helping the team succeed. Be careful, though, to spotlight more than just accomplishments. Here, time and traits matter.

Great Boss

75 percent of people who quit a job say their boss is part or all of the reason why. How bosses treat the people they supervise is the single biggest influence on employee commitment. If an individual contributor is able to work to their fullest potential, it's because their boss has engineered the environment that makes it possible.

Too often those doing the hiring believe that if someone was great in a job, they'll be good at leading others who do that job. Again and again, this proves to be untrue.

So, who should we be hiring to lead teams? Decades of research in engagement, organizational development, and motivation point to three factors: coaching, trust, and advocacy.

Coaching is the act of helping someone sort through what they know, think, and feel to determine their next actions. A good coach listens intently, asks questions, and leaves the responsibility for determining next steps to the other person in the conversation. At the heart of coaching is setting aside judgment in favor of curiosity. Coaches operate with the assumption that people are both decent and capable.

Coaching is the transcendent leadership skill.

Gallup's research has found that one meaningful coaching conversation each week can have a profound impact on engagement and retention.

Great Bosses engage in ongoing advocacy for the person first, position second.

Employalty is about creating a more humane employee experience. Next, leaders must grant and earn trust.

To be a leader who earns trust, David Horsager says, several patterns of behavior are required. Chief among them is pairing competence with humility. Here the trait of knowing what you don't know is critical. Trust is also rooted in people believing what you say. For this reason, leaders and business owners must follow through on their plans and keep their promises. We must also be transparent whenever possible. Additionally, to nurture commitment, leaders must grant trust to employees often before it is earned.

In organizations where employees enjoy high amounts of trust from their leaders, workers report 74 percent less stress, 106 percent more energy at work, 50 percent higher productivity, 13 percent fewer sick days, 76 percent more engagement, 29 percent more satisfaction with their lives, and 40 percent less burnout.

Where trust is lacking, innovation can be stifled; where trust is given, innovation can flourish.

Start with the belief that your employees have integrity. Treat them as humans with scruples and employees with talents. Then define goals, discuss progress periodically, give feedback, and provide support. That's the trust recipe.

Beyond granting and earning trust, a Great Boss cares about his or her people beyond the tasks and duties of their job. Advocacy, put simply, is acting in another person's best interests. Great Bosses engage in ongoing advocacy for the person first, position second.

If having a Great Boss is a central ingredient to Employalty, then advocacy is a central ingredient to being a Great Boss. Advocacy also requires leaders to absorb blame and distribute credit. When failure occurs on a team or project, a Great Boss says "this is my fault." When accomplishments are achieved, a Great Boss is quick to say "credit goes to... ," naming a person or team.

To compete for talent, Great Bosses must become common in your organization, from the CEO all the way down to front-line managers.

Nearly nine out of ten bosses believe they are leading well, yet fewer than two out of ten employees say that they are. This gap is everywhere.

Now more than ever before, employees from all industries are rejecting unnecessary suffering at work. As such, they are rejecting, in all forms, the prospect of working for a bad boss. If you want to have any hope of attracting talent, positioning them to become psychologically committed, and enticing them to stay, you must insist on better bosses.

Implementing the Employalty Model

The Employalty model provides the simple framework leaders need to find and keep employees, unlock their commitment, and level up your company's performance. Giving employees their Ideal Job doing Meaningful Work for a Great Boss is the blueprint to getting employees to join, stay, care, and try. It's how you turn your enterprise into a destination workplace.

Your first step should be to assess the current state of your organization against the Employalty Scorecard. First, you can ask your team members. In addition you should open a dialogue with your workforce to better understand what is and is not working well across the three factors of Ideal Job, Meaningful Work, and Great Boss. You can do this via focus groups, interviews, or by adding open-ended questions to your survey that ask employees to tell you more.

Once you've gathered insight, you'll next want to create a 30-day, 90-day, and 180-day plan.

Once you've created this set of plans, begin communicating with your employees. Introduce the Employalty concept to your organization. As weeks turn to months and you execute on your three plans, periodically reassess and adjust plans accordingly to ensure you are actually improving the employee experience in each of the nine Employalty dimensions. The clearest indicators to whether your organization is getting things right or wrong are applicants and turnover.

As you grow ever closer to creating the kind of employee experience that reflects all nine dimensions of the Employ-

alty model, it's time to start using that to your advantage. Highlight the conditions you've worked to create for your employees. Share them in job postings, on your marketing channels, on social media, and with your vendors and business partners. Once you've put in the effort to make your company a great place to work, tell everyone.

Remember, great employees follow Great Bosses, not just on the job, but out the door. Keep Great Bosses, and you'll keep great employees.

Over time, an Employalty movement requires a partnership between those who lead on the front lines and those who control the resources and strategy of the organization. Like cogs in a complex machine, if one gear malfunctions, the whole mechanism goes kaput.

After years of overwork and dehumanization, employees have gotten a glimpse of what's possible as some companies started engineering a better, more humane employee experience. Now that more and more workers are seeing a new way of working, they want only that, and those who cling to the old way of doing business are struggling to do business.

Companies that embrace Employalty understand that commitment is a two-way street. If we expect people to devote their time, attention, and effort to meeting our company's needs every day, we must devote ourselves to meeting our employees' needs every day.

When employees love what they do, how they do it, and who they do it with and for, their health, well-being, and quality of life soar. They respond to these conditions with emotional and psychological commitment. That commitment, in turn and across a team, produces a multitude of desired business results, including retention, reputation, and revenue.

Remember, people will do the best job possible when they feel they have the best job possible. Commit to them, and they'll commit to you.

Joe Mull has spent more than 15 years teaching leaders how to be better bosses. In demand as a keynote speaker and trainer, he is the host of the popular Boss Better Now podcast and founder of the Boss Better Leadership Academy. He is the author of two previous books, ***Cure for the Common Leader*** and ***No More Team Drama***. Joe holds a Master's degree from Ohio University, has taught courses at the University of Pittsburgh, and previously managed training at one of the largest healthcare systems in the U.S. Joe resides near Pittsburgh, PA with his wife, three children, and a rambunctious dalmatian named Flash.

Encouraging the Heart

A Leader's Guide to Rewarding and Recognizing Others

by Jim Kouzes and Barry Posner

THE SUMMARY IN BRIEF

Encouraging the Heart is about the principles and practices that support the basic human need to be appreciated for who we are and what we do. It is not about glad-handing, back-slapping, gold stars and pay-offs. It's about the importance of linking rewards and appreciation to standards of excellence.

Encouraging the Heart has its origins in Jim Kouzes's and Barry Posner's research on the practices of individuals functioning at their personal best as leaders. Since their studies began more than two decades ago, the authors have collected thousands of best practice leadership case studies and analyzed tens of thousands of leadership assessment instruments. They have consistently found that when getting extraordinary things done, leaders follow five practices. One of the five practices is encouraging the heart.

Leaders create relationships, and one of these relationships is between individuals and their work. Ultimately, we all work for a purpose and that common purpose has to be served if we are to feel encouraged. Encouraging the heart only works if there is a fit between the person, the work and the organization.

IN THIS SUMMARY, YOU WILL LEARN:

- Encouraging the heart requires a set of recognizable, learnable and repeatable actions that leaders can take to reinforce the standards of the enterprise.
- One way to show that you care is to pay attention to people, to what they're doing and how they're feeling.
- Learning to understand and see things from another's perspective is absolutely crucial to building trusting relations and to career success.
- Personalizing is about knowing someone so well that you know what's appropriate individually or culturally.
- Stories are better able to accomplish the objectives of motivation and mobilization than are bullet points on an overhead.

THE COMPLETE SUMMARY: **ENCOURAGING THE HEART**

by Jim Kouzes and Barry Posner

The authors: Jim Kouzes and Barry Posner are the authors of the award-winning and best-selling book, *The Leadership Challenge*, with over 1.8 million copies in print. They've co-authored a dozen other books on leadership and developed the highly acclaimed Leadership Practices Inventory (LPI), the top-selling off-the-shelf 360-degree leadership assessment instrument in the world. They are the recipients of the American Society for Training and Development (ASTD) 2009 Distinguished Contribution to Workplace Learning and Performance Award. Jim Kouzes is a professional speaker and the Dean's Executive Professor of Leadership, Leavey School of Business, Santa Clara University. Barry Posner, Ph.D., is Professor of Leadership and former Dean (1997-2009), the Leavey School of Business, Santa Clara University. Jim and Barry have also co-authored the award-winning books *A Leader's Legacy*, *Credibility: How Leaders Gain and Lose It* and *Leadership Practices Inventory*.

The Heart of Leadership

Ask yourself this question: Do I need encouragement to perform at my best? When this question was asked in leadership classes, only about 60 percent reported that they needed encouragement to do their best. The question was reframed: "When you get encouragement, does it help you perform at a higher level?" This time about 98 percent said yes, and only 2 percent said no.

These responses are in line with a study by the training and development company Kepner-Tregoe, in which researchers found that 96 percent of the North American workers they studied agreed with the statement "I get a lot of satisfaction out of knowing I've done a good job."

Starved for Recognition

So we get a lot of satisfaction from positive feedback, and encouragement helps if we get it. Why, then, do we think we don't need much positive affirmation? Perhaps it's because we don't experience enough encouragement to realize how important it is. Most workers don't get much recognition for a job well done, and most managers don't give it, according to the Kepner-Tregoe study.

Only about 40 percent of North American workers say they receive any recognition for a job well done, and about the same percentage report they never get recognized for outstanding individual performance.

Only 50 percent of managers say they give recognition for high-performance. Evidently, most assume that getting extraordinary things done is just part of the job.

As the authors of the Kepner-Tregoe study put it, "Unless this issue is addressed, the goal of achieving a high-performance workplace will remain unattainable."

Just Say Thank-You

Opening up is harder for some people than for others, but major psychotherapy is not required here. It starts with what Robert Fulghum pointed out years ago in his book *Everything I Ever Needed to Know I Learned in Kindergarten*, the little reminder pinned to the wall where you're sure to see it every morning when you come to work, "Remember to say thank you!"

Study after study points out just how fundamental all this really is. For example, one survey examining employee turnover found that the chief reason people give for leaving is that they get "limited praise and recognition."

When asked what skills their managers might develop to be more effective, employees place at the top of the list "the ability to recognize and acknowledge the contributions of others."

Appreciation, acknowledgment, praise, thank-yous, some simple gesture that says, "I care about you and what you do." It's information that communicates, "You're on the right track. You're doing really well. Thanks." To deny each other this gift of positive feedback is to deny increased opportunities for success. At the heart of effective leadership is genuinely caring for people. ●

The Seven Essentials of Encouraging

While he was president of North American Tool and Die (NATD), Tom Melohn enjoyed giving out Super Person of the Month awards to employees who went the extra mile to help the company move toward its goal of high quality and no product rejects. Melohn made himself highly visible to everyone in the workplace. But more than this, he personally presented the Super Person awards with a gregarious style that was his trademark.

Through the strength of his presence, Melohn revealed that he knew what was going on, cared about people, got a great deal of pleasure from his work and took pride in the accomplishments of others.

Underlying the practice of encouraging the heart there is a set of seven recognizable, learnable and repeatable actions leaders take that make people feel special and reinforce the standards of the enterprise. When leaders do their best to encourage the heart, they:

1. Set clear standards.
2. Expect the best.
3. Pay attention.
4. Personalize recognition.
5. Tell the story.
6. Celebrate together.
7. Set the example.

These seven essentials of encouraging the heart are core leadership skills. When striving to raise quality, recover from disaster, start up a new service or make dramatic change of any kind, leaders must make sure that people experience in their hearts that what they do matters.

Leaders 'Know Thyself'

Leadership doesn't depend on mystical qualities or inborn gifts but rather on the capacity of individuals to know themselves, their strengths and their weaknesses, and to learn from the feedback they get in their daily lives — in short, their capacity for self-improvement. Leadership scholars consistently note the high correlation between leadership skills and the capacity for self-improvement.

"Know thyself" is the inscription over the oracle at Delphi. And it's still the most difficult task any of us faces. But until you truly know yourself, your strengths and weaknesses, what you want to do and why you want to do it, you cannot succeed in any but the most superficial sense of the word.

There's a rule in golf that applies equally to self-improvement: play it as it lies. For nongolfers, that simply means that you have to play the ball from wherever it lands, whether it's in the rough or on the green 10 inches from the cup. Applied to self-improvement, the notion suggests that we have to be able to identify and look very honestly at where we are right now in terms of our skills.

The information we gather in this way tells us where to start correcting, where to start building our skills and how to make the most of our strengths. ●

Alice in Wonderland

When you were a kid, you probably read *Alice in Wonderland.* Remember the croquet match? The one where flamingos were the mallets, playing card soldiers were the wickets, and hedgehogs were the balls? Remember how all the pieces kept moving and the rules kept changing all the time?

Poor Alice, she became so frustrated. There was no way of knowing how to play the game to win. There seemed no reason even to play the game. It was rigged in favor of the Queen of Hearts, anyway. And for the queen, that was really the point.

We've all been Alice at one time or another in our lives. We've been unsure where we're supposed to be going, what the ground rules are that govern how we behave or how we're doing along the way. Just when we think we get the hang of it, the boss comes along and changes everything. This is a recipe for maddening frustration and pitiful performance. Our hearts just aren't in it.

The first prerequisite for encouraging the heart is to set clear standards. By standards we mean both goals and values (or principles). They both have to do with what's expected of us, but goals connote something short-term, whereas values and principles imply something more enduring.

The First Essential: Set Clear Standards

Tony Codianni, of Toshiba America, once said: "I have a need to be personal with my folks. To me there's no difference between work and personal life. ... Encouraging comes from the heart. It's heart-to-heart, not brain-to-heart. It has to be genuine."

But don't mistake Codianni's love of people for a

willingness to forget about standards.

Exemplary leadership is soft and demanding, caring and conscientious. As Codianni puts it, "I always tell trainers in my group that they have to master the program first, and then they're free to change it." To Codianni, having a clear set of expectations about what people will achieve is part and parcel of being caring.

We can learn a lot about leadership from the Girl Scouts and Boy Scouts. In these organizations, boys and girls learn and pledge to uphold certain principles. They earn advancement and recognition for their deeds. As they achieve specific goals they earn merit badges. The badges are symbols of living up to the standards.

Goals Concentrate Our Minds and Shape Who We Are

Values set the stage for action. Goals release the energy. University of Chicago professor Mihalyi Csikszentmihalyi has studied the state called "flow" for more than two decades. Flow experiences are those times when we feel pure enjoyment and effortlessness in what we do.

Among his findings, Csikszentmihalyi reports that "in order to experience flow, it helps to have clear goals — not because it is achieving the goals that is necessarily important, but because without a goal it is difficult to concentrate and avoid distractions. Thus a mountain climber sets as her goal to reach the summit not because she has some deep desire to achieve it, but because the goal makes the experience of climbing possible. If it were not for the summit, the climb would become pointless ambling that leaves one restless and apathetic."

Though many of us perceive goals as the finish line, Csikszentmihalyi is suggesting that the important function of goals is to get us moving with purpose and energy. What's really important to being our best is concentration and focus on something that is meaningful to us.

Goals Plus Feedback Keep Us Engaged

People need to know whether they're making progress or marking time. Goals serve that function, but it's not enough simply to know that we want to make it to the summit. We need to know if we're still climbing or if we're sliding downhill. There is revealing research about the impact that clear and positive communication has on internal motivation and physical stamina.

In one study, Stanford University's Albert Bandura wanted to find out how people's willingness to put forth effort to perform a task was influenced by the presence or absence of goals and feedback. He found that people's motivation to increase productivity on a task increases

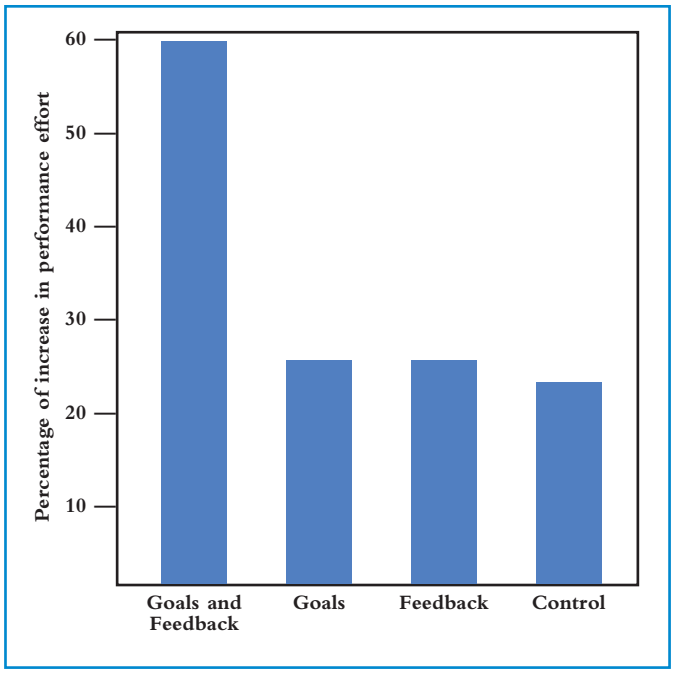

Figure 4.2

only when they have a challenging goal and receive feedback on their progress. (See Figure 4.2)

Encouragement Is Feedback

Encouragement, it can be said, is a form of feedback. It's positive information that tells us that we're making progress, we're on the right track and we're living up to the standards.

Encouragement requires us to get close to people, show that we care about them and demonstrate that we are interested in others. Because it's more personal and positive, encouragement is more likely to accomplish something that other forms of feedback cannot.

Encouraging the heart strengthens trust between leaders and constituents, a relationship that is critical to getting extraordinary things done in organizations. ●

The Second Essential: Expect the Best

Harvard professor Robert Rosenthal and co-researchers discovered that if we expect others to succeed, they probably will. If we expect them to fail, they probably will. People tend to live up, or down, to our expectations of them.

Managers communicate expectations in a number of ways. Managers with positive expectations set a climate that makes people feel more at ease. They offer positive reinforcement, give others information, give others opportunity for input and resources to do their jobs, and

are likely to lend them assistance and give them better assignments. The manager's attitude influences his or her behavior toward others, and the behavior influences the results.

Successful leaders have high expectations, both of themselves and of their constituents. The expectations that successful leaders hold provide the framework into which people fit their own realities.

People are often anxious or nervous when they are encouraged by people in leadership positions to deliver their personal best. However, surveys show that spurred on by their leaders' high expectations, they develop self-confidence that gives them the courage and volition to live up to those expectations.

Clearly, before we can encourage the heart, we have to believe in others, and in ourselves. Our belief in others has positive benefits for individual leaders, for their constituents and for the organizations they serve. High expectations matter.

Positive Images Create Positive Possibilities

Positive futures for self and others are first constructed in our minds. Unless we can see ourselves as being successful, it is very difficult to produce the behavior that leads to success. Positive images make groups more effective; relieve symptoms of illness; and enhance achievement in school, the military and business.

Exemplary leaders know how to purposefully hold in their minds high expectations for themselves and other people. ●

The Third Essential: Pay Attention

One way to show that you care is to pay attention to people, to what they're doing and to how they're feeling. If you are clear about the standards of behavior you're looking for and you believe and expect that people will perform like winners, then you're going to notice lots of examples of people doing things right and doing the right things. Paying attention is all about being curious, really. Your curiosity shows you care.

Listen With Your Eyes and Your Heart

Learning to understand and see things from another's perspective is absolutely crucial to building trusting relations and to career success. For example, studies from the Center for Creative Leadership revealed that successful executives derailed because of insensitivity and inability to understand the perspectives of other people.

They undervalued the contributions of others, making them feel inadequate. They listened poorly, acted dictatorially, played favorites and failed to give — or sometimes even share — credit with others.

The net result over time was that these traits and attitudes caught up with them. When these managers really needed the help of others around them, they were left to fend for themselves, ignored, isolated and on occasion purposely sabotaged.

Eyes-and-heart listening can't be from a distance, reading reports or hearing things secondhand. Our constituents want to know who we are, how we feel and whether we really care. They want to see us in living color. This means regularly walking the office hallways and plant floors; meeting often with small groups; and hitting the road for frequent visits with associates, key suppliers and customers.

When you really pay attention — when you're curious, when you look for the best, when you put others first, when you listen with eyes and heart, when you hang out, when you open up to and with others — then you find what you're seeking. You notice all kinds of examples of people living up to and exceeding the standards that have been set. You find lots of opportunities to recognize individuals for their contributions. ●

The Fourth Essential: Personalize Recognition

To truly recognize a person so that he or she is encouraged by your efforts, you absolutely have to know something about who he or she is — some likes and dislikes, whether the person enjoys public recognition or shirks from it, and even what he or she is or is not willing to take credit for. Failure to learn something about others can result in an act of recognition that has no meaning. In fact, it can even hurt.

Ann Cessaris of Key Communication reminds us all of another reason why it's essential to personalize, or should we say "culturalize," recognition.

"I had a client," she reported, "who was born in Asia, came to this country at age 12, and was very well acclimated to life in the United States. However, when his boss rewarded his exceptional contribution to a team project by giving him a delightful corner office, he was horrified. He felt it destroyed the feeling of teamwork and his future relations with his team members."

Cultural values run deep, says Cessaris, and she's absolutely correct. Personalizing is about knowing someone so well that you know what's appropriate individually or culturally. It's pretty arrogant for someone to assume that just because he or she is the leader he or she

naturally knows what's right for others without even bothering to inquire or observe.

What it comes down to is thoughtfulness: how much effort you put into thinking about the other person and what makes the recognition special for that person. It means observing an individual and asking, "What would really make this special and unique for this person — make it a memorable, one-of-a-kind experience?"

The Fifth Essential: Tell the Story

We're inundated with bits and bytes of information every nano-second of every day. How can we possibly sort through it all and remember even a morsel? Research clearly demonstrates that information is more quickly and accurately remembered when it is first presented in the form of an example or story.

Researchers have found, for instance, that when American history textbooks were translated into the story-based style of *Time* and *Newsweek*, students were able to recall up to three times more information than they were after reading more typical school text.

Stories are better able to accomplish the objectives of motivation and mobilization than are bullet points on an overhead. Well-told stories reach inside us and pull us along. They give us the actual experience of being there and of learning what is really important about the experience.

Because storytelling has been found to be so crucial to learning, sense making, decision making, motivating and mobilizing, it's no wonder leadership researchers have stressed how effective storytelling is as a leadership tool.

How to Tell a Great Story

Use these practical guidelines to construct a story the next time you are about to engage in an act of recognition:

1. Identify the actors. Make sure that you clearly have in mind a person (or team of people) you are trying to recognize. Name names.

2. State the predicament. Present both the problem to be solved and the standard that is at stake. It's one thing to praise people for solving a problem, but it's more powerful to also praise them for living up to the organization's beliefs.

3. Clarify the actor's intentions. In your recognition story, relate what went through the person's mind as he or she weighed the options.

4. Describe the actions. Relate in as much detail as you can what happened. It's important to describe the behaviors so the next time others are faced with a similar predicament they can have a framework for action.

5. Include the props. Like props in a play, objects are important to a story. They give detail and help people put themselves into the predicament. Objects may be inanimate or animate (as with people). There may be a protagonist and an antagonist.

6. Tell how it ended. Tell the listeners what happened in the end and why it was important.

7. Paint — or reenact — the scene. Be sure to place all of this in context. Relate when and where it happened. Talk about the surrounding circumstances.

8. Include a surprise. Every great story includes some kind of surprise. If at all possible, find a way to add an element of amazement. It adds interest, makes the story more memorable and produces more fun.

Recognition stories that include all these elements require time and preparation. Good storytelling is an art, and like any art it requires practice. But if you accept that storytelling is effective as a leadership tool, then the practice and preparation are well worth the investment.

The Sixth Essential: Celebrate Together

All individual recognitions can, in some way, be made group celebrations. When we think of celebrations, we often imagine very elaborate events. Though celebrations are often magnificent affairs, they can be very simple too. Broaden the definition of celebration to include the small as well as the grandiose. The critical ingredient is togetherness.

Celebrations Build Community

Celebrations — whether to recognize the accomplishment of one person or to cheer the achievements of many — are opportunities to promote individual health, but also opportunities for leaders to build healthier groups. Highly visible public recognition builds the self-esteem of the recipients, and it builds a sense of community and belonging, of working together to achieve shared goals and shared victories.

Terrence Deal and M.K. Key express it this way: "Celebrations infuse life with passion and purpose. ... They bond people together and connect us to shared values and myths. Ceremonies and rituals create community, fusing individual souls with the corporate spirit. When everything is going well, ritual occasions allow us to revel in our glory. When times are tough, ceremonies draw us together, kindling hope and faith that better

times lie ahead."

Celebrations increase the sense of belonging. By making achievements public, you build a culture in which people feel that their efforts are appreciated and even applauded. People who count themselves as members of this community can find meaning and purpose here.

The Seventh Essential: Set the Example

When Cary Turner took over the stores division of Pier 1 Imports, he personally called or wrote all the store managers in the company to introduce himself and thank them for their hard work. Now that he's been there for a while, according to those who work with him, he still says thank-you all the time and sends personal handwritten thank-you notes.

Small gestures, perhaps, but this is how cultures of celebration and recognition are built. One thank-you note at a time. One positive role model at a time.

Turner's also prone to the outrageous sometimes. He will accept almost any challenge to inspire and encourage associates. For instance, in December 1997, when the stores as a whole achieved a 10 percent comparative store gain, he walked barefoot on hot coals. The slogan: "We're so hot, we're cool. We're so cool, we're hot." In 1996, he made a bet with his regional managers: he'd visit all of them dressed in a chicken suit if they'd significantly increase sales. They did and he did. When a Washington, D.C., store hit $2 million in sales, and because the store manager asked him to, Turner arrived dressed as a bride to promote its bridal business. When the Northwest region increased its December sales by 11.1 percent and challenged him to do something outrageous, he parasailed over the Puget Sound and Seattle waterfront.

But it doesn't always take the outrageous to make a positive impact. Turner is well known for slapping "high fives" wherever he goes, in the stores, in the corporate office elevator and even with customers. It's his way of saying, "Thank you for everything you do." It's this enthusiastic connection that makes him approachable to the people who look to him for encouragement and inspiration.

Over and over again, it's the same story. Wherever you find a strong culture built around strong values — whether they are about superior quality, innovation, customer service, distinctiveness in design, respect for others or just plain fun — you also find endless examples of leaders who personally live the values.

Yes, it may emanate from the top, but a culture is sustained over time because everyone becomes a leader; everyone sets the example.

Credibility Is the Foundation

The recurring lesson is that it all starts with credibility. In researching the qualities that people look for and admire in their leaders, it is revealed time and time again, more than anything, people want leaders who are credible. Credibility is the foundation of leadership. Period.

Above all, people want to believe in their leaders. They want to believe that the leaders' word can be trusted, that they do what they say. The findings are so consistent over such a long period of time that this can be referred to as the first law of leadership: If you don't believe in the messenger you won't believe the message.

Leadership credibility makes a huge difference in our performance and our commitment to an organization. When people perceive their immediate managers or senior managers to have high credibility, they're significantly more likely to:

- Be proud to tell others they're part of the organization
- Feel a strong sense of team spirit
- See their own personal values as consistent with those of the organization
- Feel attached and committed to the organization
- Have a sense of ownership for the organization.

However, when people perceive their immediate managers to have low credibility, they're significantly more likely to:

- Produce only if they're watched carefully
- Be motivated primarily by money
- Say good things about the organization publicly but criticize it privately
- Consider looking for another job if the organization experiences problems
- Feel unsupported and unappreciated.

Credibility makes a difference. Among other things, loyalty, commitment, energy and productivity depend upon it. When it comes to deciding whether a leader is believable, people first listen to the words and then watch the actions. Constituents are moved by deeds. Actions are the evidence of a leader's credibility. This observation leads to a straightforward prescription for leader modeling: Do what you say you will do.

This strategy has two essential elements: the first is *say* and the second is *do*. To set an example, leaders must be

clear about their values; they must know what they stand for. Leaders must put what they say into practice. They must act on their beliefs and do.

Leaders Go First

Setting the example for encouraging the heart starts, in fact, by giving yourself permission to do so. It starts when you get personally involved.

When leaders do get personally involved in encouraging the heart, the results are always the same: the receiver and the giver both feel uplifted. ●

Finding Your Voice

You cannot lead out of someone else's experience. You can only lead out of your own.

In his witty book *Management of the Absurd*, psychologist and management consultant Richard Farson writes, "In both parenthood and management, it's not so much what we do as what we are that counts. ... There is no question that parents can and should do worthwhile things for their children, but it's what they are that will really matter. ... The same dynamic occurs in management and leadership. People learn — and respond to — what we are."

Max De Pree, former chairman and CEO of Herman Miller, the Michigan furniture maker, tells a moving story that well illustrates this point:

"Esther, my wife, and I have a granddaughter named Zoe, the Greek word for "life." She was born prematurely and weighed 1 pound, 7 ounces, so small that my wedding ring could slide up her arm to her shoulder. The neonatologist who first examined her told us that she had a 5 to 10 percent chance of living three days. …

"To complicate matters, Zoe's biological father had jumped ship the month before Zoe was born. Realizing this, a wise and caring nurse named Ruth gave me my instructions: 'For the next several months, at least, you're the surrogate father. I want you to come to the hospital every day to visit Zoe, and when you come, I would like you to rub her body and her legs and her arms with the tip of your finger. While you're caressing her, you should tell her over and over how much you love her, because she has to be able to connect your voice to your touch.'

Ruth was doing exactly the right thing on Zoe's behalf (and, of course, on my behalf as well), and without realizing it she was giving me one of the best possible descriptions of the work of a leader. At the core of becoming a leader is the need always to connect one's voice to one's touch."

De Pree goes on to explain for leaders "a prior task — finding one's voice in the first place."

Beyond Tools and Techniques

Finding your voice is absolutely critical to becoming an authentic leader. If you can't find your own true voice, you end up with a vocabulary that belongs to someone else, mouthing words that were written by some speech writer who's nothing like you at all.

Finding one's voice is something that every artist understands, and every artist knows that finding a voice is most definitely not a matter of technique. It's a matter of time and searching — soul searching.

Poet David Whyte has written "the voice throws us back on what we want for our life. It forces us to ask ourselves, Who is speaking? Who came to work today? Who is working for what? What do I really care about?" Finding your voice begins by asking yourself Whyte's questions.

It's important to answer them for yourself — to find your true voice. Because you can't lead others to places you don't want to go yourself. If you don't feel a burning passion for something, how can you inspire and encourage others to share it?

There is one truth you absolutely must confront. Understanding that the heart of effective leadership is genuine caring for people, how much do you really care about the people you lead? The question must be confronted daily, because when you care deeply, the techniques described here present themselves as genuine expressions of your caring. When you care little, they're perceived as nothing more than gimmicks and you're thought of as a phony.

You can learn to lead, but don't confuse leadership with position and place. They're not what earn you the respect and commitment of your constituents. What earns you their respect in the end is whether you are what you say your are and whether what you are embodies what they want to become. ●

THE SUMMARY IN BRIEF

What is the curse at the heart of this book? In short, as companies mature, their underlying growth naturally slows. Yet investors have come to expect continual strong growth. To meet these demands, CEOs buckle under pressure and focus on delivering short-term financial results—or the "illusion of growth." But this type of growth comes at a devastating cost. It's a distraction from developing genuine value-creating strategies.

This endless pursuit of growth is folly and unsustainable and requires a rethink about the limits to growth and how publicly listed companies are run as a consequence. It calls for the governance of companies to become more strategic so that boards have a genuine responsibility for a firm's future and prosperity. And this means the strategy process has to be more collaborative—emerging from the interaction between boards and the CEO. In ***Escaping the Growth Curse: The Path to Stronger Corporate Strategy***, authors Yves Doz and Keeley Wilson compellingly invite us to spark the collective imagination of boards.

IN THIS EXECUTIVE BOOK SUMMARY:

- Learn why stalling growth is a common issue as companies mature.
- Uncover the unrealistic growth expectations that lead to poor decisions and unethical behaviors.
- Grasp the argument for boards to shift from a passive monitoring role to a more strategic one.
- Understand the reasoning for companies to embrace strategic governance to avoid the pitfalls of short-termism.

Part 1: When Growth Stalls

There is a great delusion that companies can keep increasing their earnings year over-year. But as is becoming increasingly clear, growth is not eternal.

The Growth Conundrum

The root cause of many governance troubles is ultimately the same—stalling growth. And as companies mature, this type of slowdown in growth will be a fact of life. Yet stalling growth seems to be anathema to most CEOs and executive managers. Many influential investors have come to expect, and indeed demand, short-term quarterly growth, and so CEOs and senior executives focus much of their energy on trying to meet this expectation, with the implicit support of their boards.

The pursuit of growth has been vital at both the individual and broader economic levels for human development. It is vital to human inquiry, learning, and creativity.

Short-term growth often masks the illusion of success, sacrificing long-term value and ethical conduct for immediate gains. Leaders prioritize quarterly targets over integrity, resorting to accounting tricks and financial maneuvers to inflate results. This destructive approach undermines sustainable growth, harming shareholders and the environment. While executives benefit, shareholders and society ultimately suffer. Yet, despite its flaws, short-termism persists, driven by a relentless focus on quarterly results.

Leaders find it challenging to accept and adapt to slower growth as companies mature, requiring new competencies and board support. Without these, CEOs and executives fall into the growth trap, unable to find significant new growth opportunities. Pursuing new growth based on existing strengths is risky and complex. Companies often struggle to find new opportunities due to weak strategic assets, differing business models, or cultural rigidity.

As companies mature, they become myopic and resistant to change, focusing more on operational performance than innovation. While some companies may find new growth opportunities, the pressures of short-term earnings make it difficult for leaders to focus on long-term strategies.

The CEO's Mission Impossible: Who Would Want to Be a CEO?

Ambitious managers aspire to become CEOs, attracted by power, prestige, pay, and perks. However, the job comes with unrealistic growth expectations, incessant pressure, and relentless scrutiny. As companies mature and growth slows, these challenges intensify. CEOs often maintain the illusion of growth at the expense of long-term sustainability to avoid backlash from shareholders, the media, and their boards. The conflicting pressures and exposure make the role daunting.

The rise of celebrity CEOs and their high compensation packages further expose them to scrutiny. Despite high pay, studies show that higher CEO compensation often correlates with lower performance due to overconfidence and risky decisions. CEOs also face intense pressure from short-term earnings targets and the media, leading to increased visibility and vulnerability.

Complexity adds another layer of difficulty for CEOs. They are expected to deliver predictable quarterly growth in a complex world where traditional management tools and linear models are less effective. The VUCA (volatility, uncertainty, complexity, and ambiguity) environment leaves CEOs feeling vulnerable and anxious, making the role even more challenging.

The CEO's Wrong Response

The sense of fear and VUCA feelings (vulnerable, unaware/uninformed, confused, and anxious) that many CEOs now experience is not surprising given the significant and often contradictory pressures they face, their greater exposure, and the increasing complexity of their operating environment. As a company matures and growth slows, the alignment between leadership, board members, and investors strains, tempting CEOs to misrepresent performance to maintain the illusion of growth, compromising the long-term future of the company.

Misbehavior among CEOs ranges from short-sighted actions to ethically questionable and outright fraudulent behaviors. It is the board's duty to monitor the CEO and senior executives for signs of wrongdoing.

CEOs and managers who engage in deceit to meet market expectations are not inherently bad but may overlook their moral compass under pressure to keep investors, the board, and their reputations intact. Studies show a significant portion of leaders are involved in wrongdoing, often escalating if not caught. The scope and scale of misrepresentation can grow within an organization as managers feel pressured to meet targets.

Share buybacks are a common tool for manipulating performance targets, inflating EPS, and increasing share prices, often resulting in huge payouts for executives. However,

High-profile CEOs with a record of growing the company can be untouchable, making effective oversight difficult.

they can be value-destroying and dangerous for long-term viability. Acquisitions and divestments can also provide short-term growth while destroying value.

Misleading, borderline, or fraudulent accounting is another method to conceal bad news and meet performance targets. Engaging in these wrong responses to slowing growth can speed up a company's decline, jeopardizing its long-term future.

Under pressure, CEOs may retreat into operational efficiency, cutting long-term strategic resources. In the context of shareholder capitalism, CEOs face intense short-term pressures, lacking the skills and mindset for long-term strategy. Questions arise about who will protect the long-term interests of companies.

Part II: A New Deal at the Top

Why Strategy Matters for Governance: Broadening the Boards Mandate

Boards have become part of the problem. By adopting a passive monitoring role, many have been limited in their involvement and understanding, sometimes even unaware of brewing troubles in the companies they oversee.

If the executive management team is ill-equipped to guard against short-termism and protect the long-term future of a firm, who should take the reins? The board is uniquely positioned to navigate a mature firm toward purpose and progress. For boards to take on a more collaborative strategic role, they must overcome several impediments.

Boards face contradictory pressures and greater public scrutiny. They must balance supporting strategies for strong quarterly earnings with safeguarding the long-term future of the firm for all stakeholders.

Shareholders, motivated by self-interest and varying time horizons, often pressure boards to focus on short-term returns. Yet, the rise of shareholder lawsuits, particularly post-financial crisis, indicates growing focus on ethical and safety standards.

The relationship between a board and CEO can be challenging. High-profile CEOs with a record of growing the company can become untouchable, making effective oversight difficult.

To overcome these challenges, boards must expand their role and responsibilities, evolving from the traditional monitoring role to a more strategic one. Research suggests that boards should take on a more strategic role, including:

1. Strategic Direction
2. Purpose
3. Buffering
4. Probing
5. Measuring
6. Risk Assessment
7. Talent Assessment
8. Succession Planning

To guard against the growth curse and build a company's long-term viability, boards need to take a stronger role in strategy, requiring new skills, structures, and processes for more strategic governance.

Building an Effective Board

Despite the obvious importance of having an effective board, a rigorous set of principles and guidelines for building a high-performance board has been lacking. This requires understanding what motivates successful people to become board members, ensuring each member can contribute strategically, identifying key traits, skills, and characteristics for group effectiveness, and managing the group to maintain alignment between the CEO, executive team, shareholders, and stakeholders for the company's long-term prosperity.

Director Motivation: For boards to be effective, directors need to be impartial, engaged, and free of personal agendas.

The Importance of Strategic Minds: Directors must be skilled strategists with "strategic minds" to effectively guard the company's future.

Getting Board Composition Right: To avoid short-termism and ensure strategic governance, boards need cognitive diversity, deep and broad knowledge, industry experience, optimal board size, and appropriate length of tenure.

Leadership Unity within the Board: Effective boards require unity, fostered through open dialogue, revealing motives, aligning around common goals, and empathizing with each other.

An Effective Chair: Good chairs encourage open dialogue, collaboration, and transparency while avoiding personal agendas.

Board Assessment: Regular assessments of the board's effectiveness, including 360-degree evaluations, are essential to identify and address potential problems.

The ultimate custodians of a company should actively secure its future.

Defining the Strategic Direction

If boards are to play a more active role in safeguarding the long-term future of companies and avoiding the growth curse, then a more strategic form of governance is essential. With the average CEO tenure being around five to six years, expecting executive leadership to incorporate a long-term perspective is unrealistic.

Strategic Sensitivity-Looking Outside to Imagine the Future: To gain greater strategic sensitivity, directors need to commit additional time to analyze findings and develop a shared point of view. They can use tools and methods already in use by the company's research and innovation units.

Corporate Foresight Methods: This involves developing "what if" scenarios based on likely future challenges and opportunities arising from trends and disruptions across various areas.

Anticipating Disruptions and Inflection Points: This involves recognizing that major changes usually take years to impact.

Technology Scanning: Boards must have strategic sensitivity about emerging technologies.

Listening to Customers: Investigating customer pain points can provide insights, but boards should also consider potential customers to identify future demand.

Forward-Looking Indicators: Boards can use scenarios from corporate foresight and technology scanning to identify potential early changes and preconditions.

Learning Experiments: These provide valuable insights into future opportunities and help define long-term perspectives.

Strategic Sensitivity: Questioning Your Thinking: Enhancing strategic sensitivity requires distancing, challenging, and reframing.

Understanding the Quality of the Strategy Process

Overcoming the growth curse and setting a company on the path to a stronger corporate strategy requires not only understanding the external environment but also having a deep awareness of the strategic health of the firm. The challenge arises when management hides the company's true health behind respectable earnings.

Directors must then find ways to assess whether emerging problems are cyclical or structural and identify early warning signs to act upon before it's too late.

Inward Focus: Companies often become trapped by their success, focusing more on internal efficiencies and operational issues rather than seeking new opportunities.

Lack of Dialogue: Healthy strategy processes require open and honest dialogue.

Internal Conflicts: Companies with internal rivalries and lack of corporate coherence suffer from fragmented strategies and personal rivalries.

Narrow Framing: Companies focusing on their dominant core business may fail to embrace new opportunities.

Poor Strategic Decisions: A failing strategy process leads to poor decisions, often influenced by past commitments and entrenched orthodoxies.

Strategy Crisis: By the time a company reaches a strategy crisis, internal acknowledgment of strategic misalignment is apparent, though external perception may lag.

Getting the CEO and Executive Team Right

Good strategy emerges from the interaction between the CEO and the board, requiring collective leadership and responsibility. When boards define a long-term strategic direction and understand the quality of the strategy process, they can better assess whether they have the right CEO.

Internal candidates offer continuity, understanding the company's culture, processes, and customers. They are less of a gamble but may not be suitable if change is needed.

External candidates can provide fresh perspectives but

Companies focused on growth and renewal invest in scaling up existing assets or developing new ones.

come with their own baggage. Boards must consider whether they want the new CEO to change the company's context and culture.

Part III: Making Strategy Stronger

Strategic Assets and Strategic Options

In the search for sustainable long-term success, large mature companies need to move away from the pursuit of relentless short-term growth. Recognizing that continuous linear or exponential growth will inevitably plateau, companies must manage slowing growth in their core business while exploring strategic options for renewal.

A critical and ongoing collaborative exercise for the board, CEO, and executive management team is assessing the company's strategic assets.

Strategic assets are defined by four characteristics: they are rare or unique, distinctive and hard to substitute, not easily imitable, and not tradable. These assets include intangibles like R&D, brand, know-how, collective capabilities, culture, employee commitment, technology, and customer loyalty.

Strategic assets are dynamic and change over time. Companies focused on growth and renewal invest in scaling up existing assets or developing new ones.

However, valuable strategic assets can be squandered through ignorance and underinvestment, especially when the CEO prioritizes short-term earnings. Boards and executives must ask whether the company's strategic assets fit with the current strategy, how they may change with external disruptions, and how they can be leveraged for new opportunities.

Assessing strategic assets is challenging and should be assessed through various lenses, including input from partners, customers, complementors, and supply chains.

Underinvestment in strategic assets can lead to long-term decline, and boards should monitor such investments to safeguard the company's future. Additionally, boards must address strategic liabilities, which can hinder growth and strategic direction.

Ultimately, strategic assets are core building blocks for a company's long-term and short-term strategies.

Strategic Agility and Strategic Options

The strategic options available to a company today are narrower due to the increased speed and cycle times in the business environment, limiting the time firms have to build new capabilities and accumulate necessary strategic assets.

The three vectors of strategic agility—strategic sensitivity, leadership unity, and resource fluidity—also play a critical role in determining the company's strength. The board must understand the health of these vectors and their interactions as they impact short- and long-term growth ambitions.

Strategic Agility: This is the ability to continually seek out and react to new opportunities while withdrawing from mature businesses to avoid the growth curse. It involves three vectors:

1. Strategic Sensitivity: This is the sharpness of perception and intensity of awareness and attention.
2. Leadership Unity: This involves the ability of the executive team to make bold, fast decisions.
3. Resource Fluidity: This refers to the structural agility and processes needed to translate ideas into actions through rapid resource redeployment and capability reconfiguration.

Assessing Strategic Agility: The board must gauge the company's strategic agility by looking for symptoms of strategic rigidity and evaluating the levels of strategic sensitivity, leadership unity, and resource fluidity.

Three Vectors in Concert: Understanding the state of each vector is valuable, but analyzing their interplay provides deeper insights. Effective action requires strong leadership unity and resource fluidity to support strategic sensitivity.

Assessing Strategic Options: True agility comes from strong positions on all three vectors, offering a range of strategic

options. The board must assess the relative strength of each vector to evaluate the CEO's strategy and the company's readiness for disruptions and growth.

Revitalizing the Company for Renewal

Even with strong strategic options and a clear long-term direction, a firm's efforts at renewal and transformation can fail if there is a lack of energy and commitment. Achieving high energy and commitment is increasingly difficult due to new disruptions, technologies, trends, and demographic changes. The combination of these issues presents a significant challenge:

- COVID pandemic and changing working practices.
- Automation, AI, and de-skilling.
- Growing inequality and loss of jobs for life.
- Millennials and Generation Z.

Indicators of Low-Energy, Low-Commitment Cultures

- Lack of Purpose: Excessive operational focus leads to stress, tension, and infighting.
- Top-Down Management: Disenfranchises staff and imposes a culture of compliance, reducing autonomy and increasing frustration.
- Lack of Commitment: Fragmented organizational structures and dysfunctional communication lead to cliques and political point-scoring.
- Negative Emotional Climate: Frustration and negative emotions replace pride and purpose, leading to lethargy and resentment.
- Poor Job Satisfaction: Overwork, lack of appreciation, and barriers to performance lead to burnout and high attrition rates.

Assessing Energy and Commitment

Understanding the company's dominant logic is crucial. External assessments are often more effective as staff may not trust internal audits.

Rekindling Energy and Commitment

- Purpose: Staff need a compelling and meaningful purpose with clear goals.
- Management: Shift from top-down to bottom-up initiatives.
- Commitment: Provide the right support, structures, and processes to build trust and mutual respect.
- Emotional Climate: Foster a positive emotional environment that focuses on opportunities.
- Job Satisfaction: Ensure work is meaningful and satisfying.

To escape the growth curse and successfully navigate renewal challenges, management must inspire, engage, motivate, and instill a sense of pride and purpose in the company's employees.

Some Final Thoughts

The COVID-19 pandemic devastated physical and mental health, triggered the largest global economic crisis in recent memory, and led to unprecedented levels of public and private debt.

Additionally, Russia's 2022 invasion of Ukraine marked the first major European war in over 70 years, disrupting global food supply and deepening an existing energy crisis. Global inflation soared to 8.8 percent in 2022, up from about 3.5 percent pre-pandemic. Central banks rapidly increased interest rates, plunging millions into poverty. Financial system vulnerabilities came to light with the collapse of Silicon Valley Bank, Signature Bank, and Credit Suisse.

Geopolitical tensions increased, further strained by a retreat from globalization. Growing wealth inequality and employment uncertainty worsened societal cohesion, fueling populist movements. Environmental crises and climate change overshadowed these issues. The World Health Organization estimated air pollution causes up to 7 million deaths annually. Biodiversity loss, ocean pollution, and water shortages due to climate change exacerbated the situation. Extreme weather events cost billions and led to food shortages.

The 2022 World Economic Forum Global Risks Report identified environmental issues as top threats, with climate action failure, extreme weather events, and biodiversity loss as the most severe.

Despite these challenges, opportunities have arisen. The COVID-19 pandemic accelerated mRNA research, opening avenues for treating diseases like cancer. The war in Ukraine spurred the development of renewable energies. Climate change drove innovation in various industries, including the promise of nuclear fusion for clean energy.

Companies need to change, with some already identifying opportunities to address global challenges while gaining a competitive edge. More businesses must become forces for

good, addressing people, the planet, and the future.

Economics teaches that the search for profits is a force for good, enabling growth and innovation. However, addressing fundamental challenges requires collaboration beyond governments, involving various stakeholders, including companies.

Business leaders must consider the long-term impact of their actions and apply criteria beyond shareholder wealth. Our research found that many corporate leaders are hesitant and unprepared for this wider role. They must shift from short-termism to handling complexity and strategic surprises with multiple stakeholders.

This book highlights the need to bridge the gap between governance and strategic management. Boards must play a stronger role, providing direction anchored in long-term ambition and worthwhile purpose.

Boards should be future-oriented, guarding ethics and shielding management from short-term pressures that encourage misbehavior. Strategic governance ensures companies are better managed and better global citizens, building better societies and protecting against financialization and CEO greed. It also alleviates pressures on CEOs and their teams, fostering better workplaces, especially for younger generations prioritizing a sustainable future.

Yves Doz is the INSEAD Solvay Chaired Professor in the management of technological innovation and the Academic Committee at CEDEP. He has worked with many global corporations such as IBM, Intel, Microsoft, Nokia, P&G, Toyota and Xerox. His work with the public sector recently included advising Finnish Parliament institute. Keeley Wilson is Senior Researcher at INSEAD. Her work for the past 20 years in both research and consulting has focused on global innovation strategies, management processes, strategic alliances, and leadership challenges at a wide range of companies including HP, Novartis, Shell, Siemens, Reuters, Schneider, and Xerox.

THE SUMMARY IN BRIEF

Enterprise Rent-A-Car grew from a small leasing operation in Missouri into a private family-owned $9 billion global powerhouse in 50 years. Enterprise founder Jack Taylor and his son Andy Taylor, chairman and chief executive officer, attribute the company's success primarily to a simple yet hard-to-achieve notion: "Take care of your customers and employees first, and the profits will follow."

Exceeding Customer Expectations *traces the building of Enterprise over the years and provides insight into the time-tested strategies that have propelled Enterprise into the nation's leading car rental company.*

Among these strategies is the company's belief that winning customer loyalty is like running a marathon, not a 100-yard dash. By mastering this principle, Enterprise has earned an enviable reputation as one of the world's best companies to work for by empowering its employees, promoting from within and sharing company profits with employees. It has also won countless customer service awards and enjoyed a nearly unbroken streak of record profits.

In this summary, noted business author Kirk Kazanjian shows you how you can apply the principles of "The Enterprise Way" so your company can consistently outperform and outsmart the competition.

In addition, this summary will discuss the following:

- ✓ ***The crucial difference between "completely satisfied" and "satisfied" customers.***
- ✓ ***How to hire smart people and train them from the ground up.***
- ✓ ***The traits shared by the most successful managers to keep employees over the long haul.***
- ✓ ***How to develop differentiating features that set you apart from your competition.***
- ✓ ***The six keys to forming effective business partnerships.***

EXCEEDING CUSTOMER EXPECTATIONS

by Kirk Kazanjian

— THE *COMPLETE* SUMMARY

From the Basement to the Top

Enterprise Rent-A-Car has become a $9 billion global powerhouse, buying more new cars each year than any other company in the world. It's also the largest seller of used vehicles in the country.

How has Enterprise done it? The company has an unbending determination to keep its customers happy. At the same time, it strives to hire the smartest and most talented people possible. What Enterprise knows is that in order for employees to provide outstanding customer service, they must be both committed to their jobs and properly incentivized. The two are closely connected.

At Enterprise, having "satisfied" customers isn't enough. When you *exceed* people's expectations and bring them to the "completely satisfied" category, they are at least 70 percent more likely to do business with you again.

Does The Enterprise Way work for companies outside of the car rental industry? For an answer, you need to look no further than Enterprise itself. The Taylor family, who own Enterprise, also own and operate other diversified and completely unrelated businesses, all of which have enjoyed similar success by following these same techniques and management principles. ■

Take Care of Your Customers and Employees, and the Bottom Line Will Follow

"I didn't start out wanting to get rich," says Jack Taylor, founder of Enterprise Rent-A-Car. "Making a huge amount of money was just not high on my list. Ensuring that customers were well taken care of and that employees were happy — those were the most important things. I figured if I did those two things well, I'd make money, because I would attract customers willing to pay a fair and decent price for what I was offering."

Fifty years after Enterprise was founded on these principles, the car rental behemoth has quietly become one of the most highly rated companies in the world based on multiple measures, including customer service, financial stability and growth, employee retention and innovation.

Enterprise doesn't just want its customers to be *satisfied*. The only way an employee can be promoted is by making sure customers are *totally satisfied* and convinced that Enterprise has done everything possible to exceed their expectations. Employee promotions are based on customer satisfaction, which the company continually tracks and monitors.

Although Jack Taylor remains involved in the company, his son Andy has led Enterprise since 1980, first as president and now as chairman and CEO. "The success of Enterprise is not based on technical proficiency or a complicated business model," Andy Taylor says. "We derive our success from careful adherence to a common-sense approach: We treat our customers well, we give our employees respect and opportunities to grow, and we know that if we stick to these two rules, profits and growth will naturally follow."

Make Everyone Feel Special

Enterprise's dedication to making customers feel special is implicit in its famous slogan, "Pick Enterprise. We'll Pick You Up." The company will come get you at your house, or just about anywhere else. It's part of the company's comprehensive customer service program. Enterprise employees shake your hand and greet you by name, being professional yet friendly. And most Enterprise offices aren't very opulent, set up with

Take Care of Your Customers and Employees, and the Bottom Line Will Follow

(continued from page 2)

convenience in mind. There's a branch within 15 miles of 90 percent of the U.S. population.

Enterprise's commitment to winning repeat business is largely what differentiates it from the rest of the car rental industry. The company is singularly focused on making sure customers have a good experience and that they'll come back again.

Over the years, Enterprise has learned that there are six primary reasons people will stop doing business with you. The biggest reason: 68 percent go elsewhere because of the poor way they were treated by employees of the company. Successful retention, therefore, means building personal relationships with customers with the goal of keeping them for life. ■

For additional information on what Enterprise learned about why customers leave, go to: http://my.summary.com

Go Beyond the Call

If the employees handling your transaction at Enterprise seem more focused, engaged and, yes, brighter than those you've met behind the counter at other car rental companies, that's because those are the kind of people Enterprise intentionally hires. Enterprise isn't looking simply to hire counter clerks to check out cars. The company wants each employee to move up the leadership ladder.

Enterprise's unique structure of giving entrepreneurial freedom and sharing profits with employees has created incredible worker loyalty, fostered innovation and produced impressive results. What the company has learned over the years is that happy employees make for happy customers.

Think Ahead

After five years of selling Cadillacs for Arthur Lindburg in St. Louis, Mo., Jack Taylor was making good money. But as he contemplated his future, he began to recognize the limitations of being a car salesman. One of Lindburg's friends owned a leasing company and explained how leasing worked to Arthur and Jack.

Jack wondered why someone would buy a car if he or she could lease one instead. He was also intrigued by the potential benefits afforded to the owner of such a business. For starters, leasing companies didn't have to obtain a franchise from the manufacturer. They could open an office wherever they wanted, without geographic restriction, and had the freedom to lease any kind of car. Leasing was more flexible, enabling you to do a better job of meeting the unique needs of each customer. Jack especially loved that part of the business.

Jack asked Lindburg if he could start a leasing business, and the two worked out a deal and agreed to form a partnership for this new venture. In February 1957, Jack started Executive Leasing, the precursor to what would become Enterprise. The company operated from a basement office carved out of two car service bays in the subterranean service department at Lindburg's Cadillac dealership.

At the time, few individuals understood the financial benefits of leasing over buying. But Jack knew if he could get the ear of potential customers at a certain income level and educate them about the merits of this alternative to ownership, he had a good chance of making a sale and beating out conventional car dealers. Slowly, the business began to grow.

Surround Yourself with Like-Minded People

Jack looked for energetic, hard-working people to join the company. Most came through word of mouth, referred by mutual friends or relatives.

The men and women who came to work for Enterprise have always been taken care of by the company and given the tools and support necessary to do the same for its customers. In turn, as Jack surmised, the bottom line has more than taken care of itself.

Stand Tall in Tough Times

The real test of what a company is made of, and its commitment to employees and customers, often comes during times of crisis. Enterprise had a chance to demonstrate how it responds in such situations more than once in recent years.

One opportunity came on Sept. 11, 2001. The terrorist attacks in New York City, Washington, D.C. and Pennsylvania that morning stranded hundreds of thousands of travelers across the United States. Enterprise branches filled up with travelers looking for a way to get home to destinations hundreds, and sometimes thousands, of miles away.

Because of the decentralized nature of its business, combined with relatively low customer interest, Enterprise doesn't offer one-way or drop-off rental. But as the dimensions of the calamity became apparent, managers independently decided to let stranded customers take the cars wherever they needed to go. Headquarters quickly signed on to the plan. They determined that getting people home was the most important thing. Up to 5,000 cars were displaced as a result. It took months to get them back or sell them. But Enterprise never hesitated, in spite of the cost.

What employees wouldn't relish being able to help

(continued on page 4)

Go Beyond the Call

(continued from page 3)

people out in such a meaningful way, knowing that they had the authority to make this decision and feeling reassured that the company would back them up because they were doing the right thing? That's a big part of what taking care of both your employees and your customers is all about. ■

To Gain a Competitive Edge, Be Different

Enterprise has always tried to be very different from everyone else in the car rental business. While the most obvious difference is Enterprise's attention to service, the company also sets its products apart in other ways — the location of its branches, the professional appearance and friendly attitude of its employees and, most famously, the door-to-door service touted in its trademarked slogan, "Pick Enterprise. We'll Pick You Up."

Behind the scenes, Enterprise is fundamentally dissimilar from its major competitors. Its rental operation began by serving non-airport customers, a completely different segment of the rental market. It has a unique management and organizational structure, along with an unprecedented compensation system. Enterprise is also a privately held, family owned company, which means it isn't subject to the same pressures for quick returns and pumped up profits that much of its major competition faces.

Be Open to Opportunity

Jack Taylor viewed the car rental business as a cutthroat, crowded industry with a questionable future. To him, leasing initially seemed to be a far more attractive option. But the great thing about opportunity is that, like beauty, it is in the eye of the beholder.

Some of Jack's early leasing customers would occasionally come in looking for loaners when relatives were visiting from out of town or when the vehicles they leased were in for service. Jack started out by saying, "We don't rent cars," but then decided that he had to go into the rental business to meet the needs of his customers.

One day, Doug Brown and Don Ross, two of Jack's employees, stopped in to talk with the insurance adjuster at the insurance arm of AAA Missouri. Maybe, Brown reasoned, the adjuster would rather offer customers a rental car instead of just handing out money to pay for a rental, especially if the insurance company could better control its expenses. The adjuster agreed to give it a try.

Without realizing it at the time, Brown and Ross had just made their first sale to a vast, untapped pool of potential renters, a market that would eventually drive Enterprise to become the largest car rental company in North America. It's what is now referred to as the "home-city" market — renting to local residents who need temporary transportation due to an accident, repair, out-of-town guests or the need for a different car to accommodate any variety of needs. And it began a partnership that would fuel unprecedented new opportunities.

The rental operation began to build as the three-man rental team hit the streets to drum up business. Through diligence and determination, they had unwittingly created yet another key differentiator that set the company apart from the competition.

By 1971, Executive had five offices in St. Louis. The company changed its name to Enterprise, one of the ships Jack had served on in the Navy. Despite his initial reluctance, Jack felt that the rental business model was working well. He decided to expand this concept even further. Jack and his team began looking for the next location to move into. They wanted a mid-sized city in the Southeast that showed moderate to strong growth, and settled on Orlando, Fla. The insurance business in Florida was about to undergo a monumental change that would help both drivers and Enterprise: the enactment of "no-fault" insurance.

Pick Customers Up

Jack asked one of his best leasing managers, Bob Bell, to open the Orlando office. Jack then chose Lanny Dacus, who had joined the company less than a year before, as Bell's assistant. Dacus didn't like the thought of rental cars sitting idle on weekends because insurance companies — the majority of Enterprise's customers — were closed then.

He tried to figure out a way to turn the cars into revenue generators during this off-peak time and, in the process, helped begin a new business venture for the company: weekend leisure rentals. Dacus decided to pick up customers who were visiting the area on business, but without cars. He created a package for weekend clientele containing brochures and a map of the area showing various points of interest.

The pick-up service also proved useful as the benefits of no-fault insurance became clear to consumers. For example, small accidents that would have otherwise gone unreported were now being filed. Insurance companies couldn't keep up with the claims, and body shops were inundated with work.

Given that their customers had no cars, frustrated body shop managers and dealerships started calling Dacus, asking him to please come pick up these people. Dacus was willing to do what it took to get the business, even though providing such transportation wasn't part

(continued on page 5)

To Gain a Competitive Edge, Be Different

(continued from page 4)

of company protocol. Before long, shuttling customers became common.

Picking up customers also helped with another problem. If it was at a peak time, Dacus would offer to come pick up customers at their homes or offices — but at a time when things would likely be a bit calmer at the branch. This helped to prevent customer overload and allowed Enterprise to earn a reputation for great customer service around town. It was known as the car rental company that picked up customers. After seeing the overwhelmingly positive results, more and more Enterprise offices began to embrace this pick-up service. They came to realize it was an important differentiator between Enterprise and its competitors. It instantly gave Enterprise an advantage in the marketplace.

Take Advantage of Market Voids

While the Hertzes and Avises of the world were competing near airport runways, Enterprise was growing by leaps and bounds in American driveways. By the early 1980s, the company's core business of leasing started to share the limelight with the growing rental business. The rental side got so big that what was originally known as Enterprise Leasing (and Executive Leasing before that), officially became Enterprise Rent-A-Car.

Since 1991, Enterprise has opened an additional 5,500 branches and added an average of 38,000 cars each year to its fleet. At the same time, the home-city market has grown from $2 billion to almost $10 billion. It's only in recent years that the bigger national players have made a serious attempt to open off-airport locations as well.

Enterprise itself began opening airport offices about a decade ago, and today already has about a 7 percent to 8 percent share of the U.S. airport market segment. The airport market has grown to represent 10 percent of the company's overall revenue.

Today, Enterprise operates several other auto-related businesses — leasing (or fleet services), retail used car sales and commercial truck rentals — all of which are run under the same principles. ■

Never Settle for 'Satisfied'

As the business grew, keeping a focus on customer service ahead of profits became more challenging to consistently execute. It required putting a formalized system in place to relentlessly track customer satisfaction and ultimately hold employees accountable for delivering on the promise.

The system Enterprise built to track customer service has grown into one of the most comprehensive and effective programs of its kind in corporate America. Yet, it's also one of the simplest. The company has dubbed the program ESQi — Enterprise Service Quality index.

Every Enterprise branch is assigned its own ESQi score. These numbers are then averaged to come up with an overall company number. The ESQi score represents the percentage of customers who report being completely satisfied with their rental experience. The number is crucial, because Enterprise uses this measure as a key variable for determining who gets promoted.

When ESQi was first rolled out, many general managers thought their branches would come out at the very top of the charts. But some of the most confident ones learned the truth: They weren't doing a very good job. By the mid-1990s, Enterprise's ESQi experiment was in full swing. The more the company learned about its "completely satisfied" customers, the more it recognized their importance.

Through its ESQi surveys, Enterprise has identified six attributes that have the greatest impact on customer satisfaction. They are satisfaction with:

- Personal courtesy

(continued on page 6)

Widespread Myths About What It Takes to Make Customers Happy

Myth #1: Boosting customer satisfaction requires giving away the store.

Enterprise's research showed that outstanding overall service, not giveaways, led to higher scores.

Myth #2: Good managers already know which areas need improvement.

Enterprise proved by comparing the managers' intuitive conclusions with actual survey results that there is no substitute for statistically valid measurements. And without these measurements, it's impossible to manage knowledgeably and effectively.

Myth #3: There's not much difference between being somewhat satisfied and being completely satisfied.

Enterprise proved by tracking both survey results and subsequent behavior that completely satisfied customers are *three times* more likely to do business with you again than those who are somewhat satisfied.

Myth #4: Complete satisfaction means perfection.

Perfection is something to strive for, but it's rarely ever attained. Besides, a customer may have encountered significant problems in the transaction, yet still reported being completely satisfied, provided the problems were taken care of appropriately.

Never Settle for 'Satisfied'

(continued from page 5)

- Professionalism
- Personal timeliness of service
- Personal treatment as a valued customer
- The mechanical condition of the car
- The timeliness to complete the rental transaction.

Most of these attributes have to do with service rather than with the quality of the product. By concentrating on these attributes, groups can raise their ESQi scores. Negatives in any area are destructive to overall customer satisfaction.

Put Yourself in Your Customer's Shoes

Among the best ways to understand what customers are thinking, and therefore how you can improve their overall experience, is by putting yourself in their shoes. Workers at all levels are encouraged to constantly look around the office, hear how many times the phone rings before being picked up, look at the expressions on the faces of customers and other teammates to see whether they are smiling or showing signs of frustration, and make sure to properly greet everyone coming through the door.

Enterprise has learned through all of its processes that creating a completely satisfied customer doesn't just happen by accident. It's a deliberate process that requires continuous commitment, frequent training, constant monitoring and financial consequences for those who don't live up to the high standards of service. At the same time, the foundation is built upon those common courtesies we all expect. It really comes down to the golden rule of treating your customers the way you would want to be treated yourself. ■

For additional information on how to touch customers throughout the cycle of service, go to: http://my.summary.com

Eight Steps to Turning an Angry Customer Around

No matter how conscientious and accommodating you are, at times you will find yourself dealing with an upset customer. At Enterprise, employees are taught to do the following in an attempt to turn a volatile situation around:

1. Actively listen with an understanding attitude.
2. Record what the customer tells you.
3. Apologize.
4. Find out what the customer wants.
5. Propose a solution and attempt to get the customer's buy-in.
6. If the customer doesn't like your solution, ask him or her what a fair resolution would be.
7. Follow up by calling your customer to ensure his or her satisfaction.
8. Never let the customer lose face.

Hire and Train Good People from the Ground Up

Enterprise's growth has given it a voracious appetite for fresh, career oriented people. The company hires thousands of candidates a year for its management program. A majority of hires fall into one of two categories: recent university graduates or people wanting to begin a new career in a structured management training program.

Enterprise has more than 200 recruiters, the majority of whom work within each of the individual operating groups or regions around the world. Enterprise recruiters are a constant presence at college campuses.

The company also finds qualified candidates through its Web site, and has a paid college internship program, taking on about 1,700 juniors and seniors each year as interns and teaching them highly marketable skills relating to every aspect of running a successful business.

What attracts potential candidates to Enterprise? The opportunity to create their own career path, performance-based promotions, autonomy and the potential for substantial earnings.

Promote from Within

Enterprise's "work your way up" and "promote from within" policy assures that every field employee has been fully immersed in the company's culture and way of doing business.

In addition to allowing for continuity and rewarding hard work, promoting from within creates a much more stable work environment and fosters teamwork instead of internal jealousies and competition. Employees know that someone from the outside won't suddenly come in and become their supervisor. Everyone at the top has been exactly where they are, and each employee's hard work will be rewarded with future promotions. ■

Treat Everyone Like an Owner

Few do as much as Enterprise to truly allow employees to behave like and be compensated as owners. This feeling of entrepreneurship spurs everyone at the company to perform at their highest potential every day. And while the approach and incentives Enterprise uses might appear on the surface to be more costly than necessary, the company's innovative pay-for-performance plan is really what has made it so successful for such a long time.

(continued on page 7)

Treat Everyone Like an Owner

(continued from page 6)

Employees reaching the assistant manager level begin to receive both a base salary and a cut of the profits from the business. Indeed, Enterprise pays out almost 40 percent of all company profits to employees. While most companies see the payroll as a drag on the bottom line, Enterprise has always thrived on spreading the wealth.

Pay on Company and Individual Performance

Enterprise not only pays its people a percentage of the profits from their individual branches, but as they are promoted to the area, region and, ultimately, the group level, they receive a share of profits from all of the operating units underneath them.

One risk of tying compensation in with the profit-and-loss statement is that it has the potential to encourage short term thinking and cause one to cut corners at the expense of customer service. Enterprise keeps this in check by tying promotions in with delivering good customer service. In fact, the only way to move up at Enterprise is by wowing the company's customers.

Family Businesses Can Work Well

Enterprise today is owned almost entirely by the Taylor family. The company has become a role model for how to effectively preserve a family owned business. Such businesses generate half of the gross domestic product in the United States, hire 60 percent of American workers and create 78 percent of all new jobs. Yet only one out of every three family businesses survives into the second generation.

Today, a third generation of Taylors is working at Enterprise. Even those family members not working for Enterprise on a day-to-day basis are involved in high-level meetings about its ongoing operation. At the same time, non-family members continue to move up the ranks, with little worry the company will change its generous ownership-centered structure, which rewards them financially for excellent performance. ■

Form Strong Partnerships

Enterprise's most crucial partnerships are those with the array of insurance providers that send so much business its way. While other car rental companies covet this market and continually try to wrest market share away, Enterprise remains the preeminent leader in the insurance replacement field.

To create greater efficiencies, Enterprise set out to build what has come to be known as ARMS, short for Automated Rental Management System. At its heart, the system was designed to let insurance companies manage the entire rental process with Enterprise electronically.

Future versions would add to this experience by tracking the vehicle repair process. This would create far greater efficiencies throughout the repair, reduce friction and lower the number of bothersome follow-up calls to all parties involved, including the insurance adjuster and repair shops.

In a fairly short time, a significant percentage of all insurance companies signed on with Enterprise to use ARMS. With the rollout of ARMS underway, Enterprise took another step through the creation of preferred provider option agreements, or PPOs. These agreements serve as written understandings of what new additional value-added services Enterprise would bring to the table in exchange for suggesting Enterprise to customers with no other preference.

Continually Striving for Greater Efficiencies

The evolution of the ARMS system continues. Enterprise spends about $10 million annually on system upgrades to ARMS, and some 300 insurance companies now use the system. An affiliated application, ARMS for Dealerships, connects several thousand car dealers around the country to Enterprise, while ARMS Automotive is used by some 7,000 body shops.

Beyond the insurance companies and body shops, Enterprise also has numerous business relationships with the auto manufacturers that supply its vehicles.

What has Enterprise done to create such close and mutually beneficial partnerships over the years? The same things that every business can do to achieve similar results:

1. Begin by identifying the concerns of your customers and potential partners.
2. Once you've identified what your partners want, determine the mutual benefits from the relationship.
3. Believe in what you say you are going to do, and go into the relationship with a 100 percent commitment.
4. Don't go for the last "oink out of the pig," says Andy Taylor, meaning don't try to squeeze out every last penny of advantage. "That doesn't mean we don't negotiate hard," says Taylor. "But we try to always work together toward a common goal."
5. Keep the lines of communication fluid and open.
6. Never rest on your laurels. ■

Use Technology to Enhance the Customer Experience

Enterprise discovered long ago that no matter how good your product or service, without the smart use of technology, you'll lose out on the opportunity to make it easy and cost effective for customers to do business

(continued on page 8)

Use Technology to Enhance the Customer Experience

(continued from page 7)

with you. Enterprise's overriding philosophy is that, above all, technology should be used as a way to drive customer service.

What distinguished Enterprise from others and paved the way for impressive future innovations was the fact that senior management fully supported the company's various IT initiatives from the start and were involved in all phases of development. Indeed, Enterprise looks at technology as a strategic asset — something that can help strengthen the customer relationship — not just as another cost of doing business.

One major difference between the systems used by Enterprise and its major competitors is that Enterprise writes and develops all of the technology applications used to take care of customer needs in-house. Most other companies rely heavily on outside consultants and independent contractors, many of whom don't know the car rental business very well. ■

Grow Smart

Enterprise's most financially difficult period came in the early 1970s, just as the company was beginning phase one of its growth spurt. The country was faced with high gas prices, an energy crisis, a glut of unwanted luxury cars and a deep recession that began to drain the company's cash reserves. As 1974 progressed, business began to improve. Surviving the tough economic times wasn't easy, though it made some advantages of Enterprise's business model clear.

Up through the early 1990s, Enterprise funded all of its growth through profits and by taking out loans. As the company grew, it expanded into bank syndication financing. Now much of Enterprise's growth is funded through private placements.

By 1999, Enterprise was ready to make a formal entry into the airport market. Two to three on-site airport locations were added monthly over the next seven years, a pace that continues today. As other airport car rental companies have seen their market shares shrink, Enterprise's airport business has taken off.

What's more, Enterprise has discovered that, while the company is always open to new ideas and approaches, it is essential that any endeavor stick to the company's central operating principles. ■

Live Your Core Values

Enterprise refers to its eight founding values as "the values that define us and drive us." What are they?

- Our brand is the most valuable thing we own.
- Personal honesty and integrity are the foundation of our success.
- Customer service is our way of life.
- Enterprise is a fun and friendly place, where teamwork rules.
- We work hard and we reward hard work.
- Great things happen when we listen to our customers and to one another.
- We strengthen our communities one neighborhood at a time.
- Our doors are open.

Andy Taylor is convinced that businesses not taking their core values seriously will suffer the consequences. "These values are the reasons why customers should want to do business with you, why talented people would want to build their careers with you and why neighbors are glad to have you in their communities," he says. ■

The Enterprise Business Model

If you were to sum up the primary traits that have made Enterprise so successful over the past five decades, it would come down to the following:

1. Have a strong belief from the very top that taking care of customers and employees is job number one.
2. Empower workers as entrepreneurs and pay them on the bottom line.
3. Hold employees financially accountable for offering excellent customer service.
4. Establish strategic partnerships.
5. Dare to be different.

While all of these traits can be adopted by businesses of all types, it's important to remember that execution is everything. They must be ingrained into the fabric of your company. It's a philosophy that Jack Taylor set in motion 50 years ago when he purchased his first seven vehicles, and thus opened the doors to one incredible business. ■

Extreme Trust

Honesty as a Competitive Advantage

by Don Peppers
and Martha Rogers, Ph.D.

THE SUMMARY IN BRIEF

If you accidentally try to order the same song twice from iTunes, you'll be warned that you already own it. Not because it would be illegal or unethical for Apple to profit from your forgetfulness. There's a clear business reason: the leaders of iTunes realize there's no better way to make you trust them than to be totally honest when you least expect it.

In the age of the Web, every action an organization takes can be exposed and critiqued in real time. Don Peppers and Martha Rogers, Ph.D., the authors of *Extreme Trust*, argue that the only sane response to these rising levels of transparency is to protect the interests of customers proactively, before they have a chance to spread negative buzz — even if that requires spending extra money in the short run to preserve your reputation and customer relationships in the long run.

The companies that Peppers and Rogers call "trustable" remember what they learn from each interaction, and they use these insights to create better and better customer experiences. They focus on winning the long-term battle for trust and loyalty, even if the dollar value of that trust is hard to quantify.

With a wealth of fascinating research as well as practical applications, *Extreme Trust* will show you how to earn — and keep — the extreme trust of everyone with whom your company interacts.

IN THIS SUMMARY, YOU WILL LEARN:

- Why trustability creates a higher standard of expectations between organizations and their customers.
- The reason that trust is able to serve the interests of both customers and the bottom line.
- How to protect customer interests proactively.
- The difference between brand equity and trustworthiness.
- Why transparency is a good investment.

Trust: Not Just a Good Idea. Inevitable.

Immediately after the first Gulf War in 1991, USAA — the insurance and banking company based in San Antonio, Texas — sent out refund checks to several thousand customers, called "members" by USAA. The idea was that since the men and women who had been serving at the front couldn't drive their cars back in the United States during the several months they were posted in the Middle East, USAA suspended charges for the premiums during the time the soldiers were overseas and sent out unsolicited refunds once the military personnel got home. The employee culture at USAA is based on a simple idea: treat the customer the way you'd want to be treated if you were the customer.

As for those refund checks? Nearly 2,500 of them were sent back to USAA by grateful customers who told USAA to keep the money and just be there "when we need you."

What's the difference between USAA and the other financial services companies we all know about? Many of those companies are not bad companies. And yet none of us — not even the executives of these well-run institutions — could imagine customers refusing to take refunds from those companies.

Most businesses today consider themselves to be trustworthy, and by yesterday's standards they are. But that's as far as most businesses go, and by tomorrow's standards it won't be nearly good enough. Not even close.

Technology has now changed the landscape of competition so much that a new, more extreme form of trustworthiness will be required in order to be successful. Simply doing what you say you're going to do and charging customers what you say you're going to charge them will no longer be sufficient. Instead, businesses will be expected to protect the interests of their customers proactively — to go out of their way, to commit resources, and to use their insights and expertise in such a way as to help customers avoid making mistakes or acting against their own interests simply through their own oversight.

We've coined the term "trustability" to encapsulate this new form of extreme trust, and what we mean by trustability is very simple: "proactive trustworthiness."

Most businesses and other organizations operating today think that they're already customer-centric and that they are basically trustworthy, even though their customers would disagree. Being "trustworthy" is certainly better than being untrustworthy, but soon even "trustworthiness" won't be sufficient. Instead, companies will have to be trustable.

But trustability is a higher standard still.

Rather than simply working to maintain honest prices and reasonable service, in the near future companies will have to go out of their way to protect each customer's interest proactively, taking extra steps when necessary to ensure that a customer doesn't make a mistake, overlook some benefit or service, or fail to do or not do something that would have been better for the customer.

As Interactions Multiply, Trust Becomes More Important

Trust has always been touted as important, certainly. But one of the most important implications of a more highly interconnected world is the increased level of trust and trustworthiness we expect from others. The fact is that trust is becoming a more essential attribute of

human culture for several reasons as people connect with one another more efficiently. First, of course, is the simple fact of transparency. From WikiLeaks and the Arab Spring to a cable TV repairman asleep on your couch or an airline's luggage handlers mistreating bags, people will find things out. Transparency increases the cost of hiding the truth. ●

Serving the Interests of Customers, Profitably

One of the problems with the idea that trustability and selfishness don't mix, just in case you haven't already picked up on it, is that it calls into question the moral legitimacy of free-market economics itself, which is built on the principle that people acting in their own self-interest will, collectively, create a better standard of living for everybody. The "neoclassical" economic model assumes that people always act in their own self-interest and that these independent, self-interested actions collectively create substantial economic value. As Adam Smith famously suggested in *The Wealth of Nations*, "It is not from the benevolence of the butcher, the brewer, or the baker that we expect our dinner, but from their regard to their own interest."

It turns out that neoclassical economics is flawed, however, in the way it defines human motives, because pure, absolute self-interest in any person is not the norm but an aberration. Very few people are ever completely self-oriented, never doing anything that might undermine their own interest. People like this are called psychopaths, and what makes them aberrations is that they're completely immune to the feelings of others. The rest of us have empathy. Concern for others' feelings is hardwired in our brains. You don't have to "learn" empathy. Newborn babies a few days old will cry when they hear other newborns cry. Toddlers unable to speak will try to help adults in accomplishing tasks. So while Adam Smith's description of the baker's motive may be generally correct, if one of the baker's close friends was starving, if the baker was contributing to a community dinner or if he was particularly proud of one of his confectionary creations, then he would not be likely to look solely to his own financial interest in selling his goods.

Psychopathic Capitalism

Human beings may seldom act out of purely "rational" self-interest, but what about companies? A corporation is legally chartered to create wealth for its owners, and failing to work on behalf of creating shareholder value would seem to be an abdication of management's fiduciary duties. However, in any modern economy a successful company is also a complex organization with multiple stakeholders, including not just shareholders but also employees, customers, and the communities in which it operates. From a practical standpoint, a company must be careful not to ignore the interests of its non-shareholder constituents precisely because doing so could threaten shareholder value. Abusing employees, the community, or the environment could easily lead to costly regulations or legal conflicts.

While there is no union movement or environmental group championing the rights of customers, the discipline of competition has always been considered a sufficient check. Fail to respect your customers' interests and you will be competed out of business, or so the argument goes.

A trustable firm will find empathy returned by the customers themselves. You don't have to count your change when you're dealing with a real friend. When an untrustable company pursues immediate economic gain to the exclusion of all other considerations, however, we could make a direct analogy with the human psychopath, oblivious to how his actions affect the feelings of those around him. And while only a few of us may ever have been victimized by a psychopathic person, all of us interact regularly with at least a few "psychopathic" companies and brands. We have become so accustomed to nonempathetic customer "service," in fact, that we do not even consider it abnormal. But as standards improve, nonempathetic companies will become rare, then rarer, then endangered, and eventually extinct. ●

Basic Principles of Trustability in a Business

- **Do things right.** Be competent. Manage the functions, processes, and details right in order to make it easy for customers to do business with you. And pay attention to the customer's experience, not just to the company's financial performance.
- **Do the right thing.** Ensure that the way your organization makes money aligns with the needs and best interests of your customers. You can't be trustable if you're entirely focused on the short term. Customer relationships link short-term actions to long-term value.
- **Be proactive.** Knowing that a customer's interest is not being well served and doing nothing about it is untrustable. Not knowing is incompetent.

Trustability: Capitalist Tool

The clash between trustability and a company's own short-term financial interest is real. It is a serious and continuing obstacle to be overcome, and we don't want to minimize it. Urging companies simply to "do the right thing" isn't likely to change how management sees the world. The profit motive does that.

Taking the Long-Term View

Today's most successful firms focus on the long-term value of their customers and the importance of maintaining their trust and confidence, despite the fact that sometimes the actual economic value can be difficult to quantify. In his portrait of one such forward-thinking firm, *Googled: The End of the World as We Know It*, Ken Auletta tells the story of how its founders approached their IPO (initial public offering):

Google's two 31-year-old founders were driving the company with a clarity of purpose that would be stunning if they were twice their age. Their core mantra, which was echoed again and again in their IPO letter, was that "We believe that our user focus is the foundation of our success to date. We also believe that this focus is critical for the creation of long-term value. We do not intend to compromise our user focus for short-term economic gain."

And Google has shown again and again that it remains focused on earning the trust of its users by acting in their best interests, no matter what the short-term attractiveness might be for doing otherwise. The company never accepts money for a search result or a higher search ranking, for instance. And rather than trying to "capture" users and keep them on the website, Google's philosophy is driven by the goal of setting its users free as soon as possible so they can quickly navigate to any of the search results shown. On search results pages the ads are ranked primarily in terms of the amount of clicks they generated from users. The more clicks, the more relevant or attractive an ad is to users, and so the more prominently it is displayed. No amount of money (short-term benefit) can generate a higher-than-justified prominence for an ad (long-term erosion of trust).

Trustability and Self-Interest: A Paradox

The fact that earning your customers' trust has economic benefits for your business sets up an interesting philosophical conundrum: if you "do the right thing" for customers because it benefits your business economically, aren't you really just being self-oriented?

Trust is as trust does. It doesn't matter at all to a customer whether his interests are being proactively looked after on account of the benevolence of a company's management or on account of their desire to benefit their own shareholders. Either way the customer gets better served. It is the firm's actions the customer can see, not what's in the company's heart.

However, motive does make a difference within the firm. That is, in order to have a company that seriously tries to earn its customers' trust, there must be some unifying message or sense of mission that drives employee behavior at all levels to do this in the thousand decisions they make every day. This is a tall order, because no business rule or line of software code will ever be sufficient to ensure that employees treat customers right. Your employees have to want to do that. To have this kind of an organization you have to focus carefully on the corporate culture and on the "unwritten rules" that govern how your employees approach their jobs.

Sharing: Not Just for Sunday School

Dan Ariely, Duke University's respected behavioral economist, suggests that "revenge, even at personal expense, plays a deep role in the social order of other primates and people." He describes an experiment involving two chimpanzees placed in neighboring cages with a single table of food just outside the cages but still within each chimp's reach. The food table is wheeled, and either chimp can reach out to pull it closer to its own cage (and therefore farther from the other's). However, a "revenge rope" leading out from each cage is rigged so that if either chimp pulls it the table will collapse and spill all the food onto the floor, out of reach of both of them. Use of the rope is carefully demonstrated to the chimps, so they each know that it destroys any possibility of either of them reaching the food. Researchers have found that if both chimps share the food, all goes well in this experiment. But if either chimp rolls the table too close to its own cage and the other can no longer reach it, then that other chimp will sometimes explode in a rage and yank the rope, collapsing the table for both of them.

Empathy and the urge to punish injustice are not the only ingredients in our complex social natures. But empathy's role should not be underestimated, and its connection to the enforcement of socially accepted norms is critical.

Death by Tweet

However we frame the issue, punishing unfair behavior is an essential part of being social. And there's a reason for the phrase "sweet revenge." Don't you feel a lit-

tle tingle of satisfaction yourself when you learn about a heartless or cruel criminal getting a tough sentence?

Online technologies, of course, allow us to avenge wrongdoing in a highly social, highly interconnected way. Revenge has never been easier or more satisfying, and it can be far more long-lasting and punitive. Reminder: once an opinion about you hits the Internet, you may as well count it as immediate, ubiquitous, and permanent. As one advertising executive said, "You can't un-Google yourself." ●

Trust and the E-Social Ethos

In addition to reciprocity, empathy, and the desire to avenge injustice, our social interactions are subject to a whole set of customers and "unwritten rules" that have developed over untold generations of people conversing with each other. When you discuss something with a friend, colleague, loved one, or stranger, you adhere to these customs even without thinking. Don't interrupt. Listen first; show an interest. Respond to what others are saying.

But there are subtler principles as well. Suppose, for instance, a good friend were to ask your help in getting a job at the company where another friend of yours is a vice president. All he really wants is an introduction. He's your friend, and he would certainly do the same for you. But what if in asking for this favor your friend also offered you $100 to make the introduction? Or $500? Wouldn't you be totally put off by this? Maybe he's not really your friend after all, you might think, because this certainly isn't how friends deal with friends.

This conflict represents one of the most important differences between how we interact in a commercial setting versus in a social setting. The commercial economy is characterized by people freely exchanging money with other people. You buy from me, I sell to you, and if we do it right we both consider ourselves better off. Nor does this seem out of line to any of us.

With the rise of modern, free-market capitalism, these two domains of human activity — social and commercial — became quite distinct and separate, but technology seems to be smashing them together. Social production, for instance, combines features of both domains, being fueled by social interaction, trust and sharing, but generating real economic value as well. Whether the sharing involves someone's free time, honest opinion, computer coding, editing and curating, or computation cycles on their computer hard drive, the end result is genuine economic value, worth real money.

Over time, the e-social "ethos" that comes to govern our online interactions will develop as a set of purely informal and unwritten customs.

Regardless of the legal and regulatory protections or mandates eventually enacted, however, it is clear that trust will be a dominant guiding principle in the e-social ethos, because maintaining trust is essential for the smooth functioning of the overall system.

How Friends Treat Friends

The unfamiliar workings of the e-social ethos can easily trip a business up when it tries to deal with social media simply as a new channel for marketing or to generate positive word of mouth, because most marketing and business tactics that make sense in the commercial domain just don't apply in the social domain. Most people use social media to interact for the same reasons they attend parties or participate in casual conversations with friends — not for financial benefit or to accomplish some task but for the enjoyment and fulfillment they get from connecting with others or for the gossip, insight, and inside information they acquire. Mixing up these two domains can lead to real problems, because social influence can't be bought any more than friendship can.

In September 2006, a blog appeared entitled *Wal-Marting Across America*. It featured two intrepid RV owners, known only as Jim and Laura, who were driving from Walmart to Walmart across the United States, visiting stores along their way, and interviewing a whole stream of ever-upbeat Walmart employees. Other bloggers, however, suspected that Jim and Laura were fictitious, not real people driving their motor home around from store to store. And soon enough it was revealed that the two bloggers were actually paid contract writers for Walmart, hired by Edelman, the company's PR firm, to create a series of glowing articles. This ignited a firestorm of protest from others in the blogosphere, with people lashing out at both Walmart and Edelman. Walmart's initiative perfectly illustrates the single biggest error most companies commit when they try to operate in the social media space: rather than respecting the e-social ethos, they think they can treat social media just like any other marketing "channel," in this case using it to create a kind of advertising message.

What Walmart learned was that even though the social domain can serve as a marketing channel, the social ethos still has to be respected. You can advertise to viewers using a fictional story to entertain them on television, but you don't lie to your friends and call it "advertising." ●

Control is Not an Option

If a psychopath is someone who can't be trusted, then what do you call someone who can't trust? Control freak. Psychopaths and control freaks are flip sides of the same disorder. But e-social technologies raise the general standard of trustworthiness for all of us, no matter which side of the interaction we're on.

Extending trust to others is a particularly scary idea for executives and managers, stirring up nightmares of cheating, disengaged employees and litigious customers. You can't take the "manage" out of "manager" without creating a feeling of insecurity. But inevitably the power equation governing commercial transactions will be upended by this incoming tide. As transparency increases and customers know more and more, every advantage a business used to have as a result of one-sided information flow will evaporate. Companies can no longer control the knowledge that gets "out there."

Unarmed, Nestlé Fights a Battle of Wits with Greenpeace

Like a bad habit, the urge to control continues to plague many companies' efforts to participate in the increasingly robust network of e-social connections now available. Things seemed to be going smoothly for Nestlé and its Facebook fan page right up to early 2010, when a Greenpeace initiative turned Nestlé's own fans' conversation against the company. In a campaign to get Nestlé to stop using palm oil in its products, contending that it was damaging the environment, Greenpeace used Facebook to organize support. They rebranded the Nestlé Kit Kat bar with a faux "Killer" bar logo and posted a video on YouTube disparaging Nestlé's practices.

The first reaction on the part of Nestlé's public relations and marketing staff was to try to control this unruly and threatening discussion. The company contacted YouTube to have the video taken down on the grounds that the made-up logo violated Nestlé's trademark, but of course the video had already been widely circulated on the net, and people could still find it easily on other sites such as Vimeo.

For Nestlé, it all went predictably downhill from there. Some of the company's Facebook fans began posting comments promoting the Greenpeace video and urging others to get on board the campaign to pressure Nestlé to stop harvesting palm oil. Other fans designed their own unflattering modifications to Nestlé's logo. The hapless control freaks at Nestlé tried to stifle the discussion with an escalating series of actions that in retrospect appear naïve and petty. They deleted some critical comments posted by customers on their Facebook fan page (like maybe people wouldn't notice?), and they even began pointing out spelling and grammar errors in some of their critics' messages. This of course only stirred the embers of the smoldering Greenpeace issue into a roaring inferno, converting what might once have been a customer-engagement opportunity into a five-alarm PR disaster.

As the inferno blazed higher, it made the leap into mainstream media as well, and Nestlé's resistance to Greenpeace's demand was soon overwhelmed by public pressure. Within days, the company announced it would no longer use palm oil. But from Nestlé's actions it was obvious that the marketing types failed to realize until late in the episode that control was not an option. ●

What Could Nestlé Have Done Differently?

Nestlé's whole Kit Kat brouhaha took place on the company's own Facebook page, for heaven's sake — an online space specifically designed for the brand's best and most loyal customers.

Rather than trying to "control" the discussion to avert this nearly inevitable outcome, what if Nestlé had reached out to the ones most invested in the movement? Since the argument was lost anyway, there would have been little downside for Nestlé if it had announced a temporary moratorium on palm oil use, for instance. Coupled with an appropriate corporate acknowledgment and apology, this action might have been seen as a peace offering, taking much wind out of the other side's sails.

Build Your Trustability in Advance

It's a tough world out there. If you want to survive in this new world of transparent, always-on interactivity and rapid, unpredictable shifts in opinion, don't wait for the storm to hit. Get ready for it now.

But first, here's a self-assessment question that might indicate how well your company is prepared for trustability. Do you allow customers to make comments about your products and services on your own website for other customers and prospective customers to see?

We've asked this question of enough audiences around the world to know that the overwhelming majority of senior executives still tremble with fear at the very idea.

Customer Reviews Are Essential. And Anyway, They're Inevitable.

To be proactively trustworthy, a company *must* facilitate customers' sharing their honest opinions with other customers about the problems they are trying to solve or the needs they are meeting, and this honest sharing will include, of necessity, the role that the company's own products and services play.

Monologues are totally controlled by one party — the speaker. Mass media monologues are controlled by the marketer.

By definition, however, a dialogue cannot be totally controlled by either party — not by you and not by your customer. Instead, as a free exchange of thoughts or conversation, a dialogue will go in its own direction. You can push it and guide it, but you cannot control it.

Executives have lots of perfectly logical reasons to fear making their customers' actual opinions freely available. What if a customer has a complaint and goes public with it right on our own website? Or what if a customer just doesn't like the product? Or what if a competitor masquerades as a customer and runs our product down?

Listen up: get over it. If you abdicate your own role in the conversation, you are simply undermining your trustability. (Anyway, people will ask, What are you afraid of — the truth?)

The reality is that truth is more persuasive than spin, and this is one of the secret advantages of allowing customers to be honest in their opinions with other customers.

A bit of criticism from customers assures other customers that your online product reviews are authentic. They're genuine. You are trustable. When a company hosts this kind of information exchange, it is departing from the money-dominated commercial ethos of economic self-interest. Rather than unswerving (and psychopathic?) self-promotion, when you make it easy for customers to find out what other customers honestly think about your product or service, you are showing a human face and proving your trustability. ●

Honest Competence

Proficiency and competence are directly observable. And they are an important part of the "customer experience" — how it feels to be a company's customer. Customer experience is the reason you connect your siloed databases, send your people to seminars on mobile best practices and increase efficiency so you can save your customers time and help them find and get what they need at a fair price without any roadblocks.

To remain competitive today, a company needs to make and deliver a quality product or service, and it needs to understand and relate to the customer being sold to. We can call these two basic capabilities product competence and customer competence, and both are critical.

True Confessions: Domino's and the Transparent Pizza

Domino's had developed a reputation among pizza consumers as the "pizza of last resort," the kind of food delivery you might order if you didn't have enough money to get a good pizza or if there was no Pizza Hut or Godfather's near enough. So, to celebrate the chain's fiftieth anniversary the company rolled out a completely new and revamped product. More than that, however, to publicize the upgraded product they launched a television ad campaign frankly admitting to the error of their (past) ways. One of the new commercials, for instance, played clips from focus groups in which participants lambasted their product as "the worst excuse for pizza" they'd ever had, before cutting to CEO Patrick Doyle's confession that while his company's pizza had been below standard for years, Domino's was now determined to do better.

Six months later Domino's announced it would stop using retouched photos to promote its pizzas, relying instead on straight camera shots, honestly taken — and appealing to customers to send in their own photos for use in the ads.

The "Pizza Turnaround" campaign gave Domino's revenues and profitability a nice lift as well, with U.S. same-store sales increasing by nearly 10 percent in 2010, a phenomenal increase for the large chain. In fact, it was the first full year of positive growth since 2007, and for at least the first half of 2011 these higher levels of domestic same-store sales have been maintained or increased.

Today, however, the world has become so transparent that everybody will already know your product is "crappy," so refusing to admit it yourself is not just inauthentic but downright delusional. In the real world, fallibility is the most direct route to trustworthiness. Admitting one's own vulnerability is the first step in earning someone else's trust. ●

Trustable Information

Current estimates are that the volume of data available to the human race doubles roughly every two years, but

now that technology is beginning to connect up highly efficient networks of people, as opposed to simply streamlining the storage and processing of data itself, the speed at which new data will be generated is likely to accelerate faster than Moore's law. From a mathematical perspective the messaging in a growing network increases at a "combinatorial" rate, faster than geometric growth, and some of the more breathless estimates are that within just a few years the volume of data and "technical information" may be doubling every few hours.

This is an almost unimaginable acceleration in information. It will test the limits of human understanding, requiring us to focus ever more carefully on accuracy, reliability, usefulness, objectivity, and consistency.

Managing for Transparency

We're headed for a world in which all our e-mails and phone calls will be as public as Facebook. In such a world, no matter what actions we ultimately agree to take and regardless of how we "position" ourselves in the media, our intentions are likely to become visible as well. This is the reality of transparency, and it is technologically inevitable.

In the e-social world, spin is out and customer experience is in. When one customer communicates with another, she doesn't share her impression of the brand's promise; she shares her experience. ●

Designing Trustability into a Business

Even though it might be highly disruptive as a competitive strategy, it isn't overly difficult to imagine how trustability would operate in any given business category. We only need to put ourselves in the customer's shoes. So let's just imagine how trustability would manifest itself in a few different kinds of businesses, starting with mobile phones.

Trustability in the Mobile Phone Category

Within an environment of smartphones and increasingly capable wireless services, the charges a mobile carrier assesses can be complex, and complexity presents a tempting opportunity to take advantage of customers.

A genuinely trustable telecom operator would automatically assign customers to the most economical call plans based on their calling, texting, and data usage.

While most mobile companies (and other subscription-based businesses) will make outbound calls to customers at bill-paying time to prompt payment, when appropriate, AT&T actually calls at least some of its customers before the due date by which a late fee would be assessed.

Trustability in Financial Services

While there is obviously no requirement for any financial institution to extend credit to a customer (or to cover an overdraft without charging a fee), a large proportion of "penalty" fees are incurred by customers who are in fact creditworthy. A genuinely trustable retail bank would use easily available information to assess customers automatically for their creditworthiness, eliminating many such charges and possibly offering an automatic e-transfer among accounts when such a transfer is available but just hasn't yet been elected by the customer. At present, most banks reserve this kind of service for high-balance customers only, but there's no business reason it couldn't be more generally available.

And any genuinely trustable financial institution would allow its customers to post their own reviews of its services and products (including comparisons with other companies' offerings) on the company's own website, making these reviews freely and impartially available to other customers.

In the final analysis, it is almost certain to be the new companies and the start-ups that employ these tactics to overturn the old way. They have less invested in the current paradigm and less to lose by destroying it. Gradually, they will use trustability to transform our entire economic system, in the same way that interactivity itself has so dramatically transformed our lives already. They will deploy honesty as a brutally efficient competitive weapon against the old guard.

Very soon, for competitive reasons, all businesses, old and new, will begin to respond to the increase in demand for trustability by taking actions that are more worthy of trust from the beginning — that is, actions that are more transparently honest, less self-interested, more competently executed, less controlling, and more responsive to others' inputs. More proactively trustworthy. Trustable. ●

TRUST WORKS!

Four Keys to Building Lasting Relationships

by Ken Blanchard, Cynthia Olmstead and Martha Lawrence

© 2013 Harper Collins, 130 pages

Cynthia Olmstead, the creator of TrustWorks!™, identified trust as a key differentiator in successful organizational change initiatives. Trusting the direction established in senior management's strategic plan, as well as trusting your colleagues' ability and commitment to deliver on their respective responsibilities as part of that plan, is vital if everyone is going to pull together to accomplish the shared goals for the organization. However, as Ken Blanchard, one of Olmstead's co-authors of *Trust Works!: Four Keys to Building Lasting Relationships,* points out: "Trust is a delicate thing. It takes a long time to build, yet you can blow it in a matter of minutes."

Beginning a dialog about trust requires a shared vocabulary that, the authors propose, is very often harder to achieve than first anticipated. Trust is in the eye of the beholder, and it can be perceived from words, actions and even body language. Within that construct, those words and actions have the potential to either build or erode trust, and the person whose behavior may be eroding the trust of his or her colleagues may be totally unaware that it is happening, because we each see trust through our own filters.

A path to building trust and developing the competency to resolve trust issues is presented in the framework of a behavioral model — the ABCD Trust Model™ — that organizes successful trust behaviors into four main groups: "Able (demonstrate competence), Believable (act with integrity), Connected (care about others), and Dependable (maintain credibility)." In place of behavior-specific chapters, the authors provide an initial introduction to the model through a parable about the lack of trust between a cat (Whiskers) and a dog (Woof) and how their behavior "threatens the tranquility of an animal-friendly family." The objective here is to begin a conversation about trust in both our personal and professional lives.

Part 1: A Tale of Trust

Mr. and Mrs. Berryhill, their seven-year-old daughter Kylie, and toddler son Billy, share their country home with Whiskers, Woof, a wise old parrot named Presley, a hamster named Harriet and a goldfish named Wiggles. In recognition of the "generations-old enmity between cats and dogs," it is Whiskers and Woof who embark on a journey of behavior change as they learn to question the status quo of their relationship and to trust each other. At the same time, the Berryhill parents embark on their own journey as Mr. Berryhill faces challenges both at work and at home. At work, the pressures of new responsibilities in his job are drawing Mr. Berryhill's performance to the attention of his boss, who is questioning whether he has the necessary skills and abilities to successfully manage those new tasks. At home, yet another fight between Whiskers and Woof leads to the destruction of an entire table full of dishes and prompts Mr. Berryhill to announce that all the animals will have to go if the cat and dog can't figure out a way to get along.

It falls to the wise old parrot Presley to explain to the other animals that: "Trust is a matter of perception," and to guide them through the: "ABCDs of trust." Mrs. Berryhill shares the same wisdom with her husband, guiding him through the ABCDs in working to win back the trust and confidence of his boss.

The ABCD Trust Model™

Using a wise mentor for both the animals and the humans in the parable allows each behavioral group to be introduced from a broader perspective than a simple first-person narrative. Both sides of the trust relationship can then be examined rather than just prescribing a change path for one side or the other.

Each of the four groups is introduced with a quick self-assessment of behaviors across a five-point scale from "Hardly Ever" to "Always," allowing the reader to examine his or her own trust behavior (either personally or professionally) as the story unfolds. A cumulative self-assessment is presented at the end of the parable to use to either see if your answers have changed after you have read the entire story, or allow you to score both your personal and professional behavior in separate assessments.

Ready and Able

The first group — being Able — focuses on demonstrated competence. This means looking for opportunities to demonstrate that you trust someone and you can be trusted. For Woof's changing relationship with Whiskers, that means digging a hole under the fence to demonstrate that he knows how to help her (being *trusted*). For Mr. Berryhill, that means committing to his boss that he can handle the new responsibilities (he can be *trusted*) and asking for his help in identifying a couple of mentors to help him improve his performance (reinforcing that he trusts his boss's judgment). The quick self-assessment identifies the following behaviors as examples of being ready and **Able** to be trusted:

- I get quality results
- I solve problems
- I am highly skilled
- I am good at what I do
- I have relevant experience
- I use my skills to assist others
- I strive to be the best at what I do

Building Trust Takes Time

In order to be Believable, you must act with integrity. This takes time. You cannot simply announce that from now on you will do better when you are starting from a place of unearned trust or clear distrust. For Woof, this means keeping the confidences that Whiskers shares with him, being respectful, and not judging the behavior of others. For Mrs. Berryhill, this means keeping her promise to Kylie to get swimming lessons for Billy so that he can join her for playtime in the pool. In both cases, there was a deficit of poor behavior and broken promises that needed to be addressed before any forward progress could be achieved.

The quick self-assessment identifies another seven behaviors as examples of being **Believable:**

- I keep confidences
- I admit when I am wrong
- I am honest
- I avoid talking behind people's backs
- I am sincere
- I am nonjudgmental
- I show respect for others.

Trust Is a Two-Way Street

The third group — being Connected (caring about others) emphasizes the emotional component of trust. Trust cannot be earned by simply approaching the other behavior groups as checklist items that need to be addressed. The behavior has to be perceived by the recipient as evidence that you care about her and that her trust is important to you. This means that the recipient also shares the responsibility of demonstrating that she acknowledges and appreciates the effort through communication and the sharing of information. For Whiskers, this means breaking through the "age-old enmity" and actually talking to Woof. For Mr. Berryhill, it means regular progress checks with his boss to share updates and success stories to reinforce his commitment to do better. The quick self-assessment identifies the following seven behaviors as examples of being **Connected:**

- I listen well
- I praise others' efforts
- I show interest in others
- I share about myself
- I work well with others
- I show empathy for others
- I ask for input

The ABCD Trust Model™

Able

Believable

Connected

Dependable

It All Depends

Holding yourself accountable to others and being consistent in your behavior enables you to be Dependable and maintain your hard-earned credibility with family, friends and colleagues. The animals of the Berryhill household demonstrate this fourth behavior category by working together to protect Billy who crawls dangerously close to the edge of the pool. For Mr. Berryhill, his modified behavior at work is rewarded with a promotion that is reflective of his newly-demonstrated skills and natural strengths. The quick self-assessment identifies the final seven behaviors as examples of being **Dependable:**

- I do what I say I will do
- I am timely
- I am responsive to requests
- I am organized
- I am accountable for my actions
- I follow up
- I am consistent

> "Usually there is no safe way to discuss problems that have grown due to a lack of trust, such as poor morale, interdepartmental and interpersonal conflicts, poor customer service, and lack of communication. The beauty of the ABCD Trust Model™ is that it takes the complex subject of trust and simplifies it into a framework that leaders at all levels can use to build more trusting relationships."

Part 2: Trust Busters & Trust Boosters

In the second part of the book, the authors build on the insights gained in the parable and self-assessment by demonstrating how the ABCD Trust Model™ can identify behaviors that either encourage or undermine trust. Beginning with a brief series of red flags that you may be facing at work, the authors revisit each of the four behavior groups and suggest positive behaviors (trust *boosters*) as solutions for perceived evidence of trust issues (trust *busters*).

If, for example, you are noticing that your colleagues are withholding information from you, excluding you from meetings, avoiding eye contact, or avoiding you completely in the hallways of your offices, you probably have a trust problem. Following the template of the ABCDs of trust and the 28 specific behaviors outlined in the self-assessment, you will have a path to follow to resolve that problem.

The Importance of Perception

Until you can accurately measure the severity of the problem, you don't really have a place from which to start your resolution. This is where the problem of trust being a matter of perception becomes a significant obstacle. To illustrate what can happen when trust means different things to different people, the authors invoke the story of five blind men all describing the same elephant:

"The one who feels the leg says it's like a tree; the one who feels the tail swears it's like a rope; the one who feels the elephant's trunk is sure it's like a snake; the one who feels the ear insists it's like a fan; the one who feels its side is sure the elephant is like a wall. In the same way, people see behaviors from their own points of view."

The critical point here is that resolution of a trust issue can only be truly successful if you clearly understand the perspective of the person who has made the assessment of your 'trustworthiness.' Your past behavior may have been erroneous or inappropriate, or it may have been a simple case of misunderstanding.

Until you have that information clarified as your baseline, the four quadrants of the ABCD Trust Model™ have the potential to be misused, resulting in exacerbation rather than resolution of the original problem.

Rebuilding Damaged Trust

In a situation in which trust has, despite our best intentions, been damaged or perhaps irreparably broken, the emphasis moves from clarification of a baseline to a more volatile scenario of frank and highly emotional conversations. The authors warn that in some cases, the stakes may be so high for such conversations that the specialized services of experienced mediators or therapists may be required, but all such emotionally-charged scenarios will demand: "fortitude and forethought." The four quadrants of the ABCD Trust Model™ should be leveraged in the following five-step process:

1. Acknowledge and Assure. Acknowledging the damage done and the extent of the problem that exists is a critical starting point that may also prove to be the end-point of the conversation if the other party makes it plain that there is no interest in reaching a mutual resolution. Assurances of your intention to restore trust may allow the dialog to move forward.

2. Admit. Admission of your role in the breach of trust and ownership for whatever harm was caused is necessary if you are to start rebuilding your credibility. This is not the same as a blanket admission just to get the conversation moving, but rather a notification that you have given serious thought to what occurred and the role you played in it.

3. Apologize. Even if you feel that you weren't entirely at fault, apologizing for your behavior and committing to changing that behavior demonstrates humility and sincerity. Any attempt to make excuses or shift blame will bring that apology into question and undermine the authenticity of your commitment.

4. Assess. Using the ABCD Trust Model™, invite feedback from the other party as to which elements of the four behavior groups were violated. The more specific the information shared, the clearer the path to resolution will become, although this may present some uncomfortable emotions.

5. Agree. Identifying the trust buster behavior in step 4 should allow both parties to agree on the appropriate trust booster behaviors needed to rebuild the damaged relationship in a detailed action plan.

A Message for Leaders

The authors fervently believe that the ability to build (and, where necessary, restore) trust should be regarded as a: "defining competency for leaders in the 21st century." Trust may take time to build, but if the pace of change initiatives continues to accelerate, there will be less and less time to rebuild it if you get it wrong. Any perceived failure on any one of the four core components of trust — Able, Believable, Connected or Dependable — will bring about tangible consequences that directly hit the bottom line of the organization: "people bail on relationships and leave organizations, cynicism reigns, progress grinds to a halt, and self-interest trumps the common good."

Taken as individual events or instances, a broken promise, unfulfilled commitment, unfair treatment, or bold-faced lie to achieve an ulterior goal may simply be dismissed as an everyday business occurrence: "it's nothing personal, it's just business." However, repeated occurrences of such "trust-busting' behavior, especially by leaders or senior management, will result in a low-trust environment characterized by employees who are: demoralized, disengaged, unproductive, and afraid to take risks." By contrast, work environments built on trust will deliver deeper and more productive relationships that foster proactivity, creativity and, most importantly, a growing bottom-line.

WHY YOU WILL LIKE THIS BOOK

The parable of Whiskers and Woof manages to inject some humor, energy and a non-threatening message into a potentially dry subject matter, which is especially useful if readers are currently facing highly-charged trust issues in their workplaces. The use of a family setting in tandem with a recognizable business scenario facilitates both comprehension and adoption of the material, while underlining the value of interpersonal skills in multiple environments.

The authors: Ken Blanchard is the Chief Spiritual Officer of The Ken Blanchard Companies. His One Minute Manager Library has sold more than 15 million copies and has been translated into more than 25 languages. **Cynthia Olmstead** founded TrustWorks Group in 1987 and served as its president until it was bought by The Blanchard Companies in 2010. A group development expert, she recognized that the core of many problems is the lack of trust. **Martha Lawrence** is a former editor at Simon & Schuster and Harcourt. THE SUMMARY IN BRIEF

Faster. Messier. Tougher. examines how the environment surrounding corporate crisis communication has changed in the age of social media, political polarization, and rapid information flows. The book's central premise is that traditional crisis communication strategies no longer fit the realities organizations face today. Instead, companies must operate in a landscape where silence can be interpreted as guilt, narratives move faster than facts, and public reactions are shaped by fragmented audiences and cultural divisions.

The book introduces a set of practical frameworks for navigating this environment. These include identifying the stakeholders whose trust truly matters, understanding how trust functions as a form of reputational capital, and responding to crises with authenticity rather than scripted perfection. It also examines how misinformation spreads, how organizations are assigned narrative roles such as villain or victim during crises, and how companies can integrate AI tools into communications while maintaining credibility.

The book is structured as both analysis and practical guidance, combining conceptual frameworks with lessons drawn from real corporate crises. Author Bradley Akubuiro, a communications executive who served as a senior spokesperson at Boeing during the Boeing 737 MAX crisis, draws on firsthand experience advising organizations facing regulatory scrutiny, reputational attacks, and political pressure. His professional background informs the book's focus on how communications strategy can function as a central component of organizational decision-making during periods of public scrutiny.

IN THIS EXECUTIVE BOOK SUMMARY

- Explain why stakeholder trust shapes crisis interpretation
- Identify priority audiences by influence tiers
- Show how authentic responses navigate risk and pressure
- Use AI and analytics to improve monitoring and messaging

INTRODUCTION

Read the Room or Risk Everything

For all of us in crisis communications, it feels like the world shifted beneath our feet while we weren't looking. The strategies that served us for decades, the careful statements, the measured responses, the wait-and-see approaches, are more than just ineffective; they're actively dangerous.

The uncomfortable truth is that many organizations clinging to the old playbook aren't just failing; they're making their exposure worse.

I am offering a new framework for a world where corporate communication and crisis communication have become indistinguishable and where the ability to navigate perpetual controversy isn't just a nice-to-have skill; it's essential.

The scenario planning I learned as a teenager—understanding your environment, assessing threats, and having contingency plans—goes beyond survival instinct. It's now a core competency for anyone responsible for protecting an organization's reputation in the current moment.

Whether you're a CEO, head of communications, or otherwise responsible for protecting an organization's reputation, this is your road map to not just surviving the storm but emerging from its wake stronger than ever.

CHAPTER 1

From the Age of Impact to the Age of Issues

On the heels of the COVID-19 pandemic, America seemed to reconnect with its benevolent side. Companies, foundations, and individuals donated a whopping $557 billion in 2023, a remarkable number given the elevated cost of living and nonstop headlines warning of an impending, although never materializing, recession. American culture was embracing impact in new and meaningful ways.

Perhaps the most far-reaching backlash to the age of impact has been the dismantling of the diversity, equity, and inclusion (DEI) movement. DEI opponents began using every mechanism at their disposal to turn back the clock.By early 2025, federal policy shifts eliminated DEI programs and removed nondiscrimination as a criterion for federal contracts.

In response, many in boardrooms have felt compelled to reassess—and at the very least, rebrand, if not eliminate—their DEI initiatives or risk significant legal ramifications.

In just a few short years, we'd gone from the age of impact to the age of issues, where change is the only constant, and crisis communications has become synonymous with corporate communications. Navigating this world requires a new strategic approach.

Crisis Communications in the Age of Issues

Traditional media is dying by the day, and the elimination of fact-checkers on social media platforms means there is literally nobody empowered to defend the truth. From a communications standpoint, we have to accept the fact that we now operate in a society of half-truths, where large swaths of the population will latch onto tiny kernels of veracity wrapped in layers of lies and webs of confusion.

You, me, and the companies we represent have only ourselves to rely on when it comes to protecting our reputations and interests. As communications professionals, we are tasked with the impossible job of shielding our stakeholders from all the misinformation, disinformation, half-truths, and all-out intentional lies that can and will spread at the speed of light.

It's not going to be easy. You and your organization *will* take hits, so it's time to learn to take a punch if you have any intention of staying in the fight. This moment will require you to change the way you think about reputation, and that includes changing your approach to protecting your brand. It will mean undergoing reeducation in crisis communications.

CHAPTER 2

My People, My Party, and Me

Fear of Displacement

It comes as no surprise that, with the proliferation of AI and automation and constant media coverage of immigration, many people are experiencing stress, disorientation, and instability driven by fears of displacement by technology, demographic change, or both.

It's important to be able to identify and address legitimate concerns while toning down the unsubstantiated and often dangerous rhetoric, even if these false narratives move the needle in your company's favor.

Distilling the Five Fault Lines

As a practical framework, none of these fears and divisions are random—they follow predictable fault lines:

> It's not actually about truth; it's about trust.

- **Economic divide**: Pits "haves" against "have nots," making any action perceived as benefiting the wealthy over the average person vulnerable to populist backlash.
- **Cultural-political divide**: Identity politics and backlash cycles create opposing camps; what delights one side enrages the other.
- **Tech divide**: Reflected in views on AI and automation, where some see tools for success while others see instruments of displacement.
- **Institutional trust divide**: Reflects eroding faith in media, government, and big business, meaning different audiences will trust (or distrust) your message based on your scale, interests, and perceived power—and, more broadly, which institutions they still believe in.
- **Information divide**: Shapes where people get their news, whether from TikTok or *The New York Times*, or between MSNBC and Fox, resulting in the same communication being interpreted through entirely different information ecosystems, often with vastly different framing.

Here's what matters: When you put out messages, reactions from one side of these divides will differ radically from reactions on the other side. Read the room, know where backlash might originate, and understand that when you step on these fault lines, wittingly or unwittingly, the response may be fierce and potentially viral.

CHAPTER 3

Truth Versus Trust

We are living in an era where people get to choose their truths. In fact, 70% of us get our news from sources that align with our preconceived views. Just think about what this type of information, based on biased perception, means for our jobs as communicators.

Merriam-Webster defines truth as "the body of real things, events, and facts: actuality; the state of being the case: fact." If people *choose* what is true, they are, in essence, ignoring facts in favor of a subjectivity that comports with their chosen reality. If someone is going to tell a lie about you or your brand, the thing that will matter most is not whether the allegation has any basis in reality but how much trust your stakeholder audience already has in your brand.

When it comes to your successful reputation defense, what carries the day won't be objective facts and compelling proofs; it will be how much trust you've either built up in advance or can muster after the fact to shield you from disinformation turning into a full-fledged crisis.

Countering Lies, Rumors, and Vitriol

Misinformation and disinformation are both as old as time, but what is new is their speed and the range they travel. The key is to know your audience and what they care about in relation to you. What's more important than what is said is what people believe.

There are lots of ways to counter false narratives, but the right answer is rarely hand-to-hand combat. The only true defense is for people to love you so much that they choose not to believe the untrue things that they hear. It's not actually about truth; it's about trust.

It's important to be strategic about how and where to combat the lies, rumors, and baseless vitriol. To do that, you have to step back and figure out where your greatest vulnerabilities are and what people need to understand from you if you want to keep their trust. You need to understand what made it so easy for people to buy into the lies about your brand and what was driving such a high degree of distrust.

CHAPTER 4

Battle Lines Drawn

There is power in drawing a line in the sand, in knowing what your company stands for and the values it holds at its core. The alternative to standing up for your core values is wavering, intellectualizing the issues by weighing the pros and cons of advising your company leaders to declare who they are and what they believe.

If your convictions tell you that your company should not be associated with harmful or discriminatory behavior, then say so. Your brand will be stronger for it, and your stakeholders will feel reassured by your clarity.

Take Care of Your Employees

There are going to be times when you don't have forewarning, when circumstances demand swift and immediate action following an unanticipated event. In those instances, living your values requires showing up for your employees simply because they need you to and because it's the right thing to do.

As an employer, a leader, and someone intent on putting your actions where your values lie, it's important to go beyond the usual "thoughts and prayers" party line. Your employees don't need your platitudes. They need your support and compassion. If you're going to make a public statement, make it count.

CHAPTER 5

Breaking News, Breaking Trust

There was a time in the not-too-distant past when traditional media was widely considered the fourth estate, a reference to its role in ensuring transparency in government and as a check on abuses of power.

Today, traditional media has lost much of its magnetism. The digital age has opened the door for new entrants into the once-insulated world of news gathering and dissemination. New media, including Substack, social media influencers, video-sharing platforms, podcasts, and streaming services have provided increasingly sophisticated ways for user-generated content to draw attention away from more traditional news organizations.

There is still enormous value in engaging with print and broadcast reporters when it comes to heightening your influence across multiple media channels. But the key now is in understanding how to leverage the credibility of traditional media as a validator in conjunction with the reach and direct-to-audience access of new media.

To Engage or Not to Engage

When the alarms are sounding, one of the most urgent demands of a crisis communicator is determining whether it's in your company's best interest to engage with the media at all around a particular matter. Discretion, or in this case, discernment, can truly be the better part of valor. If you're on the fence about whether to weigh in on an issue, ask yourself first: Is this crisis even yours?

Often, when a major issue impacts an entire sector, reporters will seek out comments from companies they know will be most affected. In these instances, it's important to take a step back and think about whether there's truly any advantage to responding. If you don't have a clear goal in mind, you should take a pass.

If you determine that a certain situation does warrant media outreach, particularly if the crisis specifically involves your company, it's important to consider which reporters are most likely to help you reach your objectives, including boosting your credibility.

This may seem counterintuitive, but in a crisis, you don't always want to seek out the reporters you can count on to write a favorable story about your company. Often, it's better to engage with the person who's earned a reputation for fairness and accuracy, even if that means that your company might be raked over the coals from time to time. Toughness and credibility in reporting go hand in hand, and in a crisis, the most important ally you have is credibility.

CHAPTER 6

Employee Identity

Your employees are your most important stakeholders. They are the people with the most skin in the game when it comes to rooting for your success. If you haven't captured the hearts and minds of the people working closest with you, then you can be certain that you'll have a tough time holding on to the loyalty of your other stakeholders, such as customers and investors, should you face a crisis or a negative event.

If you want your biggest stakeholders to have your back, you're going to have to find ways to provide them with the lived, meaningful experience of being a part of something greater than themselves.

You will have to treat your employees like the critical stakeholders that they are. And that begins with showing your human side consistently and authentically. Whether you have one hundred employees or one hundred thousand, when it comes to managing through a crisis, it's more important than ever to put a human face on leadership.

CHAPTER 7

Before the Storm

The best crisis management is prevention. Stop the fire before it starts. But since that isn't always possible, the most effective way to survive a crisis is to prepare a strong crisis management and communications infrastructure well before a crisis hits.

> The human brain doesn't process crises as data points; it processes them as stories. ”

The goal of crisis preparation is to turn potential disasters into manageable challenges. Organizations that prepare well don't just survive their crises; they often emerge stronger than before. They build deeper stakeholder trust, clearer internal processes, and more resilient cultures.

What Is a Crisis?

Not every bad headline is a crisis, and not every warning is a false alarm. A true crisis is an unexpected event that threatens your ability to operate, your reputation, or the safety of people who depend on you. The operative term here is *threatens*, not annoys, complicates, or creates some bad press.

If you're wondering whether an incident or situation has risen to the level of a true crisis, consider the following criteria:

1. Are you under real-time pressure? Do you need to make decisions in hours, not days?
2. Is there potential for significant stakeholder impact? Could this materially harm people who trust you?
3. Is this something that will garner significant public attention? Will this attract media coverage or social media amplification?
4. Is there a real threat to operations? Could this disrupt your core business or change how you're regulated?

If three out of four are yes, congratulations, you're officially in crisis mode. If it's fewer than three, you're probably dealing with an issue that needs some serious management but not crisis-level resources.

Preparing for a Crisis: A Six-Step Framework

After working in the trenches with top communications professionals for nearly two decades, I've distilled comprehensive crisis prep into the following six-step framework:

Step 1: Evaluate risks

There is no substitute here for brutal honesty. You'll need to take a good, hard look at both internal and external factors that could play a role in propelling your company into crisis.

Step 2: Assemble a crisis response team

Your core crisis response team should be small and powerful. It should also be available 24/7. Start by choosing your five core team members: a crisis leader, someone from operations, a communications guru, a legal advisor, and an HR lead.

Step 3: Build a crisis positioning system (CPS)

Your crisis playbook shouldn't look like a federal regulation: thick, unreadable, and ignored when it matters most. The core of an effective playbook should be no more than fifteen pages. It needs clear guidelines, identified vulnerabilities, and actionable filters that work in real time. CPS replaces your static playbook with a living, learning architecture. It's designed to help you sense threats early, decide intelligently, act fast, and adapt continuously using both machine intelligence and human judgment.

Step 4: Implement monitoring and early warning systems

Communications leaders need to develop a reflex reaction to any early warning signs that something could be amiss. This is why monitoring the public and internal relations landscapes is crucial to your crisis preparation protocols. The sooner you get wind of an issue, the better position you'll be in to address it or even contain it.

Step 5: Train employees at all levels

Crisis response training builds muscle memory; when the pressure hits, people revert to what they've practiced. Teach your leadership team to act as your crisis cabinet and train your employees to be aware enough to function as your first line of defense.

Step 6: Review and update regularly

Your crisis plan is a living document; it's not a museum piece. The threats you prepared for last year might not be the ones that hit you this year. If your company's Y2K holding statements are still taking up space in your template library, it's past time for a refresh. You should conduct a strategic review of your crisis plan each year.

CHAPTER 8

Stop Talking to Empty Rooms

Leaders often find themselves shouting into the wind, not because their message is wrong but because they're addressing an empty arena. Not every word spoken by a powerful person has a powerful impact. Context matters. Your job is

to measure *actual* impact among your priority audiences, not react to hypothetical influence.

Identifying Your Priority Audiences

Companies that navigate crises successfully identify who can help or harm them and build strong relationships with those stakeholders in advance. This starts with defining your inner, middle, and outer circles of influence.

Inner circle: direct business impact

Your inner circle consists of the people who can immediately affect your operations. Usually, this will consist of just a handful of impactful stakeholders.

Middle circle: influence amplifiers

Your middle circle of influencers has the power to shape what your inner circle thinks. Typically, it will consist of between fifteen and fifty stakeholders, which will include industry reporters and content creators, trade association leaders, senior employees, analysts, and community leaders.

Outer circle: general awareness

The outer circle consists largely of people who are great at creating noise but generally have little significant influence, as they rarely drive business decisions. These include fringe media personalities, most social media influencers, members of the general public outside your target demographic, activist groups, and politicians not directly relevant to your business.

Know Where Your Audiences Get Their Information

Identifying your stakeholders and decision-makers in order of influence is one thing, but understanding how and where to reach them is another. This is where it's vitally important to understand the new media landscape and how to leverage it to your advantage in a way that ensures your messaging gets to its intended audience.

CHAPTER 9

Master the Message

Every crisis is a real-life drama, demanding a problem, a victim, a villain, a hero, and a resolution.

Your goal as a crisis communicator is to keep your organization from being cast as the villain. And you accomplish that goal by telling a compelling story with a strong narrative from your point of view.

If your crisis communications revolve around data points alone, you're missing a critical opportunity to connect with your audience.

The human brain doesn't process crises as data points; it processes them as stories. And every story needs characters with clear roles.

Organizations that fail to cast the people who will fill these dramatic roles end up leaving the audience no choice but to assign the roles themselves. And nine times out of ten, when left to their own devices, the public will cast a company and its executives as the villains.

Tactical Takeaway: Map Your Roles

Before you say a word in public, ask yourself these questions: Who are we in this story? Are we the victim of circumstance? The hero working toward a resolution? Or are we accidentally positioning ourselves as the antagonist that is creating obstacles to answers?

Map every stakeholder to a role, understand which role you're naturally falling into, and then decide if that serves your objectives. If it doesn't, reframe your role thoughtfully and deliberately.

Matching Urgency of Message to Medium

Not every crisis plays by the same rules. The communication strategy that works for a data breach will destroy you during a safety recall. The type of crisis determines everything about how you deploy your message.

Safety crises

When people's physical safety is at stake, such as in the case of toxic spills, product recalls, or active threats, credibility is your only currency. Lead with your most credible channels: direct website alerts, straight-to-camera CEO video, and immediate SMS and email notifications where possible.

Reputational crises

These crises play by different rules because you're changing minds, not protecting lives. This requires broader stakeholder engagement and content tailored to break through on each platform.

Spokesperson Strategy

The days of one-size-fits-all spokespeople are over. Your CEO's LinkedIn presence needs different content than your Instagram strategy, which needs different voices than your podcast appearances.

> Communication isn't a support function; it's core infrastructure.

Match voice to venue and avoid forcing square pegs into round holes. Your CFO's thoughtful analysis of market conditions might be perfect for a Bloomberg interview but terrible for a TikTok response to criticism.

CHAPTER 10

Create Compelling Content and Measure What Matters

The organizations that emerge stronger from crises don't just survive the storm; they use data to turn it into a competitive advantage. While their rivals scramble to respond to every piece of criticism, smart leaders use measurement systems to separate real threats from noise. They know which platforms their key stakeholders actually use, what messaging moves the needle, and when silence is the strongest response.

Leverage the Dramatic Power of Human Stories

People need dramatic examples to shake them out of apathy. Sometimes, the greatest impact comes from simple acts, such as a humbled leader speaking authentically or a symbolic action that demonstrates commitment.

The same applies to corporate crisis communication: you need that symbolic moment, the human element that helps people understand not just what happened, but why it matters and what you're willing to risk to make it right.

Meeting Each Audience Where They Are Ready

Different subsets of your various audiences need different content formats. Don't risk losing public opinion because you don't offer people the content in a manner that they're ready and willing to receive. Match the format to the audience's preferred consumption method, even if it's outside your organization's comfort zone.

And once you get your formats in sync with each audience, set up a solid measurement system to validate your approach and to help you pivot when required.

Develop Thick Skin to Build Resilience

Once you are confident in the data, you have to be comfortable with discomfort. This is one of the hardest challenges for a corporate board or leadership team to face.

Toughness is not traditionally a corporate strong suit, but it increasingly needs to be. The companies that win today don't just weather storms; they use the turbulence to build stronger, more resilient operations. The companies that thrive in this environment are the ones that can take hits and keep moving forward.

CHAPTER 11

Harnessing the Power of Vulnerability

People don't buy what you make; they buy why you make it. They don't connect with corporate speak. They connect with vision, possibility, and the sense that your company understands something important about their lives.

This is what authentic leadership communication is about: connecting your company's mission to something that matters deeply to the people who need to believe in it. And when a crisis hits, people connect with authenticity.

The Corporate Tendency Toward Robotics

Most companies approach crisis communications like they're diffusing a bomb. Every word gets vetted by legal. Every statement gets stripped of emotion. Every human element gets carefully sanitized away. The result? Communications that sound like they were written by an algorithm for an audience of lawyers.

But in times of uncertainty and fear, people want leadership, not legalese. That goes for words and for actions. The leaders we remember aren't those who avoided difficult moments but those who rose to meet them with genuine humanity.

This isn't just about crisis management; it's about character. When everything you thought you knew gets stripped away, what remains is who you really are and what you truly stand for. The organizations that thrive in crisis aren't those led by people with perfect plans but by those with authentic conviction and the vulnerability to admit when they're facing something entirely new.

CHAPTER 12

Put Stakeholders First

Smart organizations design their communications function from the outside in. The most effective structure is the one that's optimized to engage the stakeholders most critical to the business's success.

There are multiple models you can follow, depending on the stakeholders you prioritize. Here are a few different examples of how to consider framing based on a few of the most commonly prioritized stakeholder groups:

Employees

Your employees are the audience most likely to see through corporate BS. During a crisis, they'll either amplify your message or undermine it. There's no middle ground.

If your own employees don't believe you, no one else will.

Public and civil society

Your audience—customers, consumers, activists, community leaders—are bombarded with information and armed with skepticism.

Civil society stakeholders, including NGOs, foundations, and all sorts of community leaders, have long memories and little patience for corporate virtue signaling. They want authenticity over rhetoric, action over statements. They can detect inauthenticity from orbit, and they have platforms to amplify their skepticism instantly.

Shareholders and regulators

In times of crisis, your formal stakeholders—regulators, investors, and boards—aren't looking for empathy. They're looking for competence. They want transparency, discipline, and a clear chain of accountability. They want to see that you understand the problem, own the solution, and have systems in place to prevent recurrence.

The expectation is straightforward: Show, don't tell, that you're in control.

AI as Your Force Multiplier

Every company is grappling with how AI both threatens and empowers its stakeholder communications. The organizations that master this balance will have a decisive advantage.

With AI, anyone can now create convincing fake websites, clone executive voices, or generate professional-quality disinformation campaigns. But the inverse is also true. AI can be a force for transformative opportunity, making communications teams exponentially more effective, particularly across three core dimensions: volume of output, customization of output, and speed of development and dissemination.

Beyond these core capabilities, AI also enables increasingly sophisticated early warning systems through real-time monitoring across platforms, generates professional multimedia content without traditional design resources, and provides deep stakeholder intelligence that helps predict reactions before messages go public.

CHAPTER 13

Comms at the Center of the Storm

Too often, communicators put themselves in a behind-the-scenes box, a self-imposed prison of sorts. Executives don't necessarily expect us to stay there, but we've convinced ourselves that it's where we belong. If anything, top executives want us to share the burden of being front and center. Breaking the mindset that communication belongs behind the scenes isn't just freeing; it strengthens the entire business.

Communicators need to be equipped not only to direct communication but also to own it. Business leaders need communications professionals who function as strategic counselors, leaders who can take the heat, control the narrative, and represent the company's interests with the same authority as any C-suite executive.

The New Rules for Strategic Leaders

The communications professionals who will lead in the next decade are the ones who understand that this job is about scenario planning, not spin. They're the ones willing to walk into the mess instead of waiting for someone else to clean it up. If you're ready to do this work, here's what it requires:

- own your voice
- integrate your function
- measure what matters
- live your values
- embrace the mess

The scenario planning that kept me alive in dangerous situations growing up—understanding your environment, assessing threats, having contingency plans—is the same fundamental capability keeping companies alive in dangerous narrative environments. Both require constant vigilance, pattern recognition, and the ability to move fast when the situation changes.

Conclusion

The companies dominating the next decade are being built right now by leaders who understand that communication isn't a support function; it's core infrastructure. While your competitors are still debating whether to invest in these capabilities, you need to be shaping markets, influencing policy, and controlling narratives.

For those willing to evolve, the tools are more powerful than they've ever been. The need is greater than it's ever been. But the window won't stay open forever.

The threats aren't theoretical. They're not coming someday. They're here.

Your competitors are getting better at this while you read this sentence. Your employees are watching to see if you mean what you say. Your customers are one TikTok away from deciding you're the villain in someone else's story.

You hope reality doesn't find you, or you can build the capacity to handle that reality when it arrives.

The choice is yours.

Bradley Akubuiro is a nationally recognized expert in corporate reputation and a partner at Bully Pulpit International, where he leads the corporate communications practice. He advises global brands on crisis management, change communications, and media relations. Previously, he served as chief spokesperson for Boeing and held senior communications roles at United Technologies Corporation. His experience also includes work at Booz Allen Hamilton and advisory roles in government and international development. Bradley is a contributor to Business Insider, Forbes, and Inc. and has been recognized in Crain's Chicago Business and PRWeek 40 Under 40. He lectures at Northwestern University and serves on multiple boards.

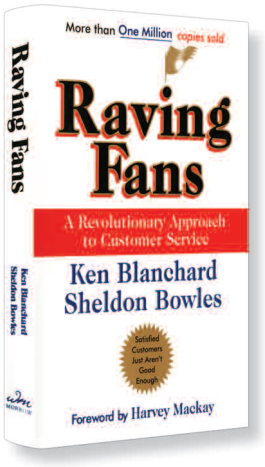
Don't Settle for Satisfied Customers



Review by Chris Lauer

RAVING FANS

by Ken Blanchard and Sheldon Bowles

© 1993, William Morrow, $22.95, 137 pages,
ISBN 978-0-688-12316-1

Appropriately enough, magic reigns supreme in the pithy little business fable co-authors Ken Blanchard and Sheldon Bowles deliver in *Raving Fans*. Although there is nothing supernatural about the real profits and repeat business created by great customer service, there is something very magical about the way attracting highly motivated, long-term customers can turn a business from just another name in the Yellow Pages to a highly successful company. In *Raving Fans*, the authors describe how any forward-looking leader can turn three secret ingredients into a powerful formula for creating outstanding customer service.

Satisfied customers are just not good enough. For a company to be successful, it needs fans who are so excited about its products and services that they rave to everyone they know about the company's greatness. Helping managers and executives build the services and products that create this type of customer is why leadership gurus Blanchard and Bowles wrote *Raving Fans* back in 1993. Today, their story and the lessons it contains remain as relevant as they were more than a decade ago.

Like all great fables, *Raving Fans* introduces us to a sympathetic hero whose fate is about to change over the course of an exciting adventure. Our hero has no name other than his new job title, the Area Manager, perhaps so every reader can put him- or herself in his shoes. The problem is, the protagonist has been hired at a company that turns over people in that position every eight months. Each of those previous people failed at the one thing the president of the company values: customer service. The Area Manager must tackle the sizable task of discovering the secret to great customer service or lose his new job.

Charlie the Fairy Godmother

Thankfully, just when he has entered the realm of perplexed panic, realizing he hardly knows a thing about great customer service, the Area Manager's fairy godmother enters the picture, appearing out of nowhere, ready to take him on a journey that will teach him everything he needs to know about the elusive customer service that will set him apart from his failed predecessors.

Forget what you've ever imagined a fairy godmother to be. This fairy godmother has no magic wand, no puffy dress, no twinkling glow. On the contrary, the fairy godmother advising the Area Manager is much different than those found in other fairy tales. This fairy godmother plays amazing golf, reads minds, predicts the weather and knows everything anyone could ever want to know about creating great customer service.

It's worth mentioning that this particular fairy godmother is a man named Charlie, and he only imparts his wisdom to those who are ready to hear his words about creating "raving fans." It seems that his celestial home

office is an equal opportunity employer, and Charlie was hired to fill its quota of men needed in its ranks of fairy godmothers.

Although the premise might sound preposterous, the principles that flow between the Area Manager and his counselor Charlie are vital for all managers. When Charlie shows our hero how to create fans so dedicated that they are willing to drive 40 miles out of their way just to spend their money, he is sharing timeless business wisdom that all modern leaders can put to use in their work.

Just as the fairy godmother in *Cinderella* acts as a mentor to her young protégée and protects her with magical powers, Charlie guides our hero through a journey to magical places where he discovers the power of total quality customer service. Along the path to his goal, the Area Manager meets a variety of successful businesspeople Charlie has mentored in the past.

Preventing Customer Flight

The starting point of our hero's journey is a company that is just treading water. The Area Manager's employer has customer service that really stinks. Nobody smiles. Employees are rude to customers. If a competitor ever steps up and does things better, customers will inevitably flock away in droves. But since everyone in the industry seems to be suffering from the same lack of inspired customer service, the company stays in business and customers hang around. The real problem for the company lurks in its future: Being no worse than its competition means that the company will be unprepared should its abused customers ever find the slightest reason to fly the coop.

The first lesson that Charlie imparts to our hero is that satisfied customers don't cut it. These are the customers that will take their business to a competitor in a heartbeat. The only way to prevent this kind of defection is to turn satisfied customers into "raving fans." Truly dedicated customers display the loyalty that keeps them around forever, and makes them brag about a business to others. They also bring their friends, families, neighbors and colleagues to that business's front door. These are the people that turn a company into a real success. Since customer service is really the bottom line for all companies, creating raving fans is an essential skill that they need to master to become booming businesses.

Charlie, the fairy godmother, has three magic secrets for creating raving fans, and through the course of the Area Manager's journey, Charlie imparts them one by one to our hero. In between their lessons, the two men play golf.

Make a Decision About What You Want

After playing their first 18 holes together, Charlie takes our hero to meet the first in a series of smart people who provide him with the insights he needs to turn Charlie's secrets into a working business model. The first person the two men visit is Leo Varley, the owner of Varley's Department Store.

In Varley's store, the Area Manager experiences exquisite customer service first hand. A greeter pins a carnation on him. A clerk finds him a book, which is out of stock at Varley's so she purchases it from a nearby store and wraps it for free. During his experience at the department store, the Area Manager notices that Varley's washroom is immaculate. He also discovers that Leo works from a desk right in the middle of the store where customers are encouraged to engage with him and ask him for anything they might need.

Leo offers the Area Manager the first secret of raving fan creation: Decide what you want to do. Although this seems simple, it is a crucial decision that every manager who wants to create great customer service must make. In other words, create a vision of what you want your business to offer to its customers. Take time to formulate a clear understanding of what your business looks like, down to the smallest detail, and imagine how you can satisfy your customers' needs. This exercise includes discovering how you will empower your employees to serve customers and what you will do differently from your competitors.

The next stop that Charlie and our hero make is at Sally's market, a grocery store that offers customers a variety of amenities that the Area Manager has never experienced before. There's valet parking, store advisers, a computerized shopping service, nutritional advice, rapid checkout, automated billing and free shoe shines to boot! These are the extras that show our hero what outstanding customer service can look like in a different retail setting.

Sally, the owner of the grocery store, explains that deciding what you want for your business also includes creating a "vision of perfection" that centers on the needs and desires of customers. She points out that this is part of the way she turned her struggling grocery store into a thriving success story. By carefully transforming her market into her fantasy of a perfect grocery store, step by step over time, she was able to attract the raving fans who make her extremely successful.

Find Out What Your Customers Really Want

Several days later, the Area Manager and Charlie go out for another drive. This time they meet Bill the plant manager. As a manufacturer with his finger on the pulse

of his customers' needs, Bill explains the second secret Charlie imparts to his students. This lesson takes the first secret of great customer service into the realm of reality even farther by injecting the manager's decisions with the desires of his or her customers: Discover what your customers really want. By asking important questions and listening closely to the answers that customers give, a manager is better able to adapt the vision of the company is his or her head with the reality of customer demand.

Bill describes how each customer will have his or her own focus, which might be incomplete, but can still provide a manager with valuable insights that can help the business fulfill desires. He also explains that some customers want much more than what the manager's original vision of the company entails. It is up to the manager to decide whether to incorporate that desire into his or her original vision, or to tell the customer to please look elsewhere for another company to fulfill that desire.

Fire Bad Customers

Herb Kelleher, the founder and former CEO of Southwest Airlines was famous for doing this on the rare occasion that he found a passenger who just could not be satisfied.

According to legend, a frequent flyer of the airline was constantly unsatisfied by everything Southwest did. She continually wrote letters to the airline complaining about the company's boarding policy, its lack of in-flight meals, the flight attendants' uniforms and the casual atmosphere during the airline's flights. When the employees in Southwest's Customer Relations Department were at a loss for what to do next, they sent the woman's letters to Kelleher.

Kelleher, who was CEO at the time, wrote back to the woman: "Dear Mrs. Crabapple, We will miss you. Love, Herb."

The authors of *Raving Fans* explain that sometimes a customer's vision for your business is so different from your vision that he or she simply does not fit into the picture. In other words, customer service is vastly important, but there are limitations. Those limitations define the business. When a customer falls outside of those parameters, it is more important for the company to bid farewell to that customer than it is to rearrange the original vision to accommodate somebody who is too hard to satisfy. Rather than waste money and resources fighting a losing battle, a better solution is to simply (yet politely, like Herb Kelleher) tell that person to take a hike.

On the other hand, when a good customer who loves your company has some input that might be useful for your company, by all means take that information to heart. Adapting your original vision to accommodate the sharp focus of a valuable customer can help you improve your customer service immensely. Just decide how far you want to go outside the lines of your vision, and work hard to keep your business in line with its goals.

Never Take 'Fine' as an Answer

Two pieces of good advice that Bill imparts to our hero are 1) a customer's silence speaks volumes and 2) a mundane response like "fine" from a customer is not good news. Bill explains that if people don't care enough about your product or service to offer you any praise or feedback, or if they simply respond with "fine" when they are asked about their experience with your company, then you are not doing enough to keep them when a competitor offers them something a little better. Don't be lulled into complacency by quiet customers. Instead, listen harder for what they really feel, every day, Bill says. The best way to do this is to ask sincere questions and respond with sincere answers. These actions show customers that you are listening. People love to be heard, so this is a great way to turn them from merely satisfied customers to raving fans.

Next, the Area Manager goes to visit his fairy godmother for another golf outing. On the way there, he meets Dennis, a cab driver who not only quickly and smoothly takes him to his destination, but also provides the Area Manager with the greatest cab ride of his life. Dennis opens and closes his door for him. He offers him cold and hot beverages. He gives him a selection of radio stations. He has magazines and the day's newspaper available. His cab sparkles, and the interior is comfortable and perfectly clean. Dennis serves as yet another example of a customer service genius and the third secret of creating raving fans: Deliver the vision plus 1 percent.

Could Be Canada

To help his student understand more deeply what Dennis had showed him in practice, Charlie takes the Area Manager on a magic carpet ride to a place far, far away. Possibly, this place is in Canada. The reason why Canada is a good bet is because the next place the pair visits is a perfect example of a customer-friendly gasoline service station where attendants run to the car, pump it full of gas, check the engine, wash the windows and provide over-the-top service with a smile. Although the story's gas station business is fictional, it is easy to speculate about the origins of this part of *Raving Fans*.

It just so happens that Sheldon Bowles, the book's co-author, was once the president and CEO of Domo

Gasoline Corp. Bowles and his chairman, Canadian Senator Douglas Everett, were responsible for building that company into one of Canada's largest independent gasoline retailers. Domo was also famous for its full-serve Jump to the Pump® service, which sounds suspiciously like the gas station the Area Manager visits in *Raving Fans*.

At the imaginary gasoline retailer in the fable, the owner, Andrew, tells our hero what he means by "deliver" and "plus one." Regarding the *deliver* part of the equation, the gas station owner explains that delivering on your customer promise is not an occasional thing. Success is built on consistency. He adds that a business that wins raving fans makes realistic promises and meets them every single time, often over-delivering on those promises.

Through continuous incremental improvement ("plus one"), a business gets better through steady growth. By improving just 1 percent of the business each week, Andrew points out, by the end of the year, the company is more than 50 percent better than it was at the beginning of the year. He calls this "The Rule of One Percent." This simple rule goes a long way toward keeping a business moving forward without upsetting the passionate customers who already love the company as it is.

Through continuous incremental improvement 'plus one,' a business gets better through steady growth. By improving just 1 percent of the business each week, by the end of the year the company is more than 50 percent better than it was at the beginning of the year.

Consistency and Flexibility

While Andrew describes the final secret in the formula for raving fans, he brings up another important concept: Systems are needed to make incremental improvements part of the structure of the business. He also points out that while systems help to keep a business humming along and growing, you must remember the importance of flexibility when it comes to encouraging employees to serve customers better. Rather than setting up strict rules that create robotic employees, he suggests creating customer-centric systems that help employees make their own decisions based on their customers' immediate needs. The consistency created by systems allows a business to make incremental improvements that take it beyond the original vision on which it is built. Customer-centric flexibility makes the business human.

Through the insights of Leo, Sally, Dennis, Bill and Andrew, Charlie makes his message clear to our protagonist. Raving fans don't just arrive out of nowhere. They are created by the persistent and consistent efforts of inquisitive and visionary managers, like the Area Manager, who listen to their customers.

By describing the secrets that can take him and his company to the next level of customer service, Blanchard and Bowles offer all professionals the tools they need to start building a more customer-focused organization. Through the simplicity, relevance and genius of their clever characters and the compelling nature of the story in which they are introduced, the authors have created a timeless piece of business fiction that can help all managers attract raving fans to their businesses in the real world. ●

The authors: Management guru Ken Blanchard is the co-author of the successful management guide *The One Minute Manager*®, which has sold millions of copies since he wrote it in 1981 with Dr. Spencer Johnson. Blanchard is also the author or co-author of an additional 23 books, including the best-sellers *Gung Ho!*, *High Five* (two more books he co-authored with Sheldon Bowles) and *Raving Fans*, which has sold more than 1 million copies to date. He is also the chairman of Blanchard Training and Development, a highly successful management consulting and training company.

Sheldon Bowles originally made a name for himself as a customer service genius when he founded and presided over Domo Gasoline Corp., a groundbreaking business that he turned into a $75 million company through a variety of unique customer service initiatives. Today, he serves as president of Ode to Joy Limited, a successful diversified holding and management company.

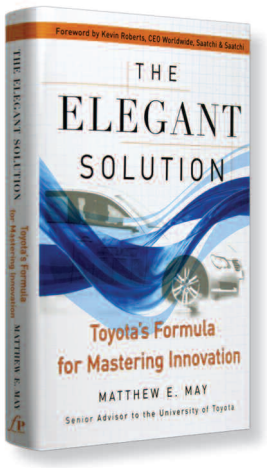
The Art and Science of Innovation



Review by Tom Moore

THE ELEGANT SOLUTION: TOYOTA'S FORMULA FOR MASTERING INNOVATION

by Matthew E. May

Free Press ©2007 237 pages, $26.00
ISBN: 978-0-7432-9017-3

Why have the wheels come off the U.S. automotive industry? Why are foreign manufacturers kicking our collective rear on nearly every measure of performance, product development, manufacturing, quality and profitability? More insidious, how pervasive is this decline? Is the erosion of U.S. automotive clout symptomatic of our business culture as a whole? Can we shake our competitive malaise and recapture our pre-eminence on the world stage?

These questions become increasingly relevant not only to the future competitiveness and prosperity of our economy but to the way we, as individuals, participate in and benefit from that economy. On that latter score, the news has been bleak. Every day, jobs are being restructured, outsourcing establishes new beachheads, unemployment ravages more communities, loyalty and meaning have all but vanished, and compensation erodes. In short, we are asked to do more with less and with fewer rewards — hardly a prescription for a fully engaged workforce or an economic recovery.

As businesses seek to rekindle their value proposition in today's post-industrial world, one competitor continues to raise the bar. By any measure — customer loyalty, vehicle quality, profit, output volume, best-selling new models, innovation, sustainability — the automaker Toyota defines excellence. Toyota's nearly $150 billion-plus market value outstrips General Motors, Ford, Daimler-Chrysler, Honda and Volkswagen combined. Toyota makes twice as much money as any other carmaker, even though it enjoys less than a 15 percent market penetration.

How does the company do it? What makes Toyota different? It's the essence of a corporate culture, engineered to encourage individual creativity, according to longtime Toyota business partner Matthew May in his insightful work, *The Elegant Solution*. He should know. He spent many years on the inside of Toyota teaching at Toyota University, and he takes us behind the scenes of Toyota's continuous improvement process. Looking through his lens, we come to better understand not only the cancer that is undermining the performance of many of our institutions but a treatment plan for our recovery.

His prognosis? America, once the economic juggernaut that defined performance, quality, leadership and prosperity, lost its edge when it grew complacent and greedy and stopped looking for new solutions that would better serve its customers. And therein contains the seeds of our recovery.

"Good Enough" Never Is

For Toyota, innovation is the mastery of thinking within the box. This oxymoronic reality — systems and

creativity — helps explain Toyota's corporate DNA and its record of outstanding performance. The system gives the individual worker purpose, direction and a sense of belonging. That is the safety net that encourages workers at all levels to seek new and better ways of doing things.

But May is skilled enough in his craft to avoid the trap of allowing this impressive story to devolve into stagnant textbook prose or sophomoric cheerleading. To drive his message home and make it more memorable, he punctuates the text liberally with quotes, sidebars, charts, pictures, templates, hansei (reflections) and anecdotes.

None is more riveting or enlightening as the inspirational story of Paul Guitierrez, an autoworker from the former General Motors plant in Fremont, Calif. When Toyota took over the facility in the 1980s, "we went from 'just do your job' to 'no one knows the job better than you,' " Guitierrez says. "They teach us how to solve problems. They say, stop the line anytime if something's wrong. I was floored. That right there changed my life. All of a sudden, I'm looking for ways to fix problems, make improvements, basically get rid of anything that was stupid."

May's use of Guitierrez's story helps to move the focus of the book along and gives the reader an insider's perspective on the shifts that take place when new management is installed in a business. Takeovers are often viewed as negative and punishing to current employees. The Toyota situation shows that a new owner can bring a great deal of success and give employees hope.

A Short History of Innovation

While May is an unapologetic Toyota enthusiast (as it turns out, with good reason) none of the principles, practices and protocols he shares are unique to Toyota. In fact, he includes a number of innovative practices from companies such as JetBlue, Starbucks, Clear Rx, Apple Computer and Anthropologie. "The magic is found in Toyota's remarkable ability to collectively and completely master all of them as a way of life, not a program centered on select teams led by specialists with artificial agendas," May explains. "That's what makes Toyota unique and worth studying."

May begins with the story of Sakichi Toyoda, who, in 1888, watched his mother work on a primitive spinning loom all day, often having to scrap an entire day's work because of a single broken thread. "I began thinking about ways to power the looms so that weaving could be done faster and more cloth could be made more cheaply," Toyoda says. "People could then buy cotton goods for less, and that would benefit society substantially." Some 30 years and numerous minor improvements later, Toyoda perfected the power loom with the capability to stop the loom automatically whenever a thread broke.

> **"Toyota implements one million ideas a year. For Toyota, innovation is the mastery of thinking within the box."**

Not only did Sakichi Toyoda find the elegant solution, he found the art and science of continuous improvement that became the lynchpin to Toyoda Automatic Loom Works, the precursor to Toyota Motor Company. This resourceful spirit was absolutely essential in an era of scarcity — land, facilities, money and labor — as he leveraged his employees' ingenuity, constant improvement and a strong will to serve society to accomplish more with less.

A Spiritual Quest

May introduces Sakichi Toyoda, not to showcase his inventive prowess but rather to place in context his nearly Zen-like quest to develop a better solution to a real problem. When it comes to solutions, simple is better, according to May. And elegance is better still. Arriving at the ultimate meaning behind the title of his book, May writes, "An elegant solution is one in which the optimal or desired effect is achieved with the least amount of effort."

What makes this intriguing is that it doesn't matter whether the focus is a discussion of a new product design, or the enginineering of a new technology, or an improvement to a daily operation, the core processes for innovation are the same and can be taught and replicated; all entailing a rigorous search for the optimal solution, all working toward solving the problem of how to do something better.

The truth is that customers are not impressed with features that don't meet their needs or solve their problems. Innovation is about satisfaction and value, not new gizmos. Therein lie the philosophical underpinnings that guide the quest for elegant solutions:

Ingenuity in craft. May urges us to reject self-limiting behaviors, such as blaming corporate bureaucracy or resource constraints for maintaining the status quo. He argues that we should develop our expertise and take pride in our work to overcome complacency by viewing such opposition as "an inventive challenge."

Pursuit of perfection. May debunks the myth of the "thunderbolt breakthrough," arguing those often serendipitous events are rarely repeatable and often don't square with a culture of innovation founded on continuous improvements and the systemic pursuit of perfection.

Fit with society. Remember the old saying that if you build a better mousetrap the world will beat a path to your door? That's not entirely true, according to May, who maintains that without a major rodent infestation, such a mousetrap, no matter how innovative, will not be successful. Establishing this fit requires a clear understanding of your business and your customers.

These are the principles that, to this day, fuel the engine of innovation at Toyota and form the basis of everything Toyota does. Without them, it's too easy for any business to become focused on short-term financial performance. Exhibit one is Toyota's competitors in Detroit.

What Is Innovation?

In demystifying innovation, May blows the doors off traditional assumptions that innovation is the province of the few, the trained, the elite. "It's NOT sitting around dreaming up earth-shattering ideas behind closed doors, trying to be clever and creative in concocting a new secret sauce that will blow the doors off the competition," he writes. "It is making best use of one's expertise while openly exploring possibility and defining the task at hand. It is a front-line worker exploring, finding and solving an important problem hands-on."

Innovation depends upon how we connect with our work, May notes. The more engaged we are and the more trust we feel, the more creativity will be unleashed. So how do we move to that level of engagement?

May says the first step is to avoid the trap of getting lost in titles and job descriptions, which inhibit us from capturing the meaning of our work. For those struggling to make the connection, May employs "The 5 Why's." He simply starts with a job description and starts peeling to unlock the real purpose or meaning of the job by asking, "Why is that important?" After five such questions, the cause should be revealed. Autoworkers, like Paul Guitierrez, come to see their jobs not as working on an assembly line but as protecting families as they drive.

The flip side of the engagement coin is relentlessly exploring new solutions by asking questions to develop a better understanding of our business and our customers. Suppressing curiosity builds drone-like conformity, the arch-enemy of innovation.

How Do We Achieve Innovation?

It's one thing to diagnose the problem; it's quite another to convert these philosophies into an actionable recovery plan. May succeeds on both counts. Appropriately, that's where he spends the bulk of his energy — elaborating on how to implement the elegant solution. Although it is a journey without a destination, the path is marked with some visible, repeatable practices.

> "Remember the old saying that if you build a better mousetrap the world will beat a path to your door? That's not entirely true…"

May carefully ensures this roadmap applies to individuals and corporations alike. For the individual, there are the tools to buck the bureaucratic inertia that can stifle innovation. And from the business leader's perspective, there are tools to remove the myopic organizational barriers that constrain personal ingenuity and creativity.

As he spells out how to implement innovative practices, May uses a problem, cause and solution format, which helps us understand each of these areas.

Perpetual learning. What separates Toyota from other companies is its mastery of perpetual learning driven by the cultivated desire to understand. In order to accomplish those objectives, Toyota employs the process of I.D.E.A. Loops (Investigate by questioning to fully analyze the problem; Design by solving problems and generating solutions; Execute by testing a solution; and Adjust by assessing results and improving the design based on user feedback). Without a systematic learning process, it's difficult to make change relevant.

Live in your customer's world. In order to avoid solutions that don't work as predicted, May encourages us to get closer to the customer. Toyota calls it, "genchi benbutsu," the Japanese term for "go and see." The idea is to observe the customer, become the customer and collaborate with the customer to develop a more complete understanding of the customer. For instance, Toyota's product developers working on the Scion attended raves and hip hop parties to understand their youthful target audience. The challenge is to be nimble enough to accept facts that run contrary to our beliefs.

Think in pictures. Pictures and images connect people in an emotional way that helps to illuminate the innovative path we need to work. This visualization can take the form of visual dashboards to monitor performance on goals or "obeya" sheets. "Obeya," which means "big room" in Japanese, is the nerve center for any Toyota team project. Output from these sessions is captured on a large tabloid-sized sheet nicknamed an A3 for the international paper size.

Capture the intangible perceptual and emotional elements. Too often solutions fail to excite the customer because of a tunnel-vision focus on features as opposed to benefits for the customer. May urges us to

capture the intangibles that people truly prize. Therein we'll find the most compelling elements of value. For instance, Lexus doesn't sell luxury transportation, but rather safe sanctuary and quiet escape. Disney doesn't operate theme parks; it sells magic and fantasy. The tangible drivers of value — quality, cost, speed — are merely the price of admission and, in order to compete, it's essential that we get these right. But if we can get to the heart of what enhances the customer experience, we have the opportunity to unleash a torrent of creativity.

Leverage the limits. Understand that resource constraints can spur ingenuity. For instance, in 2005, Toyota announced that it was looking for ways to cut in half the $5,000 difference in price between Toyota's hybrid cars and similar gasoline models, without compromising the current quality or performance. Because it was aligned with Toyota's business model, that arduous and audacious goal, once articulated, became reality.

Make kaizen mandatory. May tells us that the number of ideas submitted per employee in Japan is 100 times greater than in U.S. companies, despite the fact that the average reward is 100 times less than in the U.S. "Kaizen," the Japanese word for continuous improvement, caters to the idea of submission of ideas, not acceptance.

Keep it lean. Despite the accelerating scope and pace of change, too many businesses invest in structures that impede response time and flexibility. Customization and complexity become intertwined and will ultimately erode whatever value is provided. To combat this tendency, May encourages us to start looking at the world through the eyes of the users and to the front-line employees and relentlessly fight against complexity and "scale it back, make it simple and let it flow."

Summary

When we think of Toyota, we think cars. Yet May is quite clear that what separates Toyota from the pack is its relentless pursuit of innovation. Toyota refuses to rest on its laurels. It fights complacency by encouraging ideas from every level of the organization. It's all about incremental improvements, getting a little bit better every day.

> "Lexus doesn't sell luxury transportation, but rather safe sanctuary and quiet escape. Disney doesn't operate theme parks; it sells magic and fantasy."

The Elegant Solution serves as a clarion call for businesses or individuals flailing in the stagnant backwater of uninspirational and un-aspirational mediocrity. But far from a death knell, May's work paints an optimistic view of the future.

"More and more people are beginning to return to the almost forgotten Renaissance era of mastery. They're adopting a different view of their work. In all walks of professional life, from senior executives to factory workers to part-timers, people are beginning to see themselves as business artists and business scientists.

"Great innovation seeks to find and fit the rhythm of change happening around us. At the same time it aims to lead that change by finding a way to do something better than it's ever been done before. Great innovation is a brand of leadership. Elegant solutions meld with society. They help move the world."

There's no time to waste. Toyota is already moving away from the narrow focus on product and service quality because of the perceived creeping of commoditization. According to May, the company has set its sights on creating "compelling customer value, about how to flow that value through streamlined processes and about embedding a real discipline around the pursuit of perfection."

The best never rest. ●

The author: Matthew E. May partners as an advisor with corporate leaders to help guide change and drive innovation in their organizations. He is the director of Aevitas, a Los Angeles-based firm that works with teams to instill a strong discipline around constant innovation, using a unique blend of logic and creativity to embed the routines they need to build a balanced portfolio of ideas from the front lines to the boardroom.

For more than eight years, May partnered with the University of Toyota, playing a key role in the organizational learning strategy, design and delivery of core programs for Toyota associates both domestically and internationally.

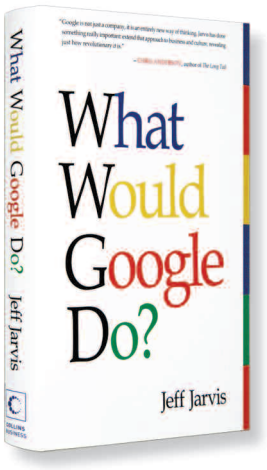
Virtuous, Virtual New World

Counterintuitive Lessons for Your Business and Your Life



Review by Tom Moore

WHAT WOULD GOOGLE DO?

by Jeff Jarvis

HarperCollins Publishers, Copyright ©2009, 257 pages, $26.99 ISBN: 978-0-06-170971-5

We are entering uncharted waters. The turbulent scope and pace of change has turned our worlds upside down and inside out, leaving us dazed and confused. Web 2.0 is already considered passe, but so many businesses have yet to come to grips with its impact. Combine the rapidity of change with the financial uncertainty and it's quite a hazardous time.

No area of society has been left unscathed. Retailers, banking, insurance, media, utilities, educational institutions, governments and social groups are clamoring for their moorings. In the wake of the raging economic tsunami, many previously successful enterprises find themselves underwater and in need of federal assistance.

Yet one business model stands out above the rest — Google. In 2008, as banks, companies and even nations took on water, Google announced profits rising 26 percent. Google has 71 percent of the share of searches in the U.S. while controlling 69 percent of online ad serving and 24 percent of online ad revenue. So, confronted with the challenges of the present it makes sense to ask: What would Google do?

The answer is revealed by Jeff Jarvis, media and news blogger at Buzzmachine.com and an associate professor and director of the interactive journalism program at the City University of New York's Graduate School of Journalism. This new-age prophet helps us navigate the treacherous currents of the new economy in his new book, *What Would Google Do?*

If that title sounds somewhat heretical, it's because it's meant to be. Jarvis says it was inspired by the bumper stickers and bracelets that ask What Would Jesus Do? In this iteration, Google has become the higher power of the new Internet economy. The point of the book is not to mimic everything that Google does but to learn how to see the world as Google does, analyzing and deconstructing its success so we can apply what we learn to our own companies, institutions and careers.

Part social commentary, part history and part prophecy, *What Would Google Do?* is an old-fashioned tent revival packed into 257 pages of exciting, thought-provoking and inspirational prose. Jarvis condemns our sinful past and spurs us on to our economic salvation by following the altruistic rules that have been the cornerstone of Google's success: openness, collaboration, transparency and trust.

The Missing Link

Jarvis provides an inside look at how he came to realize the potential of the Internet. He took to his blog to chronicle the customer service frustration he had with a new Dell computer and then shared his personal accounts when circumstances found him reporting from near Ground Zero during the 9/11 attacks.

"A few bloggers in Los Angeles read what I had written, wrote about it on their blogs and linked to me," he recalls. "I responded and linked to them. At that moment, a gong clanged over my head. I realized

"The days of the command-and-control economy, in which companies held information close to the vest to artificially pump up demand and push products and services on unsuspecting customers, are over."

we were having a conversation — a distributed conversation, happening in different places at different times, which was made possible by the link."

In that moment, Jarvis says he realized the connected, interactive and collaborative power of the Internet. He realized that this structure had the potential to transform commerce, marketing, politics, government, education — the world. "The link and search created the means to find anything and connect to anyone," he explains. "Now everyone could speak and all could hear. It enabled people to organize around any interest, task, need, market or cause."

Link and search started a revolution in the way we interact with others that continues to ripple through every sector of our society. Those that understand that the information transformation has less to do with technology and business and more with building new connections and relationships will survive and even thrive in this new era. Those that don't are doomed, Jarvis maintains.

Endangered Species

In their most messianic interludes, companies and institutions tend to view the Internet as a resource that has been created in their own images, according to Jarvis. For instance, retailers think of the Internet as an online catalog from which consumers will order merchandise. Too many businesses and institutions view the Internet as merely a portal that has done nothing more than extend their reach and accelerate the speed with which their customers can do business with them.

But the Internet abhors such inefficiency. The days of the command-and-control economy, in which companies held information close to the vest to artificially pump up demand and push products and services on unsuspecting consumers, are over. Indeed, entire industries and companies, such as car sales, advertising agencies, governmental bureaucracies, insurance, headhunters and real estate brokers, are in danger of going the way of travel agents if they don't heed Jarvis' admonition to stop trying to make money by interfering in transactions.

If this sounds like the theoretical ramblings of a wild-eyed futurist, Jarvis is quick to bring us back down to earth with a sobering dose of cold, hard reality that makes his prognostications far more prescient:

- "In 2007, eBay sold $59.4 billion in merchandise from 547,000 online stores," he writes. "It may be dwarfed by Wal-Mart's $345 billion, but in 2007 eBay beat the sales of America's largest store chain, Federated (aka Macy's), who had revenues of $26.3 billion in 853 stores."
- "Gawker Media, a gaggle of gossipy blogs started by Nick Denton, boasted in July 2008 that its dozen sites had double the Web traffic of the *Los Angeles Times* online — 254 million vs. 127 million page views in a month."
- All Weblogs, taken collectively, have an audience of readers that is larger than the number of people who buy a daily newspaper.
- "Skype — which at the end of 2007 had 276 million accounts in 28 languages — exploded as a free service before it added paid features that drastically undercut old phone companies."
- Zillow.com provides automated estimates of a home's value based on comparable sales in our communities. This invades and erodes the province previously controlled exclusively by real estate agents and the Multiple Listing Service.

"The mass market is dead," Jarvis declares. "It committed suicide by not heeding market trends and developing authentic, interactive relationships with its customers. Google just handed it the gun."

Power to the People

The new frictionless economy is fueled by companies like Google that seamlessly connect demand to fulfillment. Instead of trying to control the customer, they allow their constituents to take part in setting the direction and the rules of engagement. These companies understand the transformative power of the Internet; these networks, platforms and links put the people in charge by connecting them with information, action and each other. It is in those connections where value is created, efficiency is found, knowledge is grown and relationships are formed, Jarvis maintains. Relationships are the currency of the new economy.

These new customer relationships undermine the conventional laws of supply and demand that have defined much of our economic, political and social interactions up until this point. Consider the case of an airline that had only so many seats to sell. As demand for the scarce resource escalated, so too did the price. Google has blown the cover off of this scarcity mentality by creating a business model based on abundance: The more content there is for Google to organize and the more places

there are for it to place its ads, the better. The same counterintuitive tenets are ripping through other sectors of the economy.

Amazon.com is a case in point. The company holds as little inventory as possible, owns no stores, pays no retail rent, hires no sales clerks and owns no shipping infrastructure. Because of the sheer volume of its business, Amazon.com is able to negotiate the best prices from suppliers, a portion of which is passed back to its customers in what is termed the "Internet dividend," which only builds volume even higher.

Or consider the well-documented tales of the open-source economy fueled by a distributed phalanx of programmers who pooled their resources to collectively create the Linux operating system that powers most Internet servers, to develop the free Apache Web server software that delivers most Web pages, and to perfect Mozilla Firefox for the 500 million open-source browsers. Open-source projects are not the chaotic anarchies many would have us believe, but rather have leadership and structure — an elegant, altruistic organization in which the contributors are not motivated by selfish greed, but rather by the desire to be a part of something bigger than themselves.

The Economic Salvation

But Jarvis does more than simply extol the seismic shifts under way in our economy. He provides navigational beacons directing companies to a new prosperity based upon how much control they give back to the people. He distills Google's relationship with its customers into attributes, each bearing clever headlines such as "Small is the new big," "The post-scarcity economy," and "Atoms are a drag," which not only fuel our curiosity but help him drive home his message of transparency, collaboration and trust.

He challenges companies to step down from their self-anointed pedestals and make themselves open and responsive to their customers. It's the Golden Rule of the Internet age: Treat others the way we want to be treated. He advises us to determine what it is that we do best, stick to it and link to the rest — which frees up resources that can be better deployed.

Jarvis uses the example of Kodak as a company focused too long on its tangible product (film) rather than establishing dominance in the digital arena. He estimates that Kodak's hesitance cost the company the opportunity to acquire the online service Flickr.

Beyond that, Jarvis packs *What Would Google Do?* with dozens of sound, practical takeaways such as Googling our companies' names to determine what people are saying about us. But he doesn't stop there. He encourages us to engage these outsiders, interact with them and respond to them authentically without the barriers of an intern or a public relations company. View each interaction in strictly human terms and as an opportunity to build a personal relationship and provide better products or services. "When you hand over control you start winning," he says.

Whether we like it or not, he reminds us that when customers come looking for us on Google, we'd better have answers to their questions on our Web sites before they are asked. When customers talk about us in public, we'd better have the means to hear and respond, or face the risk of a competitor with a better answer stealing our customers in a flash.

To cultivate this new spirit of openness and transparency, he doles out liberal doses of practical steps companies can take to increase their "Googlejuice," a term he coined to describe how companies can enhance their online effectiveness.

In his prescriptive manner, Jarvis urges companies to load their Web sites with as much information as possible, using simple phrases most likely to be searched by prospective users. To facilitate the vital links with other Web sites that build credibility, "give everything published a permanent address — a permalink — so it can attract more traffic and links and so Google has a place to which it can reliably send people looking for that information."

Practicing What He Preaches

What Would Google Do? is a book that is not so much read as explored. Written in the staccato, pithy style of a blogger as opposed to the long essays more typical of a traditional book, it might appear, upon first blush, that his insights are quicker and shallower than we would typically experience in this style of work.

"Kodak's hesitance (to go beyond film into the digital photo market) cost the company the opportunity to acquire the online service Flickr."

But that's not the case. Drawing from the contemporary business commandments he preaches, Jarvis discloses that he practiced the art of collaboration in writing the book — but not by putting the writing online for readers to correct and edit and not by having readers vote on what he should say. He did so by discussing the ideas in the book on his blog as he researched them and asking readers for guidance. They generously gave their help, and it makes the end product even better. In fact, this peer and collaborative

"Part social commentary, part history and part prophecy, *What Would Google Do?* is an old-fashioned tent revival packed into 257 pages of exciting, thought-provoking and inspirational prose. Jarvis condemns our sinful past and spurs us on to our economic salvation by following the altruistic rules that have been the cornerstone of Google's success: openness, collaboration, transparency and trust."

vetting encouraged him to abandon ideas that didn't work, infusing his treatise with greater value.

But he doesn't stop there. Instead of rigidly trying to control all the information (and thus the reader's attention), Jarvis links his work to numerous thought leaders and to other Internet entrepreneurs, providing valuable context that underscores his message. For instance, he cites:

- Umair Haque, who argues that "making money by controlling production, distribution and marketing is a diminishing game," according to Jarvis. Rather, Jarvis encourages us to visit the economist's Web site for a presentation that reveals the "three sources of value creation are revelation (the good stuff), aggregation (distribution 2.0) and plasticity" (enabling online content to be extended through open, decentralized and connected niche communities).
- Adrian Holovaty, the journalist and technologist who used Google Maps to portray crime data in various neighborhoods.
- Mark Zuckerberg, who helped his friends provide "elegant organization" to study groups and social communities that already existed and that ultimately resulted in Facebook.
- Craig Newmark, founder of craigslist, who made it easy for the classified advertising community to post and search such offerings online.

Lessons Learned and Applied

In another section of the book, Jarvis applies his newfound economic theories to a range of traditional businesses and shows how they must change if they want to survive: how automakers should let us help them make cars; how retailers can help us find unique goods and services; and how universities should help us craft our education, among others.

In the new Google economy, companies will grow and prosper by building platforms to help others prosper. Indeed, growth will come less from owning assets inside one company (and amassing risk there) than from enabling others in a networked world to build their own value, reduce their cost and spread their risk.

Jarvis writes at length about how our customers and prospective customers control our destiny. They hold the key to our brand, our products and our service. There is an inverse relationship between control and trust. The more we control, the less we will be trusted; the more you hand over control, the more trust you will earn.

Trust begins with an act of opening up; it's a mutual relationship of transparency and sharing. The more ways we find to reveal ourselves in an authentic fashion that shows how much we care about our communities, the more we will breed trust, which Jarvis brilliantly exposes as the ultimate brand.

"Too many companies have been built not on trusting people, but on making rules and prohibitions, telling customers what they cannot do and penalizing them for doing wrong," he writes. "Google has built its empire on trusting us. Trust Google on this." ●

The author: Jeff Jarvis blogs about media and news at Buzzmachine.com. He is associate professor and director of the interactive journalism program at the City University of New York's Graduate School of Journalism. He is consulting editor of *Daylife*, a news startup. He writes a new media column for *The Guardian* and consults for media companies. Until 2005, he was president and creative director of Advance.net, the online arm of Advance Publications.

Prior to that, Jarvis was creator and founding editor of *Entertainment Weekly*, Sunday editor and associate publisher of the *New York Daily News*; TV critic for *TV Guide* and *People*; a columnist on the *San Francisco Examiner*; assistant city editor and reporter for the *Chicago Tribune*; and a reporter for *Chicago Today*.

A Guidebook for How Group Leaders Can Manage the Unmanageable

FIRST AMONG EQUALS

THE SUMMARY IN BRIEF

Managing people is difficult, particularly when you are tasked with leading a group of confident, intelligent professionals — often used to working with a certain amount of autonomy — to accomplish some task or essential goal. Group leaders must be skilled not only in management basics (delegation, decision-making, running meetings, and so forth), but also in the "softer" skills of inspirational leadership practices.

Crammed with concrete advice and practical applications and examples, First Among Equals, *written by two leading experts in the field of managing professionals, will help you inspire, cajole and provoke your people to reaching their full capabilities and promise.*

What You'll Learn In This Summary

In this summary, you will learn how to do the following:

✓ **Get ready to lead.** Before you lead, you must clarify the responsibilities and parameters inherent to your role as leader, to ensure that you add value to the group's activities. You also need to confirm your mandate to lead, then build relationships with each individual on your team — inspiring (not just managing) your people.

✓ **Coach your people as individuals.** You must understand what coaching entails on a one-to-one basis — what things, both formal and informal, you can and should do to be most effective.

✓ **Coach your teams as a whole.** Improving the performance of your group as a whole involves many things, including building trust within the team, selecting goals that challenge and energize your people, and acknowledging accomplishments (individual and collective) through recognition.

✓ **Build toward future successes.** Maintaining a high level of efficiency in your groups is an ongoing process; you must build on your successes by nurturing junior members of your group, keeping membership to a manageable size and learning how to properly integrate new people into the collective whole.

GETTING READY

Clarify Your Role

Your job as a group leader is to help your people, and your team, win — to be a catalyst between people with different skills and work styles, diverse experiences and (sometimes) conflicting priorities. Playing such a role is not always easy. Most times, group leaders spend their entire working lives focusing on their own individual performance; to be successful, group leaders must have a willingness to focus on other people and their success (attitude) and the ability to influence others without being domineering (skill).

Pushing for Greater Commitment

Most often, you will be working with talented people who know what to do to be successful, but who simply aren't doing it. In these cases, your role as group leader is to help people fulfill that potential by influencing their attitudes, feelings and emotions in order to raise their performance and commitment level.

There are a number of actions you should take to raise the levels of enthusiasm, excitement and performance in your group. First, you need to spend time informally coaching and developing both senior- and junior-level group members. Conduct formal performance reviews, as well as post-review coaching and counseling, when required. Celebrate individual and group achievements, both small and large.

You should also be in touch with other group members' clients, in order to help them better satisfy those clients and grow those relationships. Also, help the group explore new and innovative uses of technology to better deliver service and reduce costs. ■

For examples of what you can do for your group, go to: http://my.summary.com

Know Your Tasks

It is important for you to define (with your own management, as well as those in your group) which tasks you will perform. If you and your group are to succeed, it is necessary for you to agree upon (and write down) your role, responsibilities, accountabilities and performance measures.

Confirm Your Mandate

Before you can effectively manage your group, you must ensure that you have reached agreement (with your superiors and fellow group members) on your "terms of engagement," or your mandate. You might think everyone around you already shares the same view of your mandate, but this might not be the case. What are your priorities? What does management expect of you? What do your fellow group members expect of you?

Terms of Engagement

In addition to reaching agreement on your role, your terms of engagement should include the following:

1. Time to do the job. Probably the single biggest source of failure in making professional groups work is not giving the group leader sufficient time to perform his or her job. When leaders are expected to be as fully busy as anyone else on client or production work, the job of group leadership does not receive the priority it requires. Enabling group leaders to give leadership activities priority has both qualitative and quantifiable results for a business.

2. Your right to coach. A major part of a group leader's real value comes from discussing individual

Confirm Your Mandate

(continued from page 2)

performance and engaging in effective follow-up with individual members of the group. This follow-up may include simply reminding your colleagues about a project, or following up with a client.

3. Your performance criteria and compensation. Group leaders should be measured and appraised predominantly by how well their group has done, and whether they have undertaken the appropriate steps and activities to raise that performance. Leaders should not be paid more simply for assuming the role.

4. Input on the compensation of team members. While the group leader should not be the sole source of performance review or the sole determinant of compensation, he or she should be enabled to provide formal input to both those things for each member of the group.

5. Valuing everyone's non-reimbursed time. Much of what groups do to create their future success involves investment of non-reimbursed time in activities that build the future of the business, such as marketing activities, tool development and so forth.

6. What you need from your firm's leadership. Firm leaders need to be dedicated and committed to the success of group work at your company, particularly if the traditions of groups and group leadership are not yet well established. To demonstrate their commitment, they should: let everyone know that having effectively functioning groups is a high priority; encourage those who are reluctant to get on board; volunteer to attend group meetings; be enthusiastic cheerleaders; develop cross-functional group leader councils; and schedule periodic progress reviews. ■

Build Relationships — One at a Time

While your technical competence and knowledge will determine a portion of your effectiveness as a group leader, your real success will turn on whether you are received by your people as a trusted advisor — that is, as a group leader to whom colleagues would turn eagerly and regularly for advice, guidance and counsel.

When considering how well you build relationships, ask yourself these questions:

● **How many of those that you have the responsibility to coach would consider you their trusted advisor?** A trusted advisor helps you see things in a new way — this is different from telling you what to do.

● **Do you actually like the people you're coaching, and do they know you like them?** If they don't, your effectiveness as a coach will diminish, regardless of the intellectual rigor of your comments.

● **Do the people you're seeking to coach actually view you as being someone who cares about others?** Do they think you care specifically about them? You must be viewed as honorable, trustworthy, consistent and dependable as well.

● **Can you help your people to visualize and articulate their dreams?** You need to understand each of your people in such a way that you help each one develop an individualized, custom-tailored approach to development, one that excites and challenges them.

● **Are you investing time toward building a strong relationship?** You need to show interest in your people, understand their needs, spend time with them away from your tasks at hand and, in general, be willing to give of yourself in order to earn their trust and confidence.

● **Do people feel comfortable admitting their flaws to you?** It takes considerable emotional investment to be an effective group leader, to make your people feel comfortable coming to you in any circumstance, even to confess a weakness to you.

● **Do you always act and offer your advice in the best interests of your people?** Be sincere with your people and lead by example. If you act as if you want everyone to succeed, your group will follow you toward achieving that success. ■

Having a "Deep Insight into People" Pays Off

One of the most effective managers the authors have ever met was Don Groninger, the onetime general counsel for Bridgestone/Firestone. Groninger was always looking for ways to advance the careers of his people, even (or especially) if this meant their being promoted out of his legal group. In the words of one of his people:

"He had a deep insight into people and could discover and nurture strengths that others might not see. He paved the way for you to take on stretching challenges, expected you to produce results and, without ego, trusted you to run with the ball, calling on him only when you felt the need to. He did not micromanage, but when you asked for guidance, what you received was the wealth of his 'book learning' as well as his 'street smarts.' I don't know that he was ever wrong in the advice he gave me."

Dare to Be Inspiring

Your group will best achieve peak performance by unleashing the power of your people. This is done not by managing or leading them, but by inspiring them. There are individuals in every profession who strive to create big dreams, steeped in a strong set of personal values, in setting high standards and in striving to lift the spirits of human potential. This is not about management, nor is it strictly about leadership — it goes beyond what either of those two words might mean to us.

Inspiration is all about the details — every conversation you have with someone advances, diminishes, or leaves neutral your relationship with that person. Here are some other details—things you must do in order to inspire your people:

- **Show a genuine interest in what your group members want to achieve.** Too few group leaders bother to pay attention to what their people want and need in developing their careers; this, however, is a critical part of your role as a group leader. Do not lose good people or abet sub-par performance by not showing that interest.
- **Show an interest in the things that mean the most to your people in their personal lives.** In order to get the best you can out of people, it is helpful to get to know a bit about their personal lives — their families, leisure-time interests, the things they are most passionate about. You cannot build a successful business enterprise if everyone merely stays in a role and deals with others merely in functional or logical terms. You cannot separate your performers from who they are as human beings.
- **Be there for your people in times of personal or professional crisis.** Right now, as you read this, it is very likely that some member of your group is facing a crisis or transition. Are you aware of it?
- **Informally "check in" with each of your people.** If a group leader simply takes a few minutes to listen to his or her people — particularly in a time of high pressure or frustration — something special can happen. You can ease a burden, recharge a battery, or provide encouragement exactly at the point in which your people need it.
- **Offer to help when they truly need it.** Offer to pitch in and help your people get their work done in busy times, lightening their load and helping them through a rough period. If you want people to accept your influence in the future, help them now. ■

COACHING THE INDIVIDUAL

Once you have confirmed your mandate, built relationships within your group and learned what it takes to inspire and not simply lead, you are ready to tackle in greater detail the leadership, management and coaching activities so vital to being a group leader. You must be able to get your people to accept your guidance, build rapport with them by listening to them and deal with the exigencies that arise when working with different individuals. ■

Win Permission to Coach

Coaching is an activity, not a title or a position. It is the process by which you help another person fulfill his or her potential, and it requires that you judge well when to intervene, and when to stay away. Indeed, before you can even begin to develop and stretch your people's talent, you must assess whether you have earned the "right" to be able to do so. Here are some basic steps that may help you win permission to coach:

- **Ask how things are going.** Find out what is on the person's mind and identify any available opportunities to help that person expand his or her skills.
- **Confirm that the individual is ready for coaching.** Focus on an issue that the person seems most interested in or concerned about, and let him or her know that you are available to provide guidance, ideas or feedback.
- **Ask questions to clarify the situation, and offer support and assistance.** Phrase your questions carefully, so they do not pressure the person or imply a negative reaction. Draw out facts, and determine if he or she has the right information to move forward.
- **Offer information as appropriate.** Offer only necessary information, providing whatever the person needs to choose a course of action.
- **Listen actively.** If necessary, take some brief notes. Don't interrupt with your own ideas. Always look to build rapport through listening.
- **Help the person identify possible courses of action.** Avoid offering any of your own ideas until after the person you are coaching has finished. Encourage him or her to think aloud, and make a list of the ideas generated, without commenting on feasibility.
- **Agree on the next step**. Prompt the person to make a firm commitment to action and clarify the steps he or she is planning to take, and by when.
- **Offer your personal support and confidence.** Conclude by expressing your continued interest, your confidence in your colleague's ability to resolve the issue, and your desire to help, if and where you can do anything that would support him or her in accomplishing the specified objective. ■

Tackle the Prima Donnas

We all know the type. They are brilliant at what they do, and make outstanding creative and financial contributions to your group's success. The only problem is that, people of high achievement can sometimes insist stubbornly on having their own way, and can often be contemptuous of others. In many cases, absolutely no one else wants to work with them. Here are a few things to keep in mind:

✓ **Focus on behavior, not personality.** Giving feedback that comments on someone's personality traits is destructive. The individual will only become defensive and subsequently turn off. If it is behavior change that you're after, point out the specific actions in question.

✓ **Tell your colleague what behavior needs to change, clearly and specifically.** Try to be as objective as possible. Concrete examples — something you have observed first hand, or a situation that has been brought to your attention — will help the individual understand where the problems lie and show that you are not jumping to conclusions.

✓ **Place the situation in the context of career development.** It is important to let prima donnas know what's in it for them if they change their behavior; how they will be more valuable to the firm, acquire more respect from people around them, and even how it may affect their clients. Point out that they run the danger of alienating the people whose cooperation they need. If you come across as being critical, you may get a grudging acknowledgment, but you are not likely to achieve observable or long-term behavior change.

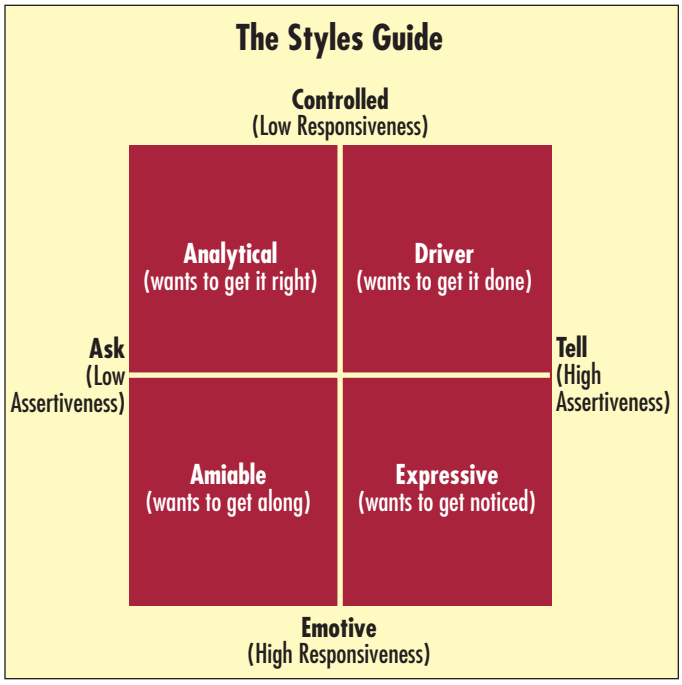
✓ **Set small, realistic goals.** Micro changes in behavior can be big victories. Change is achieved step by step.

Deal Differently with Different People

Not every individual can be managed or inspired the same way. A manager must learn to deal with each individual according to the things that energize that individual. One place to start is in trying to understand different people and how they like to be treated. To that end, we turn to the work of Dr. David Merrill, who discovered two clusters of behavior that are helpful in predicting how individuals are likely to behave in certain situations:

● **Assertiveness.** In its most practical form, an individual's level of assertiveness is the degree to which he or she is seen by others as being forceful or directive. More assertive people are "tell" people — they exert pressure for a decision, and are pointed in expressing opinions, sometimes at great volume. Less assertive people are "ask" people, who tend to be more subdued in their expressions, preferring to ask in order to gauge how others feel about a situation, to collect as much information as possible.

● **Responsiveness.** With this cluster, you are looking for how people express themselves and how they react. More responsive people tend to be emotive, appearing friendly, with an expressive countenance and engaging easily in small talk and sharing personal feelings. A more reserved and less responsive person may appear poker-faced, so that you are never quite sure whether he or she is in agreement with what you are saying. These people may indeed have strong feelings; they are just less likely to display them.



Putting the two behavior clusters together gives us an idea of what particular individuals are like, where they may be coming from, what their expectations are and how you need to work with them.

We see four distinct behavior groupings that you will likely deal with as a group leader:

● **Drivers.** Drivers are people who are highly assertive, but low in responsiveness. They are most comfortable when they are in control of themselves, the work environment and their client transactions. Drivers like to make up their own minds, and will likely be put off if you simply offer them a course of action. Therefore, when coaching drivers, present any recommendations with alternatives, together with any documentation or examples you can offer. Remember that managing drivers is not easy, because often they want to manage you!

● **Analyticals.** Analyticals are low on both responsiveness and assertiveness. They are obsessed with getting information — they crave data and often agonize over decisions, wanting to be certain of making the right choice.

(continued on page 6)

Deal Differently with Different People

(continued from page 5)

They thrive on specifics; in order to build a coaching relationship, you need to be well organized and clear, explaining your thoughts systematically and expecting to be asked a lot of questions about the situation or subject at hand. When proposing a course of action, explain both the advantages and downsides of the action. When recognizing Analyticals' work, do so privately, in specific terms, being concise and simple in your feedback.

● **Amiables.** Amiables are low on assertiveness, but high on responsiveness. They project sensitivity to others' feelings, exhibit great patience and believe it important that they take time to establish relationships. When coaching amiables, allow plenty of time to explore their thoughts and feelings. Be sure to deal with one subject at a time, one step at a time, making sure the amiable is ready to move from one topic to the next before doing so. Appeal to their need to strengthen relationships, and acknowledge their contributions, their teamwork and their dependability.

● **Expressives.** Expressives are high on both responsiveness and assertiveness. They are not hesitant about making their presence or feelings known, and are often highly intuitive and can be highly persuasive when they combine their personal power and emotional display. They are inclined to informality; when meeting with them, take a few minutes to build rapport and show them you are interested in them as people. Provide them with an opening to talk about themselves. When coaching them, don't overwhelm them by allowing them to jump into a course of action before they're ready, as is their proclivity. Help them channel their enthusiasm with reminders and hands-on assistance, to help them prioritize and organize. ■

COACHING THE TEAM

Once you understand how to manage the members of your group as individuals, you must turn your attention to managing the group as a group. Not only must you be able to understand and influence individual people, but you must understand and influence a significant number of them simultaneously. Three of the things you must do are the following:

● ***Build team trust.***
● ***Throw down a challenge.***
● ***Give recognition.*** ■

Build Team Trust

Everyday frustrations can lead to lost energy in a group, as suspicion, unresolved issues, forgotten commitments, missed deadlines and other issues lead to lost trust between group members. While trust is often an unspoken issue, it is critical to the cohesion of a group. If you don't have trust, people won't cooperate, won't be committed and won't know where they stand.

Before engaging in any trust-building initiatives, you should understand some of the elements of trust, and what you can do about them:

● **Sharing**. Group members need to feel comfortable with sharing things about themselves with the group, from personal attributes or accomplishments, to mistakes or failures. By talking about these things, they take risks, but by taking those risks, the group moves to a deeper level of trust. Trust needs to be earned.

● **Following through on commitments.** Unfulfilled promises bleed away your team's energy. Address the reasons for a member's failure to follow up on a commitment, in order to prevent that failure from eating away at any trust or goodwill specific members have built for each other.

● **Letting people know if you can't do something.** Failure to confirm agreement to a course of action breeds uncertainty, hesitation, doubt, resentment and lack of trust. Encourage your people to confirm specifics when partnering with others to get a task or job done. ■

Throw Down a Challenge

Common wisdom suggests that offering generous extrinsic rewards (money) gets people to increase their performance. But money isn't the whole story; people are moved when they have a clear set of challenges before them — solving a complex problem, discovering something new, etc.

What challenges each member of your team is largely indigenous to each individual, in his or her desires, dreams and aspirations. Your job is to find the proper balance between the action opportunities that are available and the individual skills sets of your people.

Of course, the challenges you throw down must benefit the group as a whole, as well. Once you set a goal, you need to create a powerful and urgent reason to achieve that goal, building a case for action that is based on facts and real business needs. Try the following process:

● **Ask the members of your group to articulate what's in it for them.** Discuss with each person in the group what opportunities the challenge pose for them, to get their buy-in and focus from the start.

● **Give everyone the opportunity to stand up and declare his or her personal commitment.** Everyone in the group is ultimately a volunteer — they must choose

(continued on page 7)

Throw Down a Challenge

(continued from page 6)

to be in or out.

● **Focus first on what you can do now, with existing resources.** Ensure your people do not become overwhelmed or discouraged by the complexity of the challenge. Try to produce tangible short-term results.

● **Encourage experimentation.** Encourage people to create something fundamentally new, to benefit your clients and your group as a whole.

● **Build for an early success to continue the momentum.** Remind the team of what is at stake, what the big picture holds, what larger meaning your challenge has for your enterprise and how that challenge will help your people leave their mark.

● **Search continually for opportunities for people to create or outdo themselves.** Find new ways for people to solve problems, explore new ground and deal with external challenges. And try at all times to make it fun.

● **Set unreasonable expectations.** When your objectives seem outlandish, you are forced to think differently about your opportunities. Set the upper limit on what people think is possible, and challenge your people to exceed it.

● **Focus on the excitement of the endeavor.** The influence and expectations you generate as a leader ultimately contribute to the abilities of your people to grow within the environment you provide for them. ■

Develop Your Group's Rules of Recognition

One of the major problems of groups is that they often have no explicit, shared agreement on what it means to be a group. They have not discussed, let alone reached a consensus on, what responsibilities they owe to each other, nor on what principles their group will operate. Many so-called groups are really just collections of people who, in subtle ways, are each simply pushing their own special interests.

What is needed is an approach that will create a more inspiring system that provides for higher levels of shared enthusiasm, decision making, performance, participation, and morale. This can be done by basing your group on three fundamental principles:

● **Set Levels of Mutual Accountability**. A basis for every championship team, in every endeavor, is having hard-and-fast, nonnegotiable "ground rules" that everyone agrees to abide by. Great groups formulate and commit to writing a set of ground rules for how their team will work together and how they will manage themselves, thus bringing about constructive peer pressure.

For example, is it acceptable for group members to confront those who don't complete the projects that they have accepted responsibility for? Those who place their personal agenda ahead of the group's goals? In great groups, the players police themselves. People hold themselves, and each other, accountable. The essential principle is that the group collectively sets and manages the ground rules, and the ground rules then manage the group.

● **Set Levels of Shared Contribution.** A good place to start is to ask how much "investment" time each person is willing to commit, beyond their normal production or client-serving workload, to furthering the group's objectives. The next challenge is to ensure that people appreciate that the investment time contributed to the group is for projects and activities that will benefit the group as a whole.

● **Establish Your Shared Values.** Excitement, energy and pride (and thus the accomplishment that drives financial success) can be created by building agreement that the group will conduct its affairs to higher standards than the group's competitors. The group voluntarily accepts greater discipline in monitoring and enforcing excellence, never settling for competence. ■

BUILDING FOR THE FUTURE

Maintaining a high level of efficiency and success in your groups is an ongoing process—a journey, rather than a destination. As such, you must always keep the future of your group in mind, tuning in to the things you need to do to build on your successes. These things include the following:

● ***Nurture your juniors.***

● ***Integrate new people.***

● ***Control your group's size.*** ■

Nurture Your Juniors

Junior staff, by definition, are at the early stages of a career, and need one thing above all — the chance to develop and build their skills. How well skills are built depends on two key processes:

● **Work assignment.** What projects do the junior members get to work on? Over what part of the project are they given responsibility? A good model to follow is one where all the senior people get together regularly and jointly allocate junior staff to projects, taking into consideration the best resources to provide to key clients, providing developmental work experiences, keeping motivation and morale high, and a number of other considerations.

(continued on page 8)

Nurture Your Juniors

(continued from page 7)

● **Work supervision.** What quality supervision do junior members receive while working on assigned projects? Unfortunately, many groups do not have a consistent agreement on what constitutes appropriate standards for supervising work. You should engage your senior colleagues to establish standards in your group, rather than simply trying to impose standards on them. It is, however, imperative to establish some consistent expectations and accountabilities; junior members are entitled to them.

A Sample of Supervision Standards

There are some standards of behavior in work supervision that must be considered and enforced. Junior group members are entitled to certain expectations; among them are the following:

- **They understand thoroughly what is expected of them when assigned a task.**
- **They understand how their assigned tasks fit into overall objectives for a project.**
- **Help is available when they need to have questions answered.**
- **They receive prompt feedback, good or bad.**
- **They are actively encouraged to volunteer new ideas and make suggestions for improvement.**
- **In each engagement, high standards for performance are set and enforced.** ■

Integrate New People

It takes time and effort to integrate a new member to a team, to keep the new member from floundering, creating conflict, or worse. As good people become harder to find, your internal processes for orientation and integration become absolutely critical. After all, you're not just hiring a warm body; in most cases, you're adopting a new colleague into your family. Take some essential steps to properly integrate these new people, including the following:

● **Manage first impressions.** Design an orientation program that provides information to people as soon as they arrive. Remember to introduce your group to the new person, and the new person to your group.

● **Give them support — before they ask.** New people require a clear understanding of their group's expectations, as well as introductions to specific people who can support them in getting up to speed on tools, technology, even the basic layout of your work area. It is up to the group leader to organize the investment in time necessary to make the new team member feel welcome.

● **Make them feel valued.** High-quality internal training programs not only give people the skills they need, but also send the clear message that you care about people's career development and are willing to invest in them as individuals.

● **Provide an immersion experience.** Orientation systems that steep newcomers in the personalities and culture of their new group build career-spanning relationships that support success in their new environment. Think bonding. Think teamwork.

● **Communicate, communicate, communicate.** Groups that take internal communications seriously tend to do a far better job of retaining their best members. Use the tools at your command (voice mail, e-mail, internal newsletters, etc.) to assess results, celebrate strengths and solicit feedback from your people. ■

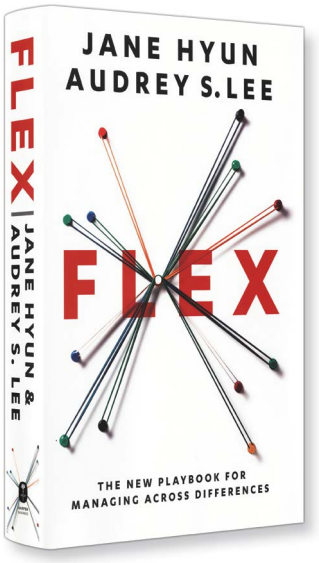
Control Your Group's Size

Bigger does not always mean better, and nowhere is that more evident than when it comes to measuring group effectiveness. One of the most certain ways to ensure failure is to allow membership to grow beyond a small, solid working group. When groups balloon in size, they often decrease in effectiveness — group members feel no real sense of attachment or personal commitment, and often find themselves spending many nonproductive hours in group meetings.

The more people in a group, the less commitment any one person shows to following through on individual projects, and the less buy-in any individual has for the group's success or failure. To avoid these problems, keep your groups small, by trying one of the following options:

● **Downsize your groups.** When new groups are formed, insist that they include fewer than a dozen people to start. Reorganize existing groups into smaller units. It may not be easy to remove some people from some groups, but the long-term impacts on productivity make this effort critical.

● **Use a "resource member" approach.** A core group should consist of only those whose full-time efforts are involved in the specialized area. This group is the decision-making body for the area, with others providing assistance or expertise as the need arises, at the discretion of the group leader. Each person chooses one core group to belong to, but they will also serve as "resource" members for other groups, according to preference or client work in those areas. As resource members, they can keep tabs on group activities, but they are not expected to volunteer for projects in that area, unless a specific task or project might involve or benefit an individual client.



● **Create splinter groups.** Break up larger teams into smaller, practice-specific splinter groups, usually defined by the distinctive clients the group seeks to serve. Not only will these focused groups be smaller, but they will have more in common and will be more likely to function as an integrated team. ■

Flex

The New Playbook For Managing Across Differences

by Jane Hyun and Audrey S. Lee, with Leslie Miller

THE SUMMARY IN BRIEF

Renowned executive coaches and global leadership strategists Jane Hyun and Audrey S. Lee offer lessons on the vital skill of "Flexing" — the art of switching leadership styles to more effectively lead people who are different from you, allowing managers to successfully manage the multicultural workers of today and tomorrow.

Flex offers a proactive strategy for managers to navigate and leverage diversity effectively in this new global economy, showing managers how to understand the power gap, the social distance between you and those in the workplace of different cultures, ages, and gender; flex your management style by stretching how you work and communicate with others, and bridging the gap with more effective communication, feedback tools and building healthy teams; and multiply the effect by teaching these skills to others and closing the power gap with clients, customers and partners to create innovative solutions.

Creating flex in a company's management style will impact all aspects of developing the talent you have, attracting future talent and building relationships with customers in this competitive marketplace. Now, *Flex: The New Playbook for Managing Across Differences* shows you how.

IN THIS SUMMARY, YOU WILL LEARN:

- Why flexing is good for business.
- How to find creative ways to bridge the power gap.
- How to develop the key traits of a fluent leader.
- How diverse thinking can drive innovation in your organization.

THE COMPLETE SUMMARY: **FLEX**

by Jane Hyun and Audrey S. Lee, with Leslie Miller

The authors: Jane Hyun is an internationally renowned global leadership strategist and consultant to Fortune 500 companies and MBA programs. She helps organizations grow their bottom line and achieve productivity through the effective deployment of human capital. In addition to *Flex*, she is the author of *Breaking the Bamboo Ceiling*, and she appears regularly on CNN, CNBC, NPR, and *Wall Street Journal*, *Fortune*, and *Washington Post* to discuss culture, authenticity, and leadership. She is passionate about helping people achieve their fullest potential in their workplaces and their communities.

Audrey Lee is an executive coach and global leadership and diversity strategist who consults with Fortune 500 companies to develop integrated leadership strategies impacting business practices throughout the organization. Prior to her work in leadership development, she managed key marketing initiatives in high-tech companies. She has written for *The New York Times*, Quartz.com, Forbes.com, AMA's MWorld Journal, and other publications.

Introduction

In life and in business, all great relationships are built on the essential principles of trust and respect. When trust is present, it's exciting to watch relationships flourish, people and teams become productive, and companies prosper. The problems start when there is a breakdown in trust and when you fail to realize that people build trust in different ways. Barriers arise when workers from different cultural contexts expect others to behave the same way they do, without understanding that while the intent might be the same (e.g., to show respect), the behaviors might look very different.

To be sure, organizations have become more diverse — a global/multicultural workforce, more women and a new generation of workers have entered our ranks in large numbers; but many businesses have not yet figured out how to best engage the talent that they have successfully recruited. Due to the speed of change in our current business environment, leaders must be adept at leveraging their employees who work throughout their local markets around the world for input, wisdom and skills to survive.

We all need to learn a new skill set that will enable successful business interactions in our new diverse surroundings. Your country manager in Vietnam as well as your finance director sitting in headquarters in Chicago may lack the fluency required to work effectively with each other. We are simply not taught how to relate to people from other backgrounds, and these skills of *flex*ing are not adequately taught in our educational systems, undergraduate programs or business schools. (Flexing is adapting how one communicates, relates and responds to others in a manner that takes into account an understanding of status differences.) Although we are more connected globally as a workforce through technology, managers aren't actually better equipped to interact and communicate globally with people. And the stakes are significant.

PART I: GETTING INSIDE THE GAP

What You Don't Know Can Hurt You

Many managers are struggling, faced with a playing field that looks dramatically different from the one into which they were hired. As of June 2012, people of multicultural backgrounds (of Asian, African American and Latino/Hispanic descent) made up 36 percent of the labor force, according to the US Department of Labor. According to a McKinsey study, women held 37 percent of all jobs in the United States in 1970 and nearly half of all jobs in 2009. By 2025, three out of every four workers around the globe will belong to Gen Y.

Although companies might agree that they have done a decent job of recruiting a fair representation of women and multicultural employees, they are far from being certain about how to get the best ones to stay and realize their full potential. Without a more nuanced understanding of the interpersonal gaps between people, managers

will be at a loss as to how to bridge the distance between themselves and employees who possess different cultural values and drivers of success.

There is a solution to all this misunderstanding, miscommunication and missed opportunity. The answer lies in valuing differences in the leadership development of your employees and developing the qualities of a fluent leader. This ability to flex affects how we deal with power and status differences and how we communicate and relate to each other.

Flexing is Good for Business

The way you handle the social distance between yourself and employees (or clients) of different cultures, genders and ages can make or break your company. This distance, or the power gap, is the "amount of emotional distance that separates subordinates from their bosses," as defined by Dutch social psychologist Mauk Mulder. Renowned intercultural expert Geert Hofstede showed that the power distance that is socially acceptable by the boss and employee depends largely on their national culture.

We apply the power gap to discuss the chasm that separates managers and employees, men and women, as well as employees of different generations and different cultures. In each of these relationships, we refer to this distance as the power gap. In particular, we see the impact of unspoken assumptions, crossed signals and confusion inside companies large and small across three key groups: culture, gender and generations.

Hardwired for Sameness

When it comes to navigating across differences, research shows that goodwill and positive intent are not enough. In the absence of an adaptive, fluent leader at the helm to encourage different viewpoints, there is tremendous pressure for employees to fit in to the existing leadership norms of the team. But employees may not thrive under this management approach, or they may resent the changes they are forced to make. Over time, some will simply tire of constantly going out of their natural comfort zone to fit in to the new culture and find an organization (or manager) that can tap in to their strengths more readily. Consequently, they will underperform or leave.

The Key Competency: Fluency

Our goal is to enable leaders to achieve what we consider to be the key competency for today's leaders, what we call *fluency.* Like someone fluent in many languages, a truly fluent business leader is able to work and communicate effortlessly with many types of people who are different from him- or herself. We must be taught to view difference as latent potential, not as a liability.

To develop fluency, take a look at your own leadership. Here are the four management styles you might encounter. Try to assess in honest terms where you fall on your own journey toward becoming a fluent leader.

Style 1: The Blindsided Manager. Working with people who are different from you makes you feel uncomfortable, and/or you might have had limited experience interacting with them. You may not be aware of the gap existing between you and your direct reports due to the power distance, and are blindsided when things don't always go the way that you expect. Therefore, most of the time, you don't even notice your lack of ability in closing the gaps with them.

Style 2: The Judging Manager. You find individuals who relate differently to you annoying or feel that there is a better way to do things. You tolerate some differences, but when push comes to shove, you know that you have the right way of doing things. You expect your team to conform to your style.

Style 3: The Golden-Rule Manager. Diversity training and previous experience have taught you that it's probably safest to treat everyone the same. You emphasize "fair treatment" and also believe that most people will respond positively if you treat them the way that you would want to be treated. You may subconsciously use your own experience and position in establishing the "universal template" for managing people.

Style 4: The Fluent Leader. You accept and are curious about potential differences across cultural, gender and generational lines. Instead of resorting to stereotypes to judge these differences, you begin your exploration and appreciate difference on an individual level. You use this knowledge to help correct negative behaviors and engage employees' motivated skills and talents on a deeper level. You are able to flex across the power gap to be more effective with your direct reports.

Managing the Power Gap

Conventional wisdom would say that the outliers from the dominant culture — the multicultural workers, the more junior people, or perhaps the young, entry-level team members — should work to get their styles, values and communication in sync with their managers and feel empowered enough to close the power gap. However, conventional wisdom might not be right and may not always work. We've seen that the same dynamics repeat themselves time and time again as the unique perspectives

of different groups are not understood by their managers, to the frustration of both sides.

As we examine the power gap dynamics, it is helpful to note the management and communication styles that exist at either extreme in the spectrum. Hierarchical management styles depend on standardized systems, value a great deal of control, and expect integration of others into the established system or order. Great deference is given to people in authority, and decision making is generally top-down. Hierarchical management styles roughly mirror traditional corporate company structures.

Egalitarian management styles are based on the doctrine of egalitarianism. In general, in a flat organizational environment, workers may share fairly equal authority in decision making. Egalitarian employees may feel comfortable questioning the manager and interacting less formally with him or her, whereas employees who are more hierarchical might wait for the manager to assign work, and maintain a safe distance.

How the Power Gap Manifests on Your Team

The more hierarchical your culture or background, the greater the power gap is apt to be. This is because hierarchical cultures reinforce the differences between managers and employees. The effect is that any power gap that exists is magnified through the lens of this dimension. A greater power gap can result in decreased communication as well as increased misunderstandings and conflict, potentially leading to missed opportunities for building significant business and career relationships.

But when managers choose to close the gap and meet their employee partway, they are *not giving away authority or respect*. Closing the power gap need not make a leader more vulnerable; in fact, it can do the opposite, creating trust and communication where before there was only conflict and poor performance.

Understanding the power gap dimension is *the* must-have survival skill in the high-stakes game of leading in the new age. As you move along your journey toward fluency, we encourage you to shift your mindset from the fear-based and conflict-avoidant model of the past and adopt a fluent leader's curious, proactive investigation of the new American workplace.

Culture and Communication: Flexing Across Styles

There are a myriad of styles and manners in which people build trust, relate to one another, and communicate their needs and expectations. Your first step toward flexing, as a manager, is to learn to identify and examine the different styles and preferences of your employees through this lens. You should also analyze your own interaction preferences. Are you a group thinker or an individual decision maker? When you have to give tough feedback to your colleagues, do you tell it to them straight, or do you try to soften the blow? Are you expressive or more emotionally restrained? Understanding the nuances of each person's style will aid you in your ability to practice flexing in your leadership.

A Premium on Direct Communication

The acceptable norm in most American organizations is to employ a direct communication style. Overall, in American culture, we are more willing than in indirect cultures to confront a difficult situation, have it out, and get the issues on the table. Direct communicators expect that whatever words they say comprise the entirety of their message. Indirect communicators may rely on other signals, signs, codes and even third parties to communicate their meaning, and depend upon the receiver of the communication to decode their meaning and understand what they are trying to say.

In cultures where direct messages are preferred, people tend to distrust indirect communicators, as they are viewed as too vague or as intentionally deceptive or even manipulative. However, we should keep in mind that most indirect communicators are trying to get their message across just as clearly as their direct-communicating counterparts; they are simply using a different style.

In practice, indirect approaches can also be very effective, another means to get the message across in a different way. It encourages both parties to actively participate in thinking over a problem rather than telling someone that what they'd done is wrong. Being indirect is about mitigating your message to soften it — and that has its value, too, because the focus is building and maintaining a relationship. When being more indirect is warranted, effective techniques include phrasing a demand as a question or making it conditional through the use of *would, could, maybe*, etc.

How Do You Build Trust?

The dimension regarding relationship or task-oriented styles speaks to how you build trust with your coworkers, with your employees and with your bosses as well. This can be described in more succinct terms as tension between "being vs. doing." Do you delve into the business agenda right away after an introduction, or do you require a more developed relationship before you feel comfortable advancing the business relationship?

In general, Americans are very task- and results-oriented when it comes to building trust. An existing relationship isn't required in order to sign a contract or make a big business deal. Other cultures are much more relationship focused. Someone might need to know everything about you — from the background of your family, to the college you went to, to your entire career trajectory — before they would dream of putting pen to paper. What seems like wasted time to a results-oriented boss might be critical networking and relationship-building time to an employee who believes he or she simply can't move forward without it.

Portrait of a Fluent Leader

One of the greatest hurdles that leaders will face lies in knowing how to engage with people from other backgrounds. The question you will have to ask at every step is, "How do I define and/or identify what gap exists in my department, my division, at every level inside my firm? Then, what do I do to bridge that gap?" Becoming a fluent leader takes much more than just knowing the best way to hear from everyone on your team or reaching out to your direct report instead of waiting for her to come to you. We discovered six critical traits for a fluent leader that encompass the attitudes and behaviors needed to flex up, down and across:

Possessing Self- and Other-Awareness. Fluent leaders have a good grasp of their own strengths, weaknesses and preferences. Additionally, they are able to quickly discern the preferences of others in order to know how to flex their style. This trait in action shows a leader's cultural competence and emotional intelligence.

Adaptability: Adaptability is a key component of fluent leadership, indicating an ability to adapt to stretch your styles and preferences and sometimes exercise other styles to better interact with others. Fluent leaders are not only able to admit their mistakes; they recast them as teachable moments and are able to adapt to shifting styles and circumstances.

Comfort with Ambiguity and Complexity: Fluent leaders are unique in that they are able to break down complex situations and uncertainty. They know how to get to the root of the relevant issues and priorities in any given situation. They manage even tough situations and search for reconciliation.

Unconditional Positive Regard: Fluent leaders demonstrate *unconditional positive regard* (UPR), a term coined by psychologist Carl Rogers that signifies the unconditional acceptance of others, even in their vulnerable and weakest moments. Fluent leaders with UPR are able to envision the future state of a situation or of a person's development, give feedback, and imagine future leadership potential for others.

Innovation: Fluent leaders are also marked by a tremendous and insatiable curiosity in other people, in their approach to differences, and in their innovative ways of building relationships and doing business. When they encounter something or someone they don't understand, their first reaction isn't avoidance — it's interest.

Flexing Across the Power Gap: Fluent leaders are comfortable owning a leadership identity and effective at managing up, down and across the organization as well as with customers and vendors. They understand their power gap preferences and those of others on the hierarchical vs. egalitarian spectrum. They close the power gap and forge trusting relationships with all levels, through empathy, trust and integrity.

PART II: THE KILLER APP: FLEXING ACROSS THE GAP

Power Gap Principle: Flex Your Management Style

We all have a default mode of relating to people. The art of flex lies in noticing when your preferred mode of relating to people is not shared by those different from you and then reaching across the power gap in search of a solution. When working across differences, the same strategies may not work and may not have the same outcome you intended. It's imperative that all of us develop the ability to flex our styles if we want the best performance out of those who work for us.

Remember that flexing requires decreasing the power gap with your team members. It is about exercising a variety of responses to make you more adaptable and fluent. Flexing is also about context: customizing and individualizing your approach to the person and situation, as you might do when raising three very different children, each with distinct learning styles and personalities. Finally, flexing always starts with authenticity. Show who you are and what you value, and then extend your curiosity toward others.

Look for Creative Ways to Bridge the Power Gap

Without realizing it, your open-door policy might actually be shutting a fair number of your employees out. Before you can investigate the motivations for their behavior, you must embrace the fact that we often work with individuals who view the world through an entirely different lens — not better or worse, just different. It's crit-

ical you not judge their behavior as wrong and first simply allow yourself to see the difference.

Most managers and executives are now trained to eradicate or ignore difference in our workplaces as a defense against legal action. However, it is only by forgoing assumptions and judgments that we can explore the potential motivations behind that behavior, then identify solutions. Once you've noticed who's not in the room or who's left out of the conversation, you need to start investigating why they aren't there. For varying reasons, different employees may not feel that they have built sufficient rapport with their bosses to just "drop by." They may feel it's their duty to solve problems on their own and spare you the aggravation and potential embarrassment. Try to understand whether the difference is cultural, rooted in gender or a generational gap.

Making the First Move: Five Steps to Productive Dialogue

If an employee is failing to participate or hasn't given you a key piece of information, here's a step-by-step framework for engagement:

1. Initiate a one-on-one conversation about a situation you have observed that you are interested in exploring.
2. Describe the impact of these actions on you and connect it to business objectives; make sure you avoid blaming the person.
3. Investigate what is beneath the surface of the behavior; examine the intentions, values and motivations that might be driving the behavior and the barriers that might be keeping the employee from developing new, effective behavior.
4. Explain why this behavior is so critical to your productivity and to your team dynamics.
5. Develop a plan of action for new behaviors that the employee can practice to bring his or her intentions, values and core motivations into alignment with the impact of the behavior.

The new challenge is to understand the varying needs of those who bring a different lens to working in your environment. Make the connections, be proactive, and don't wait for your employees to close the gap with you.

Navigate the Power Gap with Your Peers

As a leader, you not only need to be able to close the gap with your superiors and those who work for you; you need to be particularly skilled at managing *sideways*, to flex to your peers and those who work in other functions of the organization to move your project forward. The pros of effectively managing the gap with your peer colleagues include allowing you to maintain your status in the hierarchy; creating allies in the organization; fostering a stronger team relationship; building credibility and your own cultural capital; and identifying you as a leader.

Some peer relationships might appear equal on the surface — two people share the same title, the same level, and perhaps report to the same boss but display wildly different communication and cultural perspectives. Add in differences of culture, gender or generation, and you have an even wider power gap to manage.

Peer or Competitor

People often wear multiple hats in a single role: While you are on the same team and expected to play well with others, there is still the expectation that you need to differentiate yourself from your peers. You are not only colleagues; you are competitors. Some companies assess performance through ranking or quintiling, processes HR departments are charged with to ensure that the star employees are receiving promotions, bonuses and stock offerings while the lowest-ranked employees or bottom 20 percent are probably on their way out the door. Under that kind of pressure, where the competition from coworkers could literally mean your job, reaching out to close the gap with your peer might seem almost counterintuitive.

However, we believe it is important that you do set the tone for how a relationship can progress right from the start. Truly fluent leaders will find ways to flex across to peers, across differences, and even in the face of resentment and friction. Proven strategies to reach across the gap include befriending your peers. Extending a heartfelt "I can learn a lot from you" can go a long way toward eradicating animosity and getting you on the same team. Also, extend yourself and offer your own skills and help. If you have risen faster in the ranks, stem jealousy and competition by sharing ideas about how you can share power in your new position. But don't just say it. Give credit to those who have supported your ideas, and reciprocate often.

Connecting with Customers and Partners

Business success is not just about flexing your management style to better reach people who are different from

you inside your organization. It's also directly tied to your relationship building, the underlying foundation to all selling, negotiating and client-development practices. If you are able to notice, appreciate and ultimately leverage the difference between you and your global clients as well as build trust and communication with your external vendors, your business will thrive.

Aligning the Inside and the Outside of Your Organization

What does it mean to align your internal and external business culture? One tangible example of reaching external markets through internal leadership is IBM's creation of its Market Development group, tasked with growing the company's market share with minority and women-owned businesses. It does so by various strategies, including partnering with external vendors to provide sales and service to the many small- to medium-sized businesses run by minorities and women. It leveraged its internal cultural capital to reach into underutilized markets to great effect, understanding that, as David Thomas, dean of Georgetown's McDonough Business School, put it, "diversity was an untapped business resource."

You don't have to be a company as large as IBM to use a similar strategy. Smaller companies and organizations also have affinity groups or employee resource groups (ERGs) already in place. If leadership commits to the power and possibility of these groups and invests in their ability to leverage their cultural capital to the company's and the constituency's benefit, ERGs can function as an excellent bridge to connect your organization with your partners and customers.

Working With Overseas Partners

Whether you have a customer base in another country or have operations in another country for global distribution, it's critical that you bridge the gap between you and your vendors, even if you have the upper hand in the relationship. Simply expecting your vendors to communicate in the same way you do and operate with the same set of values will probably open you up to disappointment and missed opportunity. Using flex skills to close the gap with external partners and vendors, however, can turn even difficult situations into win-wins.

Some of the most effective ways we have found to overcome differences in communication styles and culture include the following:

- Give the partner or customer explicit ownership over their own expertise.
- Provide a platform for open discussion, giving them permission to speak honestly about their needs.
- Establish expectations in a way that honors their contribution.
- Clearly explain your requirements as well as the reasons behind them.
- Close with questions.

These closing questions can prove key. Offering humility on your part and offering your help to meet shared goals are a few ways to share power and get great results.

PART III: MULTIPLYING YOUR SUCCESS

Onboarding Your Employees

When new employees receive an orientation, it is typically a single event that takes an hour or two to complete. For the most part, these sessions deliver static data such as benefits, processing information and official company policy. We invite you to rethink how you bring new hires and new team members into the fold, particularly to reflect the vast array of cultural, generational and gender perspectives that your incoming hires will bring. For many, the first few weeks of work provide the best and most fertile opportunity to bridge the gap and create immediate trust and enhance communication with your incoming talent. *Onboarding* is the updated term that organizations have come up with to replace *orientation*.

We see onboarding as a company-initiated talent development process whereby the hiring manager, with the support of HR leadership, designs the most appropriate and useful entrée for new employees to be enfolded into the team. Good onboarding defines the intentional way you introduce new people to how things get done inside your organization and provides a true insider's perspective on who the players are; what the company culture is really like from the inside and how things get done; developing your personal career objectives; GARP (generally accepted rules for promotion) specific to the organization; and understanding the internal power dynamics.

Bridging the Gap with Employees New to the Company

For employees new to the company, the onboarding process is a rich opportunity not only to express clearly your mission, company values and internal processes but also to bridge the gap and understand the values that shape their interactions and preferred communication style. When you notice moments of disconnection or that you don't understand, apply these pre-engagement questions to ask yourself about your new hire:

- What are they thinking? What's behind the action?
- What don't they know about our company culture that's causing a disconnect?
- How do I connect with this person?
- How will I pass on both formal expectations and explain the unwritten rules?
- Can I connect this person with other stakeholders or an internal buddy to help her find her way?

Don't overlook the importance of relationship building in this early and critical stage. It's every bit as important for a new hire to focus on building trust as it is for companies seeking to form new relationships with global partners. The relationships form the basis for all future interactions.

Leveraging Diverse Thinking from Your Teams to Drive Innovation

Hiring a diverse workforce is not enough. People must be trained to work with difference, and the importance of diverse ideas and process must be cultivated in order for a company to spur creative thinking. In many ways, innovation is the utmost application of closing the power gap. It requires people to manage up, down and across peers to work through differences, be receptive to good ideas no matter where they originate, and encourage risk taking.

How Difference Drives Innovation

When you're forced to stay out of your comfort zone and are challenged by new information and points of view, the creative part of your mind is stimulated. These are just a few of the ways that having diverse teams can contribute to innovative thinking and processes: A diversity of opinions and experiences encourage creativity, adaptability and original thinking; diverse environments that value individual opinions are more likely to create a sustainable shift in one's mindset; diverse teams are able to leverage their more extensive networks and cultural capital to increase what is possible or thought to be possible to achieve.

Overcoming the Barriers to Innovation Through Flex

To create a culture of innovation, new ideas and risk-taking need to be encouraged and not penalized. As a fluent leader, approach each individual team member and assess how they might push into new territory and what that looks like for them. It's also important to know how each team member takes in information, processes it and then spits it back out. You will need to be attuned to these differences in thought and process and create a variety of organizational opportunities for ideas to come to the table. Consider these strategies:

Diversify your forums for debate and exchange. To capture the widest possible variety of ideas and opinions, you need to offer a wide range of organizational opportunities where people can exchange ideas and debate their merits. These can range from a suggestion box or feedback forms or designated blue-sky days.

Create sponsors at all levels. As you're building this environment, ensure there are sponsors for each team member and initiatives at all levels of the hierarchy. Create a culture where everyone at all levels is valued. If someone has a great idea, there is a forum or channel for that innovation to be tapped. Ensure people are open to a full team perspective.

Access internal and external voices to drive innovation. Innovative thinking requires that you hear from all the participants at all angles. Internally, it's crucial that you are listening vertically down the command chain and that departments hear one another's perspectives. Forge ways to connect to external points of view and close the customer gap. Speak to the people who are in direct contact with your customers, or connect regularly with virtual and offsite teams to get their perspective.

If there is one prerequisite to harnessing the full creative power of tomorrow's talent, it is this: We must be able to address and navigate through difference. We mustn't be afraid to have the conversation and work through complicated, misunderstood, messy or loaded issues. And we must become willing to go outside our own comfort zones and extend an invitation toward those different from us to meet in the middle.

If there is to be a change in how we recruit, reward and advance our best talent, it means committing to practice and persistence, continuing to apply the principles of flex while making it a part of your ingrained management process.

THE SUMMARY IN BRIEF

In ***Focus on This Not That***, author Kimberly Devlin shows that where you focus your attention is where the vehicle ends up— and the same is true of managers. She shares the secrets to strategically and proactively embracing leadership roles in order to put out fewer fires, conduct fewer counseling conversations, and deal with fewer headaches. By focusing on these amazing management strategies, managers will be able to realize the engagement, performance, and results managers need to be become exceptional— the type of leaders employees talk about for all the right reasons.

Featuring detailed strategies for removing bad managerial habits and replacing them with proactive and effective ones, Devlin shows managers that improved leadership and performance from employees is as simple as focus— where to place it, and where to leave it to your employees. By becoming more efficient with their focus, managers can help reach their own greatest potential and that of their employees and organizations.

IN THIS SUMMARY, YOU WILL LEARN:

- Three steps for developing and leading high performers.
- How to achieve business results while helping employees achieve their ambitions.
- Step-by-step processes to master your new role's responsibilities.
- How to put this guidance into practice in your career.

Get Ready, Set, Go!

As a manager, all eyes are on you. You need new skills to keep employees engaged. You need to demonstrate new behaviors to manage others' performance. You are being held accountable for getting results. And, you are pressed for time.

What you really need right now is guidance. This book is designed for you. You don't mind putting in the effort, but you need direction on how to succeed in this role. You're wondering where to direct your focus. Focus on This, Not That will share where to start, what to do, and how to follow through, while providing tools to help you at every step of the way.

Commit to learning the principles in this book, and you'll be well on your way to saving yourself hours and days of heartache as a manager. By applying the strategies in this book, your managerial effectiveness quotient will multiply exponentially.

Why Don't Employees Just Do What I Need Them to Do?

Employees can only do what you expect when they know what your expectations are. That sounds simple enough, so how is it that so few people, when asked, can provide a fantastic— or even adequate— answer to, "Will you tell me one specific expectation your manager has of you?" Not understanding their managers' expectations usually isn't the failure of these employees— it's a failure by the manager to properly set and communicate those expectations.

To set you up for success in engaging staff, managing performance, and getting results, you have to understand the three common mistakes managers make— failing to define expectations, failing to communicate them, and failing to maintain a focus on them.

Mistake #1: Fail to Define Expectations

If you are assuming your employees know what you expect, what that looks like, and how to achieve it, you are succumbing to the first mistake many managers make— failing to define expectations.

Don't leave employees guessing about what you expect. It's not as simple as providing a copy of their job description, holding a staff meeting to announce expectations, or making passing comments saying that you need more from them. Instead, prepare for one-on-one employee expectations meetings by recording specific expectations of team members based on their positions, duties, and their department's or organization's overall goals. The defined expectations should be clearly stated and observable, have performance standards associated with them, and be connected to greater goals or initiatives.

Mistake #2: Fail to Communicate Expectations

It's hard to imagine a good reason to keep your expectations from your team. Maybe you read that expectations should be set within an employee's first few weeks— ideally, they should— and months or years have now passed, leaving you thinking it is too late to bother. Perhaps you work in a dynamic industry, organization, or department that frequently reinvents itself to keep pace with shifts that impact your team's work, leaving you wondering, "What's the point? Any expectations I set today will change soon enough." Or, you might be asking, "Isn't it obvious stuff everyone should know?"

If you don't express your expectations, don't be surprised when they are not met. While establishing expectations early is a best practice, if you didn't to it yesterday, doing it today is better than tomorrow or not at all.

Mistake #3: Fail to Maintain a Focus on Expectations

"Set it and forget it" is a dangerous mantra for managers to adopt regarding expectations. This would be like planting a flower bed and never returning to water it, fertilize it, or deadhead flowers that have faded out of bloom. But, frequently that is just what happens in the workplace— about a week or two after annual performance reviews.

Keep in mind that expectations can change— in response to changes in the work environment, staffing levels, organizational shifts, or other reasons. Without your attention, established expectations can become outdated, leaving employees potentially doing just what you asked of them but not what you need from them— through no fault of their own.

Having defined expectations and established them with your employee, sharing regular feedback with them on their performance creates the expectations trifecta. If you were coaching a new driver, would you wait until they drove into a ditch to redirect their performance?

What Keeps People Engaged?

Research confirms that employees whose managers involve them in goal setting are four times more likely to be engaged than other employees.

Unfortunately, this only happens for 30 percent of employees. Let your employees be counted among them. One of the keys to achieving and maintaining engagement is using collaboratively created work goals.

The difference between expectations and goals is that expectations specify desired behaviors and goals specify desired results. Establishing expectations must come first, and then you can proceed to goal setting. What gives work goals their power to engage is that you and your employee create them together in the context of the organization's goals and your expectations as a manager.

To properly help employees create powerful goals, you will want to use the RESULT framework—Related, Evaluated, Shared, Uplifting, Length, and Transition. Each of these components will not only help with goal-setting—but with helping employees to achieve those goals.

Maintaining a Focus on Performance with Recognition and Feedback

While feedback can be used to reinforce or redirect behavior, the term often implies correction. But you're encouraged to ingrain both reinforcing language (praise) and redirecting conversations in day-to-day discussions. Make them a part of your normal routine.

Ideally, your praise will recognize actions, outputs, and behaviors that support employee expectations and goals. Redirecting feedback is equally critical to master and integrate. All employees need it—low-, mid-, and high-performers alike.

Anchors and Boomerangs: Signs You Are Micromanaging

Take a moment to consider how many anchors and boomerangs are on your desk, in your inbox, or on your to-do list. Anchors are work—tasks and projects—that could be done by another team member that you hold onto to do yourself. Boomerangs are work you have delegated to team members that you take back for one reason or another.

What do you estimate to be the total weight of these anchors you carry needlessly? How much energy would you say you expend watching for and catching boomerangs—which become anchors once caught—that you could dedicate to managing performance instead? Learn to recognize anchors and boomerangs for what they are. Anchors are ballast that drags against your ability to perform your role. Boomerangs are distractions from what you should be doing—the work that only you can do.

To better delegate and avoid micromanaging, you will want to learn to identify the work, choose the appropriate individual, define expected outcomes, share related information, build in checkpoints and follow up with feedback.

Step One: Identify the Work

Is the idea of delegating difficult or uncomfortable for you? If you are unsure of what work to delegate, start by writing a few lists. Create one list cataloging the tasks that initially helped you develop your skills that in turn can help develop your team's skills. Create another that records the work you need your team to perform competently in your absence. Create a third that lists projects that relate in some way to the career goals and ambitions your employees have shared with you. Use these three lists to identify work to delegate. Together, they represent a gold mine of delegating opportunities and will keep you from dumping on your employees.

Step Two: Choose the Appropriate Individual

One of your responsibilities as a manager is balancing the workload among the team. When determining to whom you will assign the work, assess the knowledge, skills, and abilities of your employees. Consider their current workloads and work styles. Factor in the demands and constraints of the work you are assigning. Then, define the reasons why the selected employee is the right match for the work. Here are some sample reasons for selecting the right employee:

- The work represents an opportunity for the employee to develop new skills.
- The work aligns with a career goal the employee has shared.
- It is a high-exposure project that will showcase the employee's skills.
- The project will entail learning about an aspect of the business that is of interest to the employee.
- The work supports existing responsibilities of the employee's position.

Step Three: Define Expected Outcomes and Share Related Information

To succeed at this step, focus on outcomes rather than the processes and activities that produce the outcomes. Describe the desired end result, list the ultimate deliverables, and specify what overall success looks like. As you listen to

and answer your employee's questions about the assignment, find opportunities to provide related information in the context of their questions. Be sure to place your emphasis on what is not written down that they will need to know.

But how do you balance giving your employee this project ownership while also developing your confidence that they have enough information and guidance to succeed?

Step Four: Walk Through Potential Disconnects and Resources

Questions are the key to giving your employee ownership and developing your confidence in their success. "How will you get started?" is a powerful example. It encourages independent thinking and leads your employee to recognize potential challenges and consider the resources they may need.

This step is all about asking instead of telling. Pose questions, listen to responses, and use additional questions to guide instead of directing employees in how to perform the work. This will create autonomy, lower the odds of the project becoming a boomerang, and save you the time you would dedicate to performing the work yourself.

Step Five: Build In Checkpoints

Now it's time to ensure the delegated work does not become a fire to be put out or a boomerang by setting checkpoints that are used to reconnect and assess progress. The first mistake managers make with checkpoints is failing to set them. The second is scheduling them too late. Check yourself with this brief exercise: It is Monday morning and you are delegating work to your employee. When should the first checkpoint be scheduled?

Instead of setting the first checkpoint at the 50-percent mark, set it at the 15-percent mark. This reduces last-minute crises that occur when half of the project time is left but all of the work remains to be done.

Step Six: Follow Up with Feedback

Regardless of whether you are thrilled with the results, lukewarm about them, or disappointed in them, your employee needs to receive feedback from you if managing performance is truly a priority for you. Deliver both recognition worth receiving and redirecting feedback to lead your employee to high performance.

The causes of micromanaging are varied, but the solution is universal: establish clear expectations, maintain open lines of communication, provide all the information, resources and tools needed, and schedule times to receive updates from your employees on their work. The more you practice this, the easier it becomes.

Where Do I Go from Here?

Becoming the manager you always wished you had is within your reach. You have dedicated the time to get this far. Now, dedicate time this week to lay the foundation for leading as you aspire to— by focusing on this, not that.

Kimberly Devlin is an unwavering pragmatist who believes theory is overrated and that time should have an ROI. She has discovered ways to transform information overload and time crunch into innovative and actionable systems that improve productivity and get results. Kimberly is a sharp and engaging writer, international speaker, facilitator, and instructional designer who brings practicality, humor, and 20+ years of in-the-trenches experience to build game-changing leaders and organizations. Management: Hands-On

Follow This Path

How the World's Greatest Organizations Drive Growth by Unleashing Human Potential

by Curt Coffman and Gabriel Gonzalez-Molina, Ph.D.

THE SUMMARY IN BRIEF

When it comes to getting ahead in business, The Gallup Organization has led the way. In *Follow This Path*, two Gallup researchers describe the results of a recent Gallup study of more than 10 million employees and 200,000 managers. Their groundbreaking findings show how developing your people can lead to a quantum leap in cost efficiencies and profits.

What do the world's greatest organizations have in common? They know that their most valuable resource is human — their employees and customers. And the best companies understand two important facts: People are emotional *first* and rational *second*, and, because of that, employees and customers must be emotionally engaged in order for the organization to reach its full potential. Gallup research not only bears that out, but has uncovered the secrets of creating and managing an "emotional economy" that will provide boom possibilities for your company.

Follow This Path shows employers how traditional ways to engage people no longer apply. Instead, it offers a system called The Gallup Path, based on proven, revolutionary strategies of the most successful businesses. *Follow This Path* describes how organizations forge unbreakable bonds between employees and customers with superior performance.

IN THIS SUMMARY, YOU WILL LEARN:

- Why you must look at your employees as your first line of defense.
- How to discover the best employee and customer motivators.
- How to build relationships one customer and one employee at a time.
- How to value and develop human relationships all around you to transform your business — starting today.

Introduction: The Path to Take

Great organizations achieve sustainable growth and profits because they do what other organizations don't: They maximize the innate, individual talents of their employees to connect with customers. They know that tapping the resources of humans is the only remaining area where significant improvements can — and do — lead to an unlimited source of competitive advantages.

Will this change the way you view employees and customers? It should — *if* you want to profit and grow along with great organizations and compete with them.

Now Is the Time for Change

In case you haven't noticed, there's a whole new world of employees and customers out there. Where employees are concerned, the modern workplace is not filled with a generation of workers who received identical marching orders: Get an education so that you'll be hired for a steady job at a decent salary; Work as hard as you possibly can, because a job is a privilege on which you can base your future and secure the welfare of your family; The perceived value of hard work, discipline and responsibility should never waver; Your "loyalty" will be taken for granted.

Today, the world of work has totally changed. Nowadays people skip from job to job and from company to company. Working as hard as possible may still be an ideal held by some, but too often they burn out quickly and lose their effectiveness.

An Emotion-Driven Economy

Great organizations know how to chart a course through the worldwide competitive maze to keep their customer relationships not only intact, but also thriving. They do this by connecting to their customers on an emotional level. When that happens, customers return because of *the way they feel*. The response has been so phenomenal that these organizations don't refer to their return patrons as loyal. They speak of them as being *emotionally engaged customers*.

Simultaneously, great organizations create an environment in which their best performers can do what they excel at, over and over again. These men and women are so tuned in to what they are doing, and so effective at responding to the needs of customers, that profits and growth flourish, as do the employees. These men and women are referred to, with gratitude, as being *emotionally engaged employees*.

When engaged employees utilize their natural talents, they provide an instant, and constant, competitive edge. They build a new value: emotionally driven connections between employees and customers. ●

Welcome to the Emotional Economy

Here's what the world's most successful organizations *don't* do. They don't suppose that either superior college grades or comprehensive training is the only accurate or dependable indicator of the right person for the job. Neither do they expect that employee incentives will guarantee consistently better job performance.

Instead they depend on the reliable source that other businesses disdain: *human nature*. They know that the

emotions of both employees and customers create feelings, which drive their behavior. Great organizations are aware of the power of emotions and, therefore, set up the conditions that generate and cultivate emotional mechanisms among employees and customers. The only way to achieve this is through human interaction, the fastest and most powerful trigger of emotional states.

By recognizing and unleashing the innate abilities of employees and matching their gifts to the positions that will best take advantage of them, thus making them even stronger, great organizations look inward in order to move forward.

They cherish the fluctuations in human behavior because they understand that these create a pathway as electric as any inside a brain.

For example:

- Employees who use their natural talents in their jobs produce significantly more than average workers.
- Emotionally committed employees form teams that deliver exceptional outcomes.

Customers recognize the passion and commitment employees feel toward them and cannot help but respond in an emotional way.

This emotionally driven reaction builds a bridge between employees and customers that creates engagement. This engagement becomes the key factor that drives sustainable growth. Sustainable growth is the route to profits and, ultimately, higher stock value.

In the end, great organizations know that a reason-driven economy can travel only so far. The missing link is the engagement of deep-seated emotions as the driver of growth and profits. These — and only these — feelings are the fuel that propel talented individuals to do more and inspire customers to return.

Discover the Talents of Each Employee

Mike Rose is great at what he does, and it shows. Leaning back in his chair, his feet resting on his desk, headset in place, he inhabits his area — he refers to it as the "command center" — with ease. Relaying information and answering questions with an enthusiastic manner that is endlessly engaging to the people on the other end of the line, Mike enjoys his job. When speaking to customers, he exhibits what seems to be a magical ability to "read" them, even though he never sees them.

Information technology is Mike's field of operations. He interacts with established and potential customers, presenting new products and services to them. Providing technical support is another part of his work.

But for Mike, the very process of speaking to people, finding out their likes and dislikes, guiding them to the products and services that are right for them — that's what gets him psyched every morning:

As he says, "I have the best time talking to people and figuring out what is or isn't important to them. When I make a connection, I hear it in their voices, and it makes me feel good."

Mike's connection with the people he speaks to is emotional.

Mike has a natural talent for his work. But he brings something else, something that cannot be taught. When he connects with customers, he feels good. Customers, in turn, feel that Mike cares about them. Consequently, Mike's work keeps blooming into profits.

Talent Is Where You Find It

Everyone has talent — the natural predispositions that make each of us particularly effective. It is when this recurrent pattern of thinking, feeling and behavior is applied to the right role that superior performance is generated. The trick is to find that role in which talents can be put to their best use.

Build Strong Customer Relationships

By asking "What are the ingredients for building a strong customer relationship?" Gallup researchers found:

- The strongest long-term commitment — the emotional allegiance — of a customer to a brand or to an organization does not derive solely from superior factual knowledge and rational appreciation of a product's intrinsic and extrinsic benefits.
- Rather, it is the result of an emotional experience derived from noteworthy interpersonal, product and brand interactions.

The Route That Never Goes Astray

Like ancient roads that provided the means for trade, commerce and wealth, employees can provide the pathway to profits and growth. So it makes excellent practical sense to pave the way for their talent to reach the world. With competition mounting on a global scale, no business, industry or organization can afford to pay an

employee for providing anything less than a great performance, which means one that is emotion driven.

Of course, there is a huge range within roles and situations, and among types of industry and organizations; diversity is a constant. Nonetheless, hundreds of performance-linked-to-outcome studies at Gallup, involving a highly diverse range of roles and positions, including those in sales, customer service, teaching, health provision, law enforcement, sports and the arts, revealed fascinating information.

These analyses identify the exceptional contribution of talent, as opposed to other internal or external variables. The analyses also measured the magnitude of the contribution of the employer.

Gallup discovered that great organizations:

- Identify, select and develop talent.
- Nurture their employees' strengths. Roles are constantly being adapted to better suit these strong points. Because true value comes from the best performers, the bar is continually raised. Outcomes are measured and compensation is tied to them.
- Train to develop individual strengths.
- Understand that knowledge can be transferred from one person to another, but is always specific to the situation.
- Bolster strengths so that profits will grow.

With this information in hand, the selection for the right talent to fit the right role can begin.

Talent and Profits: The Inseparable Duo

Hundreds of Gallup studies have proven, time after time, that talent makes a huge impact on profitable growth across every major type of occupation and industry. They also discovered that the effect of talent is reflected by how productive a person can become. The top 25 percent of the most productive individuals in all sorts of occupations were identified, reviewed and studied in depth with regard to their performance and personal talents.

Ultimately, the results were clear: Only the best — consistently exemplified by the most productive — generated sustainable and real value. The key to highest individual performance lies in the unbeatable combination of experience, training and talent. That's why it is imperative that the talent combinations of the best be compared with those of poor and average workers. Only then can their strengths be identified and channeled so that they, too, can spur growth. ●

Steering Toward Engagement

Gallup researchers felt that looking at both the highest- and lowest-producing work groups was imperative in order to discover the conditions that consistently distinguish them. That's why they researched all kinds of industries and organizations, identifying the issues that managers and employees alike can act upon.

They also felt that the ultimate goal would be to identify the cultural conditions that attracted and nurtured top talent as well as those that drove negative attitudes and defeating behavior.

As a result of this mammoth effort, a group of 12 highly focused questions known as the Q^{12} were posed to employees within hundreds of companies.

The 12 Conditions for a Great Workplace

The Q^{12} define the conditions of a great workplace. Great managers run productive workplaces whenever these 12 conditions are met.

1. **I know what is expected of me at work.** Without expectations, it is impossible to assess progress.
2. **I have the materials and equipment I need to do my work right.** More than anything else, information is the top necessity for every employee.
3. **At work, I have the opportunity to do what I do best every day.** In great organizations, the most productive work flows when a person's innate gifts are matched to a role that celebrates them.
4. **In the last seven days, I have received recognition or praise for doing good work.** Singling out excellent work and praising it goes a long way toward recognizing the individual contributions of employees. Not surprisingly, it adds to their sense of accomplishment.
5. **My supervisor, or someone at work, seems to care about me as a person.** Employees don't leave companies, they leave managers and supervisors whom they feel don't care about them either as individuals or as employees.
6. **There is someone at work who encourages my development.** Most people want to achieve more proficiency in what they do; it's human nature to want to improve, to overcome challenges and to come out on top.
7. **At work my opinions seem to count.** Innovative ideas are priceless.
8. **The mission or purpose of my company makes me feel my job is important.** Being part

of the bigger picture is very compelling. It comes under the heading of *emotional compensation*, because it can't be bought and paid for; instead, it is perceived. Stretching themselves to make a difference comes naturally when employees see that what they do has a profound impact.

9. **My associates or fellow employees are committed to doing quality work.** Identification with a shared commitment is crucial for the work group to turn out a quality product or service.
10. **I have a best friend at work.** Having a best friend at work improves a person's chances of being engaged by an amazing 54 percent. Not having one, on the other hand, reduces chances to zero.
11. **In the last six months, someone at work has talked to me about my progress.** What employees are doing well should be brought to their attention.
12. **This last year, I have had opportunities to learn and grow at work.** Learning must be targeted to enhance existing strengths; otherwise it won't add to an employee's personal and professional growth. ●

Directions for Enhancing and Managing Employee Engagement

Great managers employ just four keys to meet their goals:

1. When selecting someone, they opt for talent, not simply experience, intelligence or determination.
2. When setting expectations, they understand the importance of defining the right outcomes, not the steps to get there.
3. When motivating someone, they focus on the person's strengths, not his or her weaknesses.
4. When developing someone, they help find the right fit between talent and role. And they use the Q^{12} as a guide to understanding and developing their employees.

Managing the Q^{12}

Every great manager knows where each employee stands in each of the 12 conditions. Great managers almost instinctively build the 12 conditions into their work environment. They know that only in the best environment can they get their employees' talents to blossom.

Here are 12 tips:

1. **Define the right outcomes.** At the basis of the engagement process are the basic expectations of a role.
2. **Provide the necessary tools.** If the matching of skills with tools is not thoroughly examined, there can be great cost for either the individual, the organization or both.
3. **Select for talent.** The best managers clearly see the specific talents needed for every role.
4. **Focus on each person's strengths.** Effective recognition is positive in nature, immediate and real-time to performance. Additionally, it is specific about what is being praised, is close to the action and is done in a way that best impacts the recipient.
5. **Caring counts.** A productive workplace is one in which people feel safe enough to experiment, to make mistakes, to challenge, to share information and to support each other.
6. **Find the right fit.** The best managers help employees differentiate between talent, which occurs naturally and cannot be created, and both skills (the "how-to" of a job) and knowledge (factual or experiential) — each of which can be learned.
7. **Let people be heard.** Nothing is more demoralizing to employees than being excluded from being able to express opinions about major decisions that directly affect their work.
8. **Help each person find meaning.** Good managers believe that a part of their jobs is bringing the company's purpose or mission down to size. They do this by explaining it to each person in a form that each individual can relate to.
9. **We're all in this together.** Great managers clarify the definition of "quality" and make sure that employees and customers share the same vision of what that means. Therefore, everyone in a work group must understand how the customer defines "quality" and agree with it.
10. **You'll be there when I need you.** In the perspective of great managers, employees are most productive when they cooperate with one another, when they combine efforts and when they do not have to waste time watching their backs. Great managers understand their team members' need to feel that they can trust the people around them.
11. **Look at how far you have come.** All employees need feedback to know how much they have grown.
12. **Organizations learn through their people.**

Great managers learn how each employee defines personal "opportunities." ●

Emotional Economics, Part 1

The reporting of the economic impact of engagement on profits and growth has only begun. This study is ongoing at Gallup, and there are numerous areas of hidden impact that remain to be revealed and estimated. But right now, the undisputed fact is that employee engagement significantly impacts the ability of an organization to achieve profitable growth.

Since nothing in an organization occurs inside a human vacuum, however, every single event handled by human beings bears the handprint of their engagement.

The challenge is in catching up with the organizations that have already reduced the variation of engagement/disengagement within.

What can companies do to improve their ratio of engagement? First, "think big and act small," because the only way to find the real solutions to problems in the workplace is at the workplace level. The solution already lies inside your own organization, at superior individual workplaces where the outstanding stories of engagement can be identified and applied to the entire organization.

Second, it's time to realize that all problems relating to engagement are directly associated with talent that is either underutilized or ignored. No matter how many percentages are tallied or numbers are crunched, without important relationships among workers and between managers and work groups, engagement cannot happen. This is the first fundamental lesson of emotional economics.

The Disengagement Warnings You Must Heed

The numbers don't lie. You must identify your engaged, not-engaged and actively disengaged employees because they make huge impacts on your business every day. And unless your employees become engaged to their work and work group — and stay that way — they won't be able to work to their maximum ability.

If you want to win in an increasingly competitive business world, you must look at your employees as your first line of defense. They can make you or break you. Remember:

- **The majority of employees are not engaged at work.** More than 42 independent Gallup studies indicate that approximately 75 percent of employees in most companies are not engaged at work.
- **Disengaged employees cost companies hundreds of millions of dollars annually.**
- **Remedial training doesn't cure disengagement.**
- **Companies create waste.** Waste and lost opportunities represented by disengaged employees are pulling your organization down. ●

The Open Highway

First the bad news: Mounting evidence points out that in the absence of a meaningful emotional relationship with a brand or an organization, customers are naturally predisposed to switch their allegiance. This means that customers are not born loyal. The good news is that customers are naturally predisposed to be emotionally attached, once emotional connections are established.

It's All in Your Heart

Emotions are the mechanisms that set people's highest-level goals — including what they repurchase. While customers often forget factual information (how much they spent on a service or how much an item costs), they almost always remember their emotions, good and bad — more often the latter than the former — when it comes to deciding whether to buy a product again or keep a service.

This means that the process of deciding whether or not to stay also depends on the emotions experienced while purchasing and using a product or service. So apart from performing its intrinsic functions, a product or a brand carries profound emotional connotations for customers. At the beginning, middle and end of every transaction, emotional engagement is always at its heart.

Customer Loyalty

There are three kinds of customer loyalty:

- The forced kind, which is imposed by a monopoly and lasts only as long as the monopoly does.
- The bought kind, which is directed at a captive audience (frequent flier coupons are an example, where an airline offers a choice that fliers might not use).
- The emotional kind, which can go on infinitely. Unless you focus on emotional engagement, you will not be able to persuade customers to return to you. ●

The Four Emotional States That Drive Customer Engagement

There are four distinct emotional states which collectively represent the four basic dimensions of emotional

engagement: Confidence, Integrity, Pride and Passion. As you'll see, each one builds on the one preceding it. One can't be skipped to get to the next level. As with the Q^{12}, the sequence must be followed to work maximally.

- **Confidence.** Confidence develops out of a "relationship," either through mental images created by brands, through experience with products and services, or by human interactions with employees or representatives. Confidence grows from technical competence, flawless systems and proper understanding of all customer needs, including the actions and procedures that must take place. It also depends on the understanding of intangible issues, such as treatment and the knowledge required to meet customer expectations. The key words for trust are "genuine," "authentic," "accurate" and "credible."
- **Integrity.** Integrity is the belief in a brand's ethical commitment, the unequivocal compliance with principles agreed upon and with a fair resolution of problems or unanticipated events. Integrity is gauged by whether a customer feels fairly treated and by whether he or she expects a fair resolution to any problems encountered. That belief is reinforced when a customer feels he or she is dealing with a company that is not only competent and forthright, but also fair and ethical. It can be instilled, for instance, by a salesperson who steers the customer to a product he or she wants instead of immediately pushing the most expensive merchandise. Similarly, if a clerk botches a room reservation, he or she should know to offer a clear indicator of apology, like an upgrade.This calls for an organization to plainly define the principles to which it will adhere and the ways in which it will apply these in practical day-to-day scenarios that approach problems from the customer's perspective.
- **Pride.** Engaged customers develop potent feelings that result from the relationship they form with a company through all its touchpoints. These feelings extend well beyond believing that the company keeps its promises and resolves problems. These feelings represent the pride felt in being associated with a brand and all that it represents.
- **Passion.** When a customer refuses to accept an equally attractive substitute for a product and says, "No thanks. I'll wait for what I want even if I have to pay more for it," his or her passion is showing.

Passion cannot be established in the heart and mind of a customer unless the three previous emotional levels are in place. ●

Directions for Enhancing and Managing Customer Engagement

Running a successful restaurant depends on a lot of things: location, a good chef, an efficient waitstaff, fresh ingredients, a pleasant atmosphere, attractive tableware, flattering lighting; the list goes on and on. But you can have all these things and fail if your customers don't keep coming back.

So states Steve, a manager who has been responsible for transforming three restaurants into the top places to dine over a 20-year period.

"I never 'assume' that customers will come back," Steve says. "I try to appeal to them in a personal way, because experience has shown me, over and over again, that it's the only system that works."

As the manager, he is the go-between linking the employees and all of their many functions with the customers who walk in — and out — the doors every day. Like other great managers, he relies on an unbeatable combination of three actions.

First, he knows the specific talent themes of every employee. By taking the time to find these out, he can direct their strengths in the most effective directions.

Second, he meets the expectations of his customers every time they arrive. This means that the way he runs the restaurants, the treatment people receive, and the advice they hear about food and wine selections is consistent.

Third, Steve knows the likes and dislikes of his regular patrons. Because of this, he is able to initiate something new with all repeat customers each time they come in. While this isn't the easiest thing to do, he realizes that it's imperative if he wants to keep his customer relationships strong.

The Three Links

No matter where they take place or what kind of brand, product or organization they involve, every employee-customer interaction involves three simultaneous processes: actions, treatment and knowledge.

- **Actions** are the functional aspects — that is, all the activities that an employee is supposed to perform on the customer's behalf.
- **Treatment** represents the employee's personal touch, the positive or negative attitudes that set the tone of the customer's emotional response to what

the employee is doing.

- **Knowledge** refers to information and advice, which customers appreciate as "enhancing the value" of their experience.

Great managers use the following three links to make sure that action, treatment and knowledge are achieved every time an employee interacts with a customer:

First Link: Align employee strengths to meet customer expectations. Great managers recognize that every employee has talent themes and possesses a unique style of building and cultivating strong personal relationships.

Second Link: Initiate, sustain and restore customer emotional states. Great managers always regard customers as individuals waiting for an emotional state to be initiated, sustained and restored.

Third Link: Intensify the consistency of emotional states. ●

Emotional Economics, Part 2

To date, the largest proportion of fully engaged customers for any company worldwide is still less than 50 percent. This means that all organizations across the globe are running at a fraction of their potential, with severe economic implications to their financial outcomes.

In a time when CEOs and Wall Street economists are asking why soft numbers — which reflect people's attitudes, opinions and preferences both as employees and customers — are becoming increasingly serious subjects of study, great organizations have learned that these numbers matter.

In today's business environment the ability to engage customers is the exception rather than the rule. The challenge for most organizations is how to make this process the norm rather than the rare exception. The list of requirements to make it happen includes the commitment of both corporate leadership and the front-line employee. Here's what the great organizations do:

- Adopt one consistent metric and language — one that can yield valid comparisons among business units, brands, products and time.
- Identify the drivers of emotional attachment.
- Focus on the experience and the engagement of the customer and holding every executive, manager and employee accountable for how they impact the customer emotionally.
- Discover the best practices and initiatives within the organization that stimulate emotional engagement.
- Continuously align the structure and the practices of the organization to best serve the engagement requirements of the customers.
- Guide the organization's strategic response, as well as the tactical activities, of front-line managers and associates into coordinated action to enhance customer engagement.
- Empower and support all front-line employees and teams to continuously improve the customer's experience and level of engagement. ●

Managing the Emotional Economy

Gallup's experts say that maneuvering The Gallup Path successfully requires linking three elements in the proper sequence.

The study Gallup recently completed strongly speaks of a pattern employed by the world's most productive individuals, work groups and organizations. While they vary in size, managerial style, industry and location, these organizations meet the three requirements of superior performance time and time again.

1. Talent drives performance. Engage the talent of every employee. Top performers share two important traits. First, they measure their performance in terms of objectively defined business outcomes and they use their talents as the key source for their individual strengths.

2. Engaged employees are your most productive people. Have managers engage all employees. The very best behaviors that employees exhibit are clues to their talents, a signal to follow to maximize those innate strengths. The economic value that great organizations create for their best employees is entirely emotional. It is built one employee at a time.

3. Engaged customers always come back for more. Engage customers so that all become profitable. Real growth derives from both existing and new customers. All customers must be treated as the individuals they are, and not as standardized blips on a statistical chart. There is only one factor that will impel customers to return to your brand or product or organization: the way they feel about you. ●

THE SUMMARY IN BRIEF

As business owners, we've all been there. You have a long list of must-do items but you find yourself stressed, avoiding, and distracted. You are not quite at burnout but you are getting there, and quick. During these times, the strong temptation is to just throw in the towel and pivot into something else entirely. Entrepreneur and author of ***Free Time: Lose the Busywork, Love Your Business***, Jenny Blake calls this state "burn-it-all-down mode and whenever it strikes, it is a signal communicating that you are not working sustainably. If you don't do something about it, sooner or later it's going to catch up with you. The good news is that "something" could be your next big business breakthrough.

Free Time is not about working as little as possible. It's about applying a framework that creates a business that energizes every person who is involved, from you as the owner to your "Delightfully Tiny Team" and the wider community you serve. It's about designing and running a "Heart-Based Business" that does not require you to sacrifice your time or your health. By "repeatedly applying the principles and systems throughout this book" you will be able to happily, and strategically, work less.

IN THIS SUMMARY, YOU WILL LEARN:

- How to apply the Free Time Framework to your Heart-Based Business
- Why and how to align your values, energy, and strengths to your work
- How to design work for ideal outcomes, impact, and optimal process
- Who, What, and When work should be assigned to others

Heart-Based Business

Being a business owner does not mean that you have to live a stressed out, profit-focused, give it all you got life. You have a choice. Instead of focusing on growing your business at the expense of your health and peace of mind you can choose simplicity, streamlining, and the pursuit of less stress.

You can choose what types of clients or industries you serve so that they are aligned with your values and have the potential to make the kind of impact you desire to make. You can work with integrity, honoring the health and humanity of all involved. All of this and more are characteristics of the Heart-Based Business mode.

Over the last decade this evolved to become a central guiding question for Heart-Based Business, one that I have shared with thousands of small business owners to stay focused on possibility instead of worst-case scenario outcomes. Heart-Based Business means engaging with an ongoing inquiry:

How can we earn twice as much in half the time, with ease and joy, while serving the highest good?

As Heart-Based business owners, it's not about who can hustle, grind, and grit to "beat" the competition. You deserve to honor your life while you build your business.

The ingredients of meaning, community, family, and vitality are at the heart of life-giving businesses and they energize everyone who participates in them, from the owner to the team members to the clients and community.

Free Time Framework

Free Time can be viewed in two ways within the context of running a business. Free Time is:

- Used as a verb to describe the continual improvement of systems that free your time, and
- Used as a philosophy that reimagines how we work, focusing on freedom and Heart-Based Business values, instead of orienting toward money or growth at the expense of time and health.

The Free Time Framework is designed entirely within the above contexts and aimed at moving you and your business away from friction and towards flow. Let's look at both sides in more detail.

Friction: Disharmony, resistance, procrastination, overwhelm, or even dread. Too many mistakes happen, work falls through the cracks, and things go haywire. You feel guilty, even embarrassed, by the state of your systems.

Flow: Busywork is eliminated, focused on the vital few projects and clients, spend the majority of your time working on tasks that you and only you can do, aligned with your greatest strengths, while delegating the rest.

Friction in your business is typically caused by a problem in one of three areas:

- Pressure to bring in more revenue to cover rising expenses,
- Prices that do not generate profits and undervalue your services and the increasing complexity of running a business, or
- Porous boundaries with people you work with that consume crucial recharging time.

Anytime you find your business in a state of friction, you can work through the Free Time Framework process, which is structured according to three stages: **Align, Design, and Assign.**

Part 1: Align

The Free Time Framework begins with a focus on your mind, releasing yourself from invisible and outdated ways of working that are keeping your time unnecessarily and artificially constrained.

You are your best asset, and systems are a skill. You have to move towards a new way of working that is aligned with you in three key areas.

- **Your values:** Operationalizing what makes you and your company unique
- **Your Energy:** Discernment about what to work on (and how) to achieve results
- **Your strengths:** Doubling-down on your talents, intuition, and imperfection.

One of the bonuses of going through this stage is that it is also an important gauge. If you discover the work or opportunity no longer aligns, you will phase it out. No need to systematize what should not be done in the first place.

Values

Operating principles stem from core values. Principles

How can we earn twice as much in half the time, with ease and joy, while serving the highest good?

provide the logic of "why and how we do things here," the overall mindset and approach to work. Where process outlines exactly how you achieve desired outcomes within each area of the business, principles guide those processes to a higher level. Clarifying your values is only a fraction of the work; the rest follows in operationalizing those core values through streamlined systems. To ensure your values are honored throughout day-to-day interactions, you will:

- Set agile operating principles
- Create an externalized mind
- Systematize the spirit of your business

Setting Agile Operating Principles: Your operating principles, whether you are explicitly aware of them or not, are already serving as a foundation for systems you do (or don't) have in your business. Articulating them is crucial, especially as you expand your team, as they set in motion a chain of reasoning based on underlying values.

Create an Externalized Mind: In addition to your operating principles, clearly outline processes that define how you work in a well-organized, easy-to-navigate Manager Manual: your externalized business mind.

In doing so, you will be more confident and less stressed, better able to trust yourself and others to run operations smoothly, and communicate about your business clearly. In an ideal world, no piece of information (or your clients) lives only in someone's mind–yours or your team's. None. Nothing.

Systematize the Spirit of your Business: Design onboarding systems to preemptively address buyer's remorse by deciding in advance what you want their experience to be, designing a process to reflect those values, then doubling down to ensure new clients feel welcome. Special touches come from intentional process design for the values that embody the spirit of your business.

Energy

Notice your energy as you work. Pay attention to interactions with your team and clients: When and with whom do you feel most in the zone? When do you feel most disconnected and drained? What are the most energizing aspects of your business and which ones create unwanted friction? To work with ease and joy, you will:

- Set purposeful intentions
- Let it be easy, let it be fun
- Give yourself golden hour

Set Purposeful Intentions: Setting intentions allows you to filter opportunities, especially ones that seem good on the surface, but that are not energetically aligned with your aims. Purposeful intentions steer you through tough decisions toward your highest contribution. Part of intention-setting involves examining underlying, unconscious intentions muddying the waters of desired business outcomes. It could be that you are complicit in creating the conditions you say you don't want.

Let it be Easy, Let it be Fun: There are two types of challenging work: hard work and Hard Work. Lowercase hard work is rewarding, challenging, and pushes us to the edge of our stretch zone, where we discover flow. Uppercase Hard Work is worn as a badge of suffering, one that mostly leads to burnout. There is a better way.

If something is too hard, take it as a signal to pause, regroup, and revise your approach. If the process of what you are doing, building, or creating is no longer fun, stop.

Give yourself Golden Hour: You have golden hours, one or two times per day that are optimal for your peak energy and creativity, given your unique circadian rhythms. Make sure you allocate your golden hours for your best work. What's your job today?

Be discerning about what you choose and know that it will fluctuate and require trade-offs. Remind yourself that doing this one thing means it has been a successful day.

Strengths

How you do that one thing you love is not how you do everything. It is a pocket of blissful work that yields greater results than working on what you are mediocre at. The

responsibility is yours to fill or reduce the many roles that aren't aligned with your unique strengths. To remove barriers to create more space for your strengths, you will:

- Build your business intuition
- Continuously bust bottlenecks
- Embrace imperfection

Build your Business Intuition: Pay attention to abrupt signals, surprises, or alarming occurrences. These moments indicate when you are no longer in flow, despite what your heart wants, or what your mind thinks you should be doing.

The signs are speaking to you, letting you know what it is time to lean into your intuition as a strength signaling what to do next. Trust that an answer will emerge when it is time.

Continuously Bust Bottlenecks: Finding yourself embarrassed, missing important deadlines, or profusely apologizing to others on a regular basis can be signals that you are bottlenecked in your business.

You might be the best in the world at what you do, but if your systems are broken or outdated, your clients will quickly become frustrated and go elsewhere.

Embrace Imperfection: Embrace "cookie dough" work that is awkward, imperfect, and incomplete. Launch it anyway and gather real-time feedback. Trust that your creative cookie dough will be delicious as is.

Part 2: Design

This second stage of the Free Time Framework, Design, will help you create space for your most important work, ignoring distractions along the way. Before starting any new project, you will clearly define three areas:

- **Ideal Outcomes:** What are the ideal outcomes, large and small? How will you measure success? How will the finished product look? How will you know it is complete?
- **Impact:** What impact will this project have in the world? Who is it for? What problems are you solving? What do they write when they send you a thank-you note for creating it?
- **Process:** This is where you design how you and your team will work toward your ideal outcomes and impact. You will create a project plan with key milestones, and decide how to communicate along the way, noting what to do when problems arise.

Ideal Outcomes

Design the process and ideal outcomes before starting work on a new project. Notice when you are stuck thinking something will be long, hard, or exhausting. Invite nonlinear breakthroughs by opening up to the possibility that results could happen quickly, joyfully, and easily.

Stop mopping with already soaked time sponges: doing repetitive, reactive work without cleaning up the actual mess. Instead of reacting in the moment, create systems to free up time in the future. Notice micro-guilt, people-pleasing, worrying, and saying yes to lukewarm opportunities just to avoid saying no.

Invite nonlinear breakthroughs (NLBs): An NLB is an unexpected sharp turn of clarity or success, rather than a linear, long, or otherwise time-consuming analysis or slog. You may assume that the only way to achieve progress is through hard work and intense willpower. Invite an NLB instead.

Envisioning a path that might just be easier than expected, is exactly how many entrepreneurs achieve liftoff. NLBs invite us to be surprised not only by the outcomes of any business effort, but by the path to get there.

Apply serendipity as a business strategy: Serendipity happens when you release your small experiments, or pilots, out into the world, without knowing what will result. Sure enough with luck, effort, and persistence to keep putting things out there, someone's interest will spark.

If you stick with steadily launching your ideas, they accelerate. With serendipity as a business strategy, you do not have to design precise outcomes, have all the answers right away, or a detailed plan mapped out from the start.

Solve for Sisyphean systems: Sisyphean, a Greek mythological king, was sentenced to an eternity of futility, rolling a giant boulder uphill only to have it roll back down once he neared the top. In today's world, these giant boulders come in the form of never-ending inboxes and notifications.

Many of these Sisyphean systems are, by definition and by design, "hard to contain or eradicate." It takes Herculean willpower–or a shift in systems and mindset–to resist the urge to respond all day, every day, into eternity. If we get caught up in these addictive systems, we miss the chance to do our best work, in our best timing.

Be mindful of the impact of how you describe your community and customer journey and consider the myth that hard work is all it takes.

This requires awareness, stepping back to see a bigger picture and possibilities, and implementing a pattern-interrupt or new process for repeating situations that are not serving our best work.

Impact

Design with your desired impact top of mind, creating solutions that serve the highest good for all involved, including your team, clients, and broader community. Continually collect feedback and improve your products for greater resonance. Be mindful of the impact of how you describe your community and customer journey and consider the myth that hard work is all it takes. Consider the invisible privileges that impact success.

Always be listening: Built-in listening is a systematic way of ensuring there are feedback mechanisms built into the business. Always be listening by making a practice out of continuous open listening, setting up a variety of systems to do this. Consent is key, of course and in addition, ensure that a monthly recurring task rolls the feedback up for review to improve products and inform every new project.

Scale by getting ready for a big break: Prepare your systems to catch the wave of interest and incoming leads that get generated. If you scale with sloppy systems, your problems will only multiply. If you don't see it coming (or envision that it is possible and act accordingly) you may run out of inventory, crash servers, or experience other flubs. Build with excellence and prepare ahead of time for all possible outcomes.

Use life-giving language: The words you use publicly and behind the scenes matter. They carry energy. Respect and acknowledge hard work, luck, and privileges—as success is almost always a combination of these and more.

Language represents our values and beliefs. Consider how language maps to processes in your business, and your resulting motivation (or lack thereof) to follow them. For example, acquiring a new customer refers to a human you respect as an object to be bought or caught. That language is dehumanizing and demotivating, especially if you are a Heart-Based Business. Be accessible and inclusive in your language and actions.

Process

Ensure that you and your team are intentional about designing the process required to make the work happen before you assign to team members. Be strategic with your time with batching of small and not time-sensitive tasks to eliminate task bloat. Design your default state to be intentional, active focus.

Design deep work containers: You deserve to have uninterrupted, focused time to do dynamic work, at times when you are most creative. It is all important to systematize deep work time amidst a world of fractured, digital distraction.

Deep work time means nothing else gets scheduled in advance during that time. Give yourself permission to turn your phone to Do Not Disturb during deep work times.

Time block and bake in batches: Time blocking is dividing the day into specific segments to complete discrete activities through concentrated efforts. Knowing what this is and doing it are very different things. You will not block time expansively if you hold yourself to an outdated energetic imprint of what a calendar means, and how it should be managed.

Rethink calendar-cramming habits that no longer serve you. Batch your time by doing similar activities together, even planning them in advance on a quarterly basis.

Automate what you repeat: If this then that (IFTTT) represents a way of thinking for repeatable tasks in your business. No task needs to be repeated the same way twice, at least if you are paying attention and willing to do a little bit of extra work up front to define if this then that rules. By automating as much as you can, you stay focused on the work you love most.

Automate small, repetitive actions through software. Engineer simple systems to prevent failures of memory, energy, overwhelm, decision making, and delegation.

Part 3: Assign

In this last stage of the Free Time Framework, now is the time to let go of as much of it as you can by assigning next steps to someone other than you. You will set up structures that build trust in your team. The assign stage challenges you to assign most of what you can. For every task, project, and responsibility, you will get clear on:

- Who
- will do What
- by When

Who

If you are the only person working in your business, you are far more likely to be the bottleneck and to be burdened by work that drains you. In this section you will:

- Promote yourself from Chief Everything Officer
- Construct your Delightfully Tiny Team
- Double how much you delegate

Promote yourself from Chief Everything Officer: It's nearly impossible to do your best work when you're doing all the work. To create a lasting company, you need to ensure that it does not hinge only on your energy, effort, attention, and time.

Consider hiring a thought partner who compliments your skillset and an assistant or project manager who can take care of the details for both of you.

Construct your Delightfully Tiny Team: Examine team size based on leader preference, culture, and cohesion. What makes a team delightfully tiny is up to you, the leader, to decide, based on the intersection of three things: your strengths and energy, your current strategic projects, and desired outcomes for your team or business.

Delightfully Tiny Teams help you reach your personal sweet spot of efficiency and freedom as the owner, enabling you to focus on your best work.

Double how much you delegate: Even if you think you already delegate effectively, you have room for even greater efficiency and resulting peace of mind, whether on the home or work front. Conduct a 5 T's audit for tiny, tedious, time-consuming, terrible at, and time sensitive tasks you can offload next.

What

Look for person-to-project alignment as you facilitate ongoing conversations with your team. Look for ways to automate, delegate, or drop the draining work. In this section, you will:

- Make yourself replaceable with the Fiji test
- Identify, discuss, and solve for drainers
- Take responsibility for all frustration

Make yourself replaceable with the Fiji test: What would happen if any one of your team members were whisked to Fiji on a moment's notice for a three-week vacation, and told to leave all of our devices at home?

Set up systems and documentation so that a stranger to the business can step in tomorrow, in any role, and run things smoothly. Each person must work towards making themselves replaceable every day.

> Your true strengths are areas you are already skilled at and that energize you.

Identify, discuss, and solve for drainers: Your true strengths are areas you are already skilled at and that energize you. Better understanding your energizers can also help you navigate your drainers, which is work that is soul-sucking and drains your energy instead of charging you up. Conduct design-your-role conversations that identify and solve for drainers with each team member.

Take responsibility for all frustration: When the pandemic hit and all future work started being canceled, it would have been easy to wallow and feel sorry for myself. A pandemic is not any one person's fault. The best thing to do as a business owner was recenter and take full responsibility, one small step at a time. Taking responsibility and being open to feedback is the only path to sanity.

When

When you work matters as much as how you work, and how much. Most work is not urgent; Set parameters for your communication cadence, and how you will indicate when something is truly time-sensitive. In this section, you will:

- Track every task and assign one clear owner
- Answer less: every question lives three lives
- Save someone next steps

Track every task and assign one clear owner: A central task database to capture every single activity, large and small, ensures your externalized mind won't fail. You will benefit greatly by building a task management system you can trust, so you can focus without worrying that you are forgetting things.

Answer less: Disorganized documentation around common questions in your business triples the work–and the frustration–for your team and customers.

Every question lives three lives: the first time it is asked and answered, the documentation of the question and response in the Manager Manual, and the addition of that Q&A to a public-facing resource.

Save someone next steps: Ask your team to get in the habit of looking beyond the initial details of a request. Run through a quick check before marking something complete, by anticipating what the assigning person will need to do next. Take a far back view to anticipate what subtasks will follow.

The Free Time Framework can help you spot and eliminate friction step by step, pulling your attention out of the weeds and back to your highest vision. For any given project, you can realign with why work matters (sometimes phasing it out), then design a more streamlined process alongside your ideal outcomes, and finally assign it to someone on your team to shepherd its success.

By committing to smarter systems and heart-based operating principles, we expand into even more immense potential, taking extra steps now to help us soar far into the future.

Jenny Blake, author of the award-winning book Pivot and co-creator of Google's acclaimed Career Guru coaching program, is back with her signature blend of heart-based operating principles and practical tools. Jenny is an international keynote speaker helping forward-thinking organizations and individuals map what's next. She hosts two podcasts with over 1 million downloads combined: Free Time with Jenny Blake for heart-based business owners, and Pivot with Jenny Blake to help others navigate change. Jenny started her first blog, Life After College, in 2005, which was later turned into a book and published by Running Press in 2011.

Game-Changer

Game Theory and the Art of Transforming Strategic Situations

by David McAdams

THE SUMMARY IN BRIEF

Even seemingly certain defeat can be turned into victory — whether in battle, business or life — by those with the strategic vision to recognize how to "change the game" to their own advantage. The aim of David McAdams' *Game-Changer* is nothing less than to empower you with this wisdom — not just to win in every strategic situation you face but to change those games and the ecosystems in which they reside to transform your life and our lives together for the better. McAdams provides a radically new and easily learned way to outstrategize your rivals.

Game-Changer develops six basic ways to change games — commitment, regulation, cartelization, retaliation, trust and relationships — enlivened by countless colorful characters and unforgettable examples from the worlds of business, finance, sports and more. The book then digs into several real-world strategic challenges, such as how to keep prices low on the Internet. In each case, McAdams uses the game-theory approach to identify the strategic crux of the problem and then leverages that "game-awareness" to brainstorm ways to change the game or at least mitigate the underlying problem.

So get ready for a fascinating journey. With *Game-Changer,* you'll emerge a deeper strategic thinker, poised to change and win all the games you play.

IN THIS SUMMARY, YOU WILL LEARN:

- How game theory informs everything from business to politics and more.
- The benefits of using game theory to plot business tactics and gain insights.
- The five key strategies for solving the Prisoners' Dilemma and how to use them in business.

THE COMPLETE SUMMARY: **GAME CHANGER**

by David McAdams

The author: David McAdams is Professor of Business Administration at the Fuqua School of Business and Professor of Economics, Duke University. He studies microeconomic theory and game theory, with a special focus on strategic interactions between buyers and sellers, including auctions, pricing, negotiations and relationships.

Introduction

"Games" are strategic situations, and "game theory" is the art and science of strategy, but the game-theory approach to business is much more than just being smart and savvy about strategy. As Raymond Smith explained in a 1996 *Fortune* magazine article, the game-theory approach to business requires "a different kind of corporate manager: flexible, intellectually rigorous, and highly tolerant of ambiguity" and "a special kind of company that nurtures a climate of open, frank and relentlessly objective discussion so that all the variables are scrutinized honestly and without political repercussions."

At the heart of the game-theory mindset is the recognition that *the game can always be changed*. "The wise win before they fight," wrote Zhuge Liang, the great statesman, scholar and military commander of China's Three Kingdoms period. The wise win before they fight by recognizing all the games that *could* be played, steering the strategic environment in their favor, and then fighting with confidence in their ultimate victory. By contrast, the ignorant just play the game that lies before them, their victory or defeat largely out of their control, a matter of luck and fortune.

Game-awareness helps protect you from the many dangers of not knowing what games you are really playing. Once you are truly aware of the games in your life, you can take steps to change them to your strategic advantage. Mastering this art will allow you to recognize and seize strategic opportunities that others do not see, giving you a significant advantage over your peers.

Game theory helps businesses plot tactics. The most obvious games in businesses are those played at the tactical level — how to set prices, how to launch a new product and so on. Management consultants the world over use game theory when formulating tactical strategic advice on how to win such games.

Game theory provides actionable insights. We are surrounded by games whose outcomes affect us, including many over which we have little control. Game theory provides conceptual insights that allow one to understand and predict, before others, what is likely to happen in such games.

Finally and most importantly, game theory can transform the culture of an organization. Firms are not simply players in games. They are also the milieu in which many games are played: among divisions, between workers and managers, between ownership and management, among stockholders and bondholders and so on. Game theory realizes its greatest business potential when leaders of a firm create the culture and organizational structures needed for everyone to thrive together. A game-aware management team can transform everything from how employees are motivated to how buyer and supplier relationships are nurtured, and much more. When used with wisdom and humility, game theory can be a powerful and positive transformative force.

Commit

Committing others to do what you want has an obvious appeal. If you are able to change what strategies others can play and/or change their incentives, then you can gain a strategic advantage by inducing them to take actions that benefit you.

Commitments are only effective when made early enough (and visibly enough) to have an impact on what others choose to do. Thus, anyone who commits needs to "move first," in the sense of committing before others make their decisions. But what people typically mean when they speak of "moving first" is the notion of moving earlier or more quickly. But what does moving first really mean from a strategic point of view?

Influence the Timing of Moves

"The early bird gets the worm." That may be true for birds, but in business, there isn't always an advantage to being first into a new market space. Many companies that are widely believed to be pioneers were in fact late arrivals to their categories: Kodak in cameras, Procter & Gamble in diapers, Xerox in photocopiers and Apple in personal computers. These firms dominated their markets for years not because they did things *first* but because they did things *best*. Other times, being first is absolutely essential. Nowhere is this more true than in military battle, where the side that positions itself first (on more advantageous ground) often enjoys a decisive advantage.

In any battle, whether in business or war, the combatants' desire to win creates an adversarial dynamic that spills even into the question of who moves first. But not all games are like that. Sometimes everyone agrees who ought to move first.

Vacation Rental by Owner

HomeAway Inc. is the giant of the vacation rental by owner (VRBO) market, with many popular websites including HomeAway.com, VRBO.com, VacationRentals.com and BedandBreakfast.com. HomeAway.com alone offers "more than 325,000 vacation rentals to choose from." With so many properties, it is difficult to ensure the accuracy of every listing. Not surprisingly, some owners slip through the cracks with deceptive descriptions of their rental properties. There is even a term for this phenomenon: "SNAD" ("significantly not as described").

From a game-theory perspective, the fundamental problem here relates to the timing of moves: renters must pay to reserve a property *before* they can verify whether it has been described accurately. This gives unscrupulous property owners an incentive to post deceptive listings.

Fortunately, a new site called Airbnb.com has burst onto the scene with a radically different business model that solves this problem. Under Airbnb's approach, renters are not charged until 24 hours *after* their stay begins. This gives renters a chance to inspect the property and ensure that deceptive property owners aren't paid.

Everyone wins in a system like this, in which renters don't need to worry about scams or SNADs. The only potential loser is HomeAway, whose system fails to engender the same level of automatic trust and whose market is therefore potentially vulnerable to invasion by the Airbnb model. Perhaps HomeAway's CEO, Brian Sharples, should learn from what works at Airbnb and find a way to let HomeAway property owners "move first," so that vacationers can be even more confident in the quality of HomeAway rentals.

There are other situations in which the likely outcome of the game doesn't depend on the timing of moves. The most famous such game is the Prisoners' Dilemma.

The Prisoners' Dilemma

The police have arrested two criminals on charges that carry a prison term of up to five years, but strongly suspect that they also committed a worse crime (say, armed robbery) that carries a term of up to 20 years. The police interrogator puts them in separate cells and says to each, "It's time for you to confess to the armed robbery. How long you stay in prison will depend on who confesses. If you're the only one to confess, I will let you walk free today because of your cooperation. Otherwise, you'll spend five years behind bars if neither of you confesses, 10 years if both of you confess, and 20 years if you're the only one not to confess."

Each prisoner has a unilateral incentive to confess, regardless of the other's move. If the other prisoner confesses, confessing reduces your own sentence from 20 to 10 years. If the other prisoner does not confess, confessing allows you to avoid prison entirely. That is, each prisoner has a "dominant strategy" to confess. However, if both confess, both get a longer sentence (10 years, the third-best outcome) than if neither confessed (five years, the second-best outcome).

In its most general form, the Prisoners' Dilemma is defined as any game having the following two features:

- *Each player has a dominant strategy,* a move that maximizes that player's own payoff regardless of others' moves.
- *All players are worse off* when they all play their dominant strategies, compared to when each plays some other strategy.

The Prisoners' Dilemma encompasses any situation in which individual incentives conflict with the greater good, so much so that everyone is worse off when everyone pursues their own self-interest.

In this way, the Prisoners' Dilemma embodies the fundamental distinction between license and liberty and highlights the need, in some situations, to restrict our ability to make certain choices and/or to increase our personal responsibility for the consequences of our actions.

Fortunately, the Prisoners' Dilemma is an eminently *solvable* strategic problem. Indeed, game theory provides five distinct "escape routes" from the Prisoners Dilemma, each of which is broadly relevant in many other games as well:

1. Regulation
2. Cartelization
3. Retaliation
4. Trust
5. Relationships

Invite Regulation

In 1968, ecologist Garret Hardin coined the term "tragedy of the commons" to refer to any game in which individuals can freely choose how much to exploit an exhaustible resource. Each player has a dominant strategy to use as much of the resource as possible, but when everyone does so, the resource is overexploited and everyone suffers. So, the tragedy of the commons is an example of the Prisoners' Dilemma.

The idea of the tragedy of the commons, that resource exploitation is a game, has since been widely applied to understand many so-called common resource problems, such as pollution, overfishing and habitat destruction, highway traffic and spam email. Hardin famously argued that the only way to solve the tragedy of the commons is to restrict individuals' rights to use common resources. This perspective has had a profound impact, justifying major government interventions that restrict free usage rights.

Moves toward direct government control are often referred to as "greater regulation," while moves toward privatization are called "deregulation." From a game-theory perspective, however, government control and privatization are similar, as they consolidate the decentralized and often informal control that communities exercise over their common resources into the hands of a single third party, chosen by the government.

Much of the political debate between liberals and conservatives is really about which third party is likely to be a better (or less bad) steward of the commons and its fair use: a government agency or a for-profit business. In fact, there is a third option: rather than stripping communities of their right to control their own common resources, empower them to work together to use the commons in their own collective interest.

What Is "Regulation"?

The idea of regulation is to change players' payoffs, to give them the incentive to make different decisions than they otherwise would make. Every law passed by Congress, every action taken by the executive branch, and every ruling by the judiciary "regulates" the governed. Moreover, government isn't the only regulator. Administrators in schools, parents in families and trendsetters in society all "regulate" others by influencing their options and incentives. Perhaps above all, firms are at heart regulatory bodies, in the game-theory sense of incentivizing others to change their behavior, as they seek to motivate employees to work harder, entice customers to buy more and so on.

Regulation allows players to escape the Prisoners' Dilemma by changing their payoffs and thereby changing their incentives.

The Eliminating Neglected Diseases (END) Amendment

In 2007, Congress passed the END Amendment to incentivize pharmaceutical companies to develop new drugs to combat neglected diseases. Any company that develops such a drug receives a "priority review voucher" that gives its owner the right to skip to the front of the line for Food and Drug Administration review of any blockbuster drug in its portfolio. As Bill Gates noted, "If you develop a new drug for malaria, your profitable cholesterol-lowering drug could go on the market a year earlier. This priority review could be worth hundreds of millions of dollars."

The END Amendment could have a transformative effect on human welfare, if it encourages for-profit pharmaceutical firms to pursue game-changing new treatments and vaccines for neglected diseases. Several new drugs are already in the pipeline and may qualify for priority review vouchers in the near future.

Merge or "Collude"

Barbed wire reshaped the American West after its invention in the 1870s, as farmers finally had an effective way to enclose their land. The only problem for this new industry was the simplicity of the product and the ease with which firms could enter the market. Indeed, from 1873 to 1899, as many as 150 companies manufactured barbed wire. As the market matured, however, just a handful of the most

successful companies remained. These firms, whose founders were known as the Big Four, were aggressive competitors, each with an incentive to offer more attractive pricing to secure a larger share of the market.

Consider two of the leading firms, Barb Fence Co. and Southern Wire Co., as representative players. Each firm's best outcome is to be the only one offering a low price, since it can then capture the lion's share of the market, and the worst outcome is to be the only one offering a high price. Of course, if both charge the same price, both prefer a high price over a low price.

Note that each firm has a dominant strategy to price low. Why? If Southern Wire prices high, Barb Fence prefers to price low to capture the lion's share of the market (best outcome) rather than to split the market at a high price (second-best outcome). If Southern Wire instead prices low, Barb Fence again prefers to price low, though now to avoid its worst outcome in which Southern Wire gets the lion's share of the market.

Since both firms prefer to price low, regardless of the other's move, both have a dominant strategy. However, when both play that dominant strategy and price low, both are worse off than if both had set prices high. So, the Competitive Pricing Game is a Prisoners' Dilemma.

The Big Four were trapped in this state of intense competition, but not for long. In 1899, under the leadership of John Warne Gates, they merged to form the American Steel and Wire Company, instantly transforming barbed wire from one of the most competitive industries to one of the most profitable.

Cartelization allows players to escape the Prisoners' Dilemma of competition by merging into a single entity to look after their collective interest. Nowadays, all large mergers are reviewed by federal regulators and routinely blocked if these regulators fear they could hurt consumers by decreasing competition.

Collusion Isn't Always Bad

The term "collusion" brings to mind smoky backroom deals that stifle competition and harm consumers. Yet collusion can be viewed more broadly as cooperation among one set of players that just happens to harm another set of players. Indeed, collusion may even be desirable from a social welfare point of view.

Consider an industry in which firms primarily compete on research (say, to develop pharmaceutical drugs) but in which the greatest research success comes when *pairs* of firms work together. Once the first pair of firms teams up in this way, they will produce new drugs more quickly and thereby harm the other firms in the market. If left unchecked, these "colluders" could wind up driving everyone else out of business and, ultimately, harm consumers through higher prices.

Anticipating this, however, other firms are likely also to team up. In the end, the market could be transformed from one in which individual firms compete to one in which pairs of firms compete. Such an industry-wide transformation would increase the pace of discovery, making consumers better off as well.

Enable Retaliation

Jesse James and Billy the Kid, the two most infamous outlaws of all time, have each just moseyed into Dodge City, Kansas, during the heyday of the American Wild West. The town is holding its breath over what will happen next. Everyone knows that there's not enough room in one town for two such larger-than-life characters, and it's just a matter of time before there's a confrontation.

Finally it happens, in the Long Branch Saloon, when Billy and Jesse suddenly come face-to-face, only a few feet apart. In the blink of an eye, both gunslingers whip out their six-shooters and aim true. Both are so good — and so close — that any shot is sure to kill. But neither pulls the trigger. They just stand there, like statues.

Welcome, ladies and gentlemen, to the Mexican Standoff. Each outlaw in this imaginary game is driven primarily by a desire to burnish his own legend as a gunslinger and only secondarily to survive the day. In particular, each outlaw wants most to assume the mantle of "the greatest gunslinger who ever lived" and to avoid being forever relegated to second-best status. If only one outlaw survives the present contest, he will be remembered as the greatest. If both die or both survive, both will continue to be judged as coequal in their dastardly exploits.

Each outlaw has a dominant strategy to shoot. Consider Jesse James. If Billy shoots, Jesse prefers to shoot as well, to ensure that he doesn't fall to second place in the Gunslinger Hall of Fame. On the other hand, if Billy does not shoot, Jesse still prefers to shoot, though now to take first place. Of course, both are worse off when both shoot (tied and dead) than when neither shoots (tied and alive). So, the Mexican Standoff is a Prisoners' Dilemma.

Each outlaw has a dominant strategy to shoot, but neither pulls the trigger right away. Why not? Each knows that his own shot will not instantly kill and that, in fact, the other gunslinger will reflexively pull his own trigger in the moment of impact. Since shooting the other guy

is tantamount to pulling the trigger on yourself, each side refrains from starting a fight. Both sides are safe ... at least for a while.

Mutually Assured Destruction

The Mexican Standoff is an example of what's known as the Mutually Assured Destruction (MAD) Game. The crucial feature of MAD Games is that both sides can inflict devastating harm, even after suffering a devastating attack. The most famous MAD Game was played by the United States and the Soviet Union during the Cold War.

Mutually Assured Destruction Games are so-called "dynamic games." The defining feature of dynamic games is that they take place in real time, with each player capable of quickly observing and reacting to changes in the other's behavior. In the Cold War context, both the United States and the Soviet Union could observe and respond to any nuclear strike since (i) once launched, missiles are visible to radar and (ii) no preemptive attack could eliminate all missiles, especially those carried by each side's fleet of nuclear-attack submarines.

Another key feature of MAD Games is that they are "waiting games," continuing in a fixed status quo until someone finally "pulls the trigger." Not all dynamic games are like that. For instance, in the Dynamic Pricing Game considered next, each airline is capable of reversing its pricing move. This means that "mistakes" in dynamic pricing can be undone at little or no cost, whereas mistakes in MAD lead to assured mutual destruction.

Dynamic Pricing

Imagine that only two airlines (say, Delta and American) operate direct flights on some route (say, Chicago-Atlanta). Imagine further that customers interested in flying this route first check what prices the airlines are charging and then book with whichever airline is cheaper. Assume that customers only check prices once and that customers don't have any loyalty or preference between the airlines. Moreover, suppose that every traveler is willing to pay $200 for a ticket but that it only costs $100 to provide this service.

If Delta and American could form a cartel to maximize their collective profit, they would each set a price of $200 to capture every traveler's full willingness to pay for the flight. As competitors, however, Delta and American have an incentive to undercut one another on price. Yet, whether they will actually offer lower prices depends on the details of the game they play. Consider two alternative options:

- *Auction:* Each traveler requests secret price quotes from the airlines, who are not allowed to communicate with one another, and selects whichever airline has the lower price.
- *Posted Prices:* The airlines maintain public prices that travelers and the airlines can see. Each traveler views these prices and selects whichever airline has the lower price.

Consider first the auction. Assume, for simplicity of the exposition, that only prices $200 and $180 are possible. If one airline charges $200 while the other charges $180, the traveler is sure to go to the lower-priced airline, giving that airline a profit of $180 - $100 = $80. If both airlines charge $180, whether each airline makes a sale depends on the traveler's coin flip. So, each airline makes $80 half of the time and nothing the other half of the time. Each airline has a dominant strategy to price low, but when both price low, both are worse off than when both price high. So, this is a Prisoners' Dilemma.

Since the airlines offer secret price quotes in the auction, there is no way for them to use the threat of retaliation to escape this Prisoners' Dilemma. Not so with posted prices. Since travelers can check prices at any time, no airline ever wants to have the highest posted price. Should either airline lower its posted price, then, we can expect the other airline to match and to do so immediately.

Consequently, any move to lower one's own price is tantamount to lowering both airlines' prices in lockstep. With nothing to gain from undercutting the competition, both airlines will naturally sit content with a posted price set at $200, exactly *as if* they were a collusive cartel.

Build Trust

Issues of trust focus primarily on two questions:

- What can a trustworthy player achieve that an untrustworthy player cannot?
- How can trust be earned?

We live in a mostly lawful and ethical society, where people treat others honorably and well, just for the sake of doing so. But trust is never automatic. We must always decide whether to trust, knowing that there is a possibility that we might be betrayed. Fortunately, the deeper message of game theory is that trust is possible even in a completely selfish world. Furthermore, trust can powerfully transform our lives as it opens up strategic possibilities for all sorts of win-win outcomes that otherwise would be closed to us.

Trust in a Selfish World

Being a criminal isn't easy. Constantly on the lookout for law enforcement, you've also got to worry that your partners in crime may turn on you. Unlike businesspeople in the legal world, most criminals can't sign binding contracts or settle disputes in a court of law. So, cheaters really do prosper. Thus, much more so than in the legal world, trust must be earned in the criminal world.

This raises strategic challenges unique to criminal enterprise. However, the way in which criminals overcome these obstacles is instructive for us all.

Consider the strategic problem faced by criminals who would like to do a deal to trade 50 kilos of cocaine for $1 million. The buyer knows that, once he pays the money, the seller will have an incentive just to take it, walk away, and sell the drugs to someone else. Indeed, whether the buyer pays or not, the seller has a dominant strategy not to deliver the drugs. Similarly, the seller knows that once he delivers the drugs, the buyer will have an incentive just to take them and pay nothing. Whether the seller delivers the drugs or not, the buyer has a dominant strategy not to pay.

As long as both buyer and seller play their dominant strategies, however, no deal gets done, and both are worse off than if they had made the trade. So, the Coke Deal Game is a Prisoners' Dilemma.

Real-world criminals do plenty of deals, so they must have ways to overcome this incentive to cheat one another. First, criminals have internalized the lessons of cartelization and self-regulation, forming huge umbrella organizations and incentivizing good behavior among their "associates" with the threat of murder (or worse) for anyone who gets out of line. Moreover, even the most sociopathic criminal recognizes the benefits of (i) cultivating a reputation for being a trustworthy business partner and (ii) building relationships for repeat business, just as in the legal business world.

What If Only One Side Can Be Trusted?

What if only one side to a deal is trustworthy? Fortunately for criminals, it's possible to escape the Prisoners' Dilemma of illegal transactions as long as either side can be trusted, since that player can leverage its reputation to make a credible promise. For instance, a trustworthy cocaine seller can promise this to the buyer: "First, give me the money. I promise that I will then give you the drugs."

Put yourself in the shoes of the cocaine buyer, pondering this promise. If you don't give the money, you definitely don't get any drugs. If you do give the money, however, you will get the drugs as long as the seller honors his promise. And, as long as the seller's reputation is worth more to him than the value of this particular deal, you have reason to trust the seller to follow through. Of course, being a criminal yourself, you'd love to cheat the seller and get the drugs for nothing. However, by design, the seller's promise forces you to move first, so it's not possible for you to cheat.

With this example, we can understand that players can escape the Prisoners' Dilemma as long as either of them can credibly make the following promise: "First, you refuse to confess. I promise that I will then also refuse to confess."

There are two key ingredients in any promise, related to observability and credibility:

- Some player (the "last-mover") can observe and respond to the other's move.
- The last-mover can credibly commit to how it will respond.

It Pays to be Trustworthy

The fact that only one side needs to be trusted has important implications for how commercial transactions (legal and otherwise) are organized. As long as counter-parties to a trade have any doubt about each other's trustworthiness, there is a profitable niche for trusted third parties to coordinate deals. Moreover, trusted intermediaries can provide and charge for information that reduces uncertainty about the quality of a deal. For instance, Carfax reports help assure buyers that a used car for sale has never been totaled, flooded or sent back to the manufacturer as defective under state "lemon laws." Once there is less uncertainty, there is less to lie about and less need for trust to get the deal done.

Leverage Relationships

Your car has started to have some trouble, just a few weeks before you are set to drive off to a new home across the country. You take it to a local mechanic and, while explaining the situation, let slip the fact that you are about to leave town for good. Was it a mistake to tell him that you are moving? After all, the mechanic now knows that there's no prospect of repeat business or positive word of mouth from you, regardless of how good a job he does. Will he charge you more or, worse yet, not be as careful when inspecting and repairing your vehicle?

Henry Schneider, an economics Ph.D. student at Yale, came up with a clever way to find out. Schneider drove his 1992 Subaru Legacy L Wagon to 40 different repair shops in the New Haven area during the summer of 2005. He and his car were exactly the same during every

visit, with one exception: at half of the shops, Schneider claimed to be moving from Connecticut to Chicago, while at the other half, he claimed to be about to drive round-trip to Montreal. (The one-way distance to Chicago is about the same as the round-trip distance to Montreal and back.)

The "good news" is that the mechanics diagnosed about the same number of problems and recommended about the same number of unnecessary repairs, no matter whether Schneider claimed to be leaving town. The bad news is that they charged Schneider much more on average for the inspection when he claimed to be leaving town for good ($59.75) than when he said he would be returning ($37.70). Since Schneider randomly decided what to tell each mechanic and made sure to keep everything else exactly the same (even his clothing, always khakis and a polo shirt), this effect must have been caused somehow by the fact that he told them he was moving.

Mechanics, dentists and restaurants are just a few of the many types of businesses that rely on repeat customers. The prospect of repeated interaction is a powerful inducement for players to exert extra effort and cooperate in various ways.

Reputation Without Repeat Business

What if you only interact once with someone but need their trust to get a deal done? Fortunately, all the strategic benefits of repeat business can still be had if there is some way for others to verify how you have handled yourself in previous deals. For instance, online marketplaces such as eBay have introduced "reputation scores" to help address the problems of anonymity and non-repeat business over the Internet. By design, reputation scores transform anonymous eBay transactions into (at least somewhat) observable encounters that others can use when deciding with whom to do a deal. Thus, sellers know that how they treat each customer will affect not only whether that specific customer returns for repeat business but whether others will choose them as well.

How to Escape the Prisoners' Dilemma

Let's review the various ways to escape the Prisoners' Dilemma. First, are the players capable of *changing their payoffs*, either directly themselves or indirectly via the intervention of some third party? If so, obviously, they can change the payoffs so that the game is no longer a Prisoners' Dilemma.

Second, are the players capable of *merging or forming a "cartel"*? If so, again obviously, they can merge so as to look after their collective interest.

Third, does the game have *dynamic moves?* A game has dynamic moves if it occurs in real time and both players can observe and quickly react to changes in each other's moves. If so, a mutual threat to retaliate is enough to escape the Prisoners' Dilemma.

Fourth, does the game have *commitment moves?* A game has commitment moves if the players move in sequence and the last-mover can commit ahead of time to how it will respond to whatever the first-mover does. If so, a promise by the last-mover is enough to escape the Prisoners' Dilemma.

Fifth and finally, is this a *repeated game?* A game is "repeated" if the same players interact repeatedly in the context of a relationship, or, more broadly, if the outcome of the current game can be strategically linked to the outcomes of other games.

When any of these five conditions holds, there is a way out of the Prisoners' Dilemma. When none of them holds, however, there is no hope of escape. In the classic version of the Prisoners' Dilemma, all five escape routes are closed to the prisoners. Fortunately, these hopeless situations are more the exception than the rule.

Open Your Eyes!

Like anything of great value, game-awareness is not easily achieved. It's a habit that must be constantly cultivated and maintained, and reading alone won't get you where you need to be. So, when you finish reading, practice. Practice until you see the game in everything and everywhere, from the halls of Congress to the aisles of your local grocery store. Open your eyes!

RECOMMENDED READING LIST

If you liked *Game-Changer*, you'll also like:

1. ***Eat People* by Andy Kessler.** Taking risks is the name of the game — but how can you tell a smart bet from a stupid gamble? Kessler explains how the world's greatest entrepreneurs overturn entire industries.

2. ***Making Strategy Work* by Lawrence Hrebiniak.** Hrebiniak offers a comprehensive, disciplined process model for making strategy work in the real world.

3. ***12: The Elements of Great Managing* by Rodd Wagner, James K. Harter.** Using recent discoveries in the fields of neuroscience, game theory, psychology, sociology, and economics, 12 explains what every company needs to know about creating and sustaining employee engagement.

THE SUMMARY IN BRIEF

The dilemma we face when we fail in a negotiation is that we have to figure out what to do in the aftermath. How do we understand what happened? How much of the failure was due to our actions, and how do we cope with that? ***Getting Back to the Table: 5 Steps to Reviving Stalled Negotiations*** provides a five-step framework for turning failures into opportunities. Readers will learn to accept setbacks, analyze what went wrong, extract valuable lessons, unlearn unproductive habits, and return to the table smarter and more confident.

Negotiation is a multifaceted mix of the participants' actions and reactions, dealing with incomplete information, and numerous additional dynamics, some of which are in our control and some of which are not. So, we will fail. The key question is, how do we become resilient in the face of these failures and use them as an opportunity to grow and get better at this craft?

IN THIS EXECUTIVE BOOK SUMMARY:

- Understand seven types of negotiation failures and their causes, from minor missteps to significant breakdowns.
- Learn the four levels of failure severity to assess whether to persist or walk away.
- Identify and overcome obstacles like blame, bias, and loss aversion to grow from failure.
- Follow five steps to accept failure, analyze it, learn, unlearn, and return stronger.

Negotiation Failures and Their Magnitude

Generally speaking, when it comes to failure in negotiation most people want to know two things: what are the different ways I can fail, and how bad is it going to be?

Before we get to those two core questions, let's briefly define what we mean by failure in this context. For the purposes of this book, failure is defined as not meeting the objective or goal delineated at the outset of the negotiation process.

Seven Primary Types of Negotiation Failure

1. Take a Crack at It Failure

When the negotiation challenge is very difficult, but you try anyway and expect to fail in the short term. This type of failure is the least problematic; it occurs when we know that failure is actually more likely than success in the short term, but there's a strong opportunity to learn from the experience.

2. Slipping Through Our Fingers Failure

Not reaching an agreement when it is eminently possible. In other words, we did not reach an agreement that was achievable and would have met the parties' respective interests and needs when it was very possible to do so.

3. What Were You Thinking Failure

Not meeting one's negotiation objectives/interests. The goal of negotiation is not necessarily just to reach an agreement, but rather for negotiators to meet their objectives and interests as best as possible. Many agreements that are reached fail to meet a negotiator's objectives and, therefore, should be considered failures. In these cases it's fair to ask, "What you were thinking by agreeing to that?"

4. Penny-Wise and Pound-Foolish Failure

Reaching an agreement that damages the relationship. Some agreements are created in such a manner that they achieve the tangible objective—say, agreeing on a monetary amount—but in doing so they damage the relationship between the parties. The reason this type of failure is called Penny-Wise and Pound-Foolish is because a negotiator who is penny-wise tries to save a small amount in the short term at the expense of the long term.

5. Bad Agreement Failure

Reaching a bad agreement that is worse than your BATNA (aka Best Alternative to a Negotiated Agreement or walk away alternative). Many agreements that are reached are, simply put, bad, and should never have been consummated. Often negotiators reach these types of agreements because they have not done careful preparation, or they feel pressured. Whatever the cause, it is not uncommon for such agreements to fall apart shortly after the ink is dry.

6. Emotionally Unintelligent Failure

When emotions are not managed effectively, and the process collapses as a result. Emotions are an age-old challenge for any negotiator. Emotions will always play a role in negotiation, and they can do so in a productive manner if they are brought into the process with some control. But if emotions are not managed effectively, they usually overwhelm negotiators, often leading to an escalation in tension and ultimately a collapse of the process.

7. Under the Table Failure

When the parties fail to notice a hidden dynamic or intangible aspect driving the negotiation. In many negotiations, there are often various hidden dynamics and intangible aspects that hinge on a lack of information. These variables, which I like to say live under the negotiation table and out of initial sight, can often be the cause of failure.

Much of the time this happens because negotiators don't know to look for them, or miss clues that these "under the surface" elements are what are really driving the negotiation. So, they focus their efforts elsewhere and miss dealing with the essence of the challenge.

Magnitudes of Failure

When we negotiate there are bumps in the road. But are those bumps mere potholes that we can fill in and get through with some persistence, or are they more severe, where the entire road needs ripping up and repaving? There is clearly a big difference, which corresponds to the magnitude of the failure we are experiencing in our negotiation. This is something that must be determined as part of the analysis of failure.

To help us understand the nature and seriousness of the failure we are experiencing, there is a four-level magnitude scale that can help us determine whether it is worth our time and effort to try to revive a specific negotiation or come back to the table and attempt a new negotiation after some time has passed.

Level I: Intelligent Failure

This first level borrows the concept of intelligent failure

The answer is that experience can be the best teacher of all, but that requires a deep and honest analysis about what transpired in a particular negotiation.

from Sim Sitkin, who coined the term in his paper "Learning Through Failure: The Strategy of Small Losses." Sitkin defined intelligent failures as failures that are somewhat expected, due to the uncertainty of the process and the desire to push the envelope and see what happens, engaging in purposeful exploration that advances an idea or concept.

Level II: Temporary Setback

A failure at this level is the least significant type of negative failure. It manifests itself in the form of a temporary setback or the breakdown of a process, but definitely not a collapse. With this type of failure there is usually a relatively clear path back to the table; the deal still generally makes sense for the parties involved, and it is likely that they will reengage at some point in the near future.

Level III: Breakdown

Level III is a more severe form of failure, where there is a lot of uncertainty about what will happen going forward. This is characterized by a significant breakdown in the negotiation process, with the failure leading to the strong possibility that the process will not continue. It is possible for the talks to resume, but it will take a lot of work.

Level IV: Catastrophic Failure

These are the most severe type and are catastrophic scenarios where the process entirely collapses, the relationship between the parties is severely (and likely irreparably) damaged, and another effort to negotiate is highly unlikely unless something dramatic happens. This kind of failure is typically the hardest to come to grips with, because it means an almost certain end to any kind of negotiation process.

What Gets in the Way of Learning from Negotiation Failure

If we accept that failure is a reality we have to face, then the next question is, when we fail, why aren't we truly learning from those failures? Awareness is the key that opens our eyes and then our minds.

Blame

The most dominant reason we don't learn from failure is because we are too busy engaging in the blame game and rationalizing our behavior.

Biases and Heuristics

Another reason we do not learn from failure is the various psychological biases that we (often subconsciously) rely on to protect our image and reputation.

Experience and Self-Reflection

The next reason we don't really learn from our negotiation failures is because we think experience itself is a great teacher. But is it? The answer is that experience can be the best teacher of all, but that requires a deep and honest analysis about what transpired in a particular negotiation.

Loss Aversion

Another reason we don't learn from our failures is that we are naturally loss-averse. When we are loss-averse, we often bring to a situation a mindset that can prevent us from making the best decisions because we are desperately trying to avoid failure or risk—the fear of loss is simply too intense.

Lack of a Framework

The last reason we don't learn from failure to highlight is that we don't have a good framework for doing so that is not focused on blame, but rather on genuine learning.

You Failed, Now What?

The first step in the process is accepting the reality that the negotiation did not go as planned and dealing with the loss of failing. Any time we fail, it means we did not achieve our intended goal or outcome. With that new truth comes a need to cope with the loss and what it means going forward

The second step in the process is an in-depth analysis, focusing on both the Forest (the big picture) and the Trees (the minute details), to set ourselves up to truly learn from what happened and why.

The third element of the framework is learning the right lessons from a failed negotiation and how to recognize what might (and might not) be transferable to other negotiations in the future, based on the dynamics and other key dimensions.

The fourth step is to actively unlearn the behaviors and ideas that led us to our failure. The last step is to return to the table smarter and stronger, with a renewed sense of confidence because we know that we have improved on our weaknesses.

Step 1: You Failed - Accept It

When we experience a significant setback or fail in a negotiation, there is a process we need to undergo to deal with what transpired effectively. We must deal with our feelings of loss, be they related to our reputation, a missed opportunity, or, in more extreme cases, something much more onerous.

Step 2: Analyze the Forest and Trees - What Went Wrong

To genuinely understand why a failure has occurred, we must take the time to accurately analyze what happened. This analysis must happen at two levels, which we can call the Forest and the Trees. The Forest is the big picture: a high-level view of the problem that allows us to gain some broad insights. The Trees are the minute details, and they help us understand what is important to take away and to potentially apply elsewhere.

It is essential to go through this analytical process, or we cannot really learn what happened. It's also vital to conduct this step shortly after the negotiation concludes, so critical details can be recalled readily and most accurately. As time passes, our cognitive ability to distort what has transpired increases significantly.

Forest Questions

Beginning generally, we want to step back, consider the categories of failure laid out previously, and determine which one our negotiation failure falls into and why. Take some time to carefully determine the primary issue that derailed the process, and make sure you're not just looking in the comfortable places in the light.

Next, think about the magnitude of the failure. Was this just a temporary setback (a Level II failure), and can you think of ways of addressing the challenge and getting back to the table?

Or was it a bit more severe (a Level III failure), with people's reputations being tarnished and you being left quite unsure of how to restart the process? Or, even worse, was it a negotiation earthquake (Level IV) that did irreparable damage and where restarting the process is unequivocally not going to happen?

Tree Questions

After broadly assessing what went wrong, you need to get really granular in your analysis. There are two generally related negotiation concepts that are useful to consider here: critical moments and moves and turns.

There are a number of types of moves and turns in a negotiation that are made as part of a proposal or used to respond to a statement the other negotiator makes. These moves and turns include framing, reframing, diverting, interrupting, and naming.

Framing moves are very subtle and seek to take control of the negotiation by taking the first action and shaping the conversation.

A reframing move takes issue with a framing move or an assertion made by the other negotiator and presents a different way of seeing the problem or challenge.

A diverting move seeks to redirect and, to some extent, depersonalize the conversation by focusing on the substance of the problem.

The next kind of move that's commonly found in negotiations is an interrupting one. A short break, or reconvening the next day, can change the dynamic and flow of an unproductive process and help to reset the negotiation.

Finally, there is the move of naming, which is outwardly labeling a tactic or overall approach being used in a negotiation. This move points out to the other negotiator that you are aware of what is going on and what they are trying to do.

Step 3: Not Just Any Lessons - Learn the Right Ones

The previous learning step—conducting a big-picture and granular analysis—was designed with a very specific goal in mind. Applying the lessons we've learned, and making sure they're the correct ones, is tricky business. Each negotiation has its unique dimensions, and no two negotiations are ever exactly the same.

However, many negotiations do share a number of similarities, and there are lessons that can be drawn from one and applied to another if this is done thoughtfully and with great care.

Active unlearning means that we consciously recognize a problem with an idea or behavior and purposefully seek to change it.

The transferring of lessons learned happens at two levels. The first level is behaviors, in the form of tactics and skills. These are the easiest to correct and work with. The second level is attitudes, in the form of a negotiator's mindset and underlying beliefs.

These are influenced by what we have learned and internalized in the past, as well as the experiences that have defined our negotiations to this point in our lives.

When comparing two negotiations, ask yourself:

- Did they involve the same number of parties?
- Was one negotiation focused on a single issue, whereas in the other there were multiple topics to work through?
- Was one negotiation focused only on the short term, where the relationship did not matter (i.e., a one-time encounter), while the other had both a short- and a long-term dimension?
- Are there subtle similarities between the current negotiation and a previous one that did not go well that might be causing negative transference?
- Were the negotiation styles used by the parties involved the same or different?
- Were the dynamics in the negotiations the same or different?

The bottom line when it comes to learning and transferring the right lessons is comparability and understanding when our approach to negotiation and underlying mindset might be leading us awry.

Step 4: Actively Unlearn What Your Weaknesses Taught You

If we are going to learn from our mistakes and improve on our weaknesses, we need to look not only outward but also inward. It is certainly possible to unlearn something by accident or in a haphazard manner. However, active unlearning means that we consciously recognize a problem with an idea or behavior and purposefully seek to change it. Some of your weaknesses might be conscious and others subconscious. With the latter, we often have to really dig deep to uncover them.

After listing our weaknesses, we must ask ourselves why those weaknesses exist. How did we develop them, and what will we need to do to change those attitudes and behaviors?

That exploration will naturally lead us to a question that is critically important at this juncture: How can we actively unlearn the behaviors that have led us astray and change our mindset to something more productive?

To unlearn, we must begin by becoming aware of how our behavior is problematic, then question and challenge the assumptions we make, biases we hold, and underlying attitudes we possess that contribute to our thought processes and mindset.

Compromise is something negotiators need to unlearn, replacing it with problem solving and creative thinking. By focusing our attention on problem solving we make certain that we are addressing the heart of the issue, exploring our own and the other party's interests, and engaging in an inventive process to meet those interests in the best way possible. That formula has proven to be far more effective than reverting to less-than-optimal compromise arrangements.

Step 5: Return to the Table Smarter and Stronger

Confidence is an elusive concept in general, and an equally evasive one when it comes to the realm of negotiation. In negotiations, we possess confidence when we feel that we have a good command of the situation and what is being discussed. When the negotiation drifts into an area where we lack knowledge, are uncomfortable with the subject matter (or the other negotiator), or are otherwise mired in uncertainty, we begin to feel less confident, and self-doubt creeps in.

There are core elements that will help us return to the table confidently:

- Self-awareness in managing the emotional aspects involved

- Increased knowledge of negotiation in general and the specific process we are about to re-engage in
- A new way to think about uncertainty, and the mindset and skills to adapt to new information that comes our way.

Looking Back to Look Ahead

The process of getting back to the table begins with thinking through the different categories of failure and understanding the magnitude of the setback you have experienced.

Then, you can grapple with the obstacles that might get in the way of learning from it and make sure they don't influence your perspective in a manner that leads you astray. It is at that point that you will put the 5 steps into practice. In the first step, you have to genuinely accept that you experienced a significant setback or failure.

The second step is conducting a thorough big-picture (Forest) and micro (Trees) analysis to help you really understand what went wrong.

This third step requires a careful comparison, to help you avoid the classic mistake of transferring the wrong lessons from one negotiation to the next.

The fourth step is recognizing that your own weaknesses likely contributed to your failure.

This unlearning sets up the last step in the process: coming back to the table smarter and stronger. To do that, you need confidence; you need to learn to exist more comfortably in uncertainty and develop your ability to adapt to new information that comes your way.

Becoming a great negotiator is a journey, not a destination. Along that journey, as with most adventures, you will inevitably encounter many trials and tribulations, unexpected occurrences, and moments of joy, inspiration, and disappointment. However, in the end, if you embrace the ride, it will be one of the most rewarding endeavors of your lifetime.

Joshua N. Weiss is co-founder of the Global Negotiation Initiative at Harvard, where he also teaches. He is a Senior Fellow of the Harvard Negotiation Project and a senior trainer with William Ury Associates, and he heads his own consultancy, Negotiation Works. He is also on faculty at Bay Path University and has held adjunct faculty positions at ten different universities, including MIT, Harvard, UMass, UC Denver, and American University of Beirut. He is listed as one of the Top 30 Global Gurus for negotiation, and he serves on the United Nations Mediation Team.

THE SUMMARY IN BRIEF

Building or scaling a business in today's rapidly evolving landscape takes more than just capital. It demands the right strategies and a generous doze of resilience.

The book ***Getting to Resilient Mode: Finding the Path to Success Even When the Odds Are Stacked Against You*** unpacks powerful insights and actionable steps to help entrepreneurs succeed in a world of business that comes with countless challenges every step of the way.

By recounting insightful personal anecdotes, author Tariq Chauhan tells us what truly goes into creating a sustainable and successful business. By navigating the pages of this book, we acquire the mental toolkit to build high-performing teams, untangle complex business challenges, and take our leadership skills to the next level.

IN THIS SUMMARY, YOU WILL LEARN:

- What goes into building a sustainable and successful business.
- How to incorporate a people-first approach in your organization.
- How to prepare for creating quantum leaps in business.
- How to stay resilient regardless of the challenges ahead.

Introduction

This book is a true reflection of my introspection about the errors I made in life and the learnings therein. It brings in discourses and influences of some extraordinary people who touched my life. Here, I concentrate on the lessons learned from my mistakes. I have tried my best in this book to connect to all those I view as my target readers, who can apply my learning to their own insights when experiencing hardships. I am sure these readers will find opportunities to resonate with my experiences, as well as use these perspectives to manage their challenges and triumphs.

Part 1: Leadership

Chapter 1: Personal Lifestyle and Behavioral Attributes

Discipline and positivity have been the two most significant attributes that have guided me throughout my life journey. These important behaviors have helped me navigate through the most challenging of times. Working always with these attributes in the forefront of my mind, I was able to maintain a mindful state that would allow me to rise above all adversity.

Chapter 2: Demonstrating Ethical Leadership Is a Necessity

Having lived in the midst of a society with hypocritical and complex conventions, I have found it necessary to always keep my core values at the forefront. It's essential to ensure that all actions we take as leaders can be seen as aligned with the set of ethical values that we profess to follow. In pursuit of our goals and ambitions, we as leaders must remain mindful of our ethical values and commitments and let them reflect in our work and decisions. Deviating from these can be disastrous for morale, as this will create a trust deficit with your stakeholders.

Chapter 3: Altruism Must Not Just Be Professed but Practiced

I was aware that to achieve the true impact of my altruistic beliefs throughout my career, I had to go the extra mile by building a bond of trust with my employees where they could see me "walking my talk." In this context, I ensured my actions were well communicated, understood by all stakeholders, and informed of the benefits of those actions that would transform their lives. I was very emphatic in driving my ideology that employees' personal and professional good will eventually increase the organization's larger good.

Chapter 4: Diversity and Inclusion Are Business Sustainability Needs

The wisdom gained from research demands that organizations ensure diversity by including different interest groups, religions, casts, and social classes to build a robust and tolerant culture. diversity and inclusion have evolved as a necessity to create an environment where equality begins to flourish, and biases are removed. Leaders must work tirelessly to create this just and fair environment in their organizations.

Chapter 5: Transforming Mistakes into Success

The most significant gift I achieved from the low points of my life was my resilient mode, where I did not dwell on my failures but applied deep introspection from the lessons learned. This is an achievable goal for any leader who aspires to excel. I have always worked to correct my path, using my learning to rise above my previous mistakes. This is the most important lesson of resilience, one that every leader must learn.

Chapter 6: Truth and Fairness Must Prevail

A leader's biggest asset is the trust that they have gained with the people who work in the organization. It is critical that people see the leader as fair and transparent in his or her actions and decisions. The leader must enable trust and effectively communicate the reasons for his or her decisions at all times. Justice and fairness are what differentiate an ethical leader from an opportunistic leader.

Chapter 7: Leaders and Managers Must Ensure Communication That Touches the Heart

Leaders must make an effort to touch people's hearts. This can only happen if they build a deep commitment and conviction that is driven by their own hearts. Their intentions should demonstrate sincerity and selflessness, ensuring a purity of purpose that will create trust. The purpose should not have a self-driven agenda, and the communication therein must convey the spirit of the purpose that offers compassion and holistic good for all.

Part 2: The People-First Approach

Chapter 8: Blue-Collar Workers, the Real Unsung Heroes – Their Engagement and Inclusion

Being the CEO of a company with an eighteen-thousand-strong facilities management workforce, with two-

thirds of it being a blue-collar workforce, my work to ensure the success of our employee engagement process has been intense and rewarding. However, it is a complex task to manage the expectations of these employees and to gain their trust.

In the beginning, I could see that the state of blue-collar workers had its issues and needed a fresh review. I was surprised to see that these employees were never addressed by their real names but were called workers, laborers, blue collar, or trades. However, in reality, these people require respect like any other employee, because each has their own worth and intrinsic value. What seemed to matter most were only their productivity parameters, basic needs, salaries, and facilities but not their holistic needs. I realized this fundamental disconnect had to change.

To correct this long-term anomaly, it's important for company stakeholders to first understand the general mindsets of blue-collar workers and their world outlook. These people have difficulties to confront, as well as a trust deficit with the social system itself. Some have deeply embedded grievances derived from lifelong hardships. Business leaders have to make conscious efforts to push for reforming their organizations to address these issues.

Chapter 9: In Pursuit of Building a Value-Based Organization through Team Chemistry

To build a sustainable enterprise, businesses must look beyond performance, annual budgets, financial performance, and bonus or dividend payouts and instead must look at all stakeholders' perspectives as well. During team engagements, it is critical to engage the team to first buy into the leadership through the virtue of respect, as well as respect for their own tangible contribution to the purpose at hand.

Chapter 10: A Business Case Made for Happiness at the Workplace

If we implement happiness and Wellness initiatives into our corporate culture, our businesses' productivity and job satisfaction will see a significant increase. This will then directly impact the economy's growth and corporate profitability.

Money remains a prominent driver in the happiness of employees, be it salary, annual increments, or bonuses; Employees respond to this more positively. For instance, adjusting living index parity in annual wage reviews is a must for companies to build employees' trust and promote fairness.

Chapter 11: Building the Business Case for Progression

While most business leaders understand the benefits of progression, only a few organizations accord the needed attention to ensuring it. Progression helps build service excellence and staff motivation and brings the organization financial benefits. It creates an environment of learning and development that prompts people to work to move up in the organization, resulting in financial restitution and a feeling of recognition, plus rewards that spike higher motivation levels.

Chapter 12: Motivating a Diverse Workforce

Most people in organizations often get lost in salary and compensation issues when looking at the motivational needs of their core workforce. They seldom look at other critical drivers of workers' engagement. For example, you might pay well, but all other efforts are in vain if you don't pay people on time. In addition, companies must not use corporate social responsibility as a checklist to tick off; Instead, they must seek to build a culture that encompasses its real impact on all stakeholders.

Part 3: Business

Chapter 13: A Values-Based Organization Is a Fundamental Must

In the course of business and especially in context organizational realignments, the organizations' stakeholders, culture, processes, policies, and procedures must embrace and embed values. Values, be it honesty, integrity, mutual respect, courtesy, discipline, transparency, compliance, or governance areas, are not singularly driven beliefs but a force to be reckoned with, one that is to be backed by a collective resolve across all facets of the organization.

Chapter 14: The Company's Strategy and Vision Needs Mainstream Engagement

Every business, whether it is a small entity or a large public enterprise, needs a vision and mission statement. Visionary leadership is a critical business need, much more so than a leader's grandstanding. There are three significant factors to operate by: Who do we do business with? What do we do for them? What do we achieve with the value proposition?

Chapter 15: Businesses Need to Adopt Structure, System, and People Alignment

People, systems, and structures need to be incorporated to

build a resilient business. It's important to ensure that all stakeholders, employees, shareholders, clients, and suppliers' expectations are aligned with the people responsible for the execution. For example, clients need good service delivery; shareholders want a higher and stable return; employees need greater motivation in terms of salary, perks, and work environment; and suppliers wish to achieve the scalability of increasing business.

My business strategy has always been to ensure risk diversity, and therefore no single contract, country, or business vertical would exceed the acceptable risk diversity standards. These considerations must apply across all business aspects, from receivables to suppliers to employees' ethnic mix.

Chapter 16: Business Scaling Needs Specific Checks and Balances

Business scalability demands that enterprises undertake adequate scrutiny of their preparedness to manage the upside. Business science has taught us about enterprise risk agility. Entrepreneurs need to master their foresight by incorporating multiple checks and balances when deciding whether to take any quantum leaps, as ambitious projects must not interfere with smoothly running a business.

Chapter 17: Planning and Building a Sustainable Business

In any business pursuit, especially in the context of amateurs, the drive to accomplish business goals must not be based on gut feeling and emotions. Money is not the only prerequisite for starting a business however big or small it may be. To start a business, one has to have an idea or concept, the resolve to follow it through, the road map, and the resources, both financial and otherwise. Questions about mental preparedness, the ability to take risks, overcoming the fear of failure, patience to deal with unforeseen developments, and, above all, belief in one's self should be addressed. Creating a solid business plan demands a feasibility study to ascertain its commercial viability. Finally, a financial plan is something that can make or break your business. Follow the golden rule: be conservative with revenue assumptions and generous with expense estimates.

Chapter 18: Quantum Leaps in Business Growth Need Preparedness, Not Just Prospects

Dreams, grand plans, and ideas do not make success a reality but rather provide a micro review of the company's SWOT (strengths, weaknesses, opportunities, and threats) analysis. First and foremost, a company must have the ability to cope with the impending needs of its growth. During this buoyant phase, the stakeholders must map the scalability needs. To manage any quantum growth well in advance, it is critical to build appropriate technology capability.

Chapter 19: Business Growth and Scalability

Growth and business scalability are important elements of business sustainability. Over the years, in businesses I built, scalability was always integral to my vision. When I joined EFS, I wanted to build a USD 1 billion company. For this journey, I built and executed my business plans in short-, medium-, and long-term segments. Initially, in the first year, I concentrated on stability and then moved on to transformation within three years to prepare for my quantum leaps. At EFS, from 2010 to 2022, I added more than USD 2 billion worth of contracts from iconic projects in the region.

Chapter 20: A Concept of Corporate Governance Emboldens Self-Discipline and Disclosures

For companies of all shapes and sizes, the basic principles of corporate governance are accountability, transparency, fairness, and responsibility, so it matters to all. Corporate governance is about transparency and the discipline that every organization must maintain with its stakeholders. It is not about shareholders alone but about all employees, clients, bankers, auditors, regulators, and suppliers. Good corporate governance protocols and frameworks ensure outstanding organizational sustainability.

Chapter 21: The Role of The Board of Directors, Auditors, and Internal Controls

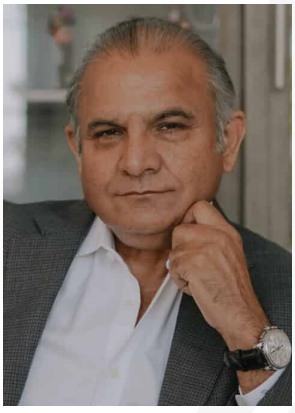
When analyzing the root cause of any corporate debacle, it's not fair to focus on the management's actions alone but also to make a holistic review of the firm's "governance ecology," as no outcome can be contemplated without first understanding the structural reasons for the failure. When undertaking a diagnostic review of financial statements, understand the application of the governance policy on the treatment of doubtful or bad debts, compliance with principles of revenue recognition, and potential impairment of receivables.

Chapter 22: Technology and Innovation

Companies must exercise caution when undertaking ambitious technology projects. They must also stay protected from any technology-driven obsolescence. An effective obsolescence management process must be put in place as an integral part of the organization's software and systems

lifecycle management. This entails the upkeep of inventory, databases of the components in use, and how they should be managed through their lifecycle.

The advent of new technologies empowers the day-to-day life of a facility manager. These are revolutionizing operations both in terms of process optimization through the telephony platform and CAFM optimization supported by tool and machine automation.



Chapter 23: Learning and Development

Besides building HR development systems on performance management for assessment, companies must also invest in dedicated L&D organizations, with in-house faculty who are competent enough to develop and run relevant curriculums. Such setups will also need education management systems that can successfully administer these programs.

The training must not be deployed as a hopeful motivational boost. Its assessment must be based on the review of an individual's SWOT analysis and the company's desired goals that will be impacted by that employee. The new learning approach must empower individuals and teams to transform their personal and professional goals and not just exist as a ruse to escape the workplace! Employees need to be engaged in upskilling as the next step towards their professional development and not just as a means to ensure job security.

Conclusion: Ready to Build Resilience?

This book is a pure, organic version of my real-life journey. The events and experiences I've recounted here have significantly shaped my thought processes and helped me articulate my management style, shaping my transformation and the successes many people believe I have achieved. It is my sincerest wish that the experiences I have offered to my readers will make a difference in their lives and the lives of their employees.

Tariq Chauhan is an investor, philanthropist, and entrepreneur based in the UAE. As the co-founder & group CEO of EFS Facilities Services Group in Dubai, he has established himself as a prominent figure in the industry. A Harvard alumnus, he was recently named one of the most powerful businessmen in the UAE by Forbes in 2021. Additionally, Tariq holds key roles on the boards of UAE- India Business Council (UIBC) – UAE Chapter and Emerge Workforce Development Edtech Advisory.

THE SUMMARY IN BRIEF

Nearly half of 1:1s are rated as suboptimal by team members. Compounding the problem, leaders' self-ratings of their skills in conducting 1:1s appear to be inflated, suggesting that leaders think they are doing a better job at leading 1:1s than they actually are. The book, ***Glad We Met: The Art and Science of 1:1 Meetings*** deeply explores the "whats," "hows," and "whys" of 1:1s by highlighting challenges, pain points, opportunities, and areas for customization.

There is an incredible opportunity to fill this gap in leadership skills and to maximize the return of investment for this critical workplace activity. The problem is that despite 1:1s filling leaders' calendars, meaningful guidance on how to conduct 1:1s is quite sparse. Managers are left to rely on what feels right to them, repeating practices they have experienced by their current and former managers, and guesswork. The purpose of this book is to fill that gap, and to provide guidance on how to balance the scales between structure and flexibility, addressing short and long term topics, solving problems and building relationships.

IN THIS EXECUTIVE BOOK SUMMARY:

- The importance of 1:1 meetings between managers and direct reports
- Ways to conduct effective 1:1 meetings via planning, frequency, agendas, and listening.
- The benefits of 1:1 meetings that can lead to improved employee performance and development
- Additional tips about skip-level meetings and how to deal with meeting overload

Section 1: Do I Really Need to Do 1:1s?

Yes, you need to have 1:1s with your directs.

1:1s are a regular and recurring time for you, as a manager, to meet with your directs to discuss a variety of topics. 1:1s go beyond regular team meetings, having an open-door policy, or informal interactions. Instead, 1:1s are an intentional, dedicated time for you to support your directs.

1:1s are leadership in action.1:1s are not an add-on to a manager's job, they ARE a manager's job. These meetings help ensure that your directs are in the best position to succeed and that you create a healthy working relationship with each member of your team.

1:1s are not performance appraisals. Performance appraisals are important, but they are not synonymous with 1:1s. Instead, 1:1s should be used to inform the performance appraisal process.

1:1s relate to various positive outcomes. Some of these outcomes include improved engagement levels, team member and manager success, diversity and inclusion, relationship development, direct report growth and development, and life satisfaction.

Won't Team Members Be Fearful of 1:1s?

Communication is key for starting 1:1s with your team. To do so effectively, set up a meeting with your entire team. Give them a rundown of what 1:1s are and why you will be having them.

Make it clear that all directs will be having 1:1s, tie the meetings to broader organizational and personal values, and stress that these meetings are not about micromanaging or control. Emphasize your desire to give your directs face time to address what is on their minds on a regular and consistent basis.

Encourage directs to ask questions. Ideally, answer these questions in a team meeting so that everyone receives the same answers, limiting the need for you to repeat yourself.

Can't I Just Meet When I Have Something I Need to Say?

Establish a 1:1 plan for your team. This ensures that you are actually having 1:1s with all team members and will help mitigate biases that could result in unconsciously favoring certain directs.

Find the right cadence. Avoid having an ad hoc (as-needed) approach to the cadence of your 1:1s. Research supports weekly 1:1s as the best option in most cases.

Assess what's reasonable. To help navigate which plan is the best fit for you and your team, consider what is possible and reasonable. Things to consider include: whether you have remote team members; the preferences, experiences, and tenure of your directs; your tenure with the team; and the size of your team.

Get feedback and adapt. Recognize that when a direct indicates a lack of interest in 1:1s or seems interested in reducing their number, this could be a sign that 1:1s are not being conducted effectively.

How Should I Schedule 1:1s—Same Day, Clustered, or Spread Out?

Find a scheduling approach that works for you. While research suggests that clustering meetings tends to be most optimal to promote uninterrupted time, limit task-switching, and achieve greater flow, managers differ in whether they desire this approach.

Pick the schedule that aligns with your needs and preferences while also giving your directs some agency in this decision.

Understand that how meetings are scheduled can affect you and your directs, and plan accordingly. Build in microbreaks so you can digest information from the previous meeting and prepare for the next.

Schedule 1:1s during natural transition times to limit task-switching and cognitive demands. Last, if you want to have all of your 1:1s on the same day, that is fine. But be cognizant of your meeting load and how that may affect you and your 1:1s.

Very rarely cancel 1:1s. Doing so may be experienced by your direct that they are not a priority to you.

Shall We Take a Walk?

Space matters. Where you meet can affect how productive 1:1s are. Ensure that wherever you decide to have your 1:1s, the space is conducive to having an effective meeting.

Location options exist. There are both traditional and nontraditional location choices for 1:1s. Based on the research, traditional choices, like a manager's office or a private conference room, are great options. However, nontraditional locations exist too. Just be mindful of the pros and cons of each location. Virtual 1:1s are another great option that most employees are very open to.

”How are you?” is not enough. Asking a question like this is not thought-provoking or helpful in eliciting meaningful conversations.

Find what works, but also switch things up at times. Discuss with your direct reports what works for you both and consider switching the location up from time to time to prevent 1:1s from becoming stale.

Is a Good “How Are You” Enough?

“How are you?” is not enough. Asking a question like this is not thought-provoking or helpful in eliciting meaningful conversations.

There are so many good questions to consider. Ask more nuanced questions to create high-quality dialogue in your 1:1s.

Sample thoughtfully from these six categories:

1. Relationship-Building
2. Engagement
3. Check-In
4. Productivity/Challenge
5. Giving/Receiving Feedback
6. Development, Growth, and Career.

It may be overwhelming to decide what questions to use in your 1:1s, given how many options are available. This will take some prep work for you, but will boost the effectiveness of your 1:1 conversations and demonstrate your care, thoughtfulness, and support to your directs.

Switch up the questions you ask. Avoid asking questions from just one category. Also, make sure to switch up the specific questions you ask over time.

Do These Meetings Need an Agenda?

Agendas support effectiveness. Whether or not to have an agenda in 1:1s is a divisive question, but the data support their use. While setting up agendas will take some time, they can improve the effectiveness and value of 1:1s.

Directs must contribute to the agenda. Agendas support 1:1 effectiveness and value, but only if the direct contributes to them.

Two models of agenda creation are most recommended by managers. The listing approach has both you and your direct write down a list of topics to discuss. These items are then compared, and a final agenda is created. The core question approach starts with a list of questions managers bring to their directs, which are broad enough to let the direct take control of the meeting content.

Avoid the status update trap. You fall into this trap when 1:1s are focused on highly tactical, short-term topics—essentially asking your direct for a status update each meeting. You can avoid this trap by dedicating part of every 1:1 or all of some 1:1s to future-oriented topics, or by integrating these topics into the meeting agenda via a template.

Track metrics sometimes. Metrics can provide both you and your direct insight into how your direct is performing. However, you don’t want to track these in every 1:1 because it can take away from their purpose and feel like micromanaging.

Section 2: Carrying out 1:1s

Is There a General Model for Conducting 1:1s?

Separate practical versus personal needs. Practical needs are tactical, focusing on how directs can successfully accomplish their work and advance their career. Personal needs are relational, focusing on how directs feel coming out of 1:1s Both are needed for effective 1:1s. The key is to balance them within your meetings.

Use an integrated model. While there isn’t a secret formula for conducting effective 1:1s, there is a general model you can use. Four stages embody this model: pre-start, start, the heart, and the end. The structure of the model helps address directs’ practical needs.

Throughout each step, managers must also enact the five key relational behaviors to meet directs’ personal needs. When combined, this integrated model can support your 1:1 effectiveness.

Note-taking is helpful. Taking notes during 1:1s creates accountability and documentation to increase the effec-

tiveness of your 1:1s, helps you better organize what is discussed in 1:1s, and increases the chances you don't miss anything. Notes can also allow you to follow up on action items or cover topics not discussed.

Ask for feedback. While this is an optional process step, asking for feedback from your directs periodically can further enhance 1:1 value.

What Do I Do to Meet the Personal Needs of Others?

Satisfying personal needs is critical. While 1:1s are meant to address directs' practical needs, they must also be conducted in a way that meets directs' personal needs.

Five Key Behaviors Are Needed to Meet Personal Needs

1. Listen and Respond with Empathy
2. Communicate Authentically and Transparently
3. Involve Directs
4. Be Kind and Supportive
5. Demonstrate Appropriate Vulnerability.

Each behavior is needed to support both 1:1 effectiveness and your relationship with your direct.

How Do I Start and End 1:1s—And the Middle Stuff Too?

Four Steps of 1:1s:

1. Pre-Start
2. Start
3. The Heart
4. End.

Each step is central to how 1:1s are conducted. The Pre-Start and Start Phases Set the Tone. The Pre-Start of 1:1s ensures you prepare for the meeting and show up with the right mindset. The Start of the meeting should begin with light topics and then dive into heavier topics such as discussing roadblocks or providing feedback.

The heart is central to 1:1 effectiveness. This is the core of the 1:1.

Five key phases happen in this phase:

1. Expressing
2. Clarifying and Understanding
3. Solutioning
4. Crafting Next Steps
5. Monitoring the Agenda.

These phases do not need to happen in a step-by-step manner. Let the conversation flow and proceed through the stages in a manner that makes good sense for the particular agenda topic.

End positively. The end of the 1:1 is a critical opportunity to review and informally document key takeaways. Always make sure to end on time, with gratitude, a reiteration of your support.

The Direct's Job During the 1:1 Is to Do What?

1:1s are a dance. Directs play an active role in making 1:1s work.

The 10 Direct Behaviors that are Critical:

Directs need to take an active role in your 1:1s to get the most out of them.

Ten key behaviors are critical in this respect:

1. Know What You Need
2. Be Curious
3. Build Rapport
4. Actively Engage
5. Communicate Well
6. Problem Solve
7. Ask for Help (Constructively)
8. Ask for Feedback
9. Receive Feedback Well
10. Express Gratitude.

These behaviors are also relevant for managers. While directs should enact these behaviors to increase the effectiveness of their 1:1s, they are also relevant for managers. For example, managers need to be actively engaged in 1:1s too.

Directs can give feedback, but in a considerate way. While it

The value of a 1:1s comes from their perception of whether the meeting is going well.

may seem daunting to do, you and your manager can benefit from providing upward feedback. However, it's important for you to go about it in a thoughtful way.

Section 3: After the Meeting

The Meeting Is Done, Now What?

Follow through on commitments. After the meeting ends, it is critical for both you and your directs to follow through on the action items they committed to. Breaking commitments hurts trust, hurts the working relationship, and makes it harder to have effective 1:1s in the future.

Broken commitments are usually avoidable. There are many reasons why commitments are broken, and they are often not because the person avoided accomplishing the task.

Set commitments up effectively. Several tactics can be used to make sure commitments are kept. Focus on creating clarity of what the action item is so people understand what they are to accomplish. Find ways to spark motivation and reduce barriers to success. Follow up with the other person on their progress and your own progress.

Did the 1:1 Work?

Our perceptions of 1:1s can be skewed. Our minds are powerful. They can work with and against us. You may think your 1:1s are going great, but your direct may think they are subpar.

Apply strategies to align perspectives. When reflecting on your 1:1s, identify specific areas that are going well and not well. Take the perspective of your direct when gauging whether your meetings are effective. Last, focus on your specific behaviors during the meetings and how they may support or hinder 1:1 effectiveness.

Ask your direct for their perspective. The value of 1:1s comes from their perception of whether the meetings are going well. Ask them for feedback and their thoughts on how your 1:1s are going.

Lagging indicators exist. The best way to see the long-term success of your 1:1s and their effectiveness is with various lagging indicators. Are your engagement numbers for the team going up? Is performance rising and turnover dropping?

Section 4: Special Topics

Wait, There Are Skip-Level 1:1s?

Skip-levels are helpful. Skip-level 1:1s are meetings between you and your directs' directs. While these meetings aren't meant for you to take over as their manager, skip-levels are a great way for you to gain insight "on the ground" and to provide higher-up support to the team.

These 1:1s are used to get a pulse on what's happening in your team and those you oversee, build trust between different levels of the team, and share information and counsel. They aren't as frequently held but can provide insight that your regular 1:1s might not fully reveal.

Don't just start having skip-levels. Your first step in setting these meetings up for success is to let your immediate directs know that you plan to have them and why. Field any questions or concerns they may have, reiterating the true purpose of these meetings.

Then do the same with your skip-level directs. If you fail to do these steps, your skip-level 1:1s may be experienced like micromanaging, or may give the impression that there is a problem with their manager, or that the team is in trouble.

Set skip-levels up for success. Make sure you set up agendas and focus on developing rapport, especially early on. Hear what your skip-level direct would like to talk about and go from there, but have your standard questions ready to go. End the meetings by praising skip-level directs where you can and follow up on any action items you have committed to accomplishing.

Don't undermine your own directs. Skip-levels are a great way to get insight about your directs as managers, but don't undermine them. Listen with an open mind and ask if your skip-level direct has talked to their manager about the idea.

What do you do if you are drowning in meetings? Eliminating meetings is not the solution.

While employees often complain about the number of meetings they have, meetings are still an essential piece of organizational democracy. There are strategies to reduce the number and increase the effectiveness of meetings to combat the negative effects of too many meetings.

Have a conversation with your team. As a leader, you control your meetings. Start by having two conversations about your meetings.

First, set expectations around when meetings are warranted and when they are not. Second, talk about cutting back the time meetings are held for, such as by holding what has been a 60-minute meeting for 50 minutes. Having these conversations will reduce the number and time spent in meetings.

Increase meeting effectiveness. Rather than eliminating meetings, the goal is to make meetings more effective, which will save rework time and allay fatigue and frustration.

There are various tactics you can use as a leader that can help with this, which can be broken down into pre-meeting, during-the-meeting, and end-of-meeting practices. Examples of such practices include creating compelling agendas, actively facilitating the meetings to boost energy, experimenting with different strategies such as silent brainstorming, and having a proper close to a meeting to assure action.

Organizational strategies exist. These range from requiring approval for larger meetings to including meeting metrics on engagement surveys. While these may be harder for you to influence and these tactics vary by organization, they do help in the pursuit of lowering the number of overall meetings.

Final Thoughts—It's About Values

1:1s embody your values. Our behaviors signal our values, and our values tell others what is important to us. 1:1s are a critical way for you to support your people, demonstrate your leadership abilities, and improve key outcomes for your team and organization. Therefore, while 1:1s may be seen as a choice, they should be seen as an obligation.

1:1 meetings are essential for building strong working relationships, ensuring your directs have the support they need, and achieving positive outcomes for both your team and the organization.

This book has equipped you with the knowledge to set up successful 1:1s, from establishing a cadence and agenda to conducting the meetings themselves and following up afterwards. Remember, 1:1s are an investment in your people and your team's success. By prioritizing these meetings and approaching them with intentionality, you can create a space where your directs feel heard, valued, and empowered to do their best work.

Steven G. Rogelberg is Chancellor's Professor at University of North Carolina, Charlotte, for distinguished national, international, and interdisciplinary contributions. He has well over 100 publications and has received the highly prestigious Humboldt Award for his research on meeting science. His work has been profiled in the Harvard Business Review, CBS News, Wall Street Journal, Washington Post, Chicago Tribune, NPR, Guardian, National Geographic, and Scientific American Mind, among other outlets.

Management

Good Boss, Bad Boss

How to Be the Best … and Learn from the Worst

by Robert I. Sutton, Ph.D.

THE SUMMARY IN BRIEF

If you are the boss, are you a good one? How can you keep honing your skills as a boss — and stir your people to give their all and be proud to work for you? Are you in tune with how your words and deeds (and those little looks on your face) affect your followers? What do they really think of you — are you aware of how they see you, or do you live in a fool's paradise? Would your employees — if given the choice — ever want to work for you again?

In *Good Boss, Bad Boss*, professor of management science and author Dr. Robert I. Sutton weaves together real-life case studies and pertinent behavioral science research to deliver a precise and sometimes startling account of what the best bosses do.

Good Boss, Bad Boss delivers a definitive manifesto for anyone who has ever been elevated to a position of authority — and a blueprint of salvation for those who suffer because their bosses just don't seem to get it.

In *Good Boss, Bad Boss*, Dr. Sutton applies his commonsense approach to show how the great bosses in our world differ from those who are just so-so or, worse yet, downright inept.

IN THIS SUMMARY, YOU WILL LEARN:

- What you need to accomplish day after day to be a Good Boss.
- What to do about it if you have a Bad Boss.
- How to adopt the hallmarks of a Good Boss.
- How to survive the worst flaws of a Bad Boss.

Preface

The prevalence of bad bosses is confirmed by careful studies. A 2007 Zogby survey of nearly 8,000 American adults found that of those abused by workplace bullies (37 percent of respondents), 72 percent were bullied by superiors.

Stories about the damage done by bully bosses are bolstered by systematic research. University of Florida researchers found that employees with abusive bosses were more likely than others to slow down or make errors on purpose (30 percent vs. 6 percent), hide from their bosses (27 percent vs. 4 percent), not put in maximum effort (33 percent vs. 9 percent) and take sick time when they weren't sick (29 percent vs. 4 percent). Abused employees were three times less likely to make suggestions or go out of their way to fix workplace problems. Abusive superiors also drive out employees: More than 20 million Americans have left jobs to flee from workplace bullies, most of whom were bosses.

Yet when people look for (or dream of) a great boss, they want a civilized boss who does many things well. Take the young professor who described her escape from a nasty and sexist department chairman. She landed a job with a new chair who was not just a delightful human being; he was renowned for getting resources for faculty and protecting them from petty and time-consuming political battles.

Whether you are the CEO of a Fortune 500 company, a head chef or a basketball coach; manage a Starbucks; or lead a product development team, your success depends on the nitty-gritty of dealing with the people you work with most closely; who see you in action up close; and you are expected to personally guide, inspire and discipline.

Being a boss or having a boss is about dealing with the confidence, comfort, warmth, resentment, confusion, and flashes of anger and despair that pervade any relationship where one person wields power in an up-close and personal way over another.

Greatness comes only through dogged effort, doing many small things well, getting up after each hard knock and helping your people press forward at every turn. The best bosses don't ride into town, save the day with a bold move or two, declare victory, and then rest on their laurels.

There are no magic bullets, instant cures or easy shortcuts to becoming a great boss. Anyone who tells you otherwise is a liar. The best bosses succeed because they keep chipping away at a huge pile of dull, interesting, rewarding, trivial, frustrating and often ridiculous chores.

Devoting relentless attention to doing one good thing after another — however small — is the only path to becoming and remaining a great boss. ●

Part I: Setting the Stage

Bosses matter. Bosses matter because most employees have bosses, are bosses or play both roles. There are at least 21 million bosses in the United States, with estimates running as high as 38 million. More than 90 percent of U.S. employees have at least one boss, someone who presides over them in the local hierarchy. Bosses work in more than 50 occupations, from top executives to military officers, to ship captains, to head cooks, to

funeral directors. Bosses matter to everyone they oversee. But they matter most to immediate followers, those just beneath them in the local pecking order, whom bosses guide and evaluate at close range and who tangle with their virtues, foibles and quirks day after day. The success or failure of every boss hinges on how well or how badly he or she navigates these vexing and all-too-human relationships.

The Difference a Boss Can Make

Corey Billington went to work for Hewlett-Packard. Corey joined the SPaM group, which uncovers and invents ways to improve HP's supply chains. The group leader (let's call him Hector) wowed executives with big ideas and flashy presentations. Unfortunately, Hector spent hardly any time talking to his people and showed little interest in their work or careers. Hector ignored his team for long stretches and then — at seemingly random intervals — rushed in and demanded that everyone work on some urgent project. To paraphrase one SPaM member, "Every now and then, he would ride in on his white horse, lead a charge, kill the enemy, declare victory and gallop away. Then we wouldn't see him for a while." People at SPaM got fed up with Hector's antics and gave him low marks on the employee attitude survey. To management's credit, they moved Hector to another job and made Corey the boss.

Corey used a different style. He listened to his people, worked with them to uncover their skills and hopes, and labored to land projects they would enjoy and that would bolster SPaM's reputation. The first years were tough. SPaM had trouble getting good work, an early project failed, Corey made a hiring mistake and some executives questioned whether HP needed SPaM at all. But Corey persisted, helping his people develop new skills, learn from setbacks, and grow a group of loyal clients both inside and — eventually — outside HP.

Under Hector, SPaM's consultants were paid much less than people who did similar work elsewhere, and he made no effort to raise their pay. Corey fought for them, because "not getting paid based on our value sucked. I had to create a job family for my organization, which was no small amount of work." Life slowly got better at SPaM. Within five years, they were doing high-profile work and were named "the best strategy group" by INFORMS (a prestigious academic society) — and about 15 percent of their work was done at "remarkably high rates" for clients outside HP.

Bosses Matter

The punch line of the SPaM story — that the difference between a bad boss and a good boss matters a lot — is bolstered by a pile of studies. Gallup's surveys of more than 100,000 employees in more than 2,500 diverse businesses show that "managers trump companies." Employees' immediate bosses have far more impact on engagement and performance than does whether their companies are rated as great or lousy places to work. Related research shows that good bosses are especially crucial to employee performance in otherwise lousy workplaces. As leadership researcher Robert Hogan concludes from numerous careful studies, including the Gallup surveys, "People do not quit organizations, they quit bad bosses."

Bosses shape how people spend their days and whether they experience joy or despair, perform well or badly, or are healthy or sick.

Great bosses work relentlessly toward two general kinds of goals — but whether or not they persistently achieve them is best judged by others:

1. **Performance.** Does the boss do everything possible to help people do great work?
2. **Humanity.** Does the boss do everything possible to help people experience dignity and pride? ●

Part II: What the Best Bosses Do

If you want to be a successful boss, you have to convince people that your words and deeds pack a punch. If they don't believe you are in charge, your job will be impossible to do and your life will be hell.

Bosses matter, especially to their immediate followers and in small teams and organizations. Yet they are not all-powerful.

Even though most of us realize that leaders have limited powers, we can't resist treating their words and deeds as the main drivers of performance. Research by James Meindl on "the romance of leadership" shows that leaders get far more credit and blame than they deserve from followers, bosses and outsiders. Meindl found that most journalists, management experts, consultants and employees attribute superhuman powers to the top dog regardless of the facts. This ingrained "cognitive error" happens because it is less taxing and more emotionally satisfying to treat leadership as the primary cause of performance than to sort through a convoluted hodgepodge of factors.

The Truth

The truth is that bosses of everything from small groups to Fortune 500 firms don't matter as much as most of us believe. They typically account for less than 15 percent of the gap between good and bad organiza-

tional performance, although they often get more than 50 percent of the blame and credit. Even when bosses have no influence at all, we still heap on the credit and blame.

The best bosses recognize they can't reverse the romance of leadership, but they can use it to their advantage.The strange twist is that by enhancing the *illusion* they are in control, bosses increase their *actual* control over what their followers do, how they feel along the way and how glowingly their work is evaluated by outsiders. Bosses do small things to create confidence that they are in charge and then spread it to others.

Tricks for Taking Charge

Here are nine tricks for taking charge:

1. **Talk more than others — but not the whole time.**
2. **Interrupt people occasionally — and don't let them interrupt you much.**
3. **Cross your arms when you talk.** Crossing your arms sends yourself a message to crank up the grit and confidence — but beware that doing it too much and too intensely can make you look like an uptight jerk.
4. **Use positive self-talk.** People who make encouraging statements to themselves enjoy higher self-esteem and performance.
5. **Try a little flash of anger now and then.** Used in small doses and with proper precautions, flashes of anger can help you seize control. But spewing out constant venom undermines your authority.
6. **If you are not sure whether to sit down or stand up, stand up.** Standing up signals you are in charge and encourages others to accept your authority.
7. **Ask your people what they need to succeed and then try to give it to them.**
8. **Tell people about your pet peeves and quirks.**
9. **Give away some power or status, but make sure everyone knows it was your choice.** ●

Strive to Be Wise

The best bosses dance on the edge of overconfidence, but a healthy dose of self-doubt and humility saves them from turning arrogant and pigheaded. Bosses who fail to strike this balance are incompetent, dangerous to follow and downright demeaning.

Consider a talkative senior executive who led a project team meeting at a large corporation. Let's call her Roberta. She joked that a key to her success was that although she appeared to be listening to others, she usually wasn't. Rather, she used the time to "reload," to prepare what to say next. Roberta's joke described her behavior all too well. She spent much of the day spewing out short speeches that were irrelevant to the team's task or to what team members had been talking about before she interjected (after all, she wasn't listening, she was "reloading"). At one juncture, an exasperated underling leaned over to a colleague and whispered a list of the company's canned PowerPoint presentations that Roberta had been regurgitating at seemingly random intervals — and added, "As usual, Roberta is all transmission and no reception."

Roberta not only didn't listen, she asked few questions. This blabbering boss learned little from the smart people in the room, gave them no useful direction and undermined their dignity, as none felt heard or respected. Roberta should have heeded coach John Wooden's advice: "Listen to those under your supervision. Really listen. Don't act as if you're listening and let it go in one ear and out the other. Faking it is worse than not doing it at all."

As Roberta demonstrated, bad bosses sometimes come in bodies that can't listen. She was plenty smart but lacked wisdom.

Know What You Don't Know

Wise bosses are devoted to knowing what they don't know. They act boldly on facts they have right now but search for signs they are wrong — seeking a healthy balance between courage and humility. Roberta didn't suffer from excessive insecurity and self-doubt (as some unwise people do); she swerved toward arrogance.

Roberta never expressed uncertainty, asked questions, really listened, asked for help or challenged her own beliefs. Roberta's opinions were so strongly held that it was impossible to penetrate them with opposing opinions, logic or facts. In contrast, to steal a phrase from futurist Paul Saffo, wise bosses have strong opinions that are weakly held — so they can update when confronted with contrary facts. ●

Stars and Rotten Apples

Rotten apples are so destructive because "bad is stronger than good." A study that tracked employees' moods found that the impact of negative interactions with bosses and co-workers on employees' feelings were five times stronger than positive interactions. Negative interactions (and the bad apples who provoke them)

pack such a wallop in close relationships because they are so distracting, emotionally draining and deflating. When a group does independent work, rotten apples drag down and infect everyone else. Unfortunately, grumpiness, nastiness, laziness and stupidity are remarkably contagious.

The upshot is that as a boss, you can't wait very long to see if these destructive characters will mend their ways. You need to intervene quickly. If pointed and persistent feedback fails, do everything you can to expel the bad apple.

Smart People Tricks

Here are four smart people tricks:

1. Show Them the Love. Organizational life is filled with time-consuming and distracting routines that burden every boss. In the crush of satisfying deadlines, going to meetings and plowing through red tape, more important things can fall through the cracks.

Many bosses spend endless hours preparing evaluations but don't take even a few moments to make people feel appreciated.

2. Assume the Best. Too many bosses forget the power of the human touch, which also entails conveying confidence to followers. The power of believing that good things will happen to your people, and communicating that to them — the self-fulfilling prophecy — is supported by much research.

3. Cut Loose the Real Losers. The self-fulfilling prophecy doesn't always work. You can bring in people who seem like talented stars, devote massive attention to them and give them every chance to succeed. Yet their performance may still suck. The challenge for bosses — as for all human beings — is that they see what they believe. Psychologists call this confirmation bias: selective thinking where "one tends to notice and to look for what confirms one's beliefs, and to ignore, not look for or undervalue the relevance of what contradicts one's beliefs."

Confirmation bias can cause bosses to make excessively glowing judgments about people they have invested a lot of time and money in or whom they simply find to be likable or admirable. Even if your judgment is generally sound, confirmation bias can blind you to mediocre or even downright rotten performance displayed by your favorites.

4. Keep Teams Together. Bringing in people with connective talents and celebrating stars that help others succeed are powerful means for accomplishing interdependent work. But even if you get the best people and put them in the best systems, learning to work together takes time.

A little experience together helps: In 1994, the National Transportation Safety Board reported that 73 percent of the mistakes made during commercial airline flights happened during the first 24 hours of the (typically) 72-hour stint that a cockpit crew spent together. They also found that 44 percent of these errors happened on the crew's first flight together. ●

Link Talk and Action

The "smart-talk trap" happens when bosses and their people know what needs to be done and keep talking about it, writing about it, studying it — yet all that blabbering becomes an end in itself rather than a stepping-stone to action. Somehow, the pile of words (and numbers and pictures) generated via glib talk, brainstorming sessions, protracted arguments, presentations, strategic planning, scenario planning, board meetings, mission statements, budgets and sales forecasts can be weirdly comforting even when it has no impact on what people actually need to do to succeed.

Don't Be a Clueless Blabbermouth — or Let Them Rule the Roost

As a boss, you need to establish a pecking order where people who know the most about a problem wield the greatest influence over what is done. You especially need to watch who talks the most (and least). Don't let your people fall prey to the blabbermouth theory of leadership.

At least in Western countries, people who talk first and most frequently usually wield excessive influence over others — even when they spew out nonsense. Some bosses make this problem worse by rambling on and stifling underlings and insisting they are right even when they are dead wrong.

Taking action and seeing what you can get done (and learn) as you muddle forward is among the most effective antidotes to the smart-talk trap. Talking, brainstorming and doing research are not a waste of time; they're all extremely useful — but only when used as steppingstones to action, not as ends themselves.

Steppingstones for Can-Do Bosses

Here are nine tips and tricks for eradicating impediments to action:

1. **When your people suggest a promising idea, say (as often as possible): "Great! Do it!"**
2. **Assign your worst smart talkers to shadow your best doers.** Reward both parties if the smart talkers become more action-oriented.

3. **Fire or demote incurable smart talkers — and let your people know why you did it.** Beware of creating a climate of fear, so give people feedback and warnings first. But if you let these rotten apples stick around, they will infect others and produce vile consequences for all.
4. **Say the same simple and good things again and again until the message shapes what people do.**
5. **Tell juicy stories about destructive things to stop doing — and simple things to start.**
6. **When in doubt, throw it out or don't add it in the first place.** Follow Steve Jobs and try to explain to one another — and customers — the differences among your products and services. If you can't do so easily, perhaps it is time to get rid of a bunch.
7. **Fight the Otis Redding problem.** List all the performance metrics you use. No matter how long it is, pick the three most important. Do you really need the rest?
8. **Ask yourself — and your people — if you have practices that "everyone else" uses but are a waste of time or downright destructive.** What about your performance evaluations? Would you be better off not doing them at all — or at least cutting 75 percent of the questions on your form?
9. **Link hot emotions to cool actions.** Crank up your people's fears and hopes to get their juices flowing, then direct that energy to effective and concrete behaviors. ●

Serve as a Human Shield

The best bosses let the workers do their work. They protect their people from red tape; meddlesome executives; nosy visitors; unnecessary meetings; and a host of other insults, intrusions and time wasters. The notion that management "buffers" the core work of the organization from uncertainty and external perturbations is an old theme in organization theory.

A good boss takes pride in serving as a human shield, absorbing and deflecting heat from superiors and customers, doing all manner of boring and silly tasks and battling back against every idiot and slight that makes life unfair or harder than necessary on his or her charges.

Fight for Followers

The main test here is whether or not followers believe their boss has their backs.

Robert Townsend could have been a poster child for the boss as a human shield. Townsend held a host of management jobs including CEO of Avis Rent-a-Car and wrote the inspired and outrageous book *Up the Organization*.

In Townsend's mind, a boss's job was to "work for your people," which meant being a defender and warrior on their behalf. He once refused to provide an Avis board member, David Sarnoff, with a complete tally of all the cars that Avis owned. Weeks of work would have been required to assemble such information; Townsend believed his people's efforts were better spent elsewhere. So he shot back at Sarnoff: "If I don't need it to run the company, you sure as hell don't need that information as an outside director."

Earlier in Townsend's career at American Express, the firm's chairman stopped him in the hall to praise a "good bond swap" by his group. Townsend replied that he didn't know about it, because he was devoting his time to scrounging for resources and better pay for the undervalued "peons" doing this magnificent work. Townsend used the encounter with his superior to fight for his people, not to bask in the reflected glory of their accomplishments.

A big part of a boss's job is shielding followers from unnecessary and destructive worries, hassles, procedures, indignities, and intruders and idiots of every stripe.

Don't Waste Their Time

If you are determined to be an effective shield, start by working on yourself. Great bosses avoid burdening their people. They invent, borrow and implement ways to reduce the mental and emotional load they heap on followers.

At Amazon.com, bosses take little heat when their people try things that fail or when their people act without asking for permission. Amazon's most prestigious employee award is called the "Just Do It." Employees win it from CEO Jeff Bezos for taking actions to help the company and doing so without getting their boss's permission first.

Employees don't need much protection from above under these conditions. As a rule, the less idiocy that rains down from above, the less shielding a good boss needs to do. ●

Don't Shirk the Dirty Work

Every boss must do things that upset and hurt people. If you are the boss, it is your job to issue reprimands; fire people; deny budget requests; transfer employees to jobs they don't want; and implement mergers, layoffs and shutdowns. If you can't or won't perform such unpleasant chores, perhaps you shouldn't be the boss. Or if you still want the job, you better recruit someone else to do your dirty work.

The best bosses don't delay or duck difficult deeds. Consider a study by Charles O'Reilly and Barton Weitz on how supervisors handled problematic sales employees — those with poor productivity, lack of punctuality, bad attitudes and other misdeeds. Bosses of the most productive work groups confronted problems directly and quickly, issued more warnings and formal punishments, and promptly fired employees when warnings failed. These no-nonsense bosses inspired team performance because their words and actions made crystal clear that they would not tolerate crummy work.

Bosses sometimes initiate dirty work because they believe it is the right thing to do. When Ann Rhoades was head of the People Department at Southwest Airlines, she helped make the decision to fire fellow executive David Neeleman, who had joined Southwest as part of a merger with Morris Air. Neeleman's quarreling and complaining about Southwest were undermining the dynamics of the senior team, along with their famously warm and cooperative culture. Rhoades agreed that Neeleman had to go and helped break the bad news to him.

How You Do It

There are times when every boss must do things that hurt others. *But there is a big difference between what you do and how you do it.* Rhoades' history with Neeleman illustrates the point: He wasn't happy about getting fired, but Neeleman was sufficiently impressed with how Rhoades handled this and other chores at Southwest that he hired her as head of human resources several years later when he founded JetBlue Airways.

Research by behavioral scientists shows that dirty work does less harm when bosses add four antidotes into the mix:

- **Predictability.** Predictability is all about creating realistic expectations. When bosses take harsher actions than in the past, they need good answers to this question: "Why are you doing this to us now?"
- **Understanding.** When people are freaked out, skilled bosses make their explanations as simple as possible and repeat them over and over — and do so through multiple communication channels.
- **Control.** Great bosses help followers feel powerful rather than powerless — especially during rough times.
- **Compassion.** The best bosses convey empathy as they make and implement tough decisions — which bolsters performance and humanity.

Squelch Your Inner Bosshole

What drives so many bosses to be seen as so cruel by so many followers? Many bosses are buffeted by forces that bring out insensitivity and nastiness. These include:

1. Toxic Tandem and Power Poisoning. Professor Dacher Keltner has studied power dynamics for more than 15 years. He reports, "When researchers give people power in scientific experiments, they are more likely to touch others in potentially inappropriate ways, to flirt in a more direct fashion," to "interrupt others, to speak out of turn, to fail to look at others when they are speaking," and to "tease friends and colleagues in hostile and humiliating fashion." Another of his studies shows that when people get a little power, it dampens how much compassion they convey and how much distress they feel when listening to others talk about painful things such as a dying friend or personal failure.

Bosses who successfully enlist others to help them avoid and reverse power poisoning usually have a history of treating people with respect and listening to and learning from criticism rather than getting defensive and shooting the messengers.

2. Extreme Performance Pressure. Although all bosses risk focusing on performance too much and humanity too little, this balance gets especially out of whack when performance pressure becomes intense — a feature of countless bosses' jobs.

After a round of performance evaluations where his direct reports seemed overwrought by even minor criticisms, one imaginative boss put things in perspective by taking his charges to a hospice, where they met dying patients and their families. He reminded them that their performance evaluations really don't mean much in the larger scheme of things and then did their next evaluations right there in the hospice.

3. Sleep Deprivation, Heat and Other Bodily Sources of Bad Moods. Research on sleep deprivation shows that a lack of sleep causes people to make lousy decisions and turns them into impatient jerks —

and when deprivation is severe, people turn irrational and fly into wild rages. Naps dampen such negative effects and also help people who are not sleep-deprived to be more effective and civilized. A 15- to 60-minute nap bolsters creativity, alertness, error detection and mood — for people who don't usually nap.

When people are physically hot, they turn mean. Folk sayings like *hot under the collar* and *steamed* are bolstered by research on temperature and aggression: Countries with hot climates suffer higher murder rates and more political violence than do countries with cool climates. More violent crimes occur in hot years than in cool years.

4. Nasty Role Models. It is difficult for any person to avoid imitating teachers and authority figures. When everyone around you acts like a jerk and admires the creeps in charge, there is no good behavior to copy and refraining from nastiness is often treated as a weakness. Yet when aspiring bosses band together to create countervailing social pressure against imitating demeaning mentors, they can avoid following in their vile footsteps.

Part III: The Upshot

If you are a boss, your success depends on staying in tune with how others think, feel and react to you. Bosses who persistently promote performance and humanity devote considerable energy to reading and responding to followers' feelings and actions and those of other key players like superiors, peers and customers. Of course, there is no single magical or simple thing that defines a great boss. Anyone who promises you an easy or instant pathway to success is either ignorant or dishonest — or both. The moves that great bosses make are too complex, varied, messy and unpredictable to be captured by any single theme, slogan or set of steps.

Yet some skills and aspirations are more important than others. Developing and sustaining self-awareness ought to be at the top of the list for every boss.

David Dunning of Cornell University shows that a hallmark of poor performers is a lack of self-awareness; they consistently overestimate their skills in just about any task that requires intellectual and social skills, such as debating, having a sense of humor or interviewing others. In contrast, Dunning finds that self-awareness is a hallmark of the best performers — they are especially cognizant of their strengths and weaknesses and fret about overcoming pitfalls that can undermine their performance. The best bosses reduce the risk of self-delusion by seeking and responding to hints and hard data about how others read their moods and moves. They urge followers to challenge them with enlightening — and disconcerting — questions. They want their followers (and bosses, peers and customers too) to keep feeding them such information, no matter how unpleasant and unflattering, because they are obsessed with how their words and deeds are interpreted by others.

Smart Versus Wise Bosses

Smart bosses have the *confidence* to act on what they know, but feel and express *little* doubt about what they believe or do. They make definitive statements; answer questions; talk well; and give help, but don't ask for help and refuse it when offered.

Wise bosses have the *confidence* to act on what they know and the *humility* to doubt their knowledge. They make statements (often "backstage") that reveal uncertainty and confusion, ask questions, listen well, give help, ask for help and accept it when offered.

The upshot is, to be a great boss you've got to think and act as if it is all about you. Your success depends on being fixated on yourself. On the surface, this conclusion clashes with advice from many gurus and experts. Former General Electric Co. CEO Jack Welch and Stanford's dean of the Graduate School of Business, Robert Joss, for example, implore managers, "It's not about you." The spirit of that advice aims to discourage bosses from falling prey to their most selfish and destructive instincts. Yet most bosses, like most human beings, are remarkably self-obsessed — and that isn't necessarily a bad thing. Yes, the worst are selfish, are oblivious to their charges and cling to dangerous delusions about their magnificent leadership skills. The best are equally self-obsessed but have different motivations. Their obsession isn't for egotistical or for selfish reasons. On the contrary, they focus on controlling their moods and moves, accurately interpreting their impact on others, and making adjustments on the fly because they want their people to produce work that others will admire — and to feel respect and dignity along the way.

Good to Great

Why Some Companies Make the Leap . . . and Others Don't

by Jim Collins

Jim Collins is a student and teacher of what makes great companies tick and an advisor to leaders throughout the corporate and social sectors. He has authored or coauthored six books that have sold in total more than 10 million copies worldwide. In 1995, he founded a management laboratory in Boulder, CO, where he continues to conduct research and engages with CEOs and senior-leadership teams. In 2017, Forbes selected him as one of the 100 Greatest Living Business Minds. www.jimcollins.com

What's Keeping Your Company Good When It Could Be Great?

Jim Collins begins with a simple assertion: society has few companies, schools, and individuals that become great, because so many of them are good. It's fairly easy to become good and even easier to stay that way. The point became clear to Collins after a casual conversation about Collins' previous book, *Built to Last*, with Bill Meehan, the managing director of McKinsey & Company's San Francisco office. Meehan posed the question: "But what about the vast majority of companies that wake up partway through life and realize that they're good, but not great?" This question planted a seed in Collins' mind that grew into the basis of *Good to Great*. "Can a good company become a great company and, if so, how? Or is the disease of 'just being good' incurable?" Inspired by this line of inquiry, Collins assembled a research team devoted to finding the answers.

Over the course of five years, the group identified eleven companies that went from having good results to having great results and managed to sustain those great results for a period of at least fifteen years. They compared the companies that fit the great criteria with a carefully chosen control group of companies that failed to make the same leap or failed to sustain the great results over time. From those comparisons the team filtered out the essential factors that distinguished the great companies from the good ones.

Level 5 Leadership

Collins and his team came to describe the kind of leaders found at the top of every great company as Level 5 leaders. These leaders direct their egos away from themselves and towards the bigger goal of building their company. They are very ambitious but "their ambition is first and foremost for the institution, not themselves."

Good-to-great executives appeared to be "cut from the same cloth." Regardless of the industry or what state the company was in, a Level 5 leader was at the helm during the company's transition from good to great. Further, the comparison companies that never reached great always lacked a Level 5 leader. In

fact, nearly two-thirds of the comparison companies had big egos in key leadership positions that actually "contributed to the demise or continued mediocrity of the company."

What sets Level 5 leaders apart from others? Collins describes them as both "modest and willful, humble and fearless." They typically come from inside the company rather than being an outsider recruited to save the day. They never let their ego get in the way of the greater cause, which is the company. Their values push them to continue on their path, even when it is extremely difficult. In the age of celebrity CEOs, the Level 5 leader shies away from the spotlight, gives credit to others instead of taking it, and surrounds him or herself with potential successors that have the potential to carry the company into the future with or without the leader.

Collins reports that those who work under Level 5 leaders, describe them with words such as "quiet, humble, modest, reserved, shy, gracious, mild-mannered, self-effacing, understated, and so forth." Level 5 leaders do not become "larger-than-life heroes." They never aspire to sit atop a pedestal or to become icons. They are "seemingly ordinary people quietly producing extraordinary results." Level 5 leaders have fierce resolve and an unwavering determination to do whatever it takes for the good of the company.

Studying Level 5 leaders revealed a pattern that Collins and his team called *the window and the mirror.* Level 5 leaders "look out the window" to give credit to factors outside of themselves, including plain good luck, when things go well. When things don't go well, they "look in the mirror" and take responsibility, never blaming bad luck. Leaders in the comparison group did the exact opposite. They look in the mirror to thank themselves when things go right and blame others when things go wrong. Collins believes that Level 5 leaders are all around us if we know what to look for in finding them. Further, many leaders have the potential to become Level 5.

First Who...Then What

Collins assumed that the first step towards transitioning from good to great would be to determine a destination. Good companies would set a new vision, create a strategy, and then direct their people towards that destination. But what they discovered was that the good to great executives first got the right people on (and off!) the bus and then they figured out where to drive it. These leaders essentially said, "Look, I don't really know where we should take this bus. But I know this much: If we get the right people on the bus, the right people in the right seats, and the wrong people off the bus, then we'll figure out how to take it someplace great."

These good-to-great leaders had an understanding of three truths:

- You can better adapt to a changing world if you begin with "who" rather than "what." If people get on the bus primarily because of where it is going, they will jump off if the bus changes direction. If people get on the bus because of who else is on the bus, they will stay on the bus no matter where it goes.
- If you have the right people, the need to tightly manage or motivate goes away. The right people are self-motivated with the drive to get results and be part of something great.
- If you have the wrong people, your company will never be great. Great vision without great people is meaningless.

Distinctive Forms of Disciplined Thought

The good-to-great companies that Collins and his group studied showed two "distinctive forms of disciplined thought." The first is that they always faced the "brutal facts of reality."

Great companies have a climate where the "truth is heard, and brutal facts are confronted," Collins writes. When companies face facts and make decisions based upon them, they end up stronger and more resilient. There is also exhilaration to be gained when you face hard truths and decide to never give up. Great companies face the truth and find a way to prevail anyway.

The second form of disciplined thought presented by Collins is called The Hedgehog Concept. In his famous essay "The Hedgehog and the Fox," author Isaiah Berlin divided people into two groups: foxes or hedgehogs. Foxes look at the world and see complexity. They are scattered and pursue many objectives at the same time. Foxes are cunning but cannot win over the simple defense of a hedgehog. Hedgehogs have a basic guiding principle that always beats the fox. They roll up and become a spike-covered ball, thwarting the fox's attack every time.

People who are foxes don't integrate their thoughts into a "unifying vision." People who are hedgehogs organize the complex into a single idea that guides everything. No matter how complex the world, a hedgehog "reduces all challenges and dilemmas to simple ideas." Good-to-great companies have hedgehog leaders that develop a Hedgehog Concept. They "developed a simple, yet deeply insightful, frame of reference for all decisions."

A Hedgehog Concept is "a simple, crystalline concept that flows from deep understanding about the intersections of the following three circles: What can you be best at in the world? What drives your economic engine? What are you deeply passionate about?

A fully developed Hedgehog Concept encompasses all three circles. It is not "a goal to be the best, a strategy to be the best, an intention to be the best, a plan to be the best. It is an understanding of what you can be the best at." Collins asserts that this is a crucial distinction.

A Culture of Discipline

Collins says that when companies grow and become increasingly complex, they begin to trip over their own success. Suddenly there are "too many new people, too many new customers, too many new orders, too many new products." In order to make sense of this newfound chaos, the board brings in new management. "Processes, procedures, checklists, and all the rest begin to sprout up like weeds." Where there used to be independence, there is now hierarchy.

> . . . greatness happens as a cumulative process. Every step, every action, and every decision 'adds up to sustained and spectacular results.'

Collins points out that bureaucratic rules are established to manage the wrong people on the bus. This in turn drives some of the right people off the bus. This results in an even higher percentage of wrong people on the bus who need more management to compensate for lack of discipline and incompetence. In a downward spiral, it goes on and on. But Collins says there is an alternative. Bureaucracy and hierarchy can be avoided when a company has a culture of discipline.

Companies must hire self-disciplined people and create a culture around freedom and responsibility. People in good-to-great companies will "take disciplined action within the three circles while being fanatically consistent with the Hedgehog Concept." The company should build a system that allows people to have freedom and responsibility without the need for close management. The system should be managed, not the people working within it. Everyone within adheres to a simple mantra: "Anything that does not fit with our Hedgehog Concept, we will not do." Great companies don't do things that don't fit. Period.

Technology Accelerators

Through periods of great change, great companies adopt and endure. There are many examples of companies doing so over a period of a hundred years or more. Some can trace their roots back through many generations of technological advancements such as electricity, television, or the internet. Collins says, "Technology-induced change is nothing new. The real question is not, 'What is the role of technology?' Rather, the real question is, 'How do good-to-great organizations think differently about technology?'"

What Collins sees is that great companies don't adopt new technologies simply for the sake of saying they have them, nor do they do so in fearful reactions of being left behind. Instead, they use technology to accelerate their momentum after a breakthrough rather than using technology to create momentum. They do not jump on technology bandwagons. Instead, they carefully choose which technologies to integrate. A great organization's use of technology is always tied directly to the company's Hedgehog Concept.

No Miracle Moment

Collins' next point is about cumulative effort and effect. He asks readers to imagine a flywheel, a huge metal disk mounted on an axle. To get the flywheel moving, it takes an incredible amount of initial effort. As you keep pushing, though, it gets a bit easier. Push after push, the flywheel moves faster and faster. Eventually, there is a breakthrough. The flywheel's momentum starts to work for you. You don't have to push harder, but the flywheel "builds upon work done earlier, compounding your investment of effort."

If someone came along and asked which push got the flywheel to move so fast, it would be impossible to say. It was every push, "added together in an overall accumulation of effort applied in a constant direction." This is what it was like for the companies that went from good to great. Their transformations did not take place because of one grand push.

Collins asserts that greatness happens as a cumulative process. Every step, every action, and every decision "adds up to sustained and spectacular results." These transformations were not named. They were not celebrated with launch events or promotions. In fact, many of the executives who led the companies through these transformations were not entirely aware that they were taking place. It was only in hindsight that they released how far they'd come.

Collins reports that there was no single miracle moment for these companies. "It was a quiet, deliberate process of figuring out what needed to be done to create the best future results and then simply taking those steps, one after the other, turn by turn of the flywheel."

In the densely populated genre of business books, *Good to Great* stands out and stands the test of time. Collins' findings are simple, accessible, and digestible but his process for reaching them is far from that. The fact that he assembled an entire team and spent five years working through highly detailed, empirical evidence sets the work apart from other books in the niche.

Executives, managers, and rising stars will find Collins' analogies relatable and relevant. For example, Collins hits home the idea that hiring and firing choices make all the difference by comparing a company to a bus. In order to become great, leaders have to get the wrong people off the bus, the right people on, and further, put the right people in the right seats. The company can go in any direction necessary and the right people will stay on and even enjoy the ride.

Readers will quickly note the inclusion of some "great" companies that have since fallen far from greatness and the references to the internet as a recent technological advancement. Although the impactful lessons of *Good to Great* can be readily applied to modern companies, the content could benefit from an update to reflect the monumental changes that have occurred since its original publication in 2001.

How Smart Companies Use Environmental Strategy to Innovate, Create Value, and Build Competitive Advantage

GREEN TO GOLD

THE SUMMARY IN BRIEF

Forward-thinking business leaders see the Green Wave coming and want to profit from it.

This summary explores what every executive must know to manage the environmental challenges facing society and business. Based on the authors' years of experience and hundreds of interviews with corporate leaders around the world, this summary shows how companies generate lasting value — cutting costs, reducing risk, increasing revenues and creating strong brands — by building environmental thinking into their business strategies.

Authors Daniel C. Esty and Andrew S. Winston provide clear, how-to advice and concrete examples from companies such as Toyota and IKEA that are achieving both environmental and business success. The authors show how these cutting-edge companies are establishing an "Eco-Advantage" in the marketplace as traditional elements of competitive differentiation fade in importance. Esty and Winston not only highlight successful strategies but also describe why environmental initiatives sometimes fail despite the best intentions.

This summary is written for executives at every level and for businesses of all kinds and sizes. Esty and Winston guide leaders through a complex new world of resource shortfalls, regulatory restrictions and growing pressure from customers and other stakeholders to strive for sustainability.

In addition, you will learn:

- ✓ ***How to keep a sharp focus on execution while using an environmental strategy.***
- ✓ ***Ways to cope with environmental pressures and responsibilities.***
- ✓ ***How to spark innovation that will drive long-term growth.***
- ✓ ***How to anticipate and manage serious business risks.***
- ✓ ***How to be good stewards of the Earth while simultaneously building the bottom line.***

GREEN TO GOLD

by Daniel C. Esty and Andrew S. Winston

— THE *COMPLETE* SUMMARY

The Environmental Lens

In the weeks before Christmas 2001, Sony faced a nightmare. The Dutch government was blocking Sony's entire European shipment of PlayStation game systems; more than 1.3 million boxes were sitting in a warehouse instead of flying off store shelves.

Why was Sony at risk of missing the critical holiday rush? Because a small, but legally unacceptable, amount of the toxic element cadmium was found in the cables of the game controls. Sony rushed in replacements to swap out the tainted wires. It also tried to track down the source of the problem — an 18-month search that included inspecting more than 6,000 factories and resulted in a new supplier management system. The total cost of this "little" environmental problem was more than $130 million. Sony executives refer to their PlayStation disaster as the "Cadmium Crisis."

Four Lessons From Sony's Stumble

Sony has been a business powerhouse for years and the company is also generally perceived as an environmental leader. Nothing foreshadowed the PlayStation stumble, yet it happened. Why? Three lessons can be drawn from Sony's difficult experience:

- **Even the best companies can be surprised by environmental issues.**
- **The environment is not a fringe issue — it can cost businesses real money.**
- **Real benefits can come from seeing things in a new light.**

Looking at all the ways environmental issues affect a business can frame thinking and strategy in a new way. By examining their business through an environmental "lens," managers can avoid expensive problems and create substantial value. Thus, a fourth lesson can be drawn from Sony's experience — and this is the fundamental one:

- **Smart companies seize competitive advantage through strategic management of environmental challenges.**

Business and Natural Resources

The business world and the natural world are inextricably linked. Our economy and society depend on natural resources. The environment provides critical support to our economic system — not financial capital, but natural capital. And evidence is growing that we're systematically undermining our asset base and weakening some of our vital support systems.

An environmental lens is not just a strategy tool or a feel-good digression from the real work of a company. It's an essential element of business strategy. It provides a way for businesses to contend with the problems of pollution and natural resource management. Mismanaging these issues can drain value out of a company quickly — and damage brand reputations built up over decades of careful cultivation. ■

Eco-Advantage

In a speech to shareholders, Wal-Mart CEO Lee Scott lays out his definition of "21st Century Leadership." At the core of his new manifesto are commitments to improve environmental performance. Wal-Mart will cut energy use by 30 percent, aim to use 100 percent renewable energy (from sources like wind farms and solar panels), and double the fuel efficiency of its massive shipping fleet. The company will invest $500 million annually in these energy programs.

Why are the world's biggest, toughest, most profit-seeking companies talking about the environment now? Because they have to. The forces coming to bear on

Eco-Advantage

(continued from page 2)

companies are growing. Industry groups are facing an unavoidable new array of environmentally driven issues. Like any revolution, this new "Green Wave" presents an unprecedented challenge to business as usual.

The Evolving Challenge

Environmental worries used to center on "limits to growth" and the prospect of running out of key natural resources like oil and industrial metals. A second line of concerns focused on pollution and has proven to be more enduring. We now know that humans can overwhelm the capacity of nature to absorb pollutants or to provide the essential "ecosystem services" we need, such as fresh water, breathable air, a stable climate and productive land.

Environmental missteps can create public relations nightmares, destroy markets and careers and knock billions off the value of a company. Companies that do not add environmental thinking to their strategy arsenal risk missing upside opportunities in markets that are increasingly shaped by environmental factors. ■

Natural Drivers of the Green Wave

In the mid-1990s, executives at consumer products giant Unilever saw a big threat to one of their product lines. Supply for the frozen fish sticks business was at risk because the oceans were running out of fish.

The Business Case for Environmental Thinking

Here are three basic reasons for adding the environmental lens to core strategy:

1. The potential for upside benefits. The "gold" that smart companies mine from being green includes higher revenues, lower operational costs and even lower lending rates from banks that see reduced risk in companies with carefully constructed environmental-management systems.

2. The management of downside risks. Efforts to cut waste and reduce resource use, often called "eco-efficiency," can save money that drops almost immediately to the bottom line. Redesign a process to use less energy and you'll lower your exposure to volatile oil and gas prices.

3. A values-based concern for environmental stewardship. Doing the right thing attracts the best people, enhances brand value and builds trust with customers and other stakeholders.

In partnership with World Wildlife Fund, the company set up the Marine Stewardship Council, an independent body to promote sustainable fisheries around the world. The Council certifies fisheries where the total catch is limited so that fish populations do not diminish over time. To create specific incentives for fishermen to seek certification, Unilever committed to buying 100 percent of its fish from sustainable sources by 2005.

Long-Term Issues

Issues such as global warming and loss of species can seem physically remote, long-term and not very pressing. Compared to the immediacy of the air we breathe or the water we drink, it's hard to get worked up about consequences that are far off. But long-term problems can prove intractable when they do arrive.

As the business world realizes that natural resources are finite, a second reality is emerging: Limits can create opportunities. Companies that manage nature's bounty and boundaries best will minimize vulnerabilities and move ahead of their competitors.

Top 10 Environmental Issues

Here are the top 10 environmental issues facing humanity:

1. Climate Change. This catch-all includes rising sea levels, changes in rainfall patterns, more severe droughts and floods, harsher hurricanes and other windstorms and new pathways for disease.

2. Energy. For big energy users — those in heavy manufacturing or transportation, for example — resource and energy productivity may become a major point of strategic advantage. Companies selling goods and services that promise to improve energy efficiency will claim market share.

3. Water. Companies around the world now face limits on access to water. For business, a number of complementary factors create both water quality and water quantity challenges.

4. Biodiversity and Land Use. Biodiversity — a catch-all term for the spectrum of plant and animal life — preserves our food chain and the ecosystem on which all life depends. It also holds prospects of new drugs, foods and other products. A key factor in the decline of biodiversity is habitat loss. Many companies face pressure about their contribution to sprawl.

5. Chemicals, Toxics and Heavy Metals. Part of what makes air pollution more dangerous is the presence of toxic elements. Exposure to chemicals like dioxin, a byproduct of production processes such as papermaking, and heavy metals such as lead and mercury can create severe public health risks. The legal liability surrounding toxics can be virtually unlimited.

(continued on page 4)

Natural Drivers of the Green Wave

(continued from page 3)

6. Air Pollution. Significant air-quality controls on factories, cars and other emissions sources have reduced air pollution over the past 30 years in the United States, Japan and Europe. But the air is still not clean.

7. Waste Management. The EPA estimates that the 1,200 Superfund sites across the country will require about $200 billion to clean up over the next 30 years. Under the liability provisions of the Superfund law, anyone found responsible for the waste at a site can be held liable for the full cost of cleanup, even if the toxics were legally disposed.

8. Ozone Layer Depletion. With a thinned ozone layer, the world becomes a more dangerous place, with reduced agricultural productivity, higher risk of skin cancer and other health problems.

9. Oceans and Fisheries. More than 75 percent of the world's fisheries are over-exploited and beyond sustainability. For those whose livelihoods depend on fishing, recreation and tourism, the effect of declining fisheries may be severe.

10. Deforestation. Every company that uses wood, paper or cardboard packaging has a stake in, and responsibility for, the state of our forests. When McDonald's realized 15 years ago that litter was an issue, it began working with a New York-based NGO (non-governmental organization), Environmental Defense, to reduce packaging. ■

Who's Behind the Green Wave?

Here are five core categories of stakeholders who care about the environment:

- **Rule Makers and Watchdogs**, such as government regulators and environmental groups.
- **Idea Generators and Opinion Leaders**, including think tanks and academics.
- **Consumers and Community**, including local officials and the general public.
- **Investors and Risk Assessors**, such as stock market analysts and bankers.

How Do Companies Create an Eco-Advantage?

1. WaveRiders cut operational **costs** and reduce environmental expenses — like waste handling and regulatory burdens — throughout the value chain.

2. They identify and reduce environmental and regulatory **risks** in their operations, especially in their supply chains, to avoid costs and increase speed to market.

3. They find ways to drive **revenues** by designing and marketing products that are environmentally superior and meet customer desires.

4. A few companies, most famously British Petroleum and General Electric, create **intangible brand value** by marketing their overall corporate greenness. ■

Managing the Downside

Over the last 15 years, chemical giant DuPont has cut its contribution to global warming by 72 percent. Half of the cuts came from changing one process: the production of adipic acid. This modification eliminated emissions of nitrous oxide, a potent greenhouse gas that causes far more warming than carbon dioxide.

The company also vowed to hold flat its energy use — the primary source of its greenhouse gas emissions — no matter how fast the company's top line grew. The company found 100 ways to meet its energy targets. Over the past decade, this strategy has saved DuPont $2 billion.

Green-to-Gold Play 1: ***Eco-Efficiency — Improve Resource Productivity.*** WaveRiders get the same output with lower inputs. In improving resource productivity, their actions stand out as the classic win-win environmental strategy.

Green-to-Gold Play 2: ***Eco-Expense Reduction — Cut Environmental Costs and Regulatory Burden.*** This Green-to-Gold Play centers on the time and money consumed by pollution control and environmental management. In addition to millions of dollars or euros spent on waste disposal and pollution-control equipment, this includes the managerial time and money spent filling out forms, the sometimes crippling cost of fines for mismanaging environmental issues and the general business slowdown caused by jumping regulatory hurdles.

Green-to-Gold Play 3: ***Value Chain Eco-Efficiency — Lower Costs Upstream and Downstream.*** Many companies have found ways to lower value chain costs by cutting the environmental and financial expenses of product distribution. IKEA is proud of its "flat packaging." Efforts to squeeze millimeters out of every box have allowed the company to pack its trucks and trains tighter. That saves up to 15 percent on fuel per item.

Green-to-Gold Play 4: ***Eco-Risk Control — Manage Environmentally Driven Business Risk.*** WaveRiders find issues before problems find them. They examine not only the supply chain, but the entire value chain. Identifying enterprise risk means understanding exactly how a company affects the environment and how the constraints of nature affect the company. ■

For additional information about Cost Reductions at Interface, go to: http://my.summary.com

Building the Upside

Environmental strategy has been on a long march for the past 40 years, from a tactical focus on compliance, to an additional — but still tactical — emphasis on costs and efficiency, to a more strategic view centered on growth opportunities. More and more companies now see the top-line potential from artfully managing the pressures of the Green Wave.

The following Green-to-Gold Plays are about growth — of sales, of brand value and of stakeholders' trust:

Green-to-Gold Play 5: ***Eco-Design — Meet Customer Environmental Needs.*** Identifying customer needs or desires and designing a product to meet them is never easy. With growing environmental consciousness, the opportunities to seize Eco-Advantage through green marketing are expanding. Companies can avoid the worst stumbles by following a few simple lessons: Meet a need that exists; don't ignore other needs of the customer; and pay attention to your own costs.

Green-to-Gold Play 6: ***Eco-Sales and Marketing — Build Product Position and Customer Loyalty on Green Attributes.*** Every day more consumers are including environmental factors in their buying equation. In parallel, companies are finding that there is money to be made from meeting the growing demands for green products.

Green-to-Gold Play 7: ***Eco-Defined New Market Space — Promote Value Innovation and Develop Breakthrough Products.*** Toyota saw the Green Wave coming and responded with the energy-efficient "hybrid" Prius. The company promoted value innovation and ended up with a breakthrough product that enhanced profits and sustained shareholder value.

Green-to-Gold Play 8: ***Intangible Value — Build Corporate Reputation and Trusted Brands.*** Positioning a brand as environmentally friendly only works if it's true. The 1980s and 1990s saw a flurry of bogus green claims. Some were just plain laughable. Hefty's highly touted biodegradable garbage bags broke down in sunlight, but not in the landfills where they would actually end up. ■

The Eco-Advantage Mindset

WaveRiders build a foundation for Eco-Advantage by reframing how everyone in the company looks at environmental issues. For these companies, environmental thinking is not always the final word on strategy, but it *is* always a consideration.

WaveRiders use an environmental lens to change the way they think and sharpen their business strategies. Deeply embedded, the **Eco-Advantage Mindset** arises naturally at every opportunity.

Here are some basic rules to get you there:

- **Look at the forest, not the trees.** WaveRiders think broadly about the time frames involved in investment and strategy decisions; the full range of potential payoffs from those investments, including hard-to-measure intangible gains; and possibilities for adding value across the full chain of production.
- **Start at the top.** Companies leveraging Eco-Advantage have a commitment to environmental thinking at the very top of the organization.
- **Adopt the Apollo 13 principle — "No" is not an option.** In leading companies, management gives the organization bold environmental goals and seemingly impossible tasks — and refuses to accept failure.
- **Recognize that feelings are facts.** Top performers know that what NGOs, employees, customers, communities and other stakeholders feel about a company's environmental performance and reputation can be much more important than the reality.
- **Do the right thing.** WaveRiders make choices based on core values, including caring for the environment, even when it might not pay off in the short run. ■

Eco-Tracking

The Eco-Advantage Mindset is a powerful motivator and the core of the environmental lens that helps companies step up to challenges and find opportunities for seizing advantage. But it's just the beginning. Companies need tools to get going. They should start with the elements of the toolkit that help them understand where they are.

This requires thinking and analysis that might not come naturally. Eco-Tracking helps to answer fundamental but sometimes unfamiliar questions:

- What are the company's big environmental impacts?
- When and where do those impacts arise? During manufacturing? During shipping and distribution? Upstream in the supply chain? Or downstream in the hands of customers?
- How do others view the company's environmental performance?

These questions can be difficult to answer. But leading companies use a core set of Eco-Tracking tools to develop an environmental self-portrait and help them manage for Eco-Advantage. To follow their lead, you should:

- **Trace your environmental footprint.** The more resources it uses or pollution it produces, the bigger a company's footprint. Understanding its footprint can help a company engage in pollution prevention, find new opportunities to serve customers, avoid problems with stakeholders and gain a leg up on the competition.

(continued on page 6)

Eco-Tracking

(continued from page 5)

● **Capture data and create metrics.** The Toxics Release Inventory program started many WaveRiders toward environmental leadership. After being required to measure and report their emissions of toxic substances, companies saw how big their footprints were.

● **Set up environmental-management systems.** Environmental issues are now considered part of the potential liabilities that companies must include in accounting. An environmental-management system (EMS) is thus essential for companies of all sizes.

● **Partner for advantage.** There is no better way to track what outsiders think of your company on an emotional level than by partnering with, and really listening to, outside organizations. These include NGOs, local communities and other companies. ■

Redesigning Your World

Green architect Bill McDonough sees vast opportunities to redesign products or even reconceive how and why we use them. He envisions a world where, after customers are done with them, products are broken down into either biological parts that can be safely disposed of, or technological parts that can re-enter the industrial system and become new products. Only design that supports this vision, he says, will lead us toward sustainability in the deepest sense.

Redesigning products, processes and even whole value chains is the second section of the Eco-Advantage Toolkit. To make environmental gains and benefits from reduced waste and increased resource productivity, companies need to fundamentally change how they do things.

Pollution Prevention Hierarchy

For most companies, the state of the art in environmental thinking can be summed up with the slogan, "Reduce, Reuse, Recycle." The best pollution-control option is to **reduce** the use of resources and eliminate waste. The next best option is to refurbish or **reuse** items. Then **recycle** what's left. As a last resort, throw something out.

The pollution-prevention hierarchy has two further levels. Before reducing, companies should explore ways to **redesign** what they do and how they do it. And even before that, they should try to **reimagine** their products or processes. Just as companies have learned it's generally cheaper to reduce than to reuse, recycle or throw out, now they are discovering that it is often more profitable to redesign and reimagine.

The Eco-Advantage Bottom Line

WaveRiders move beyond merely tracking environmental issues to change products, processes, their workplaces and even their supply chains. To carry out their redesign efforts, they deploy various tools, including:

● **Design for the Environment (DfE).** Once a company has a feel for where environmental issues arise in the value chain, it can redesign to avoid those problems.

● **Closed-Loop Systems.** In the business setting, waste is costly. It often means you're squandering valuable inputs like metals, chemicals or energy. WaveRiders seek to recapture these resources by recycling waste water, reusing materials and stripping valuable gases from exhaust. In doing all this, they reduce their footprint, improve resource productivity and often save money.

● **Industrial Ecology.** Some waste products can be useful inputs for other industries.

● **Green Building and LEED Certification.** The U.S. Green Building Council awards points for using recycled materials, incorporating energy efficiency into design and other environmental benefits when it scores buildings for Leadership in Energy and Environmental Design (LEED) certification.

● **Supply Chain Audits.** In today's networked, blog-happy world, a problem with any supplier, even a small one, can quickly tarnish a big brand. ■

Inspiring an Eco-Advantage Culture

Culture comes from more than just a high-minded mission statement. It's built with a conscious effort and incentives to shape people's behavior.

In his book *Good to Great*, Jim Collins talks about a proverbial flywheel that gets moving slowly but, with constant nudges in the right direction, gains speed and inertia. Building a corporate culture that promotes environmental thinking is a flywheel project.

The right tools help create the flywheel and get it spinning in the direction of Eco-Advantage. Everything from executing Green-to-Gold Plays to cultivating an Eco-Mindset to using Eco-Tracking and Redesign tools adds momentum.

Culture-Building Tools

WaveRiders use four basic culture-building tools:

● **A vision, reinforced by stretch goals.** WaveRiders ask their organizations what's achievable, then set stretch goals beyond that to unleash creativity, drive innovation and build Eco-Advantage.

(continued on page 7)

Inspiring an Eco-Advantage Culture

(continued from page 6)

● **Practices that fold environmental thinking into every strategic decision**. WaveRiders fold intangible benefits — such as lower risk, brand building and reputation protection — into their investment calculations.

● **Incentives for engagement with and accountability for the environmental agenda.** WaveRiders drive real environmental engagement by placing ownership for environmental strategy with management at an operational level, by cross-fertilizing executives between line operations and environmental positions and by establishing incentives for environmental success.

● **Communications aimed at both internal and external audiences.** A good environmental report should discuss the important aspects of the company's footprint. It should use quantitative metrics and cover core issues such as air emissions, water pollution, hazardous waste disposal, energy consumption, greenhouse gas emissions and notices of legal violations. Failure to review all aspects of the company's footprint signals to stakeholders that a company has something to hide. ■

External Audiences

Companies can use communications as both a shield and a sword. Touting the green qualities of a business can ensure that NGOs, regulators, the media, and ultimately, the public see the company as a responsible corporate citizen. 3M developed a simple process for managing these issues. Its Environmental Marketing Claims Committee is a cross-functional group that draws from public affairs, EHS and product responsibility and legal affairs. It checks every marketing claim, from ads to packaging, and thinks about how a particular claim will fly in the marketplace. The point, the team says, is partly legal but mainly about reputation.

Why Environmental Initiatives Fail

As vast as the opportunities for Eco-Advantage are, successfully exploiting them is not easy. Here are 13 common reasons environmental initiatives fail and some thoughts on how to avoid these pitfalls:

1. Seeing the Trees But Not the Forest. Ford committed substantial sums of money to making the River Rouge factory green, but manufacturing is not the core environmental problem in the auto industry. Instead, the company should have studied its environmental footprint and taken a hard look at its products. While Ford focused on planting grass on the River Rouge roof, Toyota was rolling out its hybrid gas-electric technology and taking the auto world by storm.

2. Misunderstanding the Market. Eco-products hold up the promise of capturing new markets while making the world a better place. But the process of deciding whether a green initiative makes business sense should be fundamentally the same as for any other new product.

3. Expecting a Price Premium. Green premiums are hard to pull off. Don't pitch only the green attributes of a product. Look closely at Toyota Prius ads and see the dual message. The car has an award-winning power train that will give you some zip, and it's got cool technological features. It also helps to save the planet. The environment is the third "button" pressed.

4. Misunderstanding Customers. When an environmental initiative depends on changing customer behavior, be careful. If the change doesn't save people time or money — and sometimes even if it does — they may resist. Know your customers' limits.

5. Middle-Management Squeeze. CEO leadership and stretch goals are still success factors, but they can also cause irreconcilable conflicts for the people caught in between — the ones actually running the company's operations and trying to meet sales goals, keep costs down and hit profit objectives. Deal directly with the multiple pressures on middle managers with incentives and training.

6. Silo Thinking. If pollution is a cancer on the earth, abatement is chemotherapy — a treatment after the problem exists. Design for the Environment (DfE) is like quitting smoking and eating right. It's preventive medicine for environmental problems.

7. Eco-Isolation. Integrating the concerns, needs and incentives of those on the company's operational front lines into the game plan is essential. The larger goal is breaking down the barriers between environmental and business strategy.

8. Claims Outpacing Actions. In eagerness to be green, sometimes companies make promises before they've taken action. To avoid getting ahead of yourself make sure everything you say is true.

9. Surprises: Wasp Stings and Unintended Consequences. Expect the unexpected. Take a systemic view and be careful about forecasting potential gains.

10. Perfect Is the Enemy of Good. Sustainability depends on long-term economic success. It's the only way to fund whatever degree of environmental commitment a company chooses to make. The quest for perfection too often leads to inaction. Successful companies often find incremental solutions that steadily improve

(continued on page 8)

Why Environmental Initiatives Fail

(continued from page 7)

environmental performance, while minimizing the burden in other areas.

11. Inertia. Moving people into a new way of thinking won't happen without a healthy push. Vision is critical. Every sweeping vision needs to be brought down into actionable steps.

12. Ignoring Stakeholders. Companies, especially multinationals, need permission from society, employees, regulators and many others to grow — even to exist. Knowing your stakeholders is essential. Start by mapping out which groups focus on particular issues. Listen to outside perspectives.

13. Failing to Tell the Story. Eco-Advantage comes from taking action — and getting credit for it. Companies need to tell their own employees what they're doing. Companies need to leverage clear wins. ■

Taking Action

The plays, the mindset, even the tools for building Eco-Advantage mean little until they are translated into action. Many companies have pieces of an environmental strategy in place, but few are systematic about driving environmental thinking into their approach to business.

Because no two businesses are the same, every company has to plot its own Eco-Advantage path. However, the pace of progress is greater if certain things get done first. Broadly speaking, the agenda is:

- **Short term:** Find out where you stand and launch pilot projects. The short-term focus is systematic analysis. Clarify who and what to think about in the environmental realm. Gap analysis — knowing what you don't know — can be a big first step.
- **Medium term:** Track performance and build an Eco-Advantage culture. In over-the-horizon scanning, look for items on the public agenda that seem to be increasing in intensity, even if they are only tangential to your business. Tracking second- and third-order connections can help you spot emerging business drivers.
- **Long term:** Drive environmental thinking deep into the business strategy. Long-term actions should center on making environment a core element of strategy. This will require advanced Eco-Advantage tools and exercises, including supply chain auditing, rethinking products and re-examining markets and stakeholder management and partnerships. ■

Eco-Advantage Strategy

Eco-Advantage has a twin logic. On one hand, the strategic gains are based on hard-edged analysis. In a world of constrained natural resources and pollution pressures, the business case for environmental stewardship grows stronger every day.

Pressures on companies now come not only from eco-radicals, but also from traditional bankers and others asking tough-minded questions about environmental risk and liability. Those who offer solutions to society's environmental problems both mute their potential critics and find expanding markets.

In parallel, there's a strong values component to the case for corporate environmental care. The WaveRiders have made money — lots of it — by refining their business strategies to incorporate environmental factors.

But as much as they are driven by profits, they also are aware that their stewardship helps more than the bottom line. When short-term gains don't justify green initiatives, they are willing to look for long-term value for themselves and their workers, for their communities and for the planet. The gold they've discovered by going green is not only about money.

Green to Gold

More and more people in the business world see corporations playing a major role in solving the world's environmental problems. Business, they know, is our most powerful mechanism for creating a functioning society and matching needs with goods and services.

Companies can and should be a force for good, leading the charge on caring for the environment and protecting our shared natural assets. Financial and environmental success can be achieved together. With the right mindset and tools, companies can handle the hard trade-offs.

In the end, Eco-Advantage is about a new way for inspired people — executives, managers and workers — to build companies and industries that are not just innovative, powerful and great … but good, too. ■

HARDBALL

THE SUMMARY IN BRIEF

Master strategists George Stalk and Rob Lachenauer predict that business competition will become so fierce over the next 10 years that marginal victories and short-term advantages will not be enough to keep a company thriving. In Hardball, *they explain that winning will require relentless strategic execution focused on turning competitive advantages into decisive advantages that neutralize, marginalize and even punish rivals.*

The world of hardball competition is a place where the players are zealously committed to winning and relentlessly driven to strengthen their competitive positions, creating a virtuous cycle that puts them far out of the reach of competitors. Stalk and Lachenauer turn the experience they have developed during 25 years advising and observing a wide range of companies into a game plan for using hardball techniques. With these techniques, companies can achieve decisive victories over competitors — without bending the law or compromising their obligations to stakeholders. Hardball competitors can unapologetically play rough, yet they are also adept at the "soft" side of management — rallying talent and building culture through a determined focus on the few issues that are most critical to their success.

Hardball *presents detailed case studies of companies from many industries to outline seven hardball strategies: unleash massive and overwhelming force, exploit anomalies, threaten competitors' profit sanctuaries, take it and make it your own, entice competitors into retreat, break industry compromises, and hardball M&A.*

What You'll Learn In This Summary

✓ Who uses hardball strategies and how have they helped?
✓ Under what circumstances does each hardball strategy work most effectively?
✓ How can a company orchestrate a hardball attack?
✓ What is the meaning of competition for the new generation of business players?
✓ Why do great companies stumble when they lose their competitive advantage?
✓ What new ideas and strategies do veteran executives have to learn to compete in today's global marketplace?

HARDBALL

by George Stalk and Rob Lachenauer with John Butman

— THE *COMPLETE* SUMMARY

The Hardball Manifesto

When companies play hardball, they use every legitimate resource and strategy available to them to gain advantage over their competitors. When they achieve competitive advantage, they attract more customers, gain market share, boost profits, reward their employees and weaken their competitors' positions. They then reinvest their gains in their businesses to improve product quality, expand their offerings, and improve their processes to further strengthen their competitive advantage. When they continue this cycle of activity for a prolonged period, they can transform their competitive advantage into a position even more powerful and desirable — they can achieve decisive advantage. They can use their decisive advantage to bring about fundamental change to an entire industry, put their competitors into a reactive position, cause their partners and suppliers to make adjustments, and deliver so much value to their customers that their market share grows larger still.

Five Hardball Principles

Hardball players live by the following five principles:

1. They focus relentlessly on competitive advantage. Hardball players strive to continually widen the performance gap between themselves and competitors. They are not satisfied with today's competitive advantage — they want tomorrow's. They know what their advantage is and exploit it relentlessly. They don't deceive themselves or cheat. They measure their competitive advantage and differentiate theirs from their competitors.

Wal-Mart began playing hardball by creating a distribution system that reduced transportation costs, increased inventory turns and gave it a competitive advantage. Then it went to "every day low prices" to stabilize demand, further reduce costs and build volume. Next it leveraged its huge sales volume to gain influence over shipments from suppliers and to dictate merchandising and product mix, reducing prices further and adding yet more volume.

2. They strive to convert competitive advantage into decisive advantage. Decisive advantage is systemically reinforcing and puts you out of the reach of your competitors. The better you get at it, the harder it is for competitors to compete against it or take it away. For example, as you get bigger than your competitors, your costs go down further, enabling you to further your market share.

Toyota's decisive advantage — which is built on its superior production system — has enabled Toyota to grow its global market share from 5 percent in 1980 to 11 percent today, with each point of market share worth about $10 billion in revenue. Toyota's market capitalization in 2003 was greater than that of GM and Ford combined.

3. They employ the indirect attack. Hardball players often avoid direct confrontation with competitors. "The indirect attack is by far the most hopeful and economic form of strategy," writes B.H. Liddell Hart, a military historian. "The most consistently successful commanders when faced by an enemy in a position that was strong naturally or materially have hardly ever attacked it in a direct way."

Southwest Airlines launched a classic indirect attack. It chose not to compete head-to-head with the major airlines at the biggest city hubs where the majors were strongest. Rather, Southwest built up operations in secondary airports. In the Washington, D.C., metropolitan region, for example, Southwest started operations from the Baltimore-Washington airport, the third largest airport in the region, with 12 flights a day. Now it has 163 departures from BWI.

4. They exploit their employees' will to win. To achieve competitive advantage, people must be action oriented and impatient with the status quo. Fortunately, the will to win can be fostered; softball players can be transformed into hardball players. But as your competitive advantage grows, it gets harder to exploit your employees' will to win. "The

The Hardball Manifesto

(continued from page 2)

number-one threat is us," Herb Kelleher, the former CEO of Southwest Airlines, told his people at a big company meeting. "We must not let success breed complacency, cockiness, greediness, laziness, indifference, preoccupation with nonessentials; bureaucracy; hierarchy, quarrelsomeness; or obliviousness to threats posed by the outside world."

5. They draw a bright line in the caution zone. To play hardball means being aware of when you are entering the "caution zone" — the area of possibility that lies between the place where society clearly says you can play the game of business and the place where society clearly says you can't. Before you enter the caution zone, you have to know where the unacceptable area is and draw a bright line for your company that marks the edge, the limit beyond which you will not venture. It is the leader's responsibility to draw the line and make it very bright and clear. Get legal and accounting counsel to help you determine what you can do and what you can't. Hardball players never engage in illegal practices. ■

Unleash Massive and Overwhelming Force

Although the indirect attack is the preferred hardball strategy, there are times when a company has such superior resources that it can use them to overwhelm its competitors with a direct onslaught. GM did so in 2001 when it used its massive financial strength and low costs to offer a zero financing scheme that forced Ford and Chrysler to respond and, ultimately, did those competitors damage. In the early 1990s, Frito-Lay unleashed its extensive resources, especially its killer distribution system, to overwhelm an upstart competitor, Eagle Snacks.

Overwhelming force is not a sure bet. The company that intends to use force must be sure it actually has the resources it thinks it has, and they must be readily accessible. A company must also have the will to deploy its resources with sufficient commitment.

Fat and Sluggish Leaders

The upstart competitor, bent on attack, can see when the leader has gotten fat and sluggish. The upstart will quickly deploy its attack strategy and penetrate the leader's customer base. If the leader does not respond, the upstart pushes the attack even harder. By the time the leader notices the attack and takes it seriously, it might be too late to marshal its overwhelming resources and force the competitor into retreat. Suddenly, the upstart has the competitive advantage and the leader is trying to hit hardballs with a softball bat.

The use of force can sometimes backfire. It can be a dangerous strategy, for example, if the company deploying it does not have a cost advantage over its competitors, and does not have at least product parity and, preferably, product advantage, as well. Without those advantages, competitors can blunt the forceful attack with attractive, new customer offers, better products or price cuts.

Undesirable Consequences

The use of force can also go too far, creating undesirable consequences for the attacker. If the force is so overwhelming that the competitor ends up as roadkill, it may be able to take cover in bankruptcy protection. Then it will have the time and ability to renegotiate contracts on favorable terms and shed unproductive assets. It may emerge from bankruptcy fitter and leaner than ever, ready to fight back or make its own direct attack. It is often best to use just enough force to weaken a competitor, but not obliterate it.

The market leader that deploys massive strength can also become a natural target for competitive protest, bad press, and legal investigation. Overwhelming force is an appropriate strategy only for the company that is willing to take the time to gather good market intelligence and make a plan that avoids any taint of the abuse of market power. If you are charged with wrongdoing, even if you are eventually found innocent, defending against a legal action is its own form of distraction, can eat up resources and can have a negative impact on a brand's reputation. Don't let that happen. ■

Exploit Anomalies

Sometimes a growth opportunity lies hidden in something — such as an idiosyncratic customer preference or a seemingly aberrant employee behavior — that, at first glance, seems to have no relevance to strategy, the business or growth. Hardball players know that such anomalies can contain the seeds of a new business idea, and they look for ways to exploit them.

An anomaly is an irregularity, a departure from the norm. Most anomalies go unnoticed or are ignored. Organizations try to contain or suppress them, precisely because they are departures from the norm and to embrace them might disrupt standard operating procedures.

Nooks and Crannies

Anomalies can sometimes reveal what your customers really want from you. They can also provide a glimpse of what your organization is capable of achieving. Paying attention to anomalies may point you to major opportunities to grow your business by doing on a broad scale what you are already doing in some aberrant nook or cranny.

Exploiting an anomaly can be difficult — taking a limited phenomenon to a much larger scale may require that business processes and systems be adjusted in order to

(continued on page 4)

Exploit Anomalies

(continued from page 3)

sustain and encourage the new behavior and to achieve competitive advantage in cost, quality, time and value.

But hardball executives do not ignore or dismiss anomalies. They dig into them and look for ways to exploit them, asking: What's really going on? How can we learn from this? Is there an insight buried here that can move the business to a whole new level?

Anomalies, such as a large market share in a single city, exist in all businesses, but you are more likely to find them in businesses that are characterized by high complexity — those that have a diverse customer base with many segments, defined by volume, product variety and customer type. The more diverse your customer base, the more likely it is that the standard process cannot be forced to fit all possibilities and that one or more customers will present an anomaly. The diverse base, however, will also make it more difficult for management to see the anomaly because so much information is available. There may be many inconsistencies and aberrations.

Mature Businesses

Mature businesses, complex or not, are also fertile breeding grounds for anomalies. Companies in mature businesses are often set in their ways, resist change and have become prisoners of existing customer relationships.

Hardball companies go looking for anomalies in an organized way with a team that looks for anomalies, analyzes their causes, estimates the profit potential they represent and comes up with recommendations for exploiting them. Once an anomaly with likely potential for building strategic advantage has been identified, the work begins. The anomaly must be thoroughly tested and explored before the strategy can be implemented. You must understand the economics of the anomaly, and the potential sources of growth and increased profitability need to be made explicit.

Taking advantage of an anomaly is an opportunity to inject into your company some of the spirit of experimentation that is characteristic of startups. By capitalizing on anomalies, you can harness the same kind of creative energy and put growth back on your company's agenda. ■

Three Types of Anomalies

Here are three examples of the types of anomalies that might catch the eye of a scouting team:

✓ Medeco, a manufacturer of high-security locks, has average sales per household in major Canadian cities that are twice the average of its sales per household in the United States, even though Canadian cities are generally safer than those in the United States. Why? What drives those sales in Canada?

✓ MEC, a consumer electronics brand, is considered a commodity in Japan, where its products sell at a discount to Sony and Matsushita. In the United States, MEC products sell at a premium through specialty retailers. Why?

✓ Steetley Industrial Distributors has a branch in Oshawa, Ontario, whose gross margins are the lowest of all Steetley's branches, but the branch's sales per employee and return on investment are the highest. Why?

For additional information on the anomaly of the prayer cards, go to: http://my.summary.com

Threaten Your Competitor's Profit Sanctuaries

You can influence the behaviors of a competitor if you can determine where its profit sanctuaries are. Profit sanctuaries are the parts of your competitor's product, service and geographic portfolio where it makes the most money. Every company has one or more profit sanctuaries, and they are important not only because they deliver healthy profits to the bottom line, but because they usually fund other — weaker or developing — parts of the business.

There are many ways to put pressure on a competitor's profit sanctuaries. You can compete aggressively on price on selected products or in selected geographies where you go head-to-head with your competitor. You can offer products with new features, or special combinations of features, at prices that will suck volume away from its products. You can increase service, while holding prices, on a portion of your offering where your own profitability is fairly minor but that provides a major source of your competitor's profitability.

The goal of devastating a competitor's profit sanctuaries is not to force your rival out of business or to create a monopoly within your industry for yourself. Rather, the goal is to choke the flow of cash from your competitor's profit sanctuaries, forcing it to change specific actions or behaviors that are detrimental to you. If it doesn't, it risks an incursion into its profit sanctuaries that will, in turn, put pressure on other areas of its business.

Japanese Automakers Attack

In the early 2000s, the leading Japanese automakers — Toyota, Nissan and Honda — took aim at an important profit sanctuary of the Big Three North American automakers: light trucks.

The initial attempts of the Japanese to move up from compact trucks to full-size trucks were only modest successes. Gradually, North American consumers accepted the Japanese light truck offerings, and the Japanese automakers

(continued on page 5)

Threaten Your Competitor's Profit Sanctuaries

(continued from page 4)

steadily grew their share of the market. From 1980 to 1995, the major Japanese light truck manufacturers had a nearly constant share of 10 percent. The North American producers held the rest of the share. By early 2000, the Japanese leaders had grown their share to almost 25 percent and Detroit's share had fallen to 75 percent.

This is a straightforward example of an entire class of competitors, the Japanese automakers, attacking the profit sanctuaries of established leaders. The result is that Toyota, Nissan and Honda now indirectly control the cash faucets of GM, Ford and Chrysler. For years to come, the strategies of the Big Three will be what Toyota allows them to be.

The use of hardball pricing to threaten a competitor's profit sanctuary and get it to change a behavior sounds straightforward, but execution is difficult. Insight and good planning are key. The management team must be willing to take risks and have the courage to press the attack even when the going gets rough. It is essential that you have good legal counsel throughout the process of planning and executing your strategy.

An attack on a profit sanctuary, especially through pricing, will very likely cause a fierce competitive reaction. It should not be undertaken by the faint of heart. ■

Take It and Make It Your Own

Many businesses achieve success by recognizing the value of an existing idea, practice or business model and making it their own. Ray Kroc didn't invent the fast food restaurant or the assembly line burger. He recognized the potential of Dick and Mac McDonald's Southern California burger joint, cut a deal to franchise it, built the McDonald's Corp., and eventually bought out the founding brothers. Similarly, The Home Depot founders Arthur Blank and Bernie Marcus didn't invent the first warehouse hardware chain. They borrowed the big box concept from their earlier employer, Handy Dan, evolved it into an even bigger box and expanded it throughout North America.

Hardball players are always on the lookout for ideas they can adopt or adapt. They look at competitors in their own industry for trade practices, pricing schemes, product designs, technologies, employee hiring and development methods, approaches to supplier management, and customer focus tactics that are better than their own. They also look in other industries for innovations — such as time and quality management methods, alternative channels and supply chain management tactics — that have not yet appeared in their own.

But hardball players do not infringe on copyrights or steal patents. When they identify a good idea, they find a way to improve it. The founder of Kmart claimed that Sam Walton, founder of Wal-Mart, "not only copied our concepts, he strengthened them. Sam took the ball and ran with it."

Hardball players know that good, proven ideas are hard to come by and are not shy about taking them for their own. In doing so, the hardball company is often able to create a competitive advantage, often faster than it would otherwise, and sometimes even decisive advantage. Hardball competitors seize on a good idea when they see one and then they add something to the model — improve it, adapt it or interpret it. Soon enough, what might have been seen as copying looks like innovation. ■

The Risks of Attack

There are many things you cannot do when attacking your competitor's profit sanctuaries, because they involve pricing practices that may be seen as anticompetitive and therefore will raise substantial risks of civil and criminal liability. U.S. federal and state laws, as well as the laws of many countries, for example, prohibit predatory pricing, which is generally defined as selling goods or services at an unreasonably low price with the intent of driving a competitor out of business. Other statutes make price discrimination criminal where the effect of such discrimination may be to substantially lessen competition or tend to create a monopoly in any line of commerce. These laws define areas that lie well beyond the caution zone, and leaders must draw a very bright line at a safe distance from them.

Entice Your Competitor Into Retreat

In certain circumstances, it is possible to entice your competitors into retreat from competing in a business area that is important and highly profitable for you. This can be done by taking actions that are likely to lure your competitors into a different business area where you also may both compete, but that is less important and profitable for you.

One of the best ways to entice a competitor to retreat from your main area of interest into another area is to leverage your superior knowledge of the costs of your business activities. If you can lure your competitor to compete in an area that it believes (because of its inferior knowledge of its costs) is highly profitable for it, but is not, you might be able to nudge it out of the area of your greatest profitability, and also cause its costs to go up, its margins to shrink and its share to decline. You have, in effect, led your competitor to a business area that it convinces itself is the entrance to a gold mine but, is, in fact, a rabbit hole. This form of indirect attack is the most complex and subtle of all the hardball strategies, and requires a superior understanding of both your own and your competitors' costs and pricing.

(continued on page 6)

Entice Your Competitor Into Retreat

(continued from page 5)

Japanese Manufacturers Lure Others to the Brink

Japanese manufacturers masterfully used a version of this strategy to attack and gain power in many industries in Western markets in the 1970s and 1980s. The Japanese company would build a base in the high-volume segment of the market, typically the low end. Its Western competitors, thinking that the low end of the market was not profitable to fight for, would respond by adding features to their offerings that would justify a price increase, rather than by trying to cut their own prices or lower their costs. Eventually, they would abandon the segment altogether and focus their efforts on the higher-end products, which generally resulted in their losing overall market share.

Two industries where Japanese companies gained decisive advantage by raising the competitor's costs are:

- **Ball bearings.** Koyo Seiko, Nippon Seiko (NSK) and Toyo Bearings led the Japanese assault on Western manufacturers, including Sweden's SKF and Germany's FAG, by focusing on a narrow product offering in the high-volume automotive market.
- **Motorcycles.** Honda, and later Yamaha and Suzuki, gutted the markets of Western manufacturers such as Norton, Triumph and Harley-Davidson by starting with small, low-priced motorcycles and then progressively moving upscale as the Western manufacturers retreated to bigger and higher-priced products.

If you have not examined your costs, in detail, within the past five years — or if you believe your competitors have not — it is very likely that there exists, lurking somewhere in your cost structure, a major opportunity to improve your profits, weaken your competitor and expand your influence.

There are limits to cost-raising strategy. As important as price is to your customers, they care about other things as well, including product features, quality, time and status. ■

For additional information on other industries where Japanese manufacturers gained advantage, go to: http://my.summary.com

Break Compromises

Breaking compromises is the most powerful hardball strategy for companies seeking breakaway growth.

The Home Depot broke the compromises inherent in the do-it-yourself home-improvement business and achieved annual growth as high as 27 percent in an industry that had become accustomed to less than 5 percent growth. By breaking compromises in air travel, Southwestern Airlines has grown seven times faster than the industry over the past decade and is among the most profitable airlines. In 1984, Chrysler introduced the minivan, breaking compromises in the auto industry, and over the next 10 years, the minivan segment grew eight times faster than did the industry overall. Chrysler maintains its leadership today.

Senior managers at The Home Depot, Southwest and Chrysler had the wisdom, curiosity and the perseverance to identify, explore and break the compromises their industries had forced customers to endure. By doing so, they released so much trapped value that they stimulated significant sales and profit growth.

What Are Compromises?

To understand compromises, they must be differentiated from choices. Customers are accustomed to, and want, choices. They want to be able to choose from among a variety of products or services with different features, characteristics and prices. In textiles, for example, the customer can choose from a huge range of fabrics, differentiated by such characteristics as thread count, type of yarn, color and pattern. Customers understand that the price will vary depending on the features and quality of the product choice they make.

A compromise, by contrast, is a limitation on customer choice made by the industry. In fabrics, for example, the customer rarely has a choice about the width of the fabric. It is governed by the capability of the looms that are standard in the industry. When such a compromise is endemic to an industry, customers don't see them as compromises. They accept them as "the way the industry works."

Most compromises don't have to be. Compromises creep into industries in various ways. Some are imposed by standard operating practices that few industry insiders or customers question. Others stem from decisions that might make marginal economic sense for the company, if customers adjust their behaviors. The most important compromises are caused when companies lose touch with their customers. They think that because customers can't see the compromise, or don't complain about it, that they are satisfied.

Then some smart company comes along, sees the compromise and finds a way to break it. And customers suddenly see the compromise, too, and are delighted they now have a choice.

Exploit Compromise-Breaking Opportunities

Here are several ways in which companies can find and exploit compromise-breaking opportunities in any industry:

- **Shop the way your customer shops.** Develop more than a rudimentary understanding of why customers behave the way they do.
- **Know how your product or service is really bought and used.** In all industries, customers devise ways of buying and using products and services so they get what they want, which is not necessarily what the company offers.

(continued on page 7)

Break Compromises

(continued from page 6)

- **Try to make a change to your product/service delivery mechanism.** Redesigning your organization presents a difficult and potentially painful challenge, yet the size of the prize is so large that some company, if not you, will step up to it.
- **Create new ways for your product/service and its delivery system to create value for customers.** Saturn dramatically changed the car-buying experience by creating a no-haggle, low-pressure sales process that placed the emphasis on the wants of the customer rather than on the needs of the manufacturer.
- **Test the limits of your imagination.** Can you find a compromise to break that could result in a radical change to your industry?
- **Relentlessly pursue the breaking of key compromises.** When a strategy breaks industrywide compromises, speed of execution becomes the ultimate differentiator. ■

Hardball M&A

Despite their high failure rate, mergers and acquisitions can be a powerful means of pursuing a hardball strategy much faster, or on a much larger scale, than could be done organically. Mergers made without a strategic rationale and acquisitions pursued on the whim of the CEO are softball moves. A good M&A deal creates competitive advantage; a great deal can help a company achieve decisive advantage, enabling it to lock up critical assets or build superior economics, making the company (almost) untouchable.

Mergers and acquisitions can be used to further any of the hardball strategies previously discussed. Companies often pursue M&A activity to rapidly expand, nationally or globally, or annex a rival and reduce competition. There can be so much strategic benefit in merging or acquiring companies that some hardball players become serial acquirers.

A Warning

There is a danger, however, in such continuous M&A activity. It can appear to be a strategy, when in fact it is only a tool that supports a strategy. M&A as a strategy unto itself does not necessarily create competitive advantage or competitive leadership. Too often, serial acquisition becomes a game, a way to gain the appearance of growth, hike share price, exploit tax loopholes, chase nonexistent synergies, gain political or social favor, settle a personal score for the CEO, or avoid fixing chronic or fundamental problems in the acquiring companies. The house built on a stack of unrelated or nonstrategic acquisitions will eventually topple.

Hardball serial acquirers — such as Partners Healthcare, Cisco, Newell, and Premdor (now Masonite International) — have a clear idea of how to build competitive advantage, and have the capabilities to consummate deals and digest acquisitions for maximum strategic benefit. Companies often begin their M&A activity as a way to pursue a modest strategic goal, but end up achieving decisive advantage.

Cisco Acquires Capability

Cisco Systems is one of the best examples of an accomplished hardball player that uses M&A to acquire capability.

Cisco was founded in 1984 as a provider of data routers but, early on, made a decision that enabled it to quickly become a major player in data networking. Cisco decided that it would purchase any capability it needed and that it could not quickly develop internally. Cisco became expert at the process, acquiring and integrating 82 companies (and shutting down a few that didn't work out) and dramatically expanding its business. Each of the acquisitions was undertaken to support a strategy that would strengthen Cisco's competitive advantage. Cisco has been successful at hardball M&A for several reasons:

- **The thoroughness of its search.**
- **The expertise and skill of its M&A team.**
- **The speed with which it executes deals.**
- **The intensity of its efforts to integrate acquisitions.**
- **Its willingness to "cut bait."** Cisco will quickly dump an acquisition or terminate an operation that does not help create or build competitive advantage.

Cisco has used its ability to identify, close deals with and integrate companies to build worldwide leadership in computer networking.

How to Win at Hardball M&A

Hardball players apply focus, speed and intensity to all stages of M&A. They are better at identifying the specific asset or capability needed to achieve competitive advantage and deciding whether it is best to develop it internally or obtain it externally. They excel in identifying and assessing targets, calculating the maximum price to be paid, negotiating deals fast in a disciplined fashion, and then integrating acquisitions quickly and efficiently in order to achieve strategic objectives.

The lessons from serial acquirers that use M&A to carry out their hardball strategies are straightforward in concept but difficult to execute:

- **Acquire only if the opportunity fits with the strategy.** Mergers and acquisitions should be pursued only if they will help you attain or strengthen competitive advantage.
- **Do not be tempted to step outside your proven process.** When the business model based on acquisitions works, especially when it has continued to work through a series of acquisitions, be wary of deviating from it.
- **If you're going to change the acquisition criteria, you might need to change the acquisition process, too.**
- **Build an internal M&A capability.** Develop your

(continued on page 8)

Hardball M&A

(continued from page 7)

own M&A capacity, build a team that can generate M&A ideas, explore and analyze them, do your own due diligence and negotiate the deals.

- **Seek outside advice and assistance.** Companies contemplating an acquisition can often benefit from the assistance of outside experts in a particular industry or business area, or from the counsel of an adviser who does not stand to gain from the acquisition.
- **Take a rigorous approach to valuation.** When assessing the value of a proposed acquisition, analyze how the purchase will affect the value of your company as well as how much it is worth on the open market.
- **Invest in post merger integration capability so you have the capacity to successfully integrate acquisitions.** ■

Changes in the Field of Play

The game of hardball is dynamic and always evolving. New barriers to achieving competitive advantage emerge and new roadblocks to building decisive advantage are erected. There are several issues that will affect the way the game of hardball must be played in the future and that change the rules for players who wish to be winners, especially on the global field:

Playing the China Card

China will be the biggest and most contentious issue in the next decade for hardball players, even if they are not global companies themselves. China will be the source of tough competitors, and as thorny an issue for all companies as Japan was in the 1980s. Now is the time for business leaders to recognize that they will have to play the China card or be played by it. Here is how hardball players will do so:

- **Drive down costs.** The first move is to drive down your costs faster than your competitors can, and use the cost saving to upset their strategies.
- **Win the Chinese domestic market.** The leaders will be those companies that are not just the leading suppliers to Western brands but are also the leading brands in the Chinese market itself.
- **Use the supply chain wisely.** Time is the greatest trade barrier of all. When U.S. companies rely on Chinese suppliers, they are stretching their supply chain over the greatest possible distance the world allows.
- **Bluff when you have no China card to play.** If you have developed a competitive advantage with customer-driven products in the U.S. market, and believe that your business will not benefit by playing the China card, you may be able to strengthen your advantage by influencing your competitors to source their products in China. ■

The Hardball Mindset

Hardball players possess a number of admirable characteristics. They have an intellectual toughness that enables them to face facts and see reality. They have an emotional awareness that means they know themselves, and their people, well. They are always dissatisfied with the status quo, no matter how fine things might seem, and they have the will to catalyze change. They're tough, but they're not bullies. They're serious about their business, but they also have fun playing the game. They have such an intense passion for winning that it rubs off on others.

The hardball player needs all of these qualities and more to accomplish its most important task: to get to the heart of the matter and stay there. The heart of the matter is that set of fundamental, often systemic, issues that is limiting the growth and success of the business.

The only way to get the firm to focus on the heart of the matter is for the senior leader to define the issues, talk about them and attack them first. Leaders who personally live in the heart of the matter have three common traits:

- **They live at the rock face.** They are physically and personally connected to the market — to customers, consumers, competitors and suppliers. Hardball players love being their own customers.
- **They have the courage to ask simple questions.** Saying "I don't know" can lead to breakthroughs. Leaders lose their edge and value when they assume too much.
- **They build a truth-telling network.** Hardball is a team sport. To play hardball you must develop your own truth-based network, or you will never be sure what the heart-of-the-matter issues really are. ■

Don't Tolerate Failure to Deliver More Than Once

A great threat to a turnaround comes from people who fail to deliver anything but excuses. Many a turnaround has been slowed or derailed because a key player fails to deliver, not just once, but two or three times. Hardball leaders in a turnaround have low tolerance for failure. Time is too precious. One failure may be understandable, even unavoidable. Two or three failures to deliver suggest a lack of will, incompetence or even subversion. This expectation for successful execution must be stated and made painfully clear to everybody at the beginning of the turnaround effort; they should understand that there may well be casualties. People who don't deliver need to be counseled, cautioned, moved or fired. Colonel John Boyd, head of the U.S. Air Force Weapons School for many years, is famous for criticizing his top officers in Europe for their low casualty rate during training. He believed it indicated that the pilots were not being pushed hard enough.

How to Anticipate Business Surprises and Seize Opportunities First

HEADS UP

THE SUMMARY IN BRIEF

In 1900, Galveston, Texas, was destroyed and 8,000 people were killed when a Category 4 hurricane passed directly over the city. By the time anyone knew the hurricane was descending on them, it was too late to react.

In 2000, a financial hurricane wreaked havoc on stock valuations, mutual funds and retirement portfolios. Unlike the Galveston hurricane, the end of the meteoric rise in the NASDAQ Composite Index arrived after many years of warnings.

Today, supercomputers and satellites constantly monitor emerging weather patterns in real time and warn the United States of approaching hurricanes well in advance. The business world, on the other hand, is not much better at forecasting than in 1900. Business "surprises," such as the bursting of the Internet bubble, occur with alarming frequency and take a considerable toll.

According to Kenneth G. McGee, however, even the worst business catastrophes rarely happen without warning. In this summary, McGee describes how managers can break the pervasive pattern of surprises that are often followed by desperate responses. Instead of trying to predict the future, McGee explains, managers need to master predicting the present — understanding what is happening right now and how these current events and outcomes will impact future success. The result: Potential disasters are turned into opportunities.

What You'll Learn In This Summary

✓ Data already exist that can be used to avoid surprises, to capitalize on opportunities, and to make midcourse corrections.

✓ Although many businesspeople are concerned about "infoflood," the amount of data that is *material* is relatively small and can be determined.

✓ Capturing and monitoring material data allow departments and organizations to "predict the present," or use material information about the present to predict everything else happening in the present.

✓ Departments and organizations can anticipate events and changes so they can adjust tactics and strategies to ensure that goals are met, opportunities are maximized, and disasters are avoided.

HEADS UP

by Kenneth G. McGee

— THE *COMPLETE* SUMMARY

PART ONE: ENDING BUSINESS SURPRISES

Turning Business Disasters Into Opportunities

Heads Up is about predicting the present. Predicting the present means taking raw empirical information, analyzing it, and determining its meaning and implications. However, managers don't need to know *all* the operational data to understand what the present situation is. Predicting the present is gathering enough information to answer the question, "Where are we *right now* in meeting our corporate goals?"

By recognizing that there is always warning, and therefore monitoring progress on a daily basis, managers can turn what would have been surprises into a whole new world of opportunity.

Opportunities to Improve Good Results

In the hands of a capable manager, current information about the state of the business always shows opportunities to improve good results or, at a minimum, to act to mitigate the impact of poor results. Therefore:

1. If you acquire the ability to capture, receive, monitor and analyze information about certain events, when those events occur, you can predict the present.

2. If you predict the present and identify the always-present early warnings of difficulties or successes, you will have identified an opportunity for better performance.

3. If you take effective action based on these opportunities, you will be engaged in real-time opportunity detection.

Real-time information is valuable because it gives the manager the most possible response options. Response options are actions that may be taken to mitigate the negative impacts or accentuate the positive aspects of an event before the impact of the event is felt. For example, if sales volumes are falling (event), a response option is to increase advertising to improve sales volume before quarterly revenue targets are missed (impact). As time passes after an event occurs, however, there are fewer and fewer responses that a manager can make to the event before the impact occurs.

Right Time Versus Real Time

When discussing real-time information there is an unfortunate tendency to mistake real-time information for real-time response. It is critical to understand what parts of the process need to occur in real time and which need only to occur at the "right time." In the ideal business context, the following processes happen in the background between an event happening and the impact of the event being felt:

1. Monitoring of information related to the event.
2. Capturing a change in the information.
3. Analyzing the information.
4. Reporting the information.
5. Responding to the information.

When discussing real-time information, the goal is to move the capture, monitoring, analysis and reporting steps not just earlier in the process, but into real time. Moving these steps into real time allows the most possible response options and enables choosing the best response from among them. A real-time response without due deliberation can sometimes be more harmful than the original situation. A "right-time" response can be far superior to a real-time response.

Although real-time information on events is always helpful, real-time response has shown in a number of cases to do more harm than good. Overly aggressive

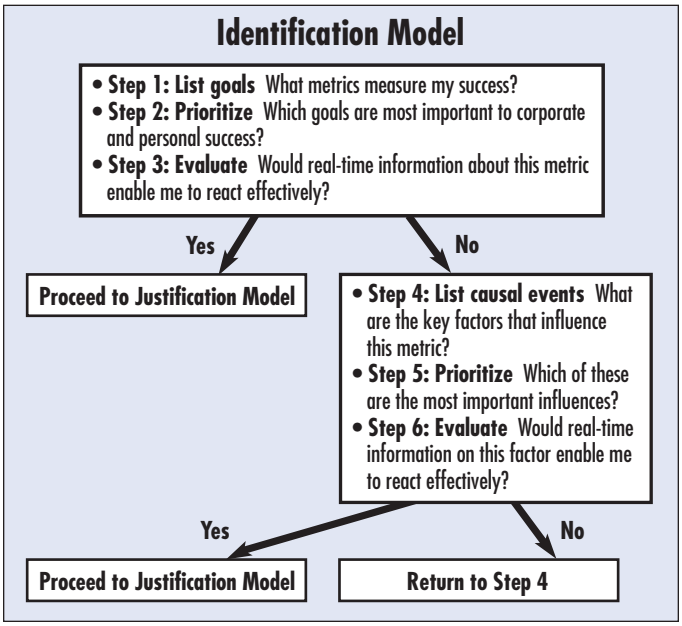
Turning Business Disasters Into Opportunities

(continued from page 2)

responses to real-time information may yield no better results than those achieved without any real-time information at all. Monitoring, capture, analysis and reporting of critical information must move to real time so predicting the present and real-time opportunity detection can take place. They will determine the "right time" for a response to achieve maximum positive results.

Opportunities Versus Disasters

There are different types of events that occur in business: surprises, opportunities and disasters. The difference between an event we call an opportunity and one we call a disaster most often depends on which of the categories the event falls into. These categories include:



- **Surprise event:** The event is not reported, in some cases because it was not monitored, captured or analyzed. Three Mile Island, *Challenger,* and September 11 are examples of surprise events.
- **Suspected event:** The event is monitored, captured, analyzed and reported but too late for effective action. The Galveston hurricane and the Internet investment bubble were suspected events.
- **Surmounted event:** The event is reported in time and effective action is taken.

To end business surprises, managers must receive a heads-up about the present — a few vital elements of data about what is happening right now in their business. Using this information, a manager can successfully understand the big picture at any given moment and predict the present. Using this real-time understanding of what is happening in his or her business, any manager has the chance to take action to prevent surprises and turn them into opportunities. ■

Identifying and Justifying The Right Real-Time Information

A manager looking to guide his or her business to the successful attainment of goals needs real-time information about *some* but not *all* aspects of operations. There are far better ways to utilize limited resources than monitoring every operational variable in real time, even though advances in technologies such as radio frequency identification, portals, wireless communications and Web services are driving down costs. Over time, the resources that are limited will become less financial and technological and more time-based.

Managers will not have the time to track all the information they can affordably monitor. Only a small percentage, perhaps 5 percent, of the potential operational

data is required to predict the present and begin real-time opportunity detection. The difficult part of choosing real-time information candidates is determining which 5 percent to monitor.

Identification and Justification

Given that every attempt to monitor any piece of information in real time costs resources, the manager must identify what information should be monitored in real time and whether the effort required to obtain and monitor the information in real time is justified.

To determine which of the wide variety of influences on reaching goals is necessary for predicting the present and worthy of being monitored, captured and reported in real time, managers must filter all the possible information candidates through the Identification and Justification Models to determine which are worth monitoring in real time. The Identification Model includes:

The Identification Model

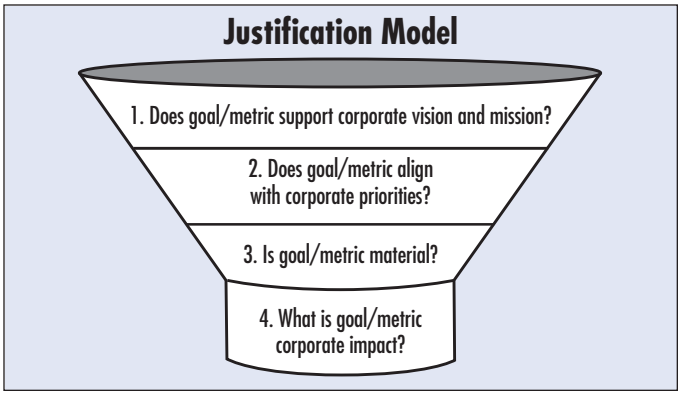
- **Step 1: List Goals.** Determine and list the goals for the planning period and determine the metrics by which achievement of the goals will be measured. (See graph above.)
- **Step 2: Prioritize.** Look at the list of goals and ask, "If I could reach only a few of these goals, which ones would be most likely to ensure corporate and personal success."
- **Step 3: Evaluate.** Ask of each candidate: "Would real-time information on this metric enable me to react differently?" Assess the relationship between the event-impact lag (the amount of time separating an event and its impact) and the response options available.
- **Step 4: List Causal Events.** If it is determined that the response options for the event in question do not fit

(continued on page 4)

Identifying and Justifying The Right Real-Time Information

(continued from page 3)

in the event-impact lag, the manager must determine the causes of the event originally considered.



- **Step 5: Prioritize.** The manager must take all the relevant causal events and prioritize them. The desired outcome is to choose only the causes that are crucial.
- **Step 6: Evaluate.** The manager must ask whether real-time information about the cause would enable him or her to respond effectively.

The Justification Model

Each candidate generated by the Identification Model must pass through a further series of tests — the Justification Model. (See graph on right.) The Justification Model acts like a funnel, further narrowing down candidates from the Identification Model. Each step is a more stringent test that fewer candidates pass.

- **Question 1:** Does the goal the information will help you achieve support the corporate vision and mission?
- **Question 2:** Does the goal align with current corporate priorities?
- **Question 3:** Is the information material to the goal, *or* would this information alone propel you to take action?
- **Question 4:** What is (or the rank of) the corporate impact of achieving (or not achieving) the goal?

Having completed both the Identification and Justification Models, the manager will have a list of the very few metrics that should be monitored in real time properly prioritized. Having used the Identification Model to determine what should be monitored and the Justification Model to determine whether the items are worth monitoring, the cloud of information will have been reduced to the 5 percent that will enable predicting the present and real-time opportunity detection. ■

PART TWO: REAL TIME IN THE REAL WORLD

Surprise Events: Missing the Warning

On Feb. 24, 1994, the nation was shocked at the arrest of Aldrich Ames on charges of espionage. Ames was a fairly high-ranking CIA officer who, it was later revealed, had been spying for the Soviet Union and Russia for more than nine years. While we may never know the full extent of the damage to U.S. intelligence caused by Ames, the director of the CIA told congress that at least nine U.S. clandestine agents in the Soviet Union were executed, the identities of many U.S. agents were disclosed to the Soviets, and many sensitive intelligence reports were handed over.

The CIA not only missed capturing evidence of the risk Ames presented before he reached a position of significant responsibility in the counterintelligence department, but it also did not monitor the very clear evidence of Ames's spying once it began. That evidence included a house Ames bought for more than $540,000 cash, and the fact that he spent $1,397,300 between April 1985 and November 1993, even though his salary during that period totaled only $336,164.

WorldCom

While spying dominated the national news in February 1994, allegations of business fraud and images of former corporate executives in handcuffs dominated the business news for much of 2002. The largest bankruptcy in U.S. history, that of WorldCom, precipitated by fraud committed by senior executives, was one of these stories. As the Ames case was clearly an unnecessary surprise brought about by an absence of monitoring or reporting of key information about an employee of the CIA, WorldCom and other cases of corporate fraud can hardly be considered surprise events.

Business fraud usually originates because of the surprise of disappointing quarterly or annual results and the exhaustion or absence of legal response options. This is exactly how fraud played out at WorldCom. First, reserves allocated for line costs were reduced. When results continued to fall below expectations for several quarters, line costs, which according to generally accepted accounting principles must be booked as operating expenses, were shifted to capital expense accounts, changing WorldCom's reported results.

Earnings Expectations

The role of earnings expectations in this discussion is critical. Fraud is often inseparably linked to the belief that expected goals must be achieved at all costs. Although real-time opportunity detection has no influence over the belief, it can have a marked influence on:

(continued on page 5)

Surprise Events: Missing the Warning

(continued from page 4)

- the expectations that are set in the first place, and
- the response options available for ensuring that expectations are met.

When any company decides to raise capital in public stock markets by selling shares, it not only prepares to meet regulatory requirements, it hires an investment bank (or banks) to represent it in the financial markets. The analysts of the main underwriting investment bank or of other banks involved often assist in the selling of the company's stock by issuing a research report that reviews the prospects and other data about the company and most important, enumerates future revenues and earnings of the company in the opinion of the analysts.

If the stock becomes widely traded, more analysts from more firms issue reports. These reports are heavily influenced by the stated expectations of the company's management as well as the analysts' confidence in the expectations in the face of prevailing market conditions. The research reports are often blended together to determine the *consensus earnings estimate* for a company.

Changing the Game

Real-time opportunity detection *can* influence the earnings and expectations that are set and the response options available for ensuring that expectations are met, thereby reducing the number of times an executive has to report the potentially devastating news of not reaching earnings estimates. The critical first small steps toward fraud are brought about by the combination of the market power of earnings estimates with the surprise actual results are to most executives. They do not know what their final results will be until well after the quarter has closed because real-time monitoring, capture and analysis of the elements that make up the results are not taking place. By this time, other response options are impossible.

Real-time opportunity detection cannot guarantee the absence of fraud, but it can reduce the likelihood of fraud as revenue-related surprise events are eliminated. Companies that engage in real-time opportunity detection can also achieve significant market valuation advantages over competitors as the market rewards these companies' ability to consistently meet expectations.

The Airline Industry

Many recent problems in the airline industry, including announced losses of tens of billions of dollars, are the result of the industry not monitoring the right information in real time. Many expenses in the industry are fixed, such as labor contracts, airline purchases, and jet fuel. In 2001, contracts were signed to increase pilot, flight attendant and mechanic pay while evidence indicated that the most profitable group of customers was cutting back. Due to the fixed cost structure, operating revenue in real time did not provide adequate warning for the industry. By the time operating revenue decreases were evident, cost increases were already locked in.

Ending business surprises depends on determining the right information to monitor and setting up the processes and procedures for monitoring, capturing and analyzing changes in that information. The airline and financial industries arguably monitor more real-time information than all other industries combined, yet they are still victims of surprise events. Although the case for real-time information is relatively straightforward, these examples clearly show that simply making the case for real-time information is not enough. Monitoring the right information is the only way to end business surprises. ■

For Additional Information on how the airline industry tracks information, go to: http://my.summary.com

Suspected Events: Reporting Too Late

Imagine if Henry Wadsworth Longfellow's famous poem "Paul Revere's Ride" was written with a slightly different scenario. Revere had arranged for real-time monitoring, capture and analysis of British troop movements in Boston. However, once he received this real-time information, rather than acting immediately, he spent several hours shoeing his horse and dressing for his ride. If Revere had behaved this way, by the time he reached the towns of Middlesex County, his warnings of the approaching British would have come too late. Or imagine that rather than crying out a warning to the inhabitants of each town, he had simply nailed a letter to the door of the town church for the townsfolk to read in the morning. Each of these scenarios, although seemingly ridiculous, is not far from reality.

A rider named William Dawes set out from Boston at the same time as Revere with the same news, but did not stir the famous response that led to the battles at Concord and Lexington. Why? Because he failed to report his information to the right people.

The imagined delays and Dawes's experience are similar to the situation encountered by many organizations today: Even when enterprises have the facilities for monitoring, capturing and analyzing the right real-time information, many do not report it to the right people in real time. These companies are tracking critical business information in real time but are still the victims of unanticipated problems or lost opportunities.

Sears

Sometimes executives are aware of changes around

(continued on page 6)

Suspected Events: Reporting Too Late

(continued from page 5)

them but a suspected event still occurs, as it did in October 2002 at Sears. In 2001, Sears's credit division accounted for 60 percent of operating income. The large credit division was at the root of Sears's fall 2002 earnings surprise when it not only missed expectations for profitability, but it announced a loss due to the need to write off $222 million of bad debt from its credit card business. Since Sears does not write off debts until they are 240 days old, too late for the credit division president to take action to change operating income for the positive, his only course was to increase reserves for delinquencies that would negatively effect operating income. Sears decided that the damage caused by inadequate monitoring and reporting on the credit portfolio had surprised the company too many times, and in July 2003, got out of the credit card business entirely.

The Contingent Road Map

One key strategic planning tool for situations where the future is uncertain and estimates are required is the contingent road map. A contingent road map specifies several possible courses of action with specific triggers for taking one course rather than another as time passes and actual information replaces estimates.

Suspected events are the most maddening of surprises — the data to stop the surprise were there; they were just not in the right hands. Real-time reporting plays a critical role in ending these types of surprises. All managers must seek information that already exists in their organization that may give them a heads-up about an approaching disaster or opportunity that would otherwise be a surprise. Information sharing is crucial to successful real-time opportunity detection.

To end surprises not just for individual managers but for the corporation as a whole, traditional silos of information must be broken down and real-time data shared. ■

Surmounted Events: Getting It Right

The notion of monitoring, capturing, analyzing, reporting and responding to critical information is not an alien concept in our day-to-day activities. From clocks, thermostats and fuel gauges to tachometers, smoke detectors, and gas pump meters, we are surrounded by examples of real-time monitoring, capturing, analyzing, reporting and responding to events.

Despite the damage caused by business surprises attributable to an absence of real-time information and the prevalence of real-time information in our personal lives, little is being done to change the culture and processes that tolerate surprises and to begin using real-time opportunity detection. However, in companies across the economy, managers are predicting the present, detecting opportunities in real time, and what were once surprise events or suspected events are becoming surmounted events.

eBay Uses Real-Time Information

On Sept. 11, 2001, five minutes after the North Tower of the World Trade Center collapsed from a terrorist attack, several listings were entered on eBay's site offering rubble from the scene.

Although the listings were probably fraudulent, the impact of the public revulsion for such crass profiteering would have reflected negatively on eBay. But eBay's reputation remains unscathed because, although many of us heard that rubble was listed, we also heard that "someone tried to auction rubble from the World Trade Center." The word "tried" makes all the difference. eBay remains trusted because it acted quickly to remove the items within minutes of the listings becoming available to users.

Amberwood Homes, a large custom builder in Arizona, has made some significant changes to its processes and culture to eliminate scheduling surprises. Over the years, each construction superintendent at Amberwood had developed his or her own process for tracking progress on a house and setting subcontractor schedules. In fact, according to Dan Johnson, Amberwood's construction manager, many subcontractors maintained no schedules at all. Johnson saw the opportunity to significantly improve operations by centralizing progress reports and making real-time adjustments to schedules.

Today, each of Amberwood's superintendents and more than 50 subcontractors use a real-time scheduling system to ensure that no unnecessary trips are made and everyone on a job knows what the current status is at each house under construction — typically 20 to 25 at any given time. Superintendents update progress on a job site as each step of the process is completed. A new schedule is generated as adjustments are made. Each morning, subcontractors check the schedule to ensure they are going to the right houses at the right time. Amberwood's savings from the program have boosted margins approximately 20 percent.

Real-Time Technology in the Retail Industry

In retail, margins are tight, and the emphasis is on inventory management. Success or failure is often measured by no more than having the right products in the right store at the right time. Selling out of a product means lost revenue, often with no chance to recover. By the time inventories can be restocked, most customers will have found the item elsewhere. Protecting against

(continued on page 7)

Surmounted Events: Getting It Right

(continued from page 6)

inventory shortfalls by overstocking leads to significant margin erosion as the goods left over have to be marked down or shipped to an overstock dealer. Wal-Mart's use of technology for efficient inventory management has set benchmarks for every industry and has put particular pressure on every company in the retail business, whether it is a direct competitor of Wal-Mart or not.

These companies provide clear evidence of the business benefits of ending surprises and capitalizing on real-time information. They rely on technology to differing degrees to accomplish real-time opportunity detection, but they are focusing on a limited range of information about the present to ensure that surprises are avoided and opportunities are exploited. Each company is applying real-time opportunity detection to only a limited part of their business, and although they are enjoying the results of their current real-time efforts, there is more they can do to expand real-time opportunity detection to become Real-Time Enterprises. ■

PART THREE: FROM REAL-TIME OPPORTUNITY DETECTION TO REAL-TIME ENTERPRISE

Following Through: Deploying Real-Time Opportunity Detection Across the Enterprise

Amberwood and eBay are both doing a great job of real-time opportunity detection. They have identified areas of their business where capturing real-time information and delivering it to the right managers can have an immediate impact in improving business results. Despite early success, they still have a long way to go to reach the ultimate goal — ending all business surprises by being Real-Time Enterprises.

The initial deployment of real-time opportunity detection is just the first of three steps on the road to becoming a Real-Time Enterprise. Real-Time Enterprises both move the detection of any event that affects their most critical business processes into real time and improve their ability to respond to these events when they occur.

To become a Real-Time Enterprise, follow these steps:

- **Step 1: Begin real-time opportunity detection.**
- **Step 2: Deploy real-time opportunity detection across the enterprise.**
- **Step 3: Overhaul processes to improve the organization's ability to respond.**

Although the three steps to becoming a real-time enterprise are logically distinct and appear linear, in practice the lines between the steps are not nearly so clear. Steps 1 and 2 can be combined by immediately looking at real-time opportunity detection from the corporate perspective. Steps 2 and 3 can be taken simultaneously — in fact, it will be necessary for many companies to do so as processes are redesigned to generate real-time information so that real-time opportunity detection can be implemented.

Deploying Real-Time Opportunity Detection

In the second step, executives and managers spread real-time opportunity detection throughout the enterprise so all critical business processes and functions are being monitored in real time. When deploying real-time opportunity detection to the entire enterprise (driven by senior executives rather than individual managers) so that all the corporation's most critical business processes are being monitored, several modifications of the Identification and Justification Models have to be made to properly direct resources.

Just as a manager cannot acquire real-time information on every important metric simultaneously, so too it is highly unlikely that any organization can undertake real-time monitoring of all its most critical business processes simultaneously. Therefore, prioritization is essential. One of the key functions of the Identification and Justification Models is to prioritize information to be monitored in real time. Specifically, in the models, the manager goes through at least two prioritization filters, the first in step 2 of the Identification Model, where the manager prioritizes his or her various goals, the other in question 4 of the Justification Model, where the candidates for real-time monitoring are prioritized by their corporate impact.

Modifying the Models

Corporate prioritizing, however, requires a slight modification to the models. In this case, rather than considering corporate impact as the last step, corporate impact is the mechanism for prioritizing goals in step 2 of the Identification Model. The easiest way to perform this step is simply to examine the firm's 10 largest expense-generating or revenue-producing processes. Information that affects the "top 10" should be the highest priority by far and is the most appropriate place to begin spreading real-time opportunity detection.

The second modification to the Identification and Justification Models involves choosing the right metrics for measuring the prioritized corporate goals. This change is necessary because the point of reference is no longer obvious. When deploying real-time opportunity detection across the enterprise, a specific manager or executive needs to be chosen as the point of reference for each prioritized goal. The proper metric to measure

(continued on page 8)

Following Through: Deploying Real-Time Opportunity Detection Across the Enterprise

(continued from page 7)

follows from that choice.

The final step looks at the process of responding as a whole and focuses on removing all unnecessary and costly delays. While real-time opportunity detection will enable individual managers to have a positive impact on their organizations, for the organization as a whole to realize the maximum opportunities for success, the real-time capture of critical data elements must join with revamped organizational structures, new management styles, and in many instances rebuilt business processes. The competitive advantage of Real-Time Enterprises will be the combination of the power of timelier monitoring and reporting of business events with the ability to respond to the events far more rapidly.

More Harm Than Good

It can't be said often enough that even in the Real-Time Enterprise, responses are not necessarily made in real time since overly quick responses can be more harmful than helpful. The real change that happens in becoming a Real-Time Enterprise is that the ability to make a decision about the proper response and to implement that response is vastly improved.

As part of improving its ability to respond, a Real-Time Enterprise does not just re-engineer response processes for efficiency: It redesigns them to both take advantage of and generate real-time information that will allow even more real-time opportunity detection.

General Motors

General Motors is one of the first companies to begin experiencing the power of bringing together the use of real-time opportunity detection across the entire enterprise and enabling much faster responses. The results, even at this early stage, are dramatic. On top of growing market share, General Motors has increased quality and productivity simultaneously, cut costs, and introduced an average of one new vehicle per month in 2003.

The best evidence of GM's success so far is the 2002 Harbour and Associates (an independent consultancy located in Troy, Mich.) report on automobile manufacturing. Here is an excerpt from that report:

"GM, with a 4.5 percent overall improvement, led the domestic manufacturers in assembly, engine and transmission productivity, which marked the first time in the history of the Harbour Report that GM finished ahead of Ford in the assembly and overall hours per vehicle (HPV) measures. Also for the first time ever, a GM plant (Oshawa #1, with a 16.79 HPV) led all North American car and truck plants in assembly productivity." ■

Solving the Challenges Of Deploying Real-Time Opportunity Detection

As companies begin to take the second and third steps toward becoming a Real-Time Enterprise, deploying real-time opportunity detection in all their most critical business processes and improving their ability to respond to the events detected, they will run into issues that are beyond their scope more and more often.

Even with a majority of managers engaging in real-time opportunity detection, some events that are critical to the organization's success may not be monitored. Although some managers may be monitoring events in real time, crucial information may not be passed to all relevant parties. In other organizations, the intersection of processes governed by real-time opportunity detection with those that are not yet real time will cause confusion and inefficiency.

Providing Up-to-Date Feedback

Changing a company's critical business processes to operate in real time, to provide up-to-date feedback on progress when necessary to end all business surprises, requires that the most senior executives of a corporation take an active role in the transformation. It requires that they take on three new roles to successfully navigate steps 2 and 3 of the path to becoming a Real-Time Enterprise:

1. Real-Time Enterprise change leader. In many cases, this function will begin to evolve as an extension of the duties of an existing senior executive, most commonly chief operating officer, chief information officer, or chief financial officer.

2. Long-distance lookout. The function of long-distant lookout will call for focus on following event-impact chains much further back than the average manager can or has the time to do.

3. Internal monitor and reporter. In companies struggling because of internal shocks, a new function will most likely emerge first. This new function will focus primarily on ensuring that corporate targets are measured accurately and reported truthfully to the rest of the organization, especially other senior executives.

A New Executive Officer

In many firms, a new governance structure will involve the creation of a new executive officer of the firm to take on all three functions, an executive we call the chief monitoring officer (CMO). The CMO will benefit the firm by single-mindedly focusing on the tasks described and these tasks alone, with the time to perform them well. ■

Using Digital Technology to Become Unique

HOW DIGITAL IS YOUR BUSINESS?

THE SUMMARY IN BRIEF

The biggest, most important issue facing business today is going digital. That's true whether you are an old-economy giant or an Internet start-up. You will go digital.

But going digital is not about wiring everyone in the company, converting your research and development departments to CAD/CAM, selling your products through your Web site, or letting your employees telecommute. Instead, going digital is about creating a great Digital Business Design (DBD) that lets your company expand its strategic options. It's really about using digital technologies to craft a business model that's superior and unique.

In this summary you will learn how to make your company a digital company. You will see that:

- ✓ **Digital Business Design** means creating unique value propositions for your customers and your employees, having a robust profit model and finding a way to protect the profitability you create.
- ✓ **Managing Bits Not Atoms** is key to DBD. You will learn how managing information (bits) instead of physical assets (atoms), lets you sell to and service customers faster, cheaper and better.
- ✓ **Creating Choiceboards** lets your company move away from guessing what customers want to letting them tell you exactly what they want, and delivering it to them faster than ever before.
- ✓ **Practicing 10X Productivity** lets your company leverage digital resources and frees employees to engage in higher level work for even greater productivity.
- ✓ **Creating a Digital Organization** lets your internal talent effectively use the information digitization makes available to everyone at every level. A digital organization is fast, accurate, morphable and has an external focus.

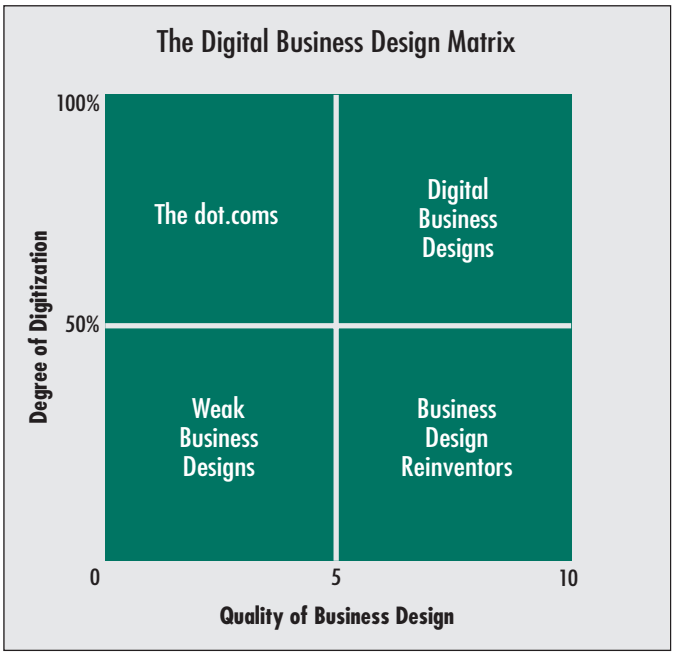
Getting Started In Digital Business Design

Until recently, the probability that any organization would enjoy long-term success was determined by a single factor: **the quality of its business design**. Today, a second crucial competitive factor has been introduced: **the degree of relevant digitization**. Based on its level of digitization and its business design, a company can fit into one of four categories:



- **low digitization, bad business design;**
- **high digitization, bad business design;**
- **low digitization, great business design;**
- **high digitization, great business design.**

Digital Business Design (DBD) — using technology to create a unique and better business design — will ensure that your company fits into the last of these categories.

How to Create a DBD

The process of designing your digital business begins with asking and answering five questions. These questions provide the most effective entry point to thinking digitally about your business. They are:

- **What are the most important business issues facing your organization today?**
- **What are the smartest business design choices for responding to those issues?**
- **Which of your company's key business activities involve managing atoms, and which involve managing bits?**
- **How can you replace atoms with bits?**
- **How can you develop bit engines that will manage the bits electronically?**

Strategic Focus

Notice that the first two questions don't have anything to do with digital technology. Instead, they concern issues of strategic focus. That's because going digital won't save a bad business idea or ill-conceived strategic business plan.

Before you do anything, therefore, you must identify the crucial factors that will determine the success or failure of your company in the next few years. The issues your company faces could include lack of innovation, difficulty finding and keeping top-notch people, competing for fast-changing customers, or inability to meet increasing service demands.

Once you have identified the issues you face, you must choose smart business designs to address them. You must decide what your business will and will not do to create unique value propositions for your customers and employees, be a robust profit model, and be capable of protecting the profitability you have created. Your company's business design will include customer

Getting Started In Digital Business Design

(continued from page 2)

selection and creating unique value propositions for those customers and for your employees. It will describe how you will make money, how you will keep those profits and customers, how you will add value, what culture and organizational structure you will create and how you will manage and distribute the intelligence in the system.

A Cement Company Goes Digital

The giant Mexican cement company Cemex is a seemingly unlikely candidate for the digital way of doing business. Yet, Cemex is at the forefront of Digital Business Design.

By developing an information system linked worldwide in real time, Cemex can deliver cement where it is needed, when it is needed — all with little delay, downtime or waste. Unlike its competitors, Cemex never has to worry about its cement hardening in its trucks because customers are ready to take it as scheduled. Cemex's trucks are linked worldwide via GPS; its information is never more than 24 hours old; and it continues to add local cement companies to its worldwide network.

The results are impressive. It is the world's third largest cement manufacturer, but outstrips its major rivals in productivity and profitability, with a cash flow 50 percent greater than that of its biggest rival.

Think Atoms and Bits

As you design your digital business, you need to understand the difference between managing the atoms and the bits in your company.

When you manage atoms, you are manipulating physical assets: stockpiling inventory, shipping products, buying equipment, installing machinery and building factories. When you manage bits, you are manipulating information by gathering, analyzing, modeling, sorting, sharing and replicating data. Managing atoms is costly, slow, cumbersome, imprecise and risky, while managing bits correctly is cheaper, faster, more efficient, more accurate and safer.

Digital Business Design is the art of developing bit engines that will manage information digitally for the maximum business benefit. Your company's bit engine can include a wide array of technological tools and systems, from internal product databases to e-commerce switchboards and electronic marketplaces. Remember, DBD is never about the technology for its own sake. It's always about using technology to enhance what you offer customers and employees while strengthening your profit model and strategic control. ■

Managing Atoms in the Auto Industry and Bits in the Computer Industry

The automobile industry is a classic example of an industry that still largely manages atoms instead of bits. Manufacturers guesstimate the number of cars that will be purchased and which models will be popular, then physically manufacture and distribute them, hoping they will sell. The lack of reliable data (bits) about what customers want forces everyone along the chain to produce and handle at great expense millions of profitless products (atoms). Dealers and manufacturers end up spending an average of $1500 per car on incentives and rebates to move cars consumers don't want.

Dell Computer, on the other hand, manages bits rather than atoms. Customers select the configuration they want for their computers at the Dell web site. Only after the specs have been determined and the customer has paid does the production system get to work, assembling the system for shipment. Dell manufactures only products that customers want and have paid for. By managing bits first, Dell reduces the need to manage atoms. And both profitability and customer satisfaction win.

The Choiceboard: A DBD Tool

One of the most effective bit engines companies can use in their digital business design is the choiceboard.

Most buyers get too little of what they want and too much of what they don't want. Customers purchase products with features they don't want or need because they have no opportunity to customize the purchase; companies create fixed product lines representing their best guess at what customers want.

When you change from *guessing* what customers want to *knowing* what they want, you will have gone a long way toward reversing this frustrating experience.

Enter the Choiceboard. A Choiceboard is an interactive online system that allows individual customers to design their own products and services by choosing from a menu of attributes, components, prices and delivery options. The customers' selections send signals to the supplier's manufacturing system that set in motion the wheels of procurement, assembly and delivery.

Some Choiceboards already at work in various industries include:

● Mattel's My Design Barbie, which lets customers select hairstyle and color, complexion and eye color.

(continued on page 4)

The Choiceboard: A DBD Tool

(continued from page 3)

● De Beer's Design Your Own Engagement Ring, which lets customers choose from 189 unique combinations of cuts, bands and side-stones.

● Cisco's Marketplace, which is an online configurator of network gear.

● Charles Schwab's Mutual Fund Finder, which lets investors design their own portfolios.

Before you plunge headlong into Choiceboard design, a word of caution is in order. Choiceboards will only work if your company and your customers are digitally ready. Start with your customers. How many own and use personal computers? Do they only use them at work or do they use them at home? Next, does your company have access to suppliers who can deliver components as needed? Without the necessary supply systems to support it, the Choiceboard model won't work. ■

10X Productivity

Digital Business Design redefines the potential for productivity improvement and business performance. It often produces tenfold improvement in business performance.

This is 10X Productivity, with productivity defined as the ratio of value created to resources used. When an organization is able to create more value while using fewer resources, productivity grows. Digitization is beginning to produce the same scale of productivity growth as steam and electricity did during the Industrial Revolutions of 1780-1820 and 1880-1920.

Potential productivity benefits from DBD fall into three main areas: Capital, Costs and Cycle Time. All three are valuable resources that are always in scarce supply. Digital Business Design can dramatically improve the efficiency with which all three are used.

But not all 10X improvements are equal. When mapping out a strategy for going digital, it's crucial to focus on the right functional areas.

Charles Schwab Goes Digital

Charles Schwab has used Digital Business Design to move from managing atoms to managing bits very effectively. More than half of its customers' trades now take place online, and customers have access to all the information they need all the time, every day. All this frees employees from low-value work. As competition for online investment dollars continues to rise, the company will continue to develop its DBD to remain its customers' first choice.

The Customer Context

Productivity outside the customer context is self-defeating. It's what customers want that matters, not your company's business objectives. If productivity gains lead to customer irritation, you lose. Take Barnes and Noble, a bookseller in a rapidly digitizing industry. If the best customer wants a book today, she takes the time and effort to drive to one of the bookstores and makes the purchase. Other times, she might be willing to wait a day or two if weather or time mean she doesn't want to visit the store. She can order online. Barnes and Noble gives her that choice, by maintaining 800 superstores complete with cappuccino bars and an online store at B&N.com.

Capital, Costs and Cycle Time

At one time, capital assets like land, machines and factories, were regarded as the keys to productivity, so much so that the free enterprise system still bears the name "capitalism." But the current focus is to reduce fixed assets, inventory and accounts receivable dramatically. In large part, digital companies will not carry huge inventories, and will in fact be paid before they manufacture the product they have been paid for.

In Dell Computer's case, customers who pay for products before they are produced are actually financing the company's growth.

Another example is Amazon.com, which does not need vast real estate holdings to sell books. It holds minimal stock and buys books and CDs from wholesalers as they are ordered, keeping inventory costs low. Accounts receivable are always lower than accounts payable since customers pay Amazon before Amazon pays its suppliers.

Costs, especially labor costs, are cut when companies digitize. Take, for example, customer service calls. The more inquiries that can be handled through self-service, the better — so long as hands-on, high-touch service is available when needed.

Digitize services that don't require in-person assistance, and the overall cost structure is improved, customers get better service and profitability is greater. For example, a typical bank transaction costs $1.25 when handled by a traditional teller, 54 cents via telephone, 24 cents at an ATM, but only two cents over the Internet. The digital improvement is more than 60X.

Cycle time is another area where digitization can reap rich rewards. A quick turnaround of inventory brings greater return on investment while speed pays cash divi-

(continued on page 5)

10X Productivity

(continued from page 4)

dends.

UPS has moved from manual to digital tracking of customer information, so that a parcel can be located wherever it is in the world. GE now can deliver spare parts ordered on the Internet within three days rather than in 100 days. Weyerhauser can deliver a custom-made door in an hour instead of two weeks.

In mapping your digitization strategy, ask yourself which of the three areas — Capital, Cost or Cycle Time — is most crucial to your business and your customers. Begin there. ■

Hybrid Power: The Incumbent's Advantage

There are few purely digital companies in business today — appropriately so. Not all customers are ready to transact all, or even most, of their business online. Nor is the technology in place to provide in digital form every kind of service customers demand. The smartest businesses are organized along hybrid lines — in other words, their organizational structures combine characteristics of both dot-coms and bricks-and-mortar companies.

A traditional business can establish a profitable beachhead on the Internet while a new dot-com can gain a bricks-and-mortar presence by building or buying it or partnering with an offline company. Success with customers will involve the ability to manufacture high-quality products, distribute them, educate customers, answer questions, accept return and perform maintenance and service.

The truth is that despite the hype over dot-com startups, it is the bricks-and-mortar incumbents who stand to gain the most from the Internet. If done well, integrating the Internet into a seamless hybrid has these advantages:

- **Channel multiplication:** A hybrid model extends your company's reach to new sets of customers.
- **Wider, deeper access to customer data.** Hybrids can track customer behavior online and off.
- **High-tech plus High-touch.** Hybrids can combine speed, convenience, accuracy and flexibility with personal contact, touch and the sense of permanence a physical presence creates.
- **Customization.** A hybrid allows for more precise customization.
- **Assets.** A hybrid model can leverage an offline brand quickly for the Internet; it does not have to create a Web site and a brand at the same time.

Land's End's Hybrid Approach

Land's End, a leading clothing retailer, combines the best of its telephone customer service interaction and online service. It offers two options for receiving real-time, interactive customer service. Customers can link to an online chat area where they can ask personal shoppers questions. Customers can also request a call back from a personal shoppers. The software automatically connects the two by phone and Internet browser, so they can talk while viewing the web site. There is also a digital tool called **"Your Virtual Model"** which shows shoppers how clothing will look on a 3D model with their coloring, height and measurements. Along with catalog and store sales, the web site is helping Land's End prosper. The online store is now the No.1 site for selling apparel on the Internet, and accounts for 10 percent of the company's revenue.

For a company branching into e-commerce, a key decision is how to position the new online operation relative to the existing organization. Managers can choose from four basic structures. Each offers trade-offs. When an **entirely separate** structure is chosen, the online and offline businesses operate as independent companies. Many investors and industry experts support this approach because it allows capital markets to value the online business as a pure play.

If a **shared resources** structure is chosen, the online company leverages the capital, infrastructure, brand and content of the offline parent. For example, PetSmart took this approach when it bought PetJungle.com and used its digital infrastructure to launch PetSmart.com.

In the **separate to combined** structure, the offline company incubates an online entity separately and later folds it in.

Finally, in the **combined at inception** structure, the offline company incorporates online activity from the start.

Each approach has its advantages and its drawbacks. The choice depends on how your company is paying for the online initiative, how fully integrated the digital and physical operations will be, and how quickly your industry is incorporating digital technologies into daily business activities.

Only you can decide which is best for your business. However, remember that incumbents have a massive advantage over dot-coms. This advantage includes products, a customer base, physical plants, storefronts, history and brand. All these are difficult, if not impossible, to rapidly duplicate. Incumbents have the edge in the hybrid world, if they use it in time. ■

The Active Customer

Digital services let customers be proactive in solving their own problems. A few minutes online and a few keystrokes gets customers where they need to be, with much less pain and aggravation than working through a complicated voicemail system and hoping to talk to the right person.

Customers have changed across three dimensions: power, specificity and activity.

Take power. Three decades ago, many products were unique, and demand grew faster than supply. Suppliers held the upper hand. Then came rapid imitation and widespread overcapacity. Customers have more choices and more power, and they know it. Competition is keen.

Specificity is also important. Customers are getting used to customized products, and are beginning to expect them. They want a perfect, no compromises shopping experience.

Let Customers Help Themselves

Then there is activity. Customers used to be passive, but no more. Customers are informed and active, demanding products rather than passively accepting what was offered. Your company will only succeed with this new customer if it makes it easy for customers to help themselves.

> ***Customers are getting used to customized products, and are beginning to expect them. They want a perfect, no-compromises shopping experience.***

In other words, why should a company continue to do a bad job of providing customer service when digitizing the process can mean that customers can do a perfect job themselves at far lower cost to them and your company?

To get the greatest benefit, create a Digital Business Design that lets your customers perform for themselves those tasks for which they are best suited. Some of these tasks may include:

- **finding general and detailed information;**
- **configuring and placing an order;**
- **checking order status;**
- **answering technical questions;**
- **scheduling repairs and purchase service contracts;**
- **downloading software, read and post reviews.**

The fewer of these tasks your customers can accomplish on their own, the more likely there is inefficiency, waste and frustration in your customer service model. ■

Obstacles to Going Digital: Beating the Odds

Many business leaders get excited when they learn about the potential benefits of going digital, only to become discouraged when they consider the practical difficulties of moving a traditional company into the digital era. The reality is that there will be Fortune 500 companies that won't make the transition. However, virtually any company can overcome the obstacles if it proceeds with both insight and courage. The obstacles are many, but they boil down to a lack of one or both of these qualities.

Common Excuses

Is your company refusing to make the shift for one or more of the following perceived obstacles?

- **We're doing too well financially, so there is no sense of urgency.**
- **Change is too difficult.**
- **We have too many other priorities.**
- **We're in the midst of a turnaround and can't refocus now.**
- **It's not part of our business plan.**
- **It's not in our budget.**
- **We don't want to alienate our customers.**
- **We don't want to upset our sales and distribution channels.**
- **Our customers and workers aren't digital-ready.**
- **Our management team doesn't understand technology.**
- **We're already too late.**

Running the Marathon

To move ahead, you have to take all the excuses you hear and counter them.

Retain the focus on customers as you come up with countermeasures. Answer objections about customer readiness, for example, by pointing out that they don't all have to be ready to begin, but that putting the processes in place means they will be there when customers are ready.

The fact that the competition isn't digital isn't a good argument either. Nor is complacency about current high profit levels, or allegations that employees aren't ready. Remember that every company has to continue to reinvent itself all the time in order to remain competitive.

It helps to realize that going digital is more like running a marathon than a sprint. In fact, the reality is that even those companies that have already made the transition took a long time to do so, an average of four years. Allow four years, but begin working on the process today. ■

GE: A Digital Case Study

Only a handful of businesses today have made the transition to digital. One established company on its way is General Electric. GE is reinventing itself as a digital business. Although a few years ago, CEO Jack Welch was quoted as saying he didn't have a computer and didn't need one, he has changed his mind. He traces his digital epiphany to the 1998 holiday season. The Welch family was immersed in Christmas shopping, but Jack noticed that they hadn't set foot outdoors. They were all shopping online. Suddenly, the practical power of the Internet became clear. What had changed was that the PC was no longer a computer; it had become a communicator and a transactor. Welch acted quickly. In January, 1999, he announced four GE initiatives, ranked as follows:

- **The Internet and e-commerce.**
- **Globalization.**
- **Services.**
- **Six Sigma.**

Globalization, service and the quality control system Six Sigma had been on the GE agenda for a while, but the Internet and e-commerce jumped to the top.

Because GE has been one of the world's most persistent reinventors, it is moving into Digital Business Design from a position of strength. GE's sales, market position, profitability and company value are at historic highs. But Welch wants to keep it that way. The campaign he devised was code-named "Destroyyourbusiness.com." Welch then e-mailed his top managers with a directive to deploy under-25-year-olds whose sole task is to figure out how the Internet could be used to destroy GE's existing businesses. Each division recruited a team of three to seven e-commerce experts who reported directly to the president. Within six months, the teams had identified every major threat GE faced and begun crafting responses to them. The campaign has now been transformed into "Growyourbusiness.com."

Among the changes GE is initiating are:

- **digital selling;**
- **customer productivity tools that use the Internet to deliver free analytic, design and modeling tools for customers;**
- **information destination sites that deliver value-added information for customers;**
- **remote diagnostics to capture real-time information that helps deliver fix-before-fail services.**

The end result is a new customer value proposition offering information, tools and actions. The more customers work with GE digital technologies, the more digital they will become, and the more closely tied to the GE systems they become.

Dot-Coms on the Move

Starting out as a digital business would logically seem to be an advantage. Unfortunately, few start-up companies have figured out that true Digital Business Design requires the integration of digital technology with sound business design. The challenge for the vast majority of today's dot-com businesses is not to keep up with the latest technology, but to develop a viable and sustainable business design.

During the first half of 2000, the fact that the bloom was off the rose of the Internet business boom was apparent. Share prices for many high-profile dot-coms were down from their highs by 80 percent and more. Nearly all dot-coms were losing money. Does it mean that the business potential of the Internet space was a cruel illusion?

The Internet is becoming a genuine business revolution. And as with any business revolution, there will be many initial players, but in the end, only a few will be left standing.

The answer is, "No." The Internet is becoming a genuine business revolution. And as with any business revolution, there will be many initial players, but in the end, only a few will be left standing. Some Internet businesses will achieve profitability within a few years, while others never will. They are simply bad businesses that happen to be online.

Since barriers to becoming a dot-com are low, with very little effort, a half-dozen twenty-somethings can create a site as impressive as one created by a Fortune 500 company. But the ease of entry also guarantees lots of competition.

In sum, there are enormous fortunes to be made in e-commerce. But that doesn't translate into easy or automatic profits for the first companies to stake claims on the Internet. As in any business, sustainable shareholder value is key. This will be produced by the same forces that govern traditional business: growth, stability, customer alliance and profitability.

Succeeding on the Internet

To make a business work on the Internet, you must remember that Digital Business Design is about business first, design second and digital third.

The companies that win are the ones that regularly deliver outstanding value to customers and thus create sticky online relationships. These companies have also found a way to monetize their customers.

America Online, Yahoo! and eBay are three dot-coms

(continued on page 8)

Dot-Coms on the Move

(continued from page 7)

that have managed to turn profits by creating truly superior Digital Business Designs.

Both AOL and Yahoo! have taken mass media business designs to the digital arena. Each has developed customer value propositions with profitable revenue streams. The key ingredients for success in traditional mass media, which they have applied to the Internet, are:

- **intense focus on the customer;**
- **ubiquitous brand-name promotion;**
- **continual refinement and addition of content;**
- **value capture through monetizing users.**

Hiding the Technology: The Story of AOL

AOL focused on computer users who were more interested in the information and personal connections they could make online than on the underlying technology. AOL's interface was developed to be as simple and friendly as possible. It also put substantial effort into building its brand name. Free trials and free software were offered everywhere. Deals were bundled with the sale of computers.

Content was also crucial to AOL's plan. It partnered with content providers, developed its own, signed up retailers and created communities through chat rooms, discussion groups and e-mail. When others began offering unlimited access to the Internet, AOL designed its site so that its members could also enjoy the rest of the Internet as well as the content on AOL. Money flows in from advertisers, access fees and partnership agreements.

Yahoo! Simplifies Searches

Yahoo!'s DBD also focuses on satisfying its customers and aggressively promoting its brand name. It provides customer-focused content and attracts a wide audience, in turn attracting top-notch advertisers and merchants.

Started as an online directory, the company turned a profit within two years of launch. Yahoo! essentially serves as a search engine ferreting out relevant information for users. While other search engines may provide more "hits" for users, the company claims its searches provides fewer false leads or irrelevant results.

Advertising generates 70 percent of Yahoo! profits. E-commerce is also becoming a part of its profit mix, as it brings along 10,500 merchants who pay a percentage of sales to the portal.

Ebay Invents Online Auctions

Ebay started out as a way for the founder's wife to trade information about her collection of Pez candy dispensers as well as the dispensers themselves. Six months after the launch of the Internet exchange, eBay began charging a small listing fee and commission on the selling price of each item sold. Today, more than 400,000 new items are listed every day. ■

The Digital Organization

The development of the digital organization is still in its early stages. It's too early to tell how it will look in finished form, but already, some characteristics are emerging.

First, companies that are innovators of Digital Business Design are generally headed by a CEO who is business-centric rather than technology-centric, and who is working in close partnership with a CIO who understands the principles of good business design. Together, they focus on the customer and the elements of good business design first, and technology second. They share a clear vision and focus as to key business issues and how to address them, and they communicate in a common language about concerns, problems, needs and plans.

Even with a collaborative team of top managers, Digital Business Design can't succeed unless the entire organization is aligned behind it. The key is internal marketing — the process of changing the thinking, attitudes and behaviors of your people. You must invest the time and energy to communicate your strategy and business design so clearly and continuously that every member of your organization is on the same page as the CEO. Everyone must know why they have to change the way they do business, what they must do to accomplish the new agenda, and what's in it for them.

Don't stop after delivering the message once. In fact, a good rule of thumb is to estimate how often you will need to communicate your message and then multiply the estimate by 10. The effort will take at least one, and more likely two, years.

Continue Developing Your Talent Base

As you begin to see changes within the organization, you must continue to develop your talent base. Fortunately, digitization creates great benefits, since it frees your employees from low-level work and allows them to perform higher-level tasks. Workers become more engaged and can begin thinking like owners instead of employees. For example, sales reps will move from being order takers to being customer problem solvers, marketers shift from being data trackers to being opportunity pursuers, and managers shift from being troubleshooters to being coaches and mentors.

A process of change management that begins with partnering at the top, invests in internal marketing and provides leveraging of talent increases the odds of making the transition to a Digital Business Design successfully. It also creates the type of organization that can compete in tomorrow's economy. ■

How Excellent Companies Avoid Dumb Things

Breaking the Eight Hidden Barriers that Plague Even the Best Businesses

by Neil Smith
with Patricia O'Connell

THE SUMMARY IN BRIEF

Every day, seemingly intelligent and successful leaders and their companies make headline news because of poor decisions that can cause their businesses to stumble, making many of us scratch our heads in wonder: Why would such a successful business make that strategic decision?

The reason: A series of natural barriers exists in every organization simply because of the way all companies are organized and do business. These are called structural barriers. Other barriers exist because of human nature — these are behavioral barriers. All barriers, individually and collectively, prevent employees from taking actions that are in the best interests of the company. In short, barriers are the reason a company does dumb things, not the employees themselves.

How Excellent Companies Avoid Dumb Things highlights the ways in which the eight hidden barriers can interrupt your business, and author Neil Smith outlines a fast, and proven, process in which 12 principles of business transformation can break down the processes that hold companies back.

IN THIS SUMMARY, YOU WILL LEARN:

- How to identify and break down the eight barriers.
- How to apply the 12 principles to bring about change in your organization.
- How to implement the 100-day change process for breaking barriers.
- The three results of the change process and how they improve your company.

Introduction: Hidden Gold

Great leaders are men and women with vision — individuals who know exactly the direction an organization should strive toward and who have the skills to take it there.

But the organizations they lead, which are often large and complex, also strive for simplicity and efficiency. Great leaders want to become as efficient as possible in a way that is fast, does not distract from the prime focus of the business, produces very significant results and has the complete buy-in of the organization.

So what is stopping these leaders? A series of natural barriers exists in every organization simply because of the way all companies are organized and do business. We call these structural barriers. Other barriers exist because of human nature. These are behavioral barriers. In short, barriers are the reason a company does dumb things, not the employees themselves.

I have identified the eight hidden barriers that cause excellent companies to do dumb things. Understanding the barriers is only the first step in breaking them down.

The leading letter in each of the eight barriers forms an acronym: "A Promise." This makes the barriers easy to remember and identify:

Avoiding Controversy

Poor Use of Time

Reluctance to Change

Organizational Silos

Management Blockers

Incorrect Information and Bad Assumptions

Size Matters

Existing Processes

One of the important elements to breaking down the barriers is culture change. Culture is about the way companies do things. It is about what is expected, tolerated, encouraged and supported. Culture change is important because it is the key ingredient in breaking down behavioral barriers. It's also key to making sure the barrier remains broken down.

Barrier 1: Avoiding Controversy

Controversial ideas exist and issues are left unresolved because dealing with them would cause too much disruption. Politics, personalities, alliances and appearances are all factors in why controversy is avoided. Usually these ideas for change have surfaced within a company over and over again because they resolve obvious problems and the issues are often large and strategic.

The solution: Neutralize controversial ideas by making the resolution part of the larger process for change that is not about any one person or project.

Barrier 2: Poor Use of Time

Even in organizations where people are very busy and long days are the norm, employees use their time very poorly. There are three aspects to this barrier: you and your colleagues do not have the time to do things ("the management of time"); companies use their employees' time very poorly ("the use of time"); and time isn't valued appropriately ("the value of time").

The solution: When breaking this barrier, the first aspect is addressed by changing the way people think and behave. Changing processes addresses the second aspect. Assigning a monetary value to time — something that is often missed — addresses the third aspect.

Barrier 3: Reluctance to Change

Of all eight barriers, this is one of the most widespread and damaging. People are creatures of habit, and when there is no urgency to change, they will not. Change is stressful because people do not know how it will affect them.

The solution: A good change process will reveal where this barrier exists and will provide a one-time fix by liberating ideas. Sometimes a crisis will provide the impetus to force change to happen. Some barriers are harder to fix than others; there is no easy, long-term solution to this barrier. The real answer comes in creating a culture that expects change to happen.

Barrier 4: Organizational Silos

Organizational silos create a natural barrier that is tricky to break down because the silos themselves are a necessary evil. Organizations need the structure silos provide — but that same structure prevents the outward flow of information, focus and control.

The solution: Because you cannot always do away with silos, you have to devise ways to connect them. The goal of breaking this barrier is not to smash the silos, but to "turn towers into tunnels" and get people to cooperate across the organization.

Barrier 5: Management Blockers

Good ideas can get shot down not for perceived lack of merit, but because a manager feels threatened in some way:

- Fear of a boss' reaction.
- Fear of underlings shining.
- Fear of losing power and influence.
- Fear of having to do work.

Employees are generally powerless in such situations. When Management Blockers are at work, employees feel frustrated and good ideas never get proper consideration.

The solution: Companies have to ensure there are processes that allow ideas to be surfaced and considered in an objective way. But the true long-term solution to breaking this barrier is to force a culture change within the organization that discourages the Management Blockers' behavior. Breaking this barrier is not so much about changing processes as it is about changing people's minds.

Barrier 6: Incorrect Information and Bad Assumptions

The right information to make a decision can be difficult to get because:

- It does not exist.
- There is too much information so it becomes lost.
- Collecting it is difficult, perhaps because access is limited.
- You have to rely on others to provide it, leading to delay or inaccuracy.
- It may not be timely.

When information is too hard to get, it will be ignored or overlooked and, as a result, assumptions are made. Decisions made using incorrect information or bad assumptions will always yield poor results.

The solution: Make sure that people are basing their decisions on facts — fact-based information should be a company mantra. Do not accept "I guess" or "I think so."

Barrier 7: Size Matters

This barrier shows up in a number of ways. A great challenge for companies is to manage the economies related to smaller (less-profitable) customers. Transaction size also matters where small transactions result in a loss. Companies also don't think about the potential impact that can result from even simple size-based changes in the way they do things.

How Poor Use of Time Forces Companies to Do Dumb Things

An investment firm gave customers the option of getting monthly statements online only as part of the firm's "going green" initiative. When the company saw more than 30 percent of its customers chose to get electronic statements, it expected to reduce complexity and improve customer service while saving money. Yet six months later, senior management realized the company was spending just as much money on monthly statements as before.

Why? The investment firm never stopped printing, processing or mailing the statements. Instead, for customers who switched to electronic statements, it resorted to a simple fix: It changed the customers' mailing address to its own headquarters. This was done because to stop customer statement delivery required a system-wide reprogramming and the technology department didn't have time to do it without shifting priorities. The real problem was not solved because of "management of time" in the technology department.

The solution: Examine every aspect of your business through a size-based lens. With the Size Matters barrier, not every opportunity is immediately obvious. The approach needs to be this: Look at everything and ask where small sizes cost you money.

Barrier 8: Existing Processes

This barrier prevents ideas from being implemented, even if they are simple and well-known, and people want to do them. It is caused because there is no process in place to change other processes. The problems to be solved are often not complex; determining how to resolve them without a process to do so, however, is. This causes frustration in customers and employees alike.

The solution: A good change process provides the platform to allow this barrier to be changed and simple ideas to be implemented. But this is the toughest barrier to break in sustainable fashion. A continuous change program, implemented after a change project and run from the CEO, has been shown to work in keeping this barrier at bay.

Twelve Principles for Breaking Barriers

In order to break down the eight barriers, apply the following principles to bring about change and make it last.

Principle 1: The CEO must personally lead and support any change process carried out across the entire organization and a majority of senior management must also support it. This is not to say that the CEO has to be involved in every meeting and decision, and it doesn't imply a major time commitment on the CEO's part. But the CEO must declare that change is expected, that the change initiative is his or her project and that it is important. The CEO's subsequent words and behavior must demonstrate that commitment.

This principle gives the project focus, and without that focus, the project will not work. If the CEO does not take the change project seriously, neither will anyone else.

Principle 2: The entire organization must be engaged in the change process. You might wonder what the point is of having even the most junior people contribute ideas if those suggestions aren't going to have a big impact on the bottom line. There are five critical reasons for involving everyone:

1. Involving the entire employee base provides a huge psychological benefit. Everyone feels invested in the change process, has ownership of it and feels included in designing the new organization.

2. It demonstrates that there are no "sacred cows." Every party of the organization is expected to contribute to the change. This sense of equality and fairness is important for getting organizational buy-in for making any changes.

3. Middle management may provide the big-dollar ideas, but small-impact ideas matter. Ideas that have smaller financial impact also tend to be the ones that help the company run better.

4. Taking the entire organization through the change process at the same time creates a cross-organizational momentum. This allows ideas to be considered and quickly resolved by the right people — it introduces a common priority.

5. Occasionally there is a brilliant idea hiding in the work force.

Principle 3: The project must be guided by "stars" who are willing to challenge the status quo. Use a small team of internal change agents — the Catalyst Team — who are pulled full-time from their normal roles in the company to work solely on the project. Typically these are people who cannot be spared, not those looking for their next role. They are deliberately assigned to work in areas they are not from and know nothing about.

This creates an interesting dynamic. Because of their everyday roles within the organization, they have the instant credibility that an outsider could never have. They quickly form an independent view of the area they're working in, and they challenge the leader of that area to consider and come up with ideas for improvement.

In selecting a Catalyst Team, look for these four qualities:

1. Intelligence.
2. The ability to be a team player.
3. A passion for change.
4. The ability to get things done.

Principle 4: There must be no up-front targets for the company as a whole or the individual departments within it. There are four reasons for not setting targets, all of which have to do with integrity:

1. The amount of change depends on the good ideas that are released when barriers are removed. Before a project starts, no one has any idea what the amount of change is likely to be.

2. The amount of change differs by area. There is no room for a one-size-fits-all approach that comes with

setting a target. A target that may be right for one department will be wrong for another.

3. When you give managers a number, that is exactly what you'll get out of them — and that is *all* you will get out of them. Some of the opportunity to do things better may be left on the table.

4. Any change brought about by setting targets rather than changing the ways things are done is not sustainable. Within a couple of years, those departments subject to the targets typically return to doing things the same old way.

Principle 5: Those who will implement an idea must own the idea. These people may not do so at the start of the process; in fact, these managers, or their departments, may not even be the source of the ideas. But a good change process gives them the chance to become the champion for those ideas, and change comes when people truly believe that they are responsible for implementing it.

Principle 6: It must be easy to put ideas into the change process but hard to remove them. To gather ideas and to avoid them from being shot down early, use the mantra that "every idea is a good idea." That's not to say every idea will be implemented, but that each idea will be fully considered.

Go against the norm of decision making: Instead of someone having to prove why an idea has merit, someone has to prove why it does not. The idea will be implemented unless someone makes a persuasive argument against it.

Because of this principle and rules governing the process (such as lack of inquests), employees feel more comfortable about offering suggestions, asking dumb questions and thinking creatively. And good creative ideas are hard to dismiss without very good reason.

Principle 7: Consideration of ideas must be based on facts and analysis, not opinion. A good change process raises the bar for proof. Managers cannot say, "I think it's a bad idea." They need to be armed with facts and information before they can shoot something down. Because beliefs and opinions about a course of action can be wrong, they should be independently tested if possible.

Principle 8: Consensus must be built. Of the 12 principles, if there is a "secret sauce" for ensuring 100 percent implementation, then building consensus is it. Consensus is built around an idea by upgrading the idea to include the views of all who consider it. This sometimes requires a compromise to the original idea.

In the consensus-building process, not everyone will agree on everything — and that isn't the goal. But you cannot move forward with any idea until and unless you have consensus among the people affected by it.

Principle 9: There must be a focus on increasing revenue, not just reducing expenses. You must pay equal attention to opportunities that allow for increasing revenue. Often these ideas will be among the most creative ones from your team. There are four types of ideas for generating revenue:

1. Stop leakage. Leakage occurs when you give away your services for free or at a discount, even though the price has already been agreed with your customer and the customer expects to pay the price.

2. Price for value. Companies are not very good at understanding the true value of the products and services they deliver to their customers. This is particularly true when there is a premium in delivering the product either very quickly or at a certain time.

3. Employ behavioral pricing. A company has behavioral pricing opportunities when it wants to discourage its customers from acting in a certain way. This includes charging a premium for custom services.

4. Employ market-based pricing. With certain products or services, it's possible to charge one price in one geographic market and another price in a different one. Pricing becomes very complicated, as there are multiple price points for the same service. In these cases, companies are not always charging what the market will bear. They can increase prices just to match those of the competition.

Every company has opportunities to increase revenues. You often find employees are more willing to come forward with expense-reduction ideas when a project focuses on both revenues and expenses. So, paradoxically, adding revenues to the equation means increased opportunity for reducing expenses.

Principle 10: The change process must not disrupt normal business. Managers will have to delegate more, unnecessary activities may be cut and some people will have to put in some extra work over the course of the project. But it's critical to commit to this principle because most businesses don't have the luxury of shutting down for a period of time while a change process takes place.

Companies keep this promise to themselves because they realize they have to keep moving. Delegation to a trusted No. 2 is certainly possible for the short time it takes to do a project, but it's clearly not sustainable.

Principle 11: Implementation must be nothing less than 100 percent. There are six reasons why expectations about the results should be so high:

1. The ideas have been decided using fact-based analysis, so the costs and implications of any decision are already known before an idea is implemented.

2. The ideas are owned by the managers of the departments who are affected by them, so there is not only buy-in, but also championing of the ideas.

3. The ideas have been publicly committed to.

4. The ideas are tracked by a system that not only keeps managers honest and focused, but also provides an early warning if an idea starts to go off track.

5. The impact of the ideas has been conservatively estimated so that many of the ideas actually produce more impact than was planned.
