6. If a particular idea goes off track, a manager is expected to replace the value of the idea. Managers commit to the impact of an idea, even if that idea is derailed through no fault of their own. They have ways to do this readily at hand, either by capturing more impact than planned from other ideas, or by implementing extra ideas on which consensus had not been built or that were previously considered too risky. Managers have an idea bank to dig into if the value of their ideas falls short of expectations.

Once people commit to ideas, they are not allowed to change their minds.

Principle 12: The change process must be about culture change, not just a completed project. This is perhaps the most difficult principle to execute against because it's about changing the way people do things not just during the course of the project, but also once it's completed. If culture change does not happen, the behavioral changes that occurred during the project are not sustainable. Here are seven things a senior management team needs to do to drive culture change in an organization:

1. Stress the importance of the project to the organization.
2. Emphasize the logic behind the change in culture.
3. Communicate expectations continuously and frequently.
4. Lead by example.
5. Expose good and bad examples — of both simplicity and complexity — in the organization.
6. Introduce new organizational language that describes the new culture.
7. Change compensation systems. Think of ways of rewarding the results of new behavior, either through regular compensation and bonus systems, or with ad hoc programs. ●

It's All About Psychology

You might think the most difficult part of the change process is getting enough good ideas out on the table, but, in fact, that turns out to be the easiest. The real challenge is completely different. Companies are made up of human beings, given specific roles and responsibilities, who have many different personalities. Companies benefit hugely from this diversity, as weaknesses in some employees are made up for by the strengths of others. What a good change process is really about is getting all of these different people to share the same focus for long enough to "play the game." They cannot be spectators to this change process.

"Playing the game" in the context of change means the following:

• Everyone must be included in the process; no part of the company can be allowed not to play.

• Managers can't delegate the process because it's not a high enough priority for them.

• Managers can't ignore the process, thinking or hoping it doesn't really apply to them.

• Managers can't present to play while actually working against the process.

• Good ideas can't be hidden.

• Good ideas can't be undervalued.

The 12 principles provide the rules of the game while the process itself provides the framework. But the real challenge is managing behavior. A good process seeks to identify early any of the errant behaviors just described because each has the potential to undermine it. And then the change process seeks to correct the behavior. ●

A 100-Day Process for Breaking Barriers

This process is called the PGI Promise and builds directly from the 12 principles. It is designed to create the environment necessary for change. The process has three major steps — as well as preplanning and implementation phases — and each one culminates in a review meeting before senior management.

Step 1: Focus on surfacing ideas and putting together a comprehensive portfolio of ideas, organized into themes. This leads up to the first review.

Step 2: Focus on valuing risk rating and debating those ideas. This leads up to the second review

Step 3: Focus on building consensus around ideas that

the company wants to move forward with. This leads up to the third and final review at which a decision is made.

Step 1 lasts four weeks, while Steps 2 and 3 last for a combined 10 weeks. After the final review following Step 3, a two-week implementation planning period transitions into the implementation phase.

Preplanning (Step 0)

One of the first steps in preplanning is to develop a communications plan to explain to the organization what is going to happen and to enlist everyone's help. The first thing to develop, if it does not naturally exist, is a rationale for doing the project. The first draft is created by the communications team for discussion with Steering Committee Members. Employees will want to know why the project is important to the company and why it is important now. The best rationale is crafted in such a way that a barrier-breaking project is seen as the next logical step for the company to take.

During this phase, the Steering Committee Members also design the Groups and select the Catalyst Team Members and Group Leaders. Also, the small finance team establishes the initial baselines for each Group Leader. The Group Leaders will have the chance to question the baselines later, but the initial round of forming the Groups' baselines takes place during the preplanning stage. The Human Resources team assigns organizational positions to each of these Groups as well.

Surfacing Ideas (Step 1)

In Step 1, the activity is focused around collecting and organizing ideas. The goal is a clean portfolio of ideas that covers all costs or revenues of the group. Surfacing ideas is the easiest part of the change process — rarely is there a shortage of ideas.

By the first Steering Committee Review — at the end of the first four weeks — a Group Leader's goal is to have developed a complete portfolio of ideas with the promise of financial savings and changing the way the Group does business. Group Leaders and their teams will have:

- Confirmed that their baseline is correct.
- Generated hundreds, if not thousands, of ideas that affect their Group.
- Removed duplicates and organized those ideas by topic.
- Attached rough value and assigned initial risk rating to each idea.
- Figured out which key analyses they need to do.

During the first Steering Committee Review, Catalyst Team Members assist each Group Leader to present their initial ideas for review. The Steering Committee Members have been primed by the Catalysts Team Members about the Group Leaders' progress and about any missing ideas. The Steering Committee Members also use the first review to test the Group Leaders' commitment. After the first review meeting, Group Leaders need to identify analysis that will be needed to support ideas going forward.

Valuing, Risk Rating and Debating (Step 2)

The goal of Step 2 is to: accurately value all the ideas in the portfolio; coordinate ideas across groups; learn about the risks of the ideas from those potentially affected by them; and debate how to overcome those risks.

Following valuation — in which each monetary gain from each idea if implemented is estimated — and coordination across the groups, all people affected by an idea participate in risk rating it, based on how risky they perceive it to be: low, medium or high. Anytime an idea is rated medium or high, the risk rater must explain, which allows debate to begin. During this step, the Group Leaders and Catalyst Team Members begin to understand who is opposed to each idea and why. This is the first stage in beginning to build consensus.

Step 2 is followed by the second Steering Committee Review. By the end of this step, there will be coordination across the Groups, savings will be calculated accurately and much of the risk rating will have been completed. This review is also the time when Steering Committee Members fully understand the ideas and begin to debate them. The goal for the Steering Committee is to encourage Group Leaders to be as aggressive as they can be in thinking about ways to change their business without introducing unnecessary risk to the organization.

Building Consensus (Step 3)

Consensus isn't about selecting the lowest common denominator of an idea — the place where everyone accepts there is no risk. It isn't about everyone being in perfect agreement and harmony. It's about reducing the risk associated with an idea to a level that all affected parties are comfortable with while not compromising the idea's value. The benefits must outweigh the risks.

By Step 3, the number of ideas still in play will have been dramatically reduced: duplicates will have been removed, similar ideas will have been consolidated and truly high-risk ideas will have been put onto the back burner.

A key aspect of building consensus is "upgrading" ideas — moving as many ideas to the low-risk category as possible. Upgrading can be about splitting ideas and figuring out what its low-risk and high-risk components are. It can be about changing an idea to accommodate a specific concern. And it can be about reducing the scope of an idea if it's overextending.

The main part of the Catalyst Team Members' job at this stage is to find creative ways to think about ideas and ferret out opportunities for compromise and brokered solutions. Out of all their responsibilities, the Catalyst Team Member's role in building consensus is the most vital. It is better to abandon an idea than to commit to one without consensus because objectors will find a way to kill it eventually.

Step 3 is followed by the final Steering Committee Review. The goal of this review is to make decisions. At this point the Steering Committee have debated the major and controversial ideas at least twice. At this stage it is very clear which ideas will be approved and which will be rejected.

Implementation Planning

First, approved ideas must be gathered into projects, then each project is assigned to a Project Manager who is responsible for the implementation of the ideas within the project. The Group Leader then assigns timing to the ideas. Implementation can occur over 36 months; the Group Leader is asked to assign a preferred completion time to each idea. While the group implementation plan is being formed, other areas, such as HR, technology, finance and more, are also planning and preparing for implementation.

As implementation begins and people see change happening, they expect not only rapid change, but continuous change going forward. People expect their ideas to be listened to in the future, not ignored. The process has changed the culture of the organization. ●

Mining Gold: The Results to Expect

Making the way you do things simpler is one of the key results coming out of a barrier-busting project. The results fall into three categories: 1) Reducing complexity; 2) Financial impact; and 3) Culture change.

Reducing Complexity. Change ideas that are most often approved involve reducing complexity within an organization and making life simpler for employees. The types of approved ideas also range from very large strategic business ideas to small ideas that change the way a process works. Big, controversial ideas get raised in a safe environment. But smaller ideas are equally important and you cannot lose sight of them. While their financial impact may be low, they contribute hugely to reducing complexity.

Financial Impact. By far the most staggering result of a good change process is the financial impact. It is one of the measures of success and one that cannot be argued with. Not all of the financial impact needs to be taken to the bottom line — the company can choose how much it saves and how much it spends. The large size of the results allows companies to reinvest some money for growth, as well as to improve shorter-term profits.

Culture Change. The culture change that a project brings about is just as important as the financial change. Culture change is critical to breaking the three behavioral barriers: No. 1, Avoiding Controversy; No. 3, Reluctance to Change; and No. 5, Management Blockers. And it is an important to fixing elements of two other barriers: No. 2, Poor Use of Time and No. 8, Existing Processes. It's also the key in ensuring new ideas are surfaced rather than hidden going forward.

Organizations need to make sure that they don't revert to their old way of doing things. If companies don't take extra steps to preserve the culture change, the danger is that there will be no ongoing pressure on the managers to continue to change their behavior. In that case, behaviors will revert to previous patterns, barriers will reappear and good ideas will be left unimplemented once more.

What Are You Waiting For?

The results of the change process include more invigorated, more efficient employees; happier, more satisfied customers; millions of dollars realized in increased profits or for investment; and a simpler way of doing things. Nirvana? It sounds like it. What do you have to lose? Why wouldn't your company undertake a project like this? ●

Taking a Holistic Approach to Enterprise Health

HOW ORGANIZATIONS WORK

THE SUMMARY IN BRIEF

Change management initiatives or organizational wellness fads can oversimplify the process. They are noble ideas, but do they address the unique needs of your organization or company? Do they cover all the variables influencing the success of your situation? Are they sustained long enough to achieve their objectives?

Organizations are like humans. Each organ, muscle, bone and nerve plays a unique part within the whole. A strong contribution from one component can't make up for deficiencies in others, and understanding each component doesn't explain the health of the whole person. Body functions are integrated and their interactions are as important as their individual roles. So are the different functions in an organization. By influencing these factors, managers can strive for organizational wellness.

This summary shows you how to take a holistic approach to organizational wellness by identifying the different parts that make up the whole.

What You'll Learn In This Summary

✓ **How to look at the whole organization.** *How Organizations Work* introduces managers to a new, integrated Enterprise Model of the organization. This model provides a 360-degree picture of organizational dynamics; managers can see all of the parts of an organization and how they fit together.

✓ **The features and healthy functions of each variable of the organization.** You'll learn the roles that each variable (or "part") of your company.

✓ **Examples of how the variable can go wrong.** This summary includes illustrations of managers working on the variables in their companies.

✓ **How to improve the functions of the variables.** The summary offers step-by-step processes for fixing each variable.

✓ **How to pull all of the variables together into a well-functioning whole.** You'll learn where to look first when addressing organizational problems.

The Parts of an Organization

The diagram on the opposite page presents the Enterprise Model, which includes all of the variables (or "parts") of a business enterprise.

There are four kinds of variables: external variables, or the context in which the organization exists; structural variables including business processes, goals, information management and organization structure; human variables including leadership, culture and human capabilities; and variables that are both structural and human such as strategy and issue resolution. All of these variables work together; to solve any complex issue, you cannot address only one. Successful managers of healthy organizations understand that these variables must be treated regularly and holistically to effect change and improve performance.

In this summary, we examine each of the variables, one by one. ■

Understanding the External Business Environment

Good physicians and psychologists need context. Before they can examine your inner person, they need to understand the environment in which you function — your work setting, your job responsibilities and demands, your pressures at home, and so forth.

The external business environment is the context in which your business operates — both the areas that you can and cannot control. Before focusing on your internal variables, you must first assess and manage these external variables.

The Value Chain

The first step in addressing the external variables is to identify your industry's value chain (notably your suppliers and customers) and your organization's current and future place in that value chain. Specifically, you need to ask questions such as: In which steps of the current value chain do we participate? What are the likely future steps in that value chain? What are the Critical Success Factors in each step in the likely future value chain?

Assessing the value chain includes clearly identifying

- **Your current and potential markets and customers and their needs;**
- **Your customers' customers, their needs, and whether your company can meet those needs directly;**
- **Your suppliers and potential suppliers, especially their influence on your effectiveness and efficiency;**
- **Your suppliers' suppliers, their strategies and status as potential competitors.**

Identify Other External Valuables

The next step in addressing the external variables of your company is to identify the other external variables that will have the most influence on your business. These external variables include the following:

- **Your resource providers who do not provide tangible materials or components for your products, but who provide money, work, technology and non-core functions.**
- **Competitors, whether they are direct, indirect, or root-need customers.**
- **Shareholders, or owners of the business, who are not interested in the daily operations of your business, but are interested in strategy and returns.**
- **The government and its regulations.**
- **The economy and its shifts.**
- **The society and community within which your organization exists.**
- **The parent company.**

Monitor External Environment

Once you have identified your company's value chain and the other important external variable that affect the success of your business, you need to establish an environmental monitoring system. In other words, be sure

Understanding the External Business Environment

(continued from page 2)

that you have supplemented your internal performance monitoring with external performance tracking. For example, you should monitor industry, competitor, technological, legislative and economic trends.

Based on information gathered from your environmental monitoring, determine future eternal threats and opportunities and use them to design strategy. We'll examine in more detail how to address strategic issues (see article page four) and business or tactical issues (see article page eight). ■

Leading the Enterprise

Leadership is setting an organization's direction and motivating people in that direction. Though all Enterprise Model variables are critical, leadership is "first among equals" and required for development and implementation of all the other components.

Addressing the Leadership Variable

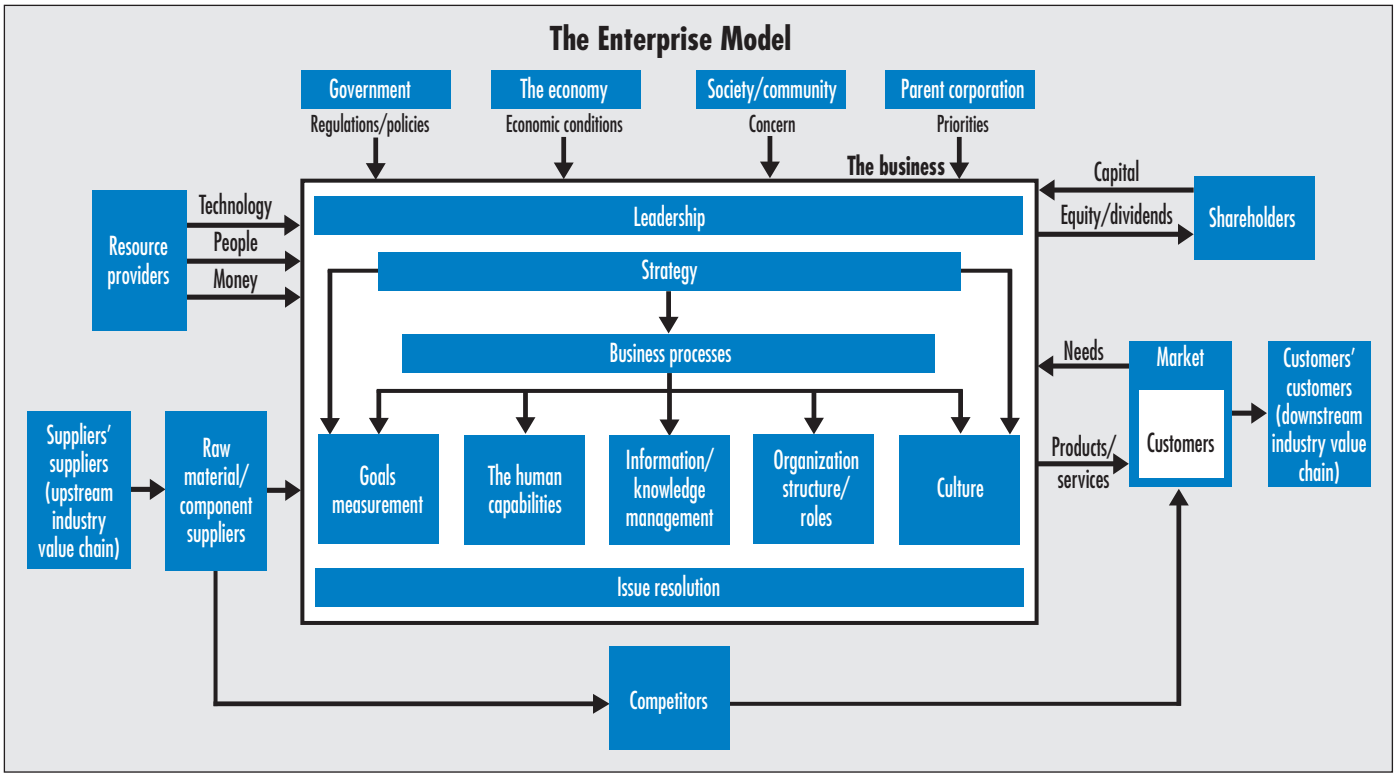
To address weaknesses in your organization's leadership variable:

1. Identify areas in which your organization most needs leadership. For example, Westbrook Plastics is a contract-manufacturing firm that operates steadily but is generally unexceptional. With many opportunities to improve, the new CEO is unable to choose which specific direction for growth he should pursue.

Westbrook's outside directors identified a clear need for a more focused strategy, a more motivated work force, and a different customer profile.

2. Define your organization's current leadership profile and identify the gaps between that and your needs.

For example, Westbrook's directors realized that though the current executives were competent managers, they lacked vision, motivating skills and communications ability. None had the intangible qualities that inspire followers.



3. Close the leadership gap by establishing clear expectations and consequences for executives. Promote individuals with demonstrated leadership into higher-impact positions, and recruit leadership talent from outside.

Instead of replacing the management team, the Westbrook board expressed new leadership expectations individually to the executives and encouraged them to adopt them. They also urged the executive to recruit outside fast-track leadership talent.

4. Fill the leadership pipeline by identifying individuals with leadership traits, closing leadership ability gaps in potential leaders, and cultivating leadership ability in those without intrinsic leadership traits.

At Westbrook the board implemented just such a leadership development program to be reviewed over time. ■

For a list of questions that will help you assess all of the organizational variables in this summary, go to: http://my.summary.com

Creating Strategic Alignment

Strategy is the framework of choices that determine the nature and direction of an organization. Top management must take the time to develop strategy to position the organization in its external environment and focus decisions such as whom to hire, priority of product development projects, capabilities to build into business processes, the structure of the organization, as well as daily decisions.

A strategy must stand up to two reality checks: Will it work? Can we implement it?

Addressing the Strategy Variable

To address the strategy variable, the book offers a five phase plan.

Phase 1. Collect and analyze information on the external and internal environment. The internal environment includes current strategy, performance information, culture, employee perception, and product/market successes and failures.

Phase 2. Establish the time frame for the strategy, articulate values, and make tough choices about what products and services you will and will not offer, competitive advantages, capabilities, goals, and critical issues. The output of this phase will be the strategy.

Phase 3. Develop a plan to communicate the strategy to lower levels of the organization, align the culture and policies, and determine how to monitor the strategy.

Phase 4. Work at all levels of the organization to carry out the initiatives of Phase 3. This phase will require the greatest investment of time and money.

Phase 5. Continually monitor the strategy in terms of its viability, underpinnings, and implementation. ■

For a case study in creating strategic alignment, go to: http://my.summary.com

(Re)designing Business Processes

Whether you like them or not, business processes are the way work gets done. Recently they have been relegated to back-burner status because of a focus on strategy, and the belief that processes were inflexible and uncreative. But a well-designed process can stimulate creativity.

Steps in Process Design (or Redesign)

The process for designing or redesigning your organization's business processes includes the following steps:

Step 1. Identify the process to be improved or designed.

Step 2. Structure a process improvement project that sets goals, identifies boundaries, and designates a process design team.

Step 3. Document and analyze the current process.

Step 4. Design the future process.

Step 5. Develop process metrics and goals.

Steps 6 and 7. Develop an implementation plan, and put the plan into effect.

Step 8. Manage the new process, including establishing process plans and budgets, building a measurement system around the process metrics, and conducting process reviews. ■

Designing Business Processes: A Case Study

Jorge Sanchez is president of the Resorts Division of Wethersfield Hotels. He is happy with his new strategy to drive growth in the hot market of luxury resorts, but he is not looking forward to the daunting task of implementing this new strategy.

Jorge and his team used the framework in this summary to redesign his business processes.

They identified the process to be improved or designed. Jorge Sanchez decided he could not handle everything at once, so he focused on the acquisitions process, market research process and the end-to-end customer service process.

They structured a process improvement project. Jorge created a team to develop an acquisitions process. Wethersfield established process goals, such as having one acquisition by the end of the year and two in the pipeline.

They analyzed the current process. Since the Resorts Division had only had one acquisition, it examined the steps and determined which worked and which did not.

They designed the future process. The acquisitions process design team benchmarked other companies, and with the lessons learned from their past acquisition, developed a new process.

They developed process metrics and goals. New metrics included financial targets and cycle time from candidate identification to assimilation.

They developed an implementation plan, and put the plan into effect. The team created a list of steps to implement the plan and determined the maximum cost and time for each step.

They managed the new process. Wethersfield appointed the team leader as the process owner and designated a permanent cross-functional process management team. A three-year process plan and budget was developed.

Setting Goals and Measuring Progress

Setting goals and measuring performance ranges from activity-based costing to the resurgence of Six Sigma. Goals are objectives that reflect what your customers and other external constituencies need so that your organization can thrive. Measures answer the question "as evidence by what?" about reaching your goals. Goals and measurement should be established at five different levels: strategic, business-wide operational, process, departmental, and team or individual goals.

Perhaps you are like Ellen Robbins, who wishes the corporate Performance Enhancement (PE) staff would just go away. As district manager of 15 Fill Your Tank convenience stores, she takes a dim view of the mantras "What gets measured gets done" and "If it is not being measured, it is not being managed." She believes:

- **Organizations measure what is easy, not what is important.**
- **Measurement systems can always be beaten.**
- **Employees are encouraged to work the metrics like educators teach to the test.**
- **Measurement is often used as a club to punish managers who go astray.**
- **Even legitimate goals take too much time to collect, document and report.**

Addressing Goals and Measurement

There are four steps to a successful goal/measurement process.

First, **identify the performance dimensions that are important to measure.** At Fill Your Tank, the top executive team reviewed and updated the corporate strategy, and came up with some goals such as 20% annual same-store sales growth, six new stores opened per year, and shrinkage of less than 0.5%.

The next two steps involve **selecting the most informative units of measurement,** and **selecting a goal for each measure.** After identifying inventories management, staff scheduling and customer service as core processes, the executive team at Fill Your Tank identified dimensions, measures and goals for each process. For instance, for cycle time, the measure was order-to-receipt time for impulse-buy products, while the goal was less than six business days. A series of defined measures and goals like these allows management to tie information back to strategy.

The greatest challenge is the fourth and final step, **developing a measurement system that tracks actual performance.** To ensure the goals were realistic, Ellen and her peers participated in developing the system. They developed metrics to assess store and individual job performance. The PE team developed an automated measurement system using the staff's input, and were careful to balance completeness with practicality, to ensure appropriate access to the system, and to link job performance measures to HR processes, such as performance evaluation. ■

Good Measurement Systems

- ✓ **Maximize information accuracy**
- ✓ **Optimize information volume**
- ✓ **Maximize usefulness as a performance management tool**
- ✓ **Maximize timelines (not too delayed to be actionable)**
- ✓ **Maximize ease of understanding**
- ✓ **Minimize information collection cost and time**
- ✓ **Minimize opportunities for "beating the system"**

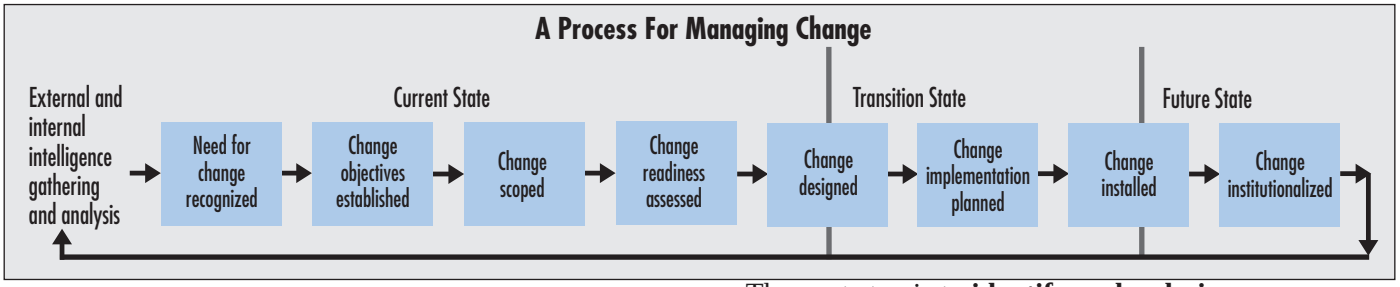
Reframing Culture

Culture describes how businesses are run, and influences strategy formulation and implementation as well as employee satisfaction. It includes the values, rules, practices, rituals and norms that conduct business and how they are communicated, and is determined by a company's current leadership, founders, strategy and customers.

Addressing the Culture Variable

The following steps will help you tackle the cultural dimension of your enterprise:

1. Profile the culture that best supports your strategy, particularly the parts of your strategy that cover values, competitive advantage, sources of growth, and capabilities.



2. Use surveys, interviews and observation to define your current culture.

3. Identify the highest-priority gaps between the culture you have and the culture you require.

4. Identify the key positions in your organization as evidenced by your strategy and business processes. (For example, does your business revolve around your field service engineers? your call center personnel? your ad copywriters? your product managers?)

5. Diagnose the cultural influences on these key positions. The cultural influences of an organization can be grouped into five categories: *strategy and leadership* (do employees understand and support the strategy and leadership of the organization?); *the job itself* (do the employees' jobs fit their skills and do they find their jobs satisfying?); *inputs* (do employees get the training and

(continued on page 6

Reframing Culture

(continued from page 5)

resources they need to do their jobs well?); *work setting* (are the day-to-day practices and physical surroundings acceptable to the employees?); and *feedback and incentives* (do the employees get regular feedback and find the incentives and benefits encouraging and rewarding?)

6. Determine what actions will be required to turn all the no answers in Step 5 to yes.

7. Lay out a plan, including responsibilities and realistic time frames for taking the actions identified in Step 6.

8. Test your plan against the gaps identified in Step 3. Add gap-closing actions for needs that are not addressed.

9. Implement the plan, making midcourse corrections when needed.

Changing an organization's culture is very difficult and will be measured in years, not months. The diagram above offers a structured framework for managing change. ■

Managing Human Capabilities

Human capabilities are the skills, knowledge and personal values and beliefs of those performing tasks in the organization. They are determined by the strategy, which in turn sets the business process requirements, department requirements, job requirements and, finally, the human capability requirements.

An example is a company having a strategic requirement to offer only differentiated products. The business process requirement — in this case, the process involved is inventory management — is to eliminate inventory of commodity products. The departmental requirement, which involves the finance department, is to manage the balance sheet impact. The job requirement is for the financial analyst to calculate write-offs. Finally, the human capabilities required are write-off policies, basic math, depreciation formulas, accounting rules and spreadsheet skills.

Address Human Capability Weaknesses

To deal with human capabilities, it is first necessary to **develop a business strategy** (see the article on page four).

The next step is to **identify and redesign your strategic and key support processes** (for example, inventory management). Then **define the outputs required of each department and its contribution to each key process** (for example, managing the balance sheet impact of inventory). Based on the department outputs, **identify the outputs expected from individuals or teams** (for example, calculating write-offs).

It is then possible to **identify the skills, knowledge, and personal values and beliefs that are required by each job output.** You should pinpoint the physical, intellectual and psychological capabilities needed for each skill, and the intellectual capabilities essential for each knowledge requirement.

After determining the human capabilities you need, **assess and document your current capabilities** in terms of the requirements established in the previous steps. I**dentify and set priorities on the gaps between your current and required capabilities,** including skills or knowledge that are missing, possessed by too few people, or are misplaced.

Develop a human capability plan describing how to close the gaps through skill development, succession planning and career development, mentoring, retention and acquisition.

Use your measuring system to determine which performance gaps are being caused by human capability deficiencies.

Finally, **monitor and update your plan regularly.** ■

Leveraging Information and Knowledge

People believe that information technology will take business to the Promised Land, but most gains from IT are in quality and speed, not value. The goal is not to store information, but to turn it into knowledge and wisdom, because all variables that affect an organization are only as effective as the information that drives and sustains them.

The first step in addressing information systems is to **develop an overall business strategy and an e-business strategy,** which will provide the compass for information management.

(continued on page 7)

Leveraging Information and Knowledge

(continued from page 6)

Next, **identify your different information needs,** including strategic, business process, measurement and issue resolution needs.

Your *strategic* information needs include external intelligence for strategic decision making, information to fuel your competitive advantage, and information to monitor performance of products, markets, and competitive advantages.

Your *business process* information system needs include information related to customers and suppliers, electronic links that would facilitate that information flow, and the process steps where automation could improve quality, reduce cost or cycle time.

Your *measurement system* needs allow you to track business performance metrics and compare them to goals.

Finally, your *resolution* needs include ways to electronically capture problem resolutions for future use and how to make that information readily available to all who need it.

You are now ready to **make decisions regarding architecture, hardware, software and database for information capture.**

You must also **determine how best practices will be shared across the organization.**

The final step is to **install the information and knowledge system you've developed,** including pilot testing and training where needed. ■

For a case study on addressing information systems, go to: http://my.summary.com

An E-Business Strategy

To create an informed e-business strategy, remember that e-business is first about business, then about "e." The following questions will help:

- ✓ **What parts of the overall strategy should be digitally enabled?**
- ✓ **Can you prevent the Internet from taking your place in the value chain?**
- ✓ **How will you protect your customer base in the digital world?**
- ✓ **How will e-business help you to attract new customers?**
- ✓ **How will you interface electronically with customers, suppliers and yourself?**
- ✓ **What role will your Web site play?**
- ✓ **How can technology improve your business processes?**
- ✓ **How can technology improve knowledge management?**
- ✓ **How can technology improve measurement?**
- ✓ **How can technology improve speed and effectiveness of issue resolution?**
- ✓ **How will you ensure that you have the systems and technology to implement the vision?**
- ✓ **What is the priority of each digital initiative?**
- ✓ **What is your implementation plan?**

Redesigning the Organizational Structure

Redesigning the organizational structure is the most common executive response to trouble, because it is highly visible and quickly implementable, at least on paper. But beware. If the underlying causes of organizational problems aren't addressed, reorganization of structure will not solve them. Reorganization is only justified when the current structure impedes implementation of strategy and disrupts the flow of key business processes.

Anthony Harrison, CEO of computer hardware manufacturing Giddings Technology, has to make an impact because growth has plateaued, customers are complaining, competitors are encroaching, and shareholders are selling. He has many options, including redefining strategy, bringing in consultants, and modifying compensations systems. But should he restructure the organization?

Steps to Restructuring

The following steps will help you determine whether you need to reorganize your organizational structure, and if so, which structure will best fit your company's needs.

The first step, as always, is to **evaluate and refine your business strategy.** For example, what products and services are you going to offer? Which markets will you serve? Anthony decided the company would offer a wide variety of computing appliances, but not software or peripherals. It would also target corporate markets and commit to winning based on custom features, quick delivery, and ease of use. He assessed its performance in terms of revenue growth, profitability, and repeat business.

Next, **identify the business processes most critical to successful strategy implementation.** At Giddings, core processes were customer-need identification, product customization, order fulfillment and technical support.

Develop a set of decision criteria or objectives and then define the characteristics of a structure that supports your strategy and core processes. Use the criteria to compare strengths and weaknesses as you decide among alternative structures. Anthony decided that the structure should allow Giddings to identify customer needs quickly and accurately, configure solutions to needs, minimize order fulfillment time, and resolve customer problems quickly.

(continued on page 8)

Redesigning the Organizational Structure

(continued from page 7)

Also **define any other objectives to be met** by the organizational structure, such as administrative, cost, and people needs. Giddings decided that its structure should also motivate employees, minimize cost, support career development and maximize role clarity.

Generate alternative organization designs in enough detail to assess them against the decision criteria. Anthony and his team decided the company could organize by product, market, geography, function, process, project (i.e. Asian expansion team), or a hybrid structure using both product and projects.

Select the best structure by using the criteria to assess relative strength of each alternative. Anthony and his team decided that a market-based structure was best.

When you have decided on a structure, **develop and carry out an implementation plan** that takes into account technical and human factors, as well as the other variables in the Enterprise Model. ■

Putting It All Together

After examining each variable in the Enterprise Model, remember that they are an integrated system. While not every variable needs to be fixed to solve every problem, you cannot adjust one variable and expect that the others will not be affected.

There are four ways to use the process for addressing each of the Enterprise Model variables.

First, **use the process as a comprehensive diagnostic.** Assess each variable to discover weaknesses. Customize and weigh the criteria in considering which lever to pull first. Take action to address priority needs, following the process for each variable. Consider which other Enterprise Model variables to address to influence the success of your intervention.

Second, **use the enterprise model in response to an issue.** Determine what issue type you have (see box). Follow the process for that type of issue, and as you do, identify the Enterprise Model variables that you will address. Follow the directions for treating those variables, being alert to influencing other variables.

Third, you may need to **use the summary in response to a change** someone has suggested for your organization. Identify the businesses needs that the change is intended to address. Use the Enterprise Model framework, questions, and guidelines to determine if the recommendation addresses the appropriate variables. Request a cost benefit analysis to evaluate the merit of the recommendation, and if it is approved, make sure the implementation plan addresses all the variables that will influence success.

The final way to use the framework is as a **change management tool.** Make sure that the change initiative is focusing on the correct variables. Assure that the change plan is addressing the variables in the right sequence. Be alert to the possible need to address unforeseen needs in the variables that will influence success. ■

For three in-depth case studies illustrating the interaction of all the variables, go to: http://my.summary.com

Resolving Business Issues

Issue resolution is a necessary support system for all other variables in the Enterprise Model. Even if everything else going well, business issues arise continually and they require a response. An issue may be a threat, an opportunity or both. Although business issues come in all shapes and sizes, they can be grouped into seven types. The seven types of issues, along with steps to address them, are listed below:

1. Where We Are Going? This occurs when the organization's direction is unclear, questionable or not viable. These issues can be addressed through strategy formulation.

2. Why Did This Happen? Describe the problem, identify possible causes, evaluate each possible cause, and confirm the true cause.

3. Which Way Should We Go? To address this type of issue, clarify the purpose of the decision, evaluate each alternative, assess the risks associated with each alternatives, and, then, make the decision.

4. How Do We Get There? Here, it is necessary to successfully implement a decision in response to a problem or opportunity. Define the project, plan the project out, and then, implement the project.

5. How Can We Avoid Serious Problems? First, identify potential problems, then, identify likely causes of those problems, take preventative actions against these causes, and plan contingent actions.

6. How Can We Take Advantage of an Opportunity? Identify all potential opportunities, identify likely causes, take promoting actions to maximize the probability that the opportunity will present itself, and plan capitalizing actions to maximize the benefits you will receive.

7. How We Find Our Way Through This Thicket? This issue involves a complex situation that might actually be a mix of other types of issues. To address this issue type, identify and clarify concerns, set the priority of your concerns, plan next steps and identify which types of issues each concern represents, and plan the involvement of those who will be involved in the resolution of the issue.

THE SUMMARY IN BRIEF

When the pandemic hit, offices basically closed overnight, and everyone was forced into a kind of grand experiment. Just like we have seen with company after company, in industry after industry, the nature of work changed. In the beginning, most companies–and most people, in fact–thought the shift would be temporary, but as lockdowns were extended, most workers began settling into a rhythm.

These new, more flexible work practices were shown to actually *increase productivity*. Flexible work offers a real opportunity, not just to attract and retain talent, but to transform the way people work and unlock their potential. In ***How the Future Works: Leading Flexible Teams To Do The Best Work of Their Lives***, authors and members of Slack's Future Forum consortium Brian Elliott, Sheela Subramanian, Helen Kupp embrace the notion that that 9-5 is a concept that just doesn't resonate with most knowledge workers today and lay out a seven-step process for getting to how the future works.

IN THIS SUMMARY, YOU WILL LEARN:

- Why flexible work works
- The competitive advantage of flexible work
- The seven steps to making flexible work successful
- How to focus on outcome over activity

Why Flexible Work Works

Flexible work is more of a mindset than a specific set of rules or policies. It's about freeing oneself from the outdated notion that work = office and the workweek = 9-to-5.

Instead we can push the boundaries of how we think about the ways in which we can work together and offer people more freedom and autonomy to get things done in ways that suit them better. We can choose to focus on which model is going to drive the best outcomes for our business, rather than on where and when work takes place.

This requires some flexible thinking.

For example, the reason why Working From Home is generally not the most beneficial version of flexible work is because the *when* is actually more important than the *where*. You see, most of the time when people talk about flexibility, they talk about location. But schedule flexibility is actually far more important.

A Future Forum survey of more than 10,000 knowledge workers across six countries found that 76% want flexibility in *where* they work but a whopping 93% said they want flexibility in *when* they work.

Because the vast majority of workers are asking for it might be reason enough to consider changing how you work, but it's hardly the only reason. When done right, flexible work offers numerous benefits that can give your organization a real competitive edge.

The Competitive Advantage

Flexible work helps companies win the battle for talent, engage employees, and build better results by having a proven positive impact in the areas of:

- Recruiting
- Retention
- Productivity
- Creativity
- Innovation
- Customer Engagement
- Diversity
- Your Bottom Line

Given all the potential benefits to flexible work, one has to ask: Why isn't everyone doing this? One of the biggest reasons why flexible work hasn't always worked in the past, and can still fail today, is because companies don't always get it right. *How the Future Works* is going to show you how with 7 steps to getting there.

Step 1: Stand for Something: Agree on Purpose and Principles

Flexibility will only succeed if you are willing to set aside outdated conceptions of how work should be done and think differently. But with so many different ideas about what flexibility can mean to each person, team, and company, it can be hard to band together and create this kind of shift.

Too many organizations have jumped into defining a flexible work strategy without understanding WHY they're implementing it, other than the fact that their employees want it or they want to keep up with peer companies who are already doing it. To move forward, your leadership team needs to talk through the real business purpose behind flexible work. Purposes may vary somewhat from company to company, but your main Flexible Work Purpose will almost surely center on your people.

Flexible Work Purpose: A statement explaining the main purpose behind your flexible work strategy. It should clearly articulate *why* flexibility is important to your company and be compatible with your organization's overall purpose and values.

Flexible Work Principles: Similar to company values, principles are core beliefs and values that support the organization's flexible work purpose. They are not specific mandates or rules, but guidance to help communicate how you expect people to behave, how they can make decisions that align with your intentions, and generally bring your *why* to life.

Your Flexible Work Principles: How Can You Support Your Purpose?

Principles don't look too different from core company values in some ways. They're not focused on the tactical how (like how many days you should be coming into the office), but more on the mindset required to make a significant shift in how you do business. Principles are meant to be shared across an organization in order to provide direction, consistency, and inspiration as people make the big changes required to enable flexible work. Allow for flexibility in the execution of your strategy, and enable individual department and team leaders to decide what works best for their

It's time to rethink the meeting. Leaders need to get a lot more intentional about the time they are taking up on people's calendars.

group–but within a framework and with top-level guidance. Any decision that gets made at any level–about how often a team will meet, for example, or how to measure team or individual success–should be consistent with those principles.

Step 2: Level the Playing Field: Create Guardrails for Behavior

Principles guide executive decision-making, but principles at the executive level are not enough: You also need guardrails to make sure those principles can be translated throughout your organization in ways that are effective and keep the playing field level so you can get the best out of all your people.

What Are Guardrails?

Guardrails are agreed-upon guidelines or parameters for behavior that will keep your principles in place. They will help people translate your principles into day-to-day habits and practices that support your flexible work strategy.

There are three main areas where they are needed most:

1. Leadership guardrails:
2. Workplace guardrails
3. Culture guardrails

Leadership Guardrails: Leaders set the tone from the top by modeling the right behaviors.

- Lead by Example: If you, as a leader, are still coming into the office on a typical 9-to-5 schedule every day, then you're sabotaging the strategy and undermining its principles (even if you don't mean to). No matter what you say, not matter what your official policy states, if employees see you in the office regularly, they will believe they need to do the same if they want access to growth and opportunities.
- Show Vulnerability: Normalize flexibility and help people feel more comfortable with it. You can do this by saying hi to the kid who accidentally interrupts a video call–or better yet, by bringing your own family on to wave a quick hello.

Workplace Guardrails: Redesign the role of the workplace to keep people from reverting back to old habits.

- Shared Space is for Teamwork First: Showing up to the office is no longer the default; it's the exception. Be intentional about the role of the office, getting teams together for a purpose that is planned in advance.
- Keep a Level Playing Field: Avoid "in-person favoritism" by enabling remote participants to be equally present and part of the discussion. Slack adopted the guardrail of "one dials in, all dial in," meaning that either everyone gets together in a room for a meeting or everyone participates remotely, even if that means logging on to a video conference from a desk in the office.

Culture Guardrails: A flexible work culture is going to be different than an in-office one, naturally. But more than that, it provides companies with the opportunity to address some challenges that have long been part of traditional workplace cultures.

- Move Beyond Meeting-Driven Culture: There are real questions about whether meetings are necessary to get things done, or if they are getting in our way far too often. It's time to rethink the meeting. Leaders need to get a lot more intentional about the time they are taking up on people's calendars. Dropbox uses their "3D" model for planning meetings: debate, discuss, decide. Slack would add a fourth D for "develop." If a meeting doesn't achieve at least one of those four objectives, then it doesn't need to be a meeting.
- Challenge the Role of the Brainstorm: Numerous studies show that the often lauded brainstorming session is a waste of time, at best; at worst it can lead to the dreaded groupthink and even harm productivity. So-called "brainwriting" has been shown to be a better way to generate new ideas, and it requires a kind of hybrid approach that flexible work is particularly well suited for. Brainwriting starts with individual work, allowing time and space for people to think deeply and freely about ideas. You ask everyone to commit their ideas to paper, and only then are they shared and debated.

Step 3: Commit to How You'll Work: Develop Team-Level Agreements

The Team-Level Agreement (TLA) takes your principles and guardrails and puts them into practice. To get started, you can use a starter template, based on Slack's own Digital-First efforts. It has five categories to kick things off:

1. Values
2. Schedules and Meetings
3. Accountability
4. Relationships
5. Checking In

Values: What Do We Value in Our Working Environment as a Team?

If your flexible work purpose is to unlock potential in your people, then start with what's important to those people. What do *they* value? To spur discussion on this topic, you may find that your company's flexible work principles are a useful guide.

Schedules and Meetings: How Will We Collaborate?

A flexible schedule is not the same as having no schedule at all. Rather than having set "working hours," what works best in most cases is for teams to set what's called "core collaboration hours."

This is generally an agreed-upon three-to-four-hour timespan during the day when team members can expect to be "live" and available to one another for things like meetings and feedback. By focusing on shorter bursts of collaboration time, you unlock a lot more productivity as a team.

Better meeting hygiene is a universal need to make all work, not just flexible work, more successful. Start by rethinking your meeting culture. Meetings should be for when team members need to engage in the Four Ds–discuss, debate, decide, develop. If you're not doing that, the meeting should be canceled. Depending on your team members, it might also be important to consider how (or if) you use videos for meetings. Reducing the use of video can help reduce fatigue but also helps level the playing field for individuals who might not have the ideal video-on situation at home.

Accountability: How Do We Hold Each Other Accountable?

For flexible work to be successful, teams need to measure success by outcomes, not by how many hours someone works in a day, or by how many meetings someone attends. To do that, teams need to focus on defining outcomes, roles, and responsibilities upfront and communicating as changes and different needs arise.

Relationships: Coming Together as a Team

While executives need to be thinking about how to build connection across a flexible organization, individual teams can play a part too by being explicit about what will help build relationships among their fellow team members. As a team, consider things like committing to celebrating one another's successes both publicly and within the team and to being honest about when you are overloaded or need support, both personally and professionally.

Checking-in: Evolving Out Team Agreements Over Time

The TLA should be reconsidered regularly to ensure that the norms team members agreed on actually support their work, instead of getting in the way of it. Teams may find they need to add more norms as they go and discover what works. Or, they may end up simplifying, finding that too many norms are counterproductive.

The Process: How to Use a Starter Template to Get Agreement

Take the Slack starter template and use it to create a flexible TLA that's specific to your company and makes clear its objectives, while still providing teams with relevant examples and options, as a framework in which they can make decisions. Follow these best practices to create your organization's own template TLA and then cascade it from there:

1. Customize the Slack starter template for your organization
2. Create early champions for change by piloting with a few teams
3. Disseminate to additional teams with context and guidance
4. Create a way for teams to give feedback and share best practices

A digital HQ means that digital space, rather than a physical office building, is the primary place where people can access information, opportunity, and each other.

Step 4: Experiment, Experiment, Experiment: Normalize a Culture of Learning

How do you make a shift this significant happen, especially when some people–especially those in decision-making positions–are personally happy with how things were before? It will require a process of experimenting, learning, and making adjustments in both behavior and thinking if you want it to stick, and not everything is going to work perfectly from the start.

There will be no perfect data point or external benchmark that will convince everyone that flexible work will work. Radical change can be scary, so you need to build evidence that it can work locally. It takes a mix of a little leap of faith to allow experimentation, executive support to prototype new ways of working, and a willingness to learn your way toward habits and practices that work for your people.

You have to experiment and learn, stay agile and make adjustments (because not every experiment is going to work on the first try), and communicate every step of the way to bring people along. It won't happen all at once–you need to build momentum and support as you move forward and figure out how to make it work.

We recommend that all organizations form a diverse task force to drive this change. The following guidance will help:

- Your task force should be composed of respected leaders and change agents, as well as people willing to ask hard questions.
- Both company leaders and task force members need to recognize this work as a real investment. It requires a sizable dedication of time and resources.
- Task force members should identify and draw from teams that are already trying new ways of working or willing to experiment.
- Those who are working to create this change need to be supported by dedicated resources from core groups–like internal communications, learning and development specialists, and executives who can scale the effort and allocate resources.

Whether it's small experiments or high-level decisions about the principles behind your flexible work strategy, a good rule of thumb for leaders to always keep in mind is to *do your work in public*. It's important that executives and task force members don't sequester ideas, decisions, and thinking for months on end. Giving a sense of where you're going, the progress you're making along the way, and transparently sharing everything you can generates trust and builds momentum.

There is no "done" when creating a better way of working. You're never done experimenting. You're never done learning. And you're never done communicating with people about what you're aiming for and how it's going.

Step 5: Create a Culture of Connection from Anywhere: Reimagine Your Headquarters

There are a wider range of options than just showing up every day at the traditional corporate headquarters. In fact, if done right, flexible work can provide an opportunity to create a more connected and inclusive culture than ever before. This step is about what we can do to start building connections in new ways, ones that support flexible work and forge better, stronger bonds.

Make Digital Your New Headquarters

Flexible work requires companies to reconceptualize the "workplace." It should no longer be thought of as merely a building, but as a network of equally important forums where work can take place and connections can be made. One of these forums could be a video conference, or a Slack project channel just as easily as it could be a conference room. It could be a shared collaborative document like Google Docs, Quip, or Notion, just as easily as it could be an in-person gathering for a PowerPoint presentation.

Communication can happen via platforms, emails, chats,

phone calls, huddles, direct messaging, social media, or in person. And people can engage in those communications form home, their car, while traveling, or in an office building. The place and the method matter much less than the quality of interaction taking place. That means thinking about digital with the same level of intentionality and investment as office space has gotten in the past.

The best way to break old habits and reconceptualize the workplace is to make digital space your new headquarters. A digital HQ means that digital space, rather than a physical office building, is the primary place where people can access information, opportunity, and each other.

Step 6: Train Your Leaders to Make it Work: "Soft" Skills Matter More than Ever

Throughout this era of uncertainty, at least one workforce reality hasn't changed and it is unlikely to change anytime soon: the critical role that managers play in your business and in the lives of employees. But here's the harsh reality: Most of your managers are not equipped to embrace flexible working arrangements or lead distributed teams. Managers need to shift from gatekeepers who conduct status checks to coaches who lead with empathy. They need to get to know the people on their team, not just the skill sets to get the work done. In short, the role of a manager needs a new definition. This step will guide leaders in helping managers regain their footing and equip them for this new way of working.

We would like to propose a new definition and purpose for managers to replace the old views. The role of today's manager is to do three things: inspire trust, create clarity, and unlock the potential within their teams. In practice, this means:

1. Being transparent about the purpose, measurements, and expectations as a way to build trust.
2. Providing clarity for team members on their responsibilities and goals through direct (and two-way) feedback.
3. Unlocking potential for team members to do their best work through equitable practices and saying "no."

Soft Skills Managers Need to Support this Redefinition

- Building psychological safety
- Communicating transparently
- Leading with empathy
- Offer regular feedback, including career growth conversations
- Accept and own mistakes, creating a culture of acceptance
- Model inclusive practices and reset practices that create exclusion
- Show how to build boundaries to avoid burnout and allow for focused work
- Permission to say "no"

Leaders can invest in reskilling managers to make this shift and enable flexible work through coaching, structured feedback, and celebrations of managers doing it right.

Step 7: Focus on the Outcomes: Avoid the Doom Loop and Embrace the Boom Loop

Companies that are successful in adopting flexible work strategies are also implementing new strategies for measuring how it's working. Flexible work arrangements have a tendency to bring to the surface common challenges around trust. Some leaders feel like they won't be able to know if their teams are working if they're not in the office or if they're unable to monitor when they're online.

The issue with monitoring, however, is that it's ineffective at best; at worst it undermines trust, hinders performance, negatively impacts employee satisfaction and overall morale, and contributes to burnout. Leaders at all levels who try monitoring tactics run the risk of getting caught up in what we call:

The Doom Loop: an unhappy cycle of *monitoring*, which leads to *meaningless metrics* and time wasted on reporting, which leads to effort wasted on checking the boxes or *avoidance* of the monitoring systems, which leads to talent attrition, which compounds a *loss of trust*, which tend to lead to more *monitoring*. And on and on it spirals.

Organizations must focus on outcomes over activity.

Quantity should never triumph over quality. Success requires clear goals set at both the company and team levels. This is important, not just to meet business outcomes, but

also to foster the kind of culture you want to build–the kind that will help you win the war for talent.

It's through this kind of reorientation that companies can avoid The Doom Loop. Instead, trust gets built by being clear about shared goals and giving people the support and room they need to meet them. We call this The Boom Loop.

The key roles of managers and leaders is to build trust, create clarity, and unlock potential as outlined previously. In this context, that means figuring out which outcomes matter, how those translate into deliverables, and how to set expectations to timeframe and quality.

In other words, people need to understand what's expected of them (clarity), they need to believe that their work is measured fairly (trust), and they need freedom within these clearly articulated parameters to do their best work (unlock potential). These things are essential for driving outcomes-based measures.

We believe that flexible work is the future, and there are a lot of reasons why businesses need to start embracing the future now. Your people want it. It's a competitive advantage that opens up your hiring pool far beyond commuting distance from the office. It helps unlock potential, fostering inclusion that leads to better business outcomes. But there's another reason, too, that we think is worth considering before we send you on your way: Flexible work can make a real difference in people's lives, including your own.

Because none of us are *just* workers after all. We're all human beings who work. What we have all seen during this grand experiment that the pandemic has forced upon us is that being given the power and the freedom to do our best work together can be transformative–for people *and* for the companies they work for.

Brian Elliott is the Executive Leader and Senior Vice President of Future Forum, a consortium launched by Slack to help companies reimagine work in the new Digital-First world. Sheela Subramanian is a Vice President of Future Forum. Prior to this role, Sheela spent five years at Slack in several leadership roles, including as the Head of Global Enterprise Marketing, where she led the company's shift to a B2B organization. Helen Kupp is the Senior Director of Product Strategy & Partnerships of Future Forum, where she leads membership program development, and strategic partnerships.

THE SUMMARY IN BRIEF

According to corporate identity expert Laurence Ackerman, the true strength of an organization is reflected in its identity — the traits and actions that make it a unique being unto itself — and in its ability to leverage that identity into creating products and services that provide value to customers. The wealth that is generated from this transaction feeds back into the organization's identity, thus creating a never-ending value creation cycle of identity, products and services and wealth.

This is the ultimate result of what Ackerman terms the Laws of Identity, which, taken individually, form a compelling set of value-identifying guidelines for any organization. These laws of identity, which will be explored in detail in the following pages of this summary, are as follows:

- **The Law of Being.** Any organization composed of one or more human beings is alive in its own right, exhibiting the distinct capacities of the individuals who make up that organization.
- **The Law of Individuality.** An organization's human capacities invariably fuse into a discernible identity that makes that organization unique.
- **The Law of Constancy.** Identity is fixed, transcending time and place, while its manifestations are constantly changing.
- **The Law of Will.** Every organization is compelled by the need to create value in accordance with its identity.
- **The Law of Possibility.** Identity foreshadows potential.
- **The Law of Relationship.** Organizations are inherently relational, and those relationships are only as strong as the natural alignment between the identities of the participants.
- **The Law of Comprehension.** The individual capacities of the organization are only as valuable as the perceived value of the whole of that organization.
- **The Law of the Cycle.** Identity governs value, which produces wealth, which fuels identity.

The Laws of Identity can light the path to greater value creation. The first question to answer: Do your organizational activities reflect your corporate identity? Your self-analysis begins on the next page ...

IDENTITY IS DESTINY

by Laurence D. Ackerman

— THE *COMPLETE* SUMMARY

The Identity Credo and Laws of Identity

Identity contains its own logic. Many of the most memorable events in the lives of individuals or organizations can be explained in relation to who or what they are and who or what they are not. In recognizing this logic — and the insights that it yields — people and companies will find not only the red flags and stop signs that guide the direction and speed with which they pursue their goals, but also the flashing opportunities waiting to be seized along the way.

The logic of identity actually flows from a definable set of laws that clarify much of what works and doesn't work in life and business. These laws exist in a certain pattern, which form a credo — an "identity" credo — that organizes everything we are and do. Here is this credo, which speaks to both individuals and companies:

I am alive, I am unique, and I am immutable, even as I grow and evolve. To truly live, however, I must express myself fully, and in this regard, have much to give. But to do so, I need others, and am most productive with those who need me in return. To establish these relationships, I must first be recognized for who I am, and it follows then that I will receive in accordance with what I give.

This identity credo flows from the laws as follows:

The Law of Being ("I am alive ...")

The Law of Individuality ("... I am unique...")

The Law of Constancy ("... and I am immutable, even as I grow and evolve.")

The Law of Will ("... To truly live, however, I must express myself fully ...")

The Law of Possibility ("... and in this regard, I have much to give.")

The Law of Relationship ("But to do so, I need others, and am most productive with those who need me in return.")

The Law of Comprehension ("To establish these relationships, I must first be recognized for who I am ...")

The Law of the Cycle ("... and it follows then that I will receive in accordance with what I give.")

In the remaining pages of this summary, we will explore each of these eight laws in turn. ■

The Law of Being

The Law of Being speaks to the need for separation from all others as a prerequisite to understanding who you are; in other words, you cannot rely on others to define your capabilities, set your course, or tell you about what you must be truly passionate. Parents, friends, counselors, managers — everyone has their own agenda, some quick advice, or an erroneous suggestion that assumes they know something you don't.

The Law of Being

Any organization composed of one or more human beings is alive in its own right, exhibiting distinct physical, mental and emotional capacities that derive from, but transcend, the individuals who make up that organization over time.

The Law of Being reveals that organizations, by virtue of the fact that they are comprised of human beings, are alive. They are self-directing beings with minds of their own. The life of a company can be described in ways that illuminate its value on multiple levels. Specifically, a company's "being" can be described in terms of its

- **Human value.** A company's life derives from the thousands of people who make up the organization over time and, thus, it is a true reflection of the organization's aggregate skills and expertise.
- **Business value.** A company makes a distinctive contribution to the marketplace, in the products and ser-

The Law of Being

(continued from page 2)

vices that flow from and reinforce identity, or in joint ventures that build upon the unique, value-creating characteristics of the partners.

- **Societal value.** A company, as a life force, brings about social improvement, impacting not just the people who comprise the organization, but also the greater world outside the walls of headquarters.
- **Economic value.** It is only in combining the effects of these three forms of value creation — human, business and societal — that leaders can assess the basic financial worth of the company, including long-term stock performance and portfolio turnover.

The Law of Being requires managers to practice the art and science of value creation on all four levels — human, business, societal and economic. The key for you as a leader is to liberate your company's identity and give it room to run. In practical terms, this means clarifying your company's innate strengths and working with those strengths to create value. ■

The Law of Individuality

It's one thing to know that you are alive; it's another thing entirely to live according to who you are. Yet the defining leaders of this and previous generations have exhibited an authenticity as individuals that effortlessly draws others to them. Likewise, the Law of Individuality asserts that every organization, like every individual, is unique. Corporate leaders must recognize that true and sustainable differentiation is not only achievable, but also necessary. If an enterprise is to thrive, its unique, value-creating characteristics must be known.

The Law of Individuality

An organization's human capacities invariably fuse into a discernible identity that makes that organization unique.

Leaders must thus look deeply within the organization to find the root and full extensions of the company's identity by doing the following:

- **Commit to finding out.** Get to know the institution as the individual it truly is. Determine what makes the company special by soliciting input from the people — customers, suppliers, employees and the like — who interact with and within the company every day. How do they perceive your organization creates value, both for them and with them? How does the company contribute to the enhancement of their welfare and that of their customers? To the productive evolution of their enterprise? To the betterment of society as a whole? Dig deep and proactively pursue the core components of your organizational individuality.
- **Assume nothing.** Most responses you receive will be multi-layered, although they may not seem so at first.

(continued on page 4)

Alcoa and the Law of Being

In the mid- and late-1980s, Alcoa was meeting new economic and competitive pressures by shrinking (while strengthening) activities inherent to its core aluminum business. For example, it was reducing smelting by 25 percent while continuing its search for new, significant uses for aluminum in industrial and commercial products.

At the same time, Alcoa was pursuing acquisitions and mergers designed to broaden the company's appeal beyond aluminum, developing new technologies, products and markets in areas such as ceramics and separations. The company was even considering buying an aerospace and defense organization.

For Alcoa's leaders, the company's identity was in transition as a result of this diversification. Author Ackerman was brought in to help redefine and communicate the identity of the "new Alcoa." Discerning the company's identity in the midst of such considerable change (the company diversification moves were coupled with management's efforts to decentralize) provided a unique challenge. Ackerman had to slice through these familiar business markers by searching for answers to one key question: If you strip away what the organization makes and sells, and if you regard its 55,000 employees as one individual, what was this "individual" really good at? From where does it derive its value?

The answer, Ackerman found, was *a genius for transformation*. Transformation — of new technology into new products or new products into new markets — was at the heart of Alcoa's identity. Alcoa even transformed society. For example, Alcoa transformed the aviation industry by allowing airplanes to be wrapped in aluminum instead of cloth. This development, in turn, helped the growth of the passenger aviation industry at the expense of the railroads.

If a genius for transformation was what defined Alcoa's identity — what set it apart from every other company — then transformation needed to be at the core of future corporate strategy or activities.

Alcoa pulled back from its diversification strategy and refocused on aluminum, thus ensuring that transformation remains key to the company's activities. Ackerman believes a diversification strategy could have also worked — as long as it remained guided by Alcoa's identity.

The Law of Individuality

(continued from page 3)

Such obvious, pat answers as low cost, service, speed, quality and innovation may actually only comprise the most superficial of layers to the true answer; peel back those layers and see what rests beyond them.

- **Celebrate individualism.** Look closely at your organization and find the capabilities and passions that make your company the individual that it is — these elements have very likely always been there. They must be drawn out and celebrated in order to make the discovery of your organizational identity that much more credible.

Fidelity Investments

Fidelity Investments wanted to make certain investors recognized the value in doing business with the company, not just with its myriad funds. The problem was that Fidelity's own employees, from managers on down, were inattentive to the institution as a whole, paying homage (as did their customers) instead to the company's various funds. The whole was, in essence, lost among the sum of its parts; there existed no real institutional glue to bind up the company's high-octane, entrepreneurial fund managers and marketing executives who had pushed the organization's growth projections to stunning heights.

What made this so astonishing was that, to a large extent, the company was driven by its need to celebrate individuals, as reflected in its commitment to private ownership; passion for innovation and invention; fierce reliance on personal skill and judgment as the foundation for the company's growth; and an almost organic organizational structure based on self-contained units or cells. Fidelity's need to celebrate individualism had been a part of its culture for as long as it had been in existence; no one within Fidelity knew that identity existed.

A commitment to individualism was the core of Fidelity's identity. Recognizing this identity, Fidelity managers took steps *not* to coordinate or control the company's activities, but rather to enhance the company's "individual to individual" connection with customers. One example: creating a company online database that provided daily fund information to all customers with personal computers and modems. ■

The Law of Constancy

In the past decade, no issue had occupied leaders more than change — specifically, the need for change and how to achieve it. Wholesale change is often viewed as the path to salvation in a corporate environment in which nothing is sacred. This is an incorrect point of view — it is identity, not change, that is sacred. For all managers who realize that life doesn't stand still and that their companies must change, this law demands a sharply counter-intuitive response — "change" initiatives, if they are to succeed, must be made in concert with the identity of the institution.

The Law of Constancy

Identity is fixed, transcending time and place, while its manifestations are constantly changing.

After all, change is really built into identity — both individually and in the context of the corporation. The challenge is to use outside forces — economic, competitive, technological and societal — to spark new ways of interpreting identity, rather than as reasons to change it.

Korn/Ferry International

Korn/Ferry International, the widely regarded executive search firm, met this challenge head-on. While most of its competitors focused solely on searches for senior-level executives, Korn/Ferry drew criticism for focusing on mid-level executives, a tactic that expanded its revenue base and influence with clients, but which ran counter to virtually every other like-tasked business in their market.

Rather than roll with the familiar or the accepted, Korn/Ferry went even further against the grain when it launched FutureStep, an online career management program that reviewed, categorized and tracked credentials submitted by mostly mid-level candidates. The initiative

(continued on page 5)

The Law of Constancy and Brand Management

The Law of Constancy tells us much about the corporate brand:

- ✓ Its definition resides within the identity of the enterprise and cannot simply be fabricated.
- ✓ It is not transitory — not simply a statement of today's corporate features — but timeless in terms of the benefits it yields.
- ✓ It requires constant reinterpretation.
- ✓ It is (or should be) "of the moment" in how it is interpreted.
- ✓ It must be established by companies as their own "turf" and defended vigorously against fads, fashions, and competitor's standards or views.
- ✓ Its strengths must develop over time and, to be fully known, must be viewed through the lens of history as well as current events and future aspirations.

The Law of Constancy

(continued from page 4)

was based in using technology — in this case, the "downscale" forum of the Internet — to create a cutting-edge, contemporary expression of the organization's bias toward multilevel, multifunctional searches. This "new" idea was actually based in an attitude and aptitude the company had held all along, one firmly rooted in its unwavering identity: a need to build leadership capital. ■

The Law of Will

The Law of Will can manifest itself in many ways — the will to break a world record in a sport, to scale Mount Everest, to be one of the most admired companies in the nation, to build the fastest, the sleekest, the most of every good thing. The Law of Will drives people and companies to be the best at whatever they do. There is, however, a danger hidden in this Law — the danger lies in attempting, or "willing" yourself, to be something you are not, something that doesn't spring naturally from your identity.

The Law of Will

Every organization is compelled by the need to create value in accordance with its identity.

A company must have a deep-seated need to create value on its own terms — it must express itself fully. Managers must make it their business to know the identity of their organization before they attempt to set the direction for that organization. They must either recognize the will of the institution as a central, value-creating force or be prepared to see their company falter.

The Upjohn Company

The Upjohn Company, a giant in the pharmaceuticals industry, spent a great deal of time dealing with a conflict within the organization, between the will of those who would tie the company's future to a relatively narrow path and the will of the institution itself, whose method of value creation was much broader.

This conflict was apparent in the uncompromising way the company approached quality — everyone in the organization took great pride in making drugs that were superior in quality to those of competitors. This admirable approach contained hidden problems. First of all, people outside the organization — customers and investors — did not view quality as an overt advantage. The other problem stemmed from the way quality was defined, valued and lived on a day-to-day basis; indeed, the company was operating in line with three very clear but unspoken definitions of quality:

- **Quality of products.** The ways in which Upjohn ensured the quality of its products seemed ritualistic, in some ways, unnecessarily so — its products regularly exceeded FDA standards.
- **Quality of life.** The environment in which employees worked was immaculate, but the value of such a setting influenced the enterprise to a surprising extent. Form reigned over substance; the comfort it generated led to a somewhat genteel pace of business.
- **Quality of people.** Although Upjohn held employees to the highest ethical standards, the company's resources weren't always deployed to the service of improving business performance or enhancing the company's ability to compete on a global scale.

With such an importance placed on quality — quality products, quality people — why couldn't Upjohn reach its full potential? The answer lies in a comment made by the company's marketing manager — "Risk taking is too risky." The company's push for quality and high ethical standards bred employees who were aggressive go-getters — creative, passionate people who could create value in a way that played off the strengths of their collective identity. The company's conservative business practices, however, stymied the energy of its employees; its insistence on creating value its way, not theirs, created discord with the true identity of the organization. Upjohn's merger with Pharmacia — its demise as an independent enterprise — is a direct result of this conflict between the company's identity and the company's practices and strategies.

Identity precedes strategy. If the direction of a company is to have staying power — whether it is referred to as vision, mission, strategy or purpose — leaders must ensure that it flows from identity. ■

The Law of Possibility

The Law of Possibility becomes a window on the future of an organization in ways that reveal its potential for timeless value creation. The richest avenues with the greatest potential for growth lie in understanding the natural drive of the organization. Managers who chase new markets solely because they are "high growth" and those who seek diversification simply to smooth the ups and downs of business cycles are focusing in the wrong places. They must first look at the value-creating potential inherent in the identity of their institutions if they want to grow in ways that are both natural and profitable.

The Law of Possibility

Identity foreshadows potential.

(continued on page 6)

The Law of Possibility

(continued from page 5)

Westinghouse

Westinghouse ensured its own demise by failing to make this connection. Its obsession with short-term financial performance — seen in microcosm in the many foundering divisions of its Advanced Industrial Systems (AIS) unit — never put Westinghouse in the same league as Caterpillar, IBM and Marriott, as the company's senior management insisted it would. Its plan to reach "greatness" was based on strategies to achieve a greater return on equity (ROE), not to create value for its customers or partners.

AIS, however, could and did create value through the collective sharing of four distinct capabilities:

- **A problem-solving approach to customer interaction**
- **A holistic view of their customer's needs**
- **An obsessive concern with the customer's welfare**
- **A deep regard for technology in general, and for engineering in particular**

To articulate the identity of AIS was to reveal its potential to create value as a single, optimally integrated organization. In the ROE-obsessed culture of Westinghouse, however, such value creation could not help the unit turn a profit. As a result, AIS never came close to "greatness," as defined by management, and was dissolved — a tragic result of Westinghouse's ignorance of its productive potential as an organization.

While leaders certainly must keep economic requirements in mind, they must also rethink what constitutes reasonable payback time horizons and acceptable ROE. They must employ identity as a guide to growth, keeping in mind that their organization as a corporate being must strive to exercise and deepen its own identity as a means by which to achieve that growth. ■

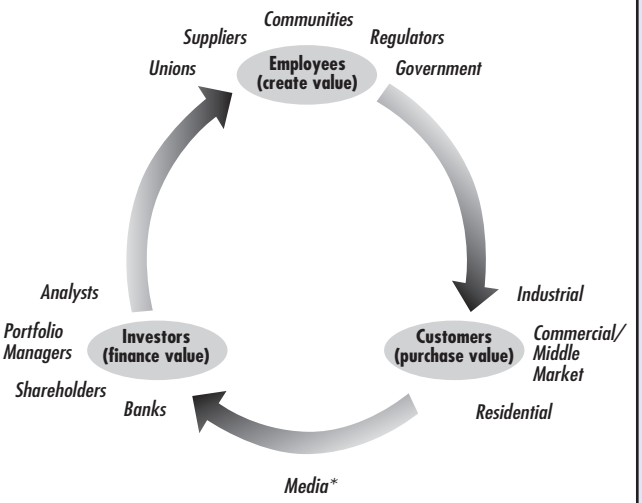
The Law of Relationship

Organizations are most productive with those who need them in return; this interdependence yields an entire framework for leading on the strength of relationships. Leaders must manage relationships with stakeholders as a whole system, not as a portfolio

The Law of Relationship

Organizations are inherently relational, and those relationships are only as strong as the natural alignment between the identities of the participants.

(continued on page 7)



The Value Circle

The Law of Relationship supplies a model called the value circle, which addresses value creation through the eyes of all stakeholders, revealing the inviolable cause-and-effect relationship among employees, customers and investors. In accordance with the Law, companies do not have a collection of stakeholders; they have a system of stakeholders, with a natural order that manifests itself in the following ways:

- ✓ Employees create value through their ideas, innovations, talents, experience and skills, and through the products and services they build, market and sell.
- ✓ Customers purchase value to the extent that they like the offerings (or the value) that they see. Revenues, sales and profits are at stake here.
- ✓ Investors finance value, putting capital back into the organization as they "approve of" the earnings that flow from the value "purchased" by customers. This act closes the loop on the value circle, fueling its constant momentum.

It is important to note that, in the value circle, no one stakeholder group is more important than any other. Investors are not, as one may think, the primary focus of the circle; this risks future growth for the sake of the present. Investors are best served by seeing themselves as beneficiaries of the value created through the interaction between employees and customers.

Exhibit Two

The Law of Relationship

(continued from page 6)

of separate, distinct relationships. The work of an organization must thus be organized in ways that put the value circle in motion (see sidebar on previous page), thus building momentum and creating a relationship advantage that will stand the test of time.

New York State Gas and Electric

That organizations are most productive with those who need them in return suggests something else no leader can afford to ignore — the fact that *need* is determined by *identity.* New York State Electric and Gas is driven by a need to "shape energy environments." This need governs the company's relationships with all stakeholders, implying value in many forms:

- For employees, NYSEG creates and sustains energy around the goal of improving the efficiency and quality of its customers' lives and businesses.
- For customers, the company focuses on boosting productivity and competitiveness (for business customers) and contributing to health, ease and reliability (for residential customers).
- For investors, NYSEG builds its brand franchise and its ability to improve earnings by modularizing its approach to identifying and meeting the needs of its customers.

Taken together, these messages form the basis of a new contract with NYSEG's most important stakeholders, aligning its approach to meeting the needs of its three core constituencies, using the value circle to simultaneously enhance its relationships with all three. ■

The Law of Comprehension

One of the underlying themes of identity is that we must take responsibility for ourselves, both as individuals and as organizations, to build productive relationships, pursue personal and professional goals, and accept the good and the bad that result from our actions. We have the need to be known for who we are as a prerequisite for building potent relationships with others. On an organizational level, managers must be certain that their organization's capacity to create value is likewise understood.

The Law of Comprehension

The individual capacities of the organization are only as valuable as the perceived value of the whole of that organization.

Again, we refer to the value circle (first referenced in the Law of Relationship) and how the needs of the three main stakeholders are affected by the Law of Comprehension:

- Current and future employees must know the identity of the enterprise they help form if they are going to live it, keeping it fresh, vital and relevant.
- Investors must know the company's identity, because identity is the key driver of wealth.
- Customers must be made to experience identity at every turn, regardless of whether they can articulate that identity.

Indeed, the role of the leader is to find every conceivable way to ensure identity is woven into the day-to-day operations of the enterprise. The Law of Comprehension is, first and foremost, fueled by how employees speak of the company and how they behave during and after work. These actions reinforce the work that is done and how that work results in products and services that are (or should be) the natural expression of identity. On an organizational level, the Law of Comprehension is reinforced through the policies and practices of the company toward the communities in which it lives, through its recognition of the whole organization and more than just the sum of its parts, and the visibility of value throughout the entire enterprise. ■

The Law of the Cycle

The final Law of Identity notes that companies will receive in direct accordance with what they give. The Law of the Cycle is expressed in another circle, not unlike the value circle. The things we believe we are (as workers and practitioners of our various interests) prescribe our sense of self and foreshadow the gifts we share with family, friends, clients and business associates. The wealth we receive in exchange for sharing those gifts a) depends on how well we blend those two intrinsically connected roles, and b) ever more fuels the expression of our identity. For companies as well as individuals, wealth is not only about money, but also the things that, like a magnet, draw people back to us over and over again.

The Law of the Cycle

Identity governs value, which produces wealth, which fuels identity.

Maytag

Home appliance conglomerate Maytag asked Laurence Ackerman to clarify the meaning of the venerable company — how its goals and practices dovetailed

(continued on page 8)

The Law of the Cycle

(continued from page 7)

with its identity. What he found was that the external perception of the organization as merely "a collection of pieces and parts" had been taken to heart within the company as well. One could tell this from the way Maytag introduced itself in its annual reports: "Maytag Corporation ... consists of x companies with y manufacturing operations in z countries and approximately xx,000 employees." Only the numbers changed from year to year, reflecting the year's acquisitions, expansions and layoffs. Maytag's management had no real definition of the company's unique role as a corporate being and, thus, explicated its identity and purpose in terms that were as quantifiable as it could make them.

... the external perception of the organization as merely "a collection of pieces and parts" had been taken to heart within the company as well.

Ackerman's analysis revealed the core of Maytag's identity: the need to improve the quality of home life. Maytag wasn't an appliance company nor a manufacturing conglomerate. It was a home management enterprise. The many brands of Maytag — including Hoover, Jenn-Air, Magic Chef and Maytag — were just the bridges that connected customers to this home management enterprise. Helping customers improve the quality of their home lives — not selling customers more brands — was the value that Maytag created. The better Maytag helped customers improve their home lives, the more value the company created and, thus, the more wealth it generated. ■

In conclusion ...

Organizations must recognize identity as the invisible, immortal core that governs organizations just as it governs people. What we do with this knowledge — how we respond to the Laws of Identity as individuals, professionals and business leaders — is a challenge each of us must meet on our own terms.

The only real prerequisite to engaging identity as life's center of gravity is believing deeply in the potential of people and organizations to create value for others, and to realize wealth in return. This is the imperative of true leaders. For individuals and organizations fueled by this belief, the Laws of Identity are there as a guide. ■

Managing by New Criteria

The Laws of Identity can be applied to all facets of day-to-day management which, when practiced in the light of identity, will help ensure the creation of value and wealth over time. This new criteria for management affects a broad swath of executive and managerial level leaders in every identity-centered organization:

- ✓ For board directors, identity may suggest the criteria for choosing chief executives, including such factors as servant leadership, insight into organizations and insight into the external environment.
- ✓ For CEOs, in turn, identity provides criteria for the composition of the board, specifically in the congruence of the candidates' world views with the value-creating characteristics of the organization. It also supplies a frame of reference for picking business partners with similar congruent goals and identities.
- ✓ For CFOs, identity provides an expanded framework for stock valuation, identifying the companies and income statements that reflect commitment in investiture and operations in accordance with identity.
- ✓ For strategic planning executives, identity provides the source of competitive differentiation and sustainable growth.
- ✓ For marketing managers, identity provides criteria for market expansion — identifying those markets where the company believes it can make a proprietary contribution based on its identity.
- ✓ For line managers, identity provides the framework for planning and running a business, clarifying the value-creating role of the unit.
- ✓ For HR executives, identity dictates how and who you recruit, hire and train. It also provides vital criteria for performance appraisals, compensation and employee recognition, establishing a framework for effective employee performance and involvement.
- ✓ For communications executives, identity is the message — the cornerstone of all communications, internal and external, now and in the future. The identity of the organization and how it affects the company's relationships with all stakeholders is inviolable.

THE SUMMARY IN BRIEF

Many organizations' strategies look sound on paper but fail to produce meaningful change. Leaders often sense that something is misaligned, yet continue to project confidence while execution stalls, teams disengage, and initiatives lose momentum. The core pain point is not a lack of ideas, but the inability to translate strategy into coordinated action, accountability, and sustained results.

Ignition: The Art & Science of Strategy addresses this gap by offering a practical framework for turning strategic intent into measurable execution. It places leadership accountability at the center of this translation. It shows leaders how to move beyond vision statements and embed strategy into daily operations. By focusing on alignment, accountability, and the human dynamics behind execution, organizations can energize teams, foster shared ownership, and adapt quickly without losing strategic clarity. The approach is designed to work across different organizational sizes and industries, emphasizing strategy as a living system rather than a static plan.

Drawing on more than two decades of global advisory experience, Dr. Kathryn Ritchie blends strategic rigor with behavioral insight, providing tools she has used to help leaders align people, priorities, and purpose. Her approach is grounded in real-world application rather than theory alone. ***Ignition*** positions strategy as both an art and a science, one that drives innovation, accountability, and lasting transformation.

IN THIS EXECUTIVE BOOK SUMMARY

- Get valuable insight into how to turn strategy from a plan into aligned action
- Understand how to engage teams and create shared ownership
- Find out how to embed strategy into everyday decision-making
- Acquire the necessary skills to lead adaptive, sustainable transformation

Introduction

Strategy has been a part of my life since I was a child. It is in my veins. I live and breathe strategy in all its guises and contexts. Part of the reason I love working in strategy is that I'm comfortable with change and uncertainty. I also love learning. All these aspects are present and play a significant role in the successful development and execution of strategy.

Humans are wired to solve problems and create certainty and stability. That said, our brains are most activated when we face uncertainty. This is why uncertainty should be embraced and seen as a time for learning, when possibilities beyond the known emerge. These are times for reflection and growth and are key ingredients for successful strategy—both its development and its execution.

As a business leader and strategy consultant for over thirty years, I have helped companies double in size, ignite teams to achieve new levels, and navigate transformations, exits, and uplifts. Across this work, I see a landscape of inspiring effort and outcomes as well as missed opportunities, wasted effort, and misused resources. The possibility of learning and improving constantly sits before us.

The Three Enoughs

My foundational business model and thesis posit that we just need enough to drive strong performance and execution.

- Enough clarity – centers on the "what" of the business and strategy.
- Enough cohesion – focuses on all things people, team, and culture.
- Enough discipline – the tools and techniques that will allow the people to lock in the strategy, execution path, and momentum to deliver.

You only need *enough*. Otherwise, you are overinvesting or removing the opportunity from some uncertainty and dissonance. You do need enough of each of these factors.

Why Do Many Miss Out on Their Growth Potential?

Maybe it's because strategy is elusive when it is genuinely in flow in an organization, when the art and science of strategy are in sync. Perhaps it is because strategy is too frequently disconnected from its execution path and equated with a presentation needing approval.

Strategy is both complex and simple, yet not easy. It is about problem-solving and is a function of both art and science. The science of strategy is all about identifying a need or want that represents a viable market opportunity, and you need evidence of this. The art is the complex part and is embodied in execution.

This is where the "ignition" really shows up. It is about observing and reading the organizational system, seeing the patterns, and finding ways to ignite the system and establish execution momentum.

CHAPTER 1

Why Organizations Fail at Strategy

While the concept of strategy has existed and been applied successfully for thousands of years, its execution still falls short in many organizations, across all organizational types. Too many leaders still struggle to fully assess what a strong competitive strategy—that is, how an organization positions itself to win—truly looks like and, more particularly, what is required to successfully unleash its full potential day-to-day.

It is often seen as a difficult and highly technical area of expertise that must be handled by those with superpowers. Perhaps this misconception is why so many leaders over the past century and a half have outsourced strategy development to consulting firms, typically large and expensive ones. However, overusing large and often costly consulting firms has dramatically slowed the building of a strong strategy muscle in the global business landscape across organizations of all shapes and sizes.

Competitive strategy can be understood, embraced, and evolved throughout your organization. Only when it is fully democratized will you unleash the true firepower of the organization you are leading.

But democratizing competitive strategy requires more than participation; it requires clarity about what strategy actually demands—understanding and embracing it as both an art and a science.

The science aspect means that there are real technical and analytical demands associated with arriving at the point of having made a robust set of choices that support your competitive positioning. The art of strategy embraces that strategy and its execution are iterative by nature and depend on taking some risks, testing, and learning. You can have the best strategy in town, but it will go nowhere without the hearts, minds, and hands of your people. These team members question, experiment, challenge, learn, and align to bring your organization's strategy to life.

> You can have the best strategy in town, but it will go nowhere without the hearts, minds, and hands of your people.

People, Systems Thinking, and Alignment

To broaden the strategy's focus, we must incorporate the human element. This involves the disciplines of sociology, philosophy, behavioral science, group dynamics, neurology, psychology, economics, and more. Understanding the impact of these disciplines is how we build our understanding of what we need to do to create and foster the conditions for people to feel inspired to do their best, learn, and grow.

Second, we must account for systems and subsystems when considering our organizations. The systems are dynamic and constantly interact on multiple and varying levels. They cannot be controlled, only shaped.

Third, we should systematically integrate and link all activities within our systems that support our competitive strategy. Once we can connect the various interdependencies to the strategy, activities and work programs can have their "oxygen" and remain aligned.

Strategy development and execution are joined at the hip, ever dynamic, and must be in the blender together. They cannot be detached. No amount of engagement or cascading will fill this void.

CHAPTER 2

Strategy Is Messy

Given that strategy is born in what the Harvard Case Method describes as a wild environment, good strategy is much more than doing the analysis, mapping it on a whiteboard, and documenting a rational story in PowerPoint. Strategy cannot be neatly packaged into boxes of information ready to hit the execution production line. Good—and certainly great—strategy serves as a rudder for your business decisions. It is iterative; the next step or question is informed by the outcome of the last.

When we try to force a mapped-out strategy development process that doesn't assume a wild environment, we'll likely miss out on a business's true potential. The magic happens when we dare to embrace this messy process.

Embracing the mess means stepping away from rigid control to allow for more speculative thinking. It involves asking questions such as:

- What might happen?
- What could we do?
- What if we tried this?
- What would need to be true for specific outcomes to occur?

How to Think About Competitive Strategy

Think of competitive strategy as an ongoing, disciplined journey rather than a slick PowerPoint deck. Michael Porter, a titan in the field of strategy, identified core generic strategies for achieving competitive advantage in his 1980 book *Competitive Strategy:*

- The strategy of cost leadership is when a company aims to be the lowest-cost producer in its industry.
- Differentiation is when a company seeks to stand out by offering unique features, qualities, or services.
- Focus, which splits into cost focus and differentiation focus, targets specific market segments with tailored low-cost or unique offerings.

Three Ways to Stand Out

When it comes to differentiation, there are three ways to stand out in the eyes of your customers:

- Have the best product to win in product leadership.
- Win based on customer intimacy—be responsive to their needs and solve their problems.
- Ensure operational excellence, where you win by being the most efficient at doing the job.

Strategy Needs to Drive Your Business

Strategy, targets, and plans are all important in driving business performance. The relevant question is: What should have priority?

In the entrepreneurial setting, strategy drives the business, whether articulated in words or writing. The risk is that the strategy and its momentum can be lost in transitions. This risk is greater if the strategy is not explicitly articulated and worked with knowingly. And this risk is further compounded if the new owners overweigh the role of financial

targets, driving purely short-term decision-making that undermines the competitive strategy.

Overweighing financial targets outside of the associated strategy gives rise to what I call target-driven strategy. It is the most common—and often dangerous—alternative to an organization being strategy-driven.

CHAPTER 3

Getting into Strategy and What Makes It Work

If a business is making money, then a strategy is in place. It might not be articulated and is likely not optimized. However, an offer in the marketplace is being presented to attract buyers over other offers.

If the business makes a profit, the strategy can be strengthened into something with real, sustainable competitive potential. If the business has reached some level of scale for its industry, there is likely to be a strong strategy foundation and much more potential through more systematic development and planned scaling.

At its core, competitive strategy is about identifying opportunities in the marketplace, choosing the best opportunities given your business, and then addressing them uniquely and superiorly so that the customer perceives higher value from that offer.

Strategy development and execution go hand in hand in a dynamic dance where each informs the other. Separating these two forces is risky for any organization.

The way these dynamics come together is different in every organization. There is no one-size-fits-all. A rolling diagnosis to understand potential blockers and opportunities helps evolve your winning position.

This allows you to get ahead of the curve, mitigate slowdowns, anticipate and address misunderstandings and a lack of ownership, build upon enthusiasm and commitment, and reduce resistance.

Strategy development is the first and most critical role of the CEO and their leadership team, and it requires continual attention. While external advisors may provide incredibly valuable input to inform an organization's strategy, strategy is the last thing a leader should hand off to external parties. Strategy is so much more than documentation. The leader's role is to embody the strategy, lift it off the page, and make it relevant to everyone.

Mindset Matters

Despite significant academic research, writings, and improvement throughout the business world, there is still considerable upside to be realized from strategy development and execution. One driver may be that organizations tend to operate in a linear and controlled manner. This worked to a greater extent when the world moved more slowly.

However, today, overvaluing a linear approach and using it in the wrong places will constrain good strategy. The process of strategy development and strategy execution involves both systems and linear thinking. The critical message here is that the *right thinking style* needs to be applied at the *right time*.

Systems Thinking

This is at the heart of strategy development. It involves exploring and mapping complex interactions within a system and appreciating the dynamic interconnections among its elements. It allows us to identify and explore various possibilities, opportunities, and risks—all essential aspects of the strategy development process.

Linear Thinking

This focuses on creating defined and sequenced pathways, something core to the planning process. It is the classic one step after the other—first this, then that, and then this. Creating a strong plan is critical to translating a competitive strategy into executable form.

In simple terms, strategy development is best approached using systems thinking. When we let go of controlling the content and thought path, patterns and connections through and across a system of possibilities can be seen. This is the place of deeply explorative and speculative thinking and is essential in developing, reviewing, and refining your competitive strategy.

Finding the right balance is key. Certain functions in organizations tend to draw upon one style over another. For example, successful sales functions usually result from a more linear approach than marketing, which is often fueled by systems thinking. Good leaders know how to toggle between different ways of thinking. They spot these style preferences in their team and harness them effectively.

CHAPTER 4

The Importance of the Human Element of Strategy

Successful entrepreneurs have extraordinary talents and connect very tightly with the initial circle of people who stand

> Strategy without culture is hollow,
> and culture without strategy is aimless.

up for their organizations. They're like the heart of a business, pumping life and direction into everything, and people follow them naturally. It's not because these entrepreneurs haven't encouraged independent thought. They are just deeply involved in steering the ship.

Yet there is typically a ceiling to how much an entrepreneur can scale their business. There comes a point where the business can't grow without new investment or leadership talent. Often, it's only after an entrepreneur leaves a company that we recognize the extent of their impact.

These businesses can reach great heights precisely because the team syncs with the entrepreneur's beat. They've been dedicating themselves to that entrepreneurial vision. They're not just working a job but are on a collective mission. Their commitment and loyalty are all tied to that inspirational force. They're doers of the highest caliber, but without the entrepreneur's guiding voice, they can run adrift.

Leadership Transitions During Growth

An important stepping stone to mitigating this risk is for founders to externalize their deep strategic understanding of their business—how they position to win, what choices must be made and executed to align with this, and what lead indicators give them a pulse check on how they are performing.

This is something first-generation entrepreneurs in particular must guard against. It's not just about losing a leader; it's about losing the person who instinctively filled every space with purpose, passion, and direction.

This transition is best done with the entrepreneur in place and usually requires the introduction of a strong COO from the outside who, in essence, has the skills of a CEO and can create the bridge between the entrepreneur and the organization's capability to develop and execute strategy on a rolling basis. This is best accompanied by thoughtful education of all key leaders in situ and involves learning the theory through the lens of real-life strategy in action in that company.

Reading the Room

David Kantor's work in providing leaders with a way to work with this is groundbreaking. He is a systems theorist and psychologist known for his contributions as a researcher, author, and organizational consultant for understanding human dynamics in group settings.

Kantor argues that, while there has been significant progress over the past couple of decades in finding good to great leaders and coaching them to even greater success, experts and high-placed leaders have tended to overlook a fundamental skill—face-to-face talk, in person and online. Kantor would say that the key to being the best leader you can be depends on this skill.

Kantor described four distinct positions individuals can take during interactions as part of his foundational research. All are required, and they are neither right nor wrong, good nor bad.

1. **Mover** – initiates the dialogue and moves all others into action or sets the direction in the group. The mover gets us going with an idea using a statement, observation, or question.
2. **Follower** – supports or follows the mover's lead and progresses the mover's idea down the path of action.
3. **Opposer** – constructively challenges or resists the direction being set.
4. **Bystander** – observes and may provide perspective or keep a neutral stance. This role feeds back the patterns it notices and helps the group understand where it is in the conversation.

Kantor also introduces the communication domain, which essentially considers our focus during conversation and indicates what issues, topics, and content naturally gravitate to us. Listening to this domain in action is almost like listening to three different languages. Once understood, it can transform how you, as the leader, can bring it all into play.

- **Power** – the language of accountability, competence, and completion. In short, getting stuff done.
- **Affect** – the language of the connection, emotion, and the lasting impact decisions have on relationships, trust, and motivation.
- **Meaning** – the language of logic and sense of purpose, focused on how ideas fit together, how they work in practice, and what they ultimately signify.

There are no right or wrong communication preferences. We need them all, in different amounts, depending on the pur-

pose of the conversation. Our styles are the combination of all the various elements.

The art here is to *read the room*—assess the efficacy of the dialogue and ask what might need to be done differently to be more effective. Teams with well-developed dialogue skills do this well. It becomes a habit and a competitive advantage. If you, the leader, know how these dynamics play out, you can be a more effective facilitator of conversations, including negotiations, with all groups and teams and in all settings.

Bringing Your People into Your Strategy

If your business is to thrive over time, your approach to competitive strategy must ensure that every team member can understand the strategy as well as where their role fits and how it contributes to the business's success. This dynamic has been demonstrated repeatedly in the world of sports—a championship team with a winning system consistently outperforms teams with only extraordinary individual champions.

Getting everyone on the same page with your strategy may take longer and be more cumbersome in the short term. You might even grow frustrated with those who can't climb as fast or grasp key concepts that seem so basic to you.

However, as you get everyone on the same page, you see the real magic begin to happen. This isn't about getting people to nod along to show agreement; it's about achieving a shared understanding. It's ensuring everyone is reading from the same script, has the confidence to question and challenge, and feels responsible for making it happen.

CHAPTER 5

Your Competitive Strategy

Competitive strategy is the heart of any business, no matter its size. While it is not the only factor in your business's success, it informs the other elements, particularly the culture and your execution focus. Different landscapes present different opportunities and ways to win. Pursuing these will involve hard work, the right skills, and discipline.

My favorite definition of competitive strategy is that it is a set of choices about winning—an integrated set of choices that uniquely positions a firm in its industry to create sustainable advantage and superior value relative to the competition.

While many frameworks can guide the development of competitive strategy, I typically use, with a few modifications, the approach set out in the book *Playing to Win: How Strategy Really Works*. Competitive strategy in the Playing to Win approach comprises five questions:

1. What is your winning aspiration?

This defines the overarching goal for the relevant period you are considering. In most instances, I would suggest three years as an appropriate timeframe.

2. Where will you play?

This allows you to call out where you can win. This includes geographies, product categories, target market segments, channels, and vertical stages of production.

3. How will you win?

This question requires you to call out how you position your business to win. What aspects of your offer make your proposition distinctive and sufficiently attractive for enough of your target market to purchase your offer over the competition so that your business is financially viable?

4. What capabilities must we have in place?

The winning capabilities shouldn't belong to a single person. They must be institutionalized and embedded deeply so they belong to the organization.

5. What management systems are required?

This question deals with translating strategy into actionable steps. This is the beginning of the bridge to a well-structured, relevant, executable plan.

CHAPTER 6

Translating Strategy into Executable Form

Why do around 70% of projects and initiatives fail to deliver on their promises? I learned that leaders, often CEOs, feared that acknowledging what hadn't worked might draw negative attention to their leadership and could even cost them their jobs. So instead of addressing the issue of poor delivery, they swept these challenges under the rug.

Understanding the drivers of the problem and exploring what could turn it around has been a passion of mine for the past three decades. Research and practice, particularly working in the trenches with leaders globally, have revealed the importance of the **Middle Ground**.

The Middle Ground is what sits between the meta-thinking of your competitive strategy and the micro level of doing. This connects, activates, and aligns organizational effort across the whole system. If done well, it focuses on choice

> The critical gap lies in the connection between competitive strategy, governance, and execution.

and filters out the noise—that is, those activities that aren't sufficiently aligned with the strategy—and clarifies what is needed to deliver on your strategy.

The Middle Ground comprises six key areas, all critical to successful execution. They support each other and work together in a way that will unleash your organization's performance operating system:

Step 1: Build out the plan

The task here is to ensure that the competitive strength is not diluted in a rush to identify action.

Step 2: Engage the team members

Engaging the hearts, minds, and hands of team members across the organization is more complex than scheduling quarterly town halls.

Step 3: Run everything through the portal of culture

Your culture will be shown in how things are done across the organization in choices, behaviors, and decisions.

Step 4: Understand the magnitude and nature of change

Change is implicit in every strategy and can encompass structural, operational, behavioral, and cultural change.

Step 5: Measure, track and report

Establishing a meaningful way of governing your efforts is core— measuring, tracking, and reporting on performance and progress are necessary disciplines to stay the course and make the required adjustments for successful execution.

Step 6: Build institutional know-how

This ensures that an organization's strategy remains strong daily and is independent of any person or team.

CHAPTER 7

More on Building the Middle Ground Plan

Effective planning is difficult, but it is absolutely essential in driving strategy execution and achieving your business's best performance over time.

Planning skills must be learned, particularly the skills that allow you to build a strong Middle Ground plan. Focusing here has the potential to unlock significant margin and value for many businesses.

How to Start Building Out Your Plan

The art of planning depends on defining initiatives and activities at the right elevation and within the right hierarchical structure, effectively creating stepping stones from the competitive strategy to relevant, aligned action at the front line. Businesses tend to be better at defining conceptual activities and micro tasks, often doing so without these intermediate links. When thoughtfully constructed, they preserve the strategic intent and power of your competitive strategy.

The development of a good plan requires strong linear thinking. Well-thought-through initiatives sequenced over time serve as the base. The question becomes, which initiatives? How do you surface those activities that will have the most consequential impact on executing your strategy?

To sharpen your thinking, we suggest you undertake an envisioning exercise to support this process and help in the inevitable prioritization and trade-off decisions.

CHAPTER 8

Change

Our environment—physically, socially, technologically, and more—is in perpetual motion. Therefore, we are in a state of constant change.

This is the business context. The ability to work with change, embrace it, and adapt to new circumstances is core to all we do, particularly our ability to learn and lead successful strategy development and execution.

We distinguish two broad categories of change:

- **Continuous change** – includes the day-to-day change such as the technology upgrade, resignation, or misplaced order.
- **Extraordinary change** – a significant change that requires planning, such as a structure change, a location move, an acquisition, or a new platform or process. It demands thoughtful planning to ensure that performance is not disrupted.

The Cynefin Framework, developed by Dave Snowden, is a useful conceptual framework to aid decision-making and problem-solving. It categorizes change situations into five domains based on the nature of the relationship between cause and effect:

- **Simple (obvious)** – cause and effect are clear and easily predictable. Solutions are straightforward and can be applied universally. Best practices and standardized procedures are effective in addressing issues in this domain.
- **Complicated** – cause and effect relationships are not immediately apparent but can be determined through analysis and expertise. Problems require a deeper understanding and expertise to solve, often involving multiple factors and variables.
- **Complex** – cause-and-effect relationships are nonlinear and emergent, making them difficult to predict. Solutions are not evident and may require experimentation, adaptation, and exploration of different approaches. There are no right answers but a range of possible responses.
- **Chaotic** – no clear relationship between cause and effect, and situations are rapidly changing and unpredictable. Immediate action is necessary to stabilize the situation, followed by a transition to a more stable, ordered domain.
- **Disorder** – represents a state of ambiguity where it's unclear which domain a situation falls into. It serves as a starting point for understanding and categorizing the nature of a problem before determining the right and appropriate approach.

This framework helps individuals and organizations navigate complexity by providing a structured way to understand and respond to different types of change circumstances that cause problems. It encourages embracing uncertainty, experimenting with solutions, and adapting approaches based on the situation's context.

CHAPTER 9

The Power of Culture

Culture is the way things are done in an organization. It matters because it sets the tone for everyone. It shows everyone how things are done. Newcomers look for signals to figure this out so they can fit in.

A strong culture shows up with strong messages and predictability. People understand what specific behaviors and decisions mean and what they reinforce. The cultural signals are clear.

With a weak culture, the meanings of cues are not clear. This leaves people guessing. Confusion and a lack of stability ensue. It could be the case that in the ever-dynamic and changing environment in which we operate today, and as our strategy evolves, our organization's culture will need to change and grow with the strategy.

A strong culture is much easier to change than a weak one simply because it is clear. Trying to change something that is loose and unpredictable is very hard. Strong cultures will serve your strategy more powerfully if aligned.

Culture eats strategy for breakfast often comes to mind when we think about the relationship between strategy and culture because everything goes through the portal of culture. Still, it won't make it to dinner if the strategy doesn't robustly carve out the organization's purpose and winning positioning.

Strategy without culture is hollow, and culture without strategy is aimless. Both must be developed harmoniously to ensure the organization can successfully navigate internal and external challenges and sustain competitive advantage across market cycles. Strategy provides the direction, and culture offers the means to execute and sustain that direction.

CHAPTER 10

Creating Momentum Through Systems

The shift from one-dimensional governance, where risk assessments are seen as separate documents and presentations to demonstrate performance, to a true system of governance is critical. Risk assessments should inform how risks are mitigated, which is built back into the plan.

These should function as part of an integrated learning, diagnosing, and iterating system that creates momentum and enables effective strategy execution and performance.

Governance isn't a one-size-fits-all playbook. It's about understanding what the organization needs to govern itself properly, maintain transparency, and keep those who are accountable informed while enabling rather than constraining effective execution.

Having worked with all structures and organizations at all stages of development, I can tell you that overdoing governance can be as damaging as doing too little. It can potentially stifle an organization to the point of failure.

CHAPTER 11

Your Strategic Leadership ToolKit

Strategy development is improving across many organizations. Most know (or assume) they have a good strategy, and if the business is making money, some form of strategy is clearly in place. Strong earnings before interest, taxes, depreciation, and amortization (EBITDA) often signal that a solid strategy is operating. Governance is also receiving increased attention. However, the critical gap lies in the connection between competitive strategy, governance, and execution.

Leadership is the lynchpin of your organization's success. *Your* leadership. No matter your success and path thus far, we all have blind spots and over-indexed superpowers that mask our blind spots. Your opportunity is to explore what might be holding you back and, consequently, the execution of your company's strategy. Whether you are a CEO or a team member, your leadership still counts.

Get clear about your strengths; perhaps have a reliable playbook that supports your success. Know it, grow it, and continue to employ it.

The 3 Pillars of Execution Excellence

Execution excellence rests on three key pillars:

- **Clarity** – encompasses how clear you are about where you're going and how you will get there. This includes strategic direction and operational clarity about roles, responsibilities, and expectations at every level of the organization.
- **Cohesion** – addresses how well your organization and its culture are aligned with the strategic direction. It's about ensuring that the various elements of your business—from culture to capabilities to operational systems—work together rather than at cross purposes.
- **Disciplines** – refer to the systematic practices and behaviors that ensure consistent execution over time. These are governance systems, planning and measurement practices, and leadership behaviors that sustain performance.

Reading the Environment Continuously

One of the most critical capabilities for ongoing success is staying connected to your operating environment. This is not a one-and-done exercise. This is critical in today's high-paced, complex, and dynamic environment, likely accelerating in importance with AI, quantum computing, and other emerging technologies.

People throughout your organization often possess sediments of knowledge—insights and intuitions about what's happening that may not yet show up in formal data. Creating mechanisms to surface and examine these insights can provide early warning signals about changes that require strategic attention.

CONCLUSION

Implementation Starts Now

There's already a strategy in place and activity happening. Your role is to assess where you are, identify what needs attention, and begin systematically strengthening the connections between strategy, execution, and governance.

Start with the self-assessment questions. Be honest about gaps. Then prioritize the areas that will have the greatest strategic impact on your ability to execute your competitive strategy effectively.

The goal isn't perfection—it's systematically improving your organization's capability to translate strategic intent into sustainable competitive advantage.

Your competitive strategy provides the foundation. Your execution capabilities determine whether that strategy creates the value you intend. Your governance systems ensure you stay on track and adapt as needed. Together, they form the integrated approach that separates successful organizations from those that are average and "kinda" survive, and those that struggle despite having good ideas.

The journey from strategy to sustainable competitive advantage isn't linear and is never complete. But with the right intention, mindset, behaviors, framework, and discipline to address what you discover and learn, you can build an organization that survives and thrives in whatever environment it faces.

Dr. Kathryn Ritchie is the founder and CEO of Ignition Institute, a consulting firm that guides leadership teams through holistic, performance-driven transformations worldwide. Known for her expertise in strategy execution, she helps organizations move from planning to measurable growth by building accountability and alignment at every level. Ritchie previously held management roles at Macquarie Bank and served on nonprofit and university boards. Trained initially as a speech pathologist, she brings a distinctive understanding of human performance and change. She holds an MBA from the Australian Graduate School of Management and was named one of *Women's Leader Magazine's* Most Inspiring Women Leaders of 2022.

THE SUMMARY IN BRIEF

Leadership goes beyond just ensuring your team completes a list of tasks or accomplishes a set of goals. Great leaders prioritize empathy and understand the value of putting people first.

The book ***In Their Shoes: Lessons on Corporate Leadership from a Former, Uninspired Employee*** urges us to explore the question, "Will I want to be treated the way I treat my subordinates?" Throughout the book, you explore different leadership styles, learn to lead by example, empower your team through transformation, extend support by thinking beyond yourself, and ultimately become the leader you wished you'd had.

By blending insightful personal anecdotes with a set of action steps directed toward bringing positive transformation in the workplace, the author inspires us to lead our teams from a position of empowerment and empathy.

IN THIS SUMMARY, YOU WILL LEARN:

- About Contingency, Situational, and Transformational leadership.
- How to cultivate trust and lead by example.
- How to encourage team participation through servant leadership.
- How to empower, motivate, and support your team.

Introduction

The reason for me to write this book was to highlight the importance of leadership – not only in business but also in our everyday lives. Looking at my life, I noticed a lack of effective leadership in the education system, among our political leaders, and among the management in the different companies where I worked during my first decade in the workforce. I hope anyone who reads this book is inspired to become the leader they always wished they had in their life. On the following pages, I give you a behind-the-scenes look at my leadership evolution, and I share why concepts such as contingency leadership, situational leadership, and transformational leadership have made a profound impact on my life.

During our journey together, I hope to help you see the only way a leader can effectively lead others is if they have walked in the shoes of those they lead.

Part 1: Contingency Leadership

Chapter 1: It's All About People

As someone who had always been fascinated with psychology, I realized the only way I would ever last at an organization was if it was built around people and not just profit.

As CEO, I'm always looking for opportunities to set my employees up for success. I want to help them get the best contracts and increase their salaries so they can have more time to do what they love outside the office. Almost every one of our seventeen employees has been with DTG Consulting Solutions for over 10 years. As a result, there is a sense of camaraderie and trust we have with one another. If you're reading this book, chances are you, like me, long to be a part of something bigger. We want to work in an organization that makes people the number one priority. We want to work for people who have walked in the shoes of those they lead.

Chapter 2: Different Leaders for Different Seasons

Because business is all about relationships, our approach to leadership must shift based on the personalities we lead and the situations we face. This is what many refer to as contingency leadership.

Contingency leadership is both relationship and task-based, and it focuses on what type of leader would be the best match for different circumstances or settings. The three variables of contingency leadership include the degree of confidence that followers have in their leader, the degree to which the structure of the task is clearly identified, and the amount of authority a leader has to discipline or reward followers.

But how can you know if you are the right leader to lead your team through your current situation? The answer comes down to whether you are willing to adapt to the situation before you. Adapting isn't always enjoyable. But it's the only sustainable way to lead an organization forward. Effective leadership is not always easy. It takes a lot of work. But the key is accountability. By taking accountability for your work, you can build a culture people trust and value.

Chapter 3: Lead by Example

Leadership starts with how we lead ourselves. Leading an organization well starts with approaching each workday with positive energy and the attitude of a professional. Part of leading by example is knowing our limitations. It is about following the positive examples of those who have walked before us.

Leading by example is not natural for some. While leadership is wonderful, it can sometimes feel very uncomfortable. Often, it doesn't feel "natural" to move into a managerial setting, and people are unsure how to respond to the change. When I encounter someone like this, I encourage them with that timeless sentence of wisdom, "Fake it till you make it."

The best leadership happens through empowerment. As we learn, grow, and develop, we empower those around us to do the same. One of the ways I empower others is by telling them where I want the company to go and letting them tell me how we will get there.

Part 2: Situational Leadership

Chapter 4: The Importance of Situation Leadership

Situational leadership is when a leader uses a different style to adapt to a situation. Contingency leadership means the effectiveness of a style is contingent upon the situation.

When you have the right leader for the situation, the next step is to ensure the leader is using the right leadership approach with each person they approach. The situational leadership model often rests upon the leader's ability to appeal to the maturity level of their followers. "Maturity" refers to the subordinate's capabilities and willingness to focus on a particular task or objective.

The success of a situational leader depends on their ability to recognize whether their subordinates require more task-

based or relational-based guidance and to adhere to those needs by adjusting their leadership style. The six styles of situational leadership include:

- Coercive leadership, where a leader sees a problem and needs it fixed instantly.
- Authoritative leadership, where the leader paints a compelling vision but lets the team choose the specific route they want to accomplish that vision
- Democratic leadership, where everyone has a voice
- Pacesetting leadership, which is all about leading by example
- Coaching leadership, where leaders work with their employees one-on-one to produce the best results.

Trust is one of the most important elements of situational leadership. Employees need to know that leaders have their best interests in mind.

Chapter 5: Encourage Partnership Through Servant Leadership

A large component of situational leadership is encouraging worker participation through servant leadership. This leadership style begins with the natural feeling that one wants to serve, to serve first. Then conscious choice brings one to aspire to lead.

Having the heart of a servant is critical. The primary focus of servant leadership is providing support to those who follow, thus motivating these followers to engage with those they lead in a similar fashion. The idea behind servant leadership is that leaders sacrifice their own needs for those of their followers. When a leader practices servant leadership, they are spreading leadership throughout their organization by putting a subordinate in the role of a leader and the leader in the role of a subordinate. When this happens, the company's culture changes as the subordinates increase their confidence and knowledge. Thus, new leaders emerge within the organization.

Chapter 6: Empower Through Transformation

The transformational style of leadership is one of the most popular theories of leadership today, in part because of its ability to translate across cultural boundaries while being applied to more situations than many of the other studied theories of leadership. The main premise of transformational leadership is to formulate a vision for subordinates to focus on a higher order of intrinsic needs and organizational goals. This is accomplished by having transformational leaders who inspire followers through motivation to become engaged in their work- thus sharing in the vision of the organization.

Transformational leaders use four components to empower people on their teams: idealized influence, inspirational motivation, intellectual stimulation, and individualized consideration. Because the transformation leadership theory creates a strong bond between leaders and subordinates, this leadership leads to long-lasting benefits between leaders and subordinates.

Chapter 7: Support Through Thinking Beyond Yourself

After you have empowered people on your team, the next step is to make sure you provide them with the support they need. One of the primary ways to support subordinates is by getting out of their way and trusting them to make the right decisions. This empowers people to grow at a faster pace because they don't always have someone looking over their shoulders. They feel the freedom to operate without a sense of fear.

When it comes to supporting people on your teams, it's not one or two major action steps that make a difference. It's a series of strong decisions that show your team members you value them and you're willing to back up what they say. Leaders who support their teams well embody what it means to walk in the shoes of those they lead.

Chapter 8: Be the Leader You Wished You Had

Much of what motivates my style of leadership stems from the lack of leadership models I've had in my life along the way. People have no problem working hard for someone who cares. But they have little time for those who misuse the trust they place in them.

In most organizations, employees learn to walk on eggshells around their boss and say all the right things because if they don't, they'll suffer the consequences. Being the leaders we wished we would have had is one of the driving motivations that allows us to lead others as though we are walking in their shoes. It's seeing a team member's present situation, doing some personal reflection, and thinking about how we would like to be treated if we were in their position.

One of the reasons leaders struggle to lead in the shoes of those on their team is that they have short memories. They forget those times when they were treated poorly and how

an inconsiderable boss made them feel. But strong leaders never forget where they've come from and lead their teams from a position of empathy and understanding.

Part 3: Transformational Leadership

Chapter 9: It Starts with Trust

Trust holds an organization together. The reality of trust is that it can take years to develop but moments to lose. When trust is lost, it is seldom regained.

Trust starts with ethical leadership. When we talk about being a person others can trust, we're talking about the importance of being an ethical person. More than ever, we need leaders who are governed by a set of ethical principles they will not violate.

Ethical leadership encompasses the duty to perform the job functions morally to avoid negative behaviors and encourage praiseworthy behaviors. Leaders and organizations are potent sources of influence due to their positions and authority. When developing a corporate culture, leaders must emphasize creating a culture centered on high moral values. They must create a culture in which employees act with integrity, take responsibility, and are held accountable for their actions.

Chapter 10: How to Think Like a Servant Leader

While the concept of servant leadership is often espoused by business leaders today, the real value of servant leadership is only realized when it changes the way one thinks, acts, and leads. Servant leadership as a theory alone results in a lot of nice rhetoric about putting others first, but the underlying motivations are often self-serving. Every business manager is for being a "servant leader"- as long as it gets others to do what they want them to do. However, the essence of servant leadership is serving others in ways that are beneficial to them. It's about looking out for the general well-being of those on your teams.

Leaders with the hearts of servants are always willing to do things that aren't glamorous to make their world a better place. Being a servant leader is a 24/7 responsibility. It's who you want to be all the time, not just during the moments you are in front of your team. If you want to be a strong servant leader in the workplace, my suggestion is to start by being a servant leader at home and in your community. Pick up trash. Make the morning coffee. Do those tasks that are below others. And before long, you will condition your reactions to be those of the heart of a servant.

Chapter 11: Create a Transformational Leadership Culture

When you walk in the shoes of those you lead and have the heart of a servant, the culture in your organization starts to change. The key to a great culture is to find great people. If you don't have people of character and competence, you'll end up spinning your wheels as you attempt to create a strong culture. You need great people, and then, you need to get everyone on the right seat on the bus.

Be beyond hard skills, and focus on evaluating the soft skills of your applicants. These skills are hard to measure and are closely related to an individual's personality. They include communication skills, work ethic, and the ability to work with others on the team. The seven characteristics to watch out for prospective team members include past work experience, ambition, cultural fit, clean social media accounts, positive attitudes, employee referrals, and employee value.

A leadership role requires you to put on many hats at once. It requires you to make tough decisions that can shift the direction of an entire organization. Great leaders must fully utilize their knowledge and skills to make suitable decisions for their firm's growth. You must be skilled at assigning tasks and assessing your team's performance. This responsibility also includes the allocation and management of resources.

Fear of failure is one of the most significant barriers that can stop you from settling into a leadership role. To push away self-doubt, you must remind yourself that you got the position for a reason. Failure is just another opportunity to learn, after all. Transitioning into a leadership role also brings on the challenge of handling disagreements among group members, both proactively and reactively. You should learn how to identify and address smaller concerns that are likely to turn into bigger issues later.

Chapter 12: Craft a Vision Worth Achieving

The concepts such as situational leadership, servant leadership, and transformational leadership sound great on the page. But they play a beautiful tune when you start to put them into practice. The key is to capture a fresh vision and know where you want to go.

Just as it does little good to start a journey without a target destination, it is pointless to lead an organization forward if you do not know where you want to end up. This is where

the importance of a strong vision statement comes into play. Creating a vision statement for your company is just like deciding on a destination for your journey. This statement describes your company's direction, making it a crucial part of the company's identity. A vision statement refers to the document that defines the current and future goals of your business for all the stakeholders, including employees, customers, and investors.

Conclusion

Leadership never stops. It's a continual process. And the key is to never lose sight of what matters most. It's showing up when you'd rather give in. It's having the heart of a servant when you're tempted to lead like a dictator. It's never losing sight of where you have come from. And it's always about walking in the shoes of those you lead.

I hope that the principles shared in this book will challenge you to take your leadership journey to the next level. Contingency leadership, situational leadership, and transformational leadership are more than just terms on a page. They are the principles to be lived out every day.

George Parente has worked at DTG Consulting Solutions, Inc. for over 22 years. He was hired as the Chief Financial Officer in April 2000. And in October of 2021, he became only the second Chief Executive Officer that DTG Consulting Solutions has had in its 50 years of operations. Currently, he is responsible for overseeing all business operations at DTG. He also continues to manage the financial operations, including banking and borrowing relations, budgeting and forecasting, financial statement preparation, payroll, and cost analysis.

THE SUMMARY IN BRIEF

While the pandemic is still with us, we must find it within ourselves to focus on what we have to do to become the kinds of businesses that our customers can't live without. There are many great companies–only a few are indispensable. The pursuit of greatness is important, but it's not enough. And outstanding leadership is essential to bringing a company from greatness to indispensability.

James M. Kerr wrote ***Indispensable*** for one type of reader: a business professional who wants to make a difference in their organization. Its intent is to provide you with a framework that you need to help your business become so outstanding that it befits holding indispensable moniker. Leadership is vital to helping businesses become indispensable. Regardless of your rank or position, you must be able to provide a captivating vision, active direction-setting, enlightened coaching, and a collaborative environment to the people you work with and serve. ***Indispensable: Build and Lead a Company Customers Can't Live Without*** teaches you how to do just that.

IN THIS SUMMARY, YOU WILL LEARN:

- Why your business needs to be indispensable.
- How the character of leaders impacts indispensability.
- The traits that are needed to move towards being indispensable.
- How to effectively manage change of this size and scope in your business.

Your Business Needs to Be Indispensable

Merriam-Webster dictionary defines indispensable as "being absolutely necessary and not subject to being set aside or neglected." The concepts offered in this book are already being used to make businesses indispensable in the marketplace. Keep in mind, though, only your customers can decide if your business is indispensable. Indeed, what we think of our businesses and their ability to delight our customers is irrelevant. We don't get to vote on that. However, there are steps that we can take to improve our chances.

Why Indispensable?

The answer is simple: the competition is overwhelming. Please believe that no matter what your company does or how it does it, there's another firm right behind you ready to take your spot. Moreover, your competition is not just local businesses. It's global. The internet and related technologies have made the world a whole lot smaller.

Your customers have choices. If you can't give them what they want in the ways they want it, someone else will. It's just a point and click away. So you better figure out quickly how to become indispensable, or you just might be replaced. Learn what your customers truly want and exceed those expectations.

You want to be on a constant lookout for ways to unlock your customer's potential. Paradoxically, the key to unlocking that potential in your customers lies with the leadership and culture of your organization. These are the keys needed to differentiate you from your competitors. These are the things that will enable you to be the provider of choice in the hearts and minds of your customers. Leaders who drive winning organizations through their leadership style and focus on culture can achieve this.

The Right Leadership

Leaders are built on a foundation rich in character, which enables them to inspire others to follow. Exceptional leaders not only possess the requisite honesty and righteousness needed to gain followership, but they emulate the hunger and conviction needed to motivate others to do great things. Leadership is one of those things that you have to get right in order to become an indispensable organization. In fact, indispensability starts with exceptional leadership, and exceptional leadership begins with character.

Leadership Begins with Character

Drawing a connection between leadership and character is not all that profound. Don't we all want leaders to be of honorable character? The idea seems universal. Here's why:

- We believe those whom we trust: You're not going to follow someone who you don't trust. Sure, you'll do your job, but that boss won't get your best effort, especially when things get tough. Leaders who lack character won't build an indispensable business because the people they lead may not consistently deliver their best effort.
- Consistency inspires confidence: We gain confidence in leaders who are consistently fair, honest, and reliable. While we may not always love every decision made by such leaders, we continue to respect and admire those who are consistent. Indispensability requires consistency among your leaders.
- Conviction draws attention: A leader with conviction generates a kind of allure that is difficult to ignore. Leaders of high character believe in what they're saying and project the conviction needed to rouse their people into action.
- Passion turns us on: It's mightily attractive to be in the moment with someone who is passionate about what they're doing. It inspires your best effort. Leaders who are passionate about making their organizations indispensable tend to create those kinds of moments.
- Indispensability demands courage: It requires tremendous courage to stir up the enthusiasm needed to drive an idea as big and expansive as indispensability. It takes even more courage to make all the hard decisions needed to realize that vision. Leaders must possess the personal character and courage to motivate while staying the course.

In a nutshell, extraordinary leaders possess a certain *je ne sais quoi* that makes them distinctive and impossible to ignore. To gain indispensability, we need leaders who hold the necessary allure to inspire others to follow.

How to Build a Team of Leaders

Building a team of passionate leaders begins with proper preparation. Once your people are properly prepared, they can be put into positions that enable them to make decisions that count. This positions you to enhance trust throughout the enterprise and build commitment to the cause of becoming indispensable in the marketplace.

Guess what, senior leader? Vision starts with you!

Here are some ideas to drive your team of leaders to greater heights of proficiency:

1. **Teach as you lead.** Don't be afraid to show your team what good looks like. Regularly take the time to gather your team together and share with them some insights about what underpins a few of your recent decisions. You can build higher competence within your team when you teach as you lead, emphasizing the importance of considering alternatives, evaluating risks, and thinking through important implications.
2. **Join forces on "decision rights."** Sometimes people are uncertain about what they're responsible for and question if they have the right to make certain business decisions. That said, it is essential that you, together with your team, reach a mutually-agreed upon set of conditions for when team members can act independently and which situations require your involvement or approval.
3. **Eradicate pocket vetoes.** If the U.S. Congress gives the president a bill and the president doesn't reject it or sign it, it dies on the vine due to inaction. This is a *pocket veto*. Don't do that to your team when they make decisions. Instead, use any subpar decision making as a learning-opportunity for your team.

These kinds of ideas can become the backbone of developing your leadership talent, especially newly minted managers who will undoubtedly play major roles in transitioning your firm to indispensability in the marketplace.

A Note About Dissent

If there was only one operating principle that you and your team should embrace and practice flawlessly from now on, it would be this: *Everyone on the team has an obligation to express their dissent.* The implications for your team in implementing this leadership principle are obvious. Indeed, not only do your people have *permission* to speak up when they don't agree with a new concept or idea–they have a *duty* to express that opposition. In fact, if your people have dissenting opinions and they fail to share them, then they are not fulfilling their responsibilities and run the risk of losing their spot on the team. If you don't encourage the expression of disagreement and you fail to listen to your team when they do, you will soon be leading a team of people who do not think. Clearly, this is not the kind of leadership needed to become indispensable.

The Right Vision

Indispensability takes vision. Without the right vision, it is difficult to inspire your people to do all the work and make all of the changes that they will need to make to reach the pinnacle of indispensability. Guess what, senior leader? Vision starts with you! It's not unusual to feel a bit apprehensive that you lack the insight and inventiveness needed to fit the bill. Stop feeling that way. It may be true that some seem to be born visionaries. While natural talent helps, it is not a prerequisite for success in crafting a completing and engaging strategic vision for your business.

Here are five simple things that you can do to begin developing your visionary capabilities.

1. **Just keep asking, "why not?"** This acts as a forcing function, allowing you to break through common resistances to new ways of thinking and doing and discover groundbreaking solutions to the most complex challenges facing your firm's path to indispensability.
2. **Flex your imagination muscles.** Visionary thinking happens when re-imagining how the work of your business can be accomplished. Taking time to imagine the possibilities helps reveal the path to great advancement.
3. **Mix contrasting ideas into your thinking.** The act of connecting disparate thoughts and theories together to produce new and trailblazing perspectives is what vision-setting is all about. The practice feeds innovative thinking.
4. **Become synergistic.** As the old adage suggests, two brains are better than one! Pull ideas and concepts from like-minded people. Synergistic thinking

will unearth the insights and perspectives needed to round out your vision.

5. **Develop customer empathy.** Seeing the business from an outsider's point of view is always illuminating. The practice of putting yourself in the customer's shoes and imagining what it must be like to do business with you can help identify opportunities for improvement within your company and discover the best ways to delight your customers.

Writing a Company Vision Story

To be clear, it is not recommended that you invest time in developing the same tired and uninspired vision statements that appear on company websites or are printed on banners strung from company rafters. These kinds of company visions are a dime a dozen. They are nice slogans, but not particularly inspiring. Your vision should be much more than slogans and catchphrases. It should serve to describe what it's like to be part of the organization and distinguish your specific enterprise from its competitors.

You want to construct a vision story so compelling and vivid that the average working professional wants to be a part of it. To accomplish this, the story must have the necessary depth and detail to capture one's imagination. It should include your overarching ideas refined by the thoughts and suggestions gained through the conversations, workshops, and survey information that was gathered from other leaders and personnel. Above all else, it must be enlightening and riveting or your people won't get revved up about achieving it.

The Right Culture

If you want to be indispensable, you need the right culture. Not convinced that culture is important? Unclear if it's with the effort to transform yours? The return on investment now obvious enough for you? No problem. Just answer a few questions.

1. **What's the value of strategic alignment?** Getting your culture aligned with where you want to take your business is absolutely critical to achieving your vision for the future. After all, you won't realize the vision if your company culture can't support it.
2. **What's the value of improved teamwork?** Getting your people to work as one is instrumental to business success. Your culture must be set up to do that. If it isn't, your performance will undoubtedly suffer.
3. **What's the value of a high-trust work setting?** All good things are based on trust. If your culture is built on trust, your business is well-positioned to overcome all of the obstacles that will confront its journey to strategic accomplishment.
4. **What's the value of improved communication?** Communication is the centerpiece of every business. Outward communication drives prospective customers to your door and supports them once they've made the choice to become actual customers.
5. **What's the value of improved customer intimacy?** It's tough to stay in business without satisfied customers! Your culture should be built around understanding their needs and wants and then delivering impeccable service so that you become the provider of choice.
6. **What's the value of high resiliency?** Running a successful business is a rough and tumble undertaking. Your company culture will determine its ability to withstand and overcome adversity.
7. **What's the value of being a talent magnet?** You want exceptional people? Build a company culture that makes you the employer of choice. Great culture attracts great talent.
8. **What's the value of greater innovation?** Your products and services better be amazing if you intend to continue to grow your business. Here's where innovation comes in. By creating a culture that continuously innovates, you improve your ability to be amazing.

What's the value of all this to your organization? Investing in cultural transformation is perhaps the best thing that you can do to become an indispensable enterprise. Indeed, company culture is the foundation of every business because it determines how people behave.

If you optimize the culture and ensure its alignment with the achievement of your strategic objectives, your business performance will improve. Place a value on that and compare it to the cost of cultural transformation and you'll have an ROI that makes the case to invest in cultural transformation.

Culture Reset™

The premise of the Culture Reset™ Methodology is simple: top-down decision makers can design their company's culture in a deliberate and rigorous way and craft the

High EQ contributors are priceless to a business and can make a big difference in making your business indispensable in many key ways.

culture that they need to become indispensable. The work is done in a series of phases:

1. Project initiation formally establishes project roles/responsibilities and commences the project.
2. Strategic framework setting develops a set of business principles that state senior leadership's preferences for how it wants to manage the company's cultural evolution.
3. Baselining assesses the current company culture and work setting and characterizes its existing people, processes, and technology from a company culture perspective.
4. Target visioning defines the cultural environment.
5. Gap analysis determines the gaps between baseline and target cultural settings.
6. Implementation planning identifies and prioritizes the work needed to implement the projects and programs identified.
7. Plan administration design recommends a process for managing the execution of all of the strategic initiatives identified in the Culture Transformation Plan.
8. Project completion formally delivers the final plan to the organization.

Interviews, surveys, and workshops are conducted with a good cross section of staff from senior leaders to middle management to frontline workers.

These provide the means for gaining insight and understanding as well as harnessing leadership's and staff's participation and commitment to the culture change effort.

The Right People

We all want to believe that we are exceptional leaders and that our people are eager to do their best every day. But sometimes we can't see the reality of the situation. Our personal blind spots get in the way.

In fact, sometimes we're not all that engaging and our people aren't as satisfied with their jobs as we like to think.

If you don't have an employee value proposition (EVP), that should change. Your EVP is of vital importance in attracting and retaining the kind of talent you need to be indispensable.

Defining Your EVP

EVP is the value that staffers gain in return for their work–and it's not all about compensation. It should consider your employees needs that range from elementary to living up to one's potential. EVP should be considered with the following terms:

- Compensation/benefits: Compensation addresses meeting your people's basic needs. Think of salary, incentives, wealth-sharing, health, retirement, and personal leave policies.
- Career path and recognition programs: This is compulsory in staff retention. Staff feel a stronger connection to your work community through the provision of the "right" kinds of job titles, training, career paths, and employee appreciation efforts.
- Work elements: Highlighted by a variety of assignments, autonomy, and the occasion to provide input, this type of environment enables staffers to feel better about themselves when they are given new and varied opportunities to contribute.
- Pride in affiliation: By ensuring that your organization is something that your personnel can be proud to be a part of goes a long way in satisfying their need for self-actualization. EVP considerations include such things as company values, brand reputation, and community involvement.

Emotional Intelligence Quotient (EQ)

People with high EQ are great listeners and tend to be strong communicators. They are masters in conflict resolution and can de-escalate situations before they get out of hand.

High EQ contributors are priceless to a business and can make a big difference in making your business indispensable in many key ways.

1. Their consideration for others improves communications.
2. They're great under pressure.
3. They generate trust in the workplace and marketplace through diplomacy.
4. They like to co-create.
5. Their charismatic personality improves team performance.
6. They are natural born leaders.

Fielding an emotionally intelligent team is a key means to winning in the marketplace. Clearly, companies need these kinds of people to lead others to victory. Indeed, they need these kinds of people to set the example and further instill the "right" values and work ethic.

The Right Trust and Empowerment

With the right people in place, one would think that trust and empowerment simply go with the territory. However, with all that has transpired in the business world and society in general of late, it's safe to assume that blind trust in those who lead is dwindling, and staffers don't always feel all that engaged or empowered.

Leaders cannot assume that their people will give them the benefit of the doubt just because they are at the top of the pyramid. Business leaders must begin to recognize the impact that this has on an organization and understand how it limits your company's potential to become indispensable in the marketplace.

The Symptoms That Indicate You May Be Affected

Here are a few characteristics that can indicate that your workforce may be feeling the pain:

1. **General anxiety**: Morale and productivity are impacted when staffers feel anxious about their future.
2. **Despondency**: People disconnect from their commitment to the company when feeling hopeless and suspicious of intent. This can be disastrous to a business.
3. **Self-aggrandizement**: When self-promotion replaces teamwork, staff can quickly shift to an "every man for himself" attitude, which stifles growth and hampers results.
4. **Exaggerated self-importance**: People in leadership positions can often develop a false sense of pomposity. This only leads to *no good* as your leaders attempt to gain the privileges that they think they are *owed* by their position.
5. **Beleaguered leadership**: When company morale is at its lowest, a leader without a clear and consistent message about how the organization will evolve is discounted by the rank and file.

How to Transcend the Fog of a Low-Trust Workplace

We have to give people something to believe in! We do that by cultivating a vision for the business that is centered on trust and doing the work needed to build a high integrity organization that people can depend on both inside and outside of the enterprise.

We've got to enhance the sense of "being in it together" within the business and build a sense of community that can energize your team and help them care about each other. By giving them something bigger than themselves to be a part of at work, we create a safe space for them to be at their best. We need our people to be at their best in order to become indispensable to our customers.

While a feeling of malaise and mistrust may pervade today's society, it doesn't have to be brought to work each day, eroding morale and having a negative impact on performance. Here are some ways to take deliberate action and improve trust within your business:

- Root out and repair trust breakdowns.
- Keep promises.
- Be transparent.
- Embrace the beatitudes of high integrity business behavior.

The Right Change Management Practices

The adoption of the right change management practices is not only necessary for successful implementation of new ideas, but it is an essential element of becoming indispensable.

Organizations have to change to remain vital and big changes require a good deal of time. Consequently, proper preparation is required.

Here are six steps you can take to ensure that your indispensability-driven change framework stands the test of time.

1. **Call it out**: Indispensability efforts deserve a name, so give them one.
2. **Take ownership**: Identify yourself as the sponsor of the change program and levy the political clout needed to garner the right level of participation among stakeholders.
3. **Make it full-time**: Identify a core team that can dedicate a full-time effort to get the job done. It's too important to do part-time.
4. **Engage everyone**: Big change doesn't happen without everyone rowing in the right direction. It requires involvement and participation of all the firm's staff–top to bottom.
5. **Determine the path forward**: Craft a program plan that identifies the projects needed to staff, fund, and execute the vision of indispensability.
6. **Broadcast results**: Create communication and engagement mechanisms to keep all of your people in the loop. Share progress and broadcast results.

It's no easy job to make a customer for life. It requires attention to the details and striving to establish the "right" traits, including:

- Vision
- Leadership
- Culture
- People
- Trust and empowerment
- Change frameworks

The challenge is significant but becoming indispensable is possible. You must never settle for "good enough!" Simply put, "good enough" does not make it "right." In fact, putting the "right" stuff in place is at the heart of becoming indispensable.

To be sure, the leader of an indispensable business knows that their best work is always ahead of them. They're never satisfied with maintaining the status quo. They're always striving for more and expecting great things from themselves and their staffers alike.

This is what an indispensable business is all about–never settling for second best. If you want your business to become indispensable, you have to be ready to set the direction and manage all the changes needed to get there. It is as simple as that!

James M. Kerr is recognized as one of today's foremost authorities on leadership, culture and organizational design. He leads the management consulting and executive coaching firm, Indispensable Consulting, and is a popular speaker, business columnist and author.

Jim specializes in culture design, leadership, business transformation and executive coaching. For nearly 30 years, he has assisted dozens of exceptional organizations. including diverse corporations like General Dynamics, The Home Depot, Mitsui Sumitomo and Accenture, to name a few of his clients.

Inspire Greatness

How to Motivate Employees with a Simple, Repeatable, Scalable Process

By Matt Tenney

Matt Tenney envisions a world in which all leaders and workplace cultures consistently make a positive impact on the well-being and growth of team members. Since 2012, Matt has helped hundreds of clients - including many Fortune 500 companies - to develop highly effective leaders who improve employee engagement, performance, and retention through his books, consulting work, and via the groundbreaking leadership development and employee engagement platform offered by his company, PeopleThriver. Matt is also frequently invited to deliver keynote speeches at company leadership meetings, events for state and national associations, and large conferences. He is known for giving inspiring keynotes that keep audiences fully engaged and provide game-changing insights that drive results.

A Book Review by Soundview

Leadership with a New Perspective

Everyone in leadership wants to do their job well. They want to lead their teams and organizations productively, resulting in success and happiness. They want the work being done to help them find meaning in the work and make them feel fulfilled. In addition, exceptional leaders work to inspire greatness in others to give their team members what they need not only to succeed but to thrive. Creating the right environment for this can sometimes feel daunting, but it doesn't have to.

In ***Inspire Greatness: How to Motivate Employees with a Simple, Repeatable, Scalable Process,*** Matt Tenney shares how leaders can approach leadership development differently and use their newly acquired skills to create a lasting change at their organization. By viewing leadership as a science rather than art and utilizing a research-based algorithm, he proposes they will be able to consistently bring out the best in their team members. Tenney references Gallup's research throughout Inspire Greatness to show that this topic is being discussed and should be taken seriously as it evolves.

He breaks *Inspire Greatness* into two parts. Part One shares his simple, four-step process that will help those working to bring out the best in their organization. By applying this scalable process, high levels of performance and retention will be seen, as will higher levels of employee engagement. Part Two dives into discovering ways to help consistently utilize the four steps to create lasting habits to bring out the best in their team members. Each chapter is closed with actions steps to be considered and taken as executives work to help their teams have what they need to succeed. Additionally, there is an appendix at the end of the book that shares how to utilize employee surveys in a way in which they can be successful and encourage employees to be more engaged at work.

Tenney encourages the reading of other leadership books but states his confidence that seeing leadership as a science rather than an art will empower the reader and the other leaders in their organization to inspire greatness in their employees.

Part One

The conversation about greatness should begin with discussing employee engagement and its meaning. When employees are engaged with their work, they are emotionally invested and willing to go the extra mile to ensure the task at hand is completed. When research into employee engagement began, the numbers showed that employees were passively and actively disengaged. In the US alone, billions of dollars have been spent on surveys and training to improve workplace engagement, but to no avail.

There are three potential causes for this. First, employee engagement is mainly seen as a need to be taken care of by HR, not a leadership issue. All too often, these matters are mainly given to HR to fix, but to improve engagement, leadership development needs to be closely synchronized with it. Secondly, while leadership training is vital, it must result in habits that stick and will improve retention and engagement. Finally, employee feedback needs to be gathered to allow quicker responses to feedback than the standard annual survey. These three are all interconnected but are often treated as individuals and must be resolved simultaneously if the employee engagement issue is to be solved.

Laying the Foundation

Over the last several years, there has been an emphasis on having a "great place to work," with perks that include memberships, on-site gyms, and other incentives. Suppose the needs of employees are not being met. In that case, however, these "perks" can quickly become a detriment and lead team members to feel like they are commodities, not people. These perks have much more to do with employee satisfaction rather than engagement. Leaders at all levels must realize that employee engagement is a "leadership thing" because leaving it all to HR has devastating consequences.

To reverse this, leaders must realize that employee engagement should be their top priority. They must inspire greatness in their team members so they can thrive in their place of work. They must serve as coaches and work to create the right conditions for employees to work together as effectively as possible. However, they must also check their motives to ensure they're not being selfish and begin to undo the conditioning they were taught.

Tenney advises the reader to print out and rewrite their job description. By writing "additional responsibilities", coming up with a creative way to say their job is to inspire greatness in others, and constantly reviewing it, they will begin to reprogram their thought process, and this shift changes everything. The best leaders know they can benefit from reminders about what matters most and reinforce that employee engagement is a leadership thing, not only an HR thing.

It is essential to quickly follow up on implementing this new system by identifying and meeting the needs of those in the organization and removing the obstacles for them to thrive. There are universal needs that each leader should strive to meet, and they should strive to understand and meet the unique needs at work by working to learn them. This will require a more in-depth study of the universal and unique needs. It should be quickly followed up by getting feedback on how well or not direct managers are meeting the needs in front of them. Doing this regularly will reveal and remove blindspots and is essential as leaders work to help their employees thrive.

Finally, once feedback is received, and to ensure that employee feedback and leadership training are tightly in sync, it is vital for leaders to follow two key steps. First, they should focus the first six months on only having questions on the surveys they know they can and should address. Secondly, they should have training ready before the survey goes out so they can quickly follow up and begin to meet the needs of their employees so they can thrive. By linking the training and feedback, an improvement will be seen in the effectiveness of the training and will ultimately produce the desired results.

Part Two

Now that foundations have been laid and leaders know what to do to inspire greatness in their team members, they can move forward and meet their workplace's universal needs. While each organization and the individuals working in it are unique, Tenney shares that research has shown that if these universal needs are met, employees will be happy, inspired people who do great work.

Facilitating excellence in others means believing in them and working to meet their needs—every human desires to be great at what they do. Still, if their environment does not give them space to flourish, the habits they create may result in the failure of their teams rather than causing their success. It is essential to note the importance of one-on-one meetings between leaders and their team members. This will allow them to quickly address problems so they don't fall by the wayside and escalate into significant problems. Dealing with these issues can be time-consuming and stressful for a manager. Still, regular one-on-one meetings will address problems, and there will be space and time for quality conversations that will impact both the personal and professional levels.

It is also essential to learn to treat appreciation as an art form. Everyone wants to feel appreciated and know their actions are essential and correct. Withholding appreciation, focusing only on the negatives, or simply not sharing feedback will leave employees uncertain. Creating a habit of showing frequent appreciation for team members' work will help them build confidence and thrive at work. It will also help management learn to see what is right and express gratitude.

They also need to provide clear expectations when tasks are presented. If expectations are not communicated, it will lead both management and employees to a place of frustration. Three main points should be considered when managers communicate to their employees to ensure the result has the most significant impact in the least amount of time. They need to begin by clearly defining each person's role. Hence, they understand their role in the organization, and direct managers should be involved when HR creates and updates job descriptions. Next, they need to share how they expect their employees to behave. This can include discussions ranging from the work

> *As leaders work to inspire greatness in their team members, they should also look for ways to improve employees' well-being. "*

culture, the dress code, or timeliness and work quality expectations. Finally, there must be clarity on what the task is. It is recommended to explain how the task fits into the overall plan. Hence, they understand why they are doing this, allowing team members to be more engaged and to clarify that they understand the task by asking follow-up questions.

As leaders work to inspire greatness in their team members, they should also look for ways to improve employees' well-being. Too often, people work at unsustainable, high-performance levels, making them struggle in every aspect of their lives. This will clearly hinder their thriving, but leaders can positively influence their work cultures if they recognize this. A culture that prioritizes the health and well-being of its employees will lead to retaining and attracting talented team members who have what they need to prosper.

Having the Right Tools

When employees struggle to perform at work, the blame is often laid at their feet without any questions being asked, leading to even more struggle. This needs to be handled carefully, and leaders should move forward with care and seek to understand the problem and how they can help their employees through it. Regular one-to-one meetings with team members will allow the opportunity to discuss performance gaps and communicate any needs they may have. Leaders need to listen carefully and ensure they are not sending signals that indicate they don't want to hear any problem, as this will be a deterrent when discussing tricky topics.

There is something powerful about helping others leverage their strengths and be able to tap into their flow state. Being in a flow state is associated with higher happiness, creativity, and productivity. This is something that leaders should work to facilitate, and they can do this by helping others identify and leverage their strengths. This should begin with observing what an employee does well and discussing with them what they think their strengths are. Formal assessments can also be completed. No matter the course of action, the focus should be shifted to helping them find ways to do more of what comes naturally to them rather than exclusively fixing their weaknesses.

Everyone wants to feel that their thoughts and ideas matter and add to their work. If only managers and executives were heard, many great ideas would be missed, and team members would feel like they were not contributing. Even if an idea does not fit, explaining why it doesn't fit the current agenda is crucial so that team members can offer ideas that align with the organization's direction.

With that in mind, leaders must learn to communicate feedback that conveys inspiration rather than judgment. There are several valid reasons why leaders don't communicate feedback well, some of which are that they were never taught how to or want to avoid the uncomfortable conversations that may follow. Leaders need to adopt a coaching mindset to encourage their team, help them excel at what's best for them, and be specific about what needs improvement. Next, they need to connect the feedback to the overarching plan so the team members can see why the recommended improvement is necessary and, finally, be a readily available resource for them to come and talk to. This will show the employees that their leader is invested in them and wants to see them succeed.

While it may seem counterproductive, employee engagement can improve if leaders learn to free up their time and give their teams more autonomy in their work. This will improve engagement and productivity and satisfy employees' innate desire to thrive at work, as they will have more control over where, when, and how work is done.

Continuing to Grow

Everyone has potential, but too many people go through life, leaving much of it locked up, untapped, and unrealized. This hinders their ability to thrive, particularly if employees feel their leaders don't care about them or their needs. This can lead to frustration, and leaders must ensure their team has what they need to live up to their fullest potential. By investing in their growth and showing that they care, employees will be able to grow both professionally and privately.

One of the most critical aspects of helping others thrive is building trust with one's employees.

When there is a lack of trust, it is only a matter of time before the organization fails, and employees and leaders are left expending an outrageous amount of energy to protect themselves from perceived threats. However, trust can act as a turbocharge and unleash a new level of greatness. There are several ways to build trust, such as being an example of integrity (i.e., doing what one says one will do and telling the truth even if it's painful,) being transparent (sharing what is truly going on in the workplace) and by extending trust to their employees. Using these steps and purposing to build a culture will encourage employees to be honest with those in leadership and create a culture centered on trust.

One of the most powerful tools for engaging employees is showing them they genuinely care about them. When team members feel cared about, they are likely to feel that they are in a safe

place where they can bring their whole selves to work. They are also more likely to go the extra mile at work because they know their leaders care about their performance. After all, they want them to succeed rather than for other potentially selfish reasons.

This will also help leaders foster a sense of belonging, mainly because they understand that the feeling of belonging can help drive business and help them reach a new level of success. Tenney states that while it is not the leader's job to make their team members get along, it is their responsibility to create an environment for healthy relationships to form and thrive. He shares a few practices used at his organizations to help facilitate this, including connecting as people at their daily team meetings. Team members share what brought them joy both at work and at home. This encourages vulnerability as they share different parts of their lives and purpose to grow together at work.

Great leaders who wish to inspire greatness in their team members must do one final thing: Provide meaning in the workplace and create the most attractive work culture possible. Is it possible to do this, and if so, is this a worthwhile pursuit? Tenney says that yes, it is, and the first step is to ensure that the organization has a mission statement that everyone can understand. It is vital that as much of the leadership team is involved in crafting it as possible and that different department managers craft a mission statement based on it specific to the area they serve in.

They should also work on crafting a vision statement to give them a goal to reach for. A compelling vision of the future can unleash energy and engagement even if this goal is ultimately unattainable. The mission and vision statement should have a clear connection of the world they hope to create and how they are working to achieve it.

Once they have done this, leaders must dedicate themselves to making the organization's culture a place where the top priority is giving team members what they need to thrive and ensure they know they are cared about. By developing and practicing qualities like kindness and generosity, leaders will soon be on the way to creating a meaningful workplace and inspiring greatness in those around them.

Inspire Greatness: How to Motivate Employees with a Simple, Repeatable, Scalable Process by Matt Tenney encourages leaders to step out side themselves, see leadership a different way and encourage those around them to be better than they are or thought they could be. Inspire Greatness is a thoughtful, easy-to-digest read that proposes that a new way of thinking when it comes to leadership and how that affects the organization. By putting the habits the Tenney proposes into action, the reader will have what they need to help their employees thrive and show them that they are seen as more than employees; they are people. Inspiring greatness in others will not only meet the universal needs that Tenney states each person has, but will give them what they need to thrive in both their personal and professional lives. Additionally, it will meet the most important need there is to love and feel loved. When love is put to work as an action, it means a willingness to sacrifice for those are around and this can help to create a workplace where people can come in, knowing that they and their work, ideas and voice are heard, valued and appreciated. Having this type of work culture will attract and retain the most talented and helped the organization as they work to have the most successful output.

As leaders work to inspire greatness in their team members, they will have a hand in developing human beings that that make the world a better place through their thoughts, actions and words.

Decide What You Do Best And Do It Better	3
Get Rid of Boundaries	4
Assemble Type "A" Workers	5
Find and Grow Ideas In a Learning Culture	6
Make Quality a Priority	7
Focus on Services	8

THE SUMMARY IN BRIEF

Jack Welch had his eye on the horizon when he took over GE in 1981. What he saw there concerned him. The previous decade's high inflation rate and encroaching competition from Japan were changing the rules of the game. Welch knew that while GE looked healthy enough to outsiders, it had to "get a lot better, faster."

That meant change — a lot of change.

Welch slashed the size of the work force, delayered management, and reduced the number of business units.

For this, he earned the name Neutron Jack.

Welch also tore down internal boundaries, improving communication and speeding up operations. He implemented programs that cultivated ideas and rewarded quality. He expanded the corporation's global reach.

For this, *Fortune* magazine voted GE the most admired company in America in 1998 and credited Welch for having "rewritten the book on management while keeping GE huge, nimble, and immensely profitable."

Management guru Warren Bennis added that Welch raised GE from "big and good" to "big and great."

Welch molded GE into the powerhouse it is today, raising its revenues to record levels by the late 1990s. And he did it his way.

By understanding his role as a leader.

By unloading the bureaucracy that weighed it down.

By looking for new ideas inside and outside GE.

By driving quality throughout the organization.

The style may be quintessential Welch, but your company can follow his example. You can — and should — speed up your business processes, constantly focus on innovation, and make sure you put only your best players on the field. Above all, says Welch, you should never forget that business isn't rocket science; it's simple.

Understand Your Role as a Leader

"I don't *run* GE," says Jack Welch. "I *lead* GE."

Leaders inspire employees by creating a vision of how things can be done better. They get people to perform at levels they didn't think possible.

Then they get out of the way.

Simplify

When it comes to visions, Welch keeps them simple. He advocates having what he calls an overarching message: "something big but simple and understandable.

"Every idea you present must be something you could get across easily at a cocktail party with strangers," he says. "If only aficionados of your industry can understand what you're saying, you've blown it."

One of Welch's visions, for example, was to have every GE business be number one or two in its market. Clear and simple.

Spread the Word

Welch takes advantage of every opportunity to promote his vision. He drives home his message in his annual Letter to Share Owners, in his speeches to the GE board, and in talks with financial analysts.

He makes sure everyone gets the same message."I don't say one thing to outsiders and another to insiders," he notes.

The CEO expects GE employees at every level to be able to identify, as well as to commit to, the company's values, for example.

Get Real

Welch believes leaders must face reality about situations, products, and people, then act quickly and decisively on that reality.

Facing reality means acting on the knowledge that the world is becoming increasingly competitive. It means understanding that no job is guaranteed for life. It means rejecting the bureaucratic approach to management. And it means acknowledging that business is simple.

Facing reality means making some hard decisions sometimes. But Welch is convinced that most mistakes come from *not* facing reality and then acting on it. He says his biggest mistake was not acting fast enough to implement some major changes at General Electric, for instance.

More specifically, he regrets not buying a food company early in his tenure as CEO — an investment he believes would have paid off. But he was too slow to make a decision.

Promote Your Values

Values are such an integral part of GE's culture that Jack Welch had them inscribed on wallet-size cards and gave every worker one of these "Values Guides."

The cards say that GE leaders, always with unyielding integrity,

- have a passion for excellence and hate bureaucracy,
- are open to ideas from anywhere and committed to Work-Out (see page 5),
- live quality and drive cost and speed for competitive advantage,
- have the self-confidence to involve everyone and behave in a boundaryless fashion,
- create a clear, simple, reality-based vision and communicate it to all constituencies,
- have enormous energy and the ability to energize others,
- stretch, set aggressive goals, reward progress, yet understand accountability and commitment,
- see change as opportunity, not threat,
- have global brains and build diverse and global teams.

When you make a mistake, admit it, advises Welch. Better yet, learn from it.☆

Decide What You Do Best and Do It Better

Jack Welch believes only the strongest survive. Weak businesses don't have the resources, muscle, and power to compete globally.

Early in his tenure as CEO, he made it his mission to strengthen GE by weeding out its weak businesses.

Number One, Number Two

In the early 1980s, GE boasted 350 GE businesses in forty-three strategic business units. Only three GE products — plastics, gas turbines, and aircraft engines — had a respectable share of the export market. And just one of these, gas turbines, was a market leader abroad.

Welch believed GE could, and should, do better.

He developed a "number one, number two" plan to boost GE's competitiveness. The strategy called for every GE business unit to be either first or second in its market. Those businesses that weren't, or that didn't have a technological advantage, risked dismantlement even if they were turning a profit.

"When you're number four or five in a market, when number one sneezes, you get pneumonia," noted Welch. "When you're number one, you control your destiny."

Purpose and Focus

Part of Welch's strategy was to sharpen GE's purpose and focus. He chose to keep and nourish businesses that concentrated on at least one of the following three functions:

- **core functions** such as lighting, major appliances, motors, transportation, turbines, and contractor equipment
- **high-technology,** including industrial electronics, medical systems, materials, aerospace, and aircraft engines
- **services** like GE Capital as well as information, construction and engineering, and nuclear services

One hundred seventeen businesses and product sectors that did not fit these categories — from toasters to coal mines — were either sold or shut down.

The company also bought assets worth $16 billion. These new acquisitions did fit the three categories. For example, the purchase of RCA, which owned NBC, and investment bank Kidder Peabody enhanced GE's services function.

Broader Markets

By the late 1980s, Welch had achieved strategic dominance at home and turned his attention to the global arena.

He told business unit managers to redefine or broaden their target markets. This set the bar a little higher, forcing unit leaders to reevaluate the business of their businesses.

The result: By fall 1997, many GE businesses attained first or second status in their markets worldwide.☆

Rightsize Your Work Force to Efficiency

One of Welch's long-term goals has been to make GE as lean as possible, as fleet as a small company. Developing a sharper focus helped, but it wasn't enough. GE's work force had to be cut and reshaped as well.

Delayer Management

The GE of the early 1980s was a large bureaucracy, employing 412,000 people.

Welch hates bureaucracies. He believes they promote sluggishness and choke initiative. He was determined to tear down GE's bureaucracy in order to make the company more competitive.

A slimmer GE meant fewer jobs. One-third of the work force was cut, leaving roughly 270,000 jobs intact.

A faster GE meant fewer managers. There were 25,000 managers when Welch took over as CEO. Five hundred were senior managers; 130 were vice presidents or higher.

Welch set about delayering GE's management structure. He eliminated sector and group-level managers. He reduced the number of vice presidents within each business to ten. He decreased the number of managers between himself and division chiefs from nine to between four and six.

He directed GE's fourteen business leaders to report directly to him or to one of his two vice chairs.

Welch's delayering strategy improved communications within GE. As a result, decision makers got the information they needed more quickly and were able to get products to market faster.☆

Give Bureaucracy the Boot: Think Small

Jack Welch believes small companies offer some very big advantages, like those he outlined in his 1992 Letter to Share Owners.

"Most small companies are uncluttered, simple, informal," he wrote. "They . . . grow on good ideas — regardless of their source. They need everyone, involve everyone, and reward or remove people based on their contribution to winning.

"We love the way small companies communicate: with simple, straightforward, passionate argument rather than jargon-filled memos, 'putting it in channels,' [or] 'running it up the flagpole.'

"Everyone in a small company knows the customers — their likes, dislikes, and needs. . . . Small companies have to face into the reality of the market every day, and when they move, they have to move with speed. Their survival is on the line."

Get Rid of the Boundaries That Interfere with Business

Most companies have too many boundaries, says Welch.

There are boundaries between management layers. Boundaries between divisions. Boundaries between organizations and their clients. Boundaries between companies and their suppliers.

These boundaries get in the way of doing business.

The Problem with Walls

Perhaps Welch's most critical objective has been to reduce GE's boundaries, particularly those between the company and the outside world. He believes these barriers support a deep-rooted corporate prejudice against any idea not generated within GE — a bias he refers to as the "not invented here" (NIH) syndrome.

In a message to General Electric shareholders in 1996, Welch wrote that NIH "limited our ability to learn from suppliers, our customers and other global companies that had 'best practices' that could be of enormous use to us."

Furthermore, boundaries prevent information from flowing internally. At one time, for example, GE's plastics, lighting, and motors divisions sold their products to the automobile industry separately instead of coordinating their sales efforts.

Similarly, GE engineers sometimes designed a product that was difficult to manufacture, hard to sell, and nearly impossible to service. The left hand simply didn't know what the right hand was doing.

Becoming Boundaryless

When you break down barriers, you empower employees. Boundarylessness opens channels of information to them and gives them opportunities to contribute ideas and make decisions. It encourages cooperation across the board.

Welch introduced the Work-Out program, described on the following page, to help people stop "wrestling with the boundaries, the absurdity that grows in large organizations." This program improved communications, enhanced innovation, and reduced NIH by providing an impetus to search the world's best companies for better ways of doing things.

Making GE boundaryless has meant bringing suppliers and customers into GE's design and manufacturing processes.

GE managers are encouraged to ask themselves, What parts of the business are slowing us down? What are the obstacles in our way? And then remove every possible roadblock that stands in the way of getting a product to market quickly.

A Bonus Benefit

Tearing down boundaries offers another benefit in addition to improving communications and speeding up processes. It creates an environment that fosters self-confidence.

Self-confident employees are more likely to embrace change because they see it as an opportunity, not a threat. They are less likely to engage in the type of turf battles and in-fighting that characterize bureaucracies. They don't need to "get credit" for every idea they originate.

Self-confident leaders are less afraid of looking simple so they are more willing to simplify. They don't need the protection of bureaucratic barriers.

When GE tore down barriers, it gave all GE employees a greater voice. They began to talk with, and listen to, one another. They began to trust each other. GE's leaders were given more independence and allowed to take bigger swings.

"If you and I and the business leadership of the country can have the self-confidence to let people go," notes chairman Welch, "to create an environment where each man and woman who works in our companies can see a clear connection between what he or she does every day, all day, and winning and losing in the real world — we can become productive beyond our wildest dreams."☆

Barriers Create Waste

Boundaries, even subtle ones, cause waste. This is one more reason why Welch is on a crusade to fashion GE into a boundaryless organization.

The chair once discovered that whenever he called a meeting, some people spent hours preparing for it, trying to answer questions they thought he might ask them. They were trying to erect a protective barrier between Welch and themselves. And they spent a lot of time doing it. Welch told them to stop it.

In response, the staffers placed an assistant on call, ready at a moment's notice to research answers they didn't know. This was yet another barrier. Welch knocked that one down too.

No boundaries, says Welch. If you don't know something, admit it. Then take steps to find out. You'll waste less time and effort.

The idea is gaining ground at GE.

Shortly before GE's Corporate Executive Council was to meet one quarter, executive Steve Kerr noticed a man sitting outside the meeting hall. Kerr asked him what he was doing.

The man replied he was there to handle "technical problems." Like what? asked Kerr.

"Well," the man replied, "let's say a bulb in the overhead projector has to be changed."

Kerr was stunned. "There are five engineers in that meeting, including the chairman," he told the man. "I'll bet one of them could change a light bulb!"

He sent the man back to his regular duties, reducing the number of barriers at GE by one.

Assemble a Team of Type "A" Employees

Only A players need apply at GE. These are people who subscribe to GE values and perform outstandingly. They have vision, courage, integrity, determination, and excellence — "the best in the world," says Welch.

A's go beyond their defined roles, as engineers or finance people, for example, to improve their value to the company and increase the company's value in the marketplace. Welch wants only A managers and he urges GE's managers to hire, and take care of, their A players.

"It's too bad that we can't define people in business as easily as you can on a basketball court or a hockey rink," says Welch. "If the guy couldn't skate, you wouldn't have him at left wing. If the guy couldn't shoot, he wouldn't be the forward. He wouldn't be on the team. And it's no different in the business team you have to build.

"Always get the best people. If you haven't got one who's good, you're shortchanging yourself."

Not everyone at GE is an A player, of course. Type B's share GE values and are productive but need to improve. They should be nourished, suggests Welch.

As for Type C's, people who don't exhibit the right stuff or share the corporation's values: "Push C's on to B companies or C companies, and they'll do just fine," says Welch. "Move them on out early. It's a contribution."

Hire Energetic Managers

Most managers *over*manage, says Welch. They enervate rather than energize, depress rather than excite.

The GE CEO looks for senior managers who are bursting with energy, who can develop and implement a vision, and who know how to fire up enthusiasm in others.

He seeks middle managers who embrace GE's values — people who are team players and coaches. Mavericks, no matter how talented, aren't welcome.

Always get the best people. If you haven't got one who's good, you're shortchanging yourself.

Welch admits this approach means sometimes you may have to bypass, or even get rid of, some otherwise impressive people. But, as he noted in GE's 1993 annual report, if your managers can't motivate and coach others, "their debilitating effect on the team can outweigh the benefits of their individual talent."☆

The Personal Touch

Welch is confident all the senior managers on GE's team are Type A players. And he is determined to keep it that way.

The chief executive makes a point of getting to know all of the five hundred top GE managers and personally signs off on their promotions. He also interviews anyone hired to fill those posts.

His personal approach seems to work. Management recruiters in a 1997 *Business Week* survey named five GE managers among the twenty executives most likely to become CEOs at major corporations within five years.

Get Everyone to Work Out Solutions

In 1989 Welch instituted a ten-year program called Work-Out. Its purpose was to provide the opportunity for *all* GE employees to help solve problems and offer good ideas. Engaged workers, he reasoned, were more productive workers.

Welch made it clear to his managers that everyone's ideas counted. "If there are three people, I want three ideas," he told them. "If you're only giving orders, I will get only your ideas. I'd rather select from the ideas of three people."

How It Works

Modeled after the New England town meeting format, Work-Out allowed employees to make suggestions directly to their bosses and get a response — immediately, when possible.

Each three-day workshop was devoted to a specific agenda or goals, such as cost reduction or new product introduction. Organizers invited who they wanted but invitees didn't have to attend. Ultimately, forty or fifty people from both staff and management might attend.

Typically, workshops at each plant opened with an address by a GE business leader or boss. Then the boss would leave and participants were divided into small groups to brainstorm. A facilitator made sure senior employees didn't dominate discussions or pull rank.

These brainstorming sessions continued into the third day when the boss returned to listen to the ideas and respond to the proposals.

Bosses had only three options: Agree to implement a proposal. Refuse the proposal. Ask for more information, in which case the boss had to authorize a team to get the information by a certain date. As a rule, only 20 percent of the decisions were postponed.

Work-Out may have been tough on bosses, but it yielded good results for GE. Consider the following:

A proposal to allow aircraft engine workers in Massachusetts to bid against an outside vendor on a project saved the corporation $80,000.

A proposal at a Pennsylvania factory to purchase paint from one supplier instead of two improved paint consistency thus eliminating rework and reducing delays.

A proposal to unseal vents and buy fans at a Kentucky plant enhanced working conditions there.☆

Find and Grow Ideas in a Learning

GE feeds on ideas and is constantly looking for more food. It searches everywhere and anywhere.

Work-Out feeds it from within by encouraging a free flow of ideas at every level.

Likewise, GE businesses share the ideas they get with each other. For example, GE's Medical Systems learned how to detect and repair from a distance malfunctions in hospital CT scanners. Med Systems shared this technology with GE's Aircraft Engines, Locomotives, Motors and Industrial Systems, and Power Systems businesses.

Now, these businesses have the capability to monitor the performance of jet engines in flight, locomotives and paper mills in full operation, and turbines in power plants.

But the days when NIH — not invented here — reigned supreme are long gone.

Welch urges people to look for ideas "from any source. So we will search the globe for ideas," he says. "We will share what we know with others to get what they know. We have a constant quest to raise the bar."

Welch openly admitted to shareholders in 1993 that GE had benefited from a host of ideas from other companies.

Over the years it has adapted new-product introduction techniques from Chrysler and Canon, effective-sourcing techniques from GM and Toyota, and quality initiatives from Motorola and Ford. GE also used advice and best practices from IBM, Johnson & Johnson, and Xerox, among others to move effectively into the Chinese market.

The CEC Factor

One way ideas get around at GE is via the Corporate Executive Council (CEC). This group includes the corporation's thirty or so most senior executives. Every quarter they meet for two or three days to go over forecasts, share war stories, and discuss any new initiatives.

Often one or several GE business leaders will adopt another business's idea or best practice. When the head of GE Capital announced at one meeting that a full day of his employee orientation program is devoted to quality training, for example, several other leaders decided to follow suit. Others chose not to. No one has to adopt anyone else's idea. The purpose of the CEC is to provide a learning experience as well as a forum in which to exchange ideas.

"It's a whole different way of thinking. 'Let me learn,'" says Welch. "If everybody in our place gets up every day trying to find a better way, it'll all take care of itself."

Everyone Benefits

The learning culture Welch has nurtured at GE has benefited the corporation in a number of ways.

Operating profits have risen to the 15 percent level in the last five years after hovering under 10 percent during the last century. Increases in company revenues reached double-digit levels in the mid-1990s. Inventory turns created a record $6 billion in cash in 1996.

Employees also enjoy the rewards of this learning culture. Welch offers generous compensation and makes it clear that sharing ideas is critical to earning one's keep at GE.

Additionally, workers have the satisfaction of knowing what they do matters. According to one survey, in fact, 87 percent of GE's employees believe their ideas count.☆

Challenging GE's Leaders In and Out of the Classroom

GE's learning culture is augmented by its Crotonville Leadership Development Center in New York's Hudson Valley. Junior and senior heads of GE businesses around the world come to the management institute to brainstorm and to learn.

Crotonville courses, some nearly a month long, teach strategy, global competition, diversity, and a host of other business skills.

The center has given birth to a variety of ideas that have been implemented at GE. The idea for Work-Out was born here, for instance. And GE's values were debated for countless hours by Crotonville participants before appearing on the Values Guides.

Open interaction and frank discussion rule the classrooms; titles and seniority afford no protection. Junior executives are expected to question conventional wisdom, even when it means challenging their bosses. Senior executives, in turn, expect to be subjected to close scrutiny.

Welch loves the open confrontational style that characterizes learning at Crotonville. Nearly every month he drops in on classes to lecture on business strategy and philosophy and to chat individually with participants.

Like GE leaders before him, Welch appreciates Crotonville as an invaluable tool for spreading his message. That's why he has invested heavily in the institute, even during those early years of his tenure when he downsized much of the corporation.

But Welch also frequents Crotonville to learn. It helps him keep his finger on the pulse of GE. Walter Wriston, a longtime GE board member, once told him that as chair and CEO, Welch would always be the last to know when something was going on at GE. Welch is determined not to let that happen.

Make Quality a Priority in Your Company

Quality has always been important at GE. But the company doesn't have a reputation for world-class quality yet. Welch is determined to change that.

Why Now?

In the eighties and early nineties, GE had the luxury of choosing its market battlegrounds. It simply abandoned businesses where it did not have an edge.

By contrast, companies like Motorola, Texas Instruments, and Hewlett-Packard had to improve their quality levels in order to survive against Japanese competitors.

Benchmarking against these companies revealed that GE needed to improve its quality standards. Too much time was spent fixing and reworking a product before it left the factory. This increased waste, reduced speed, and lowered productivity.

Welch has decided to make quality a critical management focus. He doesn't want GE to be equal to, or even better than, its competitors. He wants to take quality to a whole new level.

"We want to make our quality so special, so valuable to our customers, so important to their success that our products become their only real value choice," he says.

The solution is six sigma.

The Six Sigma Concept

Six sigma is a measurement of mistakes per one million discreet operations. Fewer errors mean higher quality.

Six sigma means that there are only 3.4 defects per million operations. By contrast, at three and a half sigma, there are 35,000 defects per million operations. This is average for most firms, including GE.

Motorola pioneered the six sigma initiative in the 1980s in an effort to reduce the number of defects in the communications equipment and semiconductors it produced. Other firms soon followed suit. All achieved dramatic results.

Welch initially was concerned that six sigma was too bureaucratic and centrally managed to work at GE. But others at the company, including participants at Crotonville, urged him to reconsider.

In 1995, Welch decided to initiate a six sigma program at GE.

Getting There

The first step in the six sigma process is to identify a project. Next, characteristics critical to quality are defined. Then a six sigma team of specialists, called master black belts and black belts (see box below), take the project through four steps. They

1. measure the defects generated by a key process,
2. analyze what variables cause the defects,
3. improve the process by determining the maximum acceptable range of these variables,
4. control by making sure the variables stay within this range.

The control phase is crucial. GE audits its quality initiative projects for six to twelve months initially and every six months thereafter. This ensures that once a problem is fixed, it stays fixed.

GE launched two hundred projects in 1995. Three thousand were completed the following year. The average project takes about four to five months and yields an 80 percent reduction in defects. This translates to $70,000 to $100,000 in savings.

Although GE has spent considerable money on quality initiatives, its return generally is double the investment.

Improved customer relations have proved another advantage. In the past, GE personnel felt they knew what was important to the customer. But six sigma taught them different.

To date, most quality efforts have focused on improving business processes that help customers become more productive. The next step is to improve GE's existing products.

Ultimately, Welch intends to incorporate six sigma thinking into every new product design.☆

Six Sigma Works

GE Lighting had a problem. Its electronic billing system wasn't a good fit with Wal-Mart's purchasing system. This caused disputes, delayed payments, and made Wal-Mart unhappy — not good because Wal-Mart was one of Lighting's best customers.

A GE black belt team applied six sigma methodology, information technology, and $30,000 to the problem. They reduced system defects by 98 percent in just four months.

Disputes and delays dropped off. Wal-Mart improved its efficiency working with GE.

The Martial Arts of Quality

It takes a new category of employees to make sure six sigma works. At GE, these people consist of champions, master black belts, black belts, and green belts.

Champions are the senior managers who approve projects, fund them, and troubleshoot.

Master black belts are full-time teachers. They also mentor and review black belts.

Black belts are full-time team leaders who measure, analyze, improve, and control key processes that influence customer satisfaction or productivity growth. They report to champions.

Green belts are team members who work on six sigma projects while holding down other jobs at GE. The ultimate goal is for every one of the firm's professional employees to become a green belt.

Focus on Services as a Growth Strategy

In 1980 only 16.4 percent of GE's profits were from service businesses. Today nearly 60 percent are from services. Jack Welch would like that percentage to top eighty.

This phenomenal growth is no accident. Welch understood early on that GE's growth would have to come from services and he took steps to make it happen.

NBC and GE Capital are two of his success stories.

Turning NBC Around

In 1985 Welch arranged for GE to buy Radio Corporation of America (RCA). The $6.28 billion purchase included television network NBC.

The network had the highest ratings of the three major networks at that time but also the lowest profits. The NBC News budget, for example, had increased from $207.3 million in 1983 to $282.5 million a year later.

Welch and his newly appointed head of NBC, Robert Wright, cut costs, turning the network around quickly. Forced to face reality, NBC's profits rose from $333 million in 1985 to $750 million in 1989.

By 1992, however, profits fell to $204 million and NBC slipped to third place among the networks. Gulf War coverage and competition from cable companies for ad dollars reduced some revenues. The wrong people in place reduced others.

Welch had a choice to make: Fix the network, close it, or sell it. He chose to fix it. He did this by hiring the right people — people who, like Wright, adhered to the GE way.

Wright and these other "A" leaders sharpened NBC's focus, slashed expenses, and made quality a priority. Under their direction, NBC launched its "Must-See TV" line-up, including such strong new shows as *Frasier, Friends,* and *ER*. It reduced its work force by more than 3,000 and expanded into a dozen cable networks. And it moved fast to sew up broadcast rights for five of the next six Olympic Games.

By 1997 NBC had become one of GE's most lucrative businesses.

The Rise of GE Capital

Another jewel in GE's crown is GE Capital Services (GECS). It began in the Depression as GE Credit, lending money to financially strapped people who wanted to buy major appliances. In the 1960s, it began financing other products and changed its name to GE Capital.

Today GECS is the driving force behind services at GE thanks in large part to Welch's efforts to push GE's service industries. It boasts twenty-seven businesses, from credit cards to satellite leasing to computer programming. Nineteen of these had double-digit growth in 1997.

Acquisitions have accounted for a large part of Capital's growth, particularly in the 1990s. Since 1994, for instance, GECS has spent $11.8 billion on dozens of acquisitions including First Colony of Lynchburg, Virginia, a leader in term life insurance, and high-tech firm Ameridata Technologies.

It expanded its global influence in the nineties, helping to finance power projects in Mexico and China and an airport privatization project in Hungary.

Despite embarrassing failures, such as the fall of investment bank Kidder Peabody and the bankruptcy of Montgomery Ward, GECS still posted an 18 percent average annual profit growth rate from 1991 to 1996.

Its success is a testament to GE's strong credit rating, savvy leadership, and commitment to the GE way of doing business.☆

Global Markets Hold Risk and Opportunity

Welch has long been determined to increase GE's global reach. His efforts began in earnest in 1987 when GE exchanged its TV set business for a medical imaging company owned by French electronics firm Thomson S.A. The deal, which took only half an hour to clinch, marked GE's move into Europe.

After Thomson there were joint ventures with German industrial engines firm Robert Bosch and Japanese electrical equipment specialists Toshiba. GE Lighting bought a majority interest in lighting companies in Hungary and the U.K. And there were others.

In fact, since 1989 GE has invested $17.5 billion in Europe, half on new plants and facilities and half on acquisitions. The strategy has worked. In 1995 GE's European operations raked in roughly $1 billion profit on revenues of $14.1 billion.

GE's success varies with its business interests, however. GE Capital Services Europe does well. On the other hand, consumer appliances have been disappointing.

Asia is another target market for growth, despite economic problems in Japan in the late nineties. Welch even is determined to crack the notoriously tough Chinese market although he admits GE may not make it in China.

"There's no expansion globally that isn't fraught with risk," he says. "But you can't stay home. Clearly, the risk side is long, but the opportunity side's longer. That, I think, is the difference."☆

Stretch to Reach Goals

Jack Welch believes in setting goals that seem almost out of reach, a strategy he calls stretching.

Stretching is daring to dream. It's being more creative about your business. It's knowing you might fail and trying anyway because it's the best way to grow.

Stretching, says Welch, "replaces a grim, heads-down determination to be as good as you *have* to be and asks, instead, how good *can* you be?"

The Personal Journey of Jack Welch

JACK: STRAIGHT FROM THE GUT

THE SUMMARY IN BRIEF

The career of former General Electric CEO Jack Welch leaves us with many lessons in management, business and leadership. From his beginnings as a stuttering, competitive kid from working-class Salem, Mass., to his early days as a GE engineer, to his ascension to CEO in 1980 and subsequent 20-plus year reign at the top, Welch stressed the importance of people, originality and creativity, and common sense. The result is a leadership style that's often imitated, but never equaled.

In Jack: Straight from the Gut, *Welch is both storyteller and coach, using his exceptional career as the backdrop to share his thoughts on what it takes to be a great leader. Part management text, part page-turner, Jack shows how the man widely regarded as the finest corporate executive of his generation built his business and his reputation.*

What You'll Learn In This Summary

✓ **It's best to be small, no matter how big you are.** By slashing unneeded bureaucracy and insisting that GE's businesses be in the top two positions in their respective fields, Welch instilled an entrepreneurial spirit and a quick-thinking, quick-moving approach to competition and constant improvement. It was a small-company approach to running an enormous, multi-billion-dollar organization, and it worked marvelously.

✓ **It's all about people.** Jack Welch's passion was making people GE's core competency, and he saw to it that the company found and developed great people.

✓ **Companies must be boundaryless to unlock their potential.** Insular thinking results in stale ideas and, consequently, stale organizations. By breaking down the walls and borders that separated various departmental and functional areas at GE, Welch was able to unlock the full creativity of his people, propelling the company forward with fresh, creative approaches to problems.

✓ **Quality is nothing without efficiency.** GE's Six Sigma initiatives replaced sloganeering quality strategies with ones that brought about measurable results in increased efficiency, reduced defects and satisfied customers.

BUILDING A PHILOSOPHY

The Vision Thing

Jack Welch's first time in front of Wall Street as CEO — a talk before financial community representatives in 1981 — was, by his own admission, a bomb. In a 20-minute speech, he gave his audience a primer on what he felt it would take for a company to be viable in the long term. Winning companies, he said, would be the ones that "search out and participate in real growth industries and insist upon being Number One or Number Two in every business they are in — the Number One or Number Two leanest, lowest-cost, worldwide producers of quality goods and services." It was a strategy to which he would commit his company with the fullest effort imaginable — a strategy that would change the face of GE forever.

Wall Street yawned. They were looking for hard numbers, things they could plug into their financial models and crank out estimates of earnings. They wanted a quantitative discussion; Welch had given them a qualitative talk, because he did not yet have a conceptual tool to communicate, much less implement, his vision.

Strategy on a Cocktail Napkin

Then, one evening, while trying to explain the concept to his wife, Welch sketched out the strategy on a cocktail napkin. The sketch showed three circles, labeled "services," "high technology" and "core." A number of GE business units were listed inside and outside the circles.

Over the next few weeks, Welch would refine, expand and share his model with everyone who would listen. Businesses inside the circles were core manufacturing, technology, or service entities — the bedrock of GE. Any businesses outside the circles would have to be fixed, sold or closed — they were marginal performers, or were in low-growth markets, or simply had a poor strategic fit. These were business that were, in other words, going to have a hard time achieving the Number One or Number Two status in their fields.

Implementing the Strategy

In the first two years of the strategy, GE sold 71 businesses and product lines, receiving a little over $500 million for them — a relatively small amount of action, but action that had purpose. When GE sold a struggling business and realized an accounting gain as well as cash, it gave the company the flexibility to reinvest in or fix up another, potentially stronger, business. This gen-

(continued on page 3)

Superficial Congeniality

In 1980, GE was, like much of American industry, a formal and massive bureaucracy, ruled by more than 25,000 managers who each averaged seven direct reports in a hierarchy with as many as a dozen levels between the factory floor and the CEO's office. Having been in the field, Welch had a strong prejudice against most of the bureaucratic culture and its "superficial congeniality" — pleasant on the surface, with distrust and savagery roiling beneath it.

Welch also hated the sense of elitism exhibited by GE managers, as exemplified by the Elfun Society — an internal management club that served as a networking group and a "rite of passage" into management. Welch told members of the Elfun Society that the club was an institution pursuing an old agenda, one without any value to the newer, faster, forward-looking GE he was trying to build.

When challenged to change, the members of Elfun rose to the occasion. Today, the once-exclusive management club is an army of GE community volunteers, with membership determined solely by the willingness of its 42,000 members (from factory workers to senior executives) to give back.

The Vision Thing

(continued from page 2)

erated the kind of consistent earnings growth that was expected of Welch when he was named CEO. It was also the outgrowth of Welch's central vision of running GE — that he and GE leadership managed businesses, not earnings. Accounting doesn't generate cash; managing businesses does. ■

For the text of Welch's 1981 speech, go to: http://my.summary.com

The Neutron Years

In 1980, the U.S. economy was in a recession, with rampant inflation and soaring energy prices. In the midst of this downturn, GE looked as solid a company as there could be, with over $1.5 billion in net income and $25 billion in sales. Yet, Jack Welch could see trouble on the horizon. The Japanese, benefiting from a weak yen and good technology, were increasing their exports into many of the U.S.'s mainstream businesses, from cars to consumer electronics. Welch recognized that GE would have to be faster and more entrepreneurial in strategy and in action.

Welch's "Number One or Number Two" vision helped shave 118,000 people from GE's payroll in a five-year period, earning him the name "Neutron Jack" (the guy who removed the people but left the buildings standing) and the distinction of being named *Fortune* magazine's "Toughest Boss in America" in 1984. All the while Welch invested millions of dollars in supposedly "unproductive" pursuits, such as renovation of the company's headquarters and a major upgrade of its Crotonville management development center.

The Paradoxes of Business

Welch answered his critics by noting that business is, in fact, a series of paradoxes:

- **Spending millions on buildings that made nothing, while closing down uncompetitive factories that produced goods.** Both were consistent with being a world-class competitor. GE could not hire and retain the best people, while becoming the lowest-cost provider of goods and services, without doing both.
- **Paying the highest wages, while having the lowest wage costs.** GE had to get the best people in the world and, consequently, had to pay them that way; at the same time, the company could not carry along people it didn't need and still be effective.
- **Managing long-term, while "eating" short-term.** Some companies squeeze out costs at the expense of the future, while others dream about the future, but deliver nothing in the short term. Welch recognized that the true test of a leader was balancing the two.
- **Needing to be "hard" in order to be "soft."** Making tough-minded decisions about people and plants is a prerequisite to earning the right to discuss "soft" values, like excellence and the learning organization. These things only have meaning in a performance-based culture.

These paradoxes helped Welch change the face of GE, rendering the "Neutron" and "Tough Boss" titles marks of greatness, not the criticisms they were intended to be. ■

The People Factory

GE is all about finding and building great people, in direct accordance with Jack Welch's passion for making people GE's core competency. The secret to GE's success in this regard is the system it employs to select and develop great people. In a company with over 300,000 employees and 4,000 senior managers, GE needed a structure and a logic, so that every employee knew and understood the rules of the game. The heart of this process is the human resources cycle — full-day Session C human resources reviews at every major business location (held in April), two-hour videoconference Session C follow-ups (held in July), and Session C-II's, held in November, which confirm and finalize the actions committed to in April.

And that is only the formal structure. At GE, there is an informal, unspoken personnel review — in the lunch-

(continued on page 4)

"Everyone You Meet Is Another Interview"

From his earliest days at GE, Jack Welch was famous for the uncommon ways in which he interviewed and hired employees. Once, when he was head of GE Plastics in the 1960s, his car's engine blew on the New Jersey Turnpike. He got towed to a local garage, where he met Horst Oburst, a German mechanic. Over the course of the next two days, as Oburst scrambled to get parts, the pair struck up a relationship. Impressed with the German's gutsy determination, Welch offered him a job.

A week later, Oburst was on the payroll at GE Plastics, where he worked for 35 years, getting several promotions along the way. Such a story illustrates Jack Welch's assertion that finding great people happens in many different ways, and that, in his words, "Everyone you meet is another interview."

The People Factory

(continued from page 3)

room, the hallways and in every business meeting. That intense people focus — testing everyone in a variety of environments — defines managing at GE.

Differentiating People

All these people-centric endeavors, both formal and informal, are done in an effort to differentiate GE's best employees and managers from the rest of the pack. Differentiation isn't easy; over the years, the company used many kinds of bell curves and block charts to differentiate talent, in an effort to rank performance and potential (high, medium and low). Eventually, Welch found a ranking tool he liked — the "Vitality Curve."

Every year, the company asked each of its businesses to rank all of their top executives, in an effort to force these business leaders to differentiate their leadership. They had to identify the people in their organizations that they considered in the top 20 percent, the vital middle 70, and, finally, the bottom 10 — by name, position and compensation.

Those who did not perform to expectations generally had to go. While making these judgments is not easy, doing so is how great organizations are built, Welch felt. Year after year, differentiation raises the bar higher and higher, increasing the overall caliber of the organization in a dynamic process that makes everyone accountable for his or her performance. People (particularly those in the top echelon) must constantly demonstrate that they deserve to be there. ■

http://my.summary.com

A Boundaryless Idea From Wal-Mart

During a 1991 visit with Wal-Mart founder Sam Walton, Welch learned about a Wal-Mart idea that was the very epitome of boundaryless.

Every Monday, Wal-Mart's regional managers in Bentonville, Ark. would fly into their territories, spending the following four days visiting their stores, as well as those of their competition. They returned to Bentonville Thursday night for a Friday morning meeting with top company officers. If a regional manager found a store or region sold out of a hot-selling product, headquarters would shift inventory from other stores to fill the gap, using a sophisticated computer and inventory system that enabled them to respond immediately to the needs of the regional managers.

Welch loved this weekly pulsing of the customer at the most basic level, and was impressed at the technology that made it all happen.

Together, Welch and his business teams came up with Quick Market Intelligence (QMI), an adaptation of the Wal-Mart practice that brought GE leadership closer to its customers. Business unit leaders began holding weekly teleconferences with their field sales teams, as well as the business' top marketing, sales and manufacturing managers. The result was the increased ability to respond immediately to issues in virtually any category, from delivery to price to product quality, and beyond.

The idea strengthened Welch's resolve to maintain a boundaryless culture at GE.

Being Boundaryless

One of Jack Welch's passions as CEO of GE was to create a corporate culture devoid of the kinds of territorial walls that can sink even the best operations. This type of "boundaryless" culture (introduced at the company's 1990 annual meeting) would remove the barriers among all the various functions at the company — engineering, manufacturing, marketing and the rest. It would recognize no distinctions between "domestic" and "foreign" operations. It would knock down external walls, making suppliers and customers part of a single process. It would eliminate the less visible walls of race and gender. It would put the team ahead of the individual ego.

Rewarding Ideas

Boundaryless would also reward people who recognized and developed a good idea, not just those who came up with one, encouraging leaders to share credit for ideas with their team, rather than take full credit themselves. The concept also opened GE to the best ideas and practices from other companies, like Wal-Mart's process to gather and use market intelligence quickly (see box above). It would make each employee and leader at GE wake up with the goal of "Finding a Better Way Every Day" — a phrase that became a slogan at GE plants and offices the world over.

Manager Types

In 1992, Jack Welch discussed with GE's leaders how to differentiate GE's managers, based on their ability to deliver numbers, while maintaining GE's values, including being boundaryless. He described four types of managers:

- **Type 1:** The manager who delivers on commitments — financial or otherwise — and shares the values. His or her future is an easy call.
- **Type 2:** The manager who doesn't meet commit-

(continued on page 5)

Being Boundaryless

(continued from page 4)

ments and doesn't share the organization's values. Not as pleasant a call, but just as easy as Type 1.

- **Type 3:** The manager who misses commitments but shares all the organization's values. This type might be given a second or third chance, just in a different environment.
- **Type 4:** The manager who delivers on all commitments, makes numbers, but doesn't share the values. This type usually forces performance out of people, rather than inspiring it. GE could not afford the Type 4 manager.

Welch immediately illustrated his commitment to these values by asking four corporate officers to leave the company, because they did not share GE's values, particularly boundaryless behavior. Suddenly, "Finding a Better Way, Every Day" wasn't just a slogan — it was the essence of boundaryless behavior, and by defining the expectations of everyone at GE, established the "social architecture" of the company. Over the course of three years, employees used that architecture to hammer out a values statement for the entire organization, one that GE considered so important, it put them on laminated cards that all employees carry. ■

For the text of the boundaryless concept's 1990 announcement, go to: http://my.summary.com

GAME CHANGERS

GE's Globalization Drive

Jack Welch, by his own admission, did not put much focus on the global direction of GE in the first half of the 1980s, apart from eliminating the company's separate international sector and putting the CEOs of individual GE businesses in charge of their own global activities. In Welch's mind, there was no such thing as a global company—companies are not global; businesses are.

The Global Push

In the early 1990s, GE pushed its global growth by acquisitions and alliances, and by moving its best people into global assignments. Indeed, by moving two of its most talented executives to worldwide leadership positions in 1991, GE proved it meant business, that globalization was now a priority.

Welch also led GE into taking a largely contrarian view of globalization, focusing on areas of the world that were either in transition or out of favor — for example, Europe in the early 1990s, Mexico in the mid-1990s, and Japan in the late part of the decade. He felt — correctly — that the best risk-reward activities were in those areas.

Global Intellectual Talent

Over time, GE's globalization goals moved from simply sourcing products and components, to tapping the intellectual capital of countries.

For example, the scientific and technical talent in India — used by GE to develop software and perform design work and basic research — is incredible. The company opened a $30 million R&D center in India in 2000, moved GE Capital's customer service centers to that country, and, one by one, transitioned all GE industrial businesses from "back rooms" in the United States to "front rooms" in India.

"Hungary" for Success

In 1989, Jack Welch and Paolo Fresco (whom Welch dubs "the father of all our global activity") nailed down the purchase of a majority interest in Tungsram, one of Hungary's largest and oldest businesses. Even under Hungary's Communist government, the company had a great reputation and a lot of technological know-how.

Fresco would attend negotiating sessions each day, then call back to Welch from the Hilton Hotel in Budapest to report on the details. It didn't take long for Fresco to notice some strange behavior during the negotiations; his counterparts seemed to begin to react to things he had told Welch privately on the phone.

Fresco tipped Welch off that he believed the Hungarians were intercepting their conversations, so the two started using the calls to set up the next day's negotiations. In one case, Fresco told Welch that Tungsram was asking $300 million for a majority interest; Welch responded that Fresco should walk away from the negotiating table if they demanded more than $100 million. The next day, Fresco found his counterparts considerably more realistic about price.

They eventually closed the deal, paying $150 million for 51 percent of Tungsram, with the option of buying the remaining piece within five years. Fresco closed the deal at midnight over a bottle of vodka with his Communist negotiators. The next day, the Berlin Wall fell. Without knowing it, Welch and Fresco had closed the first big deal in the new Eastern Europe.

GE has also taken a greater interest in moving local nationals into leadership roles within its global endeavors, calling U.S. expatriates back home as excellent local leaders take the reins. ■

Six Sigma and Beyond

For years, Jack Welch had been no fan of the so-called "quality movement," feeling that early quality programs were too heavy on slogans and light on results. The subject of quality had, however, become a concern of many GE employees by 1995, a concern backed up by industry figures.

Most companies at that time carried a defect rate of 35,000 defects per million operations — a little over three percent of the sum total of a process or of units produced. Quality like this, translated across industries, meant 5,000 incorrect surgeries performed per week; 20,000 articles of mail lost per hour; hundreds of thousands of wrong drug prescriptions filled per year. In other words, what was typically regarded as an acceptable rate of defect actually yielded quite unacceptable results.

Mobilization

Jack Welch wanted GE to get to Six Sigma quality level — fewer than 3.4 defects per million operations in a manufacturing or service process, or 99.99966 percent of perfection. But Six Sigma is more than simple quality control and statistics. Ultimately, it drives leadership to be better by providing tools to think through tough issues. At Six Sigma's core is an idea that can turn a company inside out, focusing the organization outward on the customer.

Immediately, Welch mobilized GE's executives toward the goal of making Six Sigma an enormous success. He told them to make their best people Six Sigma leaders, which meant taking those people off existing jobs for up to two years, to train them to become "Black Belts" in Six Sigma strategies and practices. The company also trained thousands of "Green Belts," to enable them to solve problems in their everyday work environment, using Six Sigma concepts and tools (unlike Black Belt leaders, these employees were not pulled from their jobs).

As with every initiative, GE backed up Six Sigma with its rewards system, altering its compensation plan for the entire company so that 60 percent of one's bonus was based on financials and 40 percent on Six Sigma results. Stock option grants were focused on employees who were in Black Belt training, both to reward GE's best employees for their involvement in Six Sigma, but also to smoke out the weakest links in the company. As of 1998, no GE employee can be considered for a management job without at least passing Green Belt training.

The results of GE's Six Sigma push were almost immediate—$150 million in savings in the first year alone, and $1.5 billion by 1999. ■

For Jack Welch's speech on Six Sigma, go to:
http://my.summary.com

Everyday Six Sigma

In bringing Six Sigma quality to GE, Jack Welch recognized that the program was not only for engineers and technical minds. Indeed, it can be used in a variety of situations in which a company's best and brightest are engaged in this quality program, among them the following:

- ✓ Plant managers can use Six Sigma to reduce waste, improve product consistency, solve equipment problems or create capacity.
- ✓ Human resources managers can use it to reduce the cycle time for hiring employees.
- ✓ Regional sales managers can use it to improve forecast reliability, pricing strategies or pricing variation.

Virtually anyone — from plumbers to car mechanics to gardeners — can use Six Sigma to better understand their customers' needs and tailor their service offerings to provide customers with the things they want. Welch does admit, though, that he cannot think of a way Six Sigma could be used by lawyers. He thinks this is because they make a living off variance — the very thing Six Sigma is best at eliminating.

E-Business: GE Goes Digital

Although Jack Welch admits he was slow to recognize the power of and opportunity inherent to the Internet, when he got into it, he got into it full-force, and brought his company into the Digital Age with him.

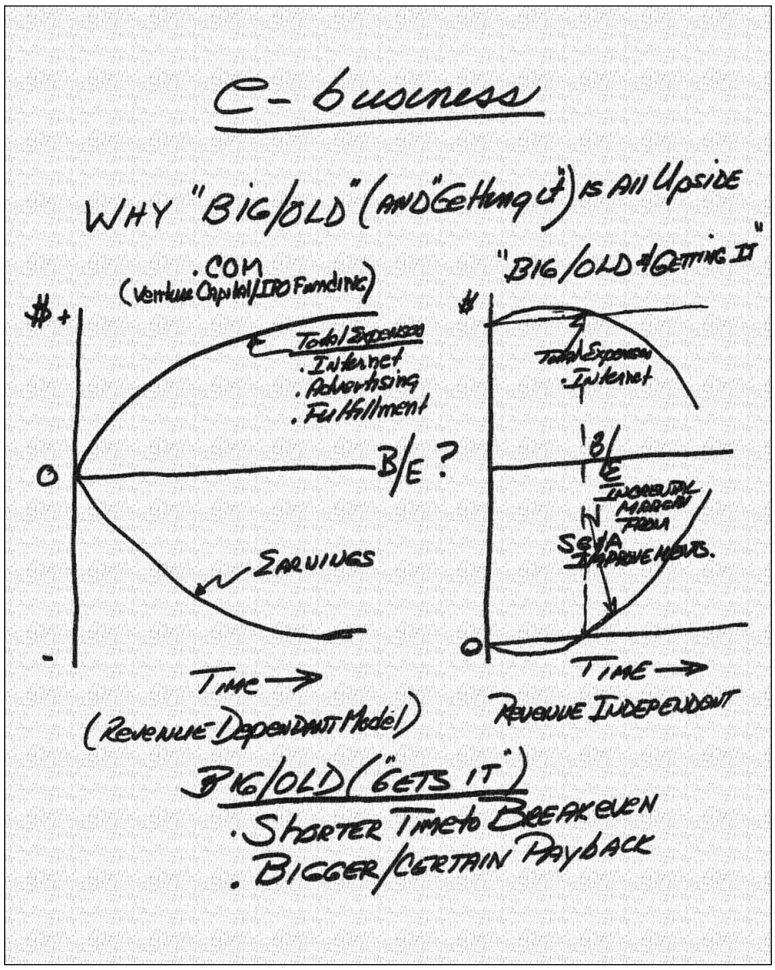
On a vacation in Mexico in 1999, Welch's wife, Jane, was absorbed by her laptop. One afternoon, she told Welch that people online were talking about the possibility of a GE stock split and his succession plan. She showed him the GE message boards on Yahoo!, and he was taken in by what people were saying about the company. Soon, he, too, was hooked, and knew immediately he was engaging with a technology that would have a big effect on GE — although, at the time, he was not entirely certain of how.

Big, Old . . . But Getting It

In the dot-com atmosphere of the late 1990s, many people were quick to write off big, old companies, in favor of anyone starting a new Internet business. Jack Welch recognized the fact that people were simply buying and selling goods over the Internet, just as they did a hundred years before from a wagon — the only difference was the technology. The buying and selling was faster and more global, and it had profound ramifications on business, but the actual creation of a virtual

(continued on page 7)

E-Business: GE Goes Digital



(continued from page 6)

storefront or auction site was not Nobel Prize work; it could be done inexpensively and easily.

Welch drew a chart that illustrated the Internet's implications for GE for the present and future. At the time, the business world was going crazy over anything that had a ".com" next to it. But in the dot-com model, expenses increase rapidly to cover the costs of Internet development, branding and fulfillment. Losses increase in direct proportion to those expenses; the breakeven point is uncertain and is almost always revenue-dependent.

In the "big-old-gets-it" category, the only extra expense is for Internet development. The big company already has strong brands and the systems to fulfill orders. Once the cost savings from Internet productivity kick in, there is a shorter time to reach the breakeven point and a bigger, more certain payback. In contrast to the dot-com model, benefits are generally independent of revenue.

Welch's drawing captured GE's advantages over the dot-coms. They didn't have to increase advertising; they didn't have to establish a new brand; they didn't have to create fulfillment organizations or build warehouses to ship goods. Welch recognized that GE could use the Internet and its tools to focus on the technology's main benefit — taking out the low-value-added work in the guts of the company. With Six Sigma in place, the company was becoming faster and more efficient than ever before; by fully using Internet technology, they could be faster and more efficient still.

Three-Way Opportunity

GE saw the Internet opportunity in three pieces: the buy, the make and the sell.

● The "buy"—what GE as a company purchased—was $50 billion of goods and services every year. Transferring some of this activity to online auctions gave GE access to more suppliers and lower costs. Although the savings figures the company had initially projected (10 to 20 percent) were inflated by half, there were still enormous savings to be gained on the buy side.

● The "make" improvements from digitization were the hidden jewel in the dot-com boom. Digitization eliminated much of the organization's massive backroom operations and tedious paperwork, improving job quality for many employees. In 2000, GE had $150 million of "make" benefits; in 2001, Welch projected $1 billion in benefits.

● GE's "sell"-side benefits were realized in the service improvements Internet technology enabled it to make. Fulfillment was faster; new and existing customers could get input on shipments without multiple phone calls; customers would never have to hear "The order is on the way" as a false promise again.

New Ways of Doing Business

GE's e-business initiatives led to many other new ways of doing business:

● Plastics put electronic sensors in some of its major customers' storage silos, enabling GE warehouses to be notified automatically when material levels drop, triggering a new order via the Internet to replenish the product.

● GE Capital uses the Internet to monitor the daily flow of cash in and out of a loan customer's income statement, reducing the potential for losses if the customer might be short.

● Most GE business leaders have digital cockpits on their computer screens that update, in real time, the data required to manage their businesses.

● Everyone at GE thinks digitally. Today, it's not uncommon for GE business leaders to ban paper from their offices in an effort to use digitization to drive productivity. It is a great mind-set shift for the entire company. ■

FINAL THOUGHTS

What This CEO Thing Is All About

There is no pat formula for being a CEO. Everyone does it differently, and there's no right or wrong way to go about it, no magic formula that is the right thing to do in all cases. Jack Welch has, however, found a number of things that have helped him lead GE over the years, among them the following:

● **Maintain your integrity.** Establish your integrity and never waver from it. People might not have agreed with Welch on every issue, but they always knew they were getting it straight and honest. He never had two agendas; there was only one way — the straight way.

● **Set the tone for your company.** The organization takes its cue from the person on top. Welch always told GE's business leaders their personal intensity determined their organization's intensity — how hard they worked and how many people they touched would be emulated a thousand times over.

● **Maximize your organization's intellect.** Getting every employee's mind into the game is a huge part of what being a CEO is all about; taking their best ideas and transferring them to others is the secret. Be open to the best of what everyone, everywhere, has to offer, then transfer that learning across the organization.

It isn't about first names, unassigned parking spaces, or casual clothing; it is about making sure everybody counts, and everybody knows they count.

● **Put people first, strategy second.** Getting the right people in the right jobs is a lot more important than developing a strategy — this truth applies to all kinds of businesses. Without the right leaders in place, the best, most forward-thinking strategies in the world will amount to little.

● **Stress informality.** Bureaucracy strangles; informality liberates. Creating an informal atmosphere is a competitive advantage. It isn't about first names, unassigned parking spaces, or casual clothing; it is about making sure everybody counts, and everybody knows they count. Passion, chemistry and idea flow from any level at any place are what matter. Everybody's welcome and expected to go at it.

● **Be self-confident.** Arrogance is a killer, and wearing ambition on one's sleeve can have the same effect; legitimate self-confidence, however, is a winner. The true test of self-confidence is the courage to be open — to welcome change and new ideas, regardless of their source. Self-confident people also are not afraid to have their views challenged; they relish the intellectual combat that enriches ideas.

● **Appraise all the time.** Whether you are handing out a stock option, giving a raise, or simply bumping into someone in the hallway, always let your people know where they stand.

● **Mind your culture.** If your company joins forces with another through merger or acquisition, establish the new entity's culture on day one, to minimize confusion and root out resistance to your goals.

● **Recognize the benefits of speed.** By acting decisively on people, plants and investments, Jack Welch was able to get out of the pile very early in his career at GE. Yet, upon his retirement 40 years later, one of his greatest regrets was that he hadn't acted fast enough on a number of occasions. He never regretted taking quick action.

● **Forget the Zeros.** The entrepreneurial benefits of being small — agility, speed and ease of communication — are often lost in a big company. Welch's experience in plastics enabled him to come to the job of CEO knowing that isolating small projects and keeping them out of the mainstream was a smart thing to do. By focusing on such projects as separate, smaller businesses, the people involved were more energized, adventurous and backed by the right resources. ■

Five Strategy-Focused Questions

A colleague gave Jack Welch an article about the Prussian general Helmut von Moltke, whose beliefs brought to Welch a series of questions that were much more useful to him over the years than all the data crunching in strategic plans. Five simple questions brought strategic thinking to life:

✓ What is the detailed global position of your business and that of your competitors — including market shares, strength by product line, and by region today?

✓ What actions have your competitors taken in the past two years that have changed the competitive landscape?

✓ What have you done in the last two years to alter that landscape?

✓ What are you most afraid your competitors might do in the next two years to change that landscape?

✓ What are you going to do in the next two years to leapfrog any of their moves?

Judgment on the Front Line

How Smart Companies Win By Trusting Their People

by Chris DeRose and Noel M. Tichy

THE SUMMARY IN BRIEF

Why are frontline leaders the key to success in organizations like Google, Amazon, Zappos and the Navy SEALs? It's simple: those employees are your most valuable source of customer knowledge and creativity.

Management experts Chris DeRose and Noel Tichy have spent years partnering with CEOs as they tried to transform their organizations, which often entails working with leaders from top to bottom to help thousands of associates align with the organization's vision.

Unfortunately, as DeRose and Tichy explain, most organizations don't tap in to the knowledge, creativity and experience of the vast majority of their staffs. Despite the many leaders who claim that "people are our organization's most important asset," few have developed methods for systematically learning from those on the front line. Even fewer know how to give frontline associates a useful tool kit for problem solving and innovation.

Judgment on the Front Line shows how to build a front line-focused organization. DeRose and Tichy offer a five-step process that helps leaders identify how to generate dynamic customer innovation at the front line, and they give powerful examples of frontline leadership in action.

IN THIS SUMMARY, YOU WILL LEARN:

- Why frontline employees are so important to organizations and why it is crucial to involve them in decision making.
- A five-step process for building a frontline-focused organization.
- Methods of frontline employee development from the corporate, military and medical sectors.

THE COMPLETE SUMMARY: **JUDGMENT ON THE FRONT LINE**

by Chris DeRose and Noel M. Tichy

The authors: Chris DeRose has consulted and taught around the world, including executive education at the Ross School of Business at the University of Michigan. Noel M. Tichy is the author of *Judgment, Control Your Destiny or Someone Else Will* and other business best-sellers. He is a professor at the Ross School.

Preface

In the United States, at least one-fifth of the entire workforce might be classified as frontline employees. In fact, retail and service workers alone total more than fifteen million people. These associates are experienced in the ways of customers, square off against the competition each day and have insights into where the machinery of their organization consistently breaks down. Yet most organizations do little to learn from these wise workers or expand their ability to deal with the complexities they face. We don't see many company leaders who tap into more than a tiny fraction of the knowledge, creativity, and judgment of their largest group of employees.

The Frontline Innovation Factory

It was Greg Linden's fondness for candy that led to his first major innovation at Amazon, as he recalled that in supermarkets, customers often find candy, potato chips and other "impulse buys" on the racks directly adjacent to the checkout lines. Why not personalize recommendations for similar impulse buys based on the items in a customer's virtual shopping cart as it approaches checkout?

When he started running it by colleagues for review, he garnered mostly positive reactions, with the important exception of a senior vice president of marketing, who "was dead set against it." As Linden later recalled, "his main objection was that it might distract people from checking out." Linden was expressly prohibited by a direct superior from proceeding with the project. However, Linden notes that at Amazon, "even for top executives, it was hard to block a test. Measurement was good. The test rolled out."

The results of the test were clear and irrefutable. Not only did the online test succeed, but the feature was so profitable that not having it live was costing Amazon a noticeable chunk of change. Linden's virtual shopping cart experiment could have only succeeded and been widely implemented under the aegis of a CEO who created a culture where experimentation and adoption was the norm as opposed to the exception.

The Turtle Tank

During the course of our clinical work many years ago, a manager of a retail branch in San Diego known for innovation and employee engagement shared an instructive lesson. He told us that if you buy a young turtle and put it in a small aquarium, it will only grow to a size that fits the tank. We looked into this. Not only is it true, but it is also a practice that infuriates animal rights advocates. Unfortunately for the turtles, the practice stops their growth, leading to health issues and an uncomfortable living environment.

So what do turtles have to do with frontline workers? As this manager shared with us, most organizations where he had worked earlier in his career had boxed in their employees with rules, bureaucracy and hierarchy that stunted their personal growth and organizational contribution. Those at the top of the organization not only failed to ask for ideas but were often dismissive when frontline employees generated suggestions. When middle managers and senior leaders claim that frontline leaders lack the necessary strategic context or see criticism of their organizational processes as resistance, this behavior has the same effect as the turtle tank.

People: The Most Ignored Asset

The mantra "people are our most important asset" is commonplace today in business circles. You can find it in so many annual reports and press releases that it has lost all of its original meaning. Yet few companies have absorbed the primary lesson: You can learn from the workers who are closest to problems and interact with customers on the front line every day. While many organizations frequently invoke the mantra of "customer-centricity," most don't pay enough attention to those who are closest to the consumer.

The Organizational Paradox: Control Versus Creativity

It is the paradox of all organizations that they require control yet succeed most spectacularly when they unleash the imagination and energy of their employees. The even more painful paradox is that companies that feel compelled to impose obsolete command-and-control protocols in an attempt to tightly govern the actions of frontline employees are actually running an even greater risk: Frontline workers will fail to provide these organizations with the information, wisdom and judgment required to solve problems and meet their customers' ever-changing expectations.

Changes in consumer behavior, a generational swing in employee attitudes and the growth of social media have all contributed to an erosion of command-and-control organizations. In their place, organizations that emphasize decentralization and collaboration are rising in order to more nimbly respond to consumer needs. Those who embrace these changes and learn from their front lines are able to create a virtual factory of new ideas and innovation. ●

Building the Front Line–Focused Organization

In a front line–focused organization, senior leaders have five primary responsibilities:

• **Define a Customer-Based Vision.** Set the vision and define a customer-based strategy for the organization. These judgments are not just passed down from the mountaintop but must reflect observations, feedback and learning from the field. Senior leaders must mobilize organizational expertise to craft a customer-value proposition that matches the product and service capabilities to what the organization can deliver.

• **Develop a Front Line–Focused Culture.** Leaders must deeply care about the opportunities their organization affords frontline employees, and they must sincerely respect the importance of their insight. They are hierarchically positioned to embed values and model leadership behaviors that ensure their organizations actively consider the needs of those on the front line and learn from their experience.

• **Obsess over Talent.** These leaders know that they will win only by having the best talent and the right kind of leadership at the customer interface. They are hard-nosed about the recruitment and hiring processes, never content to leave these solely to HR's discretion. They ensure that training and support systems are in place to teach newcomers how to be successful with customers.

• **Define the Judgment Playing Field.** These leaders define the boundaries for employee decision making, clarifying when frontline leaders can act autonomously and which issues are outside of their authority. Senior leaders ensure that employees are equipped with the right resources to make good judgments.

• **Live on the Line.** Leaders need to go where the action is. They must interact with workers at the customer interface to understand whether the front line feels capable of executing the strategy. Are individual employees committed? Are we incorporating all of our knowledge about customers? Are we providing our employees the right tools, resources, and work environment?

There is a five-step process for leaders to build or, more likely, rebuild their companies from the front line so that the ingenuity, innovation and emotion of thousands of employees can be harnessed. The steps are:

The HiPPO Corollary

The fact that many organizations commonly suffer from turtle-tank syndrome can be readily explained by the HiPPO corollary. HiPPO is a term originally coined at, appropriately enough, Amazon, that stands for "highest-paid person's opinion." In most organizations, people reflexively bow to the HiPPO or forsake their own opinion because they do not have the ability to override the HiPPO. This is a direct outcome of the hierarchical organizational construct that assumes intelligence and capability are related to a person's job title. Fortunately for Greg Linden, as we saw in the previous story, Amazon is a company that values data and customer insight over intuition. As a result, his shopping-cart experiment prevailed despite the marketing vice president's (i.e., HiPPO's) opinion that it was not worth pursuing.

• **Step 1. Connect the Front Line to the Customer.** The CEO and senior team have three fundamental responsibilities in step 1: Understand changing customer needs based on feedback from customers and employees. Ensure that the organization's capabilities match the customer promise. And connect the front line to delivery and improvement of the customer value proposition.

• **Step 2. Teach People to Think for Themselves.** Employees must be taught how to make the right customer-friendly judgments while protecting the business's long-term health. Step 2 requires continuous teaching and discussion of how judgment is applied in actual situations. Teach everyone deeply about customer needs and basic business math. Couple organizational values with a problem-solving framework that can be used by frontline employees and coached by their leaders.

• **Step 3. Experiment to Implement.** Employees can be encouraged to innovate entirely new solutions. Define the innovation areas (products, services or business processes) where frontline innovation is desired. Explain how employees work with others in the organization to generate, review and select innovation ideas for implementation. Provide a methodology for experimentation and measurement.

• **Step 4. Break Down the Hierarchy.** Invigorate the change process by resetting the organizational context. Senior leaders must actively diminish the detrimental aspects of hierarchy — disrespect, intimidation and oppressing opinions — through the careful use of language, symbolism and open discussion of role expectations.

• **Step 5. Invest in Frontline Capability.** Select candidates rigorously and in alignment with the values and customer expectations. Develop frontline judgment capability through an immediate and sustained investment. Teach leaders of frontline associates how to be effective in their critical roles. ●

Starting at the Top

David Novak is chairman and CEO of Yum! Brands, parent company of KFC, Taco Bell and Pizza Hut. Yum!'s 1997 spin-off from PepsiCo created one of the biggest opportunities ever for a "corporate do-over," as Novak likes to refer to the raft of changes he instituted over the years since he took the helm. Saddled with nearly $5 billion of debt and annual returns that had lagged both the market and the industry, the newly formed company's restaurants operated as three independent competitors more than as corporate allies.

When Novak and his leadership team set out to remake the company, their first goal was to consistently treat those who serve the customer — the restaurant managers and their teams — as the most important people in the organization.

His ultimate goal was to have employees intuitively and reflexively take care of the customer and resolve any possible complaints — "to actively try to make them feel welcome and happy eating in one of our restaurants." Novak began to formulate a Teachable Point of View: "People capability first … Satisfied customers and profitability follow." The laser focus and intensity would be directed at creating "Customer Mania" with the singular employee passion of putting "a yum on customers' faces around the world."

The Frontline Judgment Playing Field at Yum!

Yum! didn't afford its restaurant teams the freedom to play with store design, product offerings or operating processes. The primary focus of frontline employees' judgment has been ensuring a fantastic customer experience. Yum! also changed the titles of all senior managers to "coaches" instead of referring to them as "bosses." Yum! fundamentally restructured reporting relationships and spans of control to ensure that area coaches and regional coaches actually had time to work with people in the restaurant.

"The greatest driver of the results we've achieved is the recognition culture we have created. This is creating a highly spirited work environment that is serving as a magnet to retain and recruit the very best talent. The fact is too many corporations are cold, impersonal, detached from the front line and, frankly, boring."

Yum! gave every employee the power to spend up to $10 to resolve any conflict or service issue. In truth, employees exercise intelligent discretion and rarely use the $10 allowance. Today, not only are Yum! restaurants run so efficiently that there are fewer disgruntled customers, but the considerable investment in employee training has resulted in frontline workers who are able to listen and resolve problems amicably without frequently resorting to compensation. ●

Teaching People to Think

Whereas a restaurant crew member at Yum! has to contend with relatively predictable customer needs, frontline personnel in other industries must deal with more variables and higher degrees of unpredictability. The example of the U.S. Navy SEALs demonstrates

how organizations teach their frontline workers to think about multifaceted problems.

For, the SEALs, the solution lies in:

1. Anticipation of the types of problems frontline employees are likely to face.
2. Repetitive training to develop judgment.
3. Lower risk opportunities for people to practice again and again.
4. Contingency planning in case things don't go as expected.

Seventy percent of recruits come to SEAL training directly out of high school. SEALs are trained to operate in the field semiautonomously, with limited direct communications and maximum latitude to make life-and-death, real-time judgment calls at the front line. Decisions made by SEALs have significant geopolitical ramifications.

How SEALs Develop Judgment

The rough training program culminates in an exhausting ordeal known as Hell Week, during which candidates must function on a maximum of five hours of sleep — in a week, not a day. This trial by fire prepares recruits to make tough judgments on the front line by instilling a sense of confidence, courage and commitment in each candidate.

SEALs are taught to consider situational ethical issues, such as what to do when taking hostile fire from what appears to be a 14-year-old girl armed with an assault rifle. The SEALs also mentally prepare for judgment calls they may face tactically in the heat of battle. In many situations a SEAL faces, there is no right answer. This training regime emphasizes the ability to think under pressure, weigh options, evaluate consequences and take action.

It may sound strange, or even condescending, to imply that adults need help learning how to think. After all, cognition is part of what defines us as human beings. However, individual thinking styles emerge as a function of experience, education, environment and many other factors. Organizations that offer shared frameworks, methodology and models for problem solving take an important step toward promoting nonhierarchical dialogue that focuses on using the best available information — much of it from the front line. It is critical that training affords the opportunities to practice making such decisions under stress and teaches frontline employees how to develop contingency plans. ●

Experiment to Innovate on the Front Line

A hackathon is a 24- to 48-hour Red Bull-infused programming fest featuring around-the-clock highly technical work aimed at taking nascent ideas and turning them into prototypes of new products in real time. It has become an integral part of Facebook's culture. Such Facebook features as the iPhoto plug-in, Facebook Chat and video messaging all started as hackathon projects.

At Facebook, hackathons are emblematic of the company's deeply experimental culture because they:

1. Focus on Impact. The ultimate goal of a hackathon is to produce something that actually works. This is an opportunity for programmers and developers to scratch that creative itch that they don't have time to address during the normal work week.

2. Move Fast. Twenty-four hours seems like an impossibily tight time frame to accomplish much of anything useful. However, the time pressure of a hackathon develops focus and teaches people to avoid overthinking solutions.

3. Require Boldness. Hackathons invite employees to take risks and be creative. They require healthy doses of self-confidence and guts to commit to turning a great idea into a working application overnight.

Hackathons become the means by which the new developer or long-time programmer can share a vision for a new product with the management team. Stories of new frontline developers creating features now accessed daily by millions upon millions of users are deeply embedded in a corporate culture that reinforces at every turn the notion that everyone can have a lasting impact on the firm's future.

Providing Structure for Innovation

Building a frontline innovation strategy requires answering three fundamental questions:

1. Innovation Area. Should the front line focus on improving products, business processes or both? Frontline employees tend to be the most knowledgeable about what works in practice and what doesn't. They can identify ways to effectively reduce costs, speed processes or develop alternative work methods.

2. Activity Locus. Where will innovation activities actually occur? Will the front line put ideas into practice or simply pass their ideas on to others who will perform implementation? The real challenge is putting ideas into practice. Some companies prefer heavily decentralized models, where individuals work virtually autonomously.

Other organizations prefer tighter constraints and more directive focus for innovation activities.

3. Experimentation Methodology. What is the methodology for screening and testing good ideas? Individual leaders or review committees can be quickly overwhelmed by the volume of ideas generated in companies with large numbers of employees. By contrast, local employees can act quickly and nimbly to implement changes. An explicit framework for innovation and experimentation that everyone knows and that is shared throughout the organization can transform a culture. It enables dialogue and helps employees form seemingly crazy ideas or partial thoughts into serious work.

Used correctly, experimentation, particularly in industries where the cost of experiments is low, provides a radically different engagement model for frontline workers. Rather than see their ideas rejected out of hand or arbitrarily taken away from them by higher-ups for implementation, employees can have a direct hand in crafting real-life solutions.

Breaking Down the Hierarchy

How can organizations systematically break down the entrenched hierarchy that obstructs frontline associates from utilizing their judgment? There are no singular solutions, but there are many techniques that organizational leaders can employ, such as shifting organizational language and policies, eliminating unproductive work, soliciting frontline ideas more methodically and promoting collaboration among workers at all hierarchical levels.

The Mayo Clinic provides an interesting case example because societal and organizational assumptions about the roles of doctors and nurses are deeply ingrained. Encouraging nurses to speak up is more than simply a matter of imploring them to do their best for the patient. If the nurse disagrees with a physician or poses an alternative solution to a doctor's prescription, the nurse is perceived as challenging the doctor's knowledge and authority.

The new standard process dubbed Plus One is an "empowerment process, and empowerment tool, and empowerment philosophy endorsed by our leadership up to the highest level in Mayo Clinic," says Dr. Richard Zimmerman, then the hospital medical director for the Mayo Clinic in Arizona. Plus One is a protocol that enables nurses to add one person to the patient-doctor-nurse relationship at any time. A nurse or any other clinical staff member may elevate an issue up one level in the chain of command as he or she deems necessary.

There is no question that the program has been a success. The risk-adjusted mortality rate at the Arizona hospital has declined significantly faster than the U.S. average. In part, this is because every Plus One event is reviewed after the fact and treated as a learning opportunity. The knowledge that Plus One is a legitimate option has bolstered the confidence of the nursing team, Mayo's first line of patient protection.

Changing the Organizational Context

There are a few specific actions that nearly all firms are capable of taking:

• **Eliminating Unnecessary Work.** Organizations tend to create unnecessary bureaucracy as a by-product of their operations. In some organizations, employees become trained to not question policy, avoid making recommendations and keep their heads down. Involving frontline personnel has not only shed light on inefficient business practices but simultaneously given those on the front line a sense of increased control over their work environment.

• **Making Time for the Front Line to Think.** Another way to free up frontline capacity is to thoughtfully employ technology to simplify employees' work or seek their input. Many companies use technology strategically to free their front line from manual work or menial aspects of their jobs. Pepsi, for example, used route optimization technology to free up delivery drivers' capacity so they could spend more time creating customer-friendly displays.

• **Getting Intelligence Directly From the Frontline.** There is the logistical challenge of getting input from dispersed locations and hundreds or thousands of frontline employees and then making sense of it in a rational way. Every day, Spanish fast-fashion retailer Zara's staff chat up customers to get feedback on current styles and to understand what is selling. All of the information is loaded into PDAs linked to the stores' point-of-sale system. In less than an hour, every manager globally can send updates that include not only quantitative cash register data but also qualitative customer insights and their own impressions.

• **Promoting Collaboration at All Levels.** In recent years, increasing numbers of organizations are using crowdsourcing and idea markets as a way to tap the knowledge of their employees. These efforts help demonstrate that a company is seeking the best ideas, regardless of where in the hierarchy they may originate.

Ultimately, the goal is not to elevate the frontline workers at the expense of others in the hierarchy but rather to promote respect for them that diminishes the importance of titles, invites insight from employees at all

levels and encourages the use of data and the best intelligence when making decisions. ●

Investing in Frontline Capability

Extensive research has shown that the most likely reason an employee will leave the company or, perhaps worse still, remain but be disgruntled, is their relationship with their immediate supervisor. It takes two to tango, so managing this dynamic is as much about the employees an organization hires as about simply building better bosses.

As online retailer Zappos demonstrates day after day and sale after sale, intelligent hiring is an important and controllable variable. Zappos begins by screening for good incoming talent that shares its value system and affable approach to building personal connections with customers. The company also invests heavily in training those employees. In doing so, much like the US Navy SEALs' process, Zappos is able to ensure a good cultural fit and provide training related to judgment skills, business basics and technical capabilities.

The Human Factor

We use the "four Cs" model to summarize the principal dimensions that have been shown to impact an employee's sense of empowerment. Zappos addresses each element as it brings new employees on board:

- **Context.** Employees desire to connect their work to larger goals. Zappos's mission "to live and deliver WOW" customer experiences immediately connects employees to improving customers' lives. The recruiting process reinforces this by screening intensively against the company values, testing whether behaviors associated with these values play a meaningful role in the candidate's prior experience. The $2,000 offer to quit during the second week of training further reinforces this by ensuring that the candidate is motivated by Zappos's mission and culture, not just the paycheck.
- **Control.** The ability to make autonomous decisions and take action is fundamental to Zappos's mind-set and how the company prioritizes building long-term customer relationships. The parameters for making good judgments are taught throughout training using case studies, observation and real-time coaching.
- **Care.** In the time and energy invested in both recruiting and training, employees see immediate evidence that Zappos is concerned about their well-being. Many weeks of training help the candidate to learn his or her job, unlike the "sink or swim" approach favored in many frontline positions elsewhere.
- **Creativity.** Self-expression is fundamental to Zappos's culture. There is a deep respect for each individual's uniqueness. The recruiting process enables candidates to express their personality and encourages tearing down the façade that most people erect when interviewing.

Sending poorly equipped new hires to be trained by poorly prepared frontline supervisors leads to a staffing turnover cycle familiar to many companies. Many organizations fail to invest in their frontline supervisors. Those who accomplish this task well build organizational commitment, team performance, customer satisfaction and better financial results. ●

A Never-Ending Process

The turmoil that retailer Best Buy faces at the time of this writing was neither sudden nor entirely unforeseen. Since early 2011, analysts and journalists have been in search of the forces behind the company's financial descent. The consensus that emerged is that its business model is severely broken.

The five-step process we have discussed throughout must be a never-ending process in which leaders maintain mechanisms for open dialogue with leaders at all levels. Sustaining the benefits of a frontline investment requires keeping communication lines flowing with information back to top management. Otherwise, the company reverts to its initial steady state.

During our work with the company from 2002 to 2005, Best Buy was able to engage its front line for growth and innovation to deliver stellar results. In 2002, Brad Anderson took over as CEO. Although it seemed that the company could do no wrong, Anderson saw storm clouds on the horizon.

The first step was to work with the top team to agree on the vision and values. Anderson also agreed to launch an "action learning" process that included evaluating strategic options such as acquisitions or geographic expansion. In this six-month process involving 36 company officers, one team focused on capturing more share of the wallet from the high-end consumer segment.

Anderson started one meeting by screening a six-minute video. The mini movie, which had been shot on sidewalks outside Best Buy stores, featured real customers as they exited. One man caustically described the sales force he had encountered inside. Anderson used this brief exercise to create a burning platform for change. He knew that in doing so he would anger some of his top people. And he knew that this would be necessary to focus the company in a new direction.

The new "customer-centric" approach acknowledged that Best Buy's customer offer had dimmed in contrast to Walmart's potential for offering deep discounts or the brand loyalty demonstrated by Target's customers. The big opportunity would be to provide a level of localized service and customer experience that would make technology enjoyable again for customers. The way forward for Best Buy would be to create an in-store experience that would more closely connect the company's thousands of store employees with its millions of customers.

Confronting New Challenges

With things going so well and the stock hitting its high in 2007, how did Best Buy run into trouble five years later? It missed how technology was changing the consumer landscape. Customers are free to take advantage of Best Buy's service associates, play with products, ask for help and then order from whoever has the best price — often before they even leave Best Buy's parking lot. Best Buy is equally challenged by the investment required to operate the stores.

Nearly a decade after Brad Anderson assumed the CEO post, the company faces a strikingly similar challenge to reinvent itself as it did in Anderson's time. Best Buy's experience demonstrates the difficulty of not only transforming to become a front line–focused organization but also of remaining one. One transformation is rarely enough — continual transformation is a multi-year, even multi-decade effort to unleash the creativity and engagement of thousands of frontline associates. ●

Corporate Citizenship on the Front Line

Whether delivering food with an automobile factory employee or painting a halfway house with an oil industry engineer, each time we work with frontline associates in the community, we are amazed at how profoundly such work impacts them and at the unanticipated benefits it brings in their relationships with their coworkers and employers. We see great opportunity and tremendous benefits when frontline employees are able to represent organizations and community service.

Corporate-citizenship efforts offer an opportunity for frontline employees to partner directly with community members, who are often their customers. Working with someone on a volunteer project can create a more personal relationship than waiting on a restaurant customer, serving someone in a bank or selling them a mobile phone. It offers the chance for employees to understand the thoughts, concerns and lifestyles of some of their customers in an informal context, while also enabling customers to see frontline employees in an entirely different role.

Indeed, involvement in the community elevates the role of frontline workers and gives added dimension to corporate mission statements that encourage employees to help improve customers' lives. Citizenship activities also benefit individual employees by providing an opportunity to develop new leadership skills. In some cases, this may enhance their communication abilities as they interact with community members in nontraditional circumstances. In others, they may be lending a skill to leaders and community agencies, showing them how to read a profit-and-loss statement or better manage their staff. Finally, engaging frontline employees offers organizations the ability to exponentially increase both the scale and depth of their citizenship efforts. ●

Conclusion

While we have profiled and extolled the talents of a number of CEOs who have grasped these lessons and put them to good use in their own organizations, our hearts lie with those at the bottom of the organizational pyramid: retail clerks, call-center operators, bank tellers and millions of others who possess both the ability and the desire to give more, to improve their daily work experience and to make life better for the customers they serve. Countless great ideas are lying dormant and untapped in the ranks of most organizations because "nobody ever asked."

More than simply asking for frontline suggestions, it is time for leaders to create organizational structures and systems that implicitly trust those at the front line — who often earn the least yet do some of the most difficult and frustrating jobs — to exercise good judgment, get closer to customers and day in and day out, deliver great results for their organizations. ●

Leadership and the New Science

Discovering Order in a Chaotic World (Third Edition)

by Margaret J. Wheatley

THE SUMMARY IN BRIEF

We live in a time of chaos, rich in potential for new possibilities. A new world is being born. We need new ideas, new ways of seeing and new relationships to help us now. New science — the new discoveries in biology, chaos theory and quantum physics that are changing our understanding of how the world works — offers this guidance. It describes a world where chaos is natural, where order exists "for free." It displays the intricate webs of cooperation that connect us. It assures us that life seeks order but uses messes to get there.

In *Leadership and the New Science*, management professor Margaret Wheatley describes how the new science radically alters our understanding of the world, and how it can teach us to live and work well together in these chaotic times. *Leadership and the New Science* will teach you how to move with greater certainty into the new forms of organizations and communities that are taking shape.

Wheatley uses recent breakthroughs in biology, chemistry and especially quantum physics to describe a new perspective on business management. Her new insights into the nature of how people interact with each other show us how to build better organizations and better societies around the world.

IN THIS SUMMARY, YOU WILL LEARN:

- How non-linear networks and self-organizing systems flourish in the modern world.
- How relationships are what matters — even at the subatomic level.
- How life is a vast web of interconnections where cooperation and participation are required.
- How chaos and change lead to transformation.

THE COMPLETE SUMMARY: **LEADERSHIP AND THE NEW SCIENCE**

by Margaret J. Wheatley

The author: Margaret J. Wheatley, Ed.D., writes, teaches and speaks about how to restore hope and sanity to organizations. She has been a management professor and consultant since 1973.

Introduction: Searching for a Simpler Way to Lead Organizations

In chemistry, Ilya Prigogine won the Nobel Prize in 1977 for work that demonstrates how certain chemical systems reorganize themselves into greater order when confronted with changes in their environment. In the older, mechanistic models of systems, change and disturbances signaled trouble. These disruptions would only speed up the inevitable decline that was the fate of all systems. But Prigogine's work offered a new and more promising future. He demonstrated that any open system has the capacity to respond to change and disorder by reorganizing itself at a higher level of organization. Disorder becomes a critical player, an ally that can provoke a system to self-organize into new forms of being. As we leave behind the machine model of life and look more deeply into the dynamics of living systems, we begin to glimpse an entirely new way of understanding fluctuations, disorder and change.

The world described by new science is changing our beliefs and perceptions in many areas, not just those of science. New science ideas have crept into almost every discipline, including the field of organizational theory. We can see the influence of science if we look at those problems that plague us most in organizations and how we are reformulating them.

Leadership, an amorphous phenomenon that has intrigued us since people began organizing, is being examined now for its relational aspects. Few if any theorists ignore the complexity of relationships that contribute to a leader's effectiveness. Instead, there are more and more studies on partnership, followership, empowerment, teams, networks and the role of context.

Seamless Organizations

Our concept of organizations is moving away from the mechanistic creations that flourished in the age of bureaucracy. We now speak in earnest of more fluid, organic structures, of boundaryless and seamless organizations. We are beginning to recognize organizations as whole systems, construing them as "learning organizations" or as "organic" and noticing that people exhibit self-organizing capacity. These are our first journeys that signal a growing appreciation for the changes required in today's organizations.

We can forego the despair created by such common organizational events as change, chaos, information overload and entrenched behaviors if we recognize that organizations are living systems, possessing the same capacity to adapt and grow that is common to all life.

Discovering an Orderly World

For months, I have been studying process structures — things that sustain their identity over time yet are not locked rigidly into any one physical form. This stream that swirls around my feet is the most beautiful one I've encountered. Because it is vacation, I resist thinking too deeply about this stream, but as I relax into its flow, images stir and gently whorl the surface.

What is it that streams can teach me about organizations? This stream has an impressive ability to adapt, to change configurations, to let the power shift, to create new structures. But behind this adaptability, making it all happen, I think, is the water's need to flow. Water answers to gravity, to downhill, to the call of the ocean. The forms change, but the mission remains clear. Structures emerge, but only as temporary solutions that facilitate, rather than interfere. There is none of the rigid

reliance that I have learned in organizations on single forms, on true answers, on past practices. Streams have more than one response to rocks; otherwise, there'd be no Grand Canyon or Grand Canyons everywhere. The Colorado River realized there were many ways to find the ocean other than by staying broad and expansive.

Organizations lack this kind of faith, faith that they can accomplish their purposes in varied ways and that they do best when they focus on intent and vision, letting forms emerge and disappear. We seem hypnotized by structures, and we build them strong and complex because they must, we believe, hold back the dark forces that threaten to destroy us.

It's a hostile world out there, and organizations, or we who create them, survive only because we build crafty and smart — smart enough to defend ourselves from the natural forces of destruction. Streams have a different relationship with natural forces. With sparkling confidence, they know that their intense yearning for ocean will be fulfilled, that nature creates not only the call, but also the answer.

Nature offers abundant displays of order and clear lessons for how to achieve it. Despite the experience of fluctuations and changes that disrupt our plans, the world is inherently orderly. It continues to create systems of great scope, capacity and diversity. And fluctuation and change are essential to the process by which order is created. ●

Newtonian Organizations in a Quantum Age

The universe that Sir Isaac Newton described was a seductive place. As the great clock ticked, we grew smart and designed the age of machines. As the pendulum swung with perfect periodicity, it prodded us on to new discoveries. As the Earth circled the sun (just like clockwork), we grew assured of the role of determinism and prediction. We absorbed expectations of regularity into our very beings. And we organized work and knowledge based on our beliefs about this predictable universe.

It is interesting to note just how Newtonian most organizations are. The machine imagery of the cosmos was translated into organizations as an emphasis on material structure and multiple parts. Responsibilities have been organized into functions. People have been organized into roles. Page after page of organizational charts depict the workings of the machine: the number of pieces, what fits where, who the most important pieces are.

The 1990s revealed these deeply embedded beliefs about organizations as machines when "reengineering" became the dominant solution for organizational ills. Its costly failures were later acknowledged to have stemmed in large part from processes and beliefs that paid no attention to the human (or living) dimensions of organizational life.

Quantum Mechanics

In science, the beginning of the 20th century heralded the end of the hegemony of Newtonian thinking. Discoveries of a strange world at the subatomic level could not be explained by Newton's laws, and the path was open for new ways of comprehending the universe.

Quantum mechanics does not describe a clock-like universe. It tells a different story:

> *Most of the other giant steps in our understanding of nature were really evolutionary in that they sprang from previously established foundations: facts were reorganized, or connected in new ways, or seen in a different context. Quantum theory, however, broke away completely from those foundations; it dove right off the end. It could not (cannot) adequately be described in metaphors borrowed from our previous view of reality because many of those metaphors no longer apply.*
>
> *But the net result has not been to obscure reality or make the nature of things more elusive and murky. On the contrary, most physicists would agree that what quantum theory has brought to science is exactly the opposite — concreteness and clarity. (Cole, 1985)*

In the quantum world, relationships are not just interesting; to many physicists, they are all there is to reality. ●

Relationships Are Primary

We live in a universe where relationships are primary. Nothing happens in the quantum world without something encountering something else. Nothing exists independent of its relationships. We are constantly creating the world — evoking it from many potentials — as we participate in all its many interactions. This is a world of process, the process of connecting, where "things" come into temporary existence because of relationships.

Space Is Not Empty: Invisible Fields That Shape Behavior

With a quantum sensibility, there are new possibilities for how to create order. Organizational behavior is influenced by the invisible. If we attend to the fields we create, if we help them shine clear with coherence, then we can clean up some of the waste of organizational life.

In many ways, we already know what powerful organizers fields can be. We have moved deeper into understanding these invisible allies with the recent focus on organizational culture, values and purpose. We see that these are important, even when we don't quite know why.

If we understand ideas as real forces in the organization, as fields, we have a better image for understanding why concepts control as well as they do. But the shift in imagery changes the nature of our attention.

The Importance of Clarity

In a field view of organizations, we attend first to clarity. We must say what we mean and seek for a much deeper level of integrity in our words and acts than ever before. And then we must make certain that everyone has access to this field, that the information is available everywhere. Vision statements move off the walls and into the corridors, seeking out every employee, every recess in the organization.

In the past, we may have thought of ourselves as skilled designers of organizations, assembling the pieces, drawing the boxes, exerting energy to painstakingly create all the necessary links, motivation and structures. Now we need to imagine ourselves as beacon towers of information, standing tall in the integrity of what we say, pulsing out congruent messages everywhere.

We need all of us out there, stating, clarifying, reflecting, modeling, filling all of space with the messages we care about. If we do that, a powerful field develops — and with it, the wondrous capacity to organize into coherent, capable form.

Let us remember that space is never empty. If it is filled with harmonious voices, a song arises that is strong and potent. If it is filled with conflict, the dissonance drives us away and we don't want to be there.

When we pretend that it doesn't matter whether there is harmony, when we believe we don't have to "walk our talk," we lose far more than personal integrity. We lose the partnership of a field-rich space that can help bring order to our lives. ●

The Participative Nature of the Universe

Ownership describes personal connections to the organization, the powerful emotions of belonging that inspire people to contribute.

We know that the best way to create ownership is to have those responsible for implementation develop the plan for themselves. No one is successful if they merely present a plan in finished form to others. It doesn't matter how brilliant or correct the plan is — it simply doesn't work to ask people to sign on when they haven't been involved in the planning process.

This is where the observation phenomenon of quantum physics has something to teach us. In quantum logic, it is impossible to expect any plan or idea to be real to people if they do not have the opportunity to personally interact with it.

Reality is co-created by our process of observation, from decisions we, the observers, make about what we choose to notice. It does not exist independent of those activities. Therefore, we cannot *talk* people into our version of reality because truly nothing is real for them if they haven't created it.

People can only experience a proposed plan by interacting with it, by evoking its possibilities through their personal processes of observation.

The Role of the Participation Process

Think about what happens in your experience when you want to get something accepted. It happens all the time in meetings where a plan is being proposed. Even if it is excellent, it will be a long meeting in which the plan will be dissected, criticized, thrown out, brought back and finally, almost always, approved in its initial form with only a few slight modifications.

All of those participants, like the best scientists, need to observe the plan in detail, exploring its edges, searching out its interior, playing with its potentials. Each observer is evoking his or her version of the plan by the act of observation. After a period of sometimes maddening dissension, the dissections cease and people sit back content, filled with energy and commitment.

Usually we endure these processes wondering why we have to go through them, especially because the agreed-upon plan often bears a striking resemblance to what was proposed initially. But it is the *participation process* that makes the plan come alive as a personal reality. People can commit themselves because it has become real for them. ●

Change, Stability and Renewal: The Paradoxes of Self-Organizing Systems

Several organizations, particularly customer-oriented ones, brag about how a single customer inquiry or the suggestion of one employee directed them into entirely new product lines that became very successful. There was no preplanning, no long-range strategic objectives, that led them into these markets. Just the creativity of one or a few individuals who succeeded in getting the attention of the organization and then watched the suggestion amplify to the level where the company reorganized to respond to it.

Great partnering exists between the system and its environment. As the system changes and evolves, it also affects its environment. No participant in this dance is left unaffected by changes that occur in another. Scientists call this *co-evolution*.

Organizational theorist William Starbuck wrote about this process in organizations years ago. The constraints imposed by the environment, he noted, do not force the organization to behave a certain way: "Organizations and their environments are evolving simultaneously toward better fitness for each other." In this view of evolution, the system changes, the environment changes and even the rules of evolution change: "Evolution is the result of self-transcendence at all levels. … [It] is basically open. It determines its own dynamics and direction. … By way of this dynamic interconnectedness, evolution also determines its own *meaning*."

Open to Change

All life lives off-balance in a world that is open to change. And all of life is self-organizing. We do not have to fear disequilibrium, nor do we have to approach change so fearfully. Instead, we can realize that, like all life, we know how to grow and evolve in the midst of constant flux. There is a path through change that leads to greater independence and resiliency. We dance along this path by maintaining a coherent identity and by honoring everybody's need for self-determination. ●

The Creative Energy of the Universe — Information

One of an organization's most critical competencies is to create the conditions that both generate new knowledge and help it to be freely shared. More and more, there is an acknowledged benefit to sharing information within and beyond the organization, to doing away with the gates and blockages, to moving past the hoarding and fear, to developing trusting relationships.

The Origins of Order

Order is never imposed from the top down or from the outside in. Order emerges as elements of the system work together, discovering each other and inventing new capacities.

We need to learn more about these sources of order. In ways we have failed to notice, systems possess the capacity to self-organize. As we learn to work with this ability, our attention will shift away from the *parts*, those rusting holdovers from an earlier age of organizing, and focus us on the deeper, embedded processes that create effective organizations.

"What is needed," British physicist David Bohm writes "is an *act of understanding* in which we see the totality as an actual process that, when carried out properly, tends to bring about a harmonious and orderly overall action, in which analysis into parts has no meaning."

The Process of Relational Holism

In quantum physics, a homologous process is described as *relational holism*, where whole systems are created by the relationships among subatomic particles. In this process, the parts don't remain as parts; they are drawn together by a process of internal connectedness. Electrons are drawn into these intimate relations as they cross paths with one another, overlapping and merging; their own individual qualities become indistinguishable. As author Danah Zohar explains, "The whole will, as a whole, possess a definite mass, charge, spin and so on, but it is completely indeterminate which electrons are contributing what to this. Indeed, it is no longer meaningful to talk of the constituent electrons' individual properties, as these continually change to meet the requirements of the whole."

It is not difficult to recognize ourselves as electrons in organizations, moving, merging with others, forming new wholes, being forever changed in the process. We experience this when we say that a team has "jelled," suddenly able to work in harmony, the ragged edges gone, an effortless flow to the work. ●

Chaos and the Strange Attractor of Meaning

The heart of chaos has been revealed with modern computers. Watching the behavior of a chaotic system as

it is tracked on a computer screen is a mesmerizing experience. The computer records the evolution of the system, displaying each moment of the system's chaotic behavior as a point of light on the screen. Because of the computer's speed, we can soon observe how the system is evolving. The system careens back and forth with raucous unpredictability, never showing up in the same spot twice. But as we watch, this chaotic behavior weaves a pattern and, before our eyes, order emerges on the screen. The chaotic movements of the system have formed themselves into a shape. The shape is a "strange attractor," and what has appeared on the screen is the order inherent in chaos.

Strange attractors evoke feelings of awe in most who observe them. Poetic language frequently creeps into the descriptions offered by scientists. Other types of attractors are well-known, but these newly discovered ones were named *strange* by two scientists, David Ruelle and Floris Takens, because they wanted a name that was deeply suggestive. As Ruelle says, "The name is beautiful and well-suited to these astonishing objects, of which we understand so little."

Turbulence and Order

To describe this dance between turbulence and order, Ruelle reaches for several metaphors: "These systems of curves, these clouds of points, suggest sometimes fireworks or galaxies, sometimes strange and disquieting vegetal proliferations. A realm lies there of forms to explore, of harmonies to discover."

Chaos has always partnered with order — a concept that contradicts our common definition of chaos — but until we could see it with computers, we saw only turbulence, energy without predictable form. Chaos is the last state before a system plunges into random behavior where no order exists.

Not all systems move into chaos, but if a system becomes unstable, it will move first into a period of oscillation, swinging back and forth between two different states. After this oscillation stage, the next state is chaos, and it is then that the wild gyrations begin. However, in the realm of chaos, where everything should fall apart, the strange attractor emerges, and we observe order, not chaos. ●

Change — The Capacity of Life

The new sciences are filled with tantalizing and hopeful processes that foster change. But to learn these lessons, we need to shift what we look for. Many of the reformulations of new science came from just such a shift: Scientists learning to look past an object or thing to the invisible level of dynamic processes. Laying aside the machine metaphor, with its static mechanisms and separated parts, scientists saw something new. They saw the underlying processes that give rise to innumerable and different life forms. They developed answers to explain how life is capable of so much change, so much newness. Some expressed awe and humility as they encountered the unstoppable resiliency of life. Some became poets, reaching for new language to describe their encounters with life's boundless creativity.

Being Present in the Moment

We must keep participating in the moment. The changing nature of life insists that we stop hiding behind our plans or measures and give more attention to what is occurring right in front of us, right now. We need to become curious about what's going on, what just happened. The present moment overflows with information about ourselves and our environment. But most of those learnings fly by unobserved because we're preoccupied with our images of how we want the world to be.

Being present in the moment doesn't mean that we act without intention or flow directionless through life without any plans. But we would do better to attend more carefully to *the process* by which we create our plans and intentions.

We need to see these plans, standards and organization charts not as objects that we complete, but as processes that enable a group to keep clarifying its intent and strengthening its connections to new people and new information. We need less reverence for the objects we create, and much more attention to the processes we use to create them.

Healthy processes create better relationships among us, more clarity about who we are and more information about what's going on around us. With these new connections, we grow healthier. We develop greater capacity to know what to do. We weave together an organization as resilient and flexible as a spider's web. ●

The New Scientific Management

In the history of human thought, a new way of understanding often appears simultaneously in widely separated places and in different disciplines. These synchronicities, mysterious and inexplicable, pop up everywhere.

For example, Darwin proposed his theory of evolution at the same time that another researcher, working in Malaysia, published very similar ideas. When

Impressionist painters explored light for its effects on dissolving forms, even painting it as discrete dots, physicists were theorizing that light was made up of miniscule energy packets known as quanta.

We live again in a time when the same concepts are appearing in many places. These concepts are our *zeitgeist* — a way of thinking that characterizes a generation or time period. Our zeitgeist is a new (and ancient) awareness that we participate in a world of exquisite interconnectedness.

We are learning to see systems rather than isolated parts and players. Under rather austere titles of *systems thinking* or *ecological thinking*, we are discovering many things worthy of wonder. We can now see the webs of interconnections that weave the world together; we are more aware that we live in relationship, connected to everything else; we are learning that profoundly different processes explain how living systems emerge and change.

A Shift in Focus and Context

The work of Frederick Taylor, Frank Gilbreth and hosts of followers initiated the era of "scientific management." This was the start of a continuing quest to treat work and workers as an engineering problem. Enormous focus went into creating time-motion studies and breaking work into discrete tasks that could be done by the most untrained of workers. Designers were so focused on engineering efficient solutions that they completely discounted the human beings who were doing the work. They didn't just ignore them, as has been done more recently with contemporary reengineering efforts. They disdained them — their task was to design work that would not be disrupted by the expected stupidity of workers.

Though we in management may have left behind some of these beliefs and the rigid, fragmented structures that those beliefs engendered, we have not in any way abandoned science as the source of our credibility. Planning, measurement, motivation theory, organizational design and change — each of these and more bears the recognizable influence of science.

Life's Dependence on Participation

The movement toward participation is rooted in our changing perceptions of the organizing principles of life. Everywhere in the new sciences, in living systems theory, quantum physics, chaos and complexity theory, we observe life's dependence on participation. All life participates in the creation of itself, insisting on the freedom to self-determine. All life participates actively with its environment in *the process* of co-adaptation and co-evolution. No subatomic particle exists independent of its participation with other particles. And even reality is evoked through acts of participation between us and what we choose to notice. ●

The Real World

The real world demands that we learn to cope with chaos, that we understand what motivates humans and that we adopt strategies and behaviors that lead to order, not more chaos.

The science of how networks emerge out of chaos, organize around shared meaning and grow more effective provides new and more accurate measures for assessing the strength of Al Qaeda and other insurgencies. These measures focus not on size, structure or chain of command, but on meaning and emotions. They are startlingly different to the traditional ones we use.

If networks grow from passion, if Al Qaeda "rides the rage" of angry Islamic militants, then the best strategy for immobilizing terrorist networks is not to kill their leaders, but to defuse the sources of their anger, and not to incite them further. Many analysts arrive at a similar conclusion — we can only win the war on terror by eliminating the causes of rage. As long as our actions provoke their anger, we can expect more terrorists, more extreme attacks and the continuing destabilization of the world by small groups of people. Network analyst Albert-László Barabási states: "If we ever want to win the war, our only hope is to tackle the underlying social, economic and political roots that fuel the network's growth. We must help eliminate the need and desire … to form links to terrorist organizations by offering them a chance to belong to more constructive and meaningful webs."

The Need to Change

This is the real world that we resist seeing at our own imminent peril. If we continue to seek to control it by exerting ever more pressure on those who hate us, those who feel disconnected and/or those who are impoverished, we will only create a future of increasing disorder and terror.

But to see a new way out of this terrifying future, we must learn to understand and see the world differently. Albert Einstein's wonderful counsel that no problem is ever solved by the same thinking that creates it defines what we must do.

We must understand the behavior of networks in this densely interconnected world. We must understand

human motivation and our astonishing capacity to self-organize when we care about something. We must understand that we lose capacity and, in fact, create more chaos when we insist on hierarchy, roles and command-and-control leadership.

There is no more time to think about whether we need to make this shift. We can't afford to continue wandering blindly in the real world, oblivious to what's going on. But if we can become curious and willing students of life's dynamics, we will discover surprising new capacities and insights.

Whenever we humans see clearly and understand the true dimensions of any problem, we become brave and intelligent actors in the world. It is time to open our eyes, change our lens and step forward into actions that will restore sanity and possibility to the real world. ●

Epilogue: Journeying to a New World

Our culture is presently journeying through chaos. The old ways are dissolving, and the new has not yet shown itself. If this is true, then we must engage with one another differently, as explorers and discoverers.

It will make the passage more fruitful if we can learn how to honor each other in these roles. We can realize that no single person or school of thought has the answer, because what's required is far beyond isolated answers. We can realize that we must inquire together to find the new. We can turn to one another as our best hope for inventing and discovering the worlds we are seeking.

We can no longer act as patrons, waiting expectantly for the right solution. We are each required to go down to the dock and begin our individual journeys. The seas need to be crowded with explorers, each of us looking for our answers. We *do* need to be sharing what we find, but not as models. From each other, we need to learn what's possible. Another's success encourages us to continue our own search for treasure.

Reality Is Constantly New

In this new world, you and I have to make it up as we go along, not because we lack expertise or planning skills, but because that is the nature of reality. Reality changes shape and meaning as we're in it. It is constantly new. We are required to be there, as active participants. It can't happen without us, and nobody can do it for us.

If we take seriously the role of explorer and inventor, we will realize that we can't do this alone. It's scary work trying to find a new world, hoping we won't die in the process. We live in a time of chaos, as rich in the potential for disasters as for new possibilities. How will we navigate these times?

How Imposed Control Can Threaten Survival

When leaders strive for equilibrium and stability by imposing control, constricting people's freedom and inhibiting local change, they only create the conditions that threaten the organization's survival.

We Need Each Other

The answer is, together. We need each other differently now. We cannot hide behind our boundaries or hold onto the belief that we can survive alone. We need each other to test out ideas, to share what we're learning, to help us see in new ways and to listen to our stories. We need each other to forgive us when we fail, to trust us with their dreams, to offer their hope when we've lost our own.

This is a strange world, and it promises only to get stranger. Physicist Niels Bohr once said that great ideas, when they appear, seem muddled and strange. They are only half-understood by their discoverer and remain a mystery to everyone else. But if an idea does not appear bizarre, he counseled, there is no hope for it.

So we must live with the strange and the bizarre, directed to unseen lands by faint glimmers of hope. Every moment of this journey requires that we be comfortable with uncertainty and appreciative of chaos' role. Every moment requires that we stay together.

After all is said and done, we have the gift of each other. We have each other's curiosity, wisdom and courage. And we have Life, whose great ordering powers, if we choose to work with them, will make us even more curious, wise and courageous. ●

THE SUMMARY IN BRIEF

In the first half of 2022, people were grappling with high inflation and starting to talk about the possibility of recession and stagflation. Things were getting tough. But when the going gets tough, the tough get going. Business leaders need to learn about inflation's insidious effects and take those lessons back to the businesses they run to get through this period in great shape.

In ***Leading Through Inflation: And Recession and Stagflation*** co-authors Ram Charan and Geri Willigan lay out the hazards of inflation and how to avoid them so your company will survive this difficult time. It will help you build your confidence to act decisively despite the unknowns by showing how other leaders are stemming the damage and resetting their businesses for a brighter future. It will help you see inflation's impact through a wider lens and give you specific tools for dealing with it.

Economic damage comes fast. Through the overarching message that leaders must move quickly, this book is designed to speed learning and shorten the time to act.

IN THIS SUMMARY, YOU WILL LEARN:

- What you need to know about inflation.
- Why you must pay attention to cash.
- How to find cost cuts that build business.
- How to renew your business model.

What You Need to Know About Inflation

It is your job as a leader to steer the company through inflation, whether or not you have practice at it. That means fully understanding how inflation touches every part of the business and enlisting the help of others in the company to combat it. Hunkering down until the Federal Reserve fixes things is not a viable plan.

You don't need charts and graphs to know that costs have been rising. But there's more to know about how inflation affects a business. You need to understand what inflation does to a company, an industry, and the economy as a whole. Here are some important facts about inflation that may not be obvious until it is too late:

1. **Inflation consumes cash.** Cash gets trapped in inventories and accounts receivable for the same unit volume. Growth gobbles up even more cash.
2. **Price increases roll through the value chain to the end consumer like a freight train, disrupting the economics and power balance of players along the way.** At some point, consumers push back and demand drops.
3. **Aggregate measures like the Consumer Price Index don't tell much about how inflation will affect your company.** Microsegmentation across your business and the supply chain is essential.
4. **The effects of inflation are cumulative.** A 7% inflation rate may be manageable for one year but a rate even close to that compounded over several years could ravage the business.
5. **Inflation trends are partly psychological.** When people expect continual price increases, they hoard goods, creating even more demand and exacerbating the imbalance. This pattern can lead to hyper-inflation.
6. **Inflation can turn well-planned capital expenditures into bad investments.** Earlier decisions were likely based on assumptions that are no longer valid.
7. **Sacrificing customer trust to protect the business from higher costs has long-term consequences.** It is hard to restore a brand once it is tarnished.
8. **Inflation reorders competition.** It is an opportunity for businesses that can sustain in the near term and strengthen their position for future growth.

These truths show why many leaders need a broader and more urgent response to inflation than they have undertaken thus far. They should help you appreciate that cost cutting to struggle through the immediate hardships will not get you through a sustained period of inflation, let alone a spurt of hyper-inflation, recession, or stagflation.

The bright side? **The current disruption to your company may make it hard to appreciate the eighth universal truth about inflation: it creates opportunities to improve your competitive position.** Dealing with inflation's negative impact on the business will reveal a silver lining. The business will sharpen its focus and cultivate a stronger set of customers. You'll find ways to improve productivity, cut costs through more automation, or use technology to serve customers better with less cash usage. Your company's response to inflation will be a differentiator.

A War Room to Pick Up Early Signals

Inflation intensified in late 2021. Some cost increases may have been predictable, but the sudden constriction of Russian oil and Ukrainian agricultural products was a shock. Companies that have a mechanism to detect such changes and coordinate a response sooner are better positioned than others.

This is what war rooms are for. Whether or not you use the term, every company needs a mechanism to get people's attention focused on the urgent threat from high inflation and to enlist their help in executing a solution. Some companies have simply changed the content of existing meeting formats. Others have created something new.

Best practice is not just to examine the immediate threats to the business but to look ahead and make judgments about what might be coming next, an exercise of gathering data and reasoning out the possibilities. An ideal war room is not just for firefighting; it's also strategic. Early warning signals will tell you not just where the problems are emerging but also their pace. They allow you to be predictive, prescriptive, and preemptive.

Every company needs a war room. A war room is a frequent gathering of people who will aggregate information, strategize, and drive the plan. It has an important social purpose in aligning and intensifying people's focus. Much

Inflation brings the risk of insolvency.
Bankruptcy can happen to the unwary.

like in a military situation, it is an excellent way to convert anxiety and fear into energy and action. Energizing people to spring to action based on information others share is valuable, but there's another benefit: it sensitizes everyone to early warning signals they may be exposed to in the normal course of their workday.

Early warning signals from your customers, supply chain, or industry statistics should be tracked on a dashboard. Along with some macroeconomic measures you find useful, choose some metrics that are specific and critical to your business. Data can help you detect shifts in buying patterns, from which you can draw other inferences. Be sure you are monitoring internal early warning signals as well.

The only way to be preemptive is to be predictive. Use your war room to brainstorm what the data are pointing to, what trends are emerging, and take some leaps to consider how things could combine to create what's next. The thought process will set you apart.

Pay Attention to Cash

Cash management is the number-one risk to your business and the key to managing it safely through inflationary times. You need to have a clear picture at all times of where cash is coming from and where it is going to, with a view of how those flows will change in the coming quarters. You should be seeking ways to reduce costs and lower the break-even point, but the important shift is to focus on the balance sheet, not just the P&L. Orient yourself to think in terms of cash profits, not paper profits or percentages.

If you're not watching cash and taking steps to ensure you have enough of it, you are putting your business on shaky ground. As inflation persists, many items you consider done deals could come to haunt you. For example, if you have contracts to sell at fixed prices with no such assurances on the cost side, you are headed for trouble. If you have variable-rate loans or need to borrow money going forward but don't have a plan to cover higher cash payments, you could likewise be in trouble. If you are in an industry that relies heavily on energy, directly or indirectly, you could also be in trouble.

And don't forget that customers consume cash in the form of receivables, inventory, and production, some more than others. A customer that pays receivables in 275 days might not be worth having, even if you get a hefty margin. Things look very different when you analyze profitability on the basis of a margin measured in percentage points versus profitability measured on the basis of net cash.

You have to know how cash is flowing and learn where it typically gets trapped, especially as rising interest rates slow economic growth. You will want to scrutinize how you use cash to build the business and keep it running, whether as operating expenses or capital expenditures. All of your business planning and forecasts should include an analysis of cash, and you should revisit the investments you already planned with an eye toward cash.

The sooner you fix the balance sheet to protect cash, the better. In a period of rising inflation, debt is a killer. You might think it's fine to keep the debt you have because it is low-priced. But you have to consider whether you can actually service that debt. Will inflation shrink your cash margins? If you can't generate as much cash as you did before, then even low-priced debt will be a problem.

Inflation brings the risk of insolvency. Bankruptcy can happen to the unwary. Watch your balance sheet and safeguard your liquidity.

Change Your Pricing Approach–Fast

Pricing may have been a relatively low priority over the past decade, but under inflation it is central to survival. Whether you're expecting more inflation, recession, stagnation, or a return to growth, you should fully understand how pricing affects your money making and relationships with customers. It's not just that you have to raise prices, which you almost certainly do, you may have to revise your whole approach to pricing.

This economic era demands a break from past practices, even those that have worked fine so far. Maybe your sales are largely transactional, but now a subscription-based

approach works better. Maybe you've ruled out surcharges, but now they make sense. The range of options on pricing is likely wider than you think, and the options you choose matter more than you think. Revisit your choices.

Regardless of where you sit today, inflation gives you the opportunity to evolve the pricing function and build a new capability for your company. Accelerate your pace of price changes, but be thoughtful about how you implement them so you don't wear down your sales force or alienate customers.

Improve your approach to pricing broadly, including the following:

1. **Your pricing mode**–are sales transactional, subscription based, or contractual?
2. **Your pricing method**–Do you use dynamic pricing, peer pricing, index pricing, or custom negotiations?
3. **Your pricing model**–Are prices derived by a desire to fill a factory, maintain a target margin, hit a list price, or extract an estimated value?
4. **Your pricing strategy**–Do you set prices with the intent to penetrate a market, retain a customer base, or maximize value extraction?

However you combined these elements in the past, you should consider whether a shift might work better in current times. Unless you pick up the pace of price changes, you could seriously miss cash and earnings that you can never recover. Across an industry, someone will be first to make a move. If you leave it to sales and marketing alone, you may never get the price increase you need, let alone be first in line. They may stall because they don't want to lose the customer or dread getting serious push-back from them.

The dominant psychology of sales and marketing for the past decade has been to capture as many customers as possible and make every sale one can, without thinking too hard about whether the sale is profitable or the customer is sound. There's been a psychological aversion to raising prices. Senior leaders have to address this issue head on. It's one thing to know that price increases are in order and another to see that those changes are made promptly.

Find Cost Cuts that Build the Business

As you cope with inflation you'll need to cut costs. You will run up against some costs that are impossible to control, whether it's because the material is rare, the trading floor sets the price of a commodity, or front-line workers have a multitude of options. Go beyond the obvious targets and consider all the direct and indirect costs strung across the company. How could they be reduced?

Then go further. Those incremental savings will add up and help you weather rising costs, but you should also step back and ask a different question: Can you make a more radical change to reduce costs and/or cash consumption? A step or jump in reducing costs might come from looking beyond the boundaries of your business and working with others in the value chain. When one link in the chain is affected, others are too. Or you might have to completely revise your geographic footprint, for people as well as sourcing.

The point is to get through an inflationary period with customers intact and with a stronger business than before. That comes from keeping customers top of mind and searching for things you can do to help them get through. At the same time, you should work with the other side of the value chain to help suppliers cut whatever costs they can control.

Apparel, footwear, and other consumer staples are among the industries that have been severely challenged by both the pandemic and inflation. Many players in the supply chains for those industries are based in Southeast Asian countries. As consumer demand dropped precipitously, cash froze up, and exports dwindled. Companies and their domestic economies were badly hurt. One company, a medium-sized player in the middle of the footwear supply chain, recognized the opportunity to demonstrate their differentiation.

Knowing that its customers–the companies next in the value chain–were still recovering, raising prices to pass along cost increases was not a realistic option. Instead they looked to cut costs that would not weaken the business, either their own or those of the customers or the subcontractors that manufactured their products. That declaration took many typical cost cuts off the table and spurred more creative thinking.

For example, making internal changes can save money and make the company operate more efficiently, which can translate into faster approvals and decisions. The company can thus become more responsive to customer's requests. Helping to improve operations at the manufacturing level helps those customers become better able to handle the cost increases that are externally driven. Your customers and your customer's customers all stand to benefit.

If you think bigger and more broadly and don't back

If you think bigger and more broadly and don't back away from a bold change, you'll see how inflation creates a chance for your company to leap ahead.

away from a bold change, you'll see how inflation creates a chance for your company to leap ahead. In a high-inflation environment, you've got to help your customers deal with rising costs, even as you fight to contain them. You also have to work with suppliers because cost incurred on that side of the value chain will affect players at every step that follows. Along the way, you should search for ways to add value, not just cut costs, on both sides of the value chain. It's all connected.

Renew Your Business Model

The cumulative effects of inflation are leading to a world of lower consumption overall, one in which some consumer behavior will have changed permanently. There will not be a return to what we've known. Some segments–even some industries–will have shrunk, and some new ones may have appeared. As you adjust your pricing, product offerings, costs, and cash flow along the way, at some point your business model might reach a breaking point. To thrive in the emerging world of lower consumption and slower growth, you will almost certainly need a new business model.

You should focus on it now. Don't wait for mountains of evidence that the current business model isn't working. Be honest: Is your most lucrative market evaporating? Are the new market segments you've targeted still there, and at the same price points? You may be convinced demand for your services will return to what it was, but when? Can you really wait it out? Will something more appealing have sprung up in the meantime? Pool your observations, look at data and trends, and start to think about how you will reinvent the business model.

Creating a new business model may be as new to you as inflation. But don't ignore the necessity. Remember that even if you are slow to recognize that the business model is breaking, investors won't be. Declining or persistently stagnant earnings with no sign of future building will begin to affect your market valuation. With that comes another insidious impact: you'll have to use more cash for things like pension funding. When resources start to dwindle, you have fewer options to make a change.

The elements of your business model include sources of revenue, customer mix, product mix, geographic footprint, cost structure, and the money making model. The mental challenge is to conceptualize how the key elements could work together differently. To win in profitable customer segments, you need innovation. Digitalization will help you reduce waste and therefore cost. It will help you customize products and services and therefore boost revenue and cash. It also makes innovation cheaper and more efficient.

Keep iterating your conception of the business model until your products, customers, and business portfolios work with your money making formula–your need for positive cash flow, gross margin, and profitable growth that can fund critical investments.

- **Customer segments.** The need for cash might force you to drop customers that cannot keep up with payments to you, and price increases might drive some customers away.
- **Product mix.** Look at your customer mix with fresh eyes. A prolific number of products can create all kinds of complexity that works against efficient management of production and cash.
- **Ecosystem.** Your ecosystem extends beyond your linear value chain to include networks and partnerships. This is a time to question whether you have the right partners.
- **Geographic footprint.** As you look at where you sell, produce, source, and hire, geopolitics and exchange rates should play a role. You will probably want to put more emphasis on where there will be more stability and more sustainability of cash growth.
- **Portfolio Mix:** If you have a portfolio of businesses and are considering merging, acquiring, or divesting, think about how they will fare in inflation.

No business model lasts forever. Be ready by rethinking all the places and ways you currently play. Be ready to change the mix.

Inflation is Everybody's Business: Your Role

Armed with a general understanding of how inflation affects a business, you are better prepared to help your company succeed despite it. But that is not enough. Every business function has a role to play in coping with inflation and preparing for what will follow. Actions you take now will not only mitigate the damage from inflation but also strengthen the company so it will be well positioned when the economy takes a turn for the better.

What is your role?

CEO

1. **Cash coming in, going out, and its timing.** Every major financial decision must be viewed through the lens of cash.
2. **Pricing, and making it happen.** The CEO must understand the basic choices in philosophy and tactics, be hands-on with sales and marketing to be sure they are moving fast and smart on pricing, and reassign some leaders if they are unable to implement price changes.
3. **The business model and strategy.** The focus of the business may change to conserve cash or to pounce on opportunities. Continue to build the future even as you focus intensely on the day-to-day immediacies.
4. **Operations.** Link with the COO to stay grounded in how costs are changing, supply and demand are matching up, and problems are being addressed. The COO's perspective will inform communications with the investment community.

These four items alone will not sustain the business. In this time of pronounced economic volatility, the CEO must also be the chief integrator of people and information. This role involves psychological leadership, helping others to face reality and adapt their behavior. But it also has a mechanical component, which includes establishing a war-room type mechanism and a cadence of frequent communication.

The CEO does not combat inflation alone. Here are a few checklists for other key roles.

CFO and Finance Department

- Watch for cash traps
- Take charge of working capital
- Check the assumptions in planning and capital expenditures
- Communicate with investors

Sales and Marketing

- Work on segmentation and customer profitability
- Update the pricing approach
- Ask IT to help with competitive data
- Train for the new customer dynamic

Operations

- Revisit and recommend capital expenditures versus operating expenditures
- Use digital applications to keep improving
- Be a conduit between front-line employees and management
- Help investor relations build credibility

Procurement

- Secure supply
- Gather intelligence
- Keep management informed
- Be decisive

CIO and IT Department

- Learn the new business priorities
- Do small projects with a short-term payoff
- Find ways to help business leaders
- Use outside help for low cost and speed

Public Relations and Investor Relations

- Know how your company fits in the macro environment
- Be clear about the company's plans and actions
- Be ready to explain big pricing moves
- Learn what investors are thinking and doing

Human Resources

- Help identify those who can't adapt
- Defend fair treatment in times of stress

- Keep KPIs up to date
- Use training to build skills and reduce anxiety

The Board

- Spur management to action
- Help break bottlenecks
- Use a framework for capital allocation
- Revise the compensation plan

Ram's Closing Message

It is leaders who let companies decline or take them to new heights. This could be your time to shine. The things that will help you lead through inflation will also help you lead when the next change comes. Use the external change to your advantage, and get everyone aboard to navigate through the rough patch. Take the hand you are dealt. Use it to create new value for the customer, shareholders, and the constituencies you serve. That's how you and your company will come out ahead and be ready to ride high when stability and growth return–as we know they will.

Ram Charan is a bestselling author, teacher, and world renown advisor to CEOs and other business leaders of some of the world's best-known companies, including Toyota, Bank of America, Aditya Birla Group, Novartis, Fast Retailing (Uniqlo), and Humana. The author of close to forty books, four of which were bestsellers, he is known for providing real-world solutions— the kind of advice you can use Monday morning. His book Execution, lauded for its practicality, spent more than 150 weeks on the New York Times best-seller list.

THE SUMMARY IN BRIEF

Leading people should be your greatest asset, not your biggest problem. That's what this book introduces as a main concept. ***Leading What Matters Most: A Business Parable on Unlocking Human Potential*** is a compelling business parable for leaders – offering practical lessons and takeaways for organizations at every stage.

Author Phil Geldart, founder and CEO of Eagle's Flight, is a recognized authority in the areas of transforming organizational culture, leadership development, and experiential training solutions. His expertise and passion for unlocking human potential have garnered the respect of Fortune 500 global organizations.

Because of these characteristics and the author's expertise, *Leading What Matters Most* has been named the book from which "all business leaders can learn a lot about embracing a paradigm shift for the sake of long-term success."

IN THIS EXECUTIVE BOOK SUMMARY:

- Learn how to begin a leadership transformation.
- The essential of moving from "what to do" to "how to do it."
- What problems and successes do managers face along the way?
- What are the best ways to resolve organizational issues for the sake of everyone involved?

Introduction

Very often, we as leaders receive great advice about what to do but not how to do it, and knowing the "what" without the "how" is rarely as helpful as we hoped it would be!

With that in mind, I thought I'd introduce you to Bridget, my fictional CEO running a large and highly successful tech company that is now encountering problems on the people side. While Bridget is brilliant as an operational executive, her expertise in truly releasing all the potential within her workforce is seriously lacking. This has led to declining results in both performance and employee engagement. Her board is unhappy, her people are disengaged, and her leadership team is no more people-savvy than she is.

By taking Bridget's journey with her, we share in her frustrations and problems as well as her successes. More importantly, we see how she tackles, and ultimately resolves, these issues to the benefit of everyone involved.

You may perhaps identify with some of Bridget's challenges and be looking for insight about how to tackle them. As you follow her progress, you learn with her the practicalities of how, with the right help, you can change behaviors to improve performance.

Chapter 1: It's No Longer Working

Bridget took a deep breath and slowly exhaled. The board meeting had been brutal. How had things changed so drastically in what seemed like a few short months?

Turning back to her desk, she picked up the GCG (Good Corporate Governance) report, once again scanning the list of deficiencies. "Underdeveloped staff, low employee engagement, poor leadership competence, and ineffective corporate communication," she whispered to herself. She had dragged her heels getting this report—tried to deny the need for it, thinking she still had it under control, but she knew the board was right. Something was no longer working

It felt like a sink or swim moment for her personally and professionally. In fact, the board chair had made that clear.

When Bridget arrived at her ELO meeting the following week, she felt a bit embarrassed to share the challenges Talon Tech was up against. Well, not so much the challenges themselves but that she was the reason they existed.

The next two weeks were a blur as Bridget and her leadership team hunkered down, creating and implementing new policies and strategies for employee engagement and communication based on GCG's recommendations.

Regardless of the new initiatives, however, Bridget and the leadership team continued getting reports about various problems. Sales continued to push back, saying the way they had been doing things was working fine—the company just needed to figure out how to fill their orders faster. Operations complained that they didn't have time to implement these new procedures and keep up their current production levels. Customer service grumbled about customer complaints taking up too much of their time, which meant they couldn't keep up with new orders. Why couldn't leadership work on fixing those issues instead of throwing them a measly $200 bonus, and since when was it their job to interview people? Bridget wanted to scream.

That was the moment when Bridget made the conscious decision to get in touch with a business consultant named Ray Ortiz.

Chapter 2: Moving from What to How

Bridget and Ray set up a meeting at a restaurant.

During the conversation, it became clear that Ray had no intention of fixing the leadership problem. Instead, he was going to show Bridget how her team could achieve the results they were looking for.

Next, Bridget outlined the problems at Talon Tech, as she was perceiving them.

"The truth is, as recently as a week ago I was still resistant to taking this step. I think because Talon Tech has done so well—we're at the top of our industry, and we continue, at least until now, to turn a healthy profit—it's blinded me to some very real issues. Issues that I should have addressed sooner, but now, months after there were initial indications of potential trouble, I'm finally taking the steps that I hope will help me right the ship before it's too late."

Before she could formulate her next thought, Ray said, "I think what's happened is you don't know how to harness the potential of your workforce. You and your leaders know how to lead the business, but you don't know how to effectively lead your people."

Bridget felt validated. Ray had just confirmed what she had begun to suspect was the root cause of Talon Tech's problem.

Dishant continued: "I warn you, it's not as easy as it may appear, but the lessons and insights you take away from this experience will fire you up! And that collective fire is what will empower us to release the full potential of everyone."

Chapter 3: The Leap of Faith

"Trust the process," Bridget said softly to herself.

It was time to introduce Ray to the team.

Upon entering the meeting room, Ray greeted everyone who had gathered.

"It's a pleasure to meet you all," said Ray. "What you have all accomplished here at Talon Tech is incredibly impressive. The reason I'm here is that Talon Tech has been wrestling with problems. I know you have tried to identify the origin of the problems and ways to address them and that those efforts have failed. But I assure you, there is a path forward—a path that will lead to the outcomes Talon Tech needs and you all want to achieve to continue your impressive successes." Ray met everyone's eyes before continuing.

"Bridget has made it clear to me that the approach I'm about to lay out for you is the path that Talon Tech will follow. Its success requires the commitment of every leader in this room. Now, I know you don't yet understand this approach or your role in it, and I respect that, but everyone at Talon Tech must be committed to the path."

Having everyone's undivided attention, Ray set the following priorities:

- "We provide new behaviors at every level.
- It will be leader led.
- We'll align all our HR practices.
- We put everything you show/teach us into practice.
- You and your team provide guidance and support."

He also outlined the main areas of focus:

- Leadership: Each of us must own the outcome for this initiative
- Communication: Let everyone know continually and consistently how we are doing things differently and why
- Alignment: Align all the human resource practices
- Training: Experiential training. First train leaders at all levels, then train all employees
- Reinforcement: Provide support and activities to ensure that the training sticks
- Metrics: Continuous measurement of progress/outcomes

Chapter 4: The Transformation Begins

Next in line was introducing Bridget's team to the transformation that was about to happen at Talon Tech. Addressing all of her coworkers, Bridget delivered an uplifting message.

"What I promise you today, is that everyone… is wholly committed to providing each and every one of you the support, tools, and training needed to be the best you can be and to elevate Talon Tech to the next level."

The following week went by in a blur for Bridget – coordinating the company-wide communications around the initiative, as well as the daily running of Talon Tech.

She was also getting excited for the experiential parts of the transformation that Ray had suggested and she was about to introduce over the course of the coming few weeks.

Chapter 5: Crossing the Vast and Perilous Desert

The day of the final training session arrived, and Dishant (the company's CFO), who had kicked off the first two sessions, wanted the honors of kicking off the final one.

"Good morning! You are about to race across the vast and perilous desert, so I hope you are feeling rested and energized!"

While everyone responded enthusiastically, Dishant continued:

"I warn you, it's not as easy as it may appear, but the lessons and insights you take away from this experience will fire

you up! And that collective fire is what will empower us to release the full potential of everyone."

Chapter 6: A Potential Derailing

The next day, Bridget had Ray meeting her early due to technical setbacks that had been identified. She was worried about the numerous angry messages and voicemails that she'd received and wanted to communicate the information with the consultant, adjusting their strategy accordingly.

"Ray, I have a serious technical problem for which I haven't identified the source, and customer service complaints have seemingly skyrocketed overnight."

"And?" Ray asked.

"And?" I don't see how I can go out in front of the entire company and talk about our initial improvements and how we're going to head into the next round of company training when all this is going on."

"I get that it feels like a huge setback, and I'm not minimizing the seriousness of it or the headaches it will cause, but as you agreed, you must stay on course. In this case, it provides us an opportunity to focus the application of the training to this immediate issue, which is a good thing, because then they won't be learning new behaviors in the abstract – they'll be learning them based on a true scenario."

Inspired yet slightly anxious, Bridget used the time after the meeting to check her notes and review the conclusions she'd reached after meeting Ray:

- Trust the process – changing behaviors requires consistency and time
- Support the decision-making process
- Training is best when tailored to real-time issues

The next day, Bridget, Roy, and the rest of the leadership team met to pinpoint what's needed to empower those members of the team tasked with getting things done. Roy used the whiteboard to mark the main cornerstones of effective support:

- Leadership
- Unanimous focus on a common goal
- Clearly defined roles for subgroups
- Shared resources

Chapter 7: The Seven Cornerstones

In the next exercise, Jason and Gloria from the managerial team introduced the concept of the Seven Cornerstones of Teamwork. They walked the group through the first four cornerstones – leadership, unanimous focus on a common goal, clearly defined roles for subgroups, and shared resources – in much the same way that Ray had walked the executive leadership team through them the week before.

Effective and frequent message delivery was described as one of the next pillars. Next, the team learned more about the importance of consistent, united, and enthusiastic effort.

"It's important that every member of the team bring to the team's commitment outcome a consistent and enthusiastic mindset. This not only keeps the focus on performance excellence but also means that one team member's poor attitude won't negatively influence everyone else.

The seventh and final cornerstone was described as periodic and temporary suppression of the ego.

It's important to reiterate the periodic and temporary aspect of this cornerstone. It's not about permanently suppressing your ego; it is knowing when to suppress it and when not to.

Each one of the seven cornerstones is critical to a team's success and should set the standard for every team's behavior.

Based on the information and the week's exercise, a lively discussion ensued. Everyone within the organization agreed that to solve a problem, the following need to be prioritized:

- Everyone should contribute whenever possible
- Everyone should encourage their teammates to contribute
- Every team must remain focused on the results they are trying to produce
- A common language must be agreed upon and shared up front
- The opportunity to tap in whenever possible must be encouraged

Chapter 8: The Proof of the Pudding

Following the work done over the previous weeks, Bridget and the leadership team sat down to review the results of a survey carried out among the employees who participated. Four questions were asked:

> "As excited as I am about the metrics," Bridget said, "I'm more thrilled by the changes in behaviors I'm seeing across the organization."

- Do you feel that you are more engaged at Talon Tech than you were six months ago?
- Do you feel you're better able to make a difference at Talon Tech?
- Do you feel that your leaders encourage you to speak up and add value?
- Do you feel that you're better able to do your work now than you were three to five months ago?

The positive answers for each of the questions were 76, 52, 64, and 73 percent respectively.

Bridget revealed the final and most impressive result after presenting all of the other information. To the question "do you feel the problem you had was addressed to your satisfaction," the positive response rate was 100 percent.

Additionally, 93 percent of the employees reported they were given clarity on the issue, 95 percent said their concern was handled courteously and professionally, and 98 percent responded they were going to continue honoring Talon Tech with their business in the future.

"As excited as I am about the metrics," Bridget said, "I'm more thrilled by the changes in behaviors I'm seeing across the organization. I saw the beginnings of the changes when the subgroups for the chip problem came together in the configurations training."

Bridget leaned back in her chair. "I have to admit that I was still somewhat skeptical about whether or not the tools and behaviors we were all learning would actually be applied outside the controlled atmosphere of the training, but, as you both know, Ray's training programs aren't typical – they're infectious."

She continued by saying "Of course, challenges continue to occur. I'm pleased to say our teams are taking control and resolving situations quickly.

Chapter 9: Weathering the Storm

In the weeks after the positive results, Bridget had to face some challenges. Angela, Talon Tech's CIO left the company abruptly. Bridget blamed herself for a failure to notice the red flags and take action accordingly.

She briefed the leadership team on everything that had happened in relationship to Angela's departure and the aftermath of that abrupt event.

"I take full responsibility for the situation," Bridget said. "Clearly, I was not paying the level of attention I should have. While we have made tremendous progress these last seven months, there is still work to do. And as always, the work begins with everyone in this room."

After the meeting had ended and they had all left, Bridget took the advantage of having a few moments to write in her Transformation Notebook:

Remember the six areas of focus:

- Leadership: Each of us must own the outcome for this initiative and hold people accountable for modeling the new behaviors.
- Communication: Let everyone know continually and consistently how we are doing things and why. This must be intentional and planned for.
- Alignment: Align all the human resource practices. This shift in how we are leading our people must touch every aspect of what HR is responsible for.
- Training: Experiential training. First train leaders at all levels; then train all employees. Be sure the training links to our real-world issues.
- Reinforcement: Provide support and activities to ensure that the training sticks. These must be led by our line managers.
- Metrics: Continuous measurement of progress/outcomes. Share these with everyone.

Chapter 10: Are We There Yet?

In due time, Bridget and the leadership team found a replacement for Antonia. Everyone felt excited and enthusi-

astic about Grace accepting the CIO role.

The position remained vacant for 10 weeks but everyone on the team agreed not to rush the decision, waiting for the right person to come along. "Honestly, this decision has provided us with the time we needed to make sure everyone on the technology side was fully committed to the people-first initiative and there were no remaining Andrea holdouts."

The news that Talon Tech would have a new CIO by the end of next month was the perfect ending to Bridget's day. We got this; she thought as she pulled out of Talon Tech's parking lot.

Chapter 11: India Ink

Soon, Bridget and Ray scheduled a meeting to catch up and go over the events that had unfolded since the start of their partnership.

"Okay," Ray began. "I'm standing in a meeting room, holding a glass of water, and I spill the water on the carpet. It leaves a dark stain. The cleaning crew comes to clean that night as usual, but the stain has vanished. So much so that unless someone told them they had spilled water on it, they would not know it. The water has evaporated."

"The next day, I'm in the meeting room and I spill a bottle of India ink on the carpet. It leaves a dark stain. That night when the cleaning crew comes in, the stain is still there. The crew attempts to remove it, but they're never going to get it out, because India ink embeds itself so thoroughly in the material that it cannot be removed."

"So, why am I telling you this story? When people go through a culture transformation and they reach the eight- to ten-month mark, they begin to see a meaningful impact. But the big dark splotch of impact they see is merely a water stain. A water stain that will evaporate if they do not stay the course and reinforce it and make sure everybody understands that this is the new way of behaving."

"For that impact to become India ink, to become a part of the organization's DNA, they must encourage everyone in the organization to consistently apply the behaviors for two to three years. If the organization stops when it's still a water stain, complacency will set in, and the transformational culture will not take hold."

Turning a water stain into India ink is dependent on the following process:

- Our executives are trained to model, coach, and require the new behavior
- Our leaders are trained to model, coach, and require the new behavior
- Our employees are trained on the new behavior and understand that their leader is there to coach them on those behaviors
- We employ the Accountable Leader Loop consistently:
- Commit to putting the new behaviors into practice in every applicable circumstance
- Test it regularly to make sure the loop is reaching every level
- Our human resources processes and policies are tied to our people-first initiative:
- We promote people who demonstrate the new behavior
- We hire people who have an inclination towards the new behavior
- All our communications reinforce that new behavior is the way to go
- We share our metrics that result from consistently practicing the new behavior
- If we consistently and continually follow this process, we will achieve ten bars of gold every time.

Chapter 12: Line Managers Take the Stage

Almost a year into Talon Tech's people-first initiative, Bridget had fully regained her confidence as the CEO of a Fortune 100 global technology company. She felt fortunate and although her confidence may have faltered for a short period of time, she never lost her incredible passion and abilities for advancing technologies, and now, coupled with a deep understanding of how to harness the potential of her people, she felt unstoppable.

Conclusion

When implementing a leadership change, don't forget the importance of the following equation:

Lead + Train + Implement + Practice = Success

Work on embedding a people-first culture in the fabric of the organization. To do so, focus on the following:

- Recognize that leadership behaviors and employee behaviors need to be different from what they currently are. It's not about different HR policies and procedures.
- Equip all leaders to demonstrate "true" leadership that allows and encourages people to perform to their full potential:
- Encourage input into decisions
- Provide additional new tools and skills to help them do their job brilliantly
- Consistently communicate the people-first initiative to all employees. Let them know where the organization is going with respect to enabling them to contribute to their full potential and their importance to our future
- Define this priority and stick to it
- Provide training and practice
- As a leader, remember the following:
- The power of investing in everyone, based on respect for the individual regardless of rank
- The positive example of setting the pace by example
- A determination not to confuse early wins with the ultimate success
- The importance of giving the entire team the full picture

Finally, remember that changing behaviors requires both consistency and time. Trust the process, support effective decision-making, tailor training to real-time issues and you'll soon notice the sustainable, positive behavioral change that kicked off this entire journey.

Phil Geldart is the founder and C.E.O. of Eagle's Flight, a Canadian company focused on improving individual and team productivity. Eagle's Flight is presently represented in over twenty countries and enjoys an enviable reputation for customer service, product effectiveness, and having fun!. Prior to founding Eagle's Flight, Phil was with Nestlé Canada, where he worked for 18 years, the last five of which he served as a member of the Executive team in the capacity of Senior Vice President of Human Resources.

An Action Plan for Transforming Companies into Industry Revolutionaries

LEADING THE REVOLUTION

THE SUMMARY IN BRIEF

The future is indeed now. The Internet has not only provided companies with another sales channel and communications tool, it has helped restructure the very basic concepts of time and place: Businesses must anticipate and meet customer needs quickly, in any location, at any time. Unfortunately, many close-minded, entrenched organizations lack the courage to change their ways for the betterment of their employees, customers and shareholders.

These companies will falter in the coming age of revolution, according to Gary Hamel. In *Leading the Revolution*, Hamel shows why only companies that continually reinvent themselves and their industries will be able to survive in an era in which radical innovation will be the best — if not the only — source of new wealth.

Hamel has studied the "gray-haired revolutionaries" who are leading the way in innovative thinking, development and management, and has come to several key conclusions:

- The age of incremental change is over. As a result, incumbency no longer holds the protections it once did.
- The revolution is based on innovations in business concepts: radical "reconceptions" of existing business models in ways that create new value for customers, rude surprises for competitors, and new wealth for investors.
- The need for business concept innovation stems in part from the diminishing returns of old ways of doing business — reengineering, cost-cutting, cutbacks, and the like — that focused on maintaining, rather than changing, the way business was conducted.
- Activists are leading insurrections within companies struggling to adapt an old business model to someone else's business concept innovation.
- Companies can reshape themselves into perpetually innovative organizations, by continually engaging in a cycle of idea generation, experiments, assessments and implementations.

Be the first to forge a path of innovation for your organization. Here's how.

LEADING THE REVOLUTION

by Gary Hamel

— THE *COMPLETE* SUMMARY

The Age of Progress Is Over

For years, people have held the unshakable belief that progress was not only possible, it was inevitable. Life spans would increase; material comforts would multiply; knowledge would grow. There was nothing that could not be improved upon.

This progress-centered mindset entrenched itself in business, and has become a stern taskmaster. Employees around the world have been strapped to the wheel of continuous improvement. With eyes glazed, they have repeated the mantra — faster, better, cheaper. Employees have found themselves working harder and harder to achieve less and less. This version of progress has made us cynical. We were promised relief from tedium; we got a white-collar factory. We were promised autonomy; we got reams of corporate policy. We were promised a chance to contribute, to be creative; we got reengineering and meetings that beat substance to a pulp.

We now stand on the threshold of a new age — an age of revolution. It will be an age of upheaval, of fortunes made and unmade at head-snapping speed. In effect, change itself has changed. In the age of progress, change happened by degrees and seldom spawned entirely new life forms. In the age of revolution, a company that evolves slowly is already on its way to extinction. In the age of progress, the industrial giants had time to recover if they were slow to pick up on change; the advantages of incumbency (global distribution, respected brands, cash flow) granted them the luxury of time. In the new world of continuous change, a company that misses a critical bend in the road may never catch up. Here are two examples:

● Motorola, the world leader in the cellular phone business, failed to address the shift to digital wireless technology for a year or two after its introduction to the marketplace. In that time, Nokia — a little-known company making snow tires and rubber boots on the edge of the Arctic circle — jumped in with the new technology and became the world's new number one.

● SAP's R/3 system helped companies integrate internal operations like purchasing, accounting and manufacturing. They missed the boat, however, when firms started using the Web to link up with suppliers and customers. Companies like Siebel Systems and Ariba zoomed passed them to stake out leadership positions in the market.

Incumbency has never meant less; there has never been a better time to be a rebellious newcomer, eager to upend industry dogma. Nonlinear thinking rules the day, supplanting the notion of "continuous improvement" that remains the secular religion of most managers — the idea that getting better is more important than getting different. In a nonlinear world, however, only nonlinear ideas will create new wealth; such innovation requires a company to escape the shackles of precedent and imagine entirely novel solutions to customer needs.

Business Concept Innovation

Such innovation is built around entire business concepts, rather than products or services. A few examples:

● Internet telephony is an entirely different business concept from dedicated voice networks, requiring different assets, technologies and pricing.

● Banks have lost nearly half their share of U.S. household financial assets to newcomers like Fidelity and Charles Schwab. Bankers thought of customers as savers; the mutual fund industry knows we're investors, too.

● The success of DirectTV is based on a business model that has no parallel in the old world of network broadcasting — hundreds of channels, programming menus, pay-per-view, and much more.

Even with these and many other examples, in most companies, management tends to interpret a call for "more innovation" as a plea for new products or added features to old products — a highly truncated view of innovation. Executives spent the '90s with such supposedly innovative enhancements to efficiency as process reengineering and enterprise resource management — hardly radical notions that had minimal effect on businesses as a whole.

The Age of Progress is Over

(continued from page 2)

Business concept innovation (the capacity to imagine dramatically different business concepts or dramatically new ways of differentiating existing business concepts) will be the defining competitive advantage in the age of revolution. Such innovation must come from maintaining a kind of constant activism — a passion and power for innovation. Activists are changing the shape of companies around the world. Authoritarian, control-oriented companies will continue to fall as creative, authority-averse, information democrats shape the companies of the future.

Dream, create, explore, invent, pioneer, imagine — do these words describe what you do? If not, you are already irrelevant, and your organization is probably becoming so. ■

How to Innovate Your Business Model

In the new economy, the unit of analysis for innovation is not a product or a technology — it is a business concept. Those who will have the greatest success in the age of revolution will be those who possess the capacity to reconceive existing business models (business concepts, put into action) in ways that create new value for customers, rude surprises for competitors, and new wealth for investors.

The goal of business concept innovation is to introduce strategic variety into an industry or competitive domain, going beyond incremental innovation to encompass the entire concept of a business as the focus of innovative ideas and practices. This fact makes business concept innovation more comprehensive than innovation focused solely on products or technology.

To be an industry revolutionary, you must develop the capacity to think about business models in their entirety. While there are many ways of doing this, the following framework provides a complete, yet simple view.

Major Components

A business model comprises four *major components:*

● **Core strategy.** How does your firm choose to compete? Your company's business mission (the objective of your strategy), its product or market scope (where you compete), and its basis for differentiation (how you compete, and how differently) are the components that comprise your core strategy.

To develop ideas for business concept innovation, ask yourself questions such as: Is our business mission as relevant to customers as it might have been in years past? Do we have a business mission that is sufficiently distinguished from the missions of other companies in our industry? Could we offer customers something closer to a "total solution" to their needs by expanding our definition of product scope?

● **Strategic resources.** Every significant competitive

(continued on page 4)

The Diminishing Returns of Traditional Strategies

The longest bull market in history produced extraordinary gains for shareholders and executives alike. But will the tactics used to deliver skyrocketing shareholder returns deliver the goods in the age of revolution? Consider the following:

● How much more cost savings and revenue growth can your company wring out of its current business model?

● How much longer can your company keep propping up its share price through share buy-backs, spin-offs, and other forms of financial engineering?

● How different are the strategies of the four or five largest competitors in your industry from your company's strategy?

If you answered "not much" and "yes" more than a couple of times, your firm and its business model may be reaching the point of diminishing returns, a condition brought about by unsustainable growth in the following areas:

Cost cutting. Downsizing, reengineering, restructuring — all are examples of efficiency-oriented programs that produce short-term rewards, but which eventually run dry. There's a limit to how much profit even the best-managed, most efficient company can squeeze out of any fixed amount of revenue.

Revenue. Profitable growth is a derivative of innovation. Focusing on growth, rather than on the challenge of business concept innovation, is more likely to destroy wealth than create it. The reason for this is simple: after a certain point, trying to squeeze more revenue growth out of a moribund business model is no easier than trying to squeeze out more costs.

Shareholder returns. To "unlock" shareholder wealth, you must get out of bad businesses (as Jack Welch did when he took over the reins at GE). Of course, there's a limit to how many bad businesses a company can divest and how many of its assets it can dump.

Consolidation. Hoping for a temporary respite from the law of diminishing returns, companies have been merging and acquiring at a record pace. Yet, in all this merger activity, the central question is: Where does business concept innovation rest in this strategy, and why could it not be achieved through more flexible means than a large-scale merger? In the age of revolution, making a deal is no substitute for radical innovation.

How to Innovate Your Business Model

(continued from page 3)

advantage rests on resources specific to the company in question. Dramatically changing the resource base for competition can be a source of business concept innovation. These resources include core competencies (what you know), strategic assets (what you own), and core processes (what you actually do).

Questions that could lead to innovations in this area include the following: What are the deep benefits that our core competencies allow us to deliver to customers? How could we deploy those benefits in new ways or in new settings? Could our strategic assets be valuable in other industry settings? Can we imagine a radically different core process that would deliver the same benefit? Could we use our process expertise to transform some other industry?

● **Customer interface.** The Internet has caused a radical shift in how producers reach consumers. The channels you use to reach customers, the information you provide them, the way you manage the dynamics of and interaction within your customer relationships, and the way you structure prices — all have changed significantly in recent history, and will continue to change in the age of revolution. To innovate in this area, ask questions such as: Could we make the process of fulfillment and support substantially easier or more enjoyable for customers? Have we given our customers the information they need to make empowered and intelligent purchasing decisions?

● **Value network.** The suppliers, partners and coalitions that surround your firm, complementing and amplifying your resources, make up your company's value network. Questions that might spark business concept innovation ideas include the following: How effectively are we using suppliers as a source of innovation? What opportunities might be available to us if we could "borrow" the assets and competencies of other companies and marry them with our own?

Bridge Components

The four major components are linked together by three *"bridge" components:*

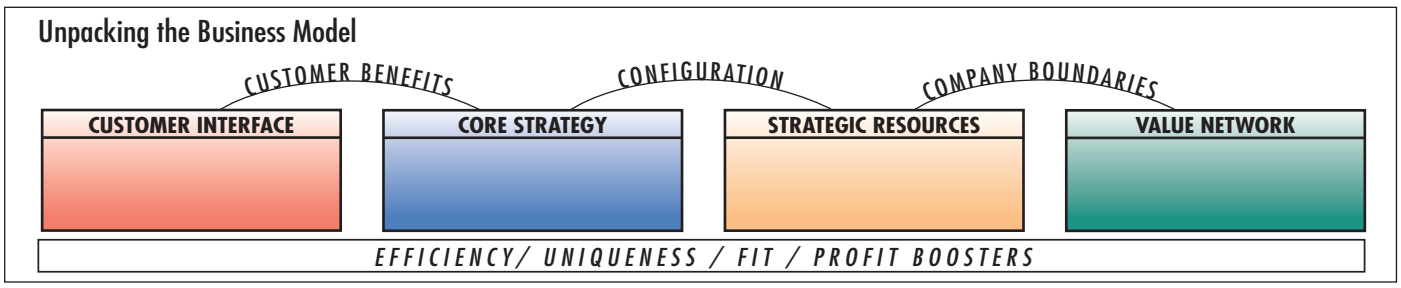
● **Configuration.** Intermediating between a company's core strategy and its strategic resources is the unique way in which competencies, assets and processes are combined and interrelated in support of a particular strategy. Ask yourself: Have we configured our assets, skills and processes in unique ways? Can we imagine very different configurations than what we have at present?

● **Customer benefits.** Intermediating between the core strategy and the customer interface is the bundle of benefits that is actually being offered to the customer — how customer-derived needs are being satisfied. Are you delivering benefits that customers don't really care about? Can you change the benefit bundle in ways that will surprise customers and frustrate competitors? These are two of the questions that business concept innovators will ask themselves.

● **Company boundaries.** Intermediating between a company's strategic resources and its value network are the decisions that have been made about what a firm does and what it contracts out to its value network. Changing the boundaries between what the firm will do for itself and what it will hire others to do is often an important contributor to business concept innovation.

Wealth Potential

Underpinning the business model are four *factors that determine its profit potential:*



● **Efficiency.** The value customers place on the benefits your business model delivers must exceed the cost of producing those benefits. To innovate in this area, test your assumptions about customer value and understand the costs incurred in providing that value.

● **Uniqueness.** The greater the convergence among business models, the less chance for profit; you must, thus, create a business model that is unique in both conception and execution. To do so, determine the points of difference across the major components of the concept, and the benefits those points will bring to customers.

● **Fit.** A business concept must be internally consistent — with all its elements working together toward the same goal. Keep from looking anomalous to customers by ensuring that all elements of the business model positively reinforce each other.

● **Profit boosters.** You need to know whether your

(continued on page 5)

How to Innovate Your Business Model

(continued from page 4)

business model will be really profitable. To ensure this, you must include in your business concept methods of increasing returns; locking out competitors; leveraging strategic economies of scale, focus and scope; and maintaining a strategic flexibility that allows you to address unpredictable demand cycles. ■

How to Start an Insurrection

Every day, dozens of organizations find themselves on the defensive, struggling to adapt an old business model to someone else's business concept innovation. But the future never arrives as a surprise to everyone in an organization — the novelty addicts, heretics and activists know tomorrow's opportunities are every bit as real and inevitable as today's sunrise, they simply don't know how to build a movement to evangelize those truths to their companies at large.

Companies don't sponsor step-by-step training programs on the principles of activism. Let's end this strange omission:

Step 1: Build a Point of View. As an activist, you need a point of view (POV) that identifies what's changing in the world, what opportunities make those changes possible, and what business concepts will profitably exploit those changes. This POV must be credible (based on unimpeachable data), coherent (with mutually reinforcing components), compelling (speaking to the hearts and intellects of others), and commercial (wealth-generating).

Step 2: Write a Manifesto. You must galvanize others with a contagious manifesto that 1) convincingly demonstrates the inevitability of the cause — why it is right to take action; 2) speaks to timeless human needs and aspirations — why people should care; 3) draws clear implications for action — gives a place to start; and 4) elicits support — shows people how to contribute.

Step 3: Create a Coalition. Recognize that you are not the only prescient, frustrated, though ultimately loyal person in your company. Identify potential recruits, building a kind of all-volunteer army to push innovation forward, and upward.

Step 4: Pick Your Targets and Your Moments. Find someone in your organization who can yank the real levers of power — someone who can say "yes" and make it stick. Understand what makes them tick and carefully pick a moment to go to that individual and present your idea. Keep it simple; make it easy to say "yes."

Step 5: Co-Opt and Neutralize. You will be forced to co-opt some of your company's aristocracy in order to advance your cause. In these cases, create win-win scenarios, rather than confrontations; getting on a soapbox and ranting at VPs will only get you so far.

Step 6: Find a Translator. Get someone who is plugged into the future, who may be shopping around for an interesting point of view to sponsor — a senior staffer or newly appointed executive in search of an agenda to make their own. Have that person carry that agenda from you and your coalition to the top management echelon in your organization.

Step 7: Win Small, Early and Often. Demonstrate how well your ideas actually work, starting with small demonstration projects and progressing incrementally until you have a string of successes to which you can point as proofs of achievement.

Step 8: Isolate, Infiltrate, Integrate. Experiments that stay experiments are failures. Convince a broad cross-section of key executives that your concept is essential to the future of your company. Infiltrate your organization with papers, projects and presentations that will allow others to share in your enthusiasm and allocate resources to make the concept happen. If your opportunity involves innovations in an existing part of the business, search for projects that will aid in the development of your innovation and integrate your ideas into them. ■

Novelty Addicts and Heretics

A whole lot of what's changing in the age of revolution simply can't be seen from where you're sitting; you have to get up, search for new experiences and learn new things. You must keep surprising yourself. What you don't know but could know is much more important than what you don't know and can't know. You must become a novelty addict.

It is, of course, not enough in the age of revolution to simply be a novelty addict — you must be a heretic as well. Heretics, not prophets, create revolutions. There is an enormous danger in viewing what's changing through the lens of what already is. It is virtually impossible to redesign business models without challenging the dominant business model of the moment, and the mental models that reinforce them.

The challenge ahead of you as a heretic is to break the construct of the mental model, to embrace the future not as an unknowable entity, but a different one. If you question the mental model — look for evidence that refutes its status quo ideas and methods — you will be able to challenge the very foundations of what others regard as axiomatic. Some consider it heresy; others consider it revolutionary.

The "Gray-Haired Revolutionary"

Most visionary companies won't be visionary more than once; particularly in the new economy, success is not easily repeated. Most have no sense of how to engage in constant innovation and will, thus, likely fold when they can no longer live off their inaugural successes.

The "gray-haired revolutionaries" — the rarest of all breed of company — have managed to reinvent themselves and their industries more than once. Their gray hair comes not from years, but from the experience of having lived through several strategy "lifetimes." They have done more than extend a legacy or enlarge a franchise — they have turned themselves and their industries inside out and upside down, repeatedly.

Charles Schwab is just such a gray-haired revolutionary. Years ago, the brokerage giant created a whole new industry — the discount brokerage industry — by undercutting the steep fees of traditional brokerage houses. They started a second revolution when they created OneSource — a mutual fund supermarket that let investors choose from over a thousand funds. But it is its status as the leading online broker that makes Schwab one of the great gray-haired revolutionaries. With 3 million Internet customers representing more than $260 billion in online assets, Schwab recast itself as a new kind of full-service broker. The company's business concept innovation rests on a few foundations; among them are:

● Outrageously ambitious growth objectives that are unattainable without business concept innovation. From 1993 to 1998, the company's revenues grew at an average annual rate of 23 percent; its earnings a robust 24 percent. During the same period, its stock price skyrocketed 1,072 percent, compared to 218 percent for Merrill Lynch and 164 percent for the S&P 500.

● Working from the customer in, rather than from existing processes and offerings out. While other institutions seem to look on customer ignorance as a profit center, Schwab presumes customers are really smart; consequently, the company doesn't try to fool customers on fees or execution.

● An innovation meritocracy where great ideas win out, no matter where they come from. Champions of innovation have been consistently promoted out of rank and out of order, rewarding people who come up with ideas and do something with them. ■

Playing the Target Game at Sony

Ken Kutaragi had a hard time convincing many people at Sony that his idea for a sophisticated digital video game system was a good one — most folks at the company snobbishly considered such systems to be toys. Kutaragi established a target relationship with Shigeo Maruyama, a disciple of Sony's president (and eventual CEO) Norio Ogha. Maruyama helped Kutaragi lobby the company president to approve a development group to create a new video game technology. The result was PlayStation — the first system to combine 32-bit processor technology with advanced graphics and decompression. In 1998, the "toy" system was responsible for more than 40 percent of Sony's profits.

Ten Design Rules for Innovation

The intricate play of the many markets that comprise the global economy and the vibrant diversity of the Internet both show us how order can emerge in the absence of an overt, central authority. Complexity theorists have demonstrated that by creating the right set of preconditions, one can provoke the emergence of highly ordered things, using top management to design the context of innovation, rather than the content. The following 10 rules will help build habitually and perpetually innovative organizations:

1. Unreasonable Expectations. The beliefs of an organization set the upper limit of what innovation is possible at that organization. If most people in your organization believe your rate of annual growth should be 5 or 10 percent, then it will be that or less. However, if your people aim higher — and set goals that reflect that higher reach — your company can do more than just aspire to outperform the mere average — it can achieve its highest expectations, time and again.

2. Elastic Business Definition. If your organization is bound by a narrow self-concept, its opportunity horizon will be likewise constricted and never changing. This mind frame would never work at a company like Virgin, which spans industries as diverse as air travel, packaged holidays, retailing, banking and radio broadcasting. If, like Virgin, your organization searches for unconditional opportunities and innovative, elastic business concepts, your opportunity horizon will likewise expand.

3. A Cause, Not a Business. True revolutionary innovators must draw much of their strength from their allegiance to a cause that goes beyond themselves, beyond even growth or profits. Without a transcendent purpose, individuals will lack the courage required to act like revolutionaries. Energy giant Enron's corporate mission

(continued on page 7)

Ten Design Rules for Innovation

(continued from page 6)

is fueled by an outrage that so much of the energy business was a government-mandated monopoly. Their innovative expansion of their business boundaries stemmed from an effort to better address the needs of their customers.

4. New Voices. If senior management wants revolutionary strategies, it must learn to listen to revolutionary voices. To do so, it must:

- Let youth be heard. Do not prevent the group with the biggest emotional stake in the future — young people — from contributing to the process of strategy creation.
- Listen to the periphery. The capacity for radical innovation increases proportionally with each kilometer you move away from a company's headquarters. These people tend to have fewer resources and, thus, tend to be more creative than those in close proximity to HQ.
- Let newcomers have their say. Next time you have a meeting on strategy or innovation, make sure half the people invited to the meeting have never been invited to such a gathering before. You'll quadruple the chances of coming up with a revolutionary business concept.

5. An Open Market for Ideas. Free the entrepreneurial spirit inside your company by creating a dynamic internal market for ideas. Tear down physical and organizational walls that would hinder innovation from being broadcast.

6. An Open Market for Capital. Don't set hurdle rates for new projects, if the ideas and plans behind those projects are innovative, sustainable and will reap some financial benefit.

7. An Open Market for Talent. Companies pursuing innovative opportunities attract the best talent. If you give people exhilarating work and solid compensation, they will join you and stay with you.

8. Low-Risk Experimentation. Being a revolutionary doesn't mean being a big risk taker. Be bold, but know how to manage the downside, if a risk doesn't pan out. You can be innovative and still limit your risks.

9. Cellular Division. Innovative companies are not monoliths; they are big companies that have been divided into a large number of revolutionary cells. When companies stop dividing and differentiating, innovation dies and growth slows. When Virgin Records started showing signs of lethargy, the company's CEO, Richard Branson, took three deputy managing executives and made them the nucleus of a new company. While Virgin is the largest independent record label in the world, it does not feel like a large company.

10. Personal Wealth Accumulation. If you want to maintain an entrepreneurial spirit at your company, you must pay people like entrepreneurs. In 1998, SAP refused to create a stock option plan for its American management; the company subsequently endured a wave of defections. ■

GE's Elasticity

After years driving home the message that a GE business must be number one or two in its industry, CEO Jack Welch has shifted the focus of his company's leaders toward looking for opportunities outside the boundaries of the businesses they manage. GE's business heads must redefine their markets so that each business has less than a 10 percent share of its market — a strategy that signals Welch's belief that only companies with expansive, elastic boundaries will grow faster than their competitors.

The New Innovation Solution

While the 10 design rules and the principles of activism are parts of the innovation solution, there are other parts that are equally important:

- **Skills.** Your company has virtually no chance of leading the revolution if the people in your company do not possess mind-sets and skills that have been retooled to meet the demands of the revolution. They must understand the role revolution plays in wealth creation. They must be able to invent new business concepts and reinvent old ones. They must understand how to apply the design rules for innovation in their parts of the company. And these are just a few of the skills required to lead in the age of revolution.
- **Metrics.** Your company must have in place methods and tools to measure innovation (versus optimization) and personal performance (as it relates to innovation), as well as benchmarks against which to measure competitors on innovation.
- **Information Technology.** You must have an innovation network — a corporate-wide IT system designed to support innovation. This might include information to help employees build their ideas into concepts, and a process in place to help them "edit," or fine-tune, their efforts.
- **Process.** Companies that have reengineered their core business processes for efficiency are now going to have to reinvent their core management processes for innovation. Management processes are designed to enforce conformance, alignment, and continuity. Their purposes must be identified, their biases (toward budget or against risk) broken, and their focus shifted toward nonlinear innovation and wealth creation. ■

The Wheel of Innovation

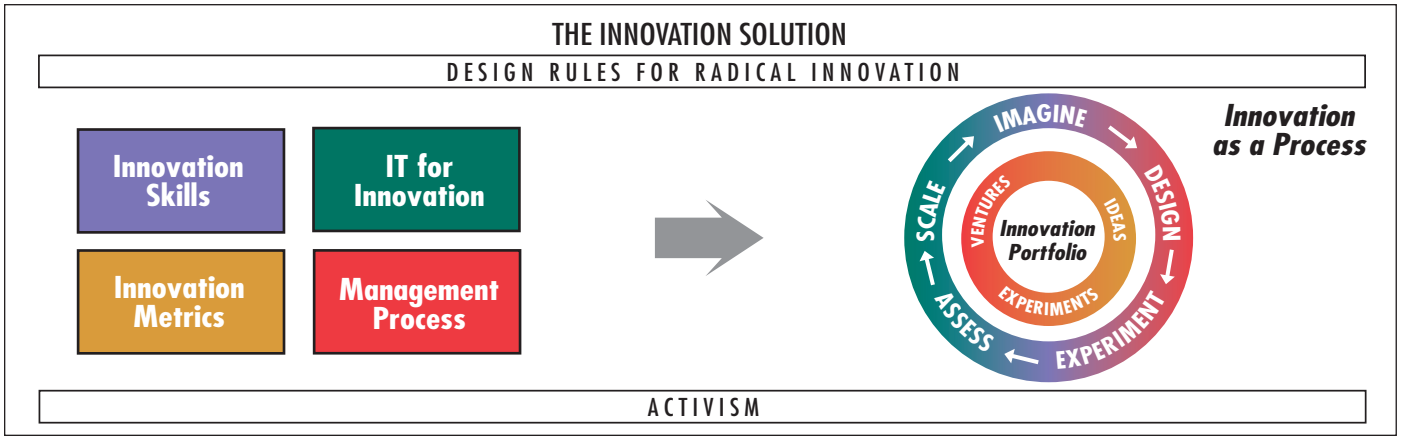
Since innovation is a dynamic process, it is constantly kept in motion with IDEAS:

- **Imagining new possibilities.**
- **Designing coherent business models around those ideas.**
- **Experimentation (on a small scale) that tests the viability of business concepts, creating the basis for adapting those concepts.**
- **Assessment of what is learned through the experimentation.**
- **Scaling up if the results are sound; going through another experiment cycle if more assessment must be done.**

The speed at which a company gets the wheel of innovation turning determines the amount of new wealth it creates. Potential innovators must, however, know how to support their ideas with coherent, profitable business concepts. Such is the difference between having too many ideas and having coherent strategic options.

The faster a company can go through a cycle of experimentation, assessment and adaptation of business concepts, the faster it can resolve any initial or lingering uncertainties about the concept and turn the concept into a viable, cash-generating endeavor. The company must also put customers in the role of co-developers in bringing business concepts to fruition, to help the company identify problems and opportunities alike. In the age of revolution, it's the only way to stay ahead of the innovation curve.

The Innovation Portfolio



When top management views the company as a portfolio of businesses, it seldom applies the logic of portfolio investing (minimizing risks by diversifying investments) in business concept experiments. Every new idea or concept cannot yield a bonanza. By the same token, having a bias against anything with the slightest hint of downside ensures a company will never find anything with an amazing upside.

There is no way to become a wealth-creating superstar without first building and then investing in an "innovation portfolio," allowing you to scale up to the original innovative idea and create exciting, inventive new ventures. Thus, your innovation portfolio is divided into three smaller portfolios:

- **A portfolio of ideas.** The Imagine and Design phases of the Innovation Process fill a portfolio of ideas, or of possibilities — business concepts that are held, nurtured, then released when the time and resources are right.
- **A portfolio of experiments.** Ideas that have great upsides, offer the chance for increasing returns, and are sponsored by truly passionate advocates fill the portfolio of experiments — ideas that have been worked into coherent versions of a business concept. For every 1000 ideas, perhaps 1 in 10 will have enough merit to be turned into experiments; a portfolio of 1000 ideas will thus yield a portfolio of 100 experiments.
- **A portfolio of ventures.** Once you have identified and reduced market and technology risks in the experimentation stage, you must focus on the feasibility of the profit and operating models, as opposed to the business concept itself. You must also look for partners who can provide financial commitments, skills and assets required (if you can't fill them in-house), and a gauge of the size of your strategic window, to fend off preemption from competition. This is also the stage in which to decide whether to operate the new venture as a standalone business, license it to another company, or spin it off as an independent entity.

The Total Innovation Solution

Your total innovation solution keeps you committed to the new innovation agenda, one that includes continuous improvement as well as nonlinear innovation, and product and process improvement as well as business concept innovation. Are you ready to start working on the new innovation solution? Either start now or wait and fight a rear-guard action. What's it going to be? ■

Low-Hanging Fruit

77 Eye-Opening Ways to Improve Productivity and Profits

by Jeremy Eden and Terri Long

THE SUMMARY IN BRIEF

In just about every area of life, we tend to think there are only two possibilities: accept things the way they are, or put in a lot of effort, time and money to make things better. *Low-Hanging Fruit* is about a third possibility. What most people don't realize is that there are dozens of easy, affordable and quick ways to make things better. We can pluck this "low-hanging fruit" every day to save time and money right away.

Step inside any organization, even a very successful one, and chances are good that you'll find a lot of waste if you know where to look. From providing a feature that consumers don't care about to doing an outstanding job on daily tasks that only require "good enough" performance, there are countless areas where resources simply go down the drain. Jeremy Eden and Terri Long have distilled 77 of their most effective techniques for generating real performance improvements drawn from their success working with major companies.

If you think you don't have the resources to be faster, better and more profitable, think again. Whether you are a member of a small team or an executive of a multinational company, you will learn from *Low-Hanging Fruit* how to identify and solve hidden problems.

IN THIS SUMMARY, YOU WILL LEARN:

- How to uncover the low-hanging fruit in your organization.
- How to use a simplifying philosophy to identify the best problems to solve and not waste time on others.
- How to motivate your company to go after the most promising solutions.

THE COMPLETE SUMMARY: **LOW-HANGING FRUIT**

by Jeremy Eden and Terri Long

The authors: Jeremy Eden and Terri Long are the Co-CEOs of Harvest Earnings Group, headquartered in Chicago. They have worked with the CEOs of a wide range of companies in both size and industry to guide their teams through a galvanizing earnings-growth process. Some of the companies include PNC Financial, H.J. Heinz, Manpower, The Schwan Food Company, Energy East, Webster Financial and Standard Register, among many others.

Introduction

Picture this: you are packing for a vacation. You carefully put everything you need into your luggage. You try to shut it, but the zipper has other ideas. It...will…not… budge! Maybe if you put all of your weight on it you can squeeze it shut.

The problem is that along with all your stuff, you were also packing air — a lot of it! That air takes up room and causes trouble. Sure, you tried to get rid of some of the air — you sat on your luggage. But you gave up quickly.

What makes air our worst enemy is that it is invisible. Because we can't see it, we don't try to get rid of it. Just imagine if your suitcase were filled with red sand instead of air! You would work hard to get rid of it.

Companies "pack air" in their processes. Managers and management practices give up way too quickly trying to squeeze it out. As your processes multiply over time, so do the pockets of air! We have helped thousands of business leaders by turning their invisible "packed air" into visible "red sand."

Low-hanging fruit is supposed to be easy to pick. It represents the actions that will improve your earnings without risk and without much effort. Unfortunately, cost cutting often leaves the low-hanging fruit and instead just lops off branches without regard to what is left of the tree.

True low-hanging fruit *is* within your reach. Harvesting low-hanging fruit produces bigger results with much less risk than those big projects on which companies rely, like strategic transformations and enterprise-wide systems! Individual pieces of low-hanging fruit come in all sizes — from those worth millions of dollars to those worth just a few thousand dollars. Collectively, it is your growth engine! Here is your guide to harvest as much as possible.

Seeing the Problem Is Harder Than Solving the Problem

Solving problems starts with *acknowledging* those problems. If you truly believe that invisible problems surround you, you are far more likely to find ways to see them.

Put a Price Tag on Everything to Stop the Waste. Imagine if everything your company did had a price tag, stamped on every section of every report, telling you how much it cost, and on every record of every transaction. Putting a mental price tag on everything helps to place the focus on solving problems that matter.

"Value Engineer" Your Products to Eliminate What Your Customers Won't Pay For. Value engineering is a powerful process used to discover and eliminate all of the elements in a product or service that customers do not value but that cost the company money. For example, when applied to a food product, value engineering can result in changes to various ingredients or packaging that save the company money while maintaining or even improving customer satisfaction.

Ask "Why?" Five Times to See the Real Problem. To understand how the world works, scientists are willing to ask, relentlessly and repeatedly, "Why?" Force yourself to ask why until the person you're asking says, "I don't know." This usually happens by the fifth why. Then find the answer. That is when you will make real progress toward finding the right problem to solve.

Ask "How Do We Know That Is True?" Much of what people believe they know just is not so. Ask this question even when you do not think it is necessary. Asking it will quickly go from being awkward to feeling

very natural. Don't be satisfied with anything less than fact-based information.

Tag It to Bag It: Name a Problem to Help Everyone See It. Waste often masquerades as work. It takes practice to see this waste. A good way to help your team see it is to have them give names to different kinds of waste. Then ask your team to look routinely for those sources of waste by name.

Turn Metrics Upside Down. Try reversing your metrics, and start focusing everyone's attention on solving the problems that remain rather than success achieved: Focus on the 10% *dissatisfaction* rate, the 65% *unserved* market share, and the 7% of projects *not completed on or ahead of time and budget*. Accentuate the negative!

The 80/20 Rule. Undertake an 80/20 analysis to identify the small set of causes that lead to a large portion of the effect. You can dramatically reduce the number of problems you need to solve while still gaining large benefits.

Find Quick-and-Dirty Data to Get Refined Results. Many managers feel they are limited to the data their systems provide. Do not let that be an excuse. Know what you want to measure. Then find a way to get the information you need.

Benchmarking Is a Mistake. Benchmarking supposedly works by knocking down your resistance to change, by compelling you with hard facts that someone else is performing better, which then motivates you to find the specific actions someone else is doing that you should be adopting. Benchmarking is usually a complete waste of time, because invariably no one is doing exactly what you are doing. The measurements are not comparing apples to apples.

Use Brainstorming in a New Way to Find Problems, Not Solutions. Brainstorming is a powerful way to give everyone permission to raise problems without being viewed as just complaining. It also helps everyone get into the flow of seeing waste that has been masquerading as work.

Now That You See It, Solve It!

The average employee today has succeeded by embracing change. But most people do resist *bad* change, and in business there is a lot of bad change. Good change does not meet resistance. What you need is a carefully designed process that engages the talent you have.

Ask the People Closest to the Work for Their Ideas. Your employees are an extraordinarily rich source of solutions. Invite those closest to the work and closest to the customer to specific problem-solving sessions with experts.

Get Out of Your Office and Go See for Yourself. Actually watch how the work gets done, or, even better, do some of it firsthand. Ask "why" a lot as you watch and work. Actively look for sources of wasted time and effort.

Stop Ignoring Your Introverts. Businesses nurture and reward extroverts without realizing that it is the introverts who are often critical to the problem solving that drives innovation, productivity and profits. Here are three practical steps to help nurture your introverts: 1) Solicit more input privately. 2) Train managers to use better meeting protocols. 3) Assign introverts to lead special project teams.

Turn Complaints into Collaboration: Interdepartmental Job Swap. Go to a unit that uses what you produce or a unit that produces something that you use. Ask the managers if they will swap one of your people for one of theirs for a few days or a few weeks. Then share observations.

Other People Have Great Ideas. Ask new hires to point out things your area is doing that other companies seem to do better. Arrange brown-bag lunches, conference calls or one-on-one interviews. Vendors know your company, they know your industry, and they see what other companies like yours are doing. They also want to make you happy. Ask them nicely, and they can tell you lots of places where they see waste masquerading as work.

Does Your Customers' Journey Take Them on a Road Full of Potholes? Imagine being a customer. Now list every interaction you have, from becoming aware of the company, to making a purchase, to using the product, to paying the bill, to making another purchase. Write down three pieces of information for each item on the list:

- Which departments directly or indirectly affect how that item is carried out?
- How painful is the step for the customer?
- How important is the step to the customer's buying decision?

The Unintentional Squelch. Here is one power that never goes away: the power to kill ideas. The only surefire response from a manager who wants an idea to move forward is to say, "I want you to analyze this idea and get back to me on [fill in date] with a progress report." Then that follow-up must be scheduled.

Stop Brainstorming to Find New Ideas That Move the Profit Needle. Brainstorming is great for finding problems but not for solving them. Engage from

three to seven experts who follow a well-structured meeting guide to focus very specifically on developing a few good ideas to solve a specific problem.

Making Problems Harder Can Make Finding Solutions Easier. "Think outside the box" and "draw outside the lines" actually inhibit creativity and innovation. Give the brain restrictions, and it will do a better job finding solutions. It is much easier to come up with realistic, practical solutions to a narrow problem than a broad one.

Use a Checklist. Use this checklist to follow the right order to find good solutions. Start at the top.

- Eliminate work
- Simplify processes
- Match task to skill
- Reorganize
- Automate
- Outsource

Turn the checklist into a corporate mantra.

Actually…Just Don't Do It. "Zombie projects" that should be killed but live on use up valuable time, while the better projects are delayed. Institute a regular "sunset" review that poses the question, "With what we know today, will we make more money by stopping this project rather than by completing it, so we can use the time and money on a better one?"

Give People What They Need, Not What They Want. When people higher up the food chain ask you for a special report, a new analysis or some other time waster, do you roll your eyes? You might be able to suggest alternatives that are not only easier for you but also more helpful to them. When asked for help, make sure you understand what problem needs to be solved.

Simplify. Steve Jobs offered a vastly simpler product line than his competitors and offered far simpler products. Systematically identify the biggest causes of complexity in your business. Then simplify your process, products or services by eliminating as much complexity as you can.

Push Work Down to the Lowest-Paid Person Capable of Doing It. Right now, there are highly skilled people in your company who are doing low-skill tasks as part of their job. Ask your team to list the tasks they do that they think someone junior (and less expensive!) could do just as well. Reassign the tasks down to the junior people, and free up time of the more senior people. Now the hard part: Either find a way to use the freed-up time to actually add hard dollars to the bottom line, or eliminate some of those senior positions.

Take Simple and Low Tech Over Sexy and High Tech. "Think outside the box" is supposed to be the secret of innovation. But thinking outside the box often leads to unnecessary risk taking. That is why we say, "Think inside the box."

Go No Tech Over Low Tech. Before asking for or approving new technology (even low tech), ask yourself how much of your goal you could achieve without any technology by changing a policy, adding low-cost head count, redesigning your product or service, reorganizing or eliminating the work, learning that customers don't value the higher quality that you would get from new technology.

Borrow Good Ideas. Take facts you already know, and figure out how to combine them in new ways or apply them to new problems.

Force People to Get Help. Some managers just "don't know what they don't know." Some know they need help but fear asking. Others think there is no budget for help. Is there a problem that has been festering in your company for months or years? Are your managers or your continuous improvement department getting the job done? If not, they probably need help.

Motivate Your Team to Harvest Low-Hanging Fruit

Good ideas come as the result of many people throughout the company trying hard to see and solve problems. Motivating managers is the single most important element to growing earnings. The good news is that it is also the easiest to get right.

Create an Idea-Based Budget. Create an idea-based budget, which starts with today's run rate and gives every specific idea that will be implemented — not in big broad strokes but in specific solutions to specific problems. The result is a budget that can be trusted.

Five Surprising Words. The five surprising words that stop good executives from being great leaders are, "I want everyone on board." If the team has compelling facts, those facts should be used to make the decision. What leaders should not do is allow *opinions without facts* to substitute for their own good judgment. When you hear these non-fact-based opinions, it is time to make the decision, even if some of your team members are not on board!

If You Want the *Money*, Spend the *Time*. According to research, for every additional 1 percent of time a CEO spends with employees, productivity goes up 2.12 percent. When you walk the walk, you are doing so on a two-way

street. In one direction, you motivate managers through inspiration, passion and expertise. In the other direction, your teams will teach you about what is really going on in the company.

Execute Motivators That Demotivate Everyone Else. Do not hold a fancy off-site management retreat where managers fly off to some resort, while you're preaching the importance of getting more from how the company spends its time and money!

The Corporate Imposter Syndrome. Fear and pride ruin earnings. The company asks you to unveil all the ways in which your area could perform better. Do you welcome this opportunity to show how much more you can do? Or does your pride in what you have done in the past make you defensive? Acknowledge this fear before you ask everyone to find new problems to solve.

Improving the Company Should Be Everyone's "Job One." Give your managers new job titles and job descriptions in addition to the ones they have now. The second title job description clarifies the specific role for which that person has authority and accountability. Give your direct reports responsibility for leading problem resolutions in their areas.

Sweat the Small Stuff. Details are both extremely important and very hard to get right. You need to really pay attention to detail. Start a new habit of asking people about a detail of your processes or products. Then ask for ideas on how to improve that detail.

Rally the Troops. A powerful call to arms must paint a clear picture of why you want everyone to join in your fight. Motivate your employees by telling them what you will buy with the money they find to make the company bigger, stronger, more important and, yes, more profitable.

Catch the Vision or Catch the Bus. Grade all your direct reports on their commitment to your goals. To get an A, they need to support all the goals publicly and proactively take actions to achieve the goals. Do not tolerate team members who are not committed. Even a strong head of sales who consistently undermines your goals to improve the company cannot be tolerated.

Eliminate Corporate Whac-A-Mole. Go to the corporate cafeteria and sit with a few of your managers. Ask them to tell you what hurdles they face trying to get good ideas approved. You want a flavor of what analysis they must do, with whom they must meet, who must sign off, how long it takes and so on.

Beat the Competition by First Beating Your Teammates. A very powerful way to motivate your peers and subordinates is to set up a friendly competition, all in the service of acting as one cohesive and focused group. Let everyone know that they are competing against each other to show who has the best problem solvers.

"Blame the Other Guy" Syndrome. "Blame the other guy" syndrome is a silent killer of motivation. It is important to have everyone acknowledge that they believe *someone else* is the problem. Then give everyone a high target to hit.

Why Paying Attention Pays Staggering Dividends. When someone new starts paying attention to our work, we work harder and better. When it is someone in power, the effect can be truly dramatic. Create a steering committee to pay attention to all of the teams working on ideas to improve productivity and profits.

Firings Can Boost Motivation. The bottom 5 to 10 percent of most organizations is filled with people who are just not very good at their jobs. Others begin to say, "Why should I bother? The boss doesn't seem to care how well we perform." Work with your team to determine how to eliminate and streamline your work so that you no longer need the positions filled by low performers.

One Company — It's Not an Impossible Dream

We recognize that blazingly fast and immensely powerful digital information systems are necessary to run large enterprises. However, our dependence on them has distracted us from realizing that there is a vastly larger human information system composed of your employees. Learning to use that human system *even slightly better* than your competitors provides you with an extraordinary advantage.

Collaboration is required to share information fast and accurately so that hidden truths can be revealed and false assumptions eliminated. Many good ideas are stuck in the pipeline because even motivated and skilled problem solvers are stuck when they cannot get the information from someone else.

Form a Steering Committee to Make Sure the Left Hand Knows What the Right Hand Is Doing. Successful companies actually need strong functional units that have *competing* needs. The real problem of improving collaboration is finding projects and ideas where there are only winners! These comprise the low-hanging fruit that teams across units like working on and that produce a stronger company. A steering committee should collectively review and approve all ideas as a team. There is absolutely nothing more powerful than having the heads of

two functions sitting together and telling their teams how to work together to solve a problem.

"Pocket Fisherman," Yes, "Pocket Veto," No! In most corporate environments, the advocates of change bear the entire burden to prove the case for their idea. Those opposed to the idea can usually kill it just by doing nothing. We call this the pocket veto. Shift the burden of proof by changing the decision-making process. If advocates can show how their idea will add to earnings, the opponents must bear the burden of explaining why the idea should not be approved, by using facts — not power, politics or position.

Hold Collaboration Workshops. Collaboration workshops deliver new revenue and/or cost savings. They are highly structured to share information that will lead to low-risk ideas that generate earnings. The planning and design ensure that these meetings are extraordinarily productive.

The One Monthly Meeting You Must Hold. Most of the time, priorities are actually set subconsciously by watching how leaders behave rather than by listening to what they say. If leaders personally engage to support implementation, then it will be clear to everyone that implementation is a priority. It only takes a little bit to go a long way. Even just one hour every month or two is plenty to create the accountability that will close the gap between the promises of approved ideas and the actual delivery.

Celebrate Good Times, Come On. Celebrating success is essential to building a culture of "one company" and of innovation. Nothing says, "I know who you are, and I appreciate what you've done" quite like *saying*, "I know who you are, and I appreciate what you've done." Include as many contributors as possible — don't forget the junior people.

Decide and Deliver

The worst chokepoint in an idea pipeline is the decision-making stage. Few companies have designed a specific process to make it easy and fast to approve good ideas. And when it comes to implementing change, studies confirm that what is promised is not delivered! Track and hold people accountable to their promises. Also, stop the obsessive emphasis on developing a few big, transformational, sexy, multiyear, multimillion-dollar, strategic-imperative projects. Instead, start focusing on harvesting large numbers of good ideas. These projects usually deliver as promised — or even a little better.

The Three Essential Parts of a GOOD Idea. They deliver hard-dollar financial benefits, net of any investments. They deliver benefits that clearly outweigh any risks (typically because there is little or no risk). They have the consensus of all relevant areas of the company that the idea should be approved. GOOD ideas are those for which facts are available, and those facts are used to build consensus.

The Miracle of Deadlines. Short deadlines squeeze out procrastination time. Establish an aggressive date for a decision as one of the early steps in developing the idea. A date creates a deadline that prevents ideas from dying a slow death.

For Big Results, Focus on Small Ideas. Small ideas are usually a lot easier to implement on time and on budget than large ideas. A focus on creating big, transformational plans distracts from the far more rewarding effort of finding many smaller ideas.

Fight the War With the Army You Have, Not the One You Want. Employees will develop ideas within their current skills and strengths. Focus on the great ideas that play to your strengths before worrying about the ideas that play to your weaknesses!

Add to Your Army Only When Necessary. Sometimes you need to implement ideas that take skills that you don't have. Or sometimes the payoff is big enough to warrant buying new skills.

Create an "Idea" Flight Plan that Coordinates Implementation. Create a master plan for the company whereby all of the different initiatives are coordinated so that the overall plan delivers the highest earnings with the least disruption. The plan becomes the promise that everyone is on board to deliver it.

Make Sure the Buy-In Is Built In. Those who plan the battle rarely battle the plan: Engage employees closest to the work and closest to the customer to develop ideas. It is natural human behavior that we must invest our own effort to feel ownership and pride.

Accountability: The Holy Grail!

People must face consequences that matter to them if they fail to deliver on their promises. Too often, managers talk a good game, but in reality they let their people off the hook. Without real accountability, all is lost!

Track Every Idea, Every Dollar, Every Month. A good tracking system must answer four questions: Who is accountable for delivering financial benefits on time and

on budget? What are the specific actions and financial benefits that must be delivered? When will the actions be completed, and when will the benefits begin? Why are specific benefits different than promised? You must have someone who is in charge of tracking, and that person must have the authority to determine whether ideas are, in fact, delivering the promised financial value.

The Golden Rule — Withdraw and Replace. If an idea is going to fail, then the owner of the idea needs to get approval to withdraw it. To get that approval, the owner also needs to *replace* the withdrawn idea with a *new* idea that will deliver the promised hard dollars.

Follow the Money All the Way to the Budget. Remember "Put a price tag on everything"? If you follow the money all the way to the end, it takes the form of valuing each idea by line item. This level of budgeting precision does more than ensure that you can incorporate the value of ideas into your budgets and track them. It also creates the rigor needed to promise hard dollars.

Don't Let Someone Else Dictate the Value of the Ideas You Implement. No one would think of getting approval for using outside vendors without getting a price. Similarly, no one should get approval for using internal support without getting a price. Do not let anyone make financial commitments that someone else has to deliver.

Want to Actually See the Earnings? Lock the Vault. Many companies complain of the "water balloon" effect — costs get pushed down in one place only to rise in another. There is a simple reason that this happens. The improvement process provides discipline to a source of new funds, but there is not sufficient discipline applied to the use of funds. Lock the new earnings in a vault that can be opened only by submitting new ideas through the same rigorous idea process described above.

Track Your Position Plan. Position tracking shows the variance, by position title and job grade, between the exact number of positions one should have and the number actually in the payroll system. It is very helpful to ensuring that the costs pushed down in one place don't bulge out, water balloon style, somewhere they shouldn't. Variances occur only when managers are not willing to promise benefits, but they still want to hire.

It's Not What You Start; It's What You Finish. There are more worthwhile projects than there is time to accomplish them all. Change the focus from the common projects in process to the important projects finished.

Make Sure You Get the Return. You likely know how much you have invested in technology in the past three years. Do you know the actual benefits that have been delivered to the bottom line? Do you know how the actual results compare to the original promises? Is someone tracking it? If not, then no one is being held accountable … and that is a problem.

Learn From Your Mistakes. An after-action report tracks promises versus delivery and provides the reasons why projects fall behind or deliver less than expected. You may find it unpleasant to rehash failure, but the rigor and discipline are important parts of transparency.

Need More Time? It's Easier to Find Than You Think!

Eisenhower said, "What is important is seldom urgent, and what is urgent is seldom important." Only when you strengthen the connection between making money and your activities can you clearly distinguish between the important and unimportant.

Everyone Is Entitled to Their Own Opinion but Not Their Own Facts. When you meet, make sure that all conflicting points of view — based on a single set of facts — are in the room. Require all factions to work together to establish facts. Then have a short meeting with all factions present to decide which position these facts support.

Replace Agendas with Game Plans that dictate the critical preparation required before the meeting, the specific actions required during the meeting and the follow-up required after the meeting.

Ban Meeting Tourists. A business meeting is not a date, but you should treat it just as seriously. Who should be there, and why? Bring exactly the right people — no more and no less. If the right people can't make it, cancel until everyone with a crucial role can attend.

Don't Have a 60-Minute Meeting to Do 22 Minutes of Work. Start scheduling meetings just for the time you absolutely need — maybe that is only 10 minutes, or maybe it is 40 minutes. Watch the clock. Use a countdown clock displayed on a laptop, and assign a timekeeper.

Use Hard Starts, Not Just Hard Stops, for Your Meetings. Starting on time must become part of corporate culture to be effective. Have the most senior person attending the meeting show up on time and start the meeting on time.

The Obligation to Dissent. Conflict is critical to progress. Unfortunately, most people and organizations are wired to avoid conflict. Remind everyone, including yourself, that they have an obligation to dissent if they

disagree with an action being taken, or even if they are simply unsure.

Talk More, Email Less. Email is a very efficient way to distribute information but a very inefficient way to resolve some issues. It takes far less time to have a short conversation that gets to the heart of an issue than to write a series of emails.

PowerPoint Kills. Replace PowerPoint presentations with simple, standard formats that focus on the key information necessary to make decisions.

Schedule a Little "Me" Time. Every few days, schedule 30 or 45 minutes of quiet time — no phone calls, no drop-in meetings and no emails. Pick an important task from your to-do list that requires you to think carefully. Spend quiet time focusing on that task. You will save time and do a better job than if you try to do the same task while constantly being interrupted.

If You Feel Busy, Take on Even More Important Work. When you take on critical tasks with urgent deadlines, you will naturally begin to squeeze out the time wasters. The old maxim says, "If you want something done, give it to a busy person."

Increase Your Return on Time. Few people analyze their return on time with anywhere near the care that they analyze how they invest the company's money. Start keeping a simplified timesheet. Capture all of your meetings, calls and inbox/outbox activity to determine what percentage of your time is spent on unproductive or low-priority activities.

In Order to Shine, Have Other People Do Your Work! Delegating more of your work to members of your team is one of the smartest ways to free up your time. You develop members of your team by giving them a chance to step up to bigger challenges — while at the same time giving yourself time to take on work that only you can do.

Don't Always Do Your Best. Some decisions do not require as much analysis as you are capable of dreaming up, and some activities do not require as much care as you are capable of providing. While you are doing the best job unnecessarily, an important task needs you!

For Our C-Suite Readers

If you are a senior executive of a company that employs thousands of people, then you have a big problem: It is extremely difficult to get thousands of people to act as one company when those people have different skills and agendas and are spread across many functions and locations. But you have the resources of the C-suite, so leverage these ideas to build a culture of continuous moneymaking innovation.

Create an Aide-de-Camp Position. Typically, this is a rotating position used as a high-profile opportunity to develop a young executive with high potential. This person attends most of your meetings, undertakes special projects and becomes the keeper of a list of commitments. This is a high-level project management role requiring great organizational and management skills.

Create a Resource Team to Build Bridges. Draft a strong, centralized group of skilled problem solvers, and you can dramatically improve information sharing. They can make sure that the left hand does know what the right hand is doing. The group builds bridges among units so that good information is shared and bad information is corrected.

Rotate High-Potential Employees Through Your Resource Team. Staff the team on a rotating basis with high-potential managers from a wide variety of functions. Such a team can huddle around someone's desk and, in minutes, make connections that might never have been made at all. When their rotation is over, they have even greater potential to take on leadership roles.

Fight Decision Fatigue. Your brain gets fatigued from use, and as the supply of glucose dwindles, your brain finds it harder to make decisions. Decision fatigue has been demonstrated in the lab and in the real world. You can try to schedule important decision making around your eating schedule. A better answer is to find the easy decisions that can replace the hard ones. Easy decisions are ones where you are asked to approve ideas that meet the definition of GOOD ideas mentioned earlier.

There are countless ways to start taking action, but as Yoda said, "Do or do not, there is no try." Start getting the sand out of your suitcase today!

Lukaszewski on Crisis Communication

What Your CEO Needs to Know About Reputation Risk and Crisis Management

by James E. Lukaszewski

THE SUMMARY IN BRIEF

Your CEO's in handcuffs! Things are going downhill, fast! Your whole world is watching to see what you do next. In this industry-defining book on crisis management and leadership recovery, nationally recognized crisis expert and strategist Jim Lukaszewski jump-starts the conversation and taps into four decades of professional expertise to clearly differentiate a crisis from other business interruption events. He introduces a concept rarely dealt with in crisis communication and operational response planning: managing the victim dimension of crisis.

Delivered in his straight-talking style and backed with compelling case studies, *Lukaszewski on Crisis Communication* is your guide to preparing for a crisis and the explosive visibility that comes with it. Lukaszewski's advice will resonate with CEOs, board members, senior executives in HR, risk management and emergency response management as he stresses what happens to those who fail to be ready for crisis. *Lukazewski on Crisis Communication* describes patterns of good business response and gives details on what went wrong and why.

IN THIS SUMMARY, YOU WILL LEARN:

- To differentiate between a crisis and a disaster, understand how crises produce victims, and avoid the toxicity of silence.
- To overcome the abusive, intrusive and coercive behavior of bloviators, bellyachers, back-bench bitchers, the media, activists and critics.
- To manage people, including your own employees, with compassion, fairness and honesty — and drive attorneys to settle instead of litigate.

It's All About Victims

I prefer to define crisis with focus on victims, a concept rarely dealt with in crisis communication and operational response planning. Victims and how they are treated will determine just how much of your crisis response will be carried out successfully.

A crisis is a show-stopping, people-stopping, product-stopping, or reputation-defining, trust-busting event that creates victims and/or explicit visibility.

Crises are caused by human beings through commission, omission, accidents, negligence or ignorance. Larger forces, generally natural events, usually cause disasters — tsunamis, earthquakes, hurricanes, tornadoes. Disasters can produce victims, but unless responders act negatively or behave carelessly or callously, a disaster brings with it far less potential for blame.

Creating victims is what makes a crisis a crisis. The greatest barriers to appropriate victim management are denial, lack of leadership and a fear of liability fostered by advice given to management by well-meaning counsel. Any credible way to reduce or mitigate this fear is essential.

The most significant causes of litigation and lousy visibility during crises are the ignored or discredited needs of victims, victims' families and survivors — and the failure of leadership to aggressively manage the victim dimension.

Leadership's focus on victims sets the tone for the entire response effort. Management should be supportive, break down barriers and act like family to those who are injured or are suffering as a result of what is going on.

Management should motivate employees and responders by being present where it's dangerous or difficult — to encourage, help build understanding and appropriate concern, and to help employees through what often are difficult, psychologically stressful and emotional times.

What Does It Mean to Be a Victim?

Being a victim is a self-perpetuating, self-energizing state. It ends when the victims by themselves determine to let go of what is adversely affecting them and get on with the rest of their lives.

No matter how damaging an event, only a small number of individuals will actually feel victimized — even in mass casualty situations. Every person suffers differently, experiences pain differently, and needs to be treated individually.

Dealing with victims becomes difficult because they instantly become self-absorbed and self-focused on the problems and afflictions of being a victim. Victims constantly ask questions but rarely actually hear the responses. Attempts to help are often interpreted as efforts to control and to minimize responsibility. Poor communication prolongs victimization.

Victims have four powerful needs. If these four needs are provided promptly — preferably by the perpetrator — victims can more easily move through their state of victimization and be less likely to need or to call or respond to attorneys, the media, or even to call attention to themselves:

• **Validation:** acknowledgement that they are indeed victims. Best rendered by the perpetrator.

• **Visibility:** a platform from which to describe their pain and warn others. The platform should come from the perpetrator.

• **Vindication:** the need victims have to take credit for any action by the perpetrator to ensure that whatever happened to the victims will be prevented from happening to others.

• **Apology:** directly and promptly tends to dramatically reduce victimization and virtually eliminate the potential for litigation.

Generally, victims sue if their situation is not acknowledged and their feelings are ignored, belittled, discredited or trivialized. ●

Getting Leadership Ready for Crisis

A prudent organization has studied its vulnerabilities, identified those that present the greatest risk, and gets ready with what it must do and say to respond quickly and effectively in the face of a crisis.

All crises happen explosively and instantly. All, however, are remediated incrementally, often over long periods of time. Work to replace the concept of crisis management with the term readiness.

When we analyze the most important components of readiness, we get a snapshot of what it takes to be ready:

• **Accurate contact information:** Always knowing the whereabouts of key decision makers is 75 percent of readiness.

• **Pre-authorization:** Decisions made in advance to expedite action are 15 percent of readiness.

• **Extensive scenario preparation and testing:** Practice and preparation exercises are 8 percent of readiness.

• **Surprise:** The unexpected is 2 percent of readiness.

When readiness is a part of company policy and culture, the CEO and senior executives endorse and participate in readiness. The factors that cause strategic efforts to fail are detected, deterred, prevented or eliminated. Identify and eliminate risks. Failure to eliminate risks by identifying vulnerabilities actually raises risk levels.

Successful communicators focus on substantive matters. They are driven by and make their choices based on a simple set of guiding principles:

• Choose the truth.

• Quantify what you want to accomplish.

• Project who you want to be.

• Plan to have significant impact. ●

Preparing for Crisis and Visibility

Much of your credibility will depend on your systematic, knowledgeable approaches to developing the kind of information that managers need to make critical operating decisions when emergencies occur. Readiness preparation for a possible crisis begins with visibility analysis, examining the possible sources of crises, their planned visibility and their unplanned visibility.

The first phase in the analysis of your organization's planned visibility is to conduct a community involvement audit or visibility audit at the corporate level. The audit identifies those activities in which your organization is involved. Put small groups of supervisors and active employees together to do the analysis for each geographic location where your business operates.

The second type of exposure your organization is subject to is unplanned visibility. We refer to them as vulnerabilities. This is also a small-group process. The first part is to identify vulnerabilities. The second part is to make simultaneous qualitative judgments about the impact, likelihood of occurrence and collateral damage caused by a specific vulnerability. The vast majority of corporate visibility is planned and comes from those activities carried out routinely.

• **Planned visibility:** City/regional/national/international events, civic/philanthropic organization participation, company-sponsored events and participation, governmental interaction, products/service/promotion and delivery, and schools and educational participation.

• **Unplanned visibility:** The result of some unintended operating process outcome that affects people, animals or the environment and attracts the attention of the news media, specific groups or government. Analyzing vulnerabilities takes impact, chance of occurrence and collateral damage into account.

Effective decisions and actions must precede communication. Emergency communication response priorities must address appropriate operational action and match the expectations of all potential audiences.

The more promptly actions are taken in response, the more quickly recovery can occur.

• **Priority #1: Stop the production of victims:** The very first priority is to get the emergent situation under control, stabilized or eliminated, but this is precisely because it will stop victim production.

• **Priority #2: Manage the victim dimension and those most directly affected:** What we say and do for victims are our most important strategic objectives. Effective communication with victims and their families

reduces media interest and coverage while building the trust of the community.

• **Priority #3: Communicate with employees:** After survivors, employees are the crucial audience for crisis communication. Employees need to know their roles during a crisis, particularly if they have crisis-related duties.

• **Priority #4: Communicate with those affected indirectly:** Persons affected indirectly include survivors, neighbors, government officials and regulators, community leaders, customers, suppliers, shareholders, allies, partners, collaborators and co-inventors or co-marketers.

• **Priority #5: Communicate with the media, other self-appointed external individuals and communications organizations:** How you behave and how responsive you can be will determine the tone and quality of media coverage. An empathetic, prompt, professional approach will help to ensure the best possible coverage under the circumstances.

One of the most difficult problems to resolve in crisis response is tying field operations and responses together with the concerns and controls required by corporate headquarters. ●

Creating the Crisis Communication Plan

Crisis communication must drive the other two aspects of contingency planning — business continuity management and disaster recovery. Too often, these three disciplines carry out their planning separately in isolation, only to watch their efforts collide to the detriment and embarrassment of the organization when a crisis occurs.

A crucial part of the planning process involves cataloging, analyzing, cross-referencing and coordinating all response requirements.

Your corporate-level preparation should focus on four broad areas:

• Non-operating problems that can be managed effectively only at the corporate level, such as those affecting reputation, integrity, credibility, shareholders, or that may have government impact.

• Umbrella guidance, coaching and training that send the unmistakable signal to the division, brand or field that this work is crucial and that operating people are expected to be involved.

• Development of useful scenarios and models to reduce the time necessary for division, branch or field operations to be involved in planning and testing their responses.

• Prior authorization for those actions and decisions that can facilitate coordination, reduce bureaucracy, and move the response process forward with greater speed.

We have divided the plan development process into five specific tasks:

Task 1: Existing plan assessment and refinement: Review and assess existing communication plans and notification processes to determine crisis response capability and readiness.

Task 2: Corporate crisis plan development: Identify and prioritize existing and potential operational and communication threats.

Task 3: Communication guidance for divisions, branches, remote facilities and franchise owners: Develop guidance and model approaches in the areas of managing the four or five most critical high-profile local scenarios, identifying vulnerabilities and assessing their potential, and developing local approaches.

Task 4: Communications coaching and training: Executives and managers should be coached on the corporate approach, processes and policies to follow during crises.

Task 5: Installation/simulation, ongoing readiness training: Untested plans fail. Identify specific processes and procedures to help ensure that the company is appropriately and adequately prepared to manage communication.

Scenario preparation is the crucial ingredient in effective emergency and crisis response. General crisis planning simply fails to work. The scenario approach allows you to work in a future-thinking mode. Developing scenarios is among the most powerful team-building and team-unifying activities that leaders and responders can undergo.

When a crisis or seriously negative event occurs in today's world, everyone heads to a website before they look for anything else. Failing to have a website in place and ready to go often leads to mistaken stories and stories based on erroneous assumptions. Crisis websites must meet the test of being simple and sensible. The site needs to be positive and constructive. Comments need to be relatively brief so that the visitor can read the materials, absorb them, and easily use them. Avoid using any negative language or phrases. Use the power of the web to manage media coverage and reduce media calls. Provide information 24/7, and script everybody. ●

Media Relations

Media relations during emergencies are crucial not just for your company but for media organizations as well. The crisis has the potential to create big business for the news media.

The first step in managing relations with the social and traditional media is to establish a sensible, professional crisis media relations policy. Here is a sample approach:

1. Regional managers and Headquarters Media Relations (HMR) employees are the designated spokespersons.

2. All other employees must secure prior approval from HMR for any outside publication, speech, interview or other communication with the media.

3. Media calls from national and international media should be directed to HMR.

4. Calls for financial information or overall company information should be directed to HMR.

5. Local media calls are to be handled by local managers when regional regulatory activity, local employee information or regulatory questions are involved.

Good Spokesperson Practices

In times of crisis and catastrophe, bad things happen fast and control is lost quickly. It is the spokesperson who sets the tone, tempo and expectations:

- Remain calm.
- Coordinate all comments with the crisis website.
- Avoid all negative words, phrases and descriptions.
- Disclose some facts immediately and continuously even if the news is bad.
- Treat the media professionally and with equality.
- Treat all inquiries fairly and promptly.
- Stick to the facts.
- Avoid "I don't know," guessing and speculation, making estimates, and flatly refusing to provide information.
- Release information about victims only after families have been notified and with their permission.
- Think before you respond.
- Monitor media coverage, correct and clarify. Have an ongoing strategy for correcting and clarifying mistakes that has little reliance on the media.
- Prepare answers for the most likely questions.
- Speak with compassion.

More and more companies are establishing template sites, sometimes called *dark* or *stealth* sites, which are pre-organized and populated with pre-authorized information. They are set up to respond immediately to the general nature of crisis and to specific scenarios and are used to get ahead of the negativity often caused by delays in responding to situations of public interest.

These dark sites reside on a server. As information is developed, various portions of these sites are reviewed, authorized and go live as circumstances warrant. These sites feature a "fill-in the blank" architecture in which key information can be easily inserted and promptly made widely available, especially to employees and the news media. Having a website with basic information immediately available can reduce media relations calls by up to 90 percent.

Take these steps before the news media arrive:

1. Develop strategic communications objectives, specific statements, messages and stories.
2. Brief communications staff, executives and employees about who is coming and why.
3. Share your communications objectives and messages widely within your organization.

While the media are there:

1. Stick to the script.
2. Stick to a time schedule, and schedule briefings as necessary. Hold group briefings that enable all reporters to hear the same thing at the same time.
3. Establish a place where reporters may gather as they arrive, such as a conference room.

For news magazine shows:

1. Negotiate — get something for everything given.
2. Cooperative but reluctant. Always express an interest in cooperating, but maintain a very realistic sense of skepticism.
3. Rigorous but circumspect. Remember that they are not on a mission to help you or your organization. Keep good records.
4. Professional but concerned. It is always about emotion and answering specific questions. Put very little in writing. Verbalize most of your responses.
5. Message driven but alert for more data. Preparation is a surprise-reduction process.
6. Be alert. These shows practice very blatant ongoing deception with story subjects and targets.
7. Maintain perspective. Resist the urge to take anything personally — not the questions, not the situation, not the show's manner of handling them.

Sure-fire ways to make bad news even worse:

- Lose your temper.
- Call the reporter and demand a retraction.

• Attack the medium on your website.

The lesson for the spokesperson is that to be an effective communicator through the news media to the publics you wish to reach, verbal skills and habits must change. It is the spokesperson who must refine, refocus, redefine and more carefully describe those things that are important to communicate. If the translation is left to the reporter, you may not be pleased with the results.

The Crisis News Conference

The news conference remains an effective way to communicate when a crisis occurs; you must especially manage many reporters and a great deal of often-conflicting information. The successful crisis news conference requires planning and preparation even when there is little time.

Types of Crisis News Conferences

There are three formats for dealing with many news media — news conferences, briefings and backgrounders.

A *news conference* is a structured meeting in which many news media are represented. In very dramatic cases dozens to hundreds of media representatives can be present. The goal is to answer questions and get messages across to many different media at the same time. Usually there are one or two spokespersons. The basic format after opening comments is Q&A.

A *news briefing* is a structured open meeting where complex information is presented, explained and provided to the media verbally and in writing. Many individuals from the organization may talk with the news media either by making presentations or simply by answering reporters' questions. Anything said at the briefing is on the record and available for use by the news media.

A media *backgrounder* is a fairly structured meeting to which only specific media are invited to attend and participate. The information is given on the promise by the media that it will neither be used in a story nor attributed to the source of the information. The purpose is to give reporters proprietary or crucial information that must be kept confidential but that they need in order to cover a specific story. Be careful with this format. The reporter's first impulse is to get what they hear on the record somehow and promptly. Avoid off-the-record backgrounders. If it is a secret that matters, it will get out. The best briefings are those that are on the record.

Setting Communications Objectives

Here is a procedure for identifying your communication objective and defining the messages that you need to convey:

Step 1: Write out your communication objective for the news conference in up to 150 words (about one minute of speaking time) each.

Step 2: Try to state in a sentence or two each up to three really important messages or themes about the topic or subject of your news conference.

Step 3: Say your communication objective and your messages out loud (rehearse), and refine the language so that you can say them comfortably and often.

Step 4: Draft your second or third communication objective as described in step 1, and develop messages as described in steps 2 and 3.

Once you have completed the development of your communication objective, drafting your opening statement becomes relatively easy.

The Opening Statement

Here are the attributes of a good opening statement:

• Up to 150 words in length (one minute).

• Positive words and language.

• Packaged or bundled key ideas and groupings of three facts, five ideas, four key thoughts, etc.

• Constructed to generate specific and positive follow-up questions first.

• Stands on its own and gives complete information.

• Creates the positive perception you seek.

• Contains benefits to the reporters and their audiences beyond the features of the topic or reason for which you are having the news conference.

Conducting the News Conference

1. Determine who should represent your company: We recommend a maximum of three speakers at a news conference. One should be a generalist. The other one or two should be experts on the product or situation so that every question receives at least a partial answer. When there will be more than one spokesperson, extra rehearsals are mandatory.

2. Set the scene: A designated individual should begin by introducing him/herself along with those involved in the news conference and by explaining which areas each will talk about. News conferences should last only 30 minutes. Introduce each principal.

3. Make the opening statement: It should be no longer than 30 seconds so that broadcasters can use it in its entirety. Organize facts, starting with the most important information, the way reporters do. Put the event in context, and cast a positive light on the compa-

ny's safety practices. This controls at least the opening portion of the news conference.

4. Handle the question and answer period: After the opening statement, ask for questions. Be sure that you have written the statement in a way that will elicit the questions you want to be asked.

5. Close the news conference: The person who opened the news conference should stand up, thank the media for coming, and remind them about handout materials, follow-up, the next briefing, etc. Offer to remain behind to handle news media questions on an individual basis. ●

Social Media

Social media have injected new intensity, urgency and effectiveness into the media relations equation.

- News travels in milliseconds, not minutes, hours or days.
- More than one billion people — combined active Facebook and Twitter users — can discuss your organization or client, its products and its competitors in just a few minutes.
- Anyone communicating online becomes, in effect, a publisher, reporter, author and a member of the Media.
- Most professional journalists live online every day, many searching social channels for scoops.

Google, Bing, Yahoo, Twitter, Facebook, LinkedIn, Flickr, Foursquare and now more than two dozen others enable everyone with Internet access to locate, relate, analyze and comment on an infinite number of topics. Social media can be your company's enemy or friend.

New media and social media, when managed correctly, can help to communicate the point of view of your company in very difficult situations. Blogs and online media can help you diffuse and respond to online attacks and crises. The opposite is also true — if you fail to monitor your news and conversations in the media and are slow to respond to emerging news stories in social media, you can experience a humiliating, self-imposed type of crisis.

Developing a monitoring strategy and putting it in place as part of the crisis plan is essential. You can take advantage of companies like BrandProtect and Risdall.com/listen, which provide reputational monitoring services. Stay ahead of instant news coverage by monitoring blogs and social media via searches using keywords for your organization.

The basic rules of media relations still apply whether you are dealing with traditional or social media. To neutralize an Internet crisis, it is essential to remain calm, manage your assumptions, investigate and verify the facts, and monitor exposure in all media. Then diagnose the problem, conduct a threat reality check, examine your options whether or not to respond, and lastly, preempt, control and contain. ●

The Activist Challenge

Activist groups, as always, add interesting challenges to communications. Activists are emotionally committed to opposing and targeting you and are against traditional corporate behavior. To win, large organizations have to be as committed to victory as their critics are committed to defeating them.

Understand the power of activism and the activist mentality. Prepare to negotiate. Ignoring activism is toxic. Advancing the corporation as a victim is weak. Almost all corporate and government targets are considered to be guilty of something at first.

Anti-corporate actions can be anticipated both through aggressive enforcement of standards of conduct and compliance review and by paying attention to the perceptions created by appearances. Be prepared to preempt these characteristic patterns of action aggressively. Avoid the obvious, the stupid, the callous and the arrogant behavior.

Often there is very little in the way of concrete evidence on either side. The imperative is to respond or anticipate with a sense of energy, control and focus. Real on-the-ground facts and information can be controlling. Get some; get there first.

Stay focused on the ultimate goal. Make incremental progress every day. Make certain that those who are affected directly and indirectly know progress is being made and what your next steps are. The more you interact directly with those whose lives, families and future you affect, the less important what the media does or says becomes.

If you have a sense of activists' tactical approaches, you can then analyze your own operations and behavioral vulnerabilities and plan appropriately. If it's important that your story be told accurately, clearly and effectively, plan to do that yourself during and after the incident. Companies lose to activists primarily because they are less committed to managing their own destiny. ●

Litigation and Legal Issues

Get ready by preparing for anticipated crises, making sure that management is aware of the legal ramifications of any lax compliance and developing for yourself a knowledge of how law and lawyers operate and how best to handle the media in the event of high-visibility litigation.

Corporate behavior patterns that predict trouble are easily recognized but often ignored. If you keep an eye on your company's approaches to regulated activity, you can easily detect operational facts and behaviors that reveal either the existence of or potential for troublesome, perhaps criminal, corporate behavior. Here are seven critical steps:

Step 1: Establish a centralized compliance function: This function oversees compliance and adherence to standards for the entire organization.

Step 2: Appoint a senior-level manager as senior VP, compliance: This individual has overall responsibility for establishing an effective compliance program.

Step 3: Train all employees, agents, vendors and customers.

Step 4: Establish a reporting process: Set up a mechanism through which employees, agents, vendors and customers can anonymously report compliance violations or inappropriate behavior.

Step 5: When violations are found, take appropriate, consistent and prompt disciplinary action: Standards without enforcement do not work.

Step 6: Communicate immediately and conclusively about compliance violations: Public acknowledgment is a powerful deterrent.

Step 7: Commit to constant improvement: These situations are opportunities to review standards and procedures, to eradicate weaknesses in the organization's ethics and compliance process, and to educate.

Legal risk assessment must be added to your scope of issue negotiation and problem prevention. Reputation-threatening legal risks arise from several corporate behaviors, all of which can be avoided: arrogance, selective disclosure, deception, ignorance, insensitivity, intolerance, secrecy, stinginess, stupidity and tardiness.

In law as in corporate life, the individual who can focus on the needs and problems of the people is the individual with the winning strategy. All litigation involves victims. Think, plan, talk and act with the victim's perspective in mind.

Settlement talks can start at any time. Hire a separate law firm to manage the settlement since litigation has to proceed until the matter is resolved. There is an inherent conflict between the litigator and the negotiator.

Settlement activity often eliminates or substantially reduces litigation visibility. Settlement happens privately, is sanctioned by the court, and much of what is discussed cannot enter the records of the actual case.

I always recommend to clients involved in potential or actual litigation that they propose settlement talks immediately, managed by an independent law firm that specializes in settlement. ●

Summing Up and Looking Ahead

My general expectation is for future problems, issues and behaviors that have been crises in the past to remain high potential candidates for crisis situations in the future.

Remember that Lukaszewski's first law of crisis survival is to recognize that forces like the government, new media, old media, your toughest critic or your most aggressive competitor are rarely successful in bringing you down. It is the perpetrators themselves, through their statements, actions and/or the statements of well-meaning employees, friends, even relatives and especially over-confident leaders, who sabotage the competence of responses in crisis.

The single most powerful, strategic approach to succeeding in crisis response involves extraordinarily positive language combined with behaviors that support contention reduction and resolution of the issues, such as victim circumstances and taking actions that prevent the types of criticism that prolong negative crisis coverage and perceptions.

If you pay attention to victim treatment and management; express regret, empathy and apology; expedite compensation; do 120 percent in every direction on every issue in question; and answer every question, these behaviors will help reduce, even mitigate, crisis impact.

In the end, it is up to you, guided by your personal values, concerns and empathetic sense of rightness. ●

Make It Matter

How Managers Can Motivate by Creating Meaning

by Scott Mautz

THE SUMMARY IN BRIEF

Are your people giving in instead of giving their all? Have they quit, but stayed? Probably. According to a shocking Gallup poll, more than seven out of 10 American workers are disengaged, which hurts productivity, products and personal satisfaction. In fact, one in five are more committed to *not* doing their jobs than doing them.

In *Make It Matter*, Scott Mautz shows that the key to winning back the disengaged (and keeping the engaged, engaged) is by fostering meaning at work, that is, by giving work a greater sense of personal significance and, thus, making work matter. Distilling reams of research, case studies, stories and interviews with managers at great companies to work for, he unveils seven essential "Markers of Meaning" that can be triggered to create meaning *in* and *at* work.

He offers dozens of tools and specific plans to get your people to better commit and enjoy work as part of their lives, not an eight-hour departure from them. He also demonstrates how meaning starts with managers because if you're not committed, no one else will be either. Most important, he draws a solid line from elevated meaning to higher profits, revenue growth and retention.

IN THIS SUMMARY, YOU WILL LEARN

- Direction: Reframe work to add meaning and motivation, and help people discover a sense of significance and purpose in what they do.
- Discovery: Craft the richest kind of opportunities to learn, grow and influence, while helping people feel valued and valuable.
- Devotion: Cultivate an authentic, caring culture, master meaning-making leadership behaviors and drive out corrosive behaviors that can quietly and unknowingly drain meaning at work.

Introduction

Nobel prize-winning physicist Richard Feynman was asked to oversee a group of engineers who were tasked, without much context, to perform an endless series of tedious calculations. The math wasn't especially difficult if you were an engineer, but the work proceeded very slowly and was full of errors. Feynman realized the problem wasn't the math but that the engineers were disengaged.

He convinced his superiors to let the engineers in on what he already knew — that they were performing calculations that would enable them to complete the race to build the atomic bomb before the Germans did. Their work would win the war. From that point forward, Feynman reported that the scientists worked 10 times faster than before, with few mistakes and with fierce commitment. Meaning matters.

PART I: DEFINITION

Why Meaning Matters

Do you matter at work? Does the work you do uniquely make a difference to your company and to others — and does it matter to *you*? Gallup research found that 71 percent of American workers can be coded as either "not engaged" or "actively disengaged" in their work, meaning they are emotionally disconnected from their workplaces and are less likely to be productive. When meaning in our work is absent, we tend to disengage at some level.

The provision of meaning is the solution for disengagement. When work has meaning, it drives the expenditure and investment of discretionary energy on a physical, cognitive and emotional level. It's the feeling that you matter and are making a difference; your engagement is paying off. A shocking number of people sadly accept their fate at work. They are effectively quitting and staying — settling for a paycheck, abandoning hope of finding fulfillment in their jobs and knowing that they aren't performing anywhere near their maximum potential.

Managers with the best intentions try a variety of tactics to elevate performance. We staff up. We spend more on technology to get better, cheaper, faster performance. We cut costs and corners to squeeze out better financial performance. We invest in better facilities. Yet a lack of engagement and fulfillment in the workplace rages on.

We deserve something that matters. We deserve something with resonance. We deserve meaning. Meaning is *the* performance enhancer of our times. We find meaning in things that make emotional connections and are remembered. When we feel belongingness or a sense that we are cared for, it's meaningful. We also find meaning in things that make us feel significant, that help us reach our full potential, and that serve who we are and what's most important to us.

Facilitating meaning not only drives employees to engage but takes them beyond engagement to elevated performance and true fulfillment. Meaning holds the engagement at the deepest, most fulfilling level, and it sustains over the long haul, flowing back into a virtuous cycle. This phenomenon is called *profound performance*. It is the inspiring end-goal for those managers who want to make work matter.

The Markers of Meaning

Finding meaning in and at work doesn't have to be happenstance. Meaning is derived from seven specific

conditions, or the *Markers of Meaning*. Satisfy these conditions, and you create meaning and fulfillment for yourself and your employees. The Markers of Meaning can be organized within three groupings:

Direction:

1. Doing work that matters (significant work that makes a real impact and is reflective of your values and beliefs and worthy of your focus and energy).

Discovery:

2. Being congruently challenged (in ways that energize and maximize individual learning and growth).
3. Working with a heightened sense of competency and self-esteem (feeling valued and valuable).
4. Being in control and influencing decisions/outcomes (autonomy).

Devotion:

5. Working in a caring/authentic/teamwork-based culture (a sense of belongingness and harmony with coworkers, leaders and company).
6. Feeling connection with and confidence in leadership and the mission.
7. Being free from corrosive workplace behaviors (removing barriers to the best self).

All of the markers of meaning, when intentionally attended to and wired into a work environment, produce outcomes that truly matter. Disengagement, mediocrity and despair do not stand a chance; the map to meaning creation is now at your disposal.

PART II: DIRECTION

The Potency of Purpose

People tend to define themselves, and be socially defined, by their work. It's why at social gatherings, talk often turns to inquiries about one's occupation. The problem arises when we don't like the definition. When our definition of self begins to feel too one-dimensional, lacking in significance or we sense we are not living up to our potential, we begin hungering to redefine who we are and what we've become.

Discovering your purpose and putting it to work in your work is how you can take back control. The truth is, work does not define you: You define your work and how it serves your higher-order purpose. Stop, reflect and articulate what your higher-order purpose is and how your work can be recast to serve that end.

When you are operating with a clear purpose, you understand and accept why you are working so hard and spending so many hours away from loved ones, friends and family — you can see and sense the higher-order end your efforts feed into. You know why what you do matters. Purpose integrates who we are with what we do. It's not about the money; it's about the meaning. It's about purpose, not perks.

Even if you can already clearly articulate your own purpose, the idea is to learn the steps on the Path to Purpose for yourself so that you are equipped to help your employees discover and articulate their purpose.

The Path to Purpose

Step 1. Change the Equation: Disappointment and dissatisfaction often result from a gap between an ideal and reality. Happiness = Reality – Expectations. As disengagement and resignation settle in, expectations of the role work can play in the fulfillment in one's life are lowered in an attempt to at least make the happiness quotient less negative. Rewrite the happiness equation: Happiness = Reality + Expectations. New heights should be set for the happiness quotient. Reality at work should be vastly improved by pursuing purpose and meaning-rich work with vigor. This formula replaces the vicious cycle with a virtuous cycle.

Step 2. Change Your Questions: Once you start asking yourself more introspective life questions, you find that what holds meaning for you may have nothing to do with your long-held beliefs about what constitutes success. Once you start asking these questions, you are on your way to exonerating yourself from one of the greatest self-crimes one can ever commit: leaving purpose buried within.

Step 3. Put the "Me" in Meaning: You have to resist the temptation to compare yourself to others, when answering introspective questions. What you assign significance to, what truly matters, is highly personal and should not be defined by others' perceptions.

Step 4. Conduct an inner interview: What are your superpowers — the strengths that you can use, like a superhero, to do good for others? What are your values and beliefs? Staying true to what you believe in is a source of great strength. The same power source can provide clues about what your purpose might be. What would you do for free? What are you doing when you lose track of time? What do you daydream about? What part of you is not showing up at work? What does the world need more of that you are well suited to serve? What would coworkers miss if you weren't there? What would people say you were meant to do?

Step 5. Commit to something greater than yourself: You have to commit to producing good for others as part of your purpose. Committing to something greater than yourself means making sacrifices, forgoing taking credit and setting aside personal gain. The greatest level of sustained performance over time comes when we strive to reach our personal fullest potential and truly commit to a good greater than ourselves.

Step 6. State your purpose: Writing something down increases compliance, so boil down the purpose you have worked to identify into a crisp sentence or two. This will also sharpen your thinking about what you are committing to. Keep your purpose statement front and center constantly. What is the verb of your purpose statement? Are you creating, unlocking, bringing, helping, stirring, championing? The choice of verb ensures your purpose statement is inspiring, action oriented and actionable — for you.

A leader can bring a sense of purpose to an organization by ensuring that each and every person understands how his or her work specifically ties to the broader mission. Enabling comprehension of mission can provide a surge of meaning (and performance). A sense of purpose and deep significance can also come when we ask ourselves what the work itself really means, who our work serves and how the work is done.

The Lighthouse of Legacy

Anyone, at any level, can leave a legacy behind. And striving to do so, like when you are working toward a purpose, means you've activated the powerful first Marker of Meaning: doing work that matters. If purpose is the profound why, then legacy is the profound what. What are you working to tangibly leave behind? What will outlast you that helped make your purpose concrete?

Let's look at the five footprints of legacy, or ways in which you can leave a legacy behind:

1. Enduring results: These are major accomplishments that you envision, invest in, drive to realization and ultimately leave behind that you can look back at five to 10 years from now with tremendous pride. It can simply mean real things you did that touched real lives of real people.

2. Transfer of knowledge: We can make an investment in coaching others and transferring information beyond what's merely required for employees to do their jobs.

3. Passing on values and life lessons: The little things we do every day are all opportunities to reinforce who we are and what values we hold. The values you live and the life lessons you pass on have a surprisingly lasting effect.

4. Relationships and lives serviced: When we invest in relationships and friendships in our professional lives, it produces meaningful connections. This is critical for sustaining maximum conductivity to something that really matters.

5. Stories told about you: What are the big, sweeping tales that characterize who you are? What will be said about the little impressions you left behind and the small gestures you made along the way?

The Five-Step Footpath to Legacy-Worthy Results

1. Appreciate the power of legacy and commit: When you can stop for a moment, break out of the temporal day-to-day and begin deeply considering the permanent tomorrow you want to work toward, it's liberating.

2. Color-code your work plan: Red is for work that we need to stop doing. Green is high-value work we need to keep doing. Gold is legacy-worthy work that will help define the lasting impact we leave behind. The thought here is to ensure that there is defining work for you to put your heart into.

3. Choose your investments for enacting a legacy: If I knew I wouldn't fail, what would I try? What missing accomplishments would cause me to label my life's work incomplete? Who do I admire for the difference they've made, and what about them can I emulate?

4. Write your legacy statement, and align your legacy projects: Here are examples. My Purpose: Unleash in others an even better, happier version of themselves. My Legacy: I will inspire actions, thoughts and feelings that fulfill — every day.

5. Be attentive to "others-focused" vehicles for legacy-worthy results: Meaningfully impacting others can be as important as any lasting business accomplishment. Be mindful of and attentive to key others whom you'd like to impact, and be intentional about how to impact them.

PART III: DISCOVERY

Learning and Personal Growth

An environment that facilitates high performance is not only essential for personal fulfillment but is absolutely critical to compete. A study by the Brookings Institution revealed that 60 percent of an organization's competi-

tive advantage is derived from internal advancements in knowledge, innovation and learning.

When you operate with a growth mindset, the enhancement of your employees' intelligence and ability is limited only by the number of connections to learning and growth opportunities that you as a manager/coach can create. Here are seven ways to build such connections:

• **Learn about learning:** Not all learning is created equal. Draw on their experience and what they know. Attend to attention spans — average attention spans have plummeted to about eight seconds. Creating opportunities for adults to practice and play with what they've learned makes the learning stick. Make clear the value of the learning opportunity. They need to understand why they are engaged in a learning process and how it benefits them. Ensure self-directed learning, and leverage mistakes as learning opportunities. Take into account different learning styles.

• **Be conducive to learning:** Have patience and empathy for the learning process (and tolerance for mistakes). Put emphasis on assets, not deficits. Listen for understanding, not for convincing others. Focus on being interested, not interesting. Enable ownership of ideas.

• **Practice managerial metamorphosis:** You have to metamorphose into a number of different roles at various times. Role Model: We are constantly teaching, whether we intend to or not. Mirror: Serve as a mirror for your employees to help them see themselves. Challenger: When you challenge thinking and the status quo, learning and growth are sure to emerge. Sounding Board: Having someone to bounce thoughts off of helps us adjust, sharpen, confirm or reconsider our thinking.

• **Reimagine their jobs:** Job reimagining happens when people feel their need for enrichment is not being met in their job as currently designed. People try to do more of what they love and more of what challenges them at work. Psychological meaningfulness of work results when people feel worthwhile and valuable. Why not encourage, manage and report all of this reimagining?

• **Promote learning exchanges:** Learning organizations are in a continuous learning mode, drawing insight from every member in the organization, encouraging participation in an energetic exchange of learning intended to amplify growth. Learning from the past can mean tapping into senior leaders. Escalate ideas — individuals will influence each other, and their ideas will co-evolve. Share and reapply best practices. Provide stimuli for discovery.

• **Make the employee's personal learning a priority:** You and your employee can explore three questions: What do I need to learn to advance my career? What do I want to learn that advances my cause? What am I interested to learn to feed my curiosity?

• **Lean forward to learn:** Encourage employees to get out of their own comfort zone and lean into something new and even daunting (but short of their panic zone). You can show your employees the way. Seek out a new learning experience for yourself that stretches you, and make a point of sharing your experience.

Meaningful Decision-Making and Influence

Work comes to be meaningful when individuals see themselves as capable of substantively influencing outcomes. It tells them they are not powerless and that they have the ability to make a real difference. Research shows that allowing employees to participate in managerial decisions also positively impacts job satisfaction, organizational commitment, labor-management relations, job performance and organizational performance, employee absenteeism and profits.

The method of centering decision-making processes on employees allows those employees to contribute their best, grow the most, and feel worthwhile and worthy. Follow these seven steps:

1. Fulfill the foundational requirements: The top two characteristics are a climate of trust and a commitment to information sharing. Being clear on roles can help eliminate the chaos that can occur when people think they have the authority to decide or veto, but they really don't.

2. Hold a decision stakeholders meeting: Confirm the decision criteria, objectives, roles and responsibilities established as part of the foundational requirement. Identify resources, and set milestones.

3. Ask for a recommendation: Give them time and space to think options through, cast their own critical eye on those options, form their own recommendations and then share those options with a decision-making body.

4. Conduct inquiries, not inquisitions: Ask good questions, and listen with understanding while showing appreciation for the thinking behind the points of view being presented. Let respect, intellectual honesty, curiosity and the desire to comprehend drive the line of questioning.

5. Debate. Decide. Commit: Varying viewpoints should be protected and respected and visibly considered.

Then when it's time to decide, it's time to decide — period. Ask for commitment to the decision.

6. Ensure energy-yielding outcomes: The outcomes should return the energy back into the system. This energy can take the form of an organization visibly acting on decisions and sticking to them over the long haul and seeing decisions communicated quickly and broadly.

7. Conduct a decision quality check: A postmortem on a sample of decisions can bring enrichment through retrospection.

What about when the employee isn't just a participant in a decision but is the proprietor of the decision? If involving employees in decision-making is meaningful to them, then enabling them to actually make the decision will be exponentially more important. Here are eight ways to grant autonomy in an intelligent fashion:

1. Fulfill the foundational requirements: Intelligent autonomy requires a baseline of trust and a practice of information sharing. An additional requirement rests on the manager's willingness to delegate growth work, not just grunt work.

2. Have an agreement for autonomy in place: Managers often struggle with the empowerment of their subordinates, seeing it only as a loss of their own power. Develop an agreement for autonomy to formalize the rules of engagement and operation in the handover of power.

3. Facilitate recipient readiness: Provide training and resources; have a discussion with them about the benefits of the newfound autonomy.

4. Provide intrinsic and extrinsic reward: Build in flexibility to allow employees to define what they want to get out of the new autonomy. Proper recognition for expanded responsibility that is well handled is a must.

5. Facilitate by assisting success versus avoiding failure: Let the cycle of empowerment work itself out, where the employee learns from both successes and failures. You have to act as a facilitator, not a fixer.

6. Construct communication loops: Autonomous employees shouldn't go off the grid but instead should report back regularly on progress. You can't just delegate and check out, either. Communication needs to be a two-way street.

7. Covet communication loops: Communicate with your empowered employees so that they actually come to covet the communication loops in place over time. Leave the empowered feeling that it is productive and powerful to continue inviting management in along the way.

8. Tie a measurement tether: Establishing success criteria and measures in the agreement for autonomy and reviewing progress periodically will help ensure work stays on course.

PART IV: DEVOTION

Cultures of Consequence

Establishing a cultural norm that connects employees to one another and inspires a drive for greater achievement must be viewed as a fundamental for long-term, sustained success.

Cultures that are rich in meaning manifestation generate feelings of significance, genuineness, belonging and expanding personal potential. Study any Great Workplaces list, and you'll uncover the three elements that the most meaning-rich cultures have in common: caring, authenticity and teamwork.

Caring

Jim Goodnight, CEO of SAS, says, "Treat employees as if they make a difference, and they will." Building a core of caring will most certainly unlock newfound levels of inner-connectedness among employees. It will also elevate morale as well as deliver returns for the company. The creation of a caring culture requires the five components of caring:

1. Family unit — not a military unit: The military's arm's-length approach doesn't really work in the business world if you want to create meaning-filled connections and maximize elevated performance over the long haul. Thinking and acting like a family unit, where relationships and connections are a priority, is a better way.

2. Rewards and recognition done right: Only the imagination limits the number of ways to recognize and reward someone. It's about the meaning behind the reward. Employees are looking for meaning, not things. Personalize it, and get everyone in on the act. Be frequent but not frivolous. Celebrate first downs and touchdowns. Think through the delivery with attention to detail.

3. Respect: Workplace incivility is a barrier that stands in the way of optimal performance. Respectful interactions and recognition of others, always and with everyone, is a foundational bedrock.

4. Work-life harmony: We only have one life, and work is part of it, so harmony among the two is undeniably worth the pursuit. Helping others (and yourself) make progress toward achieving work-life harmony involves being intentional, holistic and specific in your approach.

5. Personal well-being: You care about your family members' personal well-being. Are they getting enough exercise and sleep, eating properly, taking good care of themselves? Why shouldn't the same questions be of concern to you for your work family?

Authenticity

Authentic behavior binds human beings to one another, and it is deeply satisfying for those conducting and receiving. It helps reinforce self-identities and creates bridges to a sense of belonging. As managers and workers, we can promote feelings of authenticity in the workplace in three basic ways:

1. Being where you belong: When people aren't intrinsically engaged by their work, they feel inauthentic. If employees aren't succeeding or aren't a good fit, it may be time for a tough but liberating discussion.

2. Being true to yourself: When we act in a manner consistent with our values and beliefs, it produces a deep sense of meaningfulness. We find meaning in situations and people that are real. Work is a vehicle through which we can share our unique talents, creativity and creations. Be true to beget true.

3. Conducting yourself in an authentic manner: Disingenuous behavior has a way of surfacing and revealing itself. Nothing is more transparent than when someone's not being transparent. And the effects can be devastating. Adhering to a code of conduct for authenticity is one helpful way to ensure the right behaviors are always top of mind.

Teamwork

Teamwork creates a sense of pride, fellowship, camaraderie and loyalty. Being cared about by teammates is a strong predictor of engagement. Teamwork enables relationships to form and nurtures a sense of connectedness and belongingness. Indeed, meaning is not just derived from how individuals relate to their work but also from how individuals relate to each other.

Teamwork enables interdependence. Organizations and managers adept at fostering world-class teamwork very intentionally drive a sense of mutual interdependence to pull a loosely connected group into a tight-knit unit. You can facilitate the same sense of interdependency in your place of work. It requires understanding the kind of team goals that foster interdependency, being attentive to the impact that team deliverables and role definitions can have on fostering a sense of interdependency, and spelling out specific expectations for interdependent behavior.

A team environment where everyone is working well together serves as a shared learning lab where people are comfortably learning from one another through the sharing of experiences, wisdom and role modeling. Great teams producing great results make people feel as if they matter on a team that matters. This feeds into sustained heightened performance, which leads to more meaning and more fulfillment.

Teamwork is also the most direct contributor to the ultimate cultural end-state: achieving a sense of community.

Meaning-Making Leadership

Think of yourself as a master electrician — you help hardwire a network of emotional connections, linking the employee to the employer and vice versa, and both to a greater good. The Markers of Meaning constitute the wiring in the workplace network.

Leaders adept at meaning-making tended to have four traits that you can incorporate into your own style:

1. Have a passion for potential: Leaders with a passion for potential inspire you to make a difference every day. They challenge and grow you in energizing ways, encourage and reassure you as you go, give autonomy and make you believe you can accomplish anything.

2. Emit a caring, connective undercurrent: Caring, connective leaders draw people to them and draw the best out of them. They connect with others because they genuinely care about them, respect them and wear it on their sleeves. And because they couldn't alter their truly authentic aura if they tried.

3. Possess framing finesse: This is the kind of leader who helps connect the dots for employees, helping them feel confidence in and connection with the work they're doing, the place they're doing the work at and the people they are doing the work with. Such leaders frame and mold perceptions, mold meaning and mold winners.

4. Create an atmosphere of relaxed intensity: Leaders who excel at meaning-making also want to win, and they want to have fun while winning. Having fun and laughing at work can change attitudes, draw people closer together and step-change engagement levels.

Meaning-Making Messaging

The key to communication that engages and makes meaning is to make people feel something. Inspire a felt sense of confidence. Here are five ways to ensure your messaging will truly matter:

• **Articulate a compelling vision that resonates with people's identities:** Compelling visions make membership within an organization feel special, enriching and meaningful.

• **Drive mission fit:** If you help connect the dots by communicating how your employees' work fits into the broader mission, you enhance their feelings of self-worth and certainty.

• **Be confident when communicating:** When you communicate with confidence, it breeds relief and a sense of certainty. You can communicate hope even as you are outlining reality.

• **Tell stories of significance:** You can make meaning when you share stories of "sparkling moments" — when the team really nailed it, when they overcame adversity or when they achieved accomplishments that have been more broadly taken for granted.

• **Share goals with intrinsic, not just extrinsic, value:** What's in it for them? How will this goal connect with them personally and emotionally? How might accomplishment of this goal help them grow?

Cutting Off Corrosive Behavior

You might not realize, given all your good intentions, that you could also be engaging in negative, meaning-draining behaviors. If you are, you can be sure your employees realize it. Managers can unwittingly kill meaning in four primary ways:

• **Destroying a sense of certainty:** We can destroy an employee's sense of certainty by acting without integrity, being indecisive or inconsistent, mismanaging change or communicating poorly.

• **Destroying a sense of completion:** We are driven in part by a sense of progress, a desire to see that our unique efforts are adding up to something tangible. We can unwittingly stand in the way of this fundamental human drive with behaviors that destroy an employee's sense of ownership or that create rework or wasted effort.

• **Destroying a sense of confidence:** Dismissing the importance of an employee's ideas or work can crush a sense of self-confidence and, accordingly, a sense of meaning for the employee. If you are quick to criticize and slow to praise, don't be surprised if your employees' work needs criticizing and isn't worth praise. Assume they care about doing good work. Plant seeds of growth, not seeds of doubt. Don't manufacture misattribution; share context. Self-manage anxiety/stress. Warm up — people can read a lack of compassion and warmth a mile away.

• **Destroying a sense of community:** We strip our employees of the sense of community when we allow environments of negativity and unhealthy levels of internal competition. Sensing that they are in combat, not in a community, employees may well mentally shut down. Drive awareness of the behaviors' impact. You will get the behavior you tolerate. Go from pessimism to optimism. Challenge cynics, and invite them to be part of the solution instead. Don't let falsehoods and ferocity fester. Build people's self image, and redirect their energy.

When any of these components are enacted, it creates self-doubt, deflates a sense of devotion and causes us to question the meaning in and at work. It can also contribute to fear: fear born of mistreatment, insecurities, ambiguity or lack of understanding.

Create a level playing field. Drive a one-team, one-dream mindset. Redirect the energy of the overly aggressive or insecure to expend their energy on more positive pursuits.

PART V: DILIGENCE

A Plan to Make It Matter

To help you create meaning in and at work, create a personal to-do list for yourself, organized by groups of meaning-making activities. There are five buckets of activity for you to consider in this approach to structuring your action plan:

1. Overarching behaviors (to be mindful of)
2. Skill sharpening (to undertake)
3. Deep one-on-one connections (to facilitate)
4. Systems (to put in place)
5. Group/team connections (to enable)

Choose the activities from each of the five buckets that you find most inspiring, weave them into a tailored plan and proceed accordingly. Work can be so much more for us. All the knowledge and tools are now at your disposal.

Make Their Day!

Employee Recognition That Works (Second Edition)

by Cindy Ventrice

THE SUMMARY IN BRIEF

How is it that companies spend billions of dollars on employee recognition programs, yet most employees feel unrecognized?

Make Their Day zeroes in on what you — the manager, supervisor or team leader — can do to truly make your employees feel valued. It lays out proven recognition tactics that will provide a genuine, lasting boost for your business. Author Cindy Ventrice also demonstrates that integrating the intangible rewards people crave — praise, thanks, opportunity and respect — into the daily routine is far more effective than typical recognition awards, events, perks and privileges.

While focused on the manager, *Make Their Day* is loaded with information that anyone can use. Human resources groups will get ideas on how they can administer more effective recognition programs. Individuals in any role will learn how to give recognition to their co-workers, their managers and supervisors, and even themselves.

Ventrice describes how to provide recognition in increasingly virtual workplaces, account for cultural differences in reward preferences and ensure that rewards are perceived as fair and equitable.

Each real-world example that is highlighted will help you understand what it takes to create meaningful recognition in your organization.

IN THIS SUMMARY, YOU WILL LEARN:

- How to offer recognition that works.
- How to create an environment where people feel valued.
- How to build the cornerstone of recognition: relationships.
- How to look past superficial symbols and focus on what really matters.
- How to create memorable recognition that improves employee commitment.

Introduction: Real Results

The firms that make *Fortune* magazine's annual list of the "100 Best Companies to Work For" provide great examples of organizations that offer many forms of effective recognition. According to Robert Levering, who along with Milton Moskowitz oversees *Fortune*'s Best Companies project, "No company can have a great place to work without having good ways to show appreciation to employees." Not only do the companies on the list do a good job of offering the kind of recognition employees value, but these companies also receive tremendous payback for their efforts. Levering and Moskowitz's research reveals the following:

- Industry by industry, the companies on the list have 50 percent less turnover than their counterparts.
- Publicly traded companies on the list average a 15 percent to 25 percent greater return for investors than the S&P 500 over three-, five- and 10-year periods.

By creating meaningful recognition, you will reduce your workload, improve your productivity and create a workplace where people love to work.

PART ONE: EMPLOYEES WANT TO LOVE THEIR WORK

Recognition That Works

An international survey in 2007 found that 57 percent of the most meaningful recognition doesn't even cost a dollar.

Employees are looking for meaning, not things. They see tangible awards as a vehicle for delivering recognition, but they don't regard the awards themselves as recognition. They're much more interested in the underlying message behind the reward.

Your employees are strong believers in the old saying "It's the thought that counts." For awards to count as recognition, your employees need to see acknowledgment of their specific accomplishments and sincere appreciation of their personal value to the organization.

Missing the Mark

There's a lot you can do that will make people feel recognized, but first you have to be clear about what recognition *isn't*. It isn't perks, bonuses, plaques and awards, or incentives. While these things aren't recognition, they can be a highly valued part of the recognition experience. They can serve as excellent concrete reminders of the recognition you offer.

Focus only on the tangible award, and recognition will most likely fail. Focus on the *meaning* behind the award, and employees will receive recognition that works.

What Makes Recognition Work

Employees want to be seen — sometimes literally. When anyone higher up the organizational ladder greets an employee by name in the hallway, typically that employee will view the greeting as a form of recognition. Why? Because these are the people employees most want to be seen by because they have the most influence over their careers.

Employees also want their accomplishments identified and acknowledged. When co-workers, internal customers, managers and supervisors provide specific details about the value of an employee's contribution, they provide recognition that works at its most fundamental level.

The Elements of Recognition

Recognition that works has four basic elements: praise, thanks, opportunity and respect.

Every successful gesture of recognition includes at least one of these four basic elements and is typically a combination of more than one. If you don't include at least one of the elements, you aren't giving recognition. You're giving an incentive, prize, gift or plaque, but not recognition that works. ●

Finding Recognition Everywhere

Every day, employees everywhere look for proof they are valued. Not only do they want their managers to tell them they are important, but they also want them to show it. They want to work for a manager who builds recognition into everyday occurrences. They want to work where recognition is inherent in the way they are treated and in the work they do.

At Plante & Moran, a Midwest-based midsize accounting firm, new hires know from the moment they arrive that they're valued. On their first day of work, new recruits receive business cards, manuals that will help them do their jobs well and their own office with their name outside the door. They're assigned two people: one a supervising partner and the other an experienced co-worker called a "buddy." These two people help them adapt to work life and excel in their new careers. Plante & Moran provides concrete recognition of the value of new employees from the moment they are hired.

The Plante & Moran new-hire process addresses the need for both respect and opportunity, two of the four elements of recognition. Employees there know they are valued. They know they are part of an organization where management wants to help them succeed.

It takes planning, preparation and follow-through to make recognition part of the environment itself.

Understanding the Motivation Connection

Motivation can be intrinsic, extrinsic or some combination of the two. Extrinsic motivation comes from outside the individual. Extrinsic motivators are the incentives that you can offer: the promise of a bonus if certain criteria are met, the prize in a contest or the lure of a raise if a project is completed on time. Used properly, these types of incentives can work well, but there isn't much recognition built into them.

In contrast to extrinsic motivation, intrinsic motivation comes from within. Individuals motivate themselves based on their own personal needs and expectations. Intrinsic motivation varies from person to person, with each individual being motivated by something slightly different from anyone else.

Anything that tells people they are valued and important has inherent recognition. It isn't all about perks and social benefits. It's about basic respect.

Recognition, or lack of it, really is inherent in everything we do. Keeping employees informed and updated recognizes their value. Providing the best possible work environment does the same thing. ●

Recognition Starts With Your Relationships

With recognition, nothing is more important than the relationship between the giver and the receiver. You can structure an innovative and generous program. You can offer frequent, timely and proportional recognition. You can plan a program that is technically flawless, but none of that matters if the people you are recognizing don't value your feedback. Next to relationships, everything else is secondary.

The managers who are most successful spend less time thinking about recognition itself and more time thinking about how they can help the people they work with.

Here are some of the thoughts and actions that will make you successful:

- Get to know your people.
- Help others learn and grow.
- Share information and trust people to use it appropriately.
- Value both the individual and his or her contributions.

Relationships are the cornerstone of recognition. Without trust, respect and communication, recognition doesn't matter. With these things, nearly anything can become valued recognition.

Creating Loyalty

Strong bonds between employees at all levels create powerful company loyalty. Building strong bonds means building trust. Building trust means developing respect and cooperation. In organizations where strong relationships are valued, everyone works hard to maintain these things and is careful not to do anything to damage those relationships.

So, what do you do, as a manager? You don't have control over how your organization behaves, but you

can create respectful relationships. Here are three tips:

1. Be on the lookout for anything in your organization that seems disrespectful of employees. Do what you can to encourage change or, at the least, lessen the impact on your employees.
2. Ask employees what they want and need that will make them the most effective.
3. Listen and respond to the best of your ability. ●

PART TWO: WHOSE JOB IS RECOGNITION, ANYWAY?

Managing for the Greatest Impact

Recognition from all sources is important, but it doesn't carry the same weight as recognition that comes from the manager. In fact, research shows that 70 percent of the most meaningful recognition comes from a manager. Seems unlikely that you can achieve high satisfaction without manager involvement, doesn't it?

The 50/30/20 Rule

Employees want recognition from a number of sources. They need it to come from their manager. They also want it to come from the organization in the form of inherent recognition and big awards. And, finally, they expect it to come from their peers both formally and informally.

There seems to be a preferred mix for these three sources. Overall, employees want about 20 percent of recognition to come from the organization, 30 percent from their peers and a full 50 percent from their managers. This is the 50/30/20 Rule.

Managers often want to address employees' need for recognition through peer programs. Peer programs are important, but if managers successfully distance themselves from the recognition process and ignore the 50/30/20 Rule, employees will be frustrated by the lack of manager recognition.

What Exceptional Managers Do

Here are five tips to help you offer recognition that works:

Tip 1: Provide clear expectations, validation, respect, loyalty and trust. Build strong working relationships with each person.

Tip 2: Figure out what people have to offer and leverage those strengths. Select challenges and opportunities that are appropriate.

Tip 3: Individualize recognition. Make sure you know enough about employees to select recognition they will value.

Tip 4: Encourage employees to recognize each other. Model good behaviors and coach employees to be alert for opportunities to recognize each other.

Tip 5: Celebrate as a team. Create some form of fun recognition activity for the group. ●

Leading With Vision, Visibility and Momentum

Leaders play a unique role in the recognition process. Just as they determine the direction of an organization, department or project, they can influence the direction of recognition.

The visibility and influence of the people on your executive team make them some of the most potentially effective proponents of recognition within your organization. From their small, personal gestures to the recognition programs that they personally champion, these executives can set the tone for recognition. If they value recognition, then it's much more likely that everyone within your organization will value it as well. This is because the members of your executive team are in the best position to weave recognition into the fiber of the organization. At the same time, regardless of your role, you can offer recognition leadership.

Showing Value Through Action

How do you demonstrate that people are valued? What you believe comes through, first and foremost, in your actions.

As a leader, the more willing you are to offer recognition, the more likely that others will follow your example. Because of your visibility, you are in an excellent position to model how important recognition is. When managers and employees see their leaders recognizing people, they're more inclined to see the value in offering recognition and are more likely to offer it themselves.

Part of leadership is defining and reinforcing mission, values and strategic plans. But leaders can't just tell people what is important and expect it to stick. They need to find ways to reinforce what is valued. Recognition can do that. Think about what you would like to emphasize: customer service, teamwork or innovation. Develop a simple program and take leadership. You will get results.

You are the leader of all recognition efforts. You need to champion programs, giving them credibility and visibility. You need to personally offer effective recognition,

modeling it for everyone within your organization. By your words and actions, you will have a profound impact on recognition and, in turn, on the success of your organization.

Partnering With Program Administrators

Because the relationships people have with each other determine whether recognition works, the stars of employee recognition are the people being recognized and the people whose businesses, lives and jobs they affect.

A manager recognizes a team that has accomplished its objective. An employee recognizes his or her supervisor for providing needed support. A vice president recognizes a division for meeting a goal. Managers, supervisors, teams and individual employees — these people are the stars of recognition that works.

The Administrator's Supporting Role

In the best organizations, you, as a manager or supervisor, are responsible for recognition while your recognition administrator guides and supports you, remaining behind the scenes, influencing and coaching rather than trying to lead.

Wells Fargo has an equally effective approach. According to Cheryl Miller, recognition manager for Wells Fargo Technology Group, recognition coordinators (RCs) in her group work with managers to keep recognition efforts front and center. These RCs offer many services: They coordinate events, administer nominations, offer training and coaching and much more.

Managers and supervisors at Wells Fargo can best leverage their RCs' support by:

- Including them in staff meetings to offer updates on recognition.
- Asking them to volunteer to lead a "fun committee."
- Having them compile nomination information from business partners and customers.

You may not have a RC in your organization, but your human resources and communications teams can probably provide you with some of these types of services.

Wells Fargo's RCs also provide managers and supervisors with questionnaires to help them learn more about what their team members want.

How to Create a Simple Development Plan

Even without a formal structure, you can help employees plan their development. Take these three steps:

1. List the major responsibilities that are essential to your job, and put a star by those made possible by last year's development. You can use this section to coach employees on those responsibilities that are most valuable to the company.
2. Describe what you want to learn in the next 12 months. Work to develop a list that seems beneficial to both the company and the employee.
3. List the corresponding experiences/activities and observable measures that will meet these development objectives. List observable measures for new skills learned.

Making Recognition the Responsibility of Every Employee

If you are part of an indifferent, recognition-free environment, you might feel reluctant to be the first person to offer recognition. This is understandable. When you offer recognition, you acknowledge that other people contribute to your success. You have to be willing to share the credit for your accomplishments; and when you're barely receiving any recognition, it is difficult to share. Do it anyway. Ultimately, the recognition you offer others will improve your work environment and increase the quantity and quality of recognition you receive in return.

Simple things make a difference, like writing a thank-you note to a co-worker who covered for you when you had to leave early, or sending an e-mail to your boss telling him how much you appreciated the way he handled a problem you brought to his attention. If you want a more motivating work environment with greater levels of appreciation, take the initiative. Offer recognition to your boss, co-workers and the people you lead. You will see an increase in the amount of appreciation everyone receives. You will improve your own job satisfaction and the satisfaction of everyone around you.

Understanding Peer Recognition

Peer recognition can be very powerful. It's easy to see how a workplace where employees show each other appreciation would be a more pleasant place to work.

Employees who recognize each other show greater respect and tend to act more cooperatively. Respect and cooperation create a happier, more productive workplace — an obvious benefit for individuals and their managers.

Peer recognition can take three basic forms. It can be very unstructured and spontaneous, with employees simply acknowledging each other as they choose. It can be loosely structured, with the organization providing the awards and some criteria but letting employees decide when and how to give them. It can also be more formally structured, with systems in place for selecting recipients and managing the entire process.

While you're at it, don't forget to recognize your own manager or supervisor. Recognize everyone, regardless of his or her ability to influence the direction of your career. ●

Using Self-Recognition to Improve Quality

Many organizations have individual development plans (IDPs). When creating a development plan, individuals work with their managers to set goals for growth and improvement for the coming year. Finally, they select activities and learning opportunities that will help them achieve those goals.

On the surface, an IDP may not appear to be recognition at all, but when you remember that opportunity is one of the four elements of recognition, you will see the role an IDP can play.

Graniterock is a privately held, 100-year-old company of about 800 employees. Graniterock's IDPs use self-study, coaching and cross-training for many learning opportunities. Management has found that these methods are inexpensive and very effective. They favor cross-training, in particular, because of its ability to improve organizational focus, teamwork, knowledge and skill. These learning opportunities will work for you as well.

Adding Self-Recognition to the Mix

Self-recognition is a powerful and underutilized form of recognition. By adding self-recognition to your existing recognition mix, you can encourage employees to showcase their most important accomplishments. When employees control their own recognition, they receive validation for what is most meaningful to them. After all, who knows what an individual wants more than that individual? Self-recognition allows you a glimpse into what employees value so you can use that information to create forms of recognition that will be meaningful. Finally, self-recognition adds to the frequency of recognition. It increases the possibility that every employee will feel sufficiently recognized. ●

PART THREE: MAKING RECOGNITION WORK

Getting Specific and Relevant

Playing by the rules means you judge and recognize performance based on pre-established criteria. This increases the likelihood that your recognition will be perceived as fair. It builds trust when you play by the rules, and employees who work in an atmosphere of trust are happier and more willing to work cooperatively.

So, how do you establish the rules of recognition? You begin by identifying the values, goals and behaviors that lead to success.

What Do Values Have to Do With Recognition?

The Microsoft Business Solutions peer recognition program is based on the group's mission and shared values that are integral to their culture. The program reinforces their organizational culture because it allows employees the opportunity to see examples of what is outstanding.

Ask a Microsoft Business Solutions employee why a co-worker won the Heritage Award, and that person would know. When the award was presented and the nomination read, everyone learned why the nominee was chosen to receive the award. They know the nominee's actions embodied the values that they all shared. Ask a recipient if the award had meaning, and you would get a resounding yes.

Specific Recognition Makes Their Day

Recognized behaviors, like goals, need to be specific. When people tell you they appreciate that you offer several possible solutions when you present a problem, you know exactly what they value. You can't say the same thing when they compliment you on your positive attitude. Do they mean they like that you don't mention potential problems? Do they like that you tell jokes in the break room every morning? Or do they mean that it's great that you let them push you around without complaint? With vague recognition, their meaning is left up to the imagination.

Specific, detailed recognition, based on your organizational goals and values, is most meaningful. Communicate the specific goals, desired behaviors and intended purpose of recognition. Use recognition to emphasize the group and individual efforts and results.

Work to provide fair, specific and frequent recognition, and you'll provide recognition with meaning.

Measuring for Results

In your organization, you measure to track performance. When you then use that information in your recognition, you provide objective feedback and make the award relevant to recipients and observers alike.

What to Measure?

Last year, Suzanne Danis-Harkness, manager of application maintenance and support at Home Hardware, began documenting her measurable results. She updates this report monthly and says, "It feels good to see what I have accomplished and to meet with my manager on a monthly basis and review the results." Her manager was pleased with the process, so together they decided to expand its use within the department. Danis-Harkness is now using it with her direct reports to measure accuracy, spot a need to rework code, and determine whether they are up-to-date and meeting estimates.

To decide what to measure for your direct reports, start, as Danis-Harkness did, by finding appropriate measures for yourself. Once you are proficient in this area, you can develop measures for your direct reports.

Look at your values, business strategies and goals before you decide what to measure. They can provide focus. Measures should provide tangible proof that you are achieving your goals within the boundaries of your values.

You can usually achieve your goals by more than one method. With a strong incentive, people will achieve success in ways you never considered. Look for relationships among your values, goals and measures.

Collecting Data

When considering the validity of any information you use, hold it up to the following criteria:

- **Measurements should provide quantifiable data.** Measuring takes a vague concept and makes it tangible.
- **Measurements should be consistent over time.** Use the same measurement for an extended period. This approach will help you identify trends in your data.
- **Measurements should create an accurate picture of current conditions.** To avoid misinterpreting data and making erroneous assumptions, use multiple measures from a variety of sources.

Just as sports fans appreciate statistics on their favorite teams and players, employees like "knowing the score." Measure workplace performance, and you provide an objective yardstick that will help you create meaningful and memorable recognition.

How to Individualize Recognition

To better focus your attention and increase the positive impact, consider using this three-step process for individualizing recognition:

1. Identify how each individual contributes.
2. Determine personal recognition preferences.
3. Recognize unique contributions with personalized recognition.

Aligning Recognition With Culture

Your team has a culture. That culture is formed by the team's personalities, generations, nationalities and work styles, as well as by your industry. It is even affected by whether everyone works in the same location.

It is important that you recognize the culture of your team and take it into consideration as you plan your recognition activities.

Dealing With a Dispersed Work Force

How do you provide an environment where people feel valued when they are physically located in more than one place? Keep the following in mind:

- **The need for clear expectations and goals is as strong as and even stronger than when you are in the same location as employees.** Use a results-based work model.
- **Good communication processes are even more critical.** When someone falls out of the loop, he or she feels invisible.
- **Respect is still the key.** Take time zones into consideration when planning meetings and checking in.

One final thought on working virtually: Don't let technology become a crutch. Although technology is a terrific help in maintaining contact and visibility, it can also be a barrier. Make time for meeting in person whenever possible.

The Process of Individualization

When you take time to listen and get to know an individual, what he or she values, and the quality of that

person's work, you are offering a powerful form of recognition. Regardless if you are the employee's supervisor, someone from another department, the CEO or a person he or she works with every day, personal attention gives recognition greater impact. ●

Dealing With the Fairness Paradox

To be fair, you need to ensure that everyone has equal opportunity for recognition.

When he was a director at Cisco Systems, Doug Purcell, now VP of public sector service sales, realized that his salespeople had more chances to receive recognition than did the support members of the team. He knew that sales support provided a critical role, without which salespeople would have difficulty succeeding. As part of his efforts to provide more balance, he implemented a quarterly award to be given to an outstanding individual whose work supports the efforts of the sales team. The award, a director's chair imprinted with the name of the award and the Cisco logo, was originally called the Director's Award and now is known as the Impact Award.

Four Rules of Fairness

To be fair, we need to think in terms of equivalent recognition for equivalent performance.

1. Know individual preferences. If you've done your homework, you know what the individuals on your team value.

2. Clarify the perceived value of recognition options. Whether your "organization" is an entire company or a project team, it is your job to understand what is most and least valued. Get the help of your team to identify their recognition hierarchy.

3. Align performance with the perceived value of the recognition. The greater the value and visibility, the greater the need for solid criteria. If you make your criteria measurable, you increase the likelihood that your recognition will be perceived as fair.

4. Present your recognition message effectively. Remember to keep your message accurate and specific. Start with verbal praise and appreciation. ●

Recognition Is a Work in Progress

Recognition is never a quick fix. It requires time to create the kind of work environment where recognition is inherent and to build the kinds of relationships necessary to make recognition meaningful. Trust is established, relationships are built and habits are solidified over the long term.

The basic steps to developing consistent, meaningful recognition are: Start small, evaluate and adjust.

Make a Plan

Making a recognition plan follows this three-step process:

Step 1: Determine the current state of recognition. Read the responses from surveys, ask HR to administer a full assessment of your recognition proficiency or talk with employees. Start with an employee survey and follow it up with focus groups or one-on-one interviews to really understand what is needed.

Step 2: Plan your recognition strategy. Lay out a complete plan to ensure that you can follow through and not disappoint your people.

Step 3: Commit to a long-term, graduated implementation. Implementation recognition needs to be an ongoing cycle: implement, observe, evaluate the results, and then adapt and improve as you start the whole process again.

Where Do You Go From Here?

Employees crave meaningful recognition. When they talk about the recognition they receive, they're talking about how valued they feel. To help the people you work with feel valued, you need to focus on the essence of what recognition is. Instead of offering recognition at a superficial level, remember to look at recognition in the bigger context and over the long term.

Recognition isn't a plaque; it's the meaning behind the plaque. It's about building relationships and taking a personal, genuine interest in people and their preferences. So long as you do that and continue to look for ways to refine the recognition that you offer, employees will feel recognized. That collective feeling, in turn, will boost morale, productivity and profitability — and everybody wins. ●

Making Diversity Work

7 Steps for Defeating Bias in the Workplace

by Sondra Thiederman, Ph.D.

THE SUMMARY IN BRIEF

Workplaces are more diverse than ever, and studies show that this diversity contributes to innovative ideas and novel approaches to decision-making. A diverse workplace also makes for stronger business relationships with customers and vendors and offers opportunities for lucrative interactions with businesses around the globe.

However, when bias exists, the benefits of a diverse workforce lie dormant.

Drawing from research and nearly 30 years of experience in the field, diversity expert Sondra Thiederman, Ph.D., provides executives and managers with step-by-step strategies for minimizing conscious and unconscious bias and maximizing the ability to manage diversity effectively.

Although some individuals may find the subject matter a source of discomfort, recognizing and addressing bias are the first steps to a more transparent, productive workplace. *Making Diversity Work* includes real workplace examples, practical applications and exercises designed to guide you and your team on a journey of self-discovery, behavior change and, ultimately, healing.

IN THIS SUMMARY, YOU WILL LEARN:

- How the seven-step Vision Renewal Process can help you identify and defeat conscious and unconscious bias.
- Four strategies to help you become mindful of your biases.
- Three questions to ask to dissect your biases.
- Five strategies to identify common kinship groups.
- What are Gateway Events™ and how they can bring about productive dialogue.
- Cognitive and verbal skills to encourage better diversity dialogue.

PART ONE: THE BASICS OF BIAS

William Cunningham is a psychologist at Ohio State University. Cunningham's work, and the solutions it inspires, is rooted in previous research on how the brain generates biased responses to different groups. Addressing primarily race bias, but later broadened to other types of difference, these earlier studies found that when white people view pictures of black faces, the region of the brain that is responsible for wariness (the amygdala) responds with a sharp spike in activity. This spike amounts to a primitive "jumping to conclusions" about the nature of people different from ourselves. It is what has been termed an "instinctive bias." It is this physical reaction — the spike in response to groups different from ourselves — that gave rise to the belief that biases are part of our hardwiring and, in turn, the erroneous conclusion that they are unchangeable.

Cunningham's "tiny change" had to do with time. In the earlier studies, the faces were shown for only 30 milliseconds — removed so quickly that they could only be "seen" subconsciously. Cunningham decided to find out what would happen if the pictures were viewed for a longer period of time — 525 milliseconds, still too brief for the conscious mind to grasp. And yet, the extended time was long enough to change the brain's response. Although there was still a spike when the different faces appeared, the spike was not in the alarm center, but in the part of the brain that controls rational thought.

The upshot of this — and the very good news — is that, if given long enough, the conscious and rational brain does have the power to override even our most primitive biased instincts. ●

Bias Defined and Misdefined

A bias is an inflexible positive or negative belief about a particular category of people.

Based on this definition and going solely by the information provided below, is the following person absolutely, positively guilty?

Juan, a 50-year-old manager, had occasion to interview a woman named Nancy, who, at the time of their meeting, was in her mid-20s. After the interview, Juan said to his boss, "I'd like to hire her, but Nancy has quit four career-track jobs since college. We need someone willing to commit for the long run. It looks like some Generation Xers really do move around a lot."

Flexible Versus Inflexible

There are a couple elements in this scenario that might have misled you into believing Juan was guilty of bias, including his statement, "It looks like some Generation Xers really do move around a lot." If you look at this sentence closely, you can see that it is not a bias but, instead, a "working generality."

Another reason you might have thought Juan was guilty is that the characteristic he ascribed to Nancy (changing jobs often) could, if applied inflexibly to all Generation Xers, indeed be a reflection of a bias. This confusion highlights a key point that will help you in your efforts to accurately diagnose bias in others and yourself.

Bias is an attitude, not a behavior, and just because a word or action is consistent with a biased attitude does not automatically mean it actually reflects a biased attitude.

Guerilla Bias™

Consider this case study:

Gerry was the manager at a business journal based in New

York City. One of his writers was a young woman named Liz. Liz was a satisfactory journalist but not quite up to the standards of the organization. Because of this, Gerry had gotten into the habit of editing pieces, rather than doing what he did with the men on his staff: sending their pieces back for rewrites. When one of those men asked Gerry why he hadn't edited their writing too, Gerry said, "Your situation is different. After all, Liz is a single mother, and you know they all have a rough time and deserve an extra break."

The bad news for Gerry, and for those around him, is that he is a carrier of a particularly dangerous species of bias: Guerilla Bias.

One reason that Guerilla Bias is so dangerous is that it is difficult to spot and, therefore, very tough to diagnose. Guerilla Bias lies concealed behind good intentions, kind words, and even thoughtful acts. In Gerry's case, his so-called thoughtful act was to edit Liz's manuscripts for her rather than give her the opportunity to learn from her mistakes.

Defining bias is difficult; it involves a demoralizing glut of yeses and noes, ifs, buts, and maybes, each of which seems designed to drive us mad. Yes, being drawn to someone like you is normal; no, this impulse should not be completely indulged. Yes, it is OK to make a reasonable assumption about a person, but you are biased if you don't change your mind in the face of conflicting evidence. Yes, it is all right to be kind to an individual, but it is bias if you do it solely because of the group to which he belongs. Yes, some behaviors do not reflect a biased attitude, but, maybe, those behaviors should be changed anyway.

PART TWO: THE VISION RENEWAL PROCESS

Step One: Become Mindful of Your Biases

The fear that prevents us from admitting bias is that of having to acknowledge, even to ourselves, that we may not be quite as nice as we, and others, like to think we are. Until we overcome our dread of looking like bad people, or at least like less-good people, we will be unable and unwilling to acknowledge our biases, admit them and target them for extinction.

Strategy I: Observe Your Thoughts. Biases, as we know, are attitudes. As such they live inside our brains waiting to be noticed, first as thoughts and then as actions. Some, the most subconscious ones, are so rude that they whiz from attitude straight to action so fast that we barely feel the breeze, much less notice what is going on. Lucky for us, most biases are more courteous and make the journey to thought and then to action at a civilized pace — a pace that allows us to be aware of their presence.

We've all watched our thoughts before. Have you ever, for example, been asked to say the first thing that comes to mind when you hear the word cat, house or airplane? When you notice, and then say, the word that pops up, you are watching your thoughts. That's all there is to it. We do it all the time. It's just that when it comes to something more substantial, we lose sight of how simple and familiar the process is.

Strategy II: Examine Your Thoughts. Watching our thoughts is important, but it is merely the evidence-gathering stage of our investigation. The next step is to examine that evidence, to determine if each thought is indeed a whiff of smoke floating up from a buried bias or, instead, an innocent recollection of what our culture at large says about the group.

One way to do this is for you to look at each initial reaction and ask yourself this question: "Would I feel the same way about the meaning of this incident if the actor were of a different kinship group?"

The next step in determining if your first thought is evidence of a bias is to see how much emotion is attached to it. The less emotion, the less likely the thought is to be biased.

Strategy III: Explore Your Attitudes Toward Human Difference. Observing and analyzing your thoughts as you think of and encounter other kinship groups is a good start toward bias identification. There is still, however, one more piece of evidence that needs to be collected. Before we bring charges of bias against ourselves, we need to shore up our case by examining how we feel about the notion of difference itself. Generally, those who have few biases tend to be fairly indifferent to whether or not a person is different from themselves. People who possess the virtue of seeing others clearly neither ignore the difference when it is pertinent to the situation nor put excessive emphasis on it.

Strategy IV: Observe Your Behavior. I have gone to great lengths to emphasize that a bias is an attitude not a behavior and that not every inappropriate action reflects a bias. Having said that, there are some actions that, if observed, alert us to the possibility that a bias just might be lurking beneath the surface.

• When deciding whom to send to training, do you find yourself sending people from some kinship groups but not others?

• When picking plum assignments, is there any group you favor?

• Do you catch yourself being "nicer" to members of any one group than to members of another?

Evidence produced by observing behaviors such as these is not unto itself conclusive. If paired, however, with other pieces of evidence, it might close the case.

Step Two: Put Your Biases Through Triage

Just as injured soldiers on the battlefield are put through a triage process to discover who requires treatment first, your biases need to be triaged to identify which ones most urgently need your attention. This is accomplished by examining the damage and pain each one is apt to cause.

Does Your Bias Compromise Your Ability to Hire the Best People?

Linda would have had to answer this question with a regretful yes. The human resource director at a prestigious hotel in Beverly Hills, Linda allowed her bias to interfere with a key hiring decision.

Sitting across the desk from Linda was an applicant who, by anyone's standards, was perfect for the job: outgoing, articulate and very knowledgeable of the hospitality industry. She was also born and raised in Japan. Therein lay Linda's problem. Because of Mariko's heritage, Linda's evaluation of her was grossly distorted by another set of qualifications, or I should say misqualifications, that popped into her head and blocked her view of what Mariko had to offer. All Linda could see as she looked at Mariko was a hodgepodge of stereotypes right out of a Hollywood movie: shy, retiring and soft-spoken. Certainly, to Linda's biased eye, Mariko was not a good candidate for a high-stakes sales position.

Linda had a choice to make. The best option would have been for her to shove her bias, and these fictional characteristics, aside long enough to see Mariko for who she was and hire her. Instead, she rationalized away Mariko's assertiveness in an effort to prove her bias correct. Mariko did not get the job.

Linda paid an expensive price for this exercise in stubbornness. Shortly after the ill-fated interview, Mariko was snapped up by a neighboring hotel that then proceeded, with Mariko's help, to abscond with much of Linda's lucrative convention business.

Does Your Bias Interfere With Your Ability to Retain Quality Employees?

When a person does not conform to the positive qualities that we anticipate, there is a tendency for us to dislike him for not measuring up to our expectations.

Are you ever the target of this kind of bias? Perhaps as a woman you are expected to love children; as a straight man, to like sports; or as a gay man, to be artistic. A common positive bias toward women, for example, reads, "All women value relationships and have, therefore, a nurturing leadership style." Because of this bias, women whose leadership style is authoritarian tend, as reflected in a 2007 gender-bias study conducted by Catalyst, to be disliked and "their behavior frowned upon."

Does Your Bias Put Your Organization at Risk for Litigation?

Litigation is the worst nightmare of every organization, every manager and every CEO. Sometimes the waking dream is filled with contemptible characters who tell racist jokes, denigrate gay people or make sleazy comments to female subordinates. Other times, and this is the real worry, the act that results in litigation is of the Guerilla Bias variety; no sleazy and easily identifiable characters are in sight.

I doubt, for example, that the manager who inspired Meg's race discrimination suit was particularly sleazy; he was probably even "nice." Because he was so nice, he couldn't bring himself to tell her that she was doing a bad job. He was, you see, afraid that Meg would be offended by his comments. Eventually, Meg's performance became so bad that, despite his fear of her reaction, he fired her. This wouldn't, of course, have been a problem had he given Meg some warning — along with the information she needed in order to improve. Unfortunately, he didn't give her these things. What he did give her was clear grounds for a discrimination suit, which, by the way, Meg ultimately won.

Step Three: Identify the Secondary Gains of Your Biases

What am I gaining by holding on to my biases?

The answer lies in the truism of the human mind that most otherwise unproductive attitudes and behaviors carry within them what is called a "secondary gain." Sometimes that gain feels, at least temporarily, good.

Every bias has a secondary gain attached to it. Some of those gains are real; others are merely illusions. In every case, however, the gain is not worth all the trouble the

bias causes. Once we realize that, we move one step closer to being willing to let the bias go.

Secondary Gain: Protection From Diminished Status. Marie, a Mexican-born nurse practitioner, had a similar concern. She complained of constantly being assigned to care for, as she put it, "those dirty, uneducated Mexican immigrants." As it turns out, her bias came directly from the fear that her contact with these patients would somehow pull her back down into a status and lifestyle she had come to find repulsive. To relieve this fear, Marie manufactured the bias that these patients were in possession of remarkably few redeeming virtues and were irrevocably beneath her in terms of their position in the social stratum.

Secondary Gain: Protection From Loss. Fear of losing something we believe to be rightfully ours is one of the most common reasons for the development of bias. This explains why biases increase in times of economic slowdown and why it is then that we begin to hear a medley of mantras about how "those people" are "taking all the jobs," "getting preferential treatment" and "taking advantage of the situation."

Secondary Gain: An Excuse to Avoid Discomfort. This bias is frequently disguised behind kind thoughts such as "I don't want to hurt his feelings," "I don't want to make anyone upset" or, my personal favorite, "I wouldn't want to risk offending anybody." ●

Step Four: Dissect Your Biases

Step Four uses inquiry, as anthropologist Jennifer James puts it, to "move our responses to others out of our guts and into our minds." This inquiry will take the form of three questions, each of which, if answered honestly, will reveal the faulty logic behind your biases:

Question 1: Where did you learn your bias and under what circumstances? Many of us grew up in homes that were veritable petri dishes of the bias virus. Television, radio, the Web and newspapers are, of course, abundant sources of bias.

Of all the ways we learn bias, you would think that experience would be the most reliable. Well, maybe and maybe not. For one thing, any experience with one individual, or even 10 individuals, says nothing about other members of that kinship group. In addition, unless an experience is well-rounded and repeated, it tells us little even about the person actually encountered.

Question 2: How many people have you actually met who conform to your bias? Caution! The phrase "actually met" does not include media images, rumor, what other people say they know; all that counts here are personal encounters between members of the group in question and you.

Question 3: Have you ever met a member of your target group who does not conform to your bias? I am reminded of a young woman named Rose, who told me with complete confidence that "all Mexicans are destructive." That misguided belief grew out of one horrifying night when two Mexican immigrant teenagers tried to break into her house. When the boys found they couldn't get in, they became furious and destroyed her front fence. Rose was alone, her phone was disconnected and she was, understandably, terrified.

After she told me this story, I asked if she knew any Mexicans who weren't destructive. She looked at me as if that were the stupidest question she had ever heard and said, "Oh, yes, I live in a mostly Mexican community and all my neighbors are wonderful people." Under the bright light of logic, you could almost see her bias melt away. ●

Step Five: Identify Common Kinship Groups

A kinship group is "any population that shares a self- or externally ascribed characteristic that sets it apart from others." This characteristic might be a disability, race, a hobby, gender, age or any other of dozens of human dimensions. The virtue in the concept of a kinship group is that it allows each of us to belong to many groups at once, depending on the characteristic on which we focus. It also — and this is the best part — enables us to broaden our group to include many populations that we previously thought of as different from ourselves.

Here is one of the many advantages of sharing a kinship group: Once you identify yourself with a particular population, members of that group are transformed in your mind from "them" to "us."

Strategy I: Keep What We Share Top of Mind. We notice what we care about. Keeping what we share top of mind is a matter of caring. Once we recognize how important identifying commonalities is to bias reduction, we will care.

Strategy II: Practice Skills for Achieving Empathy. In connection with our current task of identifying what we share, the empathy we are seeking is summarized in this question: What emotions or experiences — positive or negative — have you had that are,

to some degree, like those experienced by someone who otherwise seems different from you? Those shared experiences and emotions, that empathy, becomes, in essence a shared kinship group.

Full understanding is not a prerequisite to empathy.

Strategy III: Seek Contact With Those Who Are Different From You. Of all the strategies for identifying shared kinship groups, this one seems to be the most straightforward: Spend time with and get to know people who are different from you.

Strategy IV: Create Workplace Opportunities for Cross-Group Contact. Organizations can play a major role in facilitating bias reduction by creating ways for people of diverse backgrounds to be together and, in turn, have the opportunity to discover and focus on what they share. This contact, in order to be most effective at reducing bias, needs to have the following characteristics:

1. Be appropriately intimate.
2. Be as varied as possible.
3. Be sanctioned by a relevant authority figure.
4. Be among people who are reasonably equal in status and resources.
5. Should be, if possible, unhurried.
6. Be goal-oriented.

Affinity/network/employee resource groups certainly conform to these requirements and have for years been the backbone of diversity efforts in many companies.

Strategy V: Create and Emphasize Shared Goals. Shared goals, you see, have the power to fill the fissure that separates us. When we are striving to achieve the same thing, it is just plain harder to hate each other. The goal creates a kinship group. ●

Step Six: Shove Your Biases Aside

As we have seen, bias is an attitude, and every attitude at some point is manifested as a thought. So far, we're OK — what we think, although not always good for us, is usually harmless. That is, unless we allow that thought to dictate a behavior. It is between the biased thought and the action that we want to throw the switch.

Because Jill was such a hard case, I'm going to use her as an example. Jill had what seemed to be an unshakeable bias against people over 50. This caused her to think, "There is no point in giving Lance that assignment, he'll never come up with the innovation we need." Jill refused to give Lance any challenging projects. As a result, Lance quit the organization because of lack of opportunity and took his 25 years of experience elsewhere.

The point where Jill needs to switch tracks is just after the thought "There is no point in giving Lance that assignment" comes into her head. The trick to doing this, for Jill and for us, is to stay in the moment so we can catch the thought as it whizzes by. This takes practice and vigilance, but it can be done.

We are not our thoughts. Our thoughts are tools that we produce to help us survive. Because we produce them, we can manipulate them. In short, we have the power to follow these instructions:

Think the thought, shove it aside; think the thought, shove it aside; think the thought, shove it aside.

Even if we only keep the biased thought out of the way for a few seconds, we can peer through that break in the fog and see the person more accurately. Perhaps the fog will close again, but it is a start and, like any mechanical act, shoving the thought aside becomes easier with practice. ●

Step Seven: Fake It Till You Make It

Ever since she can remember, Bess has had, as she put it, a "thing" about people who don't express themselves well in English.

For whatever reason, Bess just couldn't exterminate this bias. She was aware it existed and aware it distorted her view of many employees who had much to offer the organization. However, she still found herself avoiding people who did not articulate up to her standard.

Determined to change her behavior, she made a list of the things her bias was causing her to do and the consequences of those behaviors. Having made her behaviors and their consequences concrete and measurable, Bess set out to do things differently.

The ultimate consequence of these changes in behavior was that Bess' bias began to fade. First, it faded because the dissonance (the difference) between her behavior and her biased attitude subconsciously bothered Bess. The second reason her bias faded was that it just couldn't survive the onslaught of positive and varied information that Bess' new behaviors caused to come her way.

Fake Your Language

I am asking you to do something you do most of the time anyway: Use respectful language. The "faking"

comes in on those occasions when you are not feeling particularly respectful.

Speaking respectfully to and about people produces, of course, the same positive responses that Bess experienced when she changed her behaviors. Those responses will, as they did in Bess' case, provide the kind of positive feedback that can't help but erode bias. ●

PART THREE: GATEWAY EVENTS™: ENTERING INTO DIVERSITY DIALOGUE

Getting Diversity Fit

He couldn't call it anything other than an ambush or, if your taste runs to the medical, a "sudden onset" Gateway Event. It was early on a Monday morning and Wally was rushing to the weekly management meeting. Just as he rounded a corner, he practically collided with two of his supervisors, who were embroiled in a heated disagreement. As best he could figure it out, one of the combatants had offended the other with a comment about the new female sales associate. Knowing it was his job to do something, Wally stopped around the next turn, thought for a moment, and then, as if he had come to some kind of decision, moved on down the hall. After all, he couldn't be late for his meeting. "I just couldn't handle it," he told me. "I was caught off guard and decided to let the incident pass."

Most Gateway Events are like this: They swing open before us without warning. We rarely have time to prepare a response or, for that matter, to sort out how we feel about what is going on. When this happens, we are in danger of walking away, or worse, going into autoresponder mode, spouting glib denials and politically correct nonsense. To prevent this kind of meltdown, we need to do what Wally did not do, which was to prepare ahead of time for every contingency.

What amounts to that preparation? Becoming mindful of your biases, identifying their weak foundation and learning to shove them aside are all part of your diversity fitness program.

This exercise entails naming, and thus taming, the emotions that accompany Gateway Events. In this context, we are concerned with those small worries and larger fears that compromise in several ways our ability to carry on effective conversations about diversity and bias.

- Fear interferes with our willingness to enter into the conversation in the first place.
- Anxiety prevents us from being able to think on our feet.
- Agitation blocks our ability to interpret accurately what is going on.
- Fear pulls us out of the moment by tempting us to focus on painful experiences of the past or imagined disasters of the future rather than on the realities of the present.

If we are to be prepared to enter into gateway conversations and make them successful, we need to identify what we fear or, at least, what has us worried. ●

Defining Gateway Events

We rarely have to seek out opportunities to engage in conversations about bias; life has a way of presenting them to us. These opportunities come in the form of misunderstandings, accusations and any other happenings that involve discord between or about people who are different from each other. Because these incidents are capable of bringing about productive dialogue and thereby serve as gateways to greater understanding and reduced bias, I call them Gateway Events.

Cognitive Skills for Diversity Dialogue

Of course the impact of an act matters, and that impact, if negative, must be remedied. The actor's intent, however, also needs to be taken into consideration, because knowledge of intent just might influence the success of that remedy.

The problem is, as Douglas Stone, Bruce Patton and Sheila Heen say in their book, *Difficult Conversations*, it is almost impossible to guess a person's intentions accurately.

Intentions are invisible. We assume them from other people's behavior. In other words, we make them up.

We "make them up" largely according to our past experiences and the impact of the act on our welfare.

Here are some questions we can all ask ourselves the next time we feel the sense of hurt and anger that accompanies so many Gateway Events:

1. Is the offending word or action unusual for the person you are indicting?

2. Has this person done other things that support your reaction or, on the contrary, has she demonstrated that she respects and cares about people who are different from her?

3. If you have heard that she has done other things

that might reflect a bias, are they merely rumors or are they events that you have witnessed and evaluated for yourself?

When we feel offended, the benefit of asking questions like these is enormous. That benefit is the acquisition of power. If we calmly examine what has happened, we gain the power that comes with objectivity.

Set Productive Goals

Diversity consultant Roosevelt Thomas says it succinctly but powerfully: Dialogue is conversation with a purpose.

Aimless conversation, particularly if the catalyst for that conversation is emotionally charged, will lead nowhere or, worse, will lead somewhere we would rather not go. We need functional dialogue about bias, not just noise, and certainly not just conflict for conflict's sake.

Practice the Pyramid Principle

This strategy is informed by what any architect knows about building: Whether constructing the Pyramid of Cheops, Blenheim Palace, the Vatican or the Great Wall of China, the only way to proceed is one stone at a time.

When it comes to conversations about bias, this means we need to adopt a helpful motto.

"Think small."

Often, in the heat of a Gateway Event, we become overloaded by the scope of the issue and the intensity of emotion. That overload can, in turn, leave us paralyzed and unable to act. The trick to popping the clutch and getting moving again is to sidestep the main issue of the conflict for a moment — don't worry, we'll get back to it later — and, instead, build a foundation of small successes on which the solution to the big problem can ultimately rest. By thinking smaller, we create bite-size strategies that can be swallowed without gagging and that are manageable even when we are lost in a maze of self-consciousness, anger or fear.

And wider and wider the base becomes, and firmer the foundation, until we have constructed, if not the Great Pyramid of Cheops, at least a modest structure of good communication with the potential of better understanding. ●

Verbal Skills for Diversity Dialogue

My father, who was an actor, taught me something important about the presentation of dialogue, ideas or accusations: Lower your voice. By softening our voice, we allow, and even tempt, the listener to crane forward to hear, and more readily understand, what this mysterious and barely audible message is all about.

Many of us believe that for words to be effective, they must be forceful, dramatic and exaggerated. The opposite is true. Understatement is almost always more powerful, and often more accurate, than exaggeration.

Avoid Dogmatic and Dismissive Language

It is when someone has accused us of a biased attitude that we are most tempted to make dogmatic statements. Particularly if we haven't gotten ourselves diversity fit, we are apt to buckle at the knees and at the heart and lash back with an inflexible, "You're too sensitive" or that pair of old standbys, "You know what I meant" and "I was only kidding." Each of these dismissive phrases does little more than make the object of the allegedly offending statement feel still more diminished and the person who has been accused of bias look foolish and unkind. ●

Conclusion

Biases are distorted views of other human beings that are created by messages from the past and sustained by fear of what will happen in the future. If only we could remain in the moment — free of past messages and future fears — our vision would clear, we could see the people around us more accurately, and cases of mistaken identity would no longer weaken our ability to treat others with the respect and dignity they deserve.

Like shoving biases aside, being in the moment is a habit. I know it's a habit because most of us have been habituated to the opposite behavior since childhood. For years, we have allowed, and even encouraged, our minds to jump from subject to subject, and from past to present to future. It is time we work to break that habit and focus on the now and on the individual before us. It is time we see people for who they are. ●

THE SUMMARY IN BRIEF

Formulating strategy is difficult. Executing it throughout the organization — that's even harder. Without effective execution, no business strategy can succeed. Unfortunately, most managers know far more about developing strategy than they know about executing it — and overcoming the difficult political and organizational obstacles that stand in the way. In Making Strategy Work, *Lawrence Hrebiniak offers a comprehensive, disciplined process model for making strategy work in the real world. He shows why execution is even more important than many senior executives realize, and sheds new light on why businesses fail to deliver on even their most promising strategies. He also offers a systematic road map for execution that encompasses every key success factor: organizational structure, coordination, information sharing, incentives, controls, change management, culture, and the role of power and influence in the execution process.*

What You'll Learn In This Summary

✓ **How does a company's strategy drive its selection of an optimal structure?** In general, the greater the company's "relatedness" across products or services, the more likely it is that the company will centralize.

✓ **What is the relationship between culture and execution?** Culture reflects and affects the ownership that individuals feel for execution-related goals. A company's levels of management commitment and ownership are excellent predictors of executional success.

✓ **Why does good execution begin with good strategy?** It's not true that "good execution can overcome bad strategy." Typically, poor strategy results in poor outcomes and major frustrations as managers work long and hard in futile attempts to execute that which is not executable.

✓ **How do incentives and controls support strategy execution?** Incentives motivate behavior to achieve the execution outcomes you want. Controls provide feedback about performance, thus reinforcing execution methods, providing corrective mechanisms, and facilitating organizational learning and change.

MAKING STRATEGY WORK

by Lawrence G. Hrebiniak

— THE *COMPLETE* SUMMARY

Strategy Execution Is the Key

Execution is a disciplined process or logical set of connected activities that enables an organization to make its strategy work. Without a careful, planned approach to execution, strategic goals cannot be attained.

Execution can itself be a source of competitive advantage. If there's a series of internally consistent, integrated activities, imitation is extremely difficult if not impossible.

Consider how Southwest Airlines executes its lowest-cost strategy: no baggage transfer, meal service or boarding pass; only one type of airplane; and incentives for fast turnarounds at the gate. It's not impossible to copy Southwest, but it's extremely difficult for competitors already committed to different routines and methods.

Why Execution Is Often Handled Poorly

Despite its importance, execution is often handled poorly because of the following reasons:

- **Managers are trained to plan, not execute.** Execution is learned in the "school of hard knocks," with many mistakes and frustrations on the way to successful results.
- **Some top managers believe that implementation is best left to lower-level employees,** who then get the blame if things go awry. But execution is not trivial: It defines the essence of managerial work. It demands ownership at all levels of management.

Planning and execution are highly interdependent. The greater the interaction between "doers" and "planners" — or the greater the overlap of the two processes or tasks — the greater the likelihood of successful execution. Planning and doing should be simultaneous: Managers must be thinking about execution as they're formulating their plans.

- **Execution usually takes longer than formulating strategy.** As conditions change over time, it can be hard for managers to focus on and control the execution process. The longer execution takes, the more likely that unforeseen circumstances will derail it.
- **Strategy implementation always involves more people than strategy formulation.** Communication down the organization or across different functions becomes a challenge. The more people who are involved, the harder it is to execute strategy effectively. ■

The Execution Challenge

The following are eight areas of challenge to strategy execution. They are also areas of opportunity: Handling them well guarantees executional success.

1. **Developing a model to guide execution decisions or actions.**
2. **Understanding how the creation of strategy affects the execution of strategy.**
3. **Managing change effectively — including culture change.**
4. **Understanding power or influence and using it for executional success.**
5. **Developing organizational structures that foster information sharing, coordination and clear accountability.**
6. **Developing effective controls and feedback mechanisms.**
7. **Knowing how to create an execution-supportive culture.**
8. **Exercising execution-biased leadership.**

Overview and Model: Making Strategy Work

Successful execution involves decisions about strategy, structure, coordination, information sharing, incentives and controls. These decisions take place within an

Overview and Model: Making Strategy Work

(continued from page 2)

organizational context of power, culture, leadership and the ability to manage change. To understand how to make strategy work, we need to understand the interactions among these key decisions and contextual forces.

The model above shows a logical flow of execution decisions and actions. This is not a one-way process: Execution involves participation and communication up and down the organization, as well as lateral flows of information and coordination across operating units. Execution leads to organizational learning, so the flow includes feedback loops, and the *controls* portion comprises feedback and change.

Strategy

Strategy refers to corporate decisions about what businesses or industries should make up the organization's portfolio; whether the organization should diversify or vertically integrate; and how resources should be allocated across operating units, given differences in competitive conditions and growth possibilities across industries.

Corporate structure is the organizational arrangement created in response to the demands of corporate strategy. Why is an optimal structure so important to execution? Consider the case of diversification as a growth strategy. Mergers and acquisitions are big business. In 2003, $1.2 trillion in mergers were consummated by investment banks.

The sad truth, however, is that corporate mergers often don't work. Between 1985 and 2000, 64 percent were marked by a drop in shareholder value because companies often fail to create the appropriate organizational structure to support the merger or acquisition. They can face tough choices, as Disney did after it bought ABC.

Should corporate leave its acquisition as a separate, independent profit center, or should it meld it into an existing division or function? It's the age-old question of centralization vs. decentralization. Different businesses must be sufficiently independent to respond quickly to markets, competitors and customers. Yet they can't be so independent as to create an unnecessary duplication of resources and destroy all chances for synergy or scale economies.

The result of decisions about structure is that different units focus on different tasks or specialties. To achieve unity of effort and to combine the activities of these diverse units, companies must pay formal attention to integrative methods and mechanisms. Thus, *structural integration* refers to business processes that coordinate corporate functions with business-unit operations.

Business Strategy and Execution

A business strategy focuses on products, services and competition in a given industry. Emphasis is on industry analysis and on external forces as the business positions itself for competitive advantage.

The business unit must also pay attention to its internal resources and capabilities as it tries to create skills and competencies that differentiate it from competitors.

Business-level strategy is vital to the success of corporate strategy. Poor strategic performance at the business level detracts from the company's ability to achieve its goals, while good performance helps make corporate strategy work. Even with independent, stand-alone businesses, strategy is constrained by prior corporate decisions. Resources, for example, are allocated to businesses as a function of their role in the portfolio — but if they don't meet corporate performance expectations, their allocations will suffer.

Business-unit strategy is also limited by corporate decisions about organizational structure. Centralization of structural units, such as R&D, constrains a business, because decisions about needed resources are made by a corporate function elsewhere in the organization. For example, operating units in the old AT&T depended very much on Bell Labs, a corporate R&D unit.

Aside from constraints posed by corporate, there are two aspects of the business strategy that affect its execution and must be handled well. These are:

1. The type of strategy and the demands it places on the organization. A business unit's decision to achieve cost leadership will create demands on the company's investments, resources and capabilities. The corporation must make capital investments in technology and manufacturing to drive down the variable cost of goods sold. To achieve economies of scale and scope, it must meet demands for standardized products and high production volume. It must also develop incentives that reward cost reductions.

2. The need to translate strategy into short-term, measurable operating objectives and action plans. A business unit's everyday objectives and performance metrics must be consistent with its strategic goals and plans. All too often, people well down through the organization are unaware of how everyday objectives, activities

(continued on page 4)

For additional information on how Wal-Mart executed its cost-reduction strategy, go to: http://my.summary.com

Overview and Model: Making Strategy Work

(continued from page 3)

or performance metrics relate to the business strategy. Sometimes they're even inconsistent with it.

To accomplish the necessary integration, you should use management-by-objectives programs or their offshoots, such as the Balanced Scorecard. These will help integrate long- and short-term business objectives.

Business structure is also key to the execution of strategy. Business-level strategy and short-term operating objectives affect the choice of business-unit structure. Different businesses in the same company can face very different competitive situations and thus require different structures. Never impose the same structure on all businesses or divisions simply because they're part of the same organization. Avoid this execution error at all costs.

The structure of a business should reflect, and be driven primarily by, the nature of its strategy. At GE, for example, GE Capital and Jet Engines, two different divisions, are in two completely different industries. Each has a strategy to cope with its competitive situation.

Integration

Integration is relevant to execution at the business level, since individual businesses must develop their own ways of achieving coordination across operating units or functions. *Transferring knowledge within the business is vital to strategic success.* In addition, if people aren't committed to the execution with which they've been charged, if they're rewarded for doing the wrong things or if they're not personally involved in the outcome, execution can fail. *It's critical that the organization rewards the right things, including previously defined strategic and short-term objectives.*

You also need *incentives* and *feedback*. Fine tuning of plans, objectives and implementation methods is more often the rule than the exception. But ineffective market and customer surveillance, poor information about organizational performance, and the inability to act on feedback from the marketplace surely spell disaster for execution efforts.

Context

The strategy execution model occurs in an organizational context, and is susceptible to four kinds of environments:

1. Change management. As a rule, people resist change. Some organizations manage change better than others.

2. Culture affects much of what goes on in organizations. Culture can affect the problems or opportunities on which managers focus. It helps define performance outcomes and determines how work gets done, what behaviors are valued, how mistakes are treated and what management styles are appropriate. Culture reflects and affects the ownership that individuals feel for execution-related goals. A company's levels of management commitment and ownership are excellent predictors of executional success.

3. The organization's power structure. Those in power identify external needs or opportunities, define new markets and customers, and determine the company's direction. They create strategy. Power differences affect the formulation of strategy as well as key execution decisions and outcomes. Those in power decide on resource allocations to individuals and organizational units that affect execution efforts. If those in power don't support the execution plan, the success of the plan clearly is jeopardized.

4. Leadership climate. The climate leaders create is just as important as leadership. This climate extends up and down the organization, since most managers are both leaders and followers. They create and react to climate.

A disciplined approach to execution lays out the logical order of execution decisions and actions, and shows the variables essential to a solid execution plan. ■

For additional information on why CEO Edward Zander had to change Motorola's culture, go to: http://my.summary.com

The Path to Successful Execution: Good Strategy Comes First

Good execution begins with good strategy. For example, postage meter company Pitney Bowes followed a disciplined strategy of related diversification and its counterparts didn't, fueling its successful performance.

Four critical aspects of strategy and planning affect the success of your execution. These are:

1. The need for sound planning and a clear, focused strategy. The key components of corporate strategy are portfolio analysis, diversification and resource allocations to businesses.

Sound planning means evaluating the existing situation and the potential consequences before making any major move. Resource allocations, for example, must assess the levels of risk that corporate leaders and stakeholders can comfortably assume. Poor planning can have many — and potentially fatal — effects on execution. Perhaps needed resources won't be forthcoming for businesses in the portfolio that could grow into stars. Or a failed diversification could affect the entire organization.

The goal is a strategy that leads to competitive advantage. Success depends on the company's ability to understand its industry and competitors, and to develop capabilities that lead to a favorable competitive position.

2. The importance of integrating corporate and business strategies. Corporate and business strategies must be consistent with and support each other. Yet many situations can prevent this consistency and support. These situations include the following:

(continued on page 5)

The Path to Successful Execution: Good Strategy Comes First

(continued from page 4)

- **The role of the business is unclear.** Corporate treats the business like a "cash cow," but the business sees itself as a potential star that should receive an infusion of capital and not be "milked" dry.
- **Inappropriate performance metrics.** Poor communication and planning processes ensure that corporate and business-unit people won't agree on key performance measures. A related problem is when corporate holds all businesses accountable for the same performance measures, even though the businesses are in different industries.
- **Battles over resource allocations.** Some businesses feel neglected or that there is too much centralized control over scarce resources and not enough entrusted to them.
- **Differing assessments of business performance.** If a business feels that it's been assigned an inappropriate strategy or role in the corporate portfolio, it will regard the assignment of performance objectives as invalid or unrealistic. The prognosis for future planning is bleak, as business-unit people may feel the need to "low-ball," "play games," "change corporate's expectations" or "prove them wrong."

The Strategy Review

To address these problems and improve communication, many major companies have found it useful to employ a strategy review. Corporate and individual businesses should agree on the role of individual businesses in the corporate portfolio and game plan, resource conditions and constraints, and business strategy and operating goals.

It's especially important to understand not only the numbers, but what's behind them, so that the individual business can have realistic and agreed-upon performance measures.

Note also that the process is interactive and adaptive, with corporate and business strategies regularly reviewed to determine their continued relevance and feasibility.

3. The need for measurable objectives. Since many managers operate in the short term, successful execution depends upon the translation of strategy into short-term operational metrics that are related to long-term needs, that can be used to assess strategic performance, and that help the organization achieve long-term strategic goals.

To realize long-term goals, you must manage the short term well. A particularly important short-term objective: *define and communicate the operational components of your strategy*. Execution will definitely suffer if strategic needs are not translated into short-term metrics that are consistent with your strategy. You must be able to accurately assess your progress against a plan.

The Balanced Scorecard provides a framework for translating strategy into operational terms. It also helps develop and communicate short-term objectives in financials, customer service, internal business processes, and learning and growth, and it attempts to link these objectives to company strategy and long-term goals.

4. Understand the demands of strategy and successful execution. Strategy makes demands on an organization's skills, resources and capabilities. To ignore these demands will surely result in poor execution.

Since each corporate strategy requires a well-established, specific set of skills, be cautious of making huge strategy changes in a short time. Don't try to pursue a new strategy with old capabilities. Furthermore, each business unit's capabilities must be consistent with and supportive of the overall strategy.

The Demands of Global Strategy

A global strategy requires management to develop the right resources and capabilities to compete effectively in world markets. The key concept here is a *coordinated* global strategy, derived from the sharing and leveraging of skills and capabilities across national boundaries.

To execute a global strategy, a matrix structure — with worldwide product and local geographical components — is the design of choice. It's simply not true that "good execution can overcome bad strategy." Typically, poor strategy results in poor outcomes and major frustrations, as managers work long and hard in futile attempts to execute that which is not executable. Vague strategy and constant changes in strategy have the same frustrating results. ■

Organizational Structure And Execution

Structure affects real costs and benefits. Different ways of organizing affect outcomes, but creating the right organizational structure is a real challenge.

A spectacular negative example is General Motors and its massive but failed attempt, back in the 1980s, to reorganize into two car groups. Most employees and managers had no idea that such a large-scale change was in the offing and were shocked when it occurred. Would their jobs change? Would layoffs occur? The uncertainty was unbearable.

Top management was largely silent on the connection between strategy and structure. How would the changes help GM solve its problems in product quality, cost and organizational effectiveness? The logic of the restructuring was missing, unclear or poorly communicated.

It would be difficult if not impossible to coordinate and create subordinate goals — or to assign responsibility and accountability in a case like GM's. The company had enjoyed long years of success with relatively independent entities — some of which were abolished overnight.

(continued on page 6)

Organizational Structure and Execution

(continued from page 5)

Other companies have failed on a similar scale — companies run by bright, experienced people. Perhaps some of the poor performance may be attributable not to managerial incompetence, but to the sheer difficulty of the task itself.

The biggest structure-related challenges to execution are:

- **Measuring the impact of structure on execution.** What are the costs vs. benefits of different structural forms? How are costs and benefits measured? How does the company's structure affect actual costs or measurable benefits? What results can reasonably be expected from different organizational forms?

A dedicated organizational structure allows for quick responses to customer needs or industry changes. Even if divisions are organized functionally, the focus derived from attention to one customer, product or geographical region facilitates and enables coordination around a common goal, customer or output. The costs of divisional structures include the duplication of scarce resources.

- **Centralization vs. decentralization.** What is the right balance for optimal execution, and what determines it? Included here is the size and role of the corporate center in organizations with both centralized and decentralized units.

Efficiency and Effectiveness

Structural choice depends on what's important to top management, strategically or operationally. Given competitive conditions, industry forces and the company's strategy, a company must choose the right mix of centralized and decentralized structures to optimize both efficiency and effectiveness.

Centralization results in efficiency from the creation of expertise, an organization-wide asset. Decentralization helps the company get close to customers or markets.

- **The relationship between strategy and structure.** What aspects of strategy drive the choice of structure? How does structure affect the execution of strategy?

Commodity product or highly competitive industries usually face price competition, so additional revenues come from lower costs. Organizational structure in these low-cost strategy cases favors the efficiencies and scale economies of centralized, functional forms. These forms are characterized by standardization, volume and repetition, which foster efficiencies from economies of scale and scope.

A company with a focus strategy that is focused on a particular customer, geography or product should decentralize. Even with the predominantly decentralized divisional structure, some centralized staff may be needed to achieve efficiencies across the decentralized units.

A company adopting a differentiation strategy — e.g., offering both high-end and low-end products — should decentralize and devote separate business divisions to each.

Companies in global competition must focus on both worldwide product lines and geographical differences among markets. A common response is the matrix structure, which helps execute a coordinated global strategy. Such a structure maintains a dual focus on product and geography, and combines efficiency and effectiveness.

A company's strategy drives the selection of the optimal structure. In general, the greater the company's "relatedness" across products or services (same customers, same technologies, same distribution channels), the more likely it is that the company will centralize.

Whatever the structure is, successful execution depends on coordination and information sharing across organizational units, and clear responsibility and accountability.

A growth strategy usually requires more decentralization over time. Size has another impact on structure: It often demands that big problems be factored into smaller, more manageable proportions and handled by smaller structural units; the result is decentralization. ■

Managing Integration: Effective Coordination and Information Sharing

Structural integration requires three tasks or decisions.

1. Determine the kind of interdependence among units.

There are three kinds of interdependence:

- **Pooled.** This represents a low level of interdependence and little need for coordination, as with sales districts that are self-contained and independent.
- **Sequential.** This is seen in companies with vertical integration or an internal supply chain. Problems in these companies are more likely to affect other units than those with pooled interdependence. Higher levels of cooperation are required.
- **Reciprocal.** This is seen when the actions of each business unit affect many others. Each player is necessary to the solution of a problem, but no one player is sufficient. High levels of cooperation are essential to strategy execution.

Strategy affects structure, and structure in turn determines the type of interdependence. Structure also determines the steps an organization must take to achieve effective coordination and information flows.

2. Facilitate information sharing, knowledge transfer and communication.

Many formal and informal factors affect knowledge transfer among those responsible for making strategy work. Formal methods include databases, IT processes, formal roles and matrix structures. But informal methods and processes can also aid or inhibit information sharing.

(continued on page 7)

Managing Integration: Effective Coordination and Information Sharing

(continued from page 6)

Good communication comes from the effective use of informal contacts, direct communication and a common language (i.e., clear, agreed-upon metrics and goals).

Any or all of the following can either facilitate or block the communication that's needed to make strategy work:

- *The characteristics of the knowledge senders.* How reliable? How beneficial? Any motivation or agenda?
- *The characteristics of the knowledge users.* Can they understand new information and apply it to organizational goals? Is there any common ground with the sender?
- *The type of information that's being transferred.* Organizations that have a great deal of tacit knowledge and require an apprenticeship to learn a particular art, such as professional staff work, must be willing to allow time for interaction, discussion and information transfer.
- *The context within which information sharing occurs.* There may be technical problems, or there can be cultural problems. A culture of cooperation based on a common, perceived mission affects execution positively, whereas a culture marked by error avoidance and the need to blame others for poor results has a negative effect on execution.

3. Clarify responsibility and accountability. Make sure key decisions and actions are clear and unambiguous. Without responsibility and accountability, effective coordination and cooperation simply won't occur.

If you focus on these three issues, you'll generate both the organizational structure and integration methods that will make your strategy work. ■

Incentives and Controls: Supporting and Reinforcing Execution

Incentives motivate behavior to achieve the execution outcomes that you want. Here's how an organization can use incentives to facilitate strategy execution:

- **Incentives should not demotivate people.** They should satisfy the need for achievement that most managers already have.
- **Incentives fuel and guide motivation: They don't create it.** The role of incentives is to support motivation and guide behavior in the right direction.
- **Good incentives are tied to strategic objectives or short-term objectives derived from strategy.** They encourage strategy execution at all organizational levels.
- **Good incentives reward the right things.** Rewarding the wrong things will hurt the execution process.

Organizations always get what they actually reward, pay for or reinforce, even if it is occasionally unintentional or unanticipated.

Controls

Controls provide feedback about performance to reinforce execution methods, provide corrective mechanisms, and facilitate organizational learning and change.

For controls to work effectively and support execution, follow these guidelines:

- **Reward the doers, the performers.** It is critical that the organization celebrates success and rewards those who helped achieve it.
- **Face the brutal facts honestly.** Conduct autopsies when things go wrong so organizational learning can occur. Without the analysis of facts and the resultant learning, organizational change and adaptation are jeopardized.
- **Clarify responsibility and accountability.** The control process cannot work if responsibility and accountability for execution-related tasks are unclear.
- **Controls require timely and valid information.** For controls to work, up-to-date information about performance must be correct. Changes in strategy depend on feedback.
- **Leadership plays a central role in the control process.** Problems occur when managers aren't up to the leadership task. Leaders must set an example that's consistent with execution-related objectives. "Do as I say, not as I do" will destroy the control process and impede execution. Good leaders know how to use performance appraisals effectively, and avoid all-or-nothing objectives. They must demand total honesty from subordinates, and recognize and reward those who contribute to executional success.
- **Conduct a strategy review.** This is a key to execution. A good review fosters discussion, clarifies business strategy, helps set execution-related objectives, allows leaders to really understand their people, and facilitates learning and organizational change. All of these are important to successful execution. ■

Managing Change

Execution often involves change — in strategy, structure, coordination mechanisms, short-term performance measures, incentives and controls. How change is implemented can spell the difference between success and failure.

For example, Peugeot Citroën in 2003 became one of the most profitable car companies outside Japan because, management argued, it avoided the massive changes associated with major acquisitions and strategic alliances.

The inability to manage change is the single biggest obstacle to effective strategy execution. The problem is due largely to the complexity of the task, which includes:

- **Assessing the size and content of a strategic change.**

(continued on page 8)

Managing Change

(continued from page 7)

- **Determining the time available for execution.**
- **Determining the steps or tactics to be employed in managing change.**
- **Clarifying responsibility and accountability in the change process.**
- **Overcoming resistance to change.**
- **Setting up controls to monitor the results of change management.**

Evolutionary change happens in all organizations. It's routine and rarely noticed until small, minute problems become larger and loom as significant issues if action is not taken. If people avoid problems, the time frame for evolutionary change can be long.

In *sequential change*, an organization reduces its goals to smaller, ordered tasks — a preferable choice when the strategic problems are large. The downsides are that sequential change takes time, unanticipated factors can impinge on the process, and it's unexciting. Nevertheless, it's an effective way to handle large changes rationally and methodically.

Complex change occurs when a strategic problem is large, the time frame for execution is short, and many change-related tasks must be attended to simultaneously. Complex change is difficult and dangerous. It can result in poor change management and failed execution because:

- Coordination and control are difficult when many programs are going on simultaneously.
- The cause-affect analysis explaining performance deviations is impossible, so company learning is jeopardized.
- Organizations aren't willing to reduce managers' performance requirements. This inflexibility, under conditions of complex change, virtually guarantees poor outcomes. ■

Managing Culture and Culture Change

Changing culture is difficult but doable. Here are five rules for managing and changing culture:

1. The reasons for change must be clear, compelling and agreed upon by key players. Cause-affect analysis and learning are vital to successful change. There must be a clear, honest explanation of poor prior performance before people will accept new execution methods or cultural change as legitimate and necessary.

2. Focus on changing behavior — not directly on changing culture. Focus on behavioral changes, which can lead to culture change. New people, incentives, controls and organizational structures can motivate behavioral change and lead changes in organizational culture.

3. Effective communication is vital. The company must develop a communication plan, and leadership must communicate directly with people affected by the changes.

4. There must be an adequate effort to reduce resistance. Top managers must communicate the positive aspects of change, deal with the potential negatives, and improve participation and involvement in defining or diffusing change and its consequences.

5. Beware of excessive speed. Speed in managing culture change may be desirable or necessary — but it's fraught with problems. Changing too many things simultaneously and immediately can confuse the change process and make coordination and communication difficult. ■

Power, Influence and Execution

Power is vital to execution. Attempts to execute strategy that violate the power structure of an organization always face difficulties and are often doomed to failure.

Power is simply the opposite of dependency. An individual or unit, A, has power over another, B, if A has information or resources B needs and can't get elsewhere. If you have a monopoly on the fulfillment of someone else's needs, you have power. Problems arise because the business units solving critical problems of an organization are rewarded in an uneven distribution of scarce resources, which leads to differences in the dependencies that create power relationships.

Having power facilitates the formulation and execution of strategy. But an individual, unit, department or function lacking in power and influence can form a coalition with those who do have influence, to foster and support execution. The logic is that of a joint venture: Joining forces in creating power bases by combining individuals' and units' potential for power allows for more effective execution than an individual or unit could achieve alone.

Support

To receive support, execution methods and plans must produce clear, measurable and positive value-added results. Hierarchical superiors or potential joint venture/coalition partners within the organization will support execution if they can see and measure its results in value-added contributions to the organization. As this process continues, individuals and units acquire a reputation for producing positive results and thus gain credibility and additional influence in creating the power bases for future executional efforts.

Those who have power typically want to keep it — a possible downside for the organization. People in power may persist in doing what's necessary to perpetuate their positions, even if their actions are inappropriate under different or changing conditions. If this happens, the CEO and executive team must alter the power structure by changing strategy, structure or resource allocations, which in turn can affect the dependencies that define power relationships. ■

THE SUMMARY IN BRIEF

We are at the brink of the new millennium. And much of what we have come to accept as true of business management is about to be challenged. The world is changing at a rapid pace, and only those who understand what those changes mean will be poised to prosper under the new rules. Old paradigms will be replaced by new ones.

In this summary you will learn which old assumptions are out. You will learn that management is not just business management, and that there is no one ideal way to organize an enterprise. Nor, you will soon see, is there one way to manage people. In fact, you will see that your role will not be to manage at all. Rather, you will learn that your job is to lead. You will also come to see that national boundaries and even regional markets will no longer define your organization's boundaries.

In this summary you will also discover the trends that will radically alter life and how companies are run. The developed world is experiencing a collapse of its birthrate, and an accompanying increase in the average age of its populations. The result will be political upheaval, a new emphasis on personal investment, and a substantial increase in the length of your work life.

In the next century, you can expect to become a change leader. You will see exactly what is required of you in order to make change happen in a controlled and orderly fashion. You will see exactly why global competitiveness is here to stay and how you can measure your company against the world leader in your industry.

You will also discover what you need to do to increase the productivity of the new information workers and how to develop your own talents now and throughout your life.

MANAGEMENT CHALLENGES FOR THE 21ST CENTURY

by Peter F. Drucker

— THE *COMPLETE* SUMMARY

Management's New Paradigms

We live in a period of profound transition. The changes that are taking place are more radical than perhaps any changes in history. The challenges ahead are perhaps greater than those presented by the 19th century Industrial Revolution, by the Great Depression or by the Second World War. These changes require managers to examine the basic assumptions, or paradigms, of reality. For it is likely that old assumptions about reality are wrong. In the new century, you must be concerned about everything that affects the performance of your institution, whether within your control or not.

Unfortunately, the old assumptions have outlived their usefulness. You must therefore rethink the assumptions and formulate new ones more in line with the 21st century realities. First, forget the notion that management is business management. In the new century, your management skills can be applied to activities not traditionally considered business, such as government, health care, the professions and education.

Next, forget the notion that there is only one right organizational form or that hierarchies are dead. There must be a leader of every organization, and you must have organizational structure in place. But that structure depends on the nature of the enterprise; one size does not fit all. Neither the popular "team" concept nor the CEO "personality cult" so common today is the one answer. Teams sometimes lack the ability to make decisions, and "personality cult" leaders need successors. Each organization must therefore find its own form rather than grab one off the rack.

Another dying paradigm is the idea that you must manage employees. Instead, you must lead workers. One reason for the shift from managing to leading is the simple fact that a manager today likely does not know the area of expertise for which the subordinate is responsible. In addition, employees today need to be treated as if they are volunteers, not employees. They want more than a paycheck; they seek interesting and rewarding work. You inspire them by leading, not commanding.

You must also remember that innovations in your industry don't necessarily come from within that industry. They are just as likely to come from outside. For example, within the pharmaceutical industry, genetic research is now used to develop new treatments. That research sprang out of biology, not chemistry. Today, innovations criss-cross industries. Likewise, don't just look to your present customers to determine policy and management for your enterprise. Increasingly, you must look to a larger group and base policies on what that group chooses to do with its disposable income.

Finally, you must realize that management reaches outside the organization, and is restrained but not defined by political and national boundaries. ■

Old and New Paradigms

Old: Management is business management.
New: Management principles apply to all organizations.

Old: There is, or there must be, one right organizational structure.
New: Look for, develop and test the organization that fits the task.

Old: There is, or there must be, one right way to manage people.
New: Don't manage people, lead them.

Old: Technologies, markets and end-users are given.
New: Customer disposable-income use dictates policy and strategy; technologies criss-cross.

Old: Management's scope is legally defined.
New: Management's scope is operationally defined.

Old: The economy is defined by national boundaries.
New: National boundaries restrain but don't define.

The author: Starting with his first book, 1939's *The End of Economic Man*, Peter F. Drucker has been recognized as the father of the science of management. Since 1971, he has been Clarke Professor of Social Sciences at Claremong Graduate School. Among his many groundbreaking books are *Managing for Results*, *Managing for the Future*, *The Post-Capitalist Society* and *Peter Drucker on the Profession of Management*, all summarized by Soundview Executive Book Summaries.

Strategy: The New Certainties

The most important single new certainty is the collapsing birthrate in the developed world. You must understand the crucial impact this will have on economics and politics. Only then can you plan your company's business strategy into the new millennium.

The Collapsing Birthrate

In Western and Central Europe and in Japan the birthrate has already fallen below the rate needed to reproduce the population. Birthrates have already fallen as low as 0.8 children per woman in Japan, and 1.5 in Northern and Western Europe. The United States, too, is experiencing a declining birthrate, with slightly less than 2 per female. In order to maintain populations at the present level, those regions would need to have a per-woman birthrate of 2.1 live births.

Accompanying the decline in births will be a corresponding shift in the age of the population. As fewer children are born, a larger proportion of the population will be older.

Coupled with the fact that people are living longer than in decades past, there will be an explosion of older people and a dearth of younger ones. This is an unprecedented experience. In at least the last 200 years, all modern world institutions, including businesses, have assumed that population growth would continue.

Management Response

What does all this mean for you as a manager? Simply this. Your business must gear up for a totally different assumption, the assumption that there will be a shrinking population of young people. One new reality will be that retirement age will have to be raised, perhaps as high as 79. If not, there won't be enough workers to meet demand.

The most likely location of change in the employment sector will be the United States.

That's because the U.S. is the most flexible and least restrictive labor market in the world. In addition, American employers have a tradition of experimentation.

Marketing Opportunities

The silver lining of the collapsing birthrate is that companies that take advantage of the shrinking population stand to profit handsomely. If what happened in China when one child per couple became the norm is any indication, smaller families may mean an expanding market for luxury goods for infants and children. In China, today's one-child family spends as much on that child as earlier generations spent on three or four. Perhaps having fewer children makes each seem more precious to the parents. They then spend more of their disposable income on him or her.

Political Implications of a Shrinking Population

In the next three decades, demographics will dominate politics in the developed world.

- Current political labels like liberal and conservative won't fit the issues.
- Immigration will be the hottest political issue.
- Government instability will be the norm.
- Retirement will be spent working.

You and your company must start looking for innovative ways to stretch the aging labor pool now. You will need to forge new work relationships with older workers, especially those who qualify as knowledge workers. Knowledge workers are those whose value is in what they know and what they can do with that knowledge. Companies that first succeed in attracting and holding knowledge workers past traditional retirement age and make them fully productive will have a tremendous competitive advantage. Productivity will have to continue to grow at a rapid rate or the country will lose position and become steadily poorer.

Income Distribution

Any shift in shares of disposable income in the decades to come will impact you and your company. To take advantage of income shifts, you need to know one crucial figure: the share of your customer's disposable income that is spent on your products. The figure is important because trends in disposable spending tend to persist for long periods of time.

Identifying a shift early on will let you take advantage of the trend for a long time to come. The major disposable income growth sectors have been government, health care, education and leisure.

Leisure spending has been growing as a share of disposable income. But the trend may be on the decline since it is unlikely, given the declining population, that more time off will become the norm. Government has had a major impact on disposable income through the redistribution of income from one segment of the population to another. That trend likely will continue rather than decline. The education sector will grow, as workers will need continual upgrading of their knowledge. And health care will grow as the population ages.

All four growth segments are largely price insensitive. That is, consumers will likely pay based on the perceived value of the product or service rather than let supply and demand be the pricing factor.

Companies must monitor trends and take advantage of the opportunities they present.

Performance and Global Competitiveness

Companies expecting to prosper in the 21st century must

(continued on page 4)

Strategy: The New Certainties

(continued from page 3)

accept that their performance will be monitored carefully by shareholders. And those shareholders are increasingly not individuals. Rather, they are the large pension funds to which the well-to-do middle classes of the developed world have entrusted their retirement funds. Increasingly, companies will have to show that they are capable of providing short-and long-term profitability for pension fund investors. It will be essential that companies extend their own life expectancies beyond the present average of about thirty years. Organizations will have to survive and prosper until their investors reach retirement age!

All companies must also make global competitiveness a strategic goal. Today, all companies are measured by the standards of the leader in the field, regardless of where in the world that leader is located. Companies can no longer rely on government protectionism to survive, because government can't deliver enough "protection" to make the protected industry competitive against the global leaders. Instead, a company must measure itself against the world leader and meet that standard.

Economic Versus Political Reality

To be successful into the next century, companies cannot define their scope in terms of either national economies or national boundaries. Yet, it is clear that national boundaries are not going to go away anytime soon. It remains doubtful that the new regional economic units like the European Economic Community (EEC) or the North American Free Trade Zone (NAFTZ) will really weaken national boundaries. Nationalism appears here to stay. In fact, companies have to learn to operate in three different economic spheres. There is a true global economy of money and information, and there are regional economies in which goods, people and services circulate relatively freely. And then there are national and local governments to consider. Balancing the three is a headache, and companies will continue to struggle for the answer.

What not to do, however, is clear. You should not be willing to be bribed into subordinating economic decisions to local politics. For example, you must resist the temptation to relocate or grow your business in a particular location just to take advantage of "bribes" like tax exemptions, special tariff protections, a guaranteed monopoly position or other subsidies. Don't do anything that doesn't make economic sense for the company in the long run on the basis of incentive offers.

Do, however, consider forming alliances, partnerships and other relationships with other companies across borders. These can easily be dissolved if necessary and aren't long-term commitments. You and your company must also recognize the reality of currency instability, and will need to establish ways to manage currency fluctuations and foreign exchange difficulties. No country's currency is immune to fluctuation, and changes in the value of currency can be rapid.

Opportunity or Distraction?

You must be aware of the difference between a business opportunity and a business distraction. Identifying the former creates long-term growth and stability, but being sucked into the latter does just the opposite. A proposed expansion into a new area is an opportunity if it is consistent with your company's overall business strategy. For example, if carbonated beverages don't sell in France, Coca-Cola might do better selling fruit juice than its flagship soda product. And if vending machine coffee is big in Japan, Coca-Cola would do well to sell that there. Both new enterprises are consistent with Coca-Cola's company strategy and business plan, and both are business opportunities. But an enterprise that isn't consistent with overall company goals is just a distraction to be avoided. ■

Cheap Labor Won't Be An Advantage

In the 21st century, access to cheap labor won't give a company a substantial advantage over another. Nowhere is this more apparent than in the manufacturing sector. In most parts of the developed world, manual labor is becoming a smaller and smaller part of total costs. So while low labor productivity may endanger a company's survival, low labor costs don't necessarily deliver a cost advantage if productivity is low.

Investment Industry Growth

You and your company can benefit tremendously if you learn how to exploit today's growth industries. First and foremost among growth industries is the financial services industry. But this isn't your grandfather's financial service industry. The segment ready to be exploited by those who know how is the retail delivery of financial services to an affluent, aging population in developed countries. These middle-class seniors are quickly realizing that they could outlive their financial resources. They are looking for ways to safeguard future income. Companies providing individual investment services and products will thrive in the coming years.

Strategic Misstep: What GM Did Wrong

When Japanese automakers grabbed 30 percent of the U.S. passenger car market in 10 years starting in the mid-'70s, GM did little except fiddle with rebates and discounts. That didn't work. Finally, GM reacted by creating an entirely new car, the Saturn. It was a smash hit. Unfortunately, it soon became obvious that Saturn competed with other GM products, not Japanese models. Instead of allowing Saturn to expand its model selection, GM put resources into modernizing plants producing its dying models. Saturn sales are falling, and an opportunity was wasted.

The Challenge Of Change Leadership

You cannot manage change, you can only stay ahead of it. In times of upheaval, such as the times we are approaching, change is the norm rather than the exception. The manager who becomes a change leader will help ensure that his or her organization will survive or even thrive. Change leaders accept the inevitability of change, see it as opportunity and embrace it. Change leaders look for and find the right changes and know how to make change effective both inside and outside the organization.

How can you become an effective change leader? By following these guidelines:

- Institute policies to make the future.
- Systematically look for and anticipate change.
- Introduce change the right way, both inside and outside the organization. Balance change with continuity.

Change Policies

The first lesson you need to learn to become a change leader is to abandon yesterday.

Don't commit resources to maintaining products or services that are no longer producing results. If you do, inevitably your best and brightest waste their time for diminishing returns. These are the very people you need to help lead change.

As a change leader, your role is to put every product, service, process, distribution channel, customer and end-use on trial for its life. Ask if you would enter into the enterprise again if you knew what you know now. If the answer is "no," then abandon it.

The right answer is always abandonment under these three conditions:

- If the consensus is that the product, service, market or process "still has a few good years of life." In fact, such a product is either dead or dying. Give it up.
- If the product, service, market or process is being kept around because it "is fully written off." Ask not, "what have they cost?" Instead, ask, "what do they produce?" If they only produce because they don't appear to cost anything, get rid of them.
- If an old and declining product, service, market or process is being maintained at the expense of a new and growing product, abandon it.

Acting on Abandonment

Knowing *how* to abandon an outdated product, service or process is as important as knowing it's time to let it go. You must test abandonment on a small scale. Sometimes it may be that you simply need to identify other distribution channels for a product or service. Consider what universities have done as prospective students and their parents move away from high school counselors for college application information to books and magazines rating colleges. By focusing promotional efforts on these outlets, universities are increasing the quality of their applicants while still retaining connections with placement counselors.

Organizing Improvement, Creating Change and Piloting

Next, change leaders must organize improvement. Plan to improve contiguously, at a preset annual rate of about 3 percent. But be cautious about introducing changes system-wide without a trial. Consider the case of a commercial bank that decided to add new financial products to its mix. It surveyed customers and knew to which products they were receptive. Then it introduced the products by having tellers inform customers. The result? Lost customers due to longer teller lines. When information about the new products was offered at separate tables, the program was a success. But the bank could have saved time and trouble by testing its approach at one branch.

Build innovation into your enterprise, and do it systematically. Every six to 12 months, look for changes that may be windows of opportunity. Look at your company's unexpected successes and failures, as well as your competitors'. Then, ask if your observations are opportunities for innovation.

Finally, realize that you must pilot change through the organization. When you pilot a change, you are applying the test of reality to the idea. Only if it passes should the change be implemented. ■

Innovation Traps

Be sure each innovation is consistent with your company's strategic realities. A good idea is not enough; it must fit the company. Don't confuse novelty with innovation. New and different isn't always better. Finally, do not confuse activity with action. They are not the same.

Information Challenges: From the 'T' to the 'I' in 'IT'

Until now, the information revolution has centered on data; collecting, storing, presenting and transmitting it. In other words, the focus has been on the technology of data gathering rather than on the use of that information. The focus is about to shift from the "T" in "IT" to the "I."

The information revolution has made possible the gathering of massive amounts of data, but until now much of it has gone unused. The information needed to make decisions is there, but the decision-makers have, until now, not had the information available for their use. The first step is to think differently. What's needed isn't more raw data, more computing speed or more technology. What's needed are new concepts.

The Information Enterprises Need

Accounting will have to move from cost accounting to result control. Cost accounting concerns itself with what things cost on a component basis. But accountants have been slow to measure a very important factor: activity. Activity costing measures the cost of not doing something. Activity-based accounting, unlike traditional cost accounting, asks whether a task has to be done and, if so, where.

Activity-based accounting is expected to substantially reduce manufacturing costs, perhaps by as much as a third. Cost accounting assumes that capital can be substituted for labor. In service industries, that just isn't true. For example, if a hospital buys a new piece of equipment — capital expenditure — it will have to hire new people who can run it. The result is more workers, not fewer.

Consider another example of activity-based accounting. Pick a center of activity, like a customer or a store shelf. Measure the yield per center. For a bank customer, profitability will be measured by the volume and mix of the services he or she uses. A store shelf's value can be measured by the yield per shelf over time. Your job as a manager will be to maximize the shelf or customer yield over time.

Costing the Entire Chain

Another tactic companies that want to succeed must adopt is costing over the entire economic chain. Knowing the true cost of operations on the inside won't be enough in the next century. Rather, those companies that know and manage the cost across the chain will be the most successful. Legal boundaries don't matter. You will form new entities through outsourcing, new alliances and joint ventures. Toyota demonstrates what happens when you work closely with suppliers and distributors. Toyota considers the cost of each car to include the total cost of making, distributing and servicing it.

You must also move from cost-led pricing to price-led costing. In other words, before a product is introduced, you decide whether the price customers are willing to pay can support the cost to produce the item and still be profitable. If it can't, don't introduce the item. Traditional cost-led pricing adds the production cost and desired profit to arrive at the price. With price-led costing, fewer products will fail because you'll know that the price is acceptable to the consumer. ■

Continuing Education

One by-product of the information revolution is continuing education. As more and more knowledge workers work with their heads rather than their hands, education will have to be continuous. And that education will be delivered in new formats. It will be off campus, in homes, cars, commuter trains and anywhere small groups can meet. Long-distance education may make freestanding residential universities obsolete.

The education revolution will include the New Print Revolution. The world supports thousands of periodicals and newspapers. While general interest magazines like *Life* are disappearing, specialty mass magazines are growing by leaps and bounds. And books continue to be printed in record numbers. Students, for example, are consumers of huge numbers of print books and specialty magazines that inform.

Information You Need

A company needs to use the following four diagnostic tools to manage the business:

- foundation information consisting of cash flow and liquidity measurements;
- productivity information in the form of total cost, including cost of capital (benchmarking your performance against the best in the industry is crucial);
- competence information, requiring you to determine core competencies inside and outside;
- resource allocation information in the form of assessment of whether the allocation of capital is profitable and whether people are achieving goals set for them.

As a manager, you must know what information to use. You should, for example, be informed of any "unusual" event. Consider having employees make a monthly report of any unusual events in their sphere. Together, these can yield insight. Also, get out of the office and into the street. You need direct outside information as well as inside information.

Knowledge Worker Productivity: The Future of Manual Labor

The traditional view was that there was little to be done to raise manual labor productivity. Differences in output were thought to depend on whether the worker in question was lazy or hard working, or whether he was weak or strong. But as workers were observed and studied, the idea that outside factors could be changed to alter productivity caught on. The result has been an annual 3.5 percent rise in productivity throughout most of the century.

The process was deceptively simple: observe work and analyze the motions that make up the work. Record the time it takes for each motion, and see which can be eliminated or changed. It became clear that skill was far less important in raising productivity than identifying the best method to do the job. Scientific management was born. And in developing countries, scientific management was applied to make low-wage workers very productive at low cost.

Knowledge Worker Productivity

The techniques developed to increase manual labor productivity are unknown among knowledge workers. When it comes to knowledge-worker productivity, we are where we were with manual laborers in 1900. That must change. To make knowledge workers more productive, you must do the following:

- Identify what it is that workers do. What are their tasks?
- Give them autonomy. The knowledge workers' productivity must be their responsibility; they must manage themselves.
- Continuing innovation must be a part of every knowledge worker's job.
- Knowledge workers must continuously learn and contiguously teach others.
- Productivity must be measured by quality of the output, not quantity.
- Knowledge workers must be treated like an asset, rather than a cost.

Unlike manual labor, the foremost measure of knowledge-worker productivity is quality. We don't, for example, measure instructional productivity by how many students a teacher has in a class. We measure it by how those students do on tests and what they have learned.

To evaluate productivity, you must first define what tasks the knowledge worker performs. Remember that you don't program the knowledge worker. That is, while you tell a manual laborer exactly what he or she must do on the line, the same isn't true for knowledge workers. For a manual worker, what to do is always obvious.

For a knowledge worker, it's not. Consider this example. If a patient in a hospital goes into a coma, there are tasks the nurse must perform. But she chooses when and how to perform these tasks. A salesperson spends self-directed time ordering, filling out paperwork and coordinating deliveries. They are both self-directed.

Begin assessing productivity by asking workers what tasks they do, what they believe they should be contributing to the company, and what hampers them in getting the work done. Knowledge workers almost always know the answers to these questions. If you take action on the answers, you can expect productivity to climb rapidly, perhaps doubling or tripling it.

After tasks are identified, appropriate quality measures usually become obvious.

Consider the problem of measuring surgeon quality output. Quality is assessed as the survival rate for open-heart surgical patients or complete recovery for orthopedic surgery.

The Means Of Production

You must remember and accept that knowledge workers, unlike manual laborers, truly own the means of production. While a laborer uses company equipment to be productive and can't work without it, a knowledge worker is the equipment. Consider her or him a capital asset, not a cost. Increasingly, he or she must be made to feel a crucial part of the company. ■

The Measurement Dictates the Outcome

The measure you use to define quality dictates the outcome. Take two inner city schools in the same neighborhood. One defines the task as "helping the underprivileged," while the other defines it as "helping those who want to learn to learn." One measures success by scholastic failures (i.e. continuing to help the underprivileged who fail), while the other measures it by scholastic success. The task defines the outcome.

Nurses Double Their Productivity

When knowledge workers assess their productivity, and managers take action, the results are often dramatic. Consider what happened when a group of nurses at a major hospital identified what tasks were important and what tasks were not. After agreeing that patient care and satisfying physician demands were the most important functions they performed, the group quickly identified obstacles to productivity. These included chores like arranging patient flowers, answering phone calls and paperwork. When these functions were turned over to less skilled and lower-paid floor clerks, nurse productivity (as measured by patient satisfaction and time spent at bedside) soared.

Managing Oneself: What Knowledge Workers Can Expect

More and more people in the work force will have to learn to manage themselves. They will have to place themselves where they can make the greatest contribution to the company, and they will have to learn to develop themselves. They will also need to stay young and mentally alive during what may be a 50-year working life. They will be in charge of their own destinies.

These are powerful new demands on individuals, including

- **discovering what your strengths are, who you are and how you work;**
- **asking where you belong;**
- **defining your contribution;**
- **taking responsibility for relationships; and**
- **planning for the second half of your life.**

What Are My Strengths?

Many people think they know at what they are good. But often they are wrong. Today you must take the time and make the effort to identify your strengths. A century ago that wasn't important; you were born into a line of work, like farming or tradesman. That's not true anymore; people have choices. To discover your strengths, use the following technique. Whenever you make a key decision or take a key action, write down what you expect will happen. Nine to 12 months later, look at the result.

The results will, after two or three years, tell you where your strengths and weaknesses are. Then you must concentrate on your strengths. Place yourself where your strengths can be used. Work on improving your strengths.

This feedback analysis is also likely to identify areas where your knowledge is lacking.

Lack of knowledge in an area can be the result of the belief that information outside your area of expertise isn't valuable, or less important than that in your area. Or it can be the result of the arrogance of being "bright," and believing intelligence is a substitute for knowledge. If you discover this about yourself, get the knowledge you need to become competent. If you are going to succeed, you must overcome intellectual ignorance and work on acquiring the skills and knowledge needed to make your strengths fully productive.

You must also be aware that the way you interact with others will have an impact on your achievements. You must understand that manners are the "lubricating oil" of an organization. Too often, cooperation is hard to get because the social groundwork hasn't been done.

How Do I Perform?

Knowing what to do is only half the battle; you must also know how to do it. Individuals have different learning styles, and the one forced on you in school isn't necessarily the right one for you. Explore your own learning style by asking yourself some fundamental questions.

First, are you a reader or a listener? Some people respond better to the written word while others respond better to live questions. Consider President Eisenhower. When he was commander-in-chief of the Allied forces in Europe, press questions were written. His responses were eloquent. At the White House, press questions were shouted at him. His responses rambled without benefit of the written word.

Some people learn by reading or listening, and others learn best by writing. Beethoven always wrote his compositions down in sketchbooks, yet he never referred to them. Why? If he didn't write them down, he would forget, but once he did he never needed to look at them again. If this describes your learning style, start writing down what happened at meetings immediately afterward.

Once you know how you learn, act on that knowledge. If you don't, you are, in effect, condemning yourself to nonperformance.

You must also analyze your values and act on them. A simple test is the "mirror" test.

Ask yourself if the action you are about to take will make it impossible to look at yourself in the mirror in the morning. If the organization you work for wants you to act against your mirror test, leave or be condemned to frustration and nonperformance. Know your values, and you will know where you belong.

You should also consider the second half of your life. Second careers are becoming more common than ever before. Some decide mid-career to return to professional school, others leave for the ministry. Others start their own businesses or do charitable work. Mid-career changes can ease disappointment and add meaning to the second half of life. ■

Ideas Don't Move Mountains

Don't make the mistake many people make. Don't mistake ideas for actions. Many brilliant people conceive wonderful ideas and then don't follow through. They believe ideas will move mountains. In reality, of course, it is bulldozers that move mountains. Don't stop when the planning is over. That's when the work should begin.

THE SUMMARY IN BRIEF

At the heart of the New York Yankees' dynasty is the organization's incredible track record in managing talent. The Yankees know how to find, nurture and retain baseball stars and superstars better than anyone else.

Author Lance Berger is a management consultant to Fortune 500 companies and has served as a consultant to Major League Baseball. After looking deeply into the history of the Yankees' organization, Berger discovered that many of the same principles that made the Yankees great were also driving the success of business clients. These core principles are based on leadership, processes and culture, and have evolved over the past eight decades during the team's remarkable history.

In this summary, Berger offers time-tested management techniques that can turn any team — in sports or in business — into a long-term winner. He also shows that, contrary to popular belief, the Yankees' talent management secret isn't their payroll. In fact, most Yankees superstars — including such greats as Lou Gehrig, Mickey Mantle, Derek Jeter and Bernie Williams — have been developed internally, not bought or traded from other teams. The Yankees' secret weapon is the sophisticated talent management system Berger describes.

What You'll Learn In This Summary

- ✓ How to create a balance among superstars, stars and solid performers.
- ✓ Ways to set the bar higher than your people have ever seen it.
- ✓ What it takes to cultivate ownership values from the top down.
- ✓ Ways to make the superstar the focal point of your organization.
- ✓ How to hire the best front-line managers you can find.
- ✓ Better ways to formally recognize your informal leaders.
- ✓ What you should do to celebrate your history, heroes and legends.

How an Organization Dominated Its Industry for 80 Years

It is rare for a company to dominate an industry for more than a few years. Time changes both customers and technologies, and allows new competitors to rise. This makes the Yankees' record over the past eight decades all the more amazing. Since 1921, the Yankees have been in the World Series 39 times and have won the championship 26 times. There are few American corporations that have been a dominant force for more than eight decades.

No matter whether you love or hate the Yankees, it is clear to anyone who looks at the team in an objective, businesslike manner that it is not just another sports team. There is something special about the team that allows it to win no matter the changing players, managers and owners. The secret is a set of 14 principles that represent the Yankees' best management practices. These principles emerged under the leadership of owner Jacob Ruppert in the 1920s and have been refined by owners and management ever since.

The 14 management principles from the history of the team's success are applicable to any organization. You don't have to be a Yankees fan or even know anything about baseball to benefit from the management wisdom from this sports dynasty. You just need an interest in building a competitive advantage in your company. The Yankees, in the context of this summary, are a metaphor for sustained organizational and business excellence.

The Big Yankee Management Myth

Not everyone agrees that the 14 principles are the basis of the Yankees' eight-decade track record. One common (and misleading) myth is that the Yankees could simply buy superstars. But this is a very simplistic way of looking at Yankee success, and it dismisses many core values and guiding principles of the dynasty. If you don't look beyond the myth that the Yankees simply buy all the best players, you will deprive yourself of powerful management knowledge that could help your organization build its own dynasty.

While it is true that under George Steinbrenner the Yankees have had the biggest payroll in baseball, offering big salaries to lure superstars from other teams is only one component of their overall strategy and culture. The reality is that, with the exception of Babe Ruth and a few others, "buying" superstars has played a small overall role in Yankee history. This is due to the reserve clause, a league regulation that once bound players to their current teams and did not permit any team to buy the services of a player directly from the player. In addition, no other team traded them a superstar or sold them one. Also, the Yankees focused their scouting and player management energies on their extensive farm system, and had no reason to look outside the organization for talent.

However, even if the Yankees wanted to buy enough superstars to fill the team, some superstars have no interest in becoming a Yankee. Also, the supply of available superstars at any time is relatively small. But they haven't needed to buy that talent because, like every other great business, they have an ability to develop great talent from within. Most of the Yankee greats, over the eight-decade history of the dynasty, were home-grown. The reason why the Yankee payroll is so high is that they have to keep great players after the team discovers them and turns them into superstars. The Yankees' recent 10 straight years of postseason play have been powered by home-grown talent.

How an Organization Dominated Its Industry for 80 Years

(continued from page 2)

You don't need a Yankee-size payroll to build a superstar team. There is a perception that the Yankees' team is comprised of all superstars. The reality is the Yankees are a superstar team rather than a team of superstars. It is true that organizations need some minimal level of payroll to have any chance of competing on an ongoing basis with Yankee-like opponents, but it's not necessary to have the highest payroll. The secret to the Yankees' success is not mythical. It is a result of a set of 14 sound business practices for managing talent that were applied over an 80-year period. A shrewd manager can use the Yankee principles to create a winning tradition in his or her own organization.

The 14 principles described in this summary cover three main themes: leadership, processes and culture. Together, they constitute a road map for building your own dynasty. ■

PART I: LEADERSHIP ESTABLISHES THE FOUNDATION

Cultivate Ownership Values From the Top Down

The most influential principal Yankee owners have been, in chronological order, Jacob Ruppert, Del Webb and Dan Topping, and George Steinbrenner. And of those owners, Jacob Ruppert was the most important as he built the Yankees' winning tradition that won the team 10 pennants and seven World Championships under his stewardship. These were owners who were equally at home in traditional corporate boardrooms and in the Yankees' front office.

Winning owners have characteristics and behaviors that set them apart from their peers. Most Yankee owners brought an opportunistic spirit to the team and added their own special touch to the Yankee tradition. These owners were successful in influencing team results through the selection of a management staff built on ownership principles, and by shaping player behaviors on and off the field. They managed to instill in their employees a desire to win. All employees become an integral part of achieving organizational success; they are "empowered owners."

Empowered owners focus individual efforts on helping the team win the World Championship, cultivating professional skills, embracing the Yankee citizenship requirements, and constructively influencing and supporting players and management.

All employees of the Yankee organization are expected to embrace the principal owner's values and competencies, which are passed down through the executive office and field manager. ■

Hire the Best Front-Line Managers You Can Find

Successful Yankee managers had the superior professional skills necessary to manage the team. Tommy Holmes, Boston Braves pitcher under Stengel in 1942, stated, "Casey Stengel had more baseball brains in his little finger than any other manager I knew had in their whole body." Sportswriter Maury Allen gave Stengel credit for an additional skill that enhanced his technical skills in the perception of the baseball world: "He was a brilliant strategist and could play the press like Heifetz played the fiddle."

During the Yankees' dynasty, the first-level managers were uniquely suited for winning with the Yankees — but not because they had outstanding prior accomplishments. In fact, most had managed previous teams to sub-500 records. But they understood things about the Yankees that others did not. They shared the values of the Yankees' organization, of the owner and general manager, and instilled those values in their players.

The field manager, or first-level manager, represents the key formal figure (front-line authority) of an organization's structure. This person is the face of the organization that each member of the team sees every day. The team's performance is heavily determined by the operational and strategic decisions made by the field manager. The field manager serves as the bridge from ownership and management to the players.

The first-level manager in your organization is responsible for supervising the employees who develop or sell services or products. With the authority of the owners, the first-level manager plans, organizes and integrates a function or set of employee activities. The first-level manager must possess all the professional, citizenship and leadership competencies exemplified by ownership to help the organization create and sustain excellence. ■

Formally Recognize Your Informal Leaders

Chris Chambliss, former Yankee first baseman, said of team captain Thurman Munson: "He told me where I should play this hitter, told the center fielder where he should play, and communicated with the pitcher besides. A lot of guys looked up to Thurman's hard-nosed kind of play. With him, you just thought you were going to win."

Every company or team should have formally recognized team leaders. They are the individuals who excel

(continued on page 4)

Formally Recognize Your Informal Leaders

(continued from page 3)

at their jobs, who inspire others to excel and who display behaviors that bring credit to the team. There were eight Yankee captains between 1922 and 2004. They were officially designated captain for four reasons:

1. Their accomplishments exceeded the accomplishments of theirs peers.

2. They inspired others to superior performance.

3. They embodied the core values of the organization.

4. They were recognized and respected as team leaders by their teammates.

Players needed to fulfill all of these requirements before management would bestow the title of captain. At times, there was no Yankee captain as no player on the team at the time lived up to the role. The most inspiring of the team captains are Lou Gehrig, Thurman Munson, Don Mattingly and Derek Jeter, the captain of the current squad.

They are first recognized and respected as leaders by their teammates. Organizations must acknowledge and support these informal leaders. In baseball, the informal leader is designated captain. The captain is a role model who links traditional winning ways to current conditions. Leaders are anointed and not appointed: They are recognized by fellow employees as outstanding workers, great people and role models for the organization's values. They are respected, revered and emulated. ■

PART II: PROCESSES FOR DEVELOPING AND MAINTAINING A DYNASTY

Set the Bar Higher

It has often been said that people behave as they are measured. In 1920, Babe Ruth's first full year with the Yankees, the team failed to win the league title. Although the Yankees' attendance swelled that year due in part to Ruth's presence, and profits increased dramatically, owner Jacob Ruppert wasn't satisfied. Increased profits were obviously appreciated, and the team performed better than it had in the previous year, but such success was not what Ruppert was pursuing.

In 1921 and 1922, the Yankees won league titles, but lost the World Series. Ruppert was pleased with the increased performance of his team and manager, but had set his sights on a World Championship. In 1923, the Yankees won the World Series — but Ruppert was still not content: The next year he expected an even more dominant season. Winning the World Championship was the primary measure of success for the organization, and it remains so today. The bar had been set at the highest possible level, and the Yankees' dynasty was built on this definition of success.

High Expectations

To repeatedly achieve this lofty goal, all Yankee players must accept that specific measures of individual accomplishment are subordinate to winning the World Series. Expectations for player performance are high, concrete and linked to the team goal. For the organization and the players, the measures must be unequivocal.

Yankee team success is also measured by the size of the fan base relative to other baseball and sports teams. The owner's goal is to sell out the ballpark and to dominate the airwaves. Success is also equated with the variety and numbers of Yankee products sold in a multitude of outlets. The size of the fan base is the foundation for financial competitive advantage, which in turn translates into an increased ability to reinvest in the team by securing and paying for the best available talent, which ultimately results in additional fans. The Yankee goal is to put the most competitive team on the field not only to win championships but to attract and retain the greatest number of fans. In the corporate world, customers are equivalent to fans. ■

Organizational Competencies

Waite Hoyt, a Hall of Fame pitcher for the Yankees from 1921 to 1930, stated: "When we were challenged, when we had to win, we stuck together and played with a fury and determination that could only come from team spirit. We had a pride in our performance that was very real. It took on the form of snobbery. We felt we were superior people, and I do believe we left a heritage that became a Yankee tradition."

Competencies are the foundation for winning. The fundamental value at the root of Yankee pride is winning as a team. Yankee pride also refers to the team's core competencies: the skills, values and behaviors that are deemed critical to the success of each team member and the entire organization. In the corporate world, these are called institutional competencies. They are vital in guiding and sustaining substantial employee contributions to the organization.

Like accomplishments, competencies must have dimensions, measures and standards to ensure that they can be linked to substantial measurable results. They must be explicit, and players must be assessed against these competencies. Management decisions concerning each player must be guided by the assessments. The combination of accomplishment and competency assessment is the basis for player selection, development, career advancement, compensation and recognition.

Competencies are the observable and measurable skills, values and behaviors that contribute to enhanced employee performance and organizational success. Competencies must be clearly defined, articulated and embedded throughout your organization. ■

Three Benefits of Using Competencies

1. Provide periodic feedback to employees on their measurement against core competencies.
2. Establish organization-wide training, development, coaching and mentoring programs to close employee competency gaps.
3. Evaluate the benefits and costs of keeping employees with outstanding accomplishments but major inadequacies in other competency areas. Consider the long-term cost/benefit effects of such individuals.

Make Everyone on the Team A Talent Scout

One of the major sources of differentiation possessed by the Yankees is their ability to scout and assess talent. The Yankees are able to consistently maintain a high-quality team through their own special approach: Everyone is a scout.

In the Yankee organization, not just the managers identify, recruit and select talent. Everyone on the team realizes the necessity of keeping a steady flow of talent to the major league club. Individual players are always contacting players on other teams whom the Yankees are trying to trade for or sign. When the Yankees were pursuing Alex Rodriguez before the 2004 season, several players called Rodriguez to let him know that the Yankees were a winning organization and one where he would feel at home. Even after A-Rod's signing, players continued to take personal responsibility for introducing him to the Yankee Way.

In traditional organizations, the conduit for scouting external talent is typically recruiters and headhunters. However, organizations should formalize their scouting process under the human resources department, and all employees should be aware of their role in it. Scouting should be part of every employee's citizenship competency.

Everyone on the team is a talent scout. Your organization can expand its scouting field beyond the formal conduits by instilling talent assessment and scouting as an organizational value. Employees must understand their potentially critical role in bringing fresh talent into your company. ■

Create a Balance

You hear it all the time: "The Yankees are a team of all-stars." "The Yankees just buy other teams' superstars." "They have a superstar at every position." However, despite what many detractors believe to be the key to the Yankee dynasty, there are not enough superstars in the baseball player pool for the Yankees to buy and field a team of only superstars.

The Yankee mystique suggests that it has been a team of superstars (Hall of Fame level players) but the facts do not support this perception. It is impossible for the Yankees or any team to accomplish this feat because, by definition, the pool of superstars is always limited (probably no more than 2 percent to 4 percent of Major League Baseball players at any time), not all positions have available superstars, and not all superstars can or would play for the Yankees.

Superstars, Stars and Solid Performers

The reality is that Yankee success has resulted from skillful development and management of teams that reflect a careful blend of a very small number of superstars, several stars and many solid players. Highly entrepreneurial ownership and adept management have been able to carefully find, using the Yankees' own de facto competency profile, the required players to successfully fill all positions. The whole Yankee team performs better than the sum of its parts.

Every organization, including the Yankees (despite its reputation to the contrary), has finite dollars to be spent on its work force, so it must use its money wisely. ■

Establish Your Talent Strategy And Fill in the Gaps

The Yankees use talent classifications (superstars, stars, solid players, oddballs) to build a comprehensive inventory of players inside and outside the organization. The inventory enables the Yankees to implement a unique three-part strategy:

- **Identify and retain superstars in their organization and/or acquire them from competitor organizations.**
- **Ensure the battery (key positions — pitcher and catcher) has at least star and potential star backups.**
- **Make certain that everyone on the team is rated as at least a solid player.**

The Yankees have fielded many great teams over the past 80 years, but the 1998 team had more wins than even the great 1927 team. In fact, to win the World Series, the 1998 team went through two competitive championship series before it could even qualify for the World Series.

Let's look more closely at this team. This team had one superstar, five stars and three solid players among the starting lineup. It also had a solid pitching staff with several starting pitchers who were stars, and a relief pitcher who was a superstar. The catcher was a star. People might quibble with these evaluations, but this team clearly was not filled with superstars. The 1998 team also had a bench of solid players and potential stars. The team boasted five players from the Yankee farm system in the starting contingent. The leader of the 1998 team was the home-grown Derek Jeter. ■

Create a Solid Farm System

Historically, the Yankees have used a variety of statistical categories when evaluating the accomplishments of their players. For example, Casey Stengel emphasized hitters who did not hit into double plays, infielders who could make double plays, and home run hitters. This combination made his teams fast, powerful and defensively sound.

The Yankees entered the farm league business in 1929 when they purchased Chambersburg in the Class D Blue Ridge League. Two years later, they purchased Newark, an International League team. The next year, the Yankees made their most significant hire, but it was not a player. It was the appointment of a baseball executive named George Weiss to manage their minor league interests. Weiss laid the foundation for running Yankee farm teams. He was astute at selecting outstanding scouts, giving them ample budgets, and empowering them to sign prospects.

Weiss brought potential talent into the farm system, developed them, retained the best and sold off the surplus to finance later acquisitions. Weiss established the cycle of returning profits from player sales back into their farm system to ensure a steady stream of high-quality talent.

A strong farm system can cost-effectively build an organization's superstar and star base, and even trade surplus talent to fill its voids. Continual talent development protects a company against competitor raids and makes it less susceptible to being held hostage to excessive salary demands. ■

For additional information on how to implement the 'Create a Solid Farm System' principle, go to: http://my.summary.com

Pay Based on Contribution to Organization Success

Babe Ruth said, "Someday every player will be paid his true worth." Ruth's words finally rang true with the death of the reserve clause. Today, a player's salary should be based on his current and projected talent classification as a gauge of his actual and potential contribution to the team. The Yankees use this assessment of contribution as the basis for making decisions on the salaries of players on their major and minor league teams, and prospective players from a myriad of other sources. In order for this approach to be effective, the team must have accurate player assessments and a detailed knowledge of specific talent requirements. The latter typically comes from an organization-wide bench strength summary and talent management plan. Twice in their history, for extended periods of time, the Yankees failed to follow this disciplined approach. The result was a large payroll and mediocre team performance.

Most organizations can't afford to spend payroll dollars haphazardly. Missteps can lead to an inability to attract star talent or, even worse, loss of your top people to competitor organizations.

Allocate Sufficient Resources

A competitive team must first allocate sufficient resources to attract and retain superstar players. Similarly, star players are also valuable assets, and although they are somewhat more plentiful than superstars, their retention value is sometimes only slightly less significant. The last group to be considered is the solid players. Solid players should be fairly compensated with the remaining payroll budget. Solid players have a lower retention value to the team, are typically less attractive to competitors than superstars or stars, and may be less likely to move from a championship team to one that is less competitive because of small financial incentives. Companies cannot afford to lose, or fail to acquire, stars with superstar potential and superstars who are projected to maintain their superstar accomplishments.

For this reason, your organization must remember that the first principle in compensation management is not spending more than you can afford. The second principle is spending what you can afford wisely. Whatever your budget, wisely spending your money is the key to sustainable competitive success. ■

Make the Superstar the Focal Point of Your Organization

A superstar is a commodity in short supply. This makes the superstar a very special ingredient in a talent management program. That is why we single this person out for special attention. Superstars generally comprise only around 2 percent to 4 percent of the number of players in any given year. Their value to their team is immeasurable.

There are very few superstars, by definition, in the talent market. There are even fewer super-stalwarts in the talent market. This makes the recruitment, development, cultivation, deployment and retention of them integral to sustaining success.

A team must find a way to fill gaps in its bench-strength plan with actual superstars and star key positions on the parent team and potential ones in the farm system. Every time a superstar player is taken from a competitor, the transfer destabilizes the competitive environment. These teams believe that they have lost some type of competitive advantage — and they're correct. Losing a superstar is a direct threat to the success of the team. Every time a superstar or star key player changes hands, opposing teams attempt to adjust their rosters to remain competitive. This makes for a very fluid market for high-quality talent, and this condition,

(continued on page 7)

Make the Superstar the Focal Point of Your Organization

(continued from page 6)

in turn, spawns higher player compensation.

Hiring your competitor's superstars weakens the direct competitor's strength, demoralizes all competitors, greatly improves your team and creates media focus that heightens fan (customer) interest. And the Yankees are the best in the baseball world at doing exactly that.

Paradoxically, however, the Yankees did not pirate a superstar from a competitor between the early 1920s (Babe Ruth and Waite Hoyt) and 1975 (Catfish Hunter). Since then, they have used superstar acquisition in a highly selective mode. When the Yankee farm system started to produce high-quality talent, the Yankees added superstar retention to their strategy of superstar acquisition. ■

PART III: DESIGN YOUR CULTURE FOR SUCCESS

Diversify Your Talent Pool

Diversity is a success principle that evolved under George Steinbrenner. Until the Steinbrenner era, the Yankees lagged in expanding the ethnicity of the team. Baseball talent was what intrigued Steinbrenner, not the color of his players' skin. He knew that to fully implement the Yankee talent strategy no group of people could be excluded from the pool of available talent.

The Yankees' Checkered History of Diversity

The Yankees' dynasty was diminished by its failing to consider quality talent from all sources when its competitors were already doing so. Eight years after Jackie Robinson broke the color barrier, Elston Howard became the first African-American Yankee player in 1955.

George Weiss, the person responsible for building the best farm and scouting system in the 1940s, 1950s and 1960s, was shackled by his own bigotry that prevented him from utilizing the Negro Leagues as a source for introducing black players into the Yankee farm system. Weiss believed that black players could never meet all the Yankee appearance standards. To Weiss, being Caucasian was one of the requirements of being a Yankee. He declared, "I will never allow a black man to wear a Yankee uniform."

The failure of the Yankees to expand their pool of diverse players in the 1940s and 1950s reduced the number of superstars and stars available to the team in the late 1960s and early 1970s. This shortsightedness contributed to the Yankees' first dark age from 1965 through 1975. Today, the Yankees are a blend of African-American, Latino, Asian and Caucasian players. This diversity has been translated into on-field and box-office success. There are no restrictions on where the team searches for talent. The team knows that it must search even in the most unconventional places to bolster talent at all levels of the organization. ■

Reasons for Diversity

In order of diminishing importance, a review of the Yankees' behavior since 1975 suggests the following reasons for diversifying their talent horizons:

✓ Diversification expands the talent base for recruiting superstars, stars and key position stars. This enhances the team's chances in achieving its staffing model.

✓ Diversification expands the fan mix. This leads to greater ticket and merchandise sales, broader media attention, larger audiences and higher advertising revenue. The Yankees recognize that there is a huge fan base within and outside American borders that can be tapped through diversity. Japanese fans closely follow Japanese players, Mexican fans track their countrymen, and so forth.

✓ Diversification provides a variety of thoughts and emotions emanating from varied cultural experiences that enable team members to better share common goals, to investigate alternative solutions to problems and to weather tough times.

Celebrate Your History, Heroes and Legends

Perhaps no other organization is so filled with myth and legend as the Yankees. The names of the players, their monuments in center field at Yankee Stadium, the retired numbers, the stories, the pinstripe uniform, the World Championship banners, the rings they wear, all of it is part of what people think about when they think about the Yankees. This is not by accident.

Yankee folklore is transmitted through the principal owner, manager, captain, superstars and stalwarts of all types. They share the stories and acknowledge past champions. They are the daily reminders of what it takes to be a champion and the custodians of the Yankee Way. The Yankee Way is enmeshed in the team's history and every generation of Yankees builds on the Yankee Way template. Winners write history, and the Yankees have written more than their share.

Every organization has a history, values and competencies that set it apart and must be consistently con-

(continued on page 8)

Celebrate Your History, Heroes and Legends

(continued from page 7)

veyed by all levels of employees. Its history, values and characteristics form its own organization "way." When employees feel ownership for their company way, they are in a better position to pass on the tradition.

The Yankee organization has gone to great lengths to promote its history and tradition of excellence. The Yankees tell their stories, publicly celebrate past heroes and legends, and use their past successes to persuade current and prospective players to believe that they are destined to win. The Yankees are more than a team. They are an American success story that has captured the imaginations of people worldwide.

On and off the field, the Yankees have been successful at selling themselves. Beginning with the Ruppert era, each primary owner embraced promotional rules. ■

Boldly Promote Your Tradition of Excellence

The Yankees have done an incredible job of promoting the team's winning tradition to all members of the organization, from batboy to players to management to fans and the media. The Yankees began with two organizational promotional goals: associating the Yankee brand with winning, and becoming an employer of choice.

Branding the Yankee franchise so that the team name and logo are associated with pre-eminence in the sports industry is the primary goal of Yankee management. The Yankee public relations department aims to build a high level of awareness of the Yankees with the players, fans, general public and media as a championship organization and, therefore, a strong and compelling brand with charisma and mystique — one with which people can identify and to which they can be loyal because of its association with a special way of winning.

The Yankee winning way embraces professionalism, citizenship, leadership and accomplishments. This branding helps sell tickets and merchandise, increases viewership and leads to greater advertising revenues. It also increases "share of audience mind" with respect to its baseball and nonbaseball competitors.

Employer of Choice

The Yankees' second promotional goal is to establish the team as the indisputable employer of choice. As an employer of choice, the team has a better chance of attracting and retaining quality talent than its competitors. The Yankees convey the message to potential players that their team is where you come to win championships.

They accomplish these goals using a four-step strategy: Focus on team accomplishments, focus on the superstar, pick colorful and committed hucksters to spread the message, and package the team image in a classical and epic-evoking environment. The Yankees' brand was built using these four strategies, and the organization has become one of the most recognizable in the world. People associate the Yankees with winning. ■

Conclusion

The sustained success of the Yankees is not simply explained by luck or wild spending, although both have affected the evolution of the dynasty. Nor are the conditions that have buttressed Yankee accomplishments solely cloaked in myth and folklore. Yankee dynastic success is explained by a simple formula that consists of three factors that can be further differentiated into 14 principles. The three factors — leadership, processes and culture — had their roots in the Yankee organization that launched the dynasty, while the 14 principles evolved over the team's successful 80-plus-year history.

Any organization can achieve Yankee-like success and compete with top rivals if it utilizes the three-factor formula more effectively and efficiently than its competitors. Where do you begin?

First, you must establish a strong and pervasive leadership structure, beginning with leaders who can credibly influence employees to achieve a clearly defined goal for competitive success.

Second, the organizational goal of the leaders must be translated into a road map comprised of a set of credible, clear and practical processes the organization must follow to reach its goal.

Third, there must be a conscious effort by leaders to create and sustain a culture where employees are motivated to establish personal goals that derive value from their contribution to organizational success.

Once you achieve success, you must sustain it to become a dynasty. To paraphrase the great Yogi Berra, you must constantly achieve "déjà vu all over again." ■

Manager Redefined

The Competitive Advantage in the Middle of Your Organization

by Thomas O. Davenport and Stephen D. Harding

THE SUMMARY IN BRIEF

Management and leadership have been with us since humans invented work. For most of the last two decades, however, the manager position has been under direct assault. It's become a ragged conglomeration of pieces and parts, designed to do too many things and engineered to do none of them well. People both higher and lower in the organizational hierarchy question its value, resent the authority it confers and criticize the competence of the people who do it.

In *Manager Redefined*, Tom Davenport and Stephen Harding look at the picture differently. They view supervisors and managers as centers of insight and influence, underappreciated in many organizations, but endowed nevertheless with the potential to make dramatic contributions to enterprise success. The authors challenge readers to consider the power embedded in their managers' accumulated knowledge and experience. Building and unleashing that power is the authors' aim in *Manager Redefined*.

Davenport and Harding make the case that executives and the Human Resources function should see managers as more than just message amplifiers, system executors or (heaven forbid) a necessary evil required mainly to keep employees in line. They urge companies to think of their managers instead as potential sources of competitive advantage.

IN THIS SUMMARY, YOU WILL LEARN:

- How to resolve one of the most important and often difficult aspects of management — motivating performance.
- How to build autonomy and self-efficacy among team members while maintaining accountability.
- How to unleash the power and potential of managers for company goals.
- How high-performing managers can contribute to organizational success.

PART I: CONTEXT

Organizations (along with academics, consultants and gurus) have relentlessly elevated leadership at the expense of management.

In a *Harvard Business Review* article in 2003, Jonathan Gosling and Henry Mintzberg wrote, "Nobody aspires to being a good manager anymore; everybody wants to be a great leader." And then they added a warning note: "But the separation of management from leadership is dangerous. Just as management without leadership encourages an uninspired style, which deadens activities, leadership without management encourages a disconnected style, which promotes hubris."

What do "leader" and "manager" really mean to the functioning of an organization? The terms denote different actions and different outcomes — but what actions and what outcomes? If we extrapolate a bit from what Rear Admiral Grace Hopper said — that managers focus principally on assets, and leaders concentrate on people — we can clarify both definitions. Leadership, we submit, entails:

- Envisioning an improved situation (for instance, achieving an organizational goal, changing strategic direction, emerging from a crisis).
- Determining the best path for reaching that desirable end.
- Inspiring in others the self-motivation to reach the appealing state (that is, creating the conditions under which people feel the intrinsic motivation to move ahead).
- Boosting energy (by recognizing success, for example), removing obstacles that impede progress (political constraints, for instance) and demonstrating resilience (remaining steadfast in spite of failures), so that people can make speedy and efficient strides toward the goal.

A leader is like the captain of a 15th-century Portuguese ship sailing out of sight of land for the first time in search of gold, silver and spices. The captain envisions the destination, plots the course (with the help of a skilled navigator, of course) and engenders courage among the sailors ("Don't worry, men, I'm pretty sure we won't sail off the edge of the Earth"). Of course, the mission will fail if the boat springs a leak, the sails become shredded or the food goes rotten. Seeing to the soundness of those assets is the responsibility of a manager. With all this in mind, we suggest that managing consists of:

- Acquiring, deploying, building, preserving and exploiting assets.
- Overseeing processes and implementing systems for putting those assets to use.
- Monitoring results and making adjustments.

Without leadership, people lack the vision and courage to set sail and discover the New World. Without management, the boat sinks before it gets there.

The Definition, and the Power, of Engagement

The degree to which managers matter depends, in

part, on how effectively they contribute to employee engagement. We believe that, of all the attitudes and behaviors of employees in companies across the world, engagement best captures the energy and dedication that underlie human capital investment. Research performed by our colleagues at Towers Watson shows that engagement comprises three distinct dimensions: rational, emotional and motivational. The thinking (rational) component of engagement refers to how strongly employees understand and support the goals and values of the organization for which they work. The feeling (emotional) component of engagement describes the affective attachment that individuals feel toward their organizations. The behavioral (motivational) element encompasses employees' willingness to engage voluntarily in discretionary efforts for the good of the company — that is, to invest more of their human capital than is required just to keep their jobs.

When organizations succeed at generating engagement among their employees, those employees not only score high on the three engagement dimensions, but also channel their human capital investment into areas the company cares about. ●

Why Managers Have a Tough Job

What makes being a manager so unattractive? On one level, the answer is obvious — just look around today's workplace. As downsizing lengthens everyone's to-do lists, expanding workloads add new burdens to the manager's job. With many organizations expecting managers to act as player-coaches, both performing and overseeing work, their roles often become complex and unwieldy. Organizational flattening and widening of managers' spans of control stretch their ability to spend time coaching, or even to become acquainted with, any individual employee. It's hardly surprising that respondents to a Randstad study cited increased stress as the No. 1 reason for avoiding management responsibility. They also said they hated the idea of handling disgruntled employees (like themselves, perhaps), dealing with loads of administrative paperwork and having to terminate people, many of whom were peers not long before. Given the disinclination of people to take on manager jobs, Randstad predicts what it calls a "looming manager shortage." They recommend that, to deal with the shortfall of managers, organizations need to reconsider how they define managerial roles.

When you consider the full array of leadership and management responsibilities that fall to people with supervisor and manager titles, one thing becomes clear — managers have difficult jobs. Workload pressure from downsizing, unworkable ranges of responsibility and wide spans of control all burden managers' jobs, increase their stress levels and reduce their effectiveness. Little wonder employees are skeptical about the competence of the people to whom they report.

Work and Reward Are One and the Same

Ultimately, an employee's work and the deal that rewards him for the quality and quantity of that work are inextricably bound. Managers must recognize that, in a sense, work and reward are one and the same. They can be guided by the words of American civil rights activist and author W.E.B. DuBois: "The return from your work must be the satisfaction which that work brings you and the world's need of that work. With this, life is heaven, or as near heaven as you can get. Without this — with work which you despise, which bores you and which the world does not need — this life is hell."

We Really Don't Like Being Told What to Do

Our inherent internal conflict about leadership has an important corollary: We really don't want to follow orders. Being directed reminds us that someone else gets to call the shots. Still, if we must give up authority, we want those who have it to exercise it appropriately. As a result, we place a heavy burden on managers to hit a small target between being too assertive and not assertive enough.

The happy medium is happy indeed — it constitutes the most effective behavior in the eyes of employees. A research study conducted by Daniel Ames and Francis Flynn at Columbia University showed that managers who manifest moderate levels of assertiveness accomplished just as much as the most assertive, but with far lower social costs (in the form of disgruntled employees).

Every time a manager makes the wrong choice, he creates discontent. Of the two possible transgressions, of course, too much assertiveness engenders greater resentment.

In corporate organizations, bad boss behavior rarely leads to violence, but it can lead to lawsuits. In 2007, legislation was pending in New Jersey and at least three other states to give employees the right to seek damages if a manager created an abusive environment. In New Jersey, the bill specified that an individual who felt he or she had been wrongfully treated could sue for as much as $25,000. ●

A New Model of Manager Performance

Any group can enhance its chances for success by innovating and passing on successful methods. The goal is an edge over the competition. Corporations that achieve and sustain competitive advantage consistently deliver superior financial results.

Management guru Peter Senge has famously said that the only sustainable competitive advantage is the ability to learn faster than your competition. Although learning is certainly necessary, incorporating knowledge into what and how you produce creates the real competitive edge.

If managers play a role in the creation and application of knowledge (a key element of human capital), it then follows that they also have a part to play in achieving competitive success.

The Manager Performance Model

We analyzed our consulting experience in manager role definition and reviewed survey results from companies around the world and across the performance spectrum. Using all this information, we developed a performance model that we believe depicts how managers contribute most directly and significantly to sustainable competitive advantage. The model contains four categories of manager performance requirements:

1. Executing Tasks. This element comprises planning work, clarifying job-related roles, structuring specific job tasks, monitoring performance and making the necessary adjustments to ensure that work meets organizational needs and supports business strategy. Overseeing task execution is, in many ways, the most traditional aspect of the manager's job. Of the four performance categories, it focuses most directly on the asset deployment, process oversight and systems implementation elements that most people think of as integral to managing.

Even when the descriptors sound familiar (such as encouraging teamwork, for example), the expectations and goals of task-execution approaches will vary: Teams at Intel share quality improvement ideas; teams at Southwest Airlines scramble to serve customers; teams at SAS, a leader in business intelligence software, work with users to create new products.

2. Developing People. The next element of the performance model calls for managers to create opportunities for each employee to add to his or her storehouse of human capital. In doing so, managers create the ability for people to carry out their jobs and achieve their goals.

Southwest managers focus learning on both individual task elements and on cross-functional training so that people understand fully what others do and the team as a whole can function better.

3. Delivering the Deal. Managers play a central role in brokering the exchange of each employee's investment of human capital for the portfolio of financial and nonfinancial, intrinsic and extrinsic rewards that constitute a return on that investment. We refer to this reciprocal arrangement as *the deal* between employee and enterprise.

Intel, Southwest and SAS all understand the importance of providing an appealing deal to employees as compensation for their contributions to strategic success. Naturally, financial rewards play a part in the organizations' overall reward portfolios. The Intel jobs website, for example, proudly tells prospective candidates about the organization's incentive philosophy: "Bonuses are the major element of Intel's variable pay and are central to Intel's approach to compensation. Our philosophy is to offer a greater portion of variable pay than the market average, because this provides a strong link between employees' compensation and company performance."

4. Energizing Change. Effective managers look ahead in time and outside the boundaries of their units and their organizations to anticipate and respond to environmental shifts and to envision, plan for and create the future. Sometimes this requires managers to respond to change that is imposed and unavoidable — reorganization, strategic redirection or downsizing, for example. In other cases, innovation and creativity may spark the change, as people develop new offerings or find better ways to work. These forms of change call for varying levels of reactivity or proactivity, adaptability or resilience. ●

Constructing the Manager Role

We work with many organizations whose promotion process frequently puts highly qualified technicians into managerial roles where they fail, or at least underperform. Managers, the Human Resources department and executives all acknowledge the problem. There are many possible causal pathologies: expediency, believing that direct production is all that really counts, concluding that managers really don't matter if organizations have charismatic senior leaders. Sometimes, organizations program the manager's job to fail by promoting the right person but subsequently failing to define the job sensibly or support it effectively.

The analysis reflects sensitivity to the assumptions

many organizations bring to their conceptions of what managers are supposed to do and how they are supposed to do it. Types of skills, reporting spans and balancing work and leadership must all be considered. The point is to look at these factors together and consider how they influence each other rather than making decisions that rely too heavily on a single factor. The prize is a role definition that makes it possible for managers to execute the elements depicted in the manager performance model.

Some juggling and balancing are inevitable in the manager's job, but a thoughtful approach to defining the position can make managers' lives easier and maximize their contribution to the organization's strategic advantage.

PART II: IMPLEMENTATION

Psychologists know that we humans give ourselves far too much credit for our ability to perform rational analysis. In fact, our reasoning is fraught with deviations in judgment, cognitive faults that influence how we perceive the world and act on our perceptions.

Planning Work

From the list of logical fallacies to which humans (and therefore managers) are heir, three have a direct effect on work and project planning:

- *The framing effect.* Drawing different conclusions or taking different actions from a single set of facts, depending on how the facts are presented or labeled.
- *The illusion of control.* Believing that we can direct, or at least influence, events over which we actually have no power.
- *The planning fallacy.* Consistently underestimating the time and cost required to complete a task.

These biases influence how managers and other humans instinctively approach planning. We all experience them to a greater or lesser degree. We must recognize and deal with them if we are to succeed at the basic tasks of goal setting, resource planning and action taking, no matter what competitive strategy we hope to execute.

Clarifying Job Roles

Once the planning is finished, there's work to be done.

As with work planning, managers must overcome a set of cognitive and attitudinal biases as they work with employees to design jobs. These two are particularly relevant:

- *The actor-observer bias.* This is the tendency to attribute our own actions to situational factors and attribute the behavior of others to stable personality traits. If I feel stress before a big presentation, for example, I might ascribe it to my concern that this session will be attended by important clients, a circumstance I use to explain my sweaty palms. Conversely, if I see a colleague showing obvious nervousness before a big speech, I might put it down to his having low self-confidence. I know I'm a great presenter; I'm not so sure about him.
- *The illusion of transparency.* This occurs when we overestimate our ability to understand others' personal mental states. We believe that we know others better than they know us. In a related way, people tend to think of themselves as having complex and variable personalities, while viewing others as simpler and more predictable.

These biases threaten to impede managers' efforts to perceive accurately the complex needs and competencies of those around them and to use those insights to craft suitable work roles.

Monitoring Progress

Monitoring work progress and results, the third dimension of the manager's task-execution responsibilities, should directly reflect the logic established in work planning and job role clarification. In a product-differentiation strategy, for example, innovation matters. Therefore, the manager of the R&D unit will pay special attention to metrics indicating successful new product commercialization. Individual and team work flows will be structured to focus attention on product development, and customized jobs will provide for the free-flowing creativity necessary to inspire innovation.

Developing People

In a world where organizational focus on employee development has been compromised and learning investments threatened, managers' direct efforts to help people build their human capital take on increased urgency. An astute manager has a wide array of approaches at his disposal for engaging in direct human capital-building efforts with employees. These include:

- *Coaching.* Providing hands-on skills-improvement advice and instruction by putting learning and action close together; encouraging performance, nurturing and reinforcing success.
- *Teaching.* Imparting knowledge; learning and action may be separated by time and space.
- *Informing.* Providing information on specific job functions and broader organizational and strategic context.
- *Mentoring.* Giving the employee career guidance,

general development counseling and advice, sponsorship and support.

- *Exemplifying.* Displaying the desired attitudes and actions.

Managers may engage in any or all of these actions more or less constantly and without clear delineation of when one form of direct development stops and another begins. ●

Delivering the Deal

It is difficult to overestimate the motivational power many executives and most organizations ascribe to financial rewards. "Pay for performance" has become a largely unchallenged, albeit aspirational, foundation for reward strategies. Among respondents to our Reward Challenges and Changes survey, only 18 percent say their organizations have no formal program for differentiating performance and steering comparatively higher levels of financial rewards to people designated as high performers. Stanford professor Jeffrey Pfeffer goes to the heart of the matter when he says, "The big push for incentive pay stems from a belief that if employees were just compensated appropriately, virtually every organizational and management problem could be solved."

And how well do the programs actually work? Not very well, if you ask employees. Across our database of survey responses, less than two-thirds of employees of U.S. firms say they understand how their performance bonuses are calculated. When asked to consider their total compensation, 67 percent say they are fairly paid for the work they do. But only 43 percent believe their organizations do a good job of matching pay to performance.

Managerial Alchemy

We don't mean to suggest that incentive plans have no place in the deal between individual and enterprise. Intelligently defined and judiciously used, they have great power to signal to employees the behaviors and results the organization values most. Incentives can also play an important part in a manager's efforts to gather her team and recognize contribution — as long as the recognition encompasses more than just financial rewards. Consider this description of a reward-allocation philosophy, a paraphrase by Pfeffer of the thoughts of George Zimmer, founder of clothing retailer Men's Wearhouse: "You want incentives to be just large enough but not too large. … You want rewards to be large enough to be noticed, and you want to use them to provide an occasion for celebration and recognition, to let the group come together and share successes and enjoy each other's companionship. But you certainly don't want to make the incentives so large that they begin to drive and thereby distort behavior."

Managers who hope to use the reward tools afforded by organizations to deliver an engaging and energizing deal to employees must:

- Not just administer the organization's reward systems, but also perform a kind of alchemy, transforming extrinsic financial incentives into sources of intrinsic fulfillment.
- Not deliver the same reward portfolio to everyone, but instead create individualized deals for each employee; managers must understand that, although those deals may not differ greatly across the employee population, it's important that each person feel as though his deal is custom-tailored for him.
- Not just execute the recognition programs provided by the company, but rather create a recognition-rich environment in which formal and informal, predictable and unanticipated recognition turbocharge employee engagement. ●

Energizing Change

When organizations respond to external forces by resolving to change, they need to carve out specific roles for line managers. By doing so, they improve their chances that employees will not just accept, but also embrace, the new ways of working. One study, conducted by a team of researchers at Troy University and Auburn University, looked at how health care workers adapted to the introduction of new record-keeping technology. The team studied how nurses and other workers responded to the transition from using laptop computers for patient care documentation to using handheld devices. Nurses also had to move from printed patient care plans to automated clinical planning software. The nurses hadn't sought these changes. From their standpoint, the new ways of working were imposed by the organization. From the organization's standpoint, the potential benefits were clear. Nurses would become more efficient, improving the continuity of patient care and reducing the expense associated with copying and pushing paper.

The researchers found that individual adaptability in response to new work-altering technology depends on the degree to which managers:

- *Ensure that technology provides work support and improves performance.* When a job becomes more interesting and its mastery more fulfilling, individual perfor-

mance improves. Work process changes that add to job enrichment and mastery therefore contribute to performance. Managers needed to make sure that the new devices made jobs easier, not harder, and workers more productive, not less so.

- *Involve workers in the introduction of new technologies.* Involvement means giving the affected populations some say about when and how technology would be introduced. It requires managers to seek employees' advice on how employees, patients and customers might respond to new ways of doing things.
- *Clarify individual roles within the affected organizations before new technology comes on the scene.* Role clarity goes to the heart of rational engagement. It forms an essential connection between individual work and organizational success. Workers who have a better line of sight between their jobs and the success of the organization show more inclination to embrace changes of all kinds. Their comfort with change becomes all that much stronger when their managers help them envision a positive effect on product and service outcomes.

Choosing to Change

The manager does not act alone. His or her supportive actions must be bolstered by an organizational willingness to accept and accommodate new ideas. The sociopolitical context of organizations can at times militate against creative change, which entails, after all, a disruption of the status quo. Onne Janssen from the Netherlands looked at the relationship between manager support for innovative behavior and the perceived influence that individuals felt they had in the workplace — their belief that their actions would indeed achieve the desired effect. His research produced clear results: "Employees' sense of influence needs to be augmented by perceptions that their supervisors are likely to support their innovation. … Employees feel that their supervisors are the key actors who have the power to grant or deny them the support necessary for the further development, protection and application of their ideas."

The manager thus plays a dual role: fostering an environment that encourages and expects creative behavior, and providing the support necessary to ensure that such behavior is accepted and assimilated within the organization. ●

Authenticity and Trust

Integrity is a main pillar of authenticity. Integrity means adhering consistently to a code of high moral ethics and behavior. Consistency, in turn, forms a core element of trust. We think of authenticity and trust as sequential and complementary elements that add power to our manager performance model. In the architecture of our model, they form the foundation, the basis for strength and stability.

Connecting Authenticity and Trust

Trust is defined as the willingness of one individual to make him- or herself vulnerable to another. The acceptance of vulnerability must be grounded in the expectation that the trustee will act in a predictable way that benefits, or at least doesn't harm, the person granting trust.

Of all the elements in our manager performance model, none has a more dramatic effect on a manager's ability to work effectively offstage than reciprocal trust. If employees don't trust the people with whom they transact their business, then transactions will be few, meager and unfulfilling. Conversely, managers who foster trust, and who do all the other things we've described to make individuals and groups effective, create the environment for individual and group success.

By behaving authentically, managers establish the groundwork for trust.

Four Components of Authenticity

Authentic behavior is not a unitary, either-you-have-it-or-you-don't concept. Rather it comprises a set of attributes that any individual may display to a greater or lesser extent. A research team led by Arizona State University's Fred Walumbwa studied populations as diverse as Chinese, Kenyans and North Americans. They found supporting evidence for four components of authenticity:

- *Self-awareness.* Mindfulness about how one experiences and makes sense of the world. Self-awareness denotes an accurate understanding of personal strengths and weaknesses, and insight into how one's behavior is perceived by, and affects, other people.
- *Relational transparency.* Being consistent and genuine in interactions with others and presenting one's true and honest self to the world, without pretense, manipulation or intentional distortion. That value of transparency applies to close associates as well as to oneself; a manager strong in relational transparency helps others identify both positive and negative aspects of their behavior.
- *Balanced processing.* Willingness to evaluate all relevant information, including data that are challenging or uncomfortable, before reaching a decision. Authentic

leaders are less likely than others to ignore or distort information they may not want to hear, to deny the relevance of messages about their personal shortcomings or to punish the bearers of those messages.

- *Internalized moral perspective.* Guiding one's behavior and decisions by personal ethical standards rather than by external pressures from a group, organization or society. As Walumbwa and his colleagues explain it, a person's moral perspective is guided by deeply held values that enable the individual to avoid acting merely to please others or to attain rewards or avoid punishments. ●

Fitting the Pieces Together

Here are the summary attributes that we believe contribute most directly to a manager's success at playing the roles we've outlined across strategies, companies and functions:

- **Requisite Variety.** This concept comes from systems theory, specifically the cybernetics discipline. It means simply that a flexible system encompassing many options performs better in an uncertain environment than does a system with fewer options. That is, only variety can respond to variety. For managers, this means having the insight to recognize, and the adaptability to respond to, a range of employee attitudes and behavioral styles. The goal is efficient connection and personal rapport.
- **Cognitive Fluidity.** Cognitive fluidity goes beyond simple brain power. It denotes the ability to make intellectual connections across topics and domains. More than just balance, cognitive fluidity calls for connectivity and mental agility. A manager strong in this attribute will prove effective, for example, at determining how a redirection of business strategy will affect unit-level work planning and operational requirements; discerning the meaning for organizational structure; and identifying the ripple effects of individual employees and their deals with the organization.
- **Ability to Catalyze Action.** The essential paradox of our concept of the manager's job is that managers can perform better from offstage. This means acting as a catalyst, precipitating results without participating as a functional element in the processes used by individuals and teams. The manager-as-catalyst attribute encompasses classic competencies like results focus, bias for action and goal orientation. But we mean something more. To perform as a catalyst, a manager must combine relentless attention to what matters with a highly developed ability to get out of the way.
- **Ability to Navigate the Organization.** The ability to find and use an organization's tools and resources contributes as much to manager performance as does any other high-level attribute. This is the ultimate example of firm-specific, how-we-do-things-around-here knowledge. It requires cognitive fluidity, which enables the manager to see readily how to connect disparate resources (such as diverse learning programs) into a unified result (a practical development process for a single employee).
- **Social Intelligence.** Daniel Goleman, author of *Emotional Intelligence* and *Social Intelligence*, includes two components in his definition of social intelligence: awareness (gathering information on others and understanding how the social world functions) and facility (effective interactions using the information gathered). These attributes provide the interpersonal insight and the influence skill needed to navigate within and outside organizational boundaries. Social intelligence encompasses the authenticity that guides managers to honest understanding of their own and others' strengths and weaknesses. It's a key to working with teams from the right distance and creating the networks that provide learning contacts. Humility is essential; a sense of humor doesn't hurt. ●

Authentic Leadership

A group of researchers from the University of Nebraska has studied and elaborated on authentic leadership. They summarize the relationship between authenticity and trust this way: "Authentic leaders act in accordance with deep personal values and convictions, to build credibility and win the respect and trust of followers by encouraging diverse viewpoints and building networks of collaborative relationships with followers."

A Hard Look at the Soft Practice of Managing and Management Development

MANAGERS NOT MBAs

THE SUMMARY IN BRIEF

Every decade almost 1 million MBAs graduate into the economy. After two years of classes they expect to manage people who have many times the amount of knowledge gained through intensive personal experience. Those without the credentials are increasingly relegated to the "slow track" and subjected to the leadership of those who do not have the legitimacy to lead. The MBA was first introduced in 1908 and went through its last serious overhaul in the late 1950s. It is time for a change. The current system ensures that the wrong people will get educated in the wrong way with the wrong consequences. There is a better way. Professor Henry Mintzberg has designed a program, the International Masters in Practicing Management, that addresses many of the problems associated with traditional programs that profess to develop managers, but instead produce analysts ready to apply one-size-fits-all techniques no matter the context. By integrating reflective, analytical, worldly, collaborative, and action mindsets, this philosophy will not only improve managers, but also their organizations and society.

What You'll Learn In This Summary

✓ What is wrong with today's management education.
✓ What kinds of people make good managers and why they are not in business schools.
✓ How art, science and craft are all components of management, but business schools focus mostly on science.
✓ Whether MBAs are ready to perform in the boardroom once they make it in the door of an organization.
✓ How graduate business schools are corrupting education, managerial processes, existing organizations, and even social institutions.
✓ How most attempts at innovation of the managerial development process only change the delivery of the same inappropriate material.
✓ How an entirely new model, the International Masters in Practicing Management, teaches managerial practices instead of test-taking and knee-jerk decision making.

MANAGERS NOT MBAs

by Henry Mintzberg

— THE *COMPLETE* SUMMARY

Wrong People

Conventional MBA programs do not work because they pretend to create managers out of people with no experience or expressed leadership. Leadership is a natural quality, and teaching it to someone who has never managed is like teaching psychology to someone who has never met another human being.

More art than science, when management is mixed with craft or experience, it becomes a practice. Inexperienced students cannot appreciate the practice of management, so they focus on the science, or analysis, that is the basis of most MBA programs. Management is treated like a profession that can be learned without experience and then applied in every situation. Management is actually a facilitating activity that depends on the immediate context.

At Odds With Management

Though business schools require work experience from applicants, it is an average of only four years, and their experience is rarely managerial. This particular age group is typically seeking independence from family and roots, which is at odds with management that focuses on accepting responsibility, not throwing it off. Traditionally impatient, analytical and controlling people self-select to apply just so they can move up, and worse, often move out of the one area where they have developed experience. The GMAT encourages good test-taking, not good management, and it introduces its own bias for science over art and craft.

In 1971, Sterling Livingston wrote that few people had the **will to manage** — to foster success in others over their own success. In 1932, Alfred North Whitehead labeled the **zest for business**, which is different from the zest for riches, as another important characteristic. The former is about getting the most out of *resources*, the latter about tapping the energy of *people*.

Those with the zest for business, but not the will to manage are the problem. Such people are numerous in MBA programs. They make good investment bankers, financial analysts or consultants, which is what many of them have become. Unfortunately, those who aspire to run large corporations are likely to fail in executive positions.

We need leaders with human skills, not professionals with academic credentials. In the larger organizations especially, success depends not on what managers themselves do so much as on what they help others to do. ■

Business or Management?

Will to Manage (after Livingston)	Zest for Business (after Whitehead): NO	Zest for Business (after Whitehead): YES
NO	Do research or whatever.	Do deals, or run your own small business.
YES	Consider the public or social sector; get experience as a manager, then study management.	Consider big business: get experience as a manager, then study management.

Wrong Training

Once you have the wrong people, there is no right way to develop them. Business students receive a false sense of management and propagate it in organizations. The ill-conceived pedagogy becomes so entrenched that even when the right people are sent to executive MBA programs, they learn the wrong things.

Wrong Training

(continued from page 2)

The first graduate studies in business were offered by Dartmouth in 1900, followed by the first MBA program at Harvard in 1908. As other programs grew, the business community was not enthusiastic and the focus became academic. Case studies emerged midcentury and were much more popular with students for their practicality, but business research began to flag.

In the 1950s, interest in academic research picked up again, and the focus was on business over management. Business programs taught distinct functions, such as finance, entrepreneurship and marketing, but they did not teach management. Management was finally added as "strategy," but instead of viewing it as a synthesis of business knowledge and soft skills, it became another function to analyze.

Managing by analysis was narrowed to decision making, and became the norm. Much of decision making involves soft skills to identify problems, consider options, and set up holistic solutions. Professors either can't or don't want to teach soft skills, and young students aren't ready to learn them. The business school programs focus on what they can do — evaluate choices — a very narrow view of management. Students are encouraged to analyze by learning generally applicable techniques, but not by taking responsibility for specific situations.

Pedagogy of the MBA

- **Lecture**. Professors stand before the students and tell them how the real world is, but unfortunately the real world is experience.
- **Business Games**. Teams of students make decisions about pricing and production for simulated businesses on computers, but suffer no consequences if they are wrong.
- **Projects**. Students conduct fieldwork projects and consulting assignments in real companies, but without commitment or responsibilities, the projects are meaningless.
- **Case Studies**. Students read a 10- to 20-page discussion of a business situation with a protagonist at a crossroads, having to make a decision. This method promotes too much sitting around and talking — not action.

Do, See, Feel and Listen

Business school teaching methods develop leaders who think, when this world requires us to do, see, feel and listen. The programs broaden students' knowledge of business and financial analysis, but narrow their perceptions of management. ■

For Additional Information on case studies and their drawbacks, go to: http://my.summary.com

Impressions Left By MBA Education

✓ Managers are important even though they are disconnected from making and selling. The higher up they are, the more important they are, even if they only arrived yesterday.

✓ Managing is decision making based on systematic analysis. It is more science than art, and certainly no craft.

✓ Data for decisions come from brief cases or reports. To make decisions, numbers are massaged, words are debated, and perhaps ethics are considered.

✓ Under managers, organizations are segregated into discrete functions of finance, marketing, accounting, etc., each with its own set of techniques.

✓ Managers pronounce strategies to combine the functions. Though mysterious, these strategies are understood by those who learned industry analysis and have formulated many such strategies in a classroom.

✓ The best strategies are clear, deliberate and bold like the heroic leaders of the most interesting cases.

✓ After a manager formulates a strategy, all the other people must implement it or take action. Managers must always control this process, but never engage in it.

✓ Implementation is hard because business school graduates embrace change, but most others resist it. Managers have to bash bureaucracies and empower whoever is left.

✓ To become a manager or a leader who gets to sit at the top, you must first sit still in business school for two years. That enables you to manage anything.

Wrong Consequences

Though it is possible for some of the right people to get educated the right way within business schools, these programs are so rarely recognized that it barely matters. The fact remains that training elitist leaders in analysis and promoting them on fast tracks undermines our educational institutions, organizations and social fabric.

Corruption of Educational Process

Though business school programs claim to teach business discipline and understanding, they often focus more on fitting in and competition. Getting into the best

(continued on page 4)

Wrong Consequences

(continued from page 3)

school and networking reign over management, while learning to increase shareholder value triumphs over customer needs and product quality. Despite expanding classes in ethics, MBA graduates are becoming less and less concerned with the topic. School gives the students confidence, but not enough competence. Graduates are arrogant enough to get to the executive suite, but are ill-equipped to handle it. Combine the suspect education with the mindless drive to market MBA degrees like action films and it is no surprise business schools can't focus on developing responsible managers, businesspeople and citizens.

Corruption of Managerial Practice

The fact that so many MBA graduates make it to senior positions means that its effect on the practice of managing is enormous. Some of the commonalities of the MBA career path are unsettling:

- **Gateway to the Real World.** MBAs typically leap directly into consulting or investment banking where they have great opportunities for analysis and techniques, but little responsibility for implementation or direct management. The MBA is a status symbol giving students money and their hiring employers a way to screen for interest in business, if not loyalty.
- **End Run Around Management**. Increasing numbers of MBAs get into managing by going around it, straight into executive positions. They never make or sell anything, just involve themselves in functions that are not industry specific. The people who get these degrees are often impatient, aggressive and self-serving. Launching them into important positions without context only encourages them to rely on this behavior.
- **Managing Out of Balance**. MBA training should be a balance of the techniques and experience of craft, the art of insights and vision, and the science of analysis and assessments. Traditionally, the training is light on craft and art, leaving science to take over and propagate a calculating and dehumanizing environment.
- **Performance of Prominent MBA CEOs**. Though they can get to high positions, MBAs cannot necessarily perform there. MBAs constitute approximately 40 percent of CEOs in Fortune 100 companies, but familiar lists of the most admired business leaders — Buffett, Kelleher, Dell, Gates, Welch and Winfrey — do not include MBAs. In fact, CEOs with MBAs tend to have poor execution and people skills, exactly where their selection and training are weakest.

Corruption of Established Organizations

There are two ways of viewing interaction with the economy and its performance:

- **Exploitation** — Short-term improvement thriving on focused attention, precision and discipline. This is the calculating management style fostered by an MBA education. Removed from context, MBAs tend to exploit other people's experience in the absence of their own.
- **Exploration** — Experimentation that thrives on serendipity, free association, and relaxed control. It is risky, and success is neither assured nor often achieved. Exploration focuses on the creativity of the journey, while exploitation focuses on the final goal.

Businesses need both of these types, just as economies do. Without exploration, there is nothing to exploit. But two corresponding types of management have emerged — professional and entrepreneurial — and they do not necessarily mix well. MBAs tend to gravitate toward and do best in industries where they can control and fiddle with old technologies, such as marketing consumer goods. They can apply the same techniques to several products. The problem with MBAs is that they are apt to focus on one aspect — marketing, finance, or development — and throw the whole company off balance.

MBAs and Entrepreneurship

Entrepreneurship is now being taught in business schools, but like all other disciplines, it is taught assuming that the uninvolved CEO is responsible for everything. Entrepreneurs are typically artistic and visionary, and they rarely attend MBA programs.

MBAs are not known for their success as entrepreneurs. They may start their own low-tech businesses in consulting, real estate, or financial services, but they are rarely capable of the dedication and risky behavior inherent in entrepreneurship.

(continued on page 5)

The Soft Underbelly of Hard Data — An MBA's Best Friend

✓ Hard information is often limited in scope, failing to encompass noneconomic and nonquantitative factors.

✓ Much hard information is too aggregated to give insight into what is really going on behind the numbers.

✓ Much hard information arrives too late as trends and performance become facts. Often, managers cannot wait.

✓ A surprising amount of hard information is unreliable. Something is always lost or subject to distortion in the process of quantification.

Wrong Consequences

(continued from page 4)

Often, entrepreneurs are unable to run their successful organizations properly. This is typically the time when a professional manager is brought in and introduces the bureaucracy of formalization and centralization. Though both are necessary, problems arise when managers become distant, disconnected and inflexible. MBA programs promote centralization and so do their graduates. As they spread throughout the economy, they are responsible for the rise of bureaucratic management in a time, especially in high-technology industries, when we need to nurture teamwork, collaboration and networks.

Corruption of Social Institutions

These destructive effects of an MBA degree have their most damaging effects on society at large. The members of the professional or business class are becoming the leaders of our economic entities while those they lead do not respect them or believe they have the right to lead. Society is becoming stratified into a credentialed class and an experienced class, when in fact leaders should be varied and chosen for their qualities beyond credentials and affiliation.

Society is also leaning toward a selfishness that is embodied in the corporations that ignore social responsibility in favor of narrow shareholder value, and that regard CEOs as the sole generators of economic performance. These managers and heads of business are in powerful positions to make decisions to either thwart social needs or consider them. It is unsettling to know that they have learned lessons that include the idea that everything has a price, that everything needs to be black or white, and that companies are not responsible for the quality of life of their employees.

An Insidious Belief

Additionally, there is an insidious belief that a business education, which barely teaches business management, is adequate preparation to manage in the governmental and not-for-profit sectors as well. The hierarchical, money-focused model does not work well in the social sector where people work in teams and volunteer their time. Meanwhile, turning the government into a business turns people into customers instead of citizens. ■

New MBAs?

Given these widely recognized problems with management education, which are many, there have been many modifications and make-overs in recent years to create better MBA programs.

Most MBA programs offer the same program: functional courses in the first year, such as finance, quantitative analysis, and international business, and then electives that are listed under the same headings. Perhaps there is a required strategy course as well. It has been this way for decades, and programs keep developing new variations. **Executive MBAs** take practicing managers who have significant experience, and teach them a curriculum designed for people with no experience. **Modular curricula** integrate functions and intensify learning by teaching shorter, interconnected modules over the course of the semester and only giving one grade. **Internet, CD-ROMs, and video conferencing** do not change the degree so much as they make the process faster. The digitalization of information only leads to more analysis and less management. **Distance learning** mixes residential sessions, downloaded lectures, and bulletin boards. Yet another way to change the MBA is to add the words **international** and **global** to describe the students, faculty or location.

Real Innovation

Imagine someone from Ghana announcing that management practices and controls exercised in Accra would work just as well in New York. That is essentially what the United States does. Americans assume their management systems are the best. But there are innovations in business management occurring around the world. Other economies have designed their own systems of management and are successful without importing the American way.

(continued on page 6)

Masters of British Airways

The author gave a speech at the British Academy of Management at which he suggested that the innovation of MBA programs dedicated to single companies was taking innovation too far. Jonathan Gosling of Lancaster University was involved in such a program with British Airways (BA) and invited the author to visit while the students prepared their "Strategy Projects." One involved BA sourcing in the Far East, another designed a strategy for Gatwick Airport, and the other dealt with a threat from an American airline. The author was impressed with the topics and how they combined the conceptual thinking of the university with the practical problems of the company. These were not students playing consultants in the "real world" or experienced managers discussing other people's cases. They were managers involved in issues they were investigating and so were acutely aware of what they did not know.

New MBAs?

(continued from page 5)

Japan traditionally has theoretical business departments in its universities directed at undergraduates. Japanese businesses have taken on the job of developing practicing managers themselves. MBA programs are rare, and though corporations used to sponsor some of their managers to do MBAs in the United States, they have been cutting back because the graduates had trouble fitting back into the local business culture and had an inclination to quit the company.

Germany has been successful since WWII as well, and many of its companies became famous for quality and logistics. Though MBAs are rare, German business leaders experience discipline-based training in their undergraduate programs, and many get doctorates. As in Japan, the focus of management is in the firm, not the profession itself. Unlike Japan, which moves its best recruits around to get to know different parts of the company, German companies tend to promote in a single function.

France has the equivalent of graduate business schools, but mostly the prestige goes to graduates of *"grandes ecoles"* in business, engineering, etc. that focus on the equivalent of undergraduate education. Graduates are snapped up and move fast, much like American MBAs. Graduates from the Ecole Nationale d'Administration are so influential that they tend to occupy a high proportion of France's leadership positions — both political and business.

The **United Kingdom** ranks second in graduating MBAs after the United States. Big-name schools tend to pick up changes and trends in America and adopt them. Smaller, lesser-known schools have made developments in highly specialized MBA programs that focus on one function or industry so that the "A" in MBA stands for accounting or aerospace. Additionally, a large majority of English MBA students stay on the job, so programs are designed more for practitioners with experience. ■

Developing Managers

Despite management education's attempt to bypass experience, most development does happen during the time a manager is actually working. There are many opportunities for organizations to develop management, and to use education more effectively to do it.

Development in Practice

Management education, management training, and management development exist on a continuum of experience. The first is academic and rooted in general theories and concepts unrelated to the field where they will be practiced. The second involves consultants and trainers who teach a vocational version of the first, using techniques and skills to match general knowledge with practice. Management development approaches the needs rooted in practice in specific organizations. An organization draws on whatever it finds appropriate to further develop its own managers.

There are several options to consider when designing more effective management development strategies, including:

- **Sink or Swim**: This is the most typical way for new managers to arrive on the job and struggle to find some help. Although they have had managers as models, there is little specific preparation for the new role, and sinking is common. Development is seen as a personal responsibility, and it is up to the new manager to read a book, listen to a CD, or take a class.
- **Moving, Mentoring and Monitoring**: Management is a practice like any other, so it needs an apprenticeship. Some companies offer on-the-job (OTJ) training in rotation and mentoring programs. The developing manager then receives feedback.
- **Management Development Buffet Table:** These are off-the-job courses and programs offered by outside providers but available on site, on disk, on the Web, and on screen.
- **Learning in Action:** Traditionally, this is a way to get managers to work together on projects, learn about the world of work, and take time for reflection. The trouble comes if companies use it as a way to get work done, which takes the focus off of development.
- **Corporate Academies:** Organizations are creating in-house corporate universities to focus on the development of their managers and other personnel. They are intended to develop people for a particular organization, not conduct research and grant degrees to the business community at large.

These development methods all focus on different areas — experience and the job, education and the person, and results and the corporations. They should be balanced together judiciously to develop managers in practice.

Development in Management Education

Instead of starting with what untrained youths are taught in management education, we should start with what leaders and managers need to know. Conventional education impedes learning, and something more engaging and less controlling is needed to educate the right people for management in the right ways to achieve the right consequences. Here are eight propositions to fix what's wrong in management education:

(continued on page 7)

Developing Managers

(continued from page 6)

1. Management education should be restricted to practicing managers. Instead of having students self-select into business school and then emerge onto the fast track, have organizations choose their most promising midcareer leaders who are old enough to have experience, but young enough to benefit from education.

2. The classroom should leverage the managers' experience. Managers should remain on the job while they learn in school so that their experience is as major a force in the classroom as the instructor's teaching.

3. Insightful theories help managers make sense of their experience. Education should be hands-off. Managers have to be exposed to theories so they can learn to be thoughtful and express themselves.

4. Thoughtful reflection on experience in the light of conceptual ideas is the key to managerial learning. Learning is not doing. Learning is reflecting on doing. It involves wondering, probing, synthesizing and connecting all in a struggle to do things better the next time.

5. "Sharing" their competencies raises the managers' consciousness about their practice. Competencies such as leadership or negotiating are hard to teach and therefore hard to fit into management education. They are best learned on the job. But if managers in a classroom share how they have practiced different competencies and what worked or failed, they can learn from comparing their experiences.

6. Beyond reflection in the classroom comes learning from impact on the organization. In order for management education to approach leadership, it must encourage managers to get beyond the benefit for themselves. If an organization sends an individual for education, the obligation and commitment go both ways. The learners who go away should return as management teachers.

7. All of the above should be blended into a process of "experienced reflection." The managers bring experience to the classroom, where faculty members introduce concepts, theories and models, and reflection occurs. The resulting learning is carried back to the job, where it impacts behavior, providing further experience for reflection back in the classroom.

8. The curriculum, the architecture and the faculty should be shifted from controlled designing to flexible facilitating. The idea that teaching should be divided into discrete chunks — operations, ethics, etc. — is ridiculous. Programs should weave together values and attitudes, stories and ideas, and use engaging methods of learning to hold participants responsible for reflecting together on their experience. Instead of controlling the process, faculty members should collaborate and learn as well. ■

For Additional Information on managerial competencies, go to: http://my.summary.com

New Ways for Developing Managers

Along with a group of colleagues from Canada, England, France, India and Japan, the author developed a novel plan for management education to showcase the ideas in this summary. Though the attainment of knowledge and the enhancement of competencies are important, they wanted their program to help people become wiser human beings in addition to becoming more effective managers. They developed the International Masters in Practicing Management (IMPM), which is true to the eight propositions for an overhauled management education presented in the previous article. Though parts of the IMPM can be found in other programs, the whole package cannot.

Five Mindsets

The design of the IMPM program focuses on five different mindsets, each taught in a different two-week module. The modules include reflecting back over experiences since the last module, program time to consider the impact of the learning back at work, "white time" when nothing is scheduled so that people can discuss issues they have not had enough time for, and field studies where participants visit local operations of companies represented in class.

Module I: Managing Self — The Reflective Mindset. Participants develop a reflective mind by focusing on themselves, their work, their world, and how to use experience to become more constructive and discerning.

Module II: Managing Organizations — The Analytical Mindset. Instead of traditional analytical teaching, this module offers different perspectives on analysis, studies specific frames commonly applied in business, and integrates a new point of view.

Module III: Managing Context — The Worldly Mindset. This module encourages the participants to understand that the effects of the external environment — government and legal trends, social trends, international developments, etc. — affect the company.

Module IV: Managing Relationships — The Collaborative Mindset. This module focuses on creating meaning with shared space for emerging relationships.

Module V: Managing Change — The Action Mindset. This module focuses on leader-driven macro change, middle management micro change, and personal change.

(continued on page 8)

New Ways for Developing Managers

(continued from page 7)

Though a great deal can be done in the classroom, the essential philosophy of the IMPM requires that much of it happens back on the job. The participants are expected to write **Reflection Papers** to examine how the learning from the modules fits into their work experience. Groups of participants and faculty who are in the same geographical area get together between modules for **Tutoring**, so that they can provide support and links to learning. The participants do **Self-Study** to get themselves up to speed for the Analytical Module.

The Managerial Exchange pairs participants across companies and countries, who spend a week together after the second module. **Ventures** are action learning that the participants undertake to affect change in their organizations. Finally, in order to justify the degree and make participants and others take the program and its learning seriously, the participants must do a **Major Paper**. It is not quite a formal thesis, but it is a substantial assignment including review of serious literature supported by in-depth study.

Impact of the Learning

The IMPM offers a unique opportunity for the development of managers, but is it worth it? With this degree, the employers pay, but some might think they shouldn't because employees are too mobile and busy to merit the investment. However, if companies believe in developing leadership as much as they say they do, they should view the fees as an investment in operations rather than an expense from the management development budget.

The IMPM has the added benefit of developing a better organization at the same time it develops better managers, instead of as a consequence. Change occurs throughout the length of the program and the IMPM participant returns to the organization and shares his or her learning with others.

The IMPM program has been in existence for eight years, and the retention rates have been quite high. Many companies seeking a new kind of managerial development send more people back every year.

Moving Toward Broader Diffusion

Because of the benefits of the program, it is essential to move toward broader diffusion of the Masters of Practicing Management (MPM) instead of the MBA, which focuses on better decision making through training in analysis — in general rather than in a particular context. The MPM focuses on the practice of managing in context. It strives to make better managers, by making craftspeople instead of analysts.

The author and his colleagues are currently planning to expand the concept of the MPM by increasing the number of cycles offered by the partner schools. Similarly, the practices are extended by the people who have the degree and continue teaching back at their organizations. This extension will lead to infiltration, a concerted effort to change existing programs, and then to differentiation and applying the learning of the MPM to other sectors. ■

For Additional Information on how participants reacted to the Mindsets, go to: http://my.summary.com

Developing True Schools Of Management

Management schools need a tuneup. They have been standardized and honed to such a degree that they weaken what they intend to create. Business schools function largely as starting schools when they should be more balanced as starting schools, developing schools, and finishing schools. There can also be specializing schools and enhancing schools. The old models of research, degrees, teaching and tenure should be swept away as new forms of learning develop.

Specialized Masters Programs in Business could be designed for specific functions and industries so students get what they need and learn it in-depth instead of getting what they do not need.

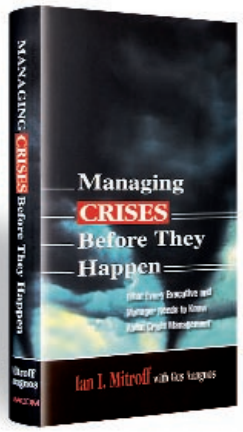
Masters Programs for Practicing Managers could be directed at midcareer managers with significant experience and junior people in their first managerial job.

Development Programs for Practicing Managers should become more innovative — not standardized, pared-down sources of easy money for universities.

Bachelors Programs to Educate should not try to train managers who have never had any experience. They should provide a liberal arts education provoking thoughtfulness.

Doctoral Programs for Adults should encourage candidates to master the research literature and methods, but also to stand on their own two feet, and break away from conventions.

More Research and Scholarship



Despite students' pleas for more practical materials, we should encourage more research and scholarship in business education. Business education should be insightful and accessible to the practicing managers who will need it, not a retread of what is taught to people with no experience. Management is everywhere is society, because so much depends on organizations. It is paramount that our leaders are equipped to helm them. ■

Page 8

THE SUMMARY IN BRIEF

While emergency and risk management deal with natural disasters, crisis management is concerned with human-caused disasters — a permanent and prominent feature of today's societies. A sample includes the random poisonings of Tylenol capsules, the devastating Exxon Valdez oil spill, the Columbine High School shootings and the crash of a ValuJet flight into the Florida swamps.

Unlike natural disasters, however, human-caused disasters are not inevitable. They do not need to happen. As a result, the general public is extremely critical of organizations who are held responsible for the crises.

Of course, it's impossible to eliminate crises completely. But with the right crisis management (CM) tools — and attitudes — in place, a company can ensure that it can either anticipate crises or effectively manage them once they occur. This summary presents the following fundamentals about crisis management:

- ✓ **The Five Components of a Crisis-Management Framework.** Mitroff and Anagnos present a crisis-management framework that includes five components: types or risk categories of crises; mechanisms; systems; stakeholders; and scenarios.
- ✓ **How Telling the Truth Is Vital to Crisis Management.** The question is not whether the truth will be revealed, but rather when that truth will become public and under what circumstances. Crises only become worse when a cover-up is attempted.
- ✓ **Assume Responsibility or Pay the Price.** If you don't assume responsibility immediately, a chain reaction of crises is guaranteed.
- ✓ **Crisis Management Is an Exercise in Creative Thinking.** Don't go for the obvious response.

Your how-to manual on crisis management begins on the next page.

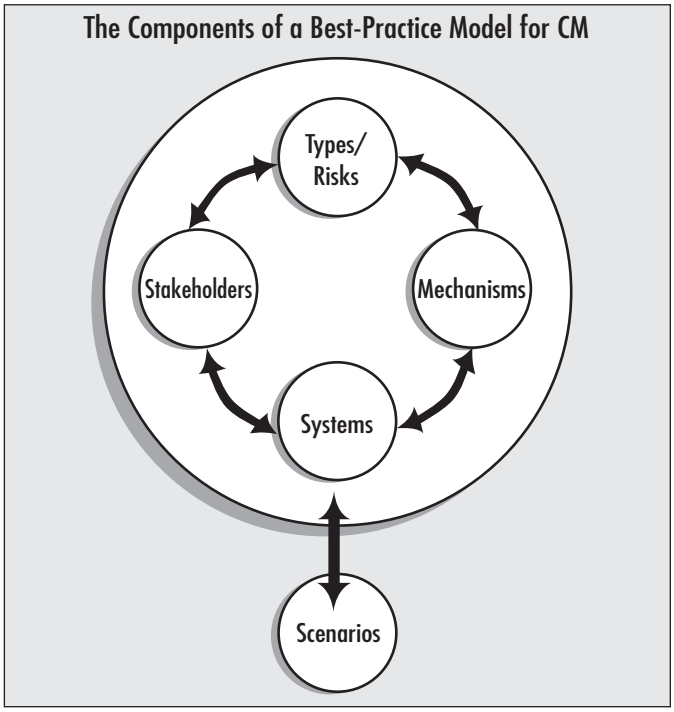
MANAGING CRISES BEFORE THEY HAPPEN

by Ian I. Mitroff with Gus Anagnos

— THE *COMPLETE* SUMMARY

The Five Components of a Crisis Management Framework



Completely preventing human-caused crises is impossible. However, with the appropriate planning and preparation, any company can limit both the duration and the damage caused by major crises. Effective crisis management also ensures that a crisis or a series of crises does not derail your major business objectives.

Authors Ian Mitroff and Gus Anagnos have developed a best-practice model that identifies the five factors companies must manage before, during and after a major crisis. These five factors are: 1) the types and risk categories of crises, 2) mechanisms, 3) systems, 4) stakeholders and 5) scenarios.

In the first section of this summary, we will look at each of these components in depth.

Types and Risk Categories of Crises

Major crises can be divided into a number of general categories. These categories include:

- **Economic crises**, such as labor strikes, labor shortage, market crash, a major decline in stock price and fluctuations or a decline in major earnings.
- **Informational crises**, such as a loss of proprietary and confidential information, tampering with computer records or a loss of key computer information with regard to customers and suppliers.
- **Physical crises**, such as a loss of key equipment,

(continued on page 3)

What Is a Major Crisis?

It's not possible to give a precise and general definition of a crisis, just as it's not possible to predict with exact certainty when a crisis will occur, how it will occur and why.

We can, however, propose a guiding definition of a major crisis. First, a major crisis affects, or has the potential to affect the whole of an organization. If it is an event that will affect only a small, isolated part of the organization, it may not be a major crisis.

A major crisis will also exact a major toll on human lives, property, financial earnings and the reputation and/or general health and well-being of the organization. Often these effects occur simultaneously. As a result, a major crisis cannot be completely contained within the organization's boundaries.

And some major crises, such as the one suffered by Barron's Bank several years ago, will actually destroy the organization.

The authors: Ian I. Mitroff is Harold Quinton Distinguished Professor of Business Policy at the Marshall School of Business, University of Southern California. He is also president of the consulting firm Comprehensive Crisis Management and was founder and director of the USC Center for Crisis Management. Gus Anagnos is Vice President of Comprehensive Crisis Management.

Types and Risk Categories of Crises

(continued from page 2)

plants and material suppliers, breakdowns of key equipment and plants, loss of key facilities and major plant disruptions.

- **Human resource crises**, such as a loss of key executives, loss of key personnel, rise in absenteeism, a rise in vandalism and accidents and workplace violence.
- **Reputation crises**, such as slander, gossip, rumors, damage to corporate reputation and tampering with corporate logos.
- **Crises resulting from psychopathic acts**, such as product tampering, kidnapping, hostage taking, terrorism and workplace violence.
- **Natural disasters**, such as earthquakes, fires, floods, explosions, typhoons and hurricanes.

As we've already noted, natural disasters do not necessarily have the same effect on an organization, since the general public will rarely see a company struck by a natural disaster as a villain. Of course, if clear mistakes were made — for example, building flimsy factories in earthquake-prone regions — the company's reputation will suffer.

Prepare for One Crisis in Each Category

Within the general categories or types of major crises, the crises share many similarities. Between the categories, there are sharp differences. The best crisis management approach is to try to prepare for at least one crisis in each of the categories.

Most companies, however, do much less. They will consider, at most, one or two categories.

For example, most companies prepare for natural disasters. Organizations that do broaden their preparations for crises other than natural disasters often do it only for "core or normal" disasters that are specific to their particular industry. The chemical industry, for example, prepares for explosions and fires, since these crises are part of the industry's day-to-day operating experience. The same holds true for fast-food companies that prepare for food contamination and poisoning.

While companies have a legitimate reason to be concerned about crises that they know will occur in their particular industry, they must not assume that the crisis they anticipate will be the crisis they will face. The fast-food industry can be hit with a crisis that has nothing to do with food contamination.

In other words, every organization can be hit with a crisis of any of the types listed above. Take product tampering, which was listed under the "psychopathic acts" category. One naturally thinks of the food or the pharmaceutical industries as being particularly vulnerable. But what about publishing?

The Systemic Nature of Crisis Management

A complex system involves a number of intertwined parts working together. The separate parts of the system cannot exist nor function in isolation from one another. For instance, you can't remove the heart or lungs from a human body and have the human body survive. Also, because systems are so tightly interconnected, one event in one part of the system can have system-wide effects.

These characteristics of complex systems are reflected in modern society. We are much more interconnected than before. The impact of one event in our society will have much wider implications than in the past.

For example, 60 years ago, the impact of human-caused crises, such as a mine disaster or an explosion, would have been limited to one particular community or region. Today, crises can impact vast areas of the globe in little time. A rogue trader in the Far East, as was recently shown, can bring down one of the oldest blue-chip banks in the world. Or a nuclear disaster such as Chernobyl can threaten the health of people on two continents.

As a result, crisis management must always include the big picture. For example, ask yourself: "How can I temper how a crisis in one area of the company will impact the entire company?" "How can I prevent one crisis from causing another crisis or a chain of crises?"

The systemic nature of crisis management also means that it must be integrated with other important organizational programs in your company, such as quality assurance, strategic planning, environmentalism or issues management. Crisis management should never be viewed as another separate, stand-alone program.

This is exactly what happened in France to the publishers of the Larousse encyclopedias. The French being avid collectors and eaters of wild mushrooms, Larousse has a page filled with illustrations of mushrooms that are edible and, on the facing page, illustrations of unsafe mushrooms. One year, the labels on the two pages were reversed, causing the unsafe mushrooms to be labeled safe, and vice-versa. This was a case of a product-tampering crisis in an industry probably unprepared for such a crisis.

In sum, as we said earlier, every organization must prepare for at least one crisis in each of the various categories or types.

(continued on page 4)

Types and Risk Categories of Crises

(continued from page 3)

Prepare for Simultaneous Crises

Fortunately, you don't have to prepare for every specific type of crisis within each of the categories. As we noted earlier, each of the specific types within a particular category or type share strong similarities. Of course, the broader range of crises for which you are prepared, the stronger your crisis management capabilities. But in the beginning, it is sufficient to prepare for one particular crisis in each category.

One final and important note: In today's world, any crisis is capable of setting off any other crisis. As a result, companies should prepare not only for each individual crisis they've selected as part of the crisis portfolio, but also for the simultaneous occurrence of multiple crises. In other words, crisis management is strongly systemic. Like total quality management or environmentalism, if it is not done systemically, then it is not being done well. ■

Risk Analysis vs. Crisis Management

Author Ian Mitroff strongly counsels against traditional risk analysis for companies. The reason: Risk analysis mainly selects crises with which the company or the company's industry is familiar. One of the fundamental steps for traditional risk analysis is to construct models of the probability of occurrence of past crises. These models will give a higher ranking to certain types of crises based on how likely they are to occur. Conversely, the models give low rankings to crises that are least likely to occur.

However, it is precisely those crises that have never occurred before that must be anticipated. Yet, using traditional risk analyses, companies will not prepare for a crisis until it happens — at which point, of course, the unprepared company can be significantly damaged.

Mechanisms to Prepare for and Respond to Crises

We now move onto the second of the five elements of our crisis management model: mechanisms.

The best form of crisis management is preparation before the crisis occurs. For this, the company must put in place a small number of mechanisms that will help your company anticipate, sense, react to, contain, learn from and redesign effective organizational procedures for handling major crises.

The first of the mechanisms concerns signal detection.

Signal Detection Mechanisms

All crises send out early warning signals. In many cases, of course, these signals may be weak and camouflaged by noise. But if your company has the mechanisms in place to enable signals to be picked up, amplified and acted upon, then it stands a greater chance of preventing crises before they happen.

For example, make sure that a process exists for front-line employees to be able to communicate with management about their concerns. After the tragic explosion of the space shuttle Challenger cost seven lives, it was discovered that a string of memos expressing concern about the design of the shuttle were ignored by management.

The Signal Detection Chain

Dr. Judy Clair of Boston College did extensive research on signal detection in a large insurance company. This company handled billions of dollars in government Medicaid payments. The threat of fraud was extremely high.

Based on her research, Dr. Clair developed the important links in the "signal detection chain."

The first link: the signal detector.

Hearing the Signal

If a company wants to detect signals, it must have signal detectors. Although this may sound obvious, most companies do not have signal detectors in place. In other words, signals of an impending crisis may be clearly visible, but no one is paying attention.

The intensity threshold must also play a role. A signal detector must be able to read a signal and determine whether it has reached a level of intensity that indicates danger or potential danger for the company.

Because different types of crises send out very different types of signals, each company must ask itself: "What would count as a signal of the impending or near occurrence of a particular type of crisis?"

One example might be a pattern of slow, but noticeable increases in the accident rate at a particular oil refinery; this pattern may signal an impending serious accident, such as an oil spill, fire or explosion.

Of course, if there is no one or no mechanism recording the accidents, then the pattern remains invisible. The signal goes undetected.

There must also be someone at the refinery or at headquarters to read the accident reports and note the pattern. If signals go off but there is no one to recognize, record and attend to them, the signals are not heard.

(continued on page 5)

Mechanisms to Prepare for and Respond to Crises

(continued from page 4)

Signal Transmission

Once the signal is heard, the next step is to transmit the signal to the right people (and in the right form). If someone picks up a signal in your company but doesn't know to whom to send it, or sends it to people who don't know what to do with it, then, once again, the signal will fail.

In sum, it is important, when putting in place signal mechanisms, to:

- **have signal detectors in place that can pick up the signals;**
- **have intensity thresholds established so that people know when a signal indicates a dangerous situation for the company;**
- **clearly communicate what people should do with a signal when it is detected.**

One final note on signal mechanisms: It is not enough to pick up individual signals from different locations. It is possible that only when two signals are combined does the danger to the company become evident. Companies must be prepared to have a gathering point for signals, in other words, a central location where the signals can be pieced together into a larger whole.

Other Mechanisms

Without proper signal detection mechanisms in place, an organization not only makes a major crisis more likely, but also reduces its chances of bringing it under control when it does occur.

Even with the best signal mechanisms in place, however, crises will occur. Thus, your company will also need damage containment mechanisms to keep the unwanted effects of the crisis from spreading. Of course, a damage containment mechanism that is appropriate for one type of crisis will not necessarily be appropriate in containing others. A systemic and systematic CM program will feature a number of damage containment mechanisms.

Finally, your company must also have postmortem mechanisms in place that will allow it to learn from the crisis and redesign the systems and mechanism to improve crisis management in the future. Few organizations conduct postmortems of crises and near-misses — and those that do either do not perform them correctly or don't implement their findings.

When doing a postmortem, the goal is not to assign blame. It is to examine the key lessons that need to be learned. The exception, of course, is in crises that involve criminal malfeasance or negligence. ■

Four Types of Signals

Signals can be differentiated along two dimensions. The first dimension relates to the source of the signal. In this dimension, signals can either originate from inside or outside the organization.

The second relates to the kind of signal. Signals can be either technical (recorded by remote sensing devices), or noticed by people.

If you put these two dimensions together, you have four types of signals that apply to every company:

1. Internal technical signals, such as monitoring devices for hazardous operations.

2. Internal people signals, for example, people working in a plant.

3. External technical signals, such as monitoring of plant emissions carried out by environmental activist groups.

4. External people signals, including members of surrounding communities who may literally "smell" that something is wrong.

Organizational Systems

The third component of the crisis management framework involves organizational systems.

A company and its various systems can be illustrated as the layers of an onion (see box next page). The outermost layer is technology. Then come organizational structure, human factors, organizational culture and finally, at the core of the organization, top management psychology. These are the systems that govern most complex organizations.

A company's systems are intertwined, interacting with one another in many ways. Complex technologies, for example, are run by humans and thus are susceptible to human errors. Technologies are also embedded in complex organizational structures. These complex structures can also lead to errors as messages and communications must travel across different and multiple layers.

Organizational Culture

Organizational culture is a critical component of the systems involved in crisis management. For example, an organizational culture that establishes reward systems that reward certain kinds of behavior can hinder communication to the right people — and, thus, lead to wrong decisions.

One example of the impact of organizational culture on crisis management involves a power utility that

(continued on page 6)

Organizational Systems

(continued from page 5)

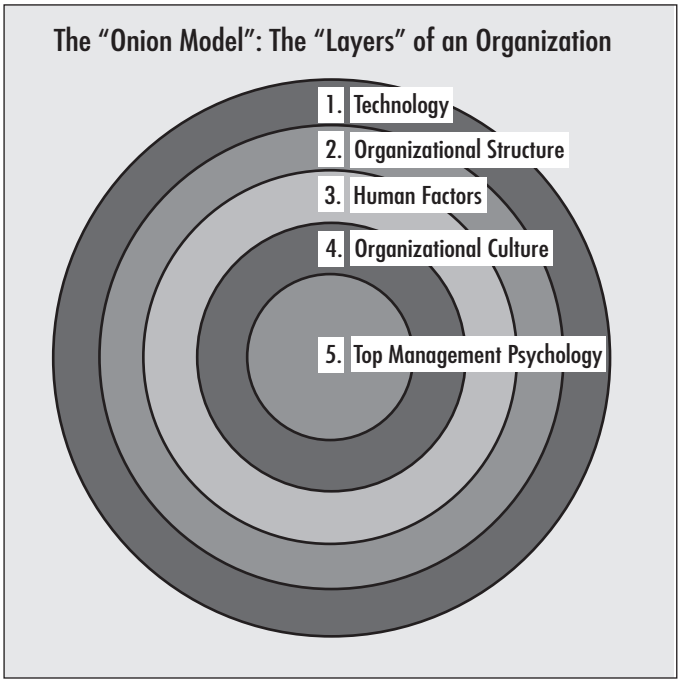
served extreme northern settlements. If the power failed, the inhabitants of these communities would literally freeze to death within 36 hours.

The most likely employees of this power utility to find flaws in the electrical generators that served these communities were maintenance workers. Maintenance workers were the signal detectors; they filled out logs at the end of each shift on the state of the generators. However, the culture of this power utility placed maintenance workers at the lowest rung of the company. Therefore, their logs were ignored and their warnings were not taking seriously.

The most prestigious jobs in the company belonged to the linemen, those who climbed the poles to repair the lines. The linemen were macho risk-takers — in fact, they made a point never to wear safety equipment.

Obviously, the macho culture of this organization made it susceptible to a variety of crises.

A Defensive Corporate Culture



The impact of a company's organizational culture on crisis management is also apparent when we look at one of the key components of a culture: defense mechanisms. As with humans, organizations have defense mechanisms that rear up to deny vulnerabilities to major crises. These defense mechanisms can take many forms, including denial ("Crises only happen to others,") disavowal ("Crises happen, but their impact on our organization is small,") grandiosity ("We are so big and powerful that we will be protected from crises") or compartmentalization ("Crises cannot affect the whole of our organization since the parts are independent of one another.") ■

Don't Forget Your Stakeholders

The fourth element of your organization that must be involved in crisis management is the company's stakeholders.

Stakeholders include all of the internal and external parties who cooperate, share crisis plans and participate in the training and development of your company's crisis management capabilities. Stakeholders can range from your employees to such external agencies as police departments, fire departments and even the Red Cross. Another important external stakeholder is the media, which will not hesitate to judge harshly an inadequate response to a crisis.

Crisis management must include developing the right relationships with stakeholders in advance to ensure the smooth functioning of the organization in the heat of a major crisis.

Make-a-Wish Foundation and its Stakeholders

The importance of understanding stakeholders in crisis management is illustrated by a story involving the Make-a-Wish Foundation. This well-respected organization grants wishes to terminally ill children. One child, a teenager suffering from a brain tumor, wished to hunt a Zodiac bear in Alaska. When the foundation enabled the teenager to achieve his wish, it suddenly found itself under fire from numerous animal-rights organizations and portions of the general public. The foundation's mistake involved several assumptions about the organization's stakeholders. The first assumption was that the primary stakeholder was the teenager, and that other stakeholders (including the general public which supports the group through donations) would not object to the wishes of the teenager, despite any ethical or moral qualms they might have. The Foundation believed those stakeholders would share the foundation's view of the situation: Make-A-Wish had to find a way to grant the wish of a dying child as effectively as possible no matter how offensive it may be to others.

Several crisis management lessons can be drawn from this example. First, never assume the outside world sees a situation exactly as you do. Second, it's a good idea to list as many assumptions as possible about as many stakeholders as you can think of. Be careful not to overlook any stakeholders, or to accept any unwarranted assumptions about stakeholders.

This story also highlights another important point about crisis management situations: Don't solve the wrong problem precisely. The foundation focused on finding a way to fulfill the teenager's wish. Solving that problem led to the crisis. ■

You Are Now Ready to Develop Crisis Management Scenarios

Taking into account all of the four elements of the crisis management framework we've discussed above — types of crises, mechanisms, systems and stakeholders — your company can develop the fifth and final component of the framework: scenarios.

What will happen if a certain crisis occurs? How will your organization and its employees and customers react? What steps will have to be taken? These are the kinds of questions that must be answered in a scenario.

The best approach is to create a "best-case, worst-case" scenario. In the best-case scenario, of course, everything goes as planned in response to the crisis — a crisis that was anticipated. A worst-case crisis scenario, on the other hand, involves a type of crisis that the organization has neither considered — and for which it is not prepared. Also, the crisis occurs at the worst possible time — over a holiday weekend, for example. And the most taken-for-granted, well-designed and well-performing systems break down.

To summarize the framework presented by Ian Mitroff and Gus Anagnos, effective crisis management means:

- understanding and preparing for the different types of crises;
- implementing the important mechanisms that will help you prepare for those crises;
- understanding the impact of your company's systems — from organizational structure and culture to human factors and the psychology of your top management — on crisis management;
- developing the right relationships with stakeholders in advance of a crisis;
- establishing best-case, worst-case scenarios.

These five components should be used as a framework for an audit of your company's crisis management program. A crisis audit will reveal any weaknesses in one or more of these areas that might hinder your crisis management capabilities. ■

How Telling the Truth Is Vital to Crisis Management

The general framework presented here is a key tool in crisis management. But by itself, no framework, while necessary, is sufficient. In addition, crisis management must confront the question of both individual and organizational character. Specifically, crisis management must address two questions:

1. Do we (the individual, the organization) always tell the truth?

2. Do we (the individual, the organization) always assume responsibility?

This article deals with the first issue: telling the truth.

Should the Public Know?

The question is not whether you or your company should lie or tell the truth. The question is: When a crisis occurs, how much of the truth must be made public? Should a company try to fix the crisis in-house, sheltered from prying eyes? For example, if a CEO is caught in a compromising position, should that CEO be fired without any explanation? Or should every detail be made public?

There are no easy answers. But here's an important consideration: In today's society, there are no secrets anymore. None. Technology in general, and television in particular, has invaded every "back-stage" that might have once existed in the lives of people and institutions. For example, overzealous police officers might have once been able to step over the limit in their behavior without being caught. Today, police brutality is likely to be captured on videotape by passersby or hovering television cameras. Human rights organizations are even distributing free video cameras to citizens in countries with poor human rights reputations so that they can film incriminating acts by their governments.

By taking the initiative, you (or your organization) controls who reveals the truth, in what circumstances and when.

The question, therefore, is not whether the truth about an organization or individual will be revealed, but rather when that truth will become public and under what circumstances.

In light of this situation, the best approach is to take the initiative to tell the truth about a crisis. By taking the initiative, you (or your organization) controls who reveals the truth, in what circumstances and when. Ian Mitroff describes the advice he offers his clients on telling the truth:

"No matter what the crisis situation, I always advise my clients to tell as much of the truth about themselves as they are able and willing to tell. I next ask them to take the additional step and tell a bit more, and a bit more, etc. Only after both of us are satisfied that they have indeed told 'enough' of the truth to ensure that the crisis will not be perpetuated any further can they finally stop. In short, how much 'truth' do I tell my clients to reveal about themselves? More than they can stand to bear, but, unfortunately, not what the world wants to hear and to gloat over!" ■

Assume Responsibility Or Pay the Price

The next issue concerning character and crisis management is whether or not to assume responsibility. In this case, the answer is clear and unequivocable: Yes. You or your organization should always assume full responsibility.

In a crisis situation, a company will fall into the role of villain — someone who knowingly causes harm or allows harm to happen.

Villains, however, fall into different categories. "Repentant" villains accept full responsibility for the crisis, promise to correct the situation and to prevent the situation from ever reoccurring, then take action to back up their promises. One example is Lee Iacocca's response to the substantiated charges that Chrysler was falsely resetting odometers on its cars: "It happened; it shouldn't have happened; it won't happen again."

Unlike repentant villains, "damn" villains are those who knowingly cause harm and then deny that they did it. In other words, they refuse to assume responsibility for their actions. Those who continually engage in stonewalling and denial are what Mitroff calls "damningly, damnable villains." They not only created a crisis in the first place, but their stonewalling sets off a chain reaction that causes additional crises. Or to put it more bluntly, if you don't assume responsibility from the very beginning, a chain reaction is virtually guaranteed. The classic case, of course, is Watergate, in which one isolated incident snowballed until it brought down a sitting U.S. president. ■

Crisis Management: An Exercise in Creative Thinking

Crisis management requires individuals and companies to think about the unthinkable. It is, in other words, an exercise in creative thinking. Creative thinking is especially important in preventing a crisis from escalating into a worse situation.

In this article, we present two case studies showing the power of creative thinking in responding to crises.

Why Benetton Erased Its Colors

In 1999, an international incident arose between the Turkish and Italian governments over the fate of Kurdish rebel Abdullah Ocalan, who had fled to Italy. When the Italian government refused to extradite Ocalan to Turkey, Italian businesses and products in Turkey, including Benetton, Ferrari and Perelli, were the targets of widespread and violent protests. Many Italian businesses took out newspaper ads pointing to the difference between an Italian parent company and the Turks who operated them. Benetton-Turkey took a different tack. To show its solidarity with the Turkish people, Benetton-Turkey's "corporate response team" — consisting of the president, head of public affairs and head of corporate finance — developed a crisis plan that was as creative as it was effective. The plan involved going to the heart of Benetton's corporate identity — the logo, "The United Colors of Benetton" — and making a statement by removing those famous colors. In addition to removing the colors from its logo, black wreaths were place on the storefronts of all Benetton stores throughout Turkey until the situation was resolved. Also, all of the mannequins in the store windows were dressed in black indicating that the company was in a state of mourning.

Benetton-Turkey's response was exemplary in many ways. Not only was it swift and dramatic, but it recognized than an emotional response, not the logical and rational response of the other businesses, was key in diffusing the crisis. Responding emotionally, and doing the unthinkable, allowed Benetton-Turkey from becoming a hated villain.

Talking Down the Greens

Another example of thinking creatively involves the Swiss chemical conglomerate CIBA. Two German Green Party activists climbed a 600-foot smokestack and unfurled a huge banner declaring that CIBA was harmful to the environment. Rather than following the typical heavy-handed response of having the protesters forceably removed (which would only bring more publicity to their cause and create more enemies), Walter von Wartburg, head of Issues Management for CIBA, sent an emissary up the smokestack to ask them to come down and talk about their issues with him. They were told they could leave their banner up. The two Greens eventually came to talk with von Wartburg over tea.

The lesson of the story: Before adopting any solution to a problem, always ask, "Is the proposed solution likely to create even worse problems?" ■

Needed: One Champion

For an organization to successfully instill a crisis management program, it must find an organizational champion to lead the way. This champion should be a leader who has championed other system-wide programs. He or she must be able to see the big picture and make the connections between the various parts of the organization. The champion also needs to understand and be able to explain to top executives how a major crisis will derail the major business objectives of the company.

Are You Spending More on Your Customers Than They Are Worth?

MANAGING CUSTOMERS AS INVESTMENTS

THE SUMMARY IN BRIEF

Customers are important assets of any company. What does your company do to make the most out of your relationships with your customers? Do you know, in explicit, dollars-and-cents terms, what value your customers bring to your business? The authors of Managing Customers as Investments *recognize the difficulties in finding and explaining the tangible impact of your efforts to attract and retain customers.*

In this summary, they offer a set of tools that shows you the correlation between your customer assets and the value of your firm. They explain the triggers that drive this value, and how to better manage your customers and, as a result, your shareholders' wealth, as well. They unlock the metrics, show you where you are and where you're going, and provide you with the tools and tips to make your customer-related efforts more efficient.

What You'll Learn In This Summary

✓ **How customers are assets.** Customers are typically the primary source of earnings for a company. If you can estimate the value of current and future customers, then you can determine the true value of your firm.

✓ **How to calculate the value of your customers simply.** If you know the profit generated from a customer, as well as your average retention/defection rate, you can use a very simple equation to estimate the lifetime value of that customer.

✓ **How customer value can drive your marketing strategies.** Effective customer-based marketing strategies take into consideration the value that a firm provides to a customer, and the value of a customer to the firm.

✓ **How your organization must change.** Shifting to a customer-based mind-set in your business means that old product-based practices and processes must be jettisoned.

MANAGING CUSTOMERS AS INVESTMENTS

by Sunil Gupta and Donald R. Lehmann

— THE *COMPLETE* SUMMARY

Customers Are Assets

Customers are the lifeblood of any organization. Without customers, a firm has no revenues, no profits, and therefore, no market value. Contrary to the commonly held view, creating shareholder wealth in the short run is not the main purpose of an organization. Long-run shareholder wealth is the reward for creating customer value.

The approach to linking customer and firm value discussed in this summary is based on a simple premise — that customers are typically the primary source of earnings for a company. If we can estimate the value of current and future customers, then we have a proxy for a large part of the value of a firm. If, for example, the average value of a customer to a firm is $100, and the firm has 30 million customers, then the value of its current customer base is $3 billion. If we factor in the firm's future customer acquisition rate and estimate the present value of future customers at $1 billion, then the value of its current and future customers is $4 billion. This estimate provides a good proxy for the value of the firm.

This approach differs from the traditional finance approach in two key aspects. First, unlike traditional finance, this approach builds from the bottom up by assessing the value of a customer. Secondly, it treats marketing expenditures differently than traditional approaches. If you believe that customers are indeed assets that generate profits over the long run, then marketing expenditures to acquire and retain these customers should be treated as investments, not expenses. ■

The Value of a Customer

The fundamental building block of the approach in this summary is the customer lifetime value (CLV), which is the present value of all current and future profits generated from a customer over the life of his or her business with a firm. This concept incorporates several aspects — the importance of not only current but also future profits, the time value of money such that $100 of profits today are worth more than $100 of profits tomorrow, and the possibility that customers may not do business with a firm forever.

To estimate CLV, two pieces of information are required: customers' profit patterns and their defection rate. The profit pattern is the profits (margin) generated from a customer over his or her tenure with the firm. The defection rate plots the pattern of the number of customers who stop doing business with a firm over a period of time.

Creating Metrics That Matter

Firms have historically faced enormous challenges in implementing the concept of customer lifetime value as a core business metric. This gap between theory and practice is a result of three major factors:

- **Data requirements.** Consider what data are needed to estimate the lifetime value of a customer. First, in order to know a customer's tenure with a company, one needs to track each customer or customer *cohort* (a group of customers acquired simultaneously). Second, for each customer or cohort, one needs to know its profit pattern over time, which requires projections of future profits. Third, one needs to know customer retention and defection rates over time.

The need for detailed customer data such as these has encouraged many companies to invest millions of dollars in creating customer relationship management (CRM) systems. While some companies have used these databases with spectacular results, most have failed.

- **Complexity.** In the zeal to create enormous databases, companies have lost sight of the big picture. Metrics

The Value of a Customer

(continued from page 2)

that matter to top management must be clear, simple, forward-looking, and they must capture the big picture. CRM systems, in contrast, have become very complex and largely the domain of a firm's information technology arm, yet they have difficulty answering the simple question of what a typical customer is worth to the firm.

What is needed is a simple, easily understood metric that captures the spirit of customer lifetime value. Simplicity is key — simple methods are more likely to be used than their complex counterparts. For most decision-making purposes, it is enough to know the approximate value of the customer. Plus, when venturing into using new metrics, it is best to start with simple methods and see how they affect decisions. Additional precision and sophistication can and will follow, if necessary.

- **Illusion of precision.** Even with the most detailed and sophisticated data and modeling, estimating CLV requires a host of assumptions and subjective decisions that make it far less precise than many would like to believe.

A Simple Approach

For typical situations, the lifetime value of a customer is simply 1 to 4.5 times the annual dollar margin (profit) that is generated from the customer. To arrive at this simplification, one must make three assumptions:

1. Profit margins remain constant over the life of a customer.
2. Retention rate for customers stays constant over time.
3. Customer lifetime value is estimated over an infinite horizon.

The customer lifetime value (CLV) simplifies to the following equation:

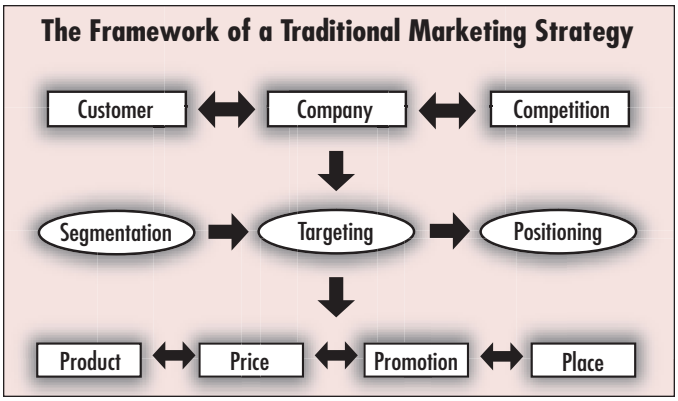
$$CLV = m\left(\frac{r}{1+i-r}\right)$$

where the following is true:

- m = margin or profit from a customer per period
- r = retention rate (expressed as a decimal or percentage, e.g., 0.8 or 80 percent)
- i = discount rate (expressed as a decimal or percentage, e.g., 0.12 or 12 percent).

The factor to which the margin (m) is multiplied is the *margin multiple*. This multiple depends on the customer retention rate (r) and the company's discount rate (i). The retention rate depends on product quality, price, customer service, and a host of related marketing activities. For most companies, retention rates are in the range of 60 percent to 90 percent.

If the assumptions inherent to the equation do not hold, the margin multiple changes, but not much. If margins grow over time, the multiple ranges from 1 to 6, instead of 1 to 4.5. A gradually increasing retention rate has only limited impact on the margin multiple. Finally, limiting the length of projection to five to seven years (a common practice) has essentially no impact on the multiple for low retention cases, but biases the multiple downward when retention rates are high. ■



Customer-Based Strategy

For years, managers have reiterated the need to focus on customers, provide them good value, and improve customer satisfaction. In fact, metrics such as customer satisfaction and market share have become so predominant that many companies not only track them but also structure employee rewards based on these measures.

This kind of customer focus misses one important component — the value of a customer to a company. Effective customer-based strategies take into consideration the two sides of customer value: the value that a firm provides ***to*** a customer, *and* the value ***of*** a customer to the firm. This approach recognizes that providing value to a customer requires marketing investment and that the firm must recover this investment. It combines the traditional marketing view, where the customer is king, with the finance view, where cash is king.

Traditional Marketing Strategy

A long-standing approach to marketing strategy discussed in most marketing and educational forums is depicted in the following figure:

The first component of this framework is the analysis of customers, company and competition (the three Cs) to understand customer needs, company capabilities, and competitive strengths and weaknesses. If a company can fulfill customer needs better than its competitors, it has a market opportunity.

The second component is to formulate the strategy for segmentation, targeting and positioning (STP). Customers are different in terms of their needs for products and ser-

(continued on page 4)

Customer-Based Strategy

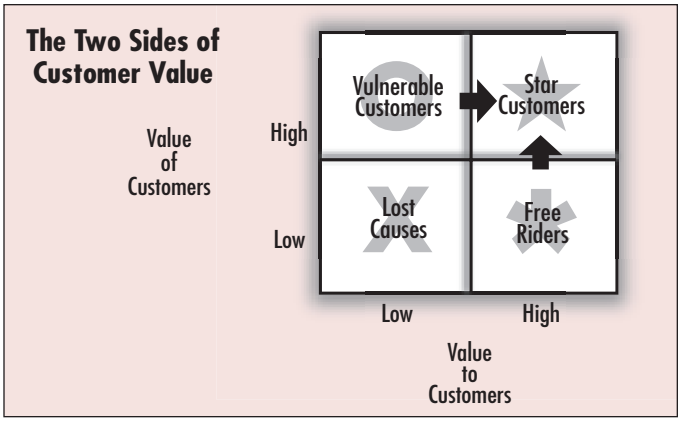
(continued from page 3)

vices, so a firm has to decide which of these customer segments it should target. After selecting a target segment, the firm must decide on the value proposition or positioning of its products with respect to competitive offerings.

The final component of this framework is to design the four Ps — product, price, place, and promotion or communication programs.

Implicit in this structure is an emphasis on providing value to customers by satisfying their needs with little focus on cost. Metrics used to measure success in this framework, such as sales or customer satisfaction, drive decisions. Missing from the framework is the explicit recognition or measurement of return on marketing investment.

Value to the Firm Vs. Value to the Customer



Customer-based strategy recognizes that marketing investment in customers must be recovered over the long run. Specifically, this approach highlights the two sides of customer value — the value a firm provides *to* a customer (the investment), and the value *of* a customer to a firm (the return on this investment).

A firm provides value to a customer in terms of products and services, and a customer provides value to a firm in terms of a stream of profits over time. Investment in a customer today may provide benefits to the firm in the future. The firm must assess that potential return. Since not all customers are equally profitable, investment in customers should vary by their profit potential. (See figure on right.)

The Two Sides of Customer Value

With this in mind, the following are the four key scenarios and their different values to and of customers:

- *Star Customers* get high value from the products and services of the firm, but they also provide high value in return, in the form of high margins, strong loyalty, and longer retention time. The relationship is balanced, equitable and mutually beneficial — a true "win-win."
- *Lost Cause* customers do not get much value from the products and services of the firm. Absent economies of scale — when many Lost Causes engage the firm — if the company cannot migrate these customers to higher levels of profitability, it should consider either reducing its investment in them, or even dropping them.
- *Vulnerable Customers* provide high value to the firm but do not get much value out of the company's services. These may be long-standing customers who, largely through inertia, remain loyal.
- *Free Riders* are the mirror image of the Vulnerable Customers. These customers get a superior value from using the company's products and services but are not very valuable to the firm. For whatever reason, these customers "exploit" the relationship with the company, appropriating the lion's share of the value.

Successful customer-based strategies require a company to consider both its investment in customer relationships, as well as the return on that investment.

Drivers of Customer Profitability

Customer profitability is influenced by three factors:

1. Customer Acquisition. In recent years, many companies, particularly the dot-coms, went on a binge to acquire customers in the belief that customer acquisition and rapid growth are critical to success. This belief was so strong, several companies had a mandate to acquire customers *regardless of the acquisition cost*. These costs can be substantial, and a surprising number of companies spent too much on customers who gave them too little in return. (See sidebar on next page.)

2. Customer Margin. While customer acquisition focuses on growing the number of customers, increasing customer margin focuses on growing the profit from each existing customer. In the context of retailing, this means increasing same-store sales rather than opening new stores. Growth can be achieved through a variety of methods, such as up-selling and cross-selling related products.

3. Customer Retention. In their zeal to grow, many companies focus almost exclusively on entering new markets, introducing new products, and acquiring new customers. However, these companies often have a "leaky bucket" — as they add new customers, old ones defect from the firm. On average, 20 percent of a company's customers defect every year. This means that, roughly speaking, the average company loses the equivalent of its entire customer base in about five years.

Studies show that the cost of acquisition is generally much higher than the cost of retaining existing customers. Therefore, it seems obvious then, that a firm should focus on retaining its existing customers. Unfortunately, many companies don't even know their customer retention or defection rates. ■

For additional information on how one flower company acquired customers, go to: http://my.summary.com

Expensive Customer Acquisition

Like most Web-based startup companies, compact disc retailer CDNow focused heavily on acquiring new customers in its early days. Its customer acquisition strategy used traditional methods such as TV, radio and print advertising, as well as some innovative programs. To many, including Wall Street, this made sense — a startup has to acquire new customers to become a viable business. During 1998–1999, financial markets started rewarding companies with strong nonfinancial measures, such as number of customers.

But the numbers simply did not add up. Based on company reports, the average customer acquisition cost for CDNow ranged from $30 to $55 in 1998–1999. During the same time, annual gross margin per customer was consistently in the range of $10 to $20. CDNow reported an average customer retention rate of 51 percent to 68 percent, a number that became increasingly difficult to maintain with increased competition on the Web and the ease with which customers could click over to a competitor.

Even assuming a favorable discount rate of 12 percent (for a risky young firm, the rate is likely to be higher) and a higher-than-reported retention rate of 70 percent, the lifetime value of a CDNow customer is 1.67 times its annual margin, or $16.70 to $33.40. Unless some unknown growth strategy was involved, the business model of CDNow was fatally flawed. Partly due to this expensive customer acquisition strategy, CDNow reported a loss of over $100 million at the end of 1999. In July 2000, CDNow was bought by Bertelsmann.

Customer-Based Valuation

Traditional approaches to determining a firm's valuation haven't always been helpful. The difficulty of valuing high-growth companies, such as dot-coms, by traditional methods led to a series of new metrics and methods. One of these was the number of customers, or "eyeballs." This metric was based on the assumption that growth companies need to acquire customers rapidly in order to gain advantage and build a strong network. Things changed after the dot-com bubble burst. These days, financial analysts are skeptical of such nonfinancial metrics, *particularly* eyeballs.

The value of a customer provides a critical link between marketing decisions and firm value. All the profits and cash flows (forming the basis of firm valuation) come from customers buying a firm's products and services. If one can assess the lifetime value of one customer, then one can also estimate the value of the entire current customer base. Knowledge of customer acquisition and retention rates enables one to estimate the number and value of future customers. The value of a single customer provides the building block for forecasting the cash flow — and, thus, the value — of a firm.

The purpose of any good valuation model is not to simply estimate the value of a firm, but also to provide guidelines to improve it. What are the key drivers of firm value? Since customers form the core of any business, and analysis suggests that customer value provides a strong proxy for firm value, factors that drive customer value directly impact firm value. There are two aspects on which to focus: the impact of marketing actions on firm value, and the impact of marketing and financial instruments on firm value.

Impact of Marketing Actions on Firm Value

Marketing actions are generally designed to improve acquisition costs, margins, and the customer retention rate. While many companies ignored customer acquisition costs during the dot-com bubble era of the late 1990s, there is now a greater emphasis on cutting those costs. Programs designed for cross-selling and up-selling, as well as customer loyalty programs, are currently employed to improve customer satisfaction and, thus, customer retention. While many of these programs serve multiple purposes, marketing managers have to allocate resources to several competing marketing programs. How should they make these critical decisions?

One way to do this is to examine how changes in acquisition costs, margins, and retention rate alter customer and firm values. Analysis has shown that improving customer retention has the largest impact on customer value. Specifically, it is estimated that improving retention by 1 percent has an effect on customer value five times larger than a 1 percent improvement in margin, and 50 times larger than a 1 percent improvement in acquisition cost.

Impact of Marketing and Financial Instruments

The discount rate or cost of capital is a critical variable in calculating the net present value of any cash flow stream and firm valuation. The finance community has for years focused on measuring and managing a firm's cost of capital. In contrast, the marketing and business community has just begun to measure and manage customer retention. Therefore, it is important for executives to understand the relative impact of marketing and financial instruments on firm value so they can allocate time and resources appropriately.

To compare the relative importance of marketing and financial instruments on firm value, focus on customer retention as a marketing instrument, and the discount rate as a financial instrument. Analysis shows that, on average, a 1 percent improvement in customer retention enhances customer value (and in turn, firm value) by about 5 percent. A similar decrease in the discount rate increases customer, and therefore firm, value by less than 1 percent. Thus, the impact of retention is more than five times the impact of the discount rate. ■

Customer-Based Planning

Since the value of customers is so critical, managers must know how to improve that value and, as a consequence, the value of their firm. One key way to do this is to use a planning process based on customers and customer data, a process consisting of these four steps:

1. Identify customer objectives.

2. Understand sources of value to customers.

3. Design marketing programs with these things in mind.

4. Use appropriate customer metrics for assessing the effectiveness of your programs.

Customer Objectives

There are three ways to organically grow your business — acquire new customers, retain existing customers, and get existing customers to generate more revenues and profits. Which method should be the focus of your energy and resources? One simple, effective way to address this matter is to create a profit tree for your business — a representation of your business that traces all the branches through which profit flows to the organization. This tree also highlights the critical bottlenecks that help you identify key customer objectives.

To generate such a tree, you must effectively follow a potential customer through various steps in the organization to see how that customer generates profit for the firm. This process also highlights the various decision points for you, and puts in explicit terms such aspects of your business as how you define your market, how you define your target customers, what your client conversion rate is, what types of clients you serve, what the average value of a client is, and more.

Such an analysis brings three points into clear relief:

1. You cannot design effective marketing programs without having a clear sense of the key decision points in your profit tree.

2. Programs cannot be viewed myopically, since most programs impact several aspects of your business. This means each manager should define clear and measurable objectives for such programs.

3. The analysis provides concrete guidelines for marketing investment. This provides a tangible metric for designing and evaluating a program.

Understanding Sources of Value to Customers

It is essential to understand the value your product or service provides to a customer. You must understand why a customer should buy from you and not from your competitors. Understanding the sources of customer value helps design effective programs.

Marketing Lipitor

Pfizer's cholesterol-reducing drug, Lipitor, was a late entry into a market whose leading medicines were producing more than $1 billion in annual sales. Lipitor became a market leader quickly not by siphoning off customers from competing drugs, but by expanding the market with new customers.

Although clinical trials showed that Lipitor had slight superiority over other drugs of its kind in reducing bad cholesterol (LDL) levels, it did not have studies to prove that individuals treated with Lipitor experienced fewer deaths from heart diseases.

Instead, Lipitor teamed up with the American Heart Association to launch a national ad campaign which emphasized that almost 57 million Americans were not meeting their LDL standards, and 26 million had LDL levels high enough to warrant drug treatment.

Pfizer supported this campaign by sending its message (and its considerable sales force) to general practitioners, in addition to cardiologists. This resulted in enormous sales of the drug — nearly $9.3 billion in 2003 alone.

Customer value depends on the benefits offered and the costs involved. Value is very different from cost — an item costing only pennies to produce may be worth thousands of dollars if it solves an important problem efficiently. Likewise, a product that is expensive to produce may have little value.

Customer value involves two basic notions of value — category value, which assumes no competing brand exists; and relative value, which involves comparison of the product with other products in the category. In general, the value provided by a product or service to customers can be grouped into three categories:

- **Economic Value.** What economic benefit does a customer derive from using a product? What is the net monetary advantage gained from using a product, versus its alternatives, over the life of the product? As important as economic value can be, it is not the only, or even the most important, basis for purchase. The *relative advantage* of a new product is only one of the many factors for its success. Other factors include *compatibility*, *complexity*, *observability*, *risk* and *divisibility*.
- **Functional Value.** This is defined by those aspects of a product that provide measurable, functional or utilitarian benefits to customers — the performance features of a product. There are well-developed research methods to quantify the value that customers derive from each functional aspect of a product. One of the most commonly used methods is conjoint analysis, in which customers compare different alternatives and consider

(continued on page 7)

Customer-Based Planning

(continued from page 6)

the trade-offs involved. By asking customers to rate different products, researchers learn their preferences, which can then be fed into product and marketing designs and pricing strategies.

- **Psychological Value.** Psychological value focuses on intangibles such as brand names, as well as images and associations with a certain brand. As markets mature and competitors catch up with one another in technology and product features, psychological benefits become key differentiating factors. Although measuring psychological value poses a major challenge due to the intangible nature of the benefits, significant research has been done to measure *brand equity* — the value of a product beyond its economic and functional value.

Designing Marketing Programs

The nature and number of marketing programs that can be designed to influence customer value and achieve customer objectives of acquisition, retention or expansion are limited only by your imagination and creativity. Some programs to consider include the following:

- **Managing customer "touchpoints."** Value does not come solely from a product's functional features. Equally important are the emotional, self-expressive and experiential benefits that occur at every touchpoint with a customer. These and other factors (store layout, interaction with employees, and other aspects of the customer's interface with your business) comprise the customer's experience. All of these factors must be integrated in order to generate a positive experience for the customer, and to help ensure that you retain his or her business.
- **Loyalty programs.** Since American Airlines introduced its frequent flier program in the 1980s, loyalty programs have become ubiquitous in nearly every industry, from airlines to hotels to supermarkets. More and more companies use these programs for developing relationships, stimulating product or service usage, and retaining customers. The design of the program is key: To get customers to buy into it, you need to offer the right things to the right people.

Assessing Effectiveness of Programs

You cannot manage something that you cannot measure. Metrics matter in this regard, but there can be overkill — measuring too many things can lead not only to a lack of focus, but also to an unnecessary diversion of resources. Therefore, management must design a set of relevant metrics that (a) impacts business profitability, and (b) can be monitored easily on a regular basis to give the firm a sense of its business health.

Firms should monitor two sets of metrics: customer-focused (which assess value to the customer) and company-focused (which help assess value of the customer to the company). The first category includes measures such as awareness, associations, attitude, trial/usage, loyalty, and word-of-mouth activity, as well as satisfaction.

The second category of metrics includes the building blocks of the value of a customer, some diagnostics about where value is migrating from, and the costs of acquiring and retaining customers. These numbers directly enter the CLV formulation and hence are critical to measure. They also provide criteria against which to measure and evaluate marketing program spending. ■

Johnson & Johnson Opens Arteries and Opportunities

Many companies use the concept of economic value in launching new products and setting prices. For example, Johnson & Johnson makes stents — tiny metal pieces used in patients to prop open clogged arteries after an angioplasty procedure. Since the arteries tend to get re-clogged with scar tissue, about 15 percent of patients treated with conventional, bare-metal stents need a second angioplasty procedure within six months.

The newer generation of drug-coated stents reduces the need for repeat procedures to less than 5 percent of the cases. This 10 percent reduction in complication provides a significant economic benefit to insurance companies and hospitals alike. As a result, Johnson & Johnson was able to launch its stent effectively with a price of $3,195 in the United States, more than $2,000 above the price of a metal stent.

Customer-Based Organization

The value of a customer is more than a concept, tool or metric. It is a mind-set. Its implementation requires a cultural change within the organization and needs to be supported by appropriate changes in the organizational structure and incentive systems.

From the perspective of a firm's organizational structure, a customer focus requires dramatic changes. For example, a firm with a focus on product management will have managers of different products trying to maximize their own profitability to fit a product-centric agenda. This structure does not facilitate the transfer of relevant customer information across departments. In fact, in many cases, conflict will arise between departments.

Customer management provides a complete picture of a customer across products, while a product management

(continued on page 8)

Customer-Based Organization

(continued from page 7)

system looks at one product at a time, and therefore provides only a partial view of a customer. Therefore, the product management system is deficient for at least two reasons. First, each product manager knows whether a customer buys or does not buy his or her product, but does not know the firm's share of that customer's wallet. This lack of information can lead to many potential problems. A second major problem with the product management system is that it can create inherent conflicts among product managers and departments — among them communication disconnects and incentive-related hoarding of resources.

Incentive Systems

A new organizational structure must be supported by an appropriate incentive system to reward employees — an incentive system with two objectives. These are:

- First, the system should be designed to avoid inter-product conflicts. This can only be achieved if the objective of each manager is not to maximize the profitability of his or her brand, but rather to maximize the profitability of a customer.
- Second, as the metric changes from brand profitability to customer profitability, the incentive system should also recognize and reward the key elements that drive customer profitability. For example, customer retention has the largest impact on customer profitability, but most companies reward their sales force on the basis of either total revenue or acquisition of new customers. A focus on revenue misses critical cost elements, and a focus on customer acquisition can lead to disconnects where sales forces are compensated solely or mostly on the basis of new accounts acquired.

Appropriate Training

Incentive systems can change employee behavior to make it compatible with a firm's objectives, but it must be supported by appropriate training. While a product orientation requires an employee or a manager to be an expert in his or her product only, a customer orientation requires that employees know about multiple products and understand customer needs more than product characteristics. This broadening of employee knowledge requires new skills and training.

Additionally, a customer orientation means that employees "own" a customer and, consequently, customer problems. This cultural change also requires training and appropriate structure to support such behavior.

Front-line employees must also receive specific training. These are the people with whom your customers come into contact most often. How they behave and interact with customers has a critical impact on customer satisfaction and retention.

Common Mistakes

Simply proclaiming a customer-based strategy is not enough: It must be applied sensibly. The biggest problems in doing so tend to stem from taking a myopic view of its implementation. Several common flaws are then prevalent, including:

- **What's in it for them.** Many so-called customer strategies focus on what's in it for the company, and largely ignore what's in it for the customers. The consequence is often optimistic (and unfulfilled) forecasts, as well as unplanned customer defections.
- **Failing to consider what they will be when they grow up.** Never assume customers will remain as they are at present, and ignore the pattern of margin likely to occur over time.
- **Rose-colored glasses.** This assumes that "great things are possible" in terms of growth in both customers and margin per customer. People sometimes mistake possibilities for probabilities when they should balance current results with rational exuberance.
- **Alone they may be trivial, but together they matter.** A common manifestation of this thinking occurs in evaluating developing economies, where low income averages lead many firms to rule out entire countries. This approach ignores the fact that potential often exists even if the majority of the population were not high-potential customers.
- **No customer is an island.** Even small customers destined to remain small can be important because of what they can do to influence others.
- **It's about us.** Customer-based strategy can lead to inadequately accounting for competition. This manifests itself in unjustified complacency, assuming current customers are more secure than they are, and in being overly optimistic about growth prospects.
- **Throwing out the baby.** Totally dismantling product-based or brand-based organization structures in favor of a customer-based structure is not advisable. Successful organizations will find ways to integrate these different perspectives. ■

THE SUMMARY IN BRIEF

Research shows you have a 50 percent chance of hiring the right employee—and a 50 percent chance of hiring the wrong one. Hiring the wrong person siphons your energy and erodes team culture. Replacing them is stressful and can cost over $40,000 per re-hire. It's a toss up, but it doesn't have to be.

With the right tools, all of that can be avoided, and you can consistently make great hires. After years of scientific research and first-hand interview experience with thousands of candidates, Chaka Booker has created a system that helps employers consistently make great hires.

In ***Mastering the Hire***, Booker provides 12 proven strategies that have been used to accurately identify the right talent 90 percent of the time. Whether you're a hiring manager, business owner, CEO, search consultant, team manager, team member, novice or expert interviewer, ***Mastering the Hire*** is for anyone who wants to beat the hiring odds.

IN THIS SUMMARY, YOU WILL LEARN:

- To manage intuition: when to trust it and when to put it aside.
- To structure interview questions to help candidates tell the truth.
- To know when to apply or release pressure during interviews.
- Tools for removing bias to give you a competitive advantage.
- To reimagine the hiring process.

Introduction: The Coin Toss

What is the purpose of a job interview? According to Frank L. Schmidt, a psychologist renowned for his research in personnel selection, the value of an interview lies in its "predictive validity"—the ability to predict future job performance. The logical next question then is, do job interviews predict job performance?

To answer this question, Schmidt partnered with psychologist John E. Hunter and conducted a meta-analysis on 85 years of research on personnel selection. The results were sobering. At best, the methods had a predictive validity of 54 percent.

Fast-forward more than two decades and little has changed. A recent Gallup study found that when it comes to management talent, companies fail to choose the right candidate 82 percent of the time.

The reason for those odds is simple. The two people who face each other at the interview table don't do it often enough to do it well. What are the odds of a great decision coming from that table? About the same as tossing a coin.

The Black Box

Organizations don't need candidates that interview well. They need candidates that can do the job well. That means they need interviewers that interview well. It is the interviewer who must have a great interview, not the candidate.

For most interviewers, the relationship between interview practices and accurate hiring decisions is a black box where the effect of one on the other is a mystery. We can all point to candidates we interviewed who turned out great. We can also point to those who didn't. But can we point to what we did during the interview that led to either result? That's the black box. Without knowing what is inside that box, we can't consistently replicate our successes. We can't beat the odds.

But there are assessment methods that are most effective at predicting who a candidate is and what they can do. Beating the odds is about recognizing those patterns. What follows are some of the patterns, rhythms, and regularities of successful interviewing distilled into strategies and practices that anyone can learn.

Interviewing should never be a game of chance. Hiring does not have to be a coin toss. Regardless of your starting point, you can increase the odds of finding great talent. That is the goal.

Part I: Reducing Interference

The moment you step into the interview room, human nature kicks in and you and the candidate instinctually begin reading each other. Signals, social cues, and assumptions fill the space between the two of you, influencing your behaviors and your decision-making processes.

Some of the signals are interpreted inaccurately or have nothing to do with assessing the candidate—they are interference. Your job is to understand and minimize the noise that interferes with an accurate read of the candidate's talent.

Strategy 1: Intuition, Know Thy Place

A common phenomenon in candidate selection is a stubborn reliance by interviewers on their intuition. We would all like to believe our instincts are razor sharp and our gut reactions are in tune with reality.

Research published in the *Journal of Personality and Social Psychology* found that first impressions tend to be incredibly accurate. But there is also good reason to be extremely cautious about first impressions. All the studies indicate that first impressions are subject to stereotyping and prejudice.

Sometimes first impressions are accurate. It's not that intuition doesn't have a place, but that you must know its place. To increase the odds of making a strong decision, you need to manage subjectivity, so you can determine the relevance of a first impression.

Practice: Park your first impressions. Eliminating first impressions would go against human nature, so don't try. Instead, go in the other direction. Acknowledge that first impressions exist and then use a practice that allows you to determine if the early impressions are accurate and relevant. That practice is called "parking your first impression." You park your first impression by documenting it the moment it happens. That practice moves it from the brain, where it quietly impacts decisions, and places it in the open, where it can be examined.

Before you are about to interview someone, write down "Yes," "I don't know," "No." Once the interview begins, within the first few moments, make a mark on the line indicating what your first impression is: "Yes, they are a strong candidate." "I don't know if they are a strong candidate." "No, they are not a strong candidate."

Now that you have logged your first impression, your job is to ignore it. This part of the process is critical; otherwise,

Behavioral interview questions generally contain some signal indicating what the answer should be.

you will seek evidence during the interview to justify your first impression. In psychology, this is called confirmation bias. To avoid it, remind yourself that your first impression is a single data point to be considered after the interview along with other evidence.

Strategy 2: Candidates Don't Answer Questions. They Answer People.

Controlling the influence of first impressions on your decisions is only part of the battle against interference. Influence flows both ways. You must also control the influence you have on the candidate during the interview.

Candidates are constantly reading interviewers for cues. Not only can they tell if you like or dislike an answer, they are good at adjusting accordingly. Because of this dynamic, the interviewer can unknowingly do more than just gather answers from the candidate. If not careful, the interviewer can push the candidate to provide certain answers.

Practice: Interview like a poker player. Professional poker players understand social cues and hone the ability to read their opponents' faces to help determine their next moves. But maintaining a consistent expression isn't just for Vegas high rollers; it is an essential skill for an interviewer. To control for the impact your behavior has on the candidate's performance, you must present the same facial expressions across candidates.

A facial expression that maintains consistency across candidates and builds trust with each candidate is the goal. If you are wondering what trustworthiness looks like, the answer is simple: It is an expression that is slightly positive and friendly. Present the smallest of smiles, a slight upturn at the corners of your mouth.

For optimal results, accompany this expression with a set of standard positive responses for all candidates: Give head nods and small encouraging smiles during the interview. Give verbal signs of affirmation that seem positive but are neutral. For example, at the end of the candidate's answer or even during the answer, the interviewer should say, "Got it," or "I understand."

Your expression and affirmative responses acknowledge that you are listening and are in a positive mood, but the comments themselves are neutral. They don't indicate that the answer is right or wrong, just that you hear it.

Strategy 3: The Right Question Asked Wrong Is the Wrong Question

We don't only send signals to candidates through social cues and explicit behaviors; we also send them through the structure of the questions we ask. Behavioral interview questions generally contain some signal indicating what the answer should be.

For example, if you ask a candidate, "Give me an example of a time that you had to learn something quickly," the candidate will know that the right answer involves them demonstrating they have learned quickly, whether they have had to learn quickly or not.

Fortunately, questions can be designed to promote honesty, rather than interfere with it, and candidates can be pointed toward the truth.

Practice: Remove the signals. If the role you are hiring for operates in an unstructured environment, you could ask a traditional behavioral question:

Interviewer: Give me an example of a time you successfully worked in an unstructured environment and had to move work forward without guidance.

This answer doesn't just signal what you want, it plainly tells the candidate you are looking for a person who can move work forward without guidance. If they haven't done this, they will create an answer—or more likely contort another answer they prepped in advance—to fit the question.

Instead, make it more open-ended.

Interviewer: Have you ever worked in an unstructured environment?

They will still sense that the "correct" answer is yes, but you have increased the odds of getting at the truth by allowing for an honest answer.

Part II: Pressure Management

What makes interviewing hard for candidates is pressure. There are two types of pressure the candidate feels: the type you apply as the interviewer and the type they put on themselves. The pressure you apply that leads to a better answer is necessary. The candidate's self-imposed pressure is unnecessary and gets in the way of accurate assessment.

There is also a pressure that you experience as the interviewer. This pressure shows up after the interview when you feel the need to make the right decision. Knowing how to release pressure, apply pressure, and make decisions under pressure will shift the odds in your favor.

Strategy 4: To End With Truth, Start With Trust

Every candidate enters the interview room with a degree of uncertainty about what to expect. They are about to sit across the table from someone who controls their future. Regardless of how confident or comfortable they seem, they have their guard up to protect themselves. The protection is necessary because each side wants something the other has, and neither is sure they want to give it up.

The interviewer has a job they are holding for just the right person. The candidate holds the truth about who they truly are and what they can do. But they don't know if what they have is what is being sought. That pressure makes the candidate not sure how much of themselves they should reveal.

From the first moments of the interview, you must create an environment that allows the candidate to willingly reveal their true selves. Lowering the pressure will get them to lower their guard. To do so, make three things clear: You and the candidate are equals. You and the candidate are working toward an outcome together. It is in both of your best interests to be open and honest.

Practice: Minimize physical barriers. If there is a physical barrier between you and the candidate, you must minimize it to increase a feeling of equality. In most interviews, you are behind a desk or a table. Don't stay seated. Break the barrier. Step from behind the desk or table to shake hands and introduce yourself. The message you are sending is that you are equals standing on the same ground with nothing between you.

Make sure there is water in the room. Ask if they would like some. And pour it for them. The message again is clear: "I'm not above you. I'm here to help."

Next, call attention to the fact that there is a physical barrier between the two of you. Interviewer: "I usually don't like to have such a big space between me and someone I'm interested in learning more about, but we'll do our best to make this work." The message you are sending is that, despite the barrier, you are still on the same side. Their guard isn't completely down yet, but it's dropped an inch or two.

Strategy 5: You're Not Assessing the Candidate. They're Assessing Themselves.

During an interview, you are the one asking the questions. So far, so good. But when you analyze what happens next, the belief falls apart.

The first thing the candidate does in response to a question is delve into their brain, selecting from a range of experiences, perspectives, and opinions. When they come back out, they share what they found. You then ask them what they did well, what they could have done better, and what they would do differently next time.

None of this is you assessing the candidate. What you have just done is ask the candidate to retrieve a memory and assess it themselves. You are judging the quality and relevance of their self-assessment.

When you tilt the interview to look at it from this angle, you expose two problems. First, interviews rely entirely on the candidate's ability to accurately recall events, results, and decisions.

Second, your assessment relies on their ability to evaluate themselves. Science suggests those are big problems. Countless studies show that stress negatively impacts working memory. Research also shows self-evaluation is inherently difficult. People often have the wrong view of their own competence because they don't have enough subjective information to accurately self-assess.

So, not only are we asking candidates to remember something under sub-optimal conditions, we are also asking them to do something humans aren't good at doing. Now that we see the interview in a different light, let's bring science back on our side, remove unnecessary pressure, and improve the odds.

Practice: The memory anchor. To lower the memory hurdle, you should intentionally use the resume as a "memory anchor." The memory anchor protocol is simply the following: At the start of the interview, ask the candidate if they have their resume. If they do, ask them to pull it out and feel free to use it to help answer any question.

If they don't have their resume, provide them a copy. Your job is to lower the psychosocial stress of interviewing and help the candidate access their thoughts. You want them to reflect on those thoughts and give you enough insight to help with your ultimate decision.

As an interviewer, your goal is not to apply extreme pressure, nor do you need to know each candidate's tipping point.

Strategy 6: Pressure Clarifies and Reveals Potential

Minimizing pressure is good when it leads to better insight and more accurate decision-making. Pressure, however, also has its benefits. A considerable amount of studies have been done in the fields of sports, law enforcement, the military, student performance, and leadership. In all fields there is a point when pressure goes from enhancing performance to hindering it. But that tipping point varies across people and settings. What is consistent is the finding that pressure which challenges people is helpful, and pressure that threatens is not.

As an interviewer, your goal is not to apply extreme pressure, nor do you need to know each candidate's tipping point for optimal performance. You need to know how to appropriately challenge candidates to gain insight for an accurate assessment. How you apply pressure that challenges candidates depends on the type of insight you are pursuing.

Practice: Keep questions lean and follow-ups specific. Whenever you ask questions during an interview, you inevitably will get an answer that does not provide the information you need to help make a decision. There are a range of reasons for this—none of them should have anything to do with your questions themselves. Strategy 3 showed how to remove signals from a question. A rule of thumb to accompany that strategy is keep the question as short as possible, keep it open-ended, and use specific follow-up questions.

Keeping the question short and open-ended puts you in stronger position of control. Not only because of fewer signals but because once the candidate starts talking, the follow-up questions can be targeted to gather specific and relevant information.

The following are ways to frame a follow-up question to gain clarity:

- "That answer was very general. I could use some more specifics to help me understand."
- "I'm not clear on what role you played and what you accomplished in that example."
- "I don't understand what the goal of that project was and whether you got there."

This should then be followed by

- "Can you give me a better answer than that?"

Strategy 7: Stop rationalizing

Think of a hiring mistake you've made, and you can likely recall moments during their interview process that indicated it wouldn't end well, but you pressed forward and hired the candidate anyway. Whatever the pressure, at the core of this faulty decision-making is our brain's ability to rationalize.

Rationalization helps reduce cognitive dissonance, an uncomfortable psychological state produced by discrepancies between actions and attitudes.

The key to conquering this self-deception is understanding that in the moment—when we make mistakes that we need to rationalize—*we know we are making a mistake*. That's precisely why we rationalize. Rationalizing requires your brain to first recognize you are being irrational—only then does it begin the process of justifying. That moment of recognition is what strong interviewers learn to identify and control.

Practice: Premortem. The trick is to have the same clarity of thought during the decision as you will after the decision. When you are leaning toward hiring a candidate, potentially against your best judgment, conduct what cognitive psychologist Dr. Gary Klein calls a "premortem" before making a final decision.

Conducting a premortem will feel like a counterintuitive approach because rather than envisioning success with this candidate, you envision failure. Imagine hiring the candidate, and then imagine every concern you have about the candidate becoming true. Imagine all the bad ways this will play out. The deadlines they will miss. The relationships they will damage. The decrease in team productivity.

Imagine firing them because of what you knew during the interview. Imagine having to restart the hiring process.

Articulating what could go wrong brings you back from the brink of doing what you want and forces you to think more clearly about what you need. You may still decide to hire the candidate. But if you do, you've shifted the odds toward it being the rational decision versus the one you rationalized.

Part III: Sharp Tools

Like a physician, the interviewer's job is to diagnose. Physicians use a structured process of question, answer, and examination to gather insight. When the issue is complex, they draw blood. An interviewer's job, to delve into the candidate's mind, is complex. It also requires them to draw from the candidate. But not blood. Answers.

The stakes during an interview are not life or death, but errors can lead to pain that could have been avoided. The interviewer's tools must be as sharp as any physician's instruments. The tools must be clean so as not to pollute the answer. The interviewer must know which tools to use when and what to look for in the answer they've drawn.

Strategy 8: An Interview Is a Glimpse

The modern meaning of interview is tightly associated with assessing talent. The original meaning of the word from the 16th century, of Middle French origin, is "entrevue," derived from "s'entrevoir," to see each other, visit each other briefly, have a glimpse of. An interview is only a glimpse of someone else.

The brevity of the interaction points toward two things. First, use the time well. Leave nothing to chance. If something is only working 50 percent of the time, then strip it down, keep what works, and rethink what doesn't. Second, to get a full picture of the candidate, take each glimpse from a very different angle.

Practice: The reverse interview. A candidate who looks strong on paper doesn't always turn out the same in person. By the time you realize that, you've already invested several hours interviewing the candidate live. You can gain some of the same insight and save time by spending 20 minutes conducting a phone screen. A phone screen often boils down to four basic pieces of information: Do they communicate well? Have they done research on the organization? Why are they interested in the role? Clarifications based on their resume.

Use these four areas to conduct the reverse phone screen. This turns the tables and gives the candidate 10 to 15 minutes to ask the interviewer the top 10 questions they have about the role, the organization, etc. The interviewer then takes five to 10 minutes to ask the candidate a few questions. With this flipped structure, the questions that candidates ask and how well they prepare tell you a ton about them, yet your preparation is minimal. To make this work, notify the candidate in advance via email of the reversed structure. This gives them time to prepare.

Strategy 9: Break Down the Fourth Wall

In the world of theater, the fourth wall is the term for the imaginary wall between the audience and what occurs on the stage. This wall exists in the world of interviewing as well. In an interview, you are the audience and the candidate is on the stage. Since you can't step onto their stage, you must observe from your seat and determine if the story being told is an accurate reflection of reality.

The traditional interview as your only mechanism means you must rely on learning about the candidate through their recounting of events. Using additional approaches breaks the fourth wall and gives you a completely different lens to look through.

Practice: In-basket assignments. In-basket assignments are activities you give the candidate to complete in advance and then you discuss them during one of the interviews. Think of in-basket assignments as homework for the candidate. The approach takes some up-front preparation by the interviewer but can be used time after time and does not have to be complex or require a lot of planning. The key is to choose assignments that mimic the work they will do on the job. Have them create a presentation, or have them do an analysis. Have them review part of your strategic plan. Have them research a topic and write a memo.

Regardless of the assignment, conduct the discussion with the candidate the same way you would with a team member. Try to re-create what it would feel like to have a meeting with you. That will give you a better sense of what working with them may be like. It also has the benefit of giving the candidates a feel for the work and what interaction as a team member is like. The interview is a glimpse of each other, and in-basket assignments are a perfect opportunity to make it a two-way experience.

Part IV: Identity and Bias

When a candidate sits at the interview table with you, they

The first step toward controlling biases is to think about what your biases might be and write them down.

represent two people: the person they are and the person you think they are. The bigger the gap between reality and perception, the higher the odds of the wrong decision being made. The opening chapters discussed the interference that fills that space. There is another culprit whose existence serves to keep reality and perception apart. That culprit is bias. This section is focused on making effective hiring decisions at the intersection of identity and bias.

Strategy 10: Biases Are Unspoken Criteria

In practice, biases fall into two categories: the ones people will admit to and those they won't. The biases in that second category tend to include race, gender, sexual orientation, religion, etc. Unconscious or not, the larger problem is those beliefs are rarely discussed. Yet the biases that spring from them lurk in our minds during the interview, quietly impacting our decisions. They become unspoken criteria that wedge between who the candidate is and who we think they are.

Your goal isn't to suddenly shift everyone's unspoken beliefs through a set of interview practices. Your goal is to make them aware of how their beliefs can negatively impact their behavior and how increased self-awareness makes them better decision makers. You won't get far if you start with a discussion about their most controversial biases. Instead, leverage the research that shows an effective approach to managing bias is to tap into people's desire to be fair-minded.

To get there, start simple by explaining that bias isn't a dirty word defined exclusively by racism, sexism, homophobia, or the like. A bias is just a tendency to believe some categories of things (people, ideas, products, etc.) are better or worse than others. Synonyms for bias include "non-objectivity," "partiality," and "one-sidedness." Whether a bias is helpful or hurtful depends on whether the underlying belief is relevant or not.

Seemingly innocent biases, such as preferences for strong handshakes, types of attire, or certain personality traits, are where you want to start. They get people to acknowledge that bias exists.

Practice: The bias list. The first step toward controlling biases is to think about what your biases might be and write them down. To increase the odds of accurately assessing someone else, you must recognize the triggers of certain emotions, assumptions, and reactions in you. Putting thoughts in writing is a powerful way to make your thinking concrete. This mechanism for capturing the "unspoken criteria" makes it easier to manage. It allows you to compare your biases against the actual criteria needed for the job.

For example, some people dislike candidates who give weak handshakes or have a heavy accent. As with first impressions, the point is not to immediately view biases as wrong but to stop them from hijacking your decisions before you have a chance to determine if they should be part of your criteria.

Strategy 11: Be Mindful

Gaining control of first impressions and creating bias lists helps disrupt automatic thinking. But the best interviewers take it a step further. They spend time specifically learning about issues related to identity. They also spend time thinking about what they think about those issues. "Thinking about what they think" is a subtle nuance worth exploring. One level of learning is to gain exposure to issues of identity that others may struggle with. A higher level is to then question what you believe about those issues and why you believe them. That practice of introspection is a type of mental preparation called mindfulness.

Psychologist Dr. Jill Suttie defines mindfulness as a mental state that involves an increased awareness of our emotions, thoughts, and surroundings, accompanied by a sense of nonjudgment. Research has shown that mindfulness can be used to overcome the impact of bias and prejudice on decision-making.

Practice: Mindfulness through reading. Increasing your mindfulness can be achieved by reading an article about the impact of implicit bias on issues of diversity shortly before you interview. After you read it, reflect on what you agree with and what elements of the reading might apply to your thought processes. A simple internet search will provide a wealth of reading options. The reading does not need to be long nor does it need to be complex.

If you have capacity, do this practice the evening before you interview and then peruse the reading again the day of the interview, shortly before you conduct it. Brief moments of this specific type of mindfulness have been shown to create positive effects against bias.

Strategy 12: Culture Fitness, Not Culture Fit

The term "culture fitness" serves as a reminder that, before you assess for culture fit, you need to get your culture in shape. On one hand, you may be in an organization where that means you need to improve your culture. That's unfortunate, but as you work to solve that problem, you will still be hiring people into that culture. On the other hand, you may have a good culture, in which case you need to get the definition of your culture in shape.

The word "fitness" also brings us back to the topic of bias. While your organizational culture may not be constantly changing, it should be constantly strengthening. A culture that is constantly strengthening requires openness to pressure from new perspectives and approaches. Fitness signifies the opposite of status quo and stagnation. If your culture is "fit," bringing in people who force you to stretch is healthy and an opportunity to consider rather than avoid.

Practice: Culture add. Before coming to a verdict involving culture fit, spend a moment in self-reflection. Ask yourself, "Can this candidate add something to our culture that we may not realize we need?" Perhaps this candidate not "fitting" could be valuable in terms of their personal experience, thinking style, identity, or other indicator that may initially signal a lack of compatibility.

When it comes to identity, your organization's and the candidate's, you need as much help as possible. So, get the candidate's input as well with the following question: "Based on your experiences either with us so far or your experiences in other organizations, what insights, viewpoints, or perspectives can you bring that others might benefit from?"

From boardrooms to corporate hallways to classrooms to meeting rooms to interview rooms to any setting where decisions must be made, instinct and good fortune are not enough.

Mental preparation serves as a foundational tenet for every practice discussed above. All the hard work of understanding the person across the table can be undone without an understanding of yourself. Don't rush into the interview room, crumpled question packet in hand. Pause. Take responsibility. Note your first impressions. Manage your body language. Reword the question. Build trust. Let the question breathe. Be mindful. Know your target. Pause. Prepare.

Let the 12 strategies help you shift the odds away from a coin toss and toward great talent.

Measure What Matters

How Google, Bono, and the Gates Foundation Rock the World with OKRs

by John Doerr

John Doerr is the chair of venture capital firm Kleiner Perkins, which he joined in 1980. By investing in some of the world's most successful entrepreneurs and companies, including Amazon, Google, Intuit, Netscape, and Twitter, he has helped create more than 425,000 jobs.

Rock Your World With OKR Superpowers

Imagine a small company with only forty or so employees in the highly competitive search engine space. Its technology is amazing, its founders are true visionaries, and its growth is explosive. However, those founders have clearly grabbed a tiger by the tail and are holding on for dear life. They have no business plan—at least, not one that analysts would consider to be strategic—and every exciting opportunity ahead of them could just as easily turn out to be a catastrophic failure. What would you do?

In his new book, *Measure What Matters: How Google, Bono, and the Gates Foundation Rock the World with OKRs*, legendary venture capitalist John Doerr takes us behind the scenes of his $12 million investment (the largest of his career at the time) on behalf of his company Kleiner Perkins in an entrepreneurial venture called Google. If you hadn't heard, things have turned out fairly well for Google. That workforce of forty employees has since grown to more than 70,000, giving Google (and corporate parent Alphabet) a market capitalization of over $700 billion.

It would be easy to assume that this book is nothing more than a retrospective on Doerr's greatest investments. To be fair, he has plenty in his portfolio—Amazon, Netscape, Intuit, and Twitter to name a few—but that's not what's on offer here. What the author presents is a deceptively simple playbook that, if followed to the letter, can lead any organization to new levels of operational excellence.

By his own admission, the process delivered here is not of Doerr's creation. He learned it as an engineer in the 1970's from Andy Grove at Intel, still one of the best-run companies Doerr has ever seen. He considers Grove to be "the greatest manager of his or any era." The process is an unwavering focus on OKRs—*Objectives* and *Key Results*. Objectives define *what* the company is aiming to achieve; key results delineate *how* those objectives will be achieved through "specific, measurable actions within a set time frame."

Don't confuse this process with key performance indicators or KPIs. They are a measurement of past performance on a process or project that's already in place. Metrics are established at the outset, often as a benchmark against competitors or industry averages, and performance is then measured against those KPIs as an assessment of efficiency. For future planning, KPIs document incremental improvements. OKRs, by contrast,

> **Wrong choices are inevitable, no matter how visionary and infallible you may consider your leadership to be.**

represent a commitment to larger scale projects—stretch goals like Jim Collins' and Jerry Porras' Big Hairy Audacious Goals (BHAG's) from *Built to Last*—where you may be taking the company in a completely new direction or embracing growth targets far beyond the incremental approach of KPIs.

Superpowers

Google's explosive growth record could easily appear to endow OKRs with implied superpowers, and Doerr does use the term in a very tongue-in-cheek classification of specific components of the process, but it is the simplicity and consistency of application that makes it so powerful. When Doerr became a venture capitalist, he shared the process with fifty different organizations. "Where the process was faithfully practiced, it worked."

Superpower #1: Focus and Commit to Priorities

The decision to focus on a limited number of options over the next three (or six or twelve) months represents a commitment of both word and deed. OKRs demand the discipline to both commit to specific priorities as well as to walking away from other options that have been distracting and diluting your focus. When those priorities are clearly communicated to your leadership team, you now have a baseline for assessment and a compass to monitor your future direction. Wrong choices are inevitable, no matter how visionary and infallible you may consider your leadership to be. For that reason, the KRs, while future-focused, should have a short-enough time horizon to be able to flag those wrong choices before any damage is done. Doerr refers to the example of Lee Iacocca's Ford Pinto, where the pressure to deliver on a BHAG, a budget-priced subcompact car to compete with fuel-efficient Japanese competitors, led to critical safety checks being overlooked. The objective of a car that was "under 2,000 pounds and under $2,000" might have been highly motivational and PR-friendly, but it led to a catastrophic decision to sacrifice a one-pound piece of plastic that cost one dollar that could have prevented the puncturing of the gas tank.

Paring back your list of goals may result in some lucrative opportunities being left on the table, but developing the emotional maturity and discipline to stick to a plan (while communicating a clear and consistent message to your team) will be worth more in the long-term than any short-term gain made from chasing every shiny object that crosses your path. For Google the guiding principle for priorities came from its mission statement: *Organize the world's information and make it universally accessible and useful*. A grand vision by any standard, but clear enough to guide the company through the development of Android, Google Earth, Chrome, and acquisitions like YouTube. Chrome and YouTube are examined at length in two separate case studies to explain the OKR process step-by-step.

Additional case studies are presented by Brett Kopf, cofounder of the academic texting platform *Remind*, and by Jini Kim, cofounder and CEO of Medicaid data platform *Nuna*. In both cases, the struggle with the perceived simplicity of OKRs resonates loudly. It may make perfect sense on paper, but implementation can be a struggle and requires some trial and error.

Superpower #2: Align and Connect for Teamwork

The foundational culture of OKRs is a meritocracy. Transparent communication allows the cleansing action of sunlight to overcome the toxicity of "organizational poisons—suspicion, sandbagging, politicking." If everyone has access to information on what everyone else is working on, the likelihood of a group being left alone to work on the wrong thing is greatly reduced. Yes, this goes against the notion of highly creative "skunkworks" working outside of normal corporate parameters, but transparency breeds collaboration and reinforces the organization-wide commitment to established priorities.

The MyFitnessPal case study, written by cofounder and CEO Mike Lee, offers a fascinating summary of maintaining communication and direction during periods of exponential growth. Focusing on developing platform-specific versions of the app (Android, Blackberry iPhone, iPad) was challenging but manageable. When the user base then jumps to 35 million across all of those platforms in 2013, maintaining direction, momentum, and communication becomes a completely different proposition. OKRs enabled the company to maintain its alignment by constantly challenging the notion of what really mattered. For 2014, the company added 27 million new users on its way to 80 million total registered users.

The Intuit case study, written by Chief Information Officer Atticus Tysen, emphasizes the adaptability that a commitment to OKRs can develop within an organization. Intuit's track record of developing world-beating products—Quicken, TurboTax, and QuickBooks—has kept the company on the list of the "World's Most Admired Companies," for over fourteen years running. However, that success is based as much on the company's ability to get back-up after stumbling as it is on launching winners right out of the gate. One of the keys to that success is a commitment to transparent communication of OKRs across the entire organization for a specific purpose. In Tysen's words: "We didn't want bureaucratic compliance, we wanted enthusiastic compliance." That enthusiasm bred engagement at a higher level than any motivational speech from the CEO could have achieved.

Superpower #3: Track for Accountability

Since the objective of every KR is achievement, Doerr advocates for designated *OKR shepherds* to manage the "late adopt-

> . . . the belief that individual human performance can be reduced to numbers is fundamentally flawed.

ers, resisters, and garden-variety procrastinators." To support those shepherds, the OKR process needs a simple system to track progress, with the joint intentions of keeping people engaged and on-track. The 'traffic light' idea of a green light for 'on track,' a yellow light for 'needs attention/modification,' and a red light for 'stop' (achieved or outlived its usefulness) provides a framework that is easy to grasp and even easier to communicate across an organization.

The Gates Foundation case study, co-written by cochairman Bill Gates and former CEO Patty Stonesifer, underlines the critical need for a tracking system—especially when the O of your OKR is to change the world. With a blank sheet of paper and the luxury of a very large blank check—Bill and Melinda Gates seeded the foundation with $20 billion in 2000—the need for detailed management of resources was arguably even greater than the typical organizational battle for project funding. As Gates notes: "Suddenly it's both a start-up and the biggest foundation in the world."

Setting big goals was the easy part. Eradicating malaria, or vaccinating every child everywhere, were highly aspirational and engaging, but the challenge came with measuring progress against them. If your goal is to eradicate malaria by 2015, how do you know where you are in 2013? In Stonesifer's words: "OKRs allowed us to be ambitious and disciplined at the same time." The objective of global vaccination of children, for example, was measured using the 80/90 rule from the Global Alliance for Vaccines and Immunization where: "80 percent of districts would have 90 percent or more coverage."

Superpower #4: Stretch for Amazing

The vision of OKRs is undeniably aspirational. The process may be internally focused in terms of measuring progress, but the objectives are, by definition, future-focused and, to borrow Jim Collins' definition of a BHAG, designed to capture the imagination and grab people in the gut.

Larry Page at Google preached "the gospel of 10x," launching Gmail with a full gigabyte of storage, five hundred times more than the competition. From Page's perspective, you achieve that level of performance by getting your people to be "uncomfortable excited," and to have "a healthy disregard for the impossible." The launch of Google Chrome and the exponential growth of YouTube are documented in detailed "stretch" case studies.

From OKRs to CFRs

Part two of *Measure What Matters* questions the larger issue of effective workplace communication. Doerr is adamant that OKRs need transparent communication as much as we need air to breathe. If your current communication practices are ineffective, your commitment to OKRs may be doomed from the start. The worst offender, from Doerr's perspective, is the annual performance review, which he considers to be "costly, exhausting, and mostly futile," taking-up, on average, "7.5 hours of manager time for each direct report." If the documented recency bias weren't bad enough, the belief that individual human performance can be reduced to numbers is fundamentally flawed. Doerr quotes Albert Einstein to underline this point: "Not everything that can be counted counts, and not everything that counts can be counted."

If OKRs are to succeed as a transformational process, they need an equally transformational system of *continuous performance management.* The instrument for this task is, the author believes, CFRs—*Conversation, Feedback, and Recognition.* Conversations must be authentic, frequent, and aimed at driving performance. Feedback must be bidirectional with the objective of evaluating progress and offering clear guidance for future improvement. Recognition must also be authentic to express appreciation for the contribution of deserving individuals.

CFRs occupy the same cultural footprint as OKRs, with an explicit commitment to "transparency, accountability, empowerment, and teamwork." As Doerr advocates: "They give OKRs their human voice." The case study of Adobe, written by Executive Vice President of Customer and Employee Experience, Donna Morris, examines a transition from "antiquated" and "demoralizing" annual performance reviews to a continuous performance management system named *Check-in* that changed the emphasis of interpersonal communication from measuring performance to enabling development.

Culture

The ultimate deliverable of OKRs and CFRs is culture change. The case study of the ONE campaign written by cofounder Bono underlines the transformational power of a dramatic philosophical change in culture. "Pivoting from working *on* Africa to working *in* and *with* Africa," changed the foundational culture of the campaign from helping developing countries to empowering those countries to grow on their own.

Doerr's approach in presenting OKRs is surprisingly low-key. Given the overwhelming evidence and the heavyweight case studies presented, it would be easy for this book to become evangelical in tone. Instead, the author delivers a deceptively simple but nonetheless pragmatic path to operational excellence. There are some consultants to add a dash of gravitas (Collins, Drucker) but Doerr's glowing admiration is reserved for Andy Grove to whom OKRs are freely attributed. If, in the end, you remain skeptical of a process that seems, on the surface, to be too obvious, consider that anything that advocates for transparent interpersonal communication and providing clear guidance for achievement at every level of an organization is surely worthy of consideration.

THE SUMMARY IN BRIEF

There's nothing more frustrating than an unproductive meeting—except when it leads to another unproductive meeting. Yet, every day millions of people conduct meetings—in person or online—without the critical understanding or formal training on how to plan and lead them effectively.

Meetings That Get Results offers a structured method to ensure that meetings will produce clear and actionable results. Meetings that are profitable and productive ultimately lead to fewer meetings. This book offers a significant edge by empowering readers to help their groups create, innovate, and break through the barriers of miscommunication, politics, and intolerance; shows how to help others forge consensus and shared understanding; and offers proven agenda steps, tools, and detailed procedures.

In a world of back-to-back meetings, ***Meetings That Get Results*** explains the how-to details behind game-changing tools and techniques. Ultimately readers will be able to resolve or manage common problems, inspire creativity, and transfer ownership to their meeting participants.

IN THIS SUMMARY, YOU WILL LEARN:

- Why great meeting facilitators are servant leaders.
- Three essential communication skills for meeting facilitation.
- Easy steps for structuring and designing effective meetings.
- Detailed strategies for planning and making decisions.

Introduction: Launching

In a world of back-to-back meetings, you barely have time to find the right resources and training to become a better leader. Yet, while you would not attempt to build a boat without the proper training, equipment, and support, every day millions of people are conducting meetings without critical understanding of or formal training on how to be an effective meeting leader in person or online.

Rarely do events, meetings, or workshops proceed in a linear fashion. They don't just "start here" and then "end there." Rather, they continually loop and twirl—for reasons such as these:

- Someone joins the meeting late, online or in person.
- A subject matter expert gets called away unexpectedly and upon return discovers that some critical information was not included.
- You are asked to go back and add something.
- Someone changes her mind because her introspection has found a connection between a few things previously not considered.
- Two people start arguing because they refuse to agree with each other based on "principle."
- You need to fully define something.
- You do a poor job handling participants' electronic leashes (cell phones, laptops, etc.), and when every one wakes up, they quickly unravel what has already been accomplished.

Making It Easy

Business facilitation is a method that removes all distractions, making it easy or attainable for a group of experts to gain traction by focusing on the same question at the same time, led by a meeting facilitator who knows how to sequence questions, ask questions with precision, and guide consensual understanding and agreement around optimal solutions for that specific group of experts.

When a group of subject matter experts manages to stay focused, miracles can happen. What follows is a method for managing anything that develops or erupts during your meetings. It will make it easier for you to be a credible meeting leader and meeting facilitator when leading diverse types of meeting sessions, for all types of groups, organizations, teams, and tribes.

Serving: Discipline of Servant Leadership

In most organizations, change begins during meetings. The problem is that meetings often fail for one of three reasons:

- The wrong people are attending (rare).
- The right people attend but are apathetic and don't care (rarest).
- The right people care, but they don't know how to conduct an effective meeting (bazinga!).

In recent centuries we relied on executives and managers for their experience and machine knowledge. As leaders, they told us what to do. Today's complex knowledge base and knowledge transfer technique, however, require a new breed of servant leaders. Most of them are trained to avoid problems attributable to weak meeting leadership, poor facilitation, and lack of meeting design. This new breed is not a person but a role—the role of the meeting facilitator.

The Servant Leader Solution

As a servant leader and meeting facilitator, you become the change agent, someone who takes meeting participants from where they are at the beginning of the meeting to where they need to be at the conclusion. All leaders must know where they are going. They must know what the group is intending to build, decide, or leave with when the meeting is done. Effective servant leaders also start with the end in mind.

A neutral meeting leader values rigorous preparation, anticipates group dynamics, and designs the meeting accordingly. The meeting leader becomes responsible for managing the entire approach—the agenda, the ground rules, the flow of conversations, and so on—but not the content developed during the meeting.

Facilitation Liberates Leaders

In the past, leaders needed to be experts on content. Today, organizations already employ and engage a wealth of subject matter experts. What organizations need are leaders who know how to be facilitative while managing context. In the past, leadership was about giving answers. Today, leadership is about asking precise and properly sequenced questions while always providing a safe environment for everyone's response.

Imagine the following scenario: Your team is tasked with developing a plan to solve the problem of employee burnout in the cybersecurity department. To assess the value of

Mastering three concepts
will enable you to lead any group
in any type of situation.

proposed solutions, the team needs to know the purpose of the cybersecurity department—why it exists.

A "presenter" might access the cybersecurity department charter from human resources. In most organizations, this task would take from 15 minutes to five hours or longer. Then the presenter might spend another 15 minutes putting together PowerPoint slides and then take five minutes to present the slides and another 10 to 20 minutes to manage questions and answers about content on the slides. Call it one hour total, minimum. At the conclusion, the presenter owns the content on the slides.

Alternatively, you, as the meeting leader, can use a procedure, such as the Purpose Tool (explained further below). The Purpose Tool distills a consensual expression about the purpose of the cybersecurity department directly from the subject matter experts who understand both the purpose and the problems in the department today. In 15 minutes or less, you can lead the team to build an expression of shared purpose using the Purpose Tool. Most important, at the end of the 15 minutes, the meeting participants, not you, own the results.

Leading: Be a Servant, Not a Senator

Clear leadership consciousness integrates the why, what, and how. Exceptional meeting leadership also requires keen awareness and the ability to describe to participants where they are going (so they know what "done" looks like); why the meeting is important (if it is not, it should not take place); what questions they need to answer and in what sequence; meeting roles and rules, leading to who does what; planned activities and procedures, leading to how participants will get done.

Mastering three concepts will enable you to lead any group in any type of situation:

- The holarchy, or graphical view, operating throughout an organization.
- The trichotomy, or first-cut analytical method, for applying structure that immediately divides complex issues into three manageable portions.
- The meeting roles that must be respected because you want subject matter experts to strive for objectivity and, therefore, leave their egos and titles in the hallway.

Holarchy: It begins with DONE. In his book ***Holism and Evolution***, Smuts defined holism as "the tendency in nature to form wholes that are greater than the sum of the parts through creative evolution." In a holarchy, each cell is both a whole and a part; systems are nested within one another.

An effective leader begins by documenting the meeting objectives, frequently called deliverables. To understand the value of a deliverable, it should be viewed with respect to its impact on all other objectives of an organization, as part of the organizational holarchy. The organizational holarchy represents the web of interdependent connections throughout an organization. The holarchy represents the unity of all the objectives, from business units to answers developed in meetings.

Understanding the organizational holarchy requires one to "begin with the end in mind," as Steven Covey put it. If actions taken or decisions made within an organization do not harmonize with the organization's purpose, stay within the organization's scope, and support the organization's objectives, the actions or decisions are unwarranted. For this reason, before we begin our meeting, we need to know what DONE looks like. In other words, where are we going?

Trichotomy: Foundation of structure. The structure of trichotomy helps you break down complex issues into manageable pieces. Structure begins with the trichotomy as a function of will, wisdom, and activity. In sequence, the trichotomy of meeting discipline fundamentally looks like this:

- **Will:** Why is something important (abstract thoughts)?
- **Wisdom:** What are we going to do to support it (transformation of the abstract into the concrete)?
- **Activity:** How are we going to get it done (clear and concrete actions and results)?

Become a disciplined leader by applying structure before

your meeting begins. Once you develop awareness about where and why you are leading a group, apply critical thinking and discipline to understand what is needed. Then you can determine how you are going to lead a group to build it consensually.

Consciousness: Meeting roles. Effective meeting leaders frequently perform four roles. When all four roles are performed by one individual, it makes that person much, much more than a facilitator; that person becomes the meeting leader. The four roles include these:

- Meeting coordinator (reserving meeting rooms and arranging for coordination, refreshments, supplies, and travel).
- Meeting documenter (documenting outputs and inflection points, not verbatim conversations; distributing meeting notes; managing edits, document versioning, and archiving).
- Meeting facilitator (conducts meetings; diplomatically channels diverse ideas into meaningful action; directs groups toward shared purpose and objectives; galvanizes consensus while remaining resilient about managing uncertainty and other open issues).
- Meeting designer (helps stakeholders codify deliverables and draft agenda steps; develops succinct questions to be answered; structures the sequence of questions; specifies tools and procedures for converting answers into final form such as a decision, plan, recommended solution, and so on).

Facilitating: Making It Easier with Three Core Skills

There are three core skills for meeting leaders who value facilitation, servant leadership, and getting DONE faster (structure). As meeting facilitator, you need to command these core skills but, at the same time, remember to always reduce or eliminate distractions so that your group stays focused.

Speaking and questioning clearly. Clarity represents the extent to which a speaker's intent secures the understanding they seek. Unfortunately, numerous filters and obstacles stand between a speaker's intent and a listener's understanding, such as biases and prejudices, perceptual challenges, speaking mannerisms, technology hiccups, vague word choice (lack of rhetorical precision).

Strive for precision, especially with your questions. For example, "Under what circumstances . . . ?" is immediately more effective than "Are there any circumstances . . . ?" In addition, "Who would like to share their thoughts . . . ?" does not compel a detailed response as well as "What are the arguments supporting [or against] . . . ?"

Actively listening and observing constantly. For servant leadership and effective facilitation, active listening becomes indispensable. As a practitioner, you will discover that feeding back (reflecting, restating) what the participant said never compares to the value of understanding and sharing why they said it.

People don't care what you know until they know that you care. Genuine active listening connotes empathy and requires four activities:

- Contact—Connect with the participant who is speaking. Make eye contact. Maintain an open posture.
- Absorb—Take in all aspects of what is being said. Do not judge or evaluate.
- Reflective feedback—Mirror, reflect, or give feedback about what you have heard and why the participant's claims are valid.
- Confirm—Obtain confirmation that you heard the participant's message accurately. If not, start the sequence over again at the beginning by having the participant restate his or her view.

Remaining neutral and controlling context without fail. Neutrality may be your most significant challenge, but it is also a defense mechanism. Being neutral means letting go of the "I," the ego, a personal stake in the specific output of a meeting. Neutrality means staying focused on the Meeting Approach, not a specific solution.

Neutrality represents a discipline that does the following:

- Conveys acceptance of opposing views.
- Draws out quiet people and perspectives.
- Prevents facilitator alignment with "sides."
- Validates the Meeting Approach.

Collaborating: How You Manage Conflict

Meeting conflict derives primarily from individual thinking styles, individual behavior, group dynamics, and oth-

er situational factors, including the facilitator and their environment. The meeting facilitator is not responsible for resolving conflict. However, they must have a procedure for (and therefore be confident about) managing arguments, conflicting claims, and contradictory evidence.

> Rules help you and the group establish decorum, keep conversations on track, and get DONE faster.

Ground Rules

Ground Rules provide norms for the behavior of groups. Rules help you and the group establish decorum, keep conversations on track, and get DONE faster. Ground Rules apply to participants equally and, therefore, are unbiased. Consider these primary ground rules:

Be here now. Encourage people to keep laptops down and phones on stun (vibrate only). Do not permit text messaging during the meeting.

Silence or absence implies consensus. As meeting facilitator, you must stress that each participant has a fiduciary responsibility. If participants have content relevant to the conversation, it is their duty and responsibility to mention it.

Consensus means "I can live with it." Carefully define consensus so that people know it does not necessarily mean that they will get their "favorite" outcome. However, consensus does imply that we are 100 percent in agreement to support the result, though it might not be everyone's or even anyone's personal favorite.

Make your thinking visible. People do not think causally. They think symptomatically. For example, two people eating the same type of curry may argue over how "spicy" it is. To one, the curry is hot. To the other, it is not. They are both correct. A great meeting facilitator will get the two people to "objectify" their claims so that they both can agree that the curry rates 1,400 Scoville Heat Units.

No hiding. For video conferences, enforce a rule that prohibits people from turning off their live video stream. When people are hidden, no one has any idea what they are doing or if they are even listening.

Conflict as Challenge and Opportunity

There is no instructional class in the world that will teach you how to facilitate a resolution to all meeting conflict, especially arguments. Sometimes, people or parties refuse to agree simply because they do not like each other. It is not your responsibility to resolve the conflict. However, you can rely on four steps to help you manage meeting conflict that frequently yield consensus:

Confirm or clarify purpose. Effective conflict resolution depends on shared purpose. Competing purposes lead to competing solutions.

Document positions and interests. When meeting conflict develops, participants may hear what was said, but they need to understand under what conditions the position holds true (and remains valid or not). Understanding the why behind their positioning requires additional challenge, leading to disclosure of their true interests.

Appeal to objectives. To help resolve conflict, learn to sequentially appeal to objectives, starting with the objectives of the product or project and then proceeding with objectives of the department or program, of the business unit, and of the entire organization that your meeting supports. If the CEO were in the meeting, which argument would he or she say better supports organizational objectives—and, more important, why?

Escalate. If the first three steps, in sequence, fail to drive consensual resolution, escalate decision-making by taking the documented positions back to the executive sponsor, steering team, or decision review board.

Structuring: Meeting Design Made Easy

No group wants the leader to ask group members how they want to proceed. They need a meeting leader prepared with the right approach and tools who will tell them how to proceed, keep them focused on the right questions, and explain how their responses support the deliverable (getting DONE).

Successful meetings demand a clear purpose (beginning), a meaningful Meeting Approach (middle), and a consensual

review and wrap (end). A Basic Agenda lists the Agenda Steps (topics to be covered) and is used by participants to track progress.

An Annotated Agenda describes in detail how the facilitator will lead the group to get DONE. Each Annotated Agenda includes a Basic Agenda but details and explains the tools used during each Agenda Step. Each tool uses procedures that a meeting facilitator unveils at appropriate times as discrete activities, questions, tasks, and visual prompts.

By using tools, each Agenda Step produces its own deliverable, such as prioritized criteria or a decision or assignments.

Use the following guidelines for every significant meeting you lead:

1. Codify the purpose and scope of the meeting: What project or product are you supporting? Stipulate what it is worth in currency and FTP (Why is it important? How much is at risk if we fail?).

2. Articulate the deliverables: What specific content represents the output of the meeting and satisfies what DONE looks like?

3. Identify known and unknown information: What is already known about the organization, business unit, department, program, product, or project? What information is needed to fill the gaps?

4. Draft Basic Agenda Steps: Compose a series of steps from experience or other proven approaches that would be used by experts to build the plan, make the decision, solve the problem, or develop the information and consensus necessary to complete the deliverable and get DONE.

5. Review Basic Agenda for logical flow: Walk through the Agenda Steps with others to confirm that they will produce the desired results.

6. Identify meeting participants: Determine the optimal subject matter expertise you require or the meeting participants who can provide the information required.

7. Detail the procedures to capture information required: Gather and assemble specific questions that need to be addressed, even questions for which subject matter experts are seeking answers. Sequence the questions optimally. Build your Annotated Agenda, including the appropriate Tools and activities to produce the information.

8. Perform a walk-through with business experts, the executive sponsor, project team members, and anyone else who will listen to you.

9. Refine: Make changes identified in the walk-through, edit your final Annotated Agenda, firm up your artifacts, fill out your glossary, complete your slides, distribute your handouts, and rehearse.

Planning Approach for Any Group: Who Does What, by When?

The word "plan" can be defined with three words (preferably five), namely "who does what" (by when)—that's a plan. This section shows you how to facilitate consensual agreement around those answers for any group.

A robust Planning Approach defines vision factors, success measures, actions, and responsibilities. While a planning session's input begins with why a group exists, the output documents what team members agree to do.

Here is a Basic Planning Agenda:

- Launch.
- Mission (why are we here?)
- Values (who are we?)
- Vision (where are we going? How do we know if we got there or not?).
- Success Measures (what are our measurements of progress?
- Current Situation (where are we now?)
- Actions (what should we do?—from strategy through tasks).
- Alignment (is this the right stuff to do?).
- Roles and Responsibilities (who does what, by when?).
- Communications Plan (what should we tell our stakeholders?).
- Review and Wrap.

Let's discuss the first three of these. **Launching** is when you introduce yourself and stress the importance of meeting roles; unveil your meeting purpose, scope, and deliverable; cover "administrivia" to clear participants' heads from thinking about themselves; provide a check-in activity or icebreaker, especially for online meetings and workshops.

Values define the principles or internal rules, laws, policies, and philosophies of conduct—the "stuff" we carry with us and value.

You also carefully explain the logic behind the sequence of your Agenda Steps; explain how Agenda Steps relate to one another; and share Ground Rules.

Mission defines the why of any business area or organizational scope. Mission expresses why the participants, or group, or organization show up—the purpose and reason for their existence. The Mission expression provides the foundation upon which other Planning Approach Agenda Steps are built. Each subsequent Agenda Step refers to the Mission expression (as purpose), ensuring harmony with the Mission of the group and organization.

For example, the Ritz-Carlton's mission is "Ladies and gentlemen serving ladies and gentlemen."

Values define the principles or internal rules, laws, policies, and philosophies of conduct—the "stuff" we carry with us and value. They answer simply, "Who are we?"

Values may be narrative descriptions of policies or philosophies. They may be full-sentence descriptions or phrases. For example, "The Ritz-Carlton experience enlivens the senses, instills well-being, and fulfills even the unexpressed wishes and needs of our guests."

Keep in mind that groups can identify both descriptive values (we are this way and walk the talk) and prescriptive values (hopes and aspirations). The former is associated with traditional management, while the latter is more associated with servant leadership.

Deciding About Anything Approach: Agree on the Why Before the What

Frequently you discover that people have similar purposes, values, and criteria, and yet they cannot agree. Why? People cannot agree because they have different priorities.

This section shows you how to forge consensual decisions by developing purpose, options, and decision criteria. Whether you are deciding which new software to use, which product to develop, or which corporate acquisition will be your most valuable target, several building blocks are required for all decisions:

Purpose of the object. The purpose of the object establishes the why before the what. Understanding why is so critical to building consensus that it needs to be listed as a separate Agenda Step, even though it may take less than 10 minutes to accomplish. Use the Purpose Tool to construct a basic requirement (I want X so that I can do Y) or to build consensual expressions that capture the benefits, intent, purpose, and reason for any scope of work. Prompt your participants: "The purpose of [insert object] is to . . . so that . . ."

Options (for the Object). This is a list of options, the myriad objects from which to choose. Depending on the situation, these could range from a few (for example, half a dozen) to many (dozens). Facilitate a quick and thorough Listing with no discussion.

Decision criteria (for the object). Decision criteria capture the reasons for deselecting or getting rid of poor options. While engaging in some Listing activity associated with Brainstorming, do not mandate or enforce that "all ideas will be allowed." Here we are restricting ourselves to appropriate reasons. Embrace the sense of "no discussion," but also confirm appropriateness if there is any doubt.

Deselecting and decision. Deselecting and decision smash together the options and decision criteria. The result is a consensually agreed-on decision, selection, or determination of the object. Eliminate any options that do not satisfy mandatory requirements such as not exceeding budget. Eliminate any options participants personally object to after they give specific reasons for their objection and those reasons are considered valid by others.

The simplest and most frequently used PowerBalls Tool provides quick support, especially for deselecting. PowerBalls help a group quickly and simply prioritize, using the Pareto principle (also known as the 80-20 rule) to help a group deselect and eliminate as many options as quickly as possible.

Controlling: Online Challenges and Special Situation Tools

Effective online facilitation requires line of sight, listening skills, conflict management acumen, and meeting design. In fact, learning what to do remains most critical, because how you complete facilitated meetings can be easily modified once you know what to do.

The larger the group, the more your meeting facilitation skills need to keep any one person from dominating online meetings. Remember, scope creep begins in meetings.

Research and results are quite clear: You can expect online meetings to take much longer to accomplish the same amount of work than in-person meetings. Participants stay more fully engaged when they are observed, can observe others, and "feel" nonverbal clues and intonations. Moreover, 30 to 60 percent of "meaning" (the intent behind the words or message) is communicated or expressed outside of the words that are selected.

Launching

Getting and keeping people involved takes a concerted effort from start to finish. Get off to a good start by setting a good example:

- Log in first and early.
- Set camera at face height, or very slightly above (not below, looking up at rolled chins and nose hairs). Look at the green dot on the camera, not your monitor. Please smile.
- Introduce each participant to subsequent arrivals.
- Lean forward into the camera to command attention. Your head should normally occupy about 25 percent of the screen.
- Confirm early that every one can hear each other clearly.
- Provide Ground Rules and then enforce them. Add the Ground Rule "no hiding."
- Consider assigning people separate roles to help you, such as a time-keeper or a specialized note-taker for each of the following: action items, decisions, communications about who needs to be informed what updates, and so forth.
- Establish and enforce protocol demanding that speakers announce their names (or nicknames) when taking a turn speaking.
- Regularly remind participants where you are in the agenda, preferably with a visual indicator.

We're all connected. On occasion, our cords get knotted. World-class facilitators are servant leaders. Potent servant leaders should be facilitating, because facilitating removes knots, making it easier for connections to flow.

The first step to becoming a world-class meeting facilitator is to be a servant leader, and the first step to becoming a world-class servant leader is to become conscious of natural law and the importance of helping others remove their knots.

As a Certified Structured Professional Facilitator (CSPF), lead instructor, and managing director of MG RUSH Facilitation Training and Coaching, Terrence Metz is passionate about training students to lead meetings that produce clear and actionable results every time. His professional experience has focused on mergers, organizational design, problem solving, process improvement, product development, and strategic planning. His decision- making tools for galvanizing consensus, including Perceptual Mapping and Quantitative TO-WS Analysis, are used worldwide.

Moments of Impact

How to Design Strategic Conversations That Accelerate Change

by Chris Ertel and Lisa Kay Solomon

THE SUMMARY IN BRIEF

In our fast-changing world, leaders are increasingly confronted by messy, multifaceted challenges that require collaboration to resolve. But the standard methods for tackling these challenges — meetings packed with data-drenched presentations or brainstorming sessions that circle back to nowhere — just don't deliver.

Great strategic conversations generate breakthrough insights by combining the best ideas of people with different backgrounds and perspectives. In *Moments of Impact*, authors Chris Ertel and Lisa Kay Simmons "crack the code" on what it takes to design creative, collaborative problem-solving sessions that soar rather than sink.

Drawing on decades of experience as innovation strategists — and supported by cutting edge social science research, dozens of real-life examples and interviews with over 100 thought leaders, executives and fellow practitioners — the authors unveil a simple, creative process that leaders and their teams can use to unlock solutions to their most vexing issues.

IN THIS SUMMARY, YOU WILL LEARN:

- The key differences between meetings and strategic conversations.
- The five core principles for designing strategic conversations.
- How to effectively confront resistance, or the "yabbuts," in your organization.
- Things that strong strategic thinkers do habitually.

Introduction

Faced with a tough challenge that calls for collaboration — such as increasing competitive pressures or a shift in business models — most leaders will reach for one of two well-worn devices: the standard meeting or the brainstorming session. While both are fine for many situations, neither is sufficient for dealing with messy, open-ended challenges.

There has to be another option — and, thankfully, there is. Strategic conversations are the third way. A strategic conversation doesn't feel like a regular meeting or brainstorming session. It is its own distinct type: an interactive strategic problem-solving session that engages participants not just analytically but creatively and emotionally. The defining features are that the stakes are high, the answers unclear, and the participants are expected to create real insights together — rather than play out prepared scripts — across organizational boundaries.

Adaptive Challenges Call for Adaptive Leadership

Ronald Heifetz, a leadership teacher at Harvard Kennedy School, draws a critical distinction between technical and adaptive challenges. *Technical challenges* involve applying well-honed skills to well-defined problems — such as building a bridge or organizing a production line. Technical challenges may be complex, but they can still be resolved within well-understood boundaries. In these situations, more traditional, hierarchical approaches to leadership work well.

Adaptive challenges, by contrast, are messy, open-ended and ill defined. In many cases, it's hard to say what the right question is — let alone the answer. Many of the most important strategic challenges that organizations wrestle with today are adaptive challenges. Navigating and solving adaptive challenges demands a different set of leadership muscles — such as asking penetrating questions, winning the full engagement of colleagues, and connecting insights from different sources in real time.

Leaders face a world-class dilemma: They need to make good strategic choices under uncertainty while engaging more people with different perspectives more effectively in the process — and do it all faster, too. To do this well, we've got to put the people back into strategy — in a much smarter way. Today, more than ever, strategy is the conversation.

Designing a Strategic Conversation

You probably already know how to run a pretty good meeting. You know that you need clear *objectives* that are reasonable given the time you have. That you should invite *participants* who can help meet those objectives. That your *content* — presentations and reports — should lay out the issues clearly. That the *venue* should be the right size for your group and contain the necessary equipment and supplies. That your *agenda* should end with next steps, roles and responsibilities.

This basic model works well for the vast majority of meetings: routine check-ins, formal board meetings,

planning sessions and the like. But not when it's time to have an important conversation about critical yet ambiguous issues. That's when you need a more powerful tool. It's critical to recognize early on when you are facing an adaptive challenge, call this out explicitly, and start designing your session as a strategic conversation.

The Five Core Principles of a Well-Designed Strategic Conversation

Designing an effective strategic conversation requires that you cover all the basics of a well-organized meeting — and a good deal more.

Designing a strategic conversation means creating a shared experience where the most pressing strategic issues facing an organization are openly explored from a variety of angles. An experience where all the assumptions that make up your mental maps about how the world works — and how it is changing — are examined. An experience where new stories about your future success are explored, tested and refined. An experience that engages a group in a deeper level of discussion than they thought possible.

The five core principles below are the main components of our process for designing strategic conversations.

Core Principle 1: Declare the Objectives ➔ Define the Purpose

A well-organized meeting requires that … you start with a clear set of objectives and desired outcomes that make sense and are realistic given the time available. *A well-designed strategic conversation* also *requires that …* you develop a clear sense of the change that this group of people needs to make together — and how this conversation will advance that process.

Core Principle 2: Identify Participants ➔ Engage Multiple Perspectives

A well-organized meeting requires that … you identify the most appropriate participants for a given session and prepare them well in advance. *A well-designed strategic conversation* also *requires that …* you dig deeper to understand the views, values and concerns of each participant and stakeholder group. Ultimately, it requires that you find ways to create value from the intersection of diverse perspectives, experiences and expertise that live inside any organization.

Core Principle 3: Assemble Content ➔ Frame the Issues

A well-organized meeting requires that … all content be highly relevant to the objectives and clearly communicated. *A well-designed strategic conversation* also *requires that …* the content and issues are *framed* in a way that illuminates different aspects of the adaptive challenge you're wrestling with, including how the various parts relate to the whole. A good frame helps makes insights "stick" and thus accelerates progress on tough issues.

Core Principle 4: Find a Venue ➔ Set the Scene

A well-organized meeting requires that … you find an appropriate venue given the size of your group and the nature of the meeting. *A well-designed strategic conversation* also *requires that …* you make thoughtful choices about all elements of the environment — from the physical space to artifacts to aesthetics. Like a great theater production, all the parts should come together in a seamless and integrated way.

Core Principle 5: Set the Agenda ➔ Make It An Experience

A well-organized meeting requires that … you follow a logical sequence of agenda items, typically starting with some form of orientation and ending with next steps. *A well-designed strategic conversation* also *requires that* you attend to the emotional and psychological experience of participants. A great strategic conversation is not just an intellectual exercise — it's an exhilarating and memorable experience.

Define Your Purpose

Imagine that your organization is facing a thorny adaptive challenge. Maybe an aggressive new competitor is stealing your market share, or an attractive but complicated growth opportunity is opening up.

Once an organization recognizes that it's facing an adaptive challenge, it typically sets out on a winding road of exploration, discussion and action that eventually leads to decisions and results. It comprises many different interactions and touch points that unfurl over time, including informal discussions, intensive research, formal review meetings, working-team sessions and — most important — strategic conversations.

This kind of creative problem solving follows an arc of divergence and convergence. You start by taking a broad perspective on a challenge, then gradually shift into identifying and winnowing down possible solutions over time.

Key Practice 1: Seize Your Moment

Strategic conversations are pivotal, synthesizing moments within this larger process. They enable a group to achieve new levels of clarity and coherence about their adaptive challenge — and help move leadership teams toward deeper levels of shared commitment and understanding. While an adaptive challenge rarely gets "solved" in

any one conversation, a well-designed session can release tremendous energy and create forward momentum. These moments of impact propel a group forward, often opening new avenues of insight and alignment along the way.

Key Practice 2: Pick One Purpose

Strategic conversations have just three overarching purposes: Building Understanding, Shaping Choices or Making Decisions. Any strategic conversation you can imagine will sort into one of these categories. A well-designed strategic conversation must focus on one — and only one — of these three types. If your group doesn't know much about the issues — or has sharply divergent opinions on them — you need to run a Building Understanding session. If they have tons of knowledge but are spinning their wheels on what to do, it's time for a Shaping Choices session. Only when you've done both of these jobs well should you consider calling a Making Decisions session.

Key Practice 3: Go Slow To Go Fast

An important part of running any good meeting or strategic conversation is getting to a clear list of next steps. When approaching a strategic conversation, it's common for participants to push for agendas that drive faster toward agreement and decision making than is realistic. That's a problem because people need time and space to process together the complexity of adaptive challenges. Groups that make the effort to get to a true moment of impact — that is, some deep alignment on important insights — recognize this as progress. After they reach this point, they can usually start taking action — fast.

If you leave a strategic conversation without consensus, no list of next steps — no matter how "action oriented" — is likely to help. By contrast, when your group walks out of the room with genuine agreement around some important new clarity, you can always sort out next steps later.

Engage Multiple Perspectives

Adaptive challenges require leaps of insight that usually only come from combining ideas from different places in new ways. Anywhere people are generating new ideas at a standout clip, you'll find a rich ecosystem of diverse perspectives coming together.

Great strategic conversations do this, too. They capture some of the magic of the coffeehouse, the scientific lab, and the after-hours bar where great cooks or musicians or entrepreneurs swap their latest ideas. To get some of this magic working for you, you have to do at least three critical things: bring together the right perspectives, create a common platform for collaboration, and carefully lean into the most important differences of opinion in a way that sets off a "controlled burn" of contained and productive conflict.

Key Practice 1: Assemble a Dream Team

Getting the best possible group into the room is key to a successful strategic conversation. Yet, most project teams are both too inclusive and not inclusive enough. While they fill the list with people they feel obliged to include, they end up excluding — or don't even think of — other people who could be a huge help. From the extensive research on creative collaboration, three findings are especially relevant to pulling together a dream team for your next strategic conversation:

1. Good ideas often come from bridging the gaps between people and groups with different areas of expertise. In the lingo of social network theory, most people live in dense "small worlds" of social connection that are separated by gaps or "structural holes." People who can bridge these gaps create valuable connections between people and ideas.
2. Novel solutions to stubborn problems often come from outsiders and nonexperts. The history of innovation is full of stories about outsiders who discovered breakthroughs that took experts by surprise.
3. The most productive groups are often those with moderate levels of familiarity. If a group works together on one project after another, they can get stuck in habits and routines that aren't conducive to creative insight.

Key Practice 2: Create a Common Platform

Once you've got the right perspectives lined up for a session, you need to start building a *common platform* for creative collaboration. This is an important task because strategic conversations can sometimes raise uncomfortable uncertainties, create status anxiety, carry real potential for loss, and raise the possibility of conflict. A critical part of your job is to find ways to offset and manage these stresses.

Eight key "planks" that make up a strong common platform for strategic conversation include having a sense of shared purpose and objectives, a sense of group identity and community, a common understanding of the challenges, a sense of urgency, a shared language system or

common definition of key terms, a shared base of information to drawn upon, the capacity to discuss tough issues, and common frames through which to see the issues.

Key Practice 3: Ignite a Controlled Burn

Once you've got a diverse group standing on a common platform, it's time to start mixing it up. We like to think of talking about challenging topics as setting off a "controlled burn" — similar to the kind that firefighters create to protect and nurture forest ecosystems. Below are eight different ways to get a group to talk about combustible topics while keeping a bit of distance from the heat that they throw off:

- Take a longer time perspective on the issues.
- Take an "outside-in" perspective, focusing on external drivers of change.
- Turn the challenge into a game or simulation.
- Focus the discussion on key assumptions, not conclusions.
- Have people walk in the shoes of others.
- Make the group grapple with tough trade-offs.
- Agree on neutral criteria for making choices.
- Set and maintain clear boundaries and ground rules.

Frame the Issues

To make progress on adaptive challenges, you as the strategic conversation designer need to do more than just gather all the relevant data for participants. You need to make smart choices about where and how to direct their attention within this mass of complex and often conflicting signals.

As the word suggests, a *frame* is a strong focusing device — a set of operating instructions for the mind. Good frames for strategic conversations turn your attention to what matters most while lighting up your peripheral vision at the same time. As a strategic conversation designer, an important part of your job is to frame (and reframe) the issues in a way that directs the attention of your group in productive ways. Here are a few key practices that can help you enable your group to arrive at shared insights more quickly and effectively.

Key Practice 1: Stretch (Don't Break) Mindsets

Your participants will surely bring their own frames — often implicit, unstated ones — with them to your session. When creating any frame for a strategic conversation, you need to keep one eye on the content and one eye on the perspectives of your participants. This means working hard to understand these perspectives before developing alternative frames. It also means testing your frames with a few key people ahead of time to make sure they resonate. When you create frames that stretch — not oppose — participants' mindsets, they have a good chance of becoming "sticky," laying a strong foundation for strategic conversation.

Key Practice 2: Think Inside *Different* Boxes

Groups facing adaptive challenges are often exhorted to "think outside the box" — an overused cliché that doesn't provide instructive guidance. To get to creative solutions, you need to help your group approach their familiar challenges from a number of angles and lenses. You need to help them think inside boxes that are different from the ones they're used to. Options include scenario planning, simulations and role-playing activities, such as taking on the personas of specific customers to find and solve problems from their point of view.

Key Practice 3: Choose a Few Key Frames

Most strategic conversations are built around a small number of key frames, usually three or fewer. In choosing these frames, your main goals are to focus attention in the right places and to ensure that group members are solving the same puzzle together at the same time. Frames can take many forms, including questions, catchphrases and metaphors, visual frameworks and stories.

For example, framing a focal question is one form. Pollsters have known for ages that the way that you frame a question can have a major impact on the answers you get. This observation also applies to strategic conversations, where a well-framed question can be one of your most powerful tools. At other times, a meme can become a framing concept, a catchphrase that acts as shorthand for a more complicated idea or argument. With visual frameworks, a simple visual image is one of the best ways to help a group see the same thing at the same time.

Finally, a critical form is the *output frame*, a bridge between what happens in a session and what needs to happen next. Creating a "sticky story" can be an especially effective way to ensure the insights of a session live on in an organization. Stories are natural translation tools: They tell what happened in a way that engages our imagination and makes us want to learn more.

When designing your next strategic conversation, you'll want to spend serious time thinking in advance about both your *input* frames — how you are setting up the problem and content of the session — and the kind of *output* frames you hope to leave with. As your frames

get smarter and more evolved, so should the choices and actions your group makes as a result.

Set the Scene

Most people, when charged with finding a meeting venue, will ask, "Where's a place that has everything we need?" Black-belt (expert) designers of strategic conversations ask instead, "Where and how can we create the best environment to support our purpose?" Instead of thinking like a project manager or an event planner, they think like a producer and a host. They fuss over finding the right kind of space — then work hard to make it their own. They bring visual thinking into the program. And they *do* sweat the small stuff — big time.

Key Practice 1: Make Your Space

Scant attention paid to meeting spaces violates not just common sense but reams of research on the ways that space shapes our mood, behavior and productivity. Access to natural light has been found to boost academic performance, workplace productivity, psychological well-being and physical health. The color scheme of a room can impact how people approach problems, with blue walls fostering creativity and red ones raising urgency. Moderate levels of ambient noise inspire higher productivity.

A space doesn't have to be loaded with extras to support a strategic conversation — it just has to get the basics right. We think of these basics as making up a *shell space*, which can then be customized for a specific purpose and group. A checklist of basic room requirements for strategic conversations includes making sure the room size doesn't feel cramped or cavernous; that the shape allows everyone to see and be easily seen; that the space works well for both plenary and breakout sessions and includes windows; wall space for hanging materials; comfortable seating and minimal visual distractions.

Key Practice 2: Get Visual

People are natural visual thinkers. Field research shows that vision trumps all other senses when it comes to how humans learn and remember. For a strategic conversation, you have at least six kinds of visuals to think about:

1. **Prepared materials**, such as slides, posters, handouts or timelines.
2. **Process templates**: worksheets or templates designed to help guide participants through a series of steps.
3. **Frameworks**: visual models that help structure conversation and connect individual issues to a larger challenge.
4. **Prototypes**: drawings or other renderings of working-draft ideas and solutions.
5. **Live capture**: Flip charts, graphic recordings, photographs and digital interfaces that capture and curate content in real time.
6. **Emergent sketches**: any visual interface used for real-time exploration and idea building, such as mind-mapping, doodling or a graffiti wall.

Almost every effective strategic conversation features some combination of these elements. The key is to be thoughtful about which ones to use — where, when, why and how.

Key Practice 3: *Do* Sweat the Small Stuff

Obsessive attention to detail is a hallmark of all great design. Steve Jobs of Apple was renowned for his insistence that all parts of the Apple system — devices, software interfaces and retail experiences — be elegant, integrated and consistent. Designers of strategic conversations are no different. They know that little details matter. So they fret over them, always scanning for opportunities to shrink risk factors and improve participants' experiences.

One major risk in any session is distraction. Strategic conversations require extended periods of focused conversation — a rarity in our age of hyperactive multitasking. People will often jump at any excuse to shift their attention elsewhere. Black-belt designers are tenacious about hunting down and banishing all sources of distraction. This means making sure that all equipment and supplies are in place; the room temperature is moderate; the furniture is comfortable; nearby noise levels are low; and food will be delivered at a reasonable time and place.

When you get the small stuff right, people notice it — often subconsciously — in a way that increases their engagement and confidence. When you mess it up, people really notice it — in a way that can undermine their trust in you and in the process.

Make It An Experience

When planning a strategic conversation's agenda, your primary goal should be to *create a powerful, shared experience*. This way you can strike the right balance between your content and your people. This focus on experience may sound counterintuitive. Many people think of "experience" as a nice-to-have additional layer — such

as kicking off a session with a pleasant dinner, finding a great off-site venue, or making sure the meeting materials look pretty. But the experience of a strategic conversation means much more than this. It means looking at the session as a psychological and emotional journey as much as an intellectual one.

Key Practice 1: Discover, Don't Tell

Serious research shows that people have a remarkable cognitive immunity against learning from presentations — even when they want to. Lectures don't work for two reasons: 1) They overload listeners with more information than their brains can handle at one time, and 2) the listeners are passive. By contrast, what does work, in study after study, is *experiential learning* — enabling people to discover key insights and concepts for themselves, with a bit of guidance.

Joe Redish, a physics professor at the University of Maryland, helps students learn Newton's second law of motion by dropping two balls of different weights simultaneously from a second-story window. Intuition tells us that the heavier ball should land first, but Newton's law says that's wrong. When the two balls hit the ground at the same time, Newton's law becomes hard to forget, long after the formula has faded from memory. Lessons learned from vivid experiences such as this are fiendishly hard to unlearn.

Key Practice 2: Engage the Whole Person

Designers have long understood that reason and emotion are interconnected. In his classic book *The Design of Everyday Things*, cognitive psychologist and design theorist Don Norman shows in detail how great designs — of products, buildings or services — engage and delight their users as whole people.

The best strategic conversations are like this, too. They engage your head and gut equally, and you're not asked to make choices between the two. A common assumption is that we should keep our passions out of important meetings, as unchecked emotions can bring out our worst instincts and subject us to all kinds of biases. But a roomful of hyperrational Mr. Spocks can't solve an adaptive challenge.

When designing a strategic conversation, ask, "How can we best engage participants as whole people? How can we tap into their logical *and* emotional selves in a way that leads to smarter choices and action?"

Key Practice 3: Create a Narrative Arc

At first glance, setting the agenda for a strategic conversation is essentially the same as for a standard meeting. In both cases, you need to generate a list of topics and activities, then sort them into a logical sequence that fits into the allotted time. However, black-belt designers approach their agendas with a different mindset. They think in terms of creating a "narrative arc" — a flow of activities that moves from beginning to end, just like a good story line.

The narrative arc concept comes from the world of drama. A five-part structure — introduction of characters, rising action, climax, falling action and resolution — captures the arc of most plays. But given that strategic conversations are more fluid than a play or a movie — participants have more say in where the story goes — black-belt designers don't follow a set formula in crafting their arcs. Rather, they customize the experience based on an understanding of the specific group of people and the issues they're facing. The next time you approach an agenda for a strategic conversation, try thinking less like an air traffic controller juggling a list of topics and interests — and more like a screenwriter or deejay.

Confronting the 'Yabbuts'

Now that you're familiar with how to design strategic conversations, it's time to visit the dark side. By this point, we suspect you've collected a good number of yabbuts in your head. That's the word that innovation-strategy pioneer Larry Keeley uses to describe thoughts like "Yeah, sure this all sounds good — but here's why this would never work in my organization." Most of the time, when a session flops, it's because it fell victim to at least one of three big yabbuts: politics, near-termism, and what we call the karaoke curse.

Yabbut 1: Politics

The phrase *political organization* is redundant; all organizations are political. Every participant at a strategic conversation brings self-interest to the table, even if few of them will talk about it freely. But while there's no such thing as "no politics," there is a continuum that runs from "bad" to "good." Bad politics is about individual self-interest, control over resources and empire building. Good politics, by contrast, involves honest debate about ideas, values and an organization's future direction.

To be sure, there are many shades of gray in between. Most people will enter a strategic conversation with mixed motives. Even "good" politicians must work to gain and retain power in order to be effective. The key is to keep a watchful eye out for common political pitfalls and address them in ways that can steer a strategic conversation away from bad politics and toward the good. Common

pitfalls include refusing to declare who has decision rights, faking participation, excessive deference, agenda hijacks and others.

Yabbut 2: Near-Termism

In today's rapidly changing environment, all organizations need to balance short-term goals with long-term growth if they want to thrive beyond the next few quarters. Unfortunately, near-termism is hardwired in our brains. One of the best-documented cognitive biases is temporal discounting — that people predictably put higher value on benefits or costs that are in their face now over ones that will come later. Temporal discounting is a big part of the reason we fail to exercise, succumb to tempting foods, "forget" to floss our teeth, neglect to save for retirement, or suffer from disabling addictions.

In the famous Stanford Marshmallow Experiment, researchers found that the ability of children to delay gratification by choosing to take two marshmallows in 20 minutes rather than one marshmallow now had long-term predictive value. In follow-up studies, preschoolers who were able to wait the extra time had greater self-control and success as adults. Organizations could learn a lot from these kids. We need more incentives to offset the powerful effects of temporal discounting — not reinforce it — if we want to thrive for years to come.

Yabbut 3: The Karaoke Curse

Ever been to a karaoke bar? After a couple of drinks, even a midlevel marketing manager might believe he can belt out Sinatra's "My Way" as well as the chairman of the board. After all, it *looks* easy when other people sing well. *Karaoke skills* is our term for areas where people's confidence tends to exceed their competence.

Strategic conversations tend to surface a number of karaoke skills, such as presenting, group facilitation or collaboration skills. But the most important is strategic thinking. Like any serious skill, strategic thinking takes time to master, and you can quickly spot a black belt (or a karaoke performer) when you see one in action. Here's a short list of things that strong strategic thinkers do habitually:

Systems thinking: Construct — and constantly tinker with — mental models about how their business works to solve problems and spot new opportunities.

Scanning and pattern recognition: Perpetually scan for new data points and insights from a wide range of sources — including those beyond their industry.

Challenge own assumptions: Invite other people to challenge their thinking as well as their underlying thought processes.

Balance future and present orientation: Consider the future and the present needs of their business at the same time, without conflict.

Synthesis and storytelling: Take observations and ideas from a wide range of contexts and combine them into coherent stories about future options.

Hypothesis testing: Look for quick-and-dirty experiments to test emerging hypotheses and see what works.

Make *Your* Moment

Strategic conversations counteract the yabbuts. Defining a clear purpose and engaging multiple perspectives help to neutralize bad politics. Giving people a visceral experience of future possibilities keeps near-termism at bay. Framing the issues enables better strategic thinking and more creative solutions. In well-designed strategic conversations, the yabbuts don't disappear. But they get starved of oxygen long enough to get important work done.

That's when you — a budding black-belt designer — can raise your ambition and lean in harder. Because your real goal is not just to neutralize the yabbuts. It's to get people focused on creating a better future with a sense of common purpose in an environment where creativity and collaboration can flourish.

When leaders show the capacity to face an adaptive challenge, they can propel their organization forward in powerful ways. Confidence and optimism become contagious. People spend more of their time thinking about and planning great things they can do next. Designing great strategic conversations is challenging and rewarding work that can also be fun. Most important, it's one way that just one person can have outsize impact on the future of an organization — and beyond.

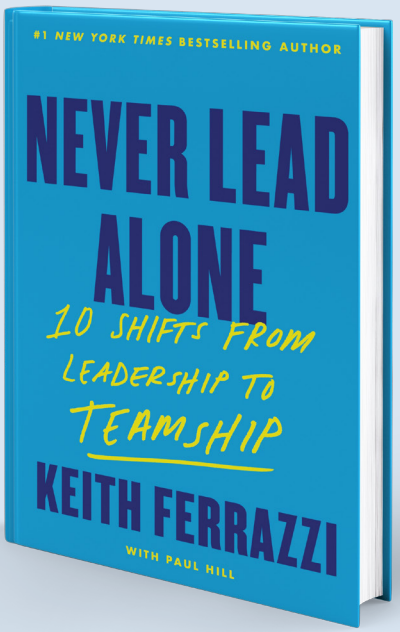
So go ahead, make *your* moment. And when you do, don't be too surprised to find that you're pushing on an open door.

RECOMMENDED READING LIST

If you liked *Moments of Impact,* you'll also like:

1. ***No More Pointless Meetings*** **by Martin Murphy**. Murphy reframes the entire concept of collaboration and introduces four "Work Sessions" that replace meetings to get more done faster than ever before.

2. ***Just Listen*** **by Mark Goulston.** Goulston reveals the secret of how to get through to anyone, even when productive communication seems impossible.



3. ***Stop Workplace Drama*** **by Marlene Chism.** Chism shows how to change the way you and your organization confront and work through problems and implement effective strategies in a drama-filled organization.

Never Lead Alone

10 Shifts from Leadership to Teamship

By Keith Ferrazzi

Keith Ferrazzi is an entrepreneur and global thought leader in high performing teams and Chairman of Ferrazzi Greenlight and its Research Institute. He is the author of the #1 New York Times bestseller *Who's Got Your Back* and bestsellers like *Never Eat Alone, Leading Without Authority,* and *Competing in the New World of Work.* He is a frequent contributor to Harvard Business Review, the Wall Street Journal, Fast Company, Forbes, Inc, Fortune, and other publications. Ferrazzi's twenty-year history of transforming C-Suite executive teams has made him an agent of transformation among the world's greatest and most sought-after coaches.

A Book Review by Soundview

Mobilize the Full Potential of the Team

Keith Ferrazzi's book, ***Never Lead Alone: 10 Shifts from Leadership to Teamship*** focuses primarily on what members of a team can do to improve overall work output and organizational success. As will be shown, Ferrazzi believes that too many companies rely on the solid leadership of key individuals rather than hold all people accountable for increasing productivity and success wherever and whenever they can. Ferrazzi recommends reliance upon the use of diagnostic tools within teams to both help gauge and improve teamwork within organizations. He notes from the outset that the diagnostics he recommends are not very effective if the questions are just given to team members. The questions become much more effective if they are explained in detail to team members. Then when the diagnostics illustrate areas in which improvement can be made, Ferrazzi gives concrete steps for how organizations can improve in these areas. His book is one about promoting teamwork rather than about being a more effective leader from the top. It is about elevating a whole team rather than holding one person in an esteemed and prized position.

Co-Elevation

Ferrazzi begins his book with a discussion on the importance of teamship. He believes that a switch to collaboration is key. Ferrazzi goes back to his childhood to discuss his father's employment in the steel industry during Ferrazzi's childhood. His father would complain that he was urged to slow down because "he was making the boss look bad as he was outworking his peers and throwing off the measured piece rate by his work pace." While Total Quality Management practices would have allowed his father to help his team shine, the steel industry did not adopt these practices. Ferrazzi's ambition and education led him to want to help the manufacturing industry from the inside. This led him to advocate for teamship because good leadership alone cannot help the best teams. Quality teamwork is the only thing that can. For Ferrazzi, "the shift to teamship has two driving forces: co-elevating behaviors" and "twenty-first-century collaborative processes and tools" which require teams to abandon the importance they place on meetings. Ferrazzi then breaks down this shift to teamship into

"behavioral practices and process shifts" that he then discusses in detail throughout the rest of his book.

The first shift Ferrazzi recommends is "shifting from hub-and-spoke to the leader to co-elevation of the team." The main rule he promotes is a commitment to "all goals of the team and each other to get there." To illustrate the importance of this rule, Ferrazzi tells the story of Sergey Young who was attempting to open up his own time while achieving 10x growth in his professional life. It turned out that what was limited the progress of his team was his own hard work and ambition. He needed his team "to become the growth engine." He knew he had a strong team, but he needed to figure out how to get them to work together. His team needed to commit themselves to the concept of co-elevation which "is the set of behavioral commitments among a team to the mission and to each other." Teammates needed to stop merely co-existing and start working together. Ferrazzi writes about the importance of a team's social contract which refers to the practices, behaviors, and beliefs that help increase accountability. No longer is the leader solely responsible for making changes to improve the team. Everybody on the team holds this responsibility to make positive changes. This shift often focuses on "an awakening to the hope and possibility that a new set of behaviors and level of performance is possible."

Candor, Bonding, and Resilience

The second shift Ferrazzi discusses is a shift "from conflict avoidance to candor," and it requires teammates to speak courageously. In order to create this "culture of candor," Ferrazzi recommends "The Things That Matter Outlier Team Meeting" which is a type of meeting Bill Connors uses at Xfinity. The purpose of this type of meeting is to get teammates to talk about even the most difficult situations in a public meeting rather than after the meeting in private which is what people tend to do. Ferrazzi quotes Connors as saying that "If you do that [talk about areas in which growth is needed publicly rather than privately,] you can start to condition the whole employee base with being comfortable with candor and setting a new standard for high-performing teams." Ferrazzi gives numerous strategies for increasing candor in teams. Among these are conducting small meetings with as few as three people to discuss difficult issues. These mini-teams then report back to the larger team. Another strategy Ferrazzi recommends is making sure to hire people skilled in candor in the first place. Teams need to come to an appreciation of the value of feedback as the gift that it is.

"Purposeful team bond-building" is the focus of Ferrazzi's next shift as teammates focus on becoming ever more bonded to one another. This helps loosen the grip of functional silos. Ferrazzi states that "Only 41 percent of team members believe caring, trusting, and supportive relationships exist with their peers," and "Fifty-eight percent of employees say that they trust strangers more than they trust their own associates at work." This can stem, in part, from resentments that have grown over the years after trust has been broken. Oftentimes bonding within teams has happened through chance encounters in the office, but now that people frequently work remotely and with a desire to change things rapidly, there is no time to rely on these serendipitous encounters. Trust comes in three forms: "professional trust, structural trust, and personal trust," all of which are crucial. Ferrazzi recommends three different practices to help build trust. The first he calls sweet and sour in which teammates spend the first five minutes of a meeting discussing something that is going well and something that is challenging in their life at the moment. Second, he recommends deeper personal professional check-ins which are longer than sweet and sours and that give each person in a team a few minutes to discuss "where you might be struggling, personally and professionally." He also recommends intimacy dinners which happen four times a year and in which people tell "the stories that made us who we are today."

Ferrazzi's next shift asks the reader to shift away from focusing on individual resilience in an attempt to prioritize team resilience. This requires people to be constantly lifting up their teammates. This also requires all members to focus on being members of their team. Ferrazzi describes how Cisco used this philosophy by asking their team "members to read obvious warning signs of a coworker struggling" which could consist of actions like turning off the video feed during meetings and contributing less to the discussion as a whole. Ferrazzi refers to resilience as "a team's ability to sustain the energy we all have for the work and commitment to support each other's mental and emotional well-being." Ways to prioritize team resilience include performing an energy check in which members are asked to numerically rank their level of energy at the beginning of a meeting. Not all members need to be incredibly energetic. Everybody has their role to play. What is important is to look for dips in energy. He also recommends performing a resilience check in which each month teams focus on "topics shown by research to erode resilience" in an effort to gauge how team members feel their team resilience is. In these ways, organizations can actually help improve the well-being of their members which will in turn help the team as a whole.

Meetings, Agile, and Celebration

Ferrazzi's fifth shift refers to building more broadly and boldly "through meeting shifting." Ferrazzi believes "we're now in the third wave of the reinvention of work." The first wave focused on "Total Quality Management (TQM) and Six Sigma," and the second wave centered around "agile software engineering." Both of these waves were spearheaded by engineers, but our current third wave requires the work of human resources because this wave is concerned with people coming back into work. Ferrazzi believes organizations should focus on how to move forward with work rather than simply getting back to work. Work must be untethered in four different ways. First, "Teamship is untethered from the traditionally siloed org chart" meaning that companies must rethink how they define what a team is and which members from a different parts of an organization should be a part of a particular team. Second, teams must "embrace radical adaptability" and avoid merely being reactive. Third, teams must act both in broad as well as in big manners. This requires teams to embrace collaboration as a way to enable diversity to "give us the bolder ideas we need." Finally, teams need to "untether from meetings as the primary form of collaboration" because there are numerous ways

> *. . . traditional meetings work for people who can think on their feet. Many do not perform their best in these meetings because they need to take a moment to process information."*

beyond just in-person meetings to deal with issues. After all, traditional meetings mainly work best for people who can think quickly and on their feet. Many people do not perform their best in these meetings because they need to take a moment to process information before being able to properly respond. Ferrazzi details the collaboration stack which consists of asynchronous, remote, hybrid, and in-person collaboration all of which work best for different purposes.

The focus of Ferrazzi's book then turns to agile as the optimal operating system for teams. Ferrazzi quotes IBM CEO Arvind Krishna as saying, "It's not the instinct of most executives to operate in agile because what has most likely made them successful and put them into senior positions is that they were able to progress and innovate by coming with a suggested outcome all packaged up with a bow around it and presenting it to the boss." Agile, on the other hand, requires people to show their work, even the messy parts. Nickel LaMoreaux, also of IBM, says that the benefit of agile is that it breaks "complex problems into manageable pieces and timelines." Ferrazzi notes that it can be difficult for companies to fully implement agile across an entire enterprise, but Ferrazzi focuses in his book on the basics that can help all organizations. In this vein, Ferrazzi focuses on key aspects of agile. He starts with "creating a customer-centric agile brief," breaking projects down into small pieces and then stress testing those smaller pieces. Teams must also be empowered to improve between sprints. Finally, a clear process must be in place for teams to make speedy and great decisions that details everybody who must be involved in the decision. Ferrazzi goes into more detail in his book about these different steps organizations can take.

Next Ferrazzi recommends "shifting from a culture of scarce praise to peer celebration and recognition." In this section Ferrazzi quotes Carol Clements of JetBlue saying that she wants her team to be excited about coming into work. She wants those in her organization to feel valued and to feel like they contribute in a meaningful way. Ferrazzi says that "our research shows that teams don't celebrate enough," and that frequently a lack of recognition is what prompts people to leave their jobs. Ferrazzi believes that even underperformers should be celebrated. After all, pushing struggling people down even further will prompt them to produce even less, and that is precisely what avoiding celebration does. He talks of the value of celebrating "the highs that they are achieving and…[the] things that you want them to achieve." He describes numerous different types of celebrations that organizations can employ. One of these is seeding recognition. This type of celebration is impromptu, and it asks people to drop "praise you know will get back" to people. As an example of this, he describes one time when he heard an employee's father was not doing well. Ferrazzi called the father and told him how great the son he raised was and how well he has done at work. These words made a lasting impact on both the employee and on his father. Another tactic Ferrazzi recommends is what he calls "exploits of the week" in which individuals highlight people or teams each week who deserve praise. This type of praise reinforces those very behaviors that are being praised. Ferrazzi also talks about the benefits of peer celebration that occurs when teams round-robin share monthly about where they see people excelling. In these peer celebrations, each team member is tasked with praising other members of the team.

Diversity, Coaching, and Alignment

The case has already been made that diversity is important in organizations, but Ferrazzi believes that "how we interact as diverse, equitable, and inclusive teams remains an underrated and underexplored topic." Ferrazzi believes that "a diversity of people and voices achieves breakthrough performance." He delves into three different practices teams can implement to help maximize their DEI efforts. First, teams need to focus on otherness. Ferrazzi states that "The power of otherness is that it recognizes that the workplace is a microcosm of society." These differences ought to be celebrated. Ferrazzi talks about how he felt like an other while a student at Yale because he had a blue collar upbringing. In addition, early in his career he felt like an outsider because of his homosexuality. Teams ought to listen to the ways in which teammates have felt like an other because it will help them appreciate the different perspectives people hold.

Next, teammates ought to focus on privilege and obstacles. He is clear to note that privilege and obstacles affect people of all demographics. Having a certain privilege in life does not mean a person does not have very real obstacles in other areas of life. Privilege merely acknowledges that certain things in life are easier under certain circumstances. For example, it is easier to have money than to not have money. This conversation can be hard in fragile teams, and outside help may be needed. Ferrazzi states that, "It's not about victims or villains. It's about understanding who we all are and the hidden advantages and obstacles that we've experienced along the way." Finally, teams need to "hold out for the right slate." This means that if the candidates for a prized position are not diverse, then an organization is better off waiting until they have found ample diverse candidates to make a decision.

Ferrazzi's penultimate shift refers to "shifting to a team of

seekers who are each other's coaches." He talks about e.l.f. Beauty. Common belief originally did not hold that it would be possible for an online cosmetics company to thrive because the belief was that cosmetic decisions were too intimate to be made anywhere but in an in-person store. The people at e.l.f. Beauty proved this wisdom wrong as they created a successful cosmetics company. CFO Mandy Fields describes how she was coached by the company's CMO about her storytelling abilities. The CMO told her that instead of answering questions directly, Fields would be best served by taking her listener through an exploration of how she came to her answer. The CMO helped Fields hone this skill, and Fields in turn helped the CMO understand the financial side of the organization better. This is co-elevation, "the commitment to the mission and commitment to care about each other enough not to let each other fail."

A prized value at e.l.f. Beauty is candor, and the company tells new employees this from the very beginning. Everyone is responsible for caring about and for supporting everybody else. They do this through everyday feedback as well as through biannual team meetings where the primary focus is on giving feedback. To facilitate candor and feedback, Ferrazzi recommends Open 360. This requires every person on a team to share various information about each person. The focus is both on strengths and on areas in which improvement is needed. This requires trust and a solid commitment to the betterment of each other.

Second, he recommends "Dial Up/Dial Down." This is primarily a self-reflective exercise in which team members evaluate their performance and commit publicly to either dial up and do more of a good behavior or to dial down and do less of a negative behavior. Teammates share their commitments to aid in accountability. Finally, he recommends a "5/5/5 learning roadmap" in which teammates share progress on their goals for five minutes and then answer questions from teammates about their roadmap to success for five minutes before finally spending five minutes in which team members give "double-barrel feedback."

Ferrazzi's final shift is "from silos to alignment." After all, "Siloed organizations are unaware of the challenges and needs of their peers so they maximize for their piece of the pie." He believes that "members of world-class teams know what their teammates are working on, what goals are being activated; they know everyone is aligned on the same critical mission." To increase alignment, Ferrazzi recommends a collaborative problem-solving teamship practice where teammates consider their mission, what remarkable things will be there when they are about to achieve that mission, what the biggest obstacles to attack are, and what is "most likely to derail" the team.

Ferrazzi's goal is to help his readers more fully understand the importance of focusing on a teamwork mentality. A mentality focusing on leadership is centered around a person or a small group of people. What Ferrazzi advocates for is that all team members lift one another up. Throughout his book, Ferrazzi effectively gives questions organizations can ask of their teams to accurately assess where teams fall on a number of important issues. He then gives tactics that team members can use in order to improve on the areas they need to in order to succeed. He also provides obstacles for teams to look out for. Because of its clear layout, use of real world examples, and actionable items, his book is easy to understand as a company strives to improve the efficacy of its teams.

5 Steps for Embracing Change — Building a Business That Thrives Into the Future

by Lior Arussy

THE SUMMARY IN BRIEF

The old business model of adapting to change for continued success is dead. Change is the new normal. There are no more periods of stability and predictability. There is only change. This continuous upheaval can undercut morale, decrease productivity and decimate profits, or it can be a game-changing opportunity.

A leading authority on customer-centric business transformation, Lior Arussy illuminates the path to opportunity. In *Next Is Now,* he helps corporate leaders and their employees view change as an opportunity to become invested, drive that change, and achieve more success and job satisfaction than if change were simply implemented from the top down.

Based on his experience working one-on-one with major corporate clients, Arussy shares his five-step Future Ready Impact program and guides change-impacted employees and business owners from a victim mentality to one of participation and ownership. For organizations seeking to thrive in the drastic, continual change that is now their everyday reality, *Next Is Now* offers groundbreaking, essential guidance.

IN THIS SUMMARY, YOU WILL LEARN:

- Why we fear and resist change and how to overcome those fears.
- To find your core cause and use it to ride the waves of change.
- A five-step process for not just managing but thriving in change.
- How to lead change resilience.

Change Resilience

Entire industries are disappearing and undergoing fundamental changes at a pace we have never encountered before. The music business was altered forever with the creation of iTunes and streaming services. The automobile industry is starting to feel the pinch from ride-sharing companies like Zipcar. Banking is now done online with a slew of new financial empowerment tools that turn every millennial into an educated banker. Travel agents? A distant, fading memory.

Our natural reaction to all of this change is resistance. And the more change thrown at us, the greater our resistance.

If we are not future ready, we reject it. But the price of our aversion to change is a loss of marketplace relevance. It hinders our ability to continue to make an impact on a world that's evolving faster than ever before.

If employees are emotionally ready for change, the chance that a new strategy will succeed is exponentially higher.

The human body can only handle so much change — and the same is true of an organization made up of large groups of human beings. So whether you're leading a change at your organization or being asked to take part in one, take heart: In this approach, we start by remembering everything that doesn't change.

We do this by identifying our "core cause"— our individual or organizational responsibilities, our mission, our values. Your core cause is a bridge that stretches from your past or your company's earliest days into the future. If your connection to your core cause is strong enough, you'll be supported the whole way.

Defining Your Core Cause

Your core cause is the reason you exist. The higher purpose that drives you. It is usually defined by the people you serve or who are enjoying the benefit of your efforts: How do your customers use your product or services? What does it empower or inspire them to do? How does it make their lives better or easier?

For teachers, a core cause might be to educate and inspire, not the tests and quizzes they give. For bankers, it is the creation of financial confidence among their clients, not the spreadsheets or formulas they use.

When you feel deeply connected to your core cause, specific tools and processes lose their power over you. The tools will always evolve. The core cause will not.

Fear of Change

People's responses to change have nothing to do with logic. We're hardwired to hold on to the Now instead of embracing the Next. After all, the Now is comforting and predictable. We do not want to leave this presumably safe, familiar place. It is reassuring and comforting. Losing it is like losing a piece of ourselves.

The Next, on the other hand, is hard. Why? In a word: *fear*. Anything that deviates from the status quo scares people. We reflexively resist new ideas and new ways of doing things because we cling to the past.

People will frequently express concerns about the future such as "What will it be like?" Such statements, however, are deceiving. If you attempt to address them, you will miss the deeper, underlying issues.

Underneath every future-based fear, there are two deeper fears: fears rooted in the past and fears triggered by the challenge to one's identity. When people are stuck in the past, they struggle with how to contextualize their past performance with a need for change. They need to place their performance in a positive light before they can engage with the future-based fears.

Identity-based fear takes this a step deeper. Often people feel that the upcoming change is a threat to who they are and not just what they do. They struggle with more existential questions about the impact of the future on their values and how they define themselves. Addressing those deeper fears is essential to preparing for the future.

The Judgment of the Past

Sweden is rapidly becoming a cashless society. One in five transactions happens digitally, and cash payments amount to less than 2 percent of the value of all payments in the country. Retailers aren't required to accept physical currency and many don't, preferring payment by credit card or smartphone. Swedes can't even use cash to pay for public transportation and many other key services.

As a result, many Swedish banks no longer keep cash on hand or allow deposits. ATMs are vanishing rapidly. Most financial transactions of any kind are completed electronically, and the trend is only accelerating.

For a Swedish bank teller with decades of experience at the counter, cashless banking tells her, "You're useless." She will struggle to reconcile the hard work she has invested over the years with the shiny new technology that renders all of it obsolete. She will wrestle with accepting what is, to everyone else, an unambiguous improvement.

Typical change initiatives are so preoccupied with celebrating the future that they fail to recognize the importance of the past and those who labored to get the organization here. It is only when we respectfully acknowledge the significance of the past that we begin to get people unstuck. This requires proactive communication and a genuine understanding of the history of the organization leading up to the change.

If you're leading a change program at your organization, it's your job to make people comfortable by creating a meaningful transition between the past and the future. If you're an employee tasked with adapting to a new change, you have the opportunity to help your colleagues and customers embrace the change by demonstrating the connection between the past you've lived and the future you will build.

The Secret to Change Resilience: Engagement

If you're currently resisting a change, ask yourself, "Am I truly engaged with the process or its proposed outcome?" Be honest.

If you don't know the answer, here are some other questions to ask: "When asked to make a change, do I think creatively about how to approach it?" "If I'm driving the change at my organization, do I ask employees for their ideas?" "When charged with making a decision or solving a problem, would I prefer to defer to my managers so I'm not held responsible?" "Do I give my employees opportunities to solve problems related to change?"

Much like good customer service, creativity around change cannot be dictated from the top. Employees need to personally decide to change — and to think creatively about how to change. A paycheck only buys your employees' passive attendance — but compliance isn't enough. You need engagement.

In 2016, the consulting group Strativity launched a nationwide study of 30,183 adults, in an attempt to better understand employee engagement. The study found that when people are inspired to act, understand the need they are addressing for their customer, and have their role in making an impact clearly communicated, they are ready to make a difference.

In other words, people demonstrate the highest engagement not when their personal needs are being met but, rather, when they feel empowered to make an impact and help others. People in the study felt most engaged when they were doing something meaningful with a clear impact on a real human being.

An organization that provides its employees with the tools to make a real impact on people's lives is the company that will have the most engaged employees. Consider these three drivers of engagement:

- **Engagement Driver #1**: Give people the power to have an impact on someone else's life.
- **Engagement Driver #2**: Put customers at the center, and empower people to serve them.
- **Engagement Driver #3**: Give employees personal ownership of the strategy.

Whether you're being asked to embrace some new change at work or you're willingly embarking on a personal transformation, the same drivers apply. If you want the change to stick, ask yourself how it could benefit others.

Are You Future Ready?

Are you ready to embrace the unknown? To be proactive and stay ahead of the game? To own your destiny — and use your skills to help others?

The following five-step Future Ready Impact process was designed to help you get there — and to take your colleagues and your organizations with you. These five steps are designed to accelerate change and guide you to the next place you belong. They will empower you to be the authority of your life.

Step 1: Face It!

The first step in embracing change is getting honest with yourself about the reason for it: anything from industry trends and technology advancements to a changing customer base or environmental factors. Your challenge? Face the change squarely and objectively and decide your next step.

Facing the facts is difficult. Therefore, we wear different lenses when we face any data suggesting that change is needed. These lenses come in many different colors. None of them, unfortunately, are the ones we need: the colorless lenses that allow us to see clearly through to the mirror.

The blue lenses tell us the change is doomed from the start. Why bother changing? It won't help. The red lenses make us mad. The data must be wrong — it certainly contradicts what we believe to be true.

Pink lenses see the status quo as rose-colored, diminishing the intensity of the data and the sense of urgency. "I'm working on it already," we tell ourselves with a smile. "It's all good." The green lenses tell us change is too expensive. Staying the current course is the prudent financial approach.

The black lenses simply will not see anything. We know our job so well that we don't have to pay attention to industry news and trends. Just keep doing the same work, and everything will be fine.

Do you remember the Wells Fargo fake accounts fiasco of 2016? Employees at the bank created millions of fake accounts for real customers in order to boost their sales figures and make more money. This disaster resulted in the firing of 5,300 employees and eventually led to the resignation of the company's longtime CEO on October 12, 2016.

A case of denial on an astronomical scale. How could so many people see the facts and not address them? How could so many people believe they would get away with this? What were they planning to tell their customers about the fees they were charging for fake accounts?

We are not dealing with one rogue person here. This was an institutional approach. Their aggressive sales quotas — the green lenses — biased the judgment of 5,300 employees who were able to put their integrity aside and even risk their jobs to increase profits. For many people, our preoccupation with the here-and-now is enough to keep us oblivious to the inevitable change happening all around us.

What Would a New CEO Do?

That's the question Andy Grove, the legendary founder of Intel, would ask at critical strategic junctures: "What would a new CEO do?"

In his book *Only the Paranoid Survive*, he describes how this little game would help him look at problems with a fresh set of eyes — and without worrying about politics. He wanted to face the facts squarely and without any personal biases.

We can take a cue from Grove whether we're driving a change initiative, being asked to embrace a new tool or system, or approaching a change in our personal lives.

If you're a manager, put your employees in the CEO's seat. Let them face the same facts you've been given and reach their own conclusions. It is amazing what happens when instead of forcing employees to be passive recipients of change, you ask them to join you in analyzing harsh realities. Many initiatives fail because leaders don't take this step, giving employees a perfect excuse not to change. By putting employees in the driver's seat, on the other hand, you allow them to engage with the facts and reach their own conclusions.

As for those of you who've been asked to change or who are proactively diving into the Next, try imagining the advice you would give to someone seeking the same results. Pretend you have no emotional entanglement. As you consider the complexity of the problem before you, you will start to see a clear direction for the future. You will start to sense the urgency — and understand why a change is necessary.

Step 2: Analyze It!

Step 1 asked you to suspend your fears and emotions. Now, Step 2 asks you to turn them loose. Without understanding how your emotions are holding you back from changing, you cannot successfully move forward.

A rational decision alone will not turn you into a champion for change. Our emotions often make the choice about whether innovative strategies are adopted or not.

Emotions matter. They are the bloodline of change. Before developing new skills, we must develop emotional readiness.

Fear of Getting Hurt

When designing a cancer treatment center experience, it's important to consider every aspect — everything from the look of the waiting room to the amenities available in each treatment room. But you can design the most comfortable and soothing center in the world, and if the employees are not engaged, patients will feel no comfort.

When the subject of emotional engagement came up with nurses at the cancer treatment center Strativity had been asked to design, their reluctance to truly engage with patients was surprising. While they knew quite well the importance of connecting emotionally, they worked to maintain boundaries with patients whenever possible.

When asked about it, they explained it was a method of self-preservation. The pain their patients experienced — and the fact that some didn't make it — was incredibly difficult for the nurses. As a result, they were not willing to open up. They were afraid to get hurt. As one nurse put it so succinctly, "I do not want to go to any more funerals."

Many of them saw their patients' suffering and deaths as a sign of the nurses' inability to connect with them. Despite all their efforts, many patients didn't get better. Thanks to that deep emotional insight, Strativity decided upon an approach that addressed the nurses' frustration and sense of helplessness.

They began to design the patient experience as a journey, not as a destination, redefining the role of the nurse as a personal guide. No longer did nurses need to feel responsibility for "solving" the patient's illness. Instead, they could act as the patient's companion. By recognizing the nurses' distress and sense of impotence, a new approach to managing change was developed.

The results were phenomenal. The nurses felt a new sense of purpose and fulfillment. The patients' reaction to this authentic care was beyond wildest expectations. Some even got tattoos of the logo of the cancer treatment center in appreciation.

Change may be painful, but there's no use ignoring it. Addressing the root of the pain and fear often helps you come up with the right solution for everyone.

Here's another fear: FOMO — the fear of missing out. FOMO is a term that has gained popularity in recent years, especially on social media.

When it comes to exciting new changes in our world, a little bit of FOMO can actually drive us to overcome our fears and embrace change. If our doctor recommends a new treatment regime for managing a chronic disease, skipping it would mean giving up on our future, on everything from seeing new places to experiencing our children's growth. Ignoring the latest technologies may prevent us from communicating more effectively with our loved ones.

Every change brings with it a new promise, a promise we will most definitely miss if we do not adapt in a timely manner. You could miss out on a life experience or an opportunity to make an impact on the world. Is your fear worth missing out on something so important?

Step 3: Redefine It!

Now it's time to accelerate your commitment to change. Acknowledging our fears does not mean we should let them dictate our future. In this phase, we will bridge the gap between past and future. We will personalize the change and understand the role it plays in our life's journey. This phase enables us to view change as a continuation of — not a departure from — the past.

After attending a session focused on teaching frontline employees to think like their customers, John, a product manager, decided to take action. He approached his colleagues, more than 200 of them, and asked them a simple question: "Who do you work for?" John asked each colleague to write his or her answer on a piece of paper and hand it to him. They all complied without thinking too much of it. After all, the answer was clear.

For the most part the answers were consistent. Employees worked for management: the people who hired them, the managers they reported to, the ones who could fire them.

After reading all the answers, John shared the following insight: "One day, your direct supervisor will retire. You don't work for him. One day, the CEO will get another job elsewhere and leave you behind. You don't work for him. One day, the head of sales will win the lottery and move to Jamaica without as much as a backward glance. You don't work for him either. One day the shareholders will sell their stock and move their investments elsewhere. You don't work for them either. We all have one ultimate boss. It's our customer."

We often forget this simple yet invincible truth. No customer = no business = no job. It is as simple as that. If customers stop entering your store or visiting your website, the game is over.

Recognizing this is a critical step toward discovering your cause. You may not directly interact with customers every day in your line of work, but somewhere down the line there is a customer who needs you. Every job, every transaction has a customer. That person needs you to deliver

to the best of your ability. The only way you will do so is if you recognize how much that customer needs you.

What's Your Core Cause?

It's time to identify your core cause and assess how it's connected to the change you're facing. The following two exercises will help you achieve this goal.

Exercise 1: Choose your cause. Imagine that you are free of any financial worries or obligations and have the opportunity to volunteer with the charity of your choice:

- Which charity would you choose? An organization dedicated to health-care reform? A mentoring program for kids? An environmental protection group?
- Why would you choose to volunteer there? Is it because you're attracted to manual labor, specialized work or fund-raising?
- How would you feel while volunteering there?
- What would you be known for at the charity? Would you be the comic relief, the one who always sees the silver lining, the person who wears his heart on his sleeve, the strategic thinker or the most dependable volunteer?

Exercise 2: Define your mission. Now use your answers from the previous questions to identify your mission. The previous exercise should focus your thinking and allow you to assess yourself in the most pure, unbiased, unrestricted way.

- What do you love? (your mission).
- Whom would you love to help? (your world).
- How would you like to impact them? (your skills and values).
- What future do you want to create for them? (your hope).

The answers to the above questions should allow you to answer the following questions: 1. What values define you? 2. How would you like to make an impact on the world?

Now that you know your cause, you are ready to redefine any change you face so that it aligns with who you are. Understanding how this change will affect the lives of your stakeholders and what your desired impact is will help you view change as a friend and not a foe.

Step 4: Grow It!

Now it's time to build your confidence in your ability to work or live the change effortlessly. To achieve this, we need to grow our skill sets.

During this step we will operationalize the cause that inspires us and apply it to our everyday activities, behaviors and interactions with customers. Operationalizing an idea means bringing it to life, making it real and relevant.

Change needs to be properly scaled — so we're going to start small by practicing our new behaviors in low-risk ways.

To make an impact, you first need to understand your customer. But this is not always easy. If you love music and you serve people who love music, you can relate. But the cardiologist who's never had a heart attack will never be able to fully understand what his patients are experiencing.

Operationalizing your commitment to change isn't just about adding in a new task here or there. Rather, it's about examining how you spend each day and determining where the new change will have an impact and how it will alter the way you perform. Here is a recommended process to "rehearse" the change:

1. Map your daily activities and responsibilities. What are you in charge of? How are you being measured? How do you fulfill your responsibilities? List all of your activities and the customers who benefit from them.

2. Identify the impact a change will have on your daily operations and activities. How will the change impact your activities? What will you have to do differently? What will stay the same? What might be eliminated altogether? What will the impact be on time available to you?

3. Visualize your new activities with the change. What will a typical day look like for you? How will it make you feel? How will it impact your customer? What does it do to the time available? What tools would you need to execute it? Draw a clear image of the newly delivered activities.

4. Create a step-by-step diagram of the new ideal state. What skills do you need to master? What behaviors should you adapt? What behaviors should you stop?

5. Develop a communication plan. Imagine you are communicating the change to your customers. How will you explain the need for it? How will you communicate the customer's role? How will you explain your future role? What will be your choice of words?

Let's look at a banker whose goal is to start operationalizing her job as the Creator of Customer Financial Security. Yes, the change she's grappling with is her bank's use of a new digital platform. But that doesn't change her role as someone whose job is to help customers feel like their financial lives are safe and secure.

We can actually rehearse how she can deliver the same exceptional service using a new set of tools: A customer arrives to discuss her unexpected divorce. Her husband

has always managed their finances, and she is now left with no clue as to how to move forward. Her life as she knows it is in ruins, she's an emotional wreck and now her financial world is in an equally dismal state. What does she need right now?

The old banker would have responded that the customer needs a line of credit, a new credit card, maybe a new checking account — all of which the customer can apply for via the new digital channels. But the banker in touch with her core cause will recognize that the customer's real need is for clarity and support. She needs to regain control over her life. She needs to develop new financial understanding. Without an emotional readiness and a sense of control, no financial product is going to make a difference. What she needs right now is a sense of hope and reassurance that the loss and sense of destruction she feels in this moment will not last.

Thanks to digital platforms that can perform a lot of the banker's old tasks, she is liberated to spend more time providing comfort and understanding to this particular customer. She can guide the customer's next steps, helping her see which products will best suit her needs. Helping the customer create a budget and enlisting her in digital alerts that will enable her to manage her budget correctly will create the sense of control — and hope — that she currently lacks.

By fusing the power of digital tools and human empathy, the banker can create a lasting memory and a value her customer will not forget. At the end of the day, in her moment of truth, she was there for someone who needed her.

Step 5: Own It!

To own change, you need more than just determination. You need a plan with goals and milestones. You need to celebrate successes and create a process for learning and adapting to whatever new changes come your way.

Many people have a vision of success but have no plan to operationalize it. Others have the opposite problem: They take all the right steps but fail to recognize success when it arrives. They simply let it pass by without any sense of jubilation and accomplishment.

To be change-resilient, we must address both issues. How? By developing an "ecosystem of success"— a set of activities that will allow you to activate new behaviors and weave them into your life. Consider the following activities:

Visualize success. Start by painting a clear picture of success — then move backward to identify the steps to get there. What do you need to stop doing? What do you need to start doing? What steps are required to achieve this journey?

Create daily rituals. A passionate, authentic daily ritual will get you aligned and connected. Building a ritual requires confidence and practice. Such rituals remind us of our commitment, reinforce the rationale behind it and demonstrate that we are making progress. They should refocus your attention on your core cause and remind you of what you need to do differently to bring your commitment to life.

Plan to fail. We need to recognize the temptations, time pressures and inevitable obstacles, and accept them. We will fail on our journey. We can also forgive ourselves — as long as we know we are ready to get back on track. So plan to fail. Accept it. And keep going.

Capture the success stories. As you venture on the road to personal or professional transformation, you're going to achieve a number of quantitative objectives. But first you will experience qualitative progress. A qualitative result is a story about the impact you've created. These reaffirming stories build your character, confidence and commitment to continue on the journey toward transformation.

Daily experiments. One way to get yourself future ready is to start experimenting in different areas of your life. Push yourself — but do so gently. When was the last time you tried a new PowerPoint template? Animation? Or *any* new feature? As you see that you start reaching your goals, extend your boundaries bit by bit.

Solicit feedback. Ask people for honest feedback. Invite them to rate — and even coach. Most of us rate our own performance as above average and declare victory before it is achieved. Let others help you reflect more accurately and support your progress.

Celebrate success — reward yourself. Reward yourself for sticking to the change plan and making it this far. At every milestone, take some action to make success visible and celebrate it.

Leading Change Resilience

Let's focus on how to lead change. If you start making positive changes in your life, you can bet people will start

asking how you did it. Here's your opportunity to think about how to scale your efforts so that you can help others live their core causes. This requires you to think about how the change will affect those around you and how to bring others on board to support your efforts.

Know your ecosystem. In the world of performing arts, Deborah Rutter is regarded as a true change agent. As the CEO of the John F. Kennedy Center for the Performing Arts, she is working to leverage its rich heritage while ensuring its continued relevance. Her first piece of advice? "Know your cultural ecosystem." In other words, change resilience ought to be developed based on what is natural to people and, therefore, intrinsic. Do not attempt to change who anyone is; rather, make sure your initiatives take into consideration their beliefs and values — and build from there.

The sum total of everyone's decisions. Leaders need to accept the fact that their role is not to decide but, rather, to empower decisions. After all, it is not the BIG decision made in the boardroom that matters much. It is the millions of small decisions employees make every day that activate the desired change in many ways.

Success isn't guaranteed. Transformation is, by definition, risky. You are attempting to do something you've never done. You don't know how it will work. That is part of the excitement and the fear. When you repeat something you've always done, on the other hand, that's safe. Unfortunately, it's also no longer special or distinctive. You can't have it both ways. If you want the excitement of the new, you must assume the fear of the unknown.

Nurturing employee engagement. As a leader, your main purpose is to help others reach new heights of performance. The more they achieve, the better your results will be. Consider the following techniques to create a culture of engagement:

- Set aspirational goals to motivate them. What is the next "exceptional" for them?
- Identify the tools they need to succeed, and empower them to accomplish their goals.
- Provide a safety net that allows them to feel comfortable to experiment and do things they've never done before.

Sharing impact with those working behind the scenes. If your organization does not serve customers directly or only provides back-office support, then sharing impact becomes even more critical. Use stories or customer testimonials to make the impact on customers clear to everyone at your organization. Every completed task should include a description of the impact it made on real people who live with the outcome of the team's work.

Do the human thing first. When you live by your core cause, doing the human thing first becomes almost as natural as breathing. Put people first, and the rest will follow. Employees who know that their organization puts people first will be more apt to act responsibly and proactively — even in the most challenging moments.

Proud to be here. Take a look around you. Are your people proud to be here? This does not mean just when you participate in a Habitat for Humanity project or during the alcohol-infused holiday party. This means on a day-to-day basis. Do they look happy? Are they sharing their work with pride? Do they see the connection their work has and the impact they are making? Pride is not a passive state of nirvana. It's active and it's powerful. It means empowering everyone to ask, "What's Next?"

Trust your conviction. Fear and doubts are a natural part of any transformation. Hold on to the cause and stay confident. As doubts try to creep in, recognize that the unknown aspect of transformation can be a source of excitement.

We all have the opportunity to start viewing change as a liberation. A world in which people stop changing is a world without progress. Our job as human beings is not to just accept the world the way it is but to build it as we want it to be.

THE SUMMARY IN BRIEF

Chris Dreyer didn't begin his professional journey thinking he would establish one of the most successful SEO agencies in the country. In fact, he studied history in college and landed his first job as a detention room supervisor for a local high school (this wasn't part of the plan, either). When his Google query, "how to make money online," directed him to digital marketing courses, Chris found his calling. Soon his own sites ranked number one for "double chin," "stained concrete," and "acai fruit." The rest, as they say, is history.

Now, Rankings.io hits the top of industry lists year after year as an SEO agency for personal injury lawyers. The company is one of the best for a simple reason: Chris has found his niche. In ***Niching Up: The Narrower the Market, the Bigger the Prize***, Chris Dreyer reveals the path to enduring notoriety and long-term profitability by way of a streamlined, specialized market focus. He debunks the myths associated with selecting a specific target and shares his stories of making it big by reducing his prospects. Sometimes success is about having the right mindset. Through Chris's personal stories of lessons learned and how he's learned them, you'll realize that good opportunities come to those who simplify.

IN THIS SUMMARY, YOU WILL LEARN:

- How to see your business through the niching lens.
- The benefits of niching.
- How to apply niching to any business vertical.
- How to figure out if niching is right for you.
- How to niche with the data you already have.

Introduction

"Niching up" means moving forward from a place of abundance and growth. Many individuals' biggest fear with niching is that by saying yes to one area, they're saying no to many others. But in reality, niching provides opportunities and gives you optionality.

By saying no to some things, niching opens the door to many things—including more or better possibilities. Far from narrowing your options, niching up opens a world of possibility to say yes to the people who are right for you and your business—the ones you are best suited to help.

Through the stories in this book, I hope I am able to help you learn from my journey with niching—both from my mistakes and what I got right. Along the way, I'll help you to see your own existing business, or the business you dream of founding, through the niching lens.

You'll understand the many benefits niching can offer, and how it can be easily applied to any business vertical. You'll learn how to figure out if niching is right for you simply by determining who it is that you are able to serve best and most efficiently. Finally, I'll show you that you don't need to undertake a ton of research or spend money to do any of it. You already collect all of the data that you'll need.

Attack of the Cons

When you do something that no one else is doing, you stand out. Every coach and entrepreneur loves to refer to niching as the Holy Grail of owning a business, and they always talk about the pros, but they tend to skip over the cons. But the reality is that there are both advantages and disadvantages to niching. The pros far outweigh the cons, but those cons do exist and we need to address them.

When you niche there is a smaller market and, therefore, fewer buyers. It can be more difficult and cost you more money to get in front of your target audience when dealing with a niche. Niching also introduces competition. Once you decide on a niche, there is a lack of diversity in your work.

Industry risk is another easily envisioned con of niching. Another potential con of niching is product perfection. When you niche, you may make things more difficult for your buyers by increasing the amount of effort and sacrifice they have to make.

Different industries and different markets are going to experience these cons at differing levels. The remaining chapters will focus on the advantages of niching up and how to use those advantages, well, to your advantage.

Awareness

Before you decide to niche, you should start broader by gaining more experience in your desired industry. If you just decide to go narrow out of the gate, it could be difficult to find buyers—or to even know which is the right niche for you. When you go broad and gain more generalized experience, you will have more awareness about your industry and market, as well as about potential niches.

Another benefit of first looking at the broader picture before choosing a niche is the ability to discover whether or not you have a natural competency in that niche. Once you do decide on a niche, you can identify opportunities you previously didn't even know existed.

You should choose a niche only after you've had those experiences, and you understand what you have a passion for and the competence to do, and the data supports you in choosing that niche. That's when you will begin to discover those other opportunities that weren't even available to you until you find your niche. Once you have decided to niche up (if that's what's right for you), you'll begin to experience the next advantage: becoming an expert in your niche.

Expertise

In his book *Outliers: The Story of Success*, Malcolm Gladwell posits the "10,000 Hour Rule." This is the notion that it takes roughly ten thousand hours of practice and repetition to become an expert in any single discipline. Expertise is important when niching up because people make buying decisions based upon two things: trust and their expectation that the individual they're buying from will achieve the outcome they're looking for.

When you are an expert in a niche, you gain two of the primary motivators we, as humans, all share: wealth and status. You are the best at what you do, so you can charge more. And, you are the best—the winner—and people want to work with and buy from the best. Niching up also brings status because you are going against the norm.

To become the best, you have to learn from the best. When you seek to get better at something, find someone who is already an expert in that subject to learn from. That is the

quickest way to accelerate your learning.

Premium Pricing

The first reason you can charge higher fees is because your customers are paying for your experience and expertise. The second reason you can charge more when you're an expert is because you're worth it. You understand the value you're delivering, and your clients will pay more for that value.

In order to increase your pricing, you have to first become an expert so that you're worth it. But in the beginning, when you are learning your craft and still working to become an expert, charge lower fees and create a low barrier to entry. Establish a track record of success and, as you do, raise your prices accordingly.

Pricing may vary based on the industry, because the niche you choose dictates how much something is potentially worth to your market. Once you have the stats to support your expertise, you then have to ask: how much are your buyers willing to pay? And what will they receive for that price? When considering pricing, you have to figure out the benefit that your customer or client will receive—how it will help them achieve their desired outcome.

Of course, you'll eventually hit a point where people—even your biggest supporters—won't continue paying more. The solution is to increase the value that you provide.

Conversions

This chapter focuses on another advantage of niching: having a higher rate of conversions. As we've established, every sales conversation is really a conversation about trust. By niching, you are aiming to show that prospect that you have experience, focus, and expertise in your area, so they are more likely to trust you. Because of that increased trust, you are more likely to convert those conversations into sales.

That completes the loop: you know what you are doing, so you have confidence; your prospect sees that confidence and develops trust in you; then, after converting them to a customer, you give them the outcome they want; and finally, your confidence is cemented both in your actual expertise (you did the thing!) and in your customer's perception of your expertise.

Additionally, niching up allows you to be more specific, which also helps increase conversions. Because you're solving a problem for one smaller group of people, for whom your product or service is designed, you can easily put words to that problem. Being specific makes you substantially more memorable and creates the perception of deeper expertise.

Finally, when you put all of this together—the trust, the proof, the confidence, and the specificity—niching helps you develop rapport with prospects more quickly, which makes it easier to convert them to clients.

Relationship Equity

When you are developing these relationships in your niche, you may start by working with smaller businesses or clients. As you gain experience and establish a track record of success, people in your market will grow familiar with you, so you can be seen as trusted. When they trust you, they are more likely to introduce you to their peers. This is how you can become a thought leader.

Join communities or associations your target audience are members of. Go to the conferences they go to, and spend time where they congregate. Once you get to know people and do business with them, your relationship network can grow exponentially.

Be a fan, not a stalker. A fan gives praise, accolades, and validation. If you start following someone in your niche wherever your people hang out online, don't be that person who just looks at their pictures all day. Comment on their posts, engage with them, and try to be helpful. If you're in person at a conference, go up to them and have a conversation about a recent win or something positive about them.

When you lead with value first, it lowers people's guard. It shows that you are a person of value, not just a taker. That can be an opening to a relationship. If you give value, other people are more likely to value you.

Referrals

A great way to help people and add value (which, as we also saw in the last chapter, builds relationship equity) is to give referrals. The best way to create a referral relationship is to give a referral, to give value. Even if you are not the person delivering the end goal, by giving a referral you are still helping someone achieve their desired outcome. You are still delivering value.

The best referral opportunities benefit three people: the person giving the referral, the prospect who is being

referred, and the person receiving the referral. Referrals create and build relationships, which can lead to marketing opportunities like speaking engagements, webinars, blogging, or podcasts. The number one way to get referrals is to give referrals.

Efficiency

We've talked about all the other pros of niching up that you've read so far, and this concept of efficiency ties them all together. You can be efficient with your processes, but you can also learn to be more efficient with referrals, with relationships, with conversions, and everything else just by gaining experience performing in one area with such expertise. By becoming more efficient, you can make more money, too.

Being efficient means using your resources without waste, and one of the most important resources we all have is time. The overarching benefit of being more efficient—and of niching overall—can boil down to one word: time. That's where value is created. That's also where profit is created. Time is what lends itself to trust, and a transaction is a form of time.

Conclusion

We've talked about wealth and status, and niching up gives you both. It leads to greater profit margins, and you also improve your status because you're better at what you do, you are an expert in the space, and you're confident in the results you deliver. Niching up gives you a sense of gratification, a sense of confidence, and a feeling of goodwill, knowing that you can truly serve the people that come to you, who need your help.

In a world of saturation and competition, all of us just want the best. When you niche, you focus all your efforts on doing what is best to help your customers. If you're a business owner and you have a passion for helping a certain market, I would encourage you to go all-in—to think not about the cons of having less, but to look at all the advantages of what niching up can mean for you, from the perspective of wealth and happiness.

If you find yourself competing in a red ocean with a ton of competition, you may benefit from looking at your audience and seeing who you can truly help provide the most value to. Find your own blue ocean—and remember: the narrower the market, the bigger the prize.

The No Asshole Rule

Building a Civilized Workplace and Surviving One That Isn't

by Robert I. Sutton, Ph.D.

THE SUMMARY IN BRIEF

The No Asshole Rule provides a compelling inquiry into the difficult challenge of having to work with other human beings, and what you can do about it. Author Robert I. Sutton, Ph.D., provides readers with practical ideas for what they can do about a poisonous work environment and how they can survive the people who inhabit it.

Sutton first addressed the taboo topic: the no asshole rule, in a landmark article published in the *Harvard Business Review*. When presented with Sutton's book proposal, Business Plus immediately pre-empted his book project for publication. The book struck an immediate chord with business audiences everywhere and landed on all the major bestseller lists despite the provocative title.

Sutton's target includes employees who are insensitive to their colleagues, corporate bullies and bosses who just don't get it. And unfortunately, most people have to contend with co-workers who are flat-out rude, selfish, uncivil, mean-spirited and really don't seem to care about who they step on.

The No Asshole Rule sheds real analytical light on how this ongoing problem ruins morale, lowers productivity and can truly devastate a company's culture. It also provides insight into how your company can pinpoint this problem and strategies for eliminating it.

IN THIS SUMMARY, YOU WILL LEARN:

- How to tell if you are part of the problem or part of the solution.
- How to drive out and reform nasty people or, when that isn't possible, limit the damage that these creeps do to you and your workplace.
- How to work with — and survive — bullies, creeps, jerks, tyrants, tormentors, despots, backstabbers, egomaniacs and all the other people who do their best to destroy you at work.

What Workplace Assholes Do and Why You Know So Many

Many of us use the term indiscriminately, applying it to anyone who annoys us, gets in our way or happens to be enjoying greater success than we are at the moment. But a precise definition is useful if you want to implement the no asshole rule. It can help you distinguish people who are having a bad day or a bad moment from persistently nasty and destructive jerks. And a good definition can help you explain to others why your coworker, boss or customer deserves the label — or come to grips with why others say you are one (at least behind your back) and why you might have earned it.

Researchers such as Bennett Tepper who write about psychological abuse in the workplace define it as "the sustained display of hostile verbal and nonverbal behavior, excluding physical contact." That definition is useful as far as it goes. But it isn't detailed enough for understanding what assholes do and their effects on others.

Although some assholes do their damage through open rage and arrogance, it isn't always that way. People who loudly insult and belittle their underlings and rivals are easier to catch and discipline. Two-faced backstabbers, those who have enough skill and emotional control to save their dirty work for moments when they can't get caught, are tougher to stop — even though they may do as much damage as a raging maniac.

There are many other actions — sociologists call them "interaction moves" or simply "moves" — that bullies use to demean and deflate their victims. Whether we are talking about personal insults, status slaps (quick moves that bat down social standing and pride), shaming or "status degradation" rituals, jokes that are insult delivery systems or treating people as if they are invisible, these and hundreds of other moves are similar in that they can leave targets feeling attacked and diminished, even if only momentarily. These are the means that assholes use to do their dirty work.

Many Workplaces Are Plagued With Them

There is a big pile of scholarly research that reaches much the same conclusions without using the term "asshole." It is conducted under the banner that includes bullying, interpersonal aggression, emotional abuse, abusive supervision, petty tyranny and incivility in the workplace. These studies show that many workplaces are plagued by "interpersonal moves" that leave people feeling threatened and demeaned, and often are directed by more-powerful people at less-powerful people.

For example, a 2000 study by Loraleigh Keashly and Karen Jagatic found that 27 percent of workers in a representative sample of 700 Michigan residents experienced mistreatment by someone in the workplace, with approximately one out of six reporting persistent psychological abuse.

The Best Measure of Human Character

Diego Rodriguez works at IDEO, a small innovation company and a civilized place to work. Rodriguez urges organizations to develop "a shock-proof, bullet-resistant asshole detector."

Here are two steps for detection:

1. Identify people who persistently leave others feeling demeaned and de-energized.

2. Look to see if their victims usually have less power and social standing than their tormentors.

These tests imply an even more fundamental lesson:

The difference between how a person treats the powerless versus the powerful is a good measure of human character.

The Damage Done: Why Every Workplace Needs the Rule

Every organization needs the rule because mean-spirited people do massive damage to victims, bystanders who suffer the ripple effects, organizational performance and themselves.

Damage to Victims

The vile effects of this behavior are confirmed by numerous studies in the United States, Europe (especially in the United Kingdom) and, recently, Australia and Asia.

Tepper's research on abusive supervision, for example, examined a representative group of 712 employees in a Midwestern city. He found that many of these employees had bosses who used ridicule, put-downs, the silent treatment and insults. These demeaning acts drove people out of their organizations and sapped the effectiveness of those who remained.

A six-month follow-up found that employees with abusive supervisors quit their jobs at accelerated rates, and those still trapped in their jobs suffered from less work and life satisfaction; reduced commitment to employers; and heightened depression, anxiety and burnout.

Similar findings are uncovered in other studies, with victims reporting reduced job satisfaction and productivity; trouble concentrating at work; and mental and physical health problems, including difficulty sleeping, anxiety, feelings of worthlessness, chronic fatigue, irritability, anger and depression.

Battered Bystanders

Assholes don't damage just the immediate targets of their abuse. Co-workers, family members or friends who watch — or just hear about — these ugly incidents suffer ripple effects. Tepper found that employees with abusive supervisors faced greater conflict between work and family, agreeing with statements like "The demands of my work interfere with my home and family life."

Demeaning jerks are victims of their own actions. They suffer career setbacks and, at times, humiliation. A hallmark of their behavior is that they sap the energy from victims and bystanders.

People who persistently leave others feeling de-energized undermine their own performance by turning co-workers and bosses against them and stifling motivation throughout their social networks. They also suffer because, even when they do their jobs well by other standards, they get fired.

The Dirty Dozen

Here are some common, everyday actions used by assholes:

1. Personal insults
2. Invasion of others' "personal territory"
3. Uninvited physical contact
4. Threats and intimidation, both verbal and nonverbal
5. Sarcastic jokes and teasing used as insult delivery systems
6. Withering e-mail flames
7. Status slaps intended to humiliate their victims
8. Public shaming or "status degradation" rituals
9. Rude interruptions
10. Two-faced attacks
11. Dirty looks
12. Treatment of people as if they are invisible

Impaired Organizational Performance

The damage that jerks do to their organizations is seen in the costs of increased turnover; absenteeism; decreased commitment to work; and the distraction and impaired individual performance documented in studies of psychological abuse, bullying and mobbing.

It must have cost producer Scott Rudin, one of the nastiest Hollywood bosses, a fortune — and a lot of time — to manage the entrances and exits of the 119 assistants who worked for him between 2000 and 2005 (or 250 assistants, if you accept *The Wall Street Journal*'s estimate rather than Rudin's).

The Upshot

A *Harvard Business Review* reader suggested that more companies would be convinced to enforce the rule if they estimated the "total cost of assholes," or their "TCA." As he put it, "The organizational impact, in terms of both retention and recruitment, lost clients [and] excess organizational calories being expended on the wrong things could provide some very interesting results."

Researchers Charlotte Rayner and Loraleigh Keashly demonstrate how to produce an estimate of such costs. They start by estimating (based on past studies in the United Kingdom) that 25 percent of bullying "targets"

and 20 percent of "witnesses" leave their jobs, and that the "average" bullying rate in the U.K. is 15 percent. Rayner and Keashly calculate that in an organization of 1,000 people, if 25 percent of the bullied leave, and the replacement cost is $20,000, then the annual cost is $750,000. They add that if there is an average of two witnesses for each victim, and 20 percent leave, that adds $1.2 million, for a replacement cost just shy of $2 million per year. ●

How to Implement the Rule, Enforce It and Keep It Alive

Several readers of the *Harvard Business Review* essay about the rule wrote to explain that the rule was a centerpiece of their leadership style. Roderick C. Hare, CEO of Mission Ridge Capital, wrote: "For most of my professional career, I have been telling anyone who would listen that I can work with just about every type of person, with one glaring exception — assholes. In fact, I have always used that very word. As much as I believe in tolerance and fairness, I have never lost a wink of sleep about being unapologetically intolerant of anyone who refuses to show respect for those around them."

Weave the Rule Into Hiring and Firing Policies

IDEO, one of the most successful innovation firms in the world, aggressively screens out demeaning and arrogant people. Many candidates are given job offers only after working as interns — people who have demonstrated under real working conditions that they aren't jerks. And when candidates haven't worked with IDEO before, people in the company take the time to filter out the bad seeds. Insider Rodriguez explains:

1. We really value references from people we trust. We also encourage staff to teach university classes and learn how job candidates perform in the classroom — especially in teams that are under pressure to do good work and do it fast.

2. We try to select for professional competence before people walk in the door so that the interviewing process can focus more on a person's human qualities (or lack thereof).

3. Once in the door, you'll probably speak to a good number of people — more than would seem reasonable by most corporate standards. It's all about creating a mutual feeling of "fit."

4. Every candidate is interviewed by people who will be above, below and alongside them, status-wise. And people from unrelated professional disciplines participate. That way, if you do get hired, you feel that the entire company wants you, not just one specific high-status manager — who, by the way, might or might not be a total asshole. This method also keeps assholes in a hiring position from replicating.

Rodriguez's last point is crucial. Research on job interviews and hiring decisions shows that a recruiter tends to hire candidates who look and act like his or her favorite person on the planet — himself or herself. Harvard Business School professor Rosabeth Moss Kanter calls this "homosocial reproduction," which means that the hiring process (unwittingly) causes most organizations to "bring in the clones." The implication is that assholes will breed like rabbits.

Managers will reproduce themselves in the hiring process, and soon, as Rodriguez says, your organization will have groups dominated by tools — which then start battling other groups or, worse yet, gain power and spread their poison everywhere. IDEO battles this tendency by having hiring decisions made by a broader group.

Teach People How to Fight

Enforcing the rule doesn't mean turning your organization into a paradise for conflict-averse wimps. The best groups and organizations — especially the most creative ones — are places where people know how to fight. At Intel, the largest semiconductor maker in the world, all full-time employees are given training in "constructive confrontation," a hallmark of the company culture.

Leaders and corporate trainers emphasize that bad things happen when "the bullies win," when fighting means personal attacks, disrespect and rude intimidation. These ill effects include "only the loudest and strongest voices get heard," "no diversity of views," poor communication, high tension, low productivity, and the belief that people are first "resigned" to living with the nastiness and then "resign" from the company. Intel preaches that the only thing worse than too much confrontation is no confrontation at all. So the company teaches employees how to approach people and problems positively, to use evidence and logic, and to attack problems and not people.

'Disagree and Then Commit'

The University of Michigan's Karl Weick advises, "Fight as if you are right; listen as if you are wrong." That is what Intel tries to teach through initial lectures, role playing and, most essential, the ways in which man-

agers and leaders fight. It teaches people how to fight and when to fight. Its motto is "Disagree and then commit," because second-guessing, complaining and arguing after a decision is made saps effort and attention — which obscures whether a decision is failing because it is a bad idea or whether it is a good idea that is implemented with insufficient energy and commitment.

People are also taught to delay their arguments until all the key facts are in, because it wastes time and because taking a public stance based on incomplete information leads people to defend and publicly commit to paths that ultimately clash with the best evidence.

Having all the right business philosophies and management practices to support the rule is meaningless unless you treat the person *right in front of you, right now, in the right way.*

The Top 10 Steps to Enforcing the Rule

Here's how you can enforce the rule:

1. Say the rule, write it down and act on it.

2. Keep your resident assholes out of the hiring process. Or, if you can't, involve as many "civilized" people in interviews and decisions as possible.

3. Get rid of assholes fast.

4. Treat assholes as incompetent employees.

5. Power breeds nastiness. Beware that giving people — even seemingly nice and sensitive people — even a little power can turn them into big jerks.

6. Embrace the power-performance paradox. Accept that your organization does have and should have a pecking order, but do everything you can to downplay and reduce unnecessary status differences among members.

7. Manage moments — not just practices, policies and systems. Effective asshole management means focusing on and changing the little things that you and your people do.

8. Model and teach constructive confrontations.

9. Adopt the one asshole rule. The rule might be most closely followed in organizations that permit one or two token jerks to hang around. These "reverse role models" remind everyone else of the wrong behavior.

10. The bottom line: Link policies to small decencies. Effective management happens when there is a virtuous, self-reinforcing cycle between the "big" things that organizations do and the little things that happen when people talk to one another and work together. ●

Bully Victims Quit

Researchers Charlotte Rayner and Loraleigh Keashly estimate that 25 percent of victims and 20 percent of witnesses of bullying leave their jobs, compared to a typical rate of about 5 percent.

How to Stop Your 'Inner Jerk' From Getting Out

Most of us, even the most "naturally" kind and mentally healthy, can turn caustic and cruel under the wrong conditions. Human emotions, including anger, contempt and fear, are remarkably contagious.

Yet there are ways to quell your contempt. The first step is to view acting like a jerk as a communicable disease. Once you unleash disdain, anger and contempt, or someone unleashes it on you, it spreads like wildfire. "Emotional contagion" is what researcher Elaine Hatfield and her colleagues call it. "In conversation, people tend automatically and continuously to mimic and synchronize their movements with the facial expressions, voices, postures, movements and instrumental behaviors of others." If you display contempt, others (even spectators, not just your targets) will respond in much the same way, igniting a vicious circle that can turn everyone around you into a mean-spirited monster just like you.

Experiments by Leigh Thompson and Cameron Anderson show that even when compassionate people join a group with a leader who is "high-energy, aggressive, mean, the classic bully type," they are "temporarily transformed into carbon copies of the alpha dogs."

How to Avoid 'Poisoning'

Do your homework before taking a job. Find out if you are about to enter a den of assholes and, if you are, don't give in to the temptation to join them in the first place. Leonardo da Vinci said, "It is easier to resist at the beginning than at the end," which is sound social psychology. The more time and effort that people put into anything — no matter how useless, dysfunctional or downright stupid it might be — the harder it is for them to walk away, be it a bad investment, a destructive relationship, an exploitive job or a workplace filled with browbeaters, bullies and bastards.

Research on "framing" by social psychologists suggests a few tricks you can use to avoid being an overly competitive jerk and to help immunize yourself from catching the poison. The assumptions and language we

use — the lenses that we see the world through — can have big effects on how we treat others. Even seemingly small differences in language that we hear and use can determine whether we cooperate or compete.

Three 'Cooperative Frames' That Can Help

If you want to quell your inner jerk and avoid spreading (and catching) poisoning, use ideas and language that frame life in ways that will make you focus on cooperation.

First, although many situations do require a mix of competition and cooperation, try focusing on the win-win aspects.

Renowned management guru Peter F. Drucker looked back at his 65-year consulting career shortly before he died. He concluded that the most inspiring and effective managers he knew all had a few things in common, including, "They thought and said *we* rather than *I*." So start listening to the words that you and your colleagues say. Tape-record and listen to a couple of meetings; if they are nearly all about "me, myself and I," and "us versus them," it might be time to start changing the way you talk — it can help keep your inner jerk in check.

Second, adopt a frame that turns your attention to ways in which you are no better or worse than other people. Don't focus on all the big and little ways that you are superior or inferior. Think of all the ways that fellow human beings are just like you, such as the needs that we all have for love, comfort, happiness and respect.

Finally, tell yourself, "I have enough." Too many of us are never satisfied and feel constantly slighted, even though — by objective standards — we have all we need to live a good life. This frame can help you be at peace with yourself and treat those around you with affection and respect.

Face Your Past

Research shows that if you were a bully in school, you will be more prone to taunting, teasing, threatening and even doing physical harm to your co-workers.

Facing the facts about your past behavior can help you assess your "risk" of acting like a creep in the future. But there is also intriguing research by anthropologists, historians and psychologists suggesting that the culture you were raised in can amplify your risk, especially if you grew up in an aggressive and violence-prone country, region or neighborhood.

Experiments by Dov Cohen and his colleagues that were published in the *Journal of Personality and Social Psychology* show that for men raised in the southern United States, the culture of honor continues to have measurable and strong effects, even after those men have moved to the northern United States. Studies show that if you were raised a Southerner — or perhaps a cowboy — you will likely be more polite than your colleagues most of the time, but if you run into an even mildly insulting person, you are prone to lash out and risk fueling a cycle of poisoning. ●

When Assholes Reign: Tips for Surviving Nasty People and Workplaces

Psychologists have found that if you can't escape a source of stress, changing your mindset about what is happening to you, or reframing, can help reduce the damage done to you. Some useful reframing tricks include avoiding self-blame, hoping for the best but expecting the worst, and developing indifference and emotional detachment. Learning when and how to simply not give a damn isn't the kind of advice you hear in most business books, but it can help you make the best of a lousy situation.

Martin Seligman's research on "learned optimism" shows that when people view difficulties as temporary and not their fault, and as something that will not pervade and ruin the rest of their lives, this frame protects their mental and physical health and enhances their resilience.

Hope for the Best; Expect the Worst

Framing demeaning encounters in an optimistic light can help sustain your physical and mental health. Yet, especially if you are subjected to mean-spirited people for long stretches, unbridled optimism can be dangerous to your spirit and self-esteem.

Unwavering hope that all those hard-core jerks are going to be transformed into nice people is a recipe for one reliable disappointment after another. If you expect that one beautiful day all those jerks will suddenly apologize to you, begin begging for forgiveness or at least start treating you with respect, you are setting yourself up for disappointment and frustration.

Develop Indifference and Emotional Detachment

When organizational life takes an ugly turn, linking your self-worth to how people treat you and putting all your effort and emotional energy into your workplace is a path to exploitation and self-destruction. Self-preservation sometimes requires the opposite response: Learn to feel and practice indifference and emotional detachment.

When your job feels like a prolonged personal insult, focus on just going through the motions, on caring as little as possible about the jerks around you and think about something more pleasant as often as you can — just get through each day until something changes at your job or something better comes along.

Look for Small Wins

The ability to gain control over little, seemingly trivial things is a hallmark of people who survive horrible and uncontrollable events — including natural disasters or being a castaway, hostage or prisoner of war.

Rigorous research confirms that the feeling of control — perceiving that you have the power to shape even small aspects of your fate — can have a huge impact on human well-being. The implication for surviving a workplace where assholes abound is that if you can't escape completely, start looking for ways to seize bits of control. Try to find little steps you can take to reduce your exposure to their venom.

Find and build some pockets where you can hide from assholes and hang out with decent people. Doing so can reduce your exposure to jerks, give you a breather and provide a bit of control over when and how these creeps do their dirty work to you. These pockets can be buildings or rooms. They can be found in even tiny moments, such as during brief interactions with supportive customers, colleagues or clients. ●

The Virtues of Assholes

Do you want to be the best asshole that you can possibly be for yourself and your organization? Some tips are offered below, but they come with the following red-hot warning: These ideas are inherently dangerous. People who are destructive jerks can use these alleged virtues to justify and glorify their wicked ways. The weight of the evidence shows that they do far more harm than good.

Do You Want to Be an Effective Asshole?

Here are five key lessons:

1. Expressing anger, even nastiness, can be an effective method for grabbing and keeping power.

2. Nastiness and intimidation are especially effective for vanquishing competitors.

3. If you demean your people to motivate them, alternate it with (at least occasional) encouragement and praise. Alternate the carrot and the stick; the contrast between the two makes your wrath seem harsher and your occasional kindness seem even sweeter.

4. Create a "toxic tandem." If you are nasty, team up with someone who can calm people down, clean up your mess, and extract favors and extra work from people because they are so grateful to the "good cop."If you are "too nice," you might "rent a jerk," perhaps a consultant, a manager from a temporary staffing firm or a lawyer.

5. Being an asshole all the time won't work. Effective jerks have the ability to release their venom at just the right moment and turn it off when just enough destruction or humiliation has been inflicted on their victims.

Assholes often don't realize that every time they demean someone — say, with a nasty glare, a mean-spirited joke or tease, by treating a person as if he or she were invisible, or by exaggerating their self-importance yet one more time — their list of enemies grows longer day after day.

Fear compels most of the asshole's enemies to stay silent, at least for a while. But as their enemies' number and power grow, they can lie in wait until something happens to weaken the bully's position, such as organizational performance problems or a small scandal. Then they pounce. It is impossible to be in a position of power without annoying and alienating some people, but seemingly cold, unpleasant and unkind people often create more enemies than they realize.

Why They Fool Themselves

Are you suffering from delusions of effectiveness?

1. You and your organization are effective despite, rather than because, you are a demeaning jerk. You make the mistake of attributing success to the virtues of your nasty ways, even though your demeaning actions actually undermine performance.

2. You mistake your successful power grab for organizational success. The skills that get you a powerful job are different — often the opposite — from the skills needed to do the job well.

3. The news is bad, but people only tell you good news. The "shoot the messenger" problem means that people are afraid to give you bad news, because you will blame and humiliate them. So you think things are going great, even though problems abound.

4. People put on an act when you are around. Fear causes people to do the "right" things when you are watching them. As soon as you leave, they revert to less-effective or downright destructive behavior — which you don't see.

5. People work to avoid your wrath rather than to do what is best for the organization. The only employees who can survive your management style devote all their energy to avoiding blame rather than fixing problems.

6. You are being charged "asshole taxes" but don't know it. You are such a jerk that people are willing to work for you and your company only if you pay them premium rates.

7. Your enemies are silent (for now), but the list keeps growing. Your demeaning actions mean that day after day, you turn more people against you, and you don't realize it. Your enemies don't have the power to trash you right now, but are lying in wait to drive you out. ●

The Rule as a Way of Life

Here are seven key lessons about the rule:

1. A few demeaning creeps can overwhelm the warm feelings generated by hordes of civilized people. Remember that if you want to enforce the no asshole rule in your organization, you'll get more bang for your buck by eliminating those folks who bring people down. Bear in mind that *negative interactions have five times the effect on mood than do positive interactions* — it takes a lot of good people to make up for the damage done by just a few demeaning jerks. The first things you need to do are screen out, reform and expel all of them in your workplace. It will then become easier to focus on helping people become warmer and more supportive.

2. Talking about the rule is nice, but following up on it is what really matters. Talking about or posting the rule isn't necessary if people understand it and act on it. But if you can't enforce the rule, it is better to say nothing. Otherwise, your organization risks being seen as both nasty and hypocritical.

3. The rule lives — or dies — in the little moments. Having all the right business philosophies and management practices to support the rule is useless unless you treat the person right in front of you, right now, in the right way.

4. Should you keep a few assholes around? Once people believe that they can get away with treating others with contempt or, worse yet, believe they will be praised and rewarded for it, a reign of psychological terror can spread throughout your organization that is hard to stop.

5. Enforcing the rule isn't just management's job. The no asshole rule works best when everyone involved in the organization steps in to enforce it when necessary. Treating people right means conveying respect, warmth and kindness to them — and assuming the best about their intentions.

6. Embarrassment and pride are powerful motivators. In organizations where the no asshole rule reigns, people who follow it and don't let others break that rule are rewarded with respect and appreciation. When people violate the rule, they are confronted with painful, and often public, embarrassment and the feelings of shame that go with it.

7. Assholes are us. If you want to build an asshole-free environment, you've got to start by looking in the mirror. When have you been an asshole? When have you caught and spread the contagious disease? What can you do, or what have you done, to keep your inner asshole from firing away at others?

Just stay away from nasty people and places. This means you must defy the temptation to work with a swarm of assholes, regardless of a job's other perks and charms. And if you make this mistake, get out as fast as you can. Admitting you're an asshole is the first step. ●

Ripple Effects

European researchers have assembled the best evidence on ripple effects. A British study of more than 5,000 employees found that while 25 percent had been victims of bullying in the past five years, nearly 50 percent had witnessed bullying incidents. Another British study of more than 700 public-sector employees found that 73 percent of the witnesses to bullying incidents experienced increased stress and 44 percent worried about becoming targets themselves.

No More Pointless Meetings

Breakthrough Sessions That Will Revolutionize the Way You Work

by Martin Murphy

THE SUMMARY IN BRIEF

Meetings are the bane of work life: time-consuming and inadequate for addressing today's innovation and speed-to-market imperatives. Everyone grumbles about them, but nothing ever changes — until now.

Martin Murphy has helped dozens of corporate clients transform conventional meetings into workflow sessions that are truly productive, by reframing workflow management issues into four critical activities: Issues Management, Innovation, Problem-Solving, and Ongoing Planning. By doing so, he has upended the entire concept of the one-size-fits-all traditional meeting model and has set a new standard for collaborative results.

No More Pointless Meetings gives you workflow management tools to dramatically improve both in-the-flesh and digital collaboration by leveraging the cognitive and creative potential of the individuals who report to you.

IN THIS SUMMARY, YOU WILL LEARN:

- How to use action plans to improve cognitive and creative productivity in a way that ensures early ownership of issues, accountability and transparency.
- How to deploy three fast-track collaboration sessions: issues management, innovation and problem-solving.
- How to stay current with exponential change by installing an ongoing planning system and a planning database.
- How to use information gaps to upgrade your organization's IQ.

Why Meetings Fail: Reframing Workflow Management

Meetings have survived as the primary collaborative process because it is assumed that an individual, once promoted to a leadership position, already knows how to effectively leverage human capital. The facts don't support this — all of us still get trapped in meetings that squander time we'll never recover. While the number and complexity of issues that require resolution accelerate, unsatisfactory meeting outcomes are still an everyday event.

For most executives, managers and supervisors, the meeting is the only work management tool they've ever used for collaboration. The drill is ingrained: Everyone gathers in a conference room, and the most senior executive both conducts and participates in the meeting at the same time. This wasteful collaborative ritual takes place millions of times daily in organizations around the globe. And while its shortcomings are acknowledged, it has been the principal means for collaboration over the course of many generations.

If managers are doing a poor job of collaborating in person-to-person gatherings — and be assured that they are — digital collaborative performance will be even less effective.

Guiding Principles

Reframing workflow management activities into four broad categories of need transforms the effectiveness of workflow management in general and collaboration in particular. Those categories — the need to manage issues, to solve problems, to innovate and to plan — yielded the following collaborative elements of a workflow management system:

1. The Issues Management Session
2. The Innovation Session
3. The Problem-Solving Session
4. Ongoing Planning.

The fourth element, Ongoing Planning, provides the means to capitalize on exponential change by building speed-to-market capabilities.

There are, however, two principles on which all of these sessions are based:

1. Content and process must be kept separate.
2. The boss (or highest-ranking person in the room) should not run workflow management sessions.

Separate Content and Process

The core elements of all interpersonal communications are content and process. Content refers to what's being discussed, the subject or purpose for having a meeting in the first place. Process refers to virtually everything else, for example, Who's talking the most? How's the energy level in the room? Is there a spirit of openness and teamwork? Are things getting accomplished?

Collaboration is transformed by the simple act of keeping content and process separate. Facilitators don't participate in content discussions. Their job is to handle process only and to do so in a manner that motivates all participants to contribute to the maximum of their ability. At the beginning of every workflow management session the facilitator needs to get three agreements from the group:

1. The facilitator accepts responsibility for meeting process.
2. The group accepts responsibility for meeting content.
3. Both the facilitator and the group commit to an outstanding workflow session outcome. ●

The Issues Management Session

Issues constitute the dynamics one is responsible for managing. This includes anything related to the welfare of the organization that requires attention, something that needs to be resolved, a trend to explore, an opportunity that could be exploited or a problem that needs to be solved. An issue might be relevant only to one's job or it might be something bigger that affects the entire organization, the competition or the industry in general.

Issues have differing degrees of importance: The most important are classified as Critical Issues and require immediate attention or resolution. The timely assessment of all issues minimizes the numbers that become critical.

The Issues Management Session enables you to comfortably handle expanding workloads and streamline day-to-day workflow management. All group workflow sessions require three easels with large paper pads, colored markers for the facilitator, and writing pads and pens for participants. Here are the steps for conducting an Issues Management Session:

Step One: Laying the Groundwork. The most important step in any workflow management session is how well one explains the difference between conventional meetings and workflow management sessions and the concepts of content and process.

Once you have clearly established an agreement on the different roles, write the heading "Information Gaps" on one of the easels. In any collaborative work session there are many questions that emerge during the process. In some cases, the questions are answered during the session; in other cases, these Information Gaps have to be filled after the session. Explain to the participants that you will record all the unanswered questions that pop up during the session.

Step Two: Identify the Purpose of the Session. Once you have the groundwork laid and the logistics in place, the next step is to define the purpose of the session. Don't launch into a session unless all participants have a clear understanding of the purpose of the session.

Step Three: Surface All the Issues. Once you have an agreement on the purpose, the next step is to surface all of the possible issues related to the purpose of the session. Instruct the participants to write "Issues" on their personal writing pads and, without discussion, to write down all of the issues they think must be addressed.

Step Four: Narrow the List to Critical Issues. Ask participants to identify the five issues they think are the most critical, and give them five minutes to do so. Then go around the room taking no more than two critical issues from any one person at a time, and display them (in a small group, I'd take only one at a time). Usually, there is some overlap, which you can handle by adding a check mark to an issue that has already been submitted. Remember that all of this is done without discussion.

Step Five: List the Top 10 Critical Issues. Once you have compiled your list of Critical Issues, break the group into teams and ask them to come up with their top 10 Critical Issues, within five minutes.

Now is the time to get a consensus on the Critical Issues. Address the group as follows:

I'm going to point to each issue, and I'd like you to rank it in terms of its importance. Give it a score of 3 if you think it needs to be resolved immediately, a score of 2 if it needs to be resolved soon, and a score of 1 if it can wait to be resolved until the 3s and 2s are handled.

Accord each issue a number of check marks corresponding to each person's score for that particular issue (a score of 3 gets three checks, etc.).

Count the number of check marks for each issue and record each total with a colored marker. You now have a ranking, which establishes the sequence we'll use in addressing these issues.

Step Six: Resolve the Issues or Move Them to Another Session. Some of the Critical Issues on the list can be resolved in-session. Others are more complicated and require that actions be taken out of session. Some defy any kind of resolution in the Issues Management Session and require a Problem-Solving or Innovation Session. Your goal is to help the group identify which of the issues can be resolved in-session and provide the Next Steps for those issues that can't.

On one of your easels, write "Action Plan," point to the first issue and ask the group:

Can Critical Issue No. 1 be resolved right now? Take three minutes to decide, as a group.

The objective is to facilitate group discussion about the resolution of Critical Issue No.1. If the group seems to be making headway, let them run with it and stay out

of the way. If after about three minutes they seem to be stymied, however, intervene with a process suggestion: to schedule the issue for resolution via a Problem-Solving or Innovation Session, and then direct the group to the resolution of Critical Issue No.2.

By resolution, I mean that the group agrees on what the Next Steps should be, they have identified who's responsible for making this happen and they have established a deadline.

Step Seven: Write the Action Plan. All workflow sessions conclude with an Action Plan. Action Plans serve as the means to record the conclusions that were drawn, the solutions that were identified and the agreements that were made in any work session. An important function of Action Plans is that they ensure outcomes are implemented in a manner that optimizes accountability, transparency and speed-to-market performance. An Action Plan consists of four vertical columns:

1. Tasks/Next Steps. This column covers the nature of any issue's disposition, so it should be wide enough to accommodate descriptions of related tasks and spin-off activities.

2. Responsibility. The names of the individuals who have been assigned particular responsibilities are recorded. It's important to be clear about who is responsible for each step.

3. Due Date. Delay entering any dates until all other aspects of the Action Plan have been completed. This gives individuals who have volunteered to complete more than one assignment the opportunity to review the full list of their commitments and agree to realistic delivery dates.

4. Report. This column identifies the individual(s) to whom task results will be submitted. As a general rule, it's good practice to inform all participants of all task outcomes. However, there may be circumstances when this includes an individual who did not attend the meeting — perhaps a particular executive whose authorization is required to move things forward. ●

The Innovation Session

The Innovation Session is the work management session to use when you want to tap into the creative potential of a group. It has many applications, and use of it is indicated when any of the following needs are identified:

- Development of new products or services.
- Upgrade of systems and procedures.
- Streamlining of intradepartmental communications.
- Identification of alternative marketing strategies.
- Development of a name for a new product, service or initiative.
- Identification of a unique promotional idea or initiative.
- Jump-start of a stalled Problem-Solving Session.

An Innovation Session comprises four phases: Ideation, Building, Evaluation and Action Plan.

As with any workflow management session, begin an Innovation Session by clearly explaining to participants the difference between a conventional meeting and a workflow management session; then clarify the difference between content and process.

Purposefully state the goal as broadly as possible, and then ask the group if they agree with your interpretation. Without making it a drawn-out affair, allow them to guide you in rewording the statement if necessary.

Phase One: Ideation. In a roomful of people about to tackle the task of creating new product ideas, be assured that most of them already have some new product ideas in their heads. As in the Issues Management Session, you need to get those ideas out of their heads and onto paper as quickly as possible. Write "Ideas" on an easel and instruct the group as follows:

Our goal is to generate new product ideas. Most of you have some ideas already, and we want to capture all of those before we continue. With that in mind, and without discussion, would you please write as many new product ideas as you can. Absurdity is encouraged. Forget viability for the moment and strive for quantity of ideas. You have three minutes to do this.

At the end of the first three-minute period, instruct the group to stop writing. Go around the room and ask each participant to read aloud one or two of their ideas.

Don't take more than two issues at a time — especially with a large group. The reason for taking only two ideas from each person is that many people have similar ideas and by the time you get to them they complain that all of their ideas have already been boarded.

Once participants have identified concepts that appear to have strong appeal, guide them in ranking these concepts in terms of their viability.

By now the group is a bit more relaxed with the process, and their imaginations have been stirred by the ideas of their colleagues. To capitalize on this, ask participants to take another three minutes to use the ideas displayed on the walls to trigger additional new product ideas.

Now you have a decision to make: Do you go for a third round of Ideation or switch gears? This is a judgment call based on your feel for what's left in the group's creative tank.

Phase Two: Building. The strategy of the Building phase is threefold:

1. Focus on ways to make ideas work.
2. Avoid any discussion about why the ideas might not work.
3. Convert raw ideas into concepts.

The difference between a new product idea and a new product concept is in the degree of completeness. A new product idea is often just a bare-bones hunch or an inkling of what might be possible; a new product concept, however, is an idea that has been fleshed out. Often a new product concept reveals itself when several ideas are combined or when a value-added feature is integrated with an existing product or service. A new product idea usually needs more attention (building) before it is considered viable. Sometimes raw ideas are exposed in focus groups to find that missing piece of the puzzle that promotes a new idea to concept status.

For this step, again break the group into teams. The assignment for each team is to use the ideas displayed on the walls to build discrete new product concepts — concepts that the teams believe their organization could market successfully. The teams get 15 minutes to agree upon 10 new product ideas.

Phase Three: Evaluation. The Evaluation phase moves the participants from a focus on creativity to a focus on possibility and potential. The goal of this phase is to evaluate each concept and identify those that are most likely to be successful.

Once participants have identified concepts that appear to have strong appeal, guide them in ranking these concepts in terms of their viability. Specifically, ask them to take a sheet of paper and, without discussion, to list their top 10 new product concept choices. Give them 10 minutes to do this.

Phase Four: The Action Plan. The final step in the process is to develop an Action Plan to document the Innovation Session output in an actionable format with Tasks, Responsibilities and Due Dates.

Once the top new product concepts and Information Gaps have been accounted for in the Action Plan, you have completed the Innovation Session. ●

The Problem-Solving Session

The Problem-Solving Session produces transformative outcomes because it's an innovation-driven process; we don't try to cognitively hammer out solutions. Instead, we create an environment that entices the solution to reveal itself. This process upgrades the ability of a group to solve problems utilizing a unique blend of cognitive and creative skills.

The following is a partial list of specific needs that would benefit from the use of a Problem-Solving Session:

- Obtaining input from key individuals with regard to a specific problem, such as a systems and procedures upgrade.
- Enabling managers and supervisors to operate from a unified strategic perspective.
- Fostering earlier ownership for issues across departments and disciplines.

Step One: Laying the Groundwork. As in all work sessions, the first step is to establish an agreement with the group regarding your role and theirs. Emphasize that you are responsible for the process — structuring and guiding them through the session — but they are responsible for content.

Step Two: Identify the Problem. The next step is to identify the core problem that will be at the center of the session. Begin by writing your understanding of the problem on an easel. Then, guided by the group, edit your description of the problem to the satisfaction of the group. Don't strive for perfection — it isn't necessary at this point. Your goal is to get general agreement that the problem statement is in the ballpark of reality. In a normal situation, try not to spend more than five minutes on this step. Sometimes it helps if the group attempts to simplify what appears to be a complex problem by breaking it down into a set of smaller problems that might be easier to solve.

Step Three: Reframe the Problem. As mentioned previously, the Problem-Solving Session depends as much on creative thinking as on cognitive skills, such as the ability to analyze data and form rational and logical conclusions from that data. The process for resolving problems, therefore, includes a number of creativity exercises.

The first is the What-If Exercise. This exercise allows the group to uncover different facets of the problem and, in the process, some possible solutions, by turning the core problem into a "What if … ?" statement.

Once the group has agreed on the core problem, ask the participants to take five minutes to write as many interpretations of this problem (or its solution) as possi-

ble, without any discussion among themselves. They have only five minutes for the exercise. At the conclusion, ask each participant to share his or her list.

Step Four: Ask for Solutions. Once you've conducted several rounds of the What-If Exercise and have identified some of the roots of the problem you are addressing, you can make your first request for solutions. Instruct the group to write three possible solutions to the problem, without discussion. Give them five minutes for this exercise.

When their time is up, go around the room and display one solution from each person. When all of the solutions have been displayed, ask the group, "Do we have a solution to the problem?"

If any group indicates that they've found a solution, display it, with the group's editorial input, and determine whether there is consensus. If there is agreement that a solution has been found, you can proceed directly to Step Six: the Action Plan.

Step Five: Expand the Search. A solution rarely presents itself from the first request. More likely, a series of creativity exercises — including the vitally important Question Exercise — will be necessary before the group can identify a solution or solutions. Ask each participant to write the word Questions at the top of a sheet of paper and respond to the following: What question do we need to ask ourselves at this time? Give the group three minutes then take one question from each person. Without addressing the questions instruct the group to write a better question. Give them one minute. You now have a list of many questions that are related, in varying degrees, to the problem. Asking for a better question is a key element of this exercise. Board these questions. Resisting the urge to address any of them, push the group into a third round. You'll notice that the questions become more solution-oriented and that Information Gaps begin to sprout. With each series of questions, the group moves closer to the solution.

Step Six: The Action Plan. As with the Issues Management and Innovation sessions, it is vital to capture all of the Information Gaps, Conclusions and Next Steps from the session into an Action Plan. This provides transparency and responsibility and ensures ownership of issues. ●

The Ongoing Planning Process

To stay current, innovation and speed-to-market capabilities must be valued as core competencies and the ability to leverage human capital more effectively must be a strategic imperative.

Bottom line, to be effective in the digital age, the time span between planning and implementation must be minimized. Accomplishing this has to be an ongoing process that (1) capitalizes on the interconnectivities created by technologies and (2) maximizes speed-to-market capabilities.

This has created the need to reframe the planning function from a scheduled event executed by a few to an ongoing process that involves many in order to leverage the cognitive and creative capabilities of in-house talent, to stay current in the face of exponential change, and to shorten the timeline between intentions, strategies and implementation.

Effective Ongoing Planning is driven by three interrelated dynamics:

1. Innovative Collaboration Practices
2. A Robust Planning Database
3. Personal Workflow Planners

Innovative Collaboration Practices. Outcomes from the three collaboration sessions (Issues Management, Innovation and Problem-Solving) in the form of Action Plans are fed to a Planning Database at the conclusion of every workflow management session. This process creates critical-path transitioning from collaboration to Ongoing Planning.

A Robust Planning Database. The Planning Database is fed, primarily, by Action Plans and functions as the intelligence nerve center of the organization. Action Plans, in turn, function as the cohesive factor for Ongoing Planning, since they reflect and document outcomes from all workflow management sessions that occur within the organization.

The architecture of the Planning Database is customized to enable senior management to identify and assess interconnectivities, patterns and trends in a variety of contexts and to monitor both the workflow of the organization and the heartbeat of the marketplace in real time. The Planning Database also functions as sonar for pre-emptive opportunities.

A planning coordinator monitors the database. This individual's job is to extrapolate strategically pertinent information from the Action Plans and other sources of competitive and market data. All managers utilize the database to identify collaborative opportunities and interconnectivities that create value and to ensure they're operating from a unified strategic perspective. Input by individual managers is encouraged in the form of Information Gap queries, initiative updates, intradepartmental task and project coordination, and so forth.

As a learning and training resource, the database is invaluable.

The Ongoing Planning Database is a vital component of best workflow management practices for two reasons: It is comprehensive and it is ongoing.

Personal Workflow Planners. Workflow planners are used by managers to handle expanding personal workloads and to streamline workflow management practices. The planners enable managers to maintain a strategic perspective as they manage issues. Workflow planners are not submitted to the planning database. They are personal workflow tools that managers may customize to fit their individual leadership styles. ●

One-on-One Sessions

While the cornerstone workflow management sessions are utilized primarily for team collaboration, they can also be used to upgrade the effectiveness of one-on-one collaboration.

One-on-one collaboration is the established approach for activities such as performance feedback and compensation discussions. However, it can also be quite effective as an alternative to meetings for many workflow management tasks.

A one-on-one session can be used to resolve a large number of issues expeditiously with another individual. It can be conducted on the spur of the moment and the human capital investment is minimal. The process can be as effective digitally as in person and it can serve as a means to introduce another person to the Issues Management Session.

Usually, you get the most out of an Innovation Session when it's done with a group. However, there are times when you want to simply explore some possibilities with a colleague informally.

The one-on-one Problem-Solving Session is a work management session that two people can utilize to solve problems effectively. While it's not expected to produce the large-caliber results of a formalized group Problem-Solving session, it can be relied upon to deliver solutions on a sustained basis with an economy of human capital, and it will produce better results than conventional problem-solving efforts.

Your instructions in a one-on-one session should be as precise and crisp as if you were leading a 15-person group Problem-Solving Session. Stay on-purpose and move things along at a challenging pace. Remember, the dynamics of the facilitator role are consistent, regardless of the type of work session you're conducting. ●

Solo Sessions

To run a productive solo workflow management session, you must be able to separate process from content without the benefit of a facilitator and be capable of switching back and forth in the alternate roles of facilitator and participant without getting lost in content. This means you adopt the role of a bridger, one who can do both. (This is one of the reasons that I strongly recommend you acquire experience in facilitating group workflow sessions before you make use of their corresponding solo versions.)

The solo issues management process enables you to quickly identify all Critical Issues, resolve those that you can, and be certain about which issues would best benefit from delegation or collaborative attention.

Once you're familiar with the group Innovation Session, the solo version enables you to tap into your own creative potential between collaborative sessions.

Solo problem-solving can be an economically sound alternative to group sessions. Just because you have the ability to leverage the cognitive and creative capital of others to solve problems doesn't mean you should always opt to do so. Once you acquire the skill to facilitate workflow sessions, you can choose to resolve many problems independently. ●

Making It Happen

Ideation is a tool for accessing and leveraging the creative potential of individuals and groups. It's an integral part of all the workflow management sessions. Most managers justify their lack of attention to this issue by citing demanding workloads of a more "pragmatic" nature. However, the pace of innovation set by the technological evolution puts enormous demands on leadership in other industries to stay relevant.

Here are some reminders about how to get the most out of the innovation processes you've already learned:

Lead by example. It's up to you to set the tone for upbeat, enjoyable and productive workflow sessions. You need to show up looking well-rested and filled with positive energy. This attitude is contagious, so let the group see that you are enjoying yourself.

Validate. Expect to do a lot of encouraging and validating. Your role is to orchestrate a roomful of mainly pragmatic minds to switch mental gears and tap into their creative capabilities. For many people, this is a new and potentially exciting experience.

Expect success. As a facilitator, you need to remember a very important fact: There is enough intellectual and creative talent in the room to solve any work-related problem and identify a billion-dollar idea. Your job is to convince the participants of their unused creative potential and to provide them with the environment and the collaborative tools to access it.

Always be asking. In sales, it's a well-known fact that the most successful salespeople don't hesitate to ask for the order; they're "always closing." Similarly, you should always be asking for new ideas. Don't get so wrapped up in the excitement of the session that you forget your purpose: to elicit innovative ideas and breakthrough solutions.

Handle the chaos. A hardworking group often becomes so loud and excited that the session appears to be chaotic. Properly guided, the moment that seems most chaotic can also be the most productive point in the session. As you gain facilitator experience, you'll be able to create the right balance between chaos and structure.

Stay tuned in. Always be tuned in to the energy level of your group and allow yourself to be influenced by them in terms of when to take breaks, which Ideation exercises to select and how long sessions should last. You are there to enable the participants to exceed their normal collaborative performance. How you collaborate with them dictates how well they collaborate with each other.

Clarify instructions. Continually ask the group whether there is anyone who does not understand an instruction before you direct them to begin a new process or cycle. If you don't, you're likely to experience interruptions midcycle by participants who are uncertain or confused. This slows down the pace of the session and deflates the energy in the room.

Maintain speed. Speed plays an important role in all workflow management sessions because it creates the tendency to bypass rational thought; it doesn't give participants the time to settle into their cognitive comfort zones. So make your instructions to the group precise and to the point. Doing so short-circuits rational thought processes and, in their place, encourages uncensored creativity.

Refrain from judging. Be extra firm about refraining from evaluation during an Ideation phase. By instructing a group to strive for quantity of ideas, you deny them the time to indulge in self-censorship and evaluation.

Free their minds. Most participants in an Ideation exercise already have some ideas in mind before the start of the process. You need to get all of these ideas and opinions out of their heads and onto paper as quickly as possible. Otherwise, those ideas will prejudice and contaminate their contributions throughout the session.

Restrict discussion. By restricting discussion during most sessions and exercises, you intensify individual focus, build the desire to collaborate and minimize distractions. Make sure the group understands that there will be time allotted for discussion in every session.

Encourage laughter. Laughter helps release pent-up stress and enables enjoyable creativity. In general, the more laughter there is in an Innovation Session, the better the results.

Maintain control. Stay in control of the group. It's a big part of your job. You've probably noticed an apparent paradox here: You're imposing structure to enable the group to be creative. It works.

Stand up. Always conduct workflow management sessions on your feet. Motion generates energy. One of the hallmarks of the conventional meeting model is that everyone is sitting down. Some are asleep.

One of the many ways to keep a group involved is to conduct some exercises while participants are standing instead of sitting.

Don't comment. If you comment on the quality of any idea offered by a member of the group, it has an undermining effect on productivity. By all means, feel free to ask for clarification to make sure you're boarding a person's idea accurately.

Be assured that the window of innovative opportunity is normally quite short before individuals relapse into habitual thinking patterns. One of your primary responsibilities as a facilitator is to create an environment that makes it easy for people to break out of their habitual thinking patterns at will. ●

No More Tears

The Dark Secrets of Johnson & Johnson

By Gardiner Harris

Gardiner Harris is the public health reporter for The New York Times. Before working at the Times, he worked at The Wall Street Journal and lived for four years in Hazard, Kentucky, as the Eastern Kentucky bureau chief for The Louisville, Kentucky Courier-Journal. His reporting in Kentucky led to broad changes in laws governing coal-mine safety and black-lung compensation, and it earned him national journalism awards, including a George Polk Award and the Worth Bingham Prize for investigative journalism.

A Book Review by Soundview

Uncovering Shocking but Necessary Revelations

Family is one of the most important things to people. They will do almost anything to protect and care for them. Parents of newborns carefully select what medicine to give to the sick baby. Men and women will discuss the different uses of baby powder, swapping stories from their childhood, and associating certain people with certain smells. Nostalgia is real and plays a significant role in decision-making, particularly regarding medicines and medical procedures. However, what happens when hidden truths come out? Destroyed papers, doctored files, and experiments with falsified results. When these come to light, and consumers are told the depth of deceit, that trust is broken and is almost impossible to regain.

In ***No More Tears: The Dark Secrets of Johnson and Johnson***, Gardiner Harris explores the downfall of a company many Americans grew up fond of and use daily. He delves into the various products that Johnson & Johnson said were safe. Still, instead, they led to the death and permanent injury of consumers. No More Tears is broken down into four parts. Part One discusses two of the most well-known Johnson & Johnson products and the lengths they went to keep them on the shelves. Part Two is about their prescription drugs and their plans to keep their less-than-ideal findings hidden from everyone, including the FDA. Part Three sees the journey into medical devices and the problems and pain their consumers would endure. Finally, Gardiner explores Johnson & Johnson's attempt to save their face by taking part in the making of COVID-19 vaccines.

Part One

Gardiner shares that Johnson & Johnson (J & J) has been associated with families and their ability to care for them since its inception. They have been surrounded by the protective halo of various consumers, officials, and others have provided for them. This brand is closely associated with baby products, which affords them high emotional trust, particularly regarding Tylenol and Johnson's Baby Powder. Several experiments were performed to create Johnson's Baby Powder's distinctive scent, which has become one of the most recognized fragrances in the world. While these two products have not contributed signifi-

cantly in several years, their histories have become the company's defining history.

Johnson's Baby Powder

Talc blocks (soapstone) are found on almost every continent. They are used to make sinks, lab countertops, and electric switchboards. They are incredibly soft and, when finely ground, can be used in various ways. Still, most controversially, they were used in cosmetics and baby powder.

The first reports of danger came in 1922 when researchers saw babies grabbing bottles and showering the powder on their faces. Because it is not water-soluble, the particles would block the tiny air sacs where oxygen is passed into the bloodstream and asphyxiate them. The official journal of the American Academy of Pediatrics warned against using talcum powder in 1969 and 1981, and while J & J placed warning labels on the bottles and redesigned the spout, the risk of death never truly disappeared.

While there had been questions about the dangers of inhaling powders, researchers and industry officials wrote in 1956, 1963, and 1968 that asbestos was a common ingredient in talc-based powders. Talc and asbestos are similar in several ways, so much so that veins of one or the other are found sandwiched with the other. Though some concerns had been raised about the impact of talcum powder on consumers, reassurances and denials were always quickly released until the mounting evidence couldn't be ignored anymore. J & J finally stopped selling talc-based baby powder in 2020, blaming the spread of misinformation concerning the product's safety. The truth, however, couldn't be denied, and Harris says that J & J is likely one of the more litigious companies in the world. In their attempt to save face, they refused to release life-saving research and make the necessary change to save the people who trusted their word about the safety of their product.

Tylenol

In the 80s, there was a series of seemingly unrelated and unexplainable deaths, which seemed unrelated until samples were sent out and tests revealed cyanide was the cause. Since that was the case, how was that possible? Both J & J and the FDA knew that how they responded to this would define how they were seen for a generation, at the very least.

J & J had been considering tamper-proof containers for several years. Still, in light of these murders, they decided to recall the Tylenol products on the shelves and produce the new containers (every other manufacturer of over-the-counter medicines quickly followed these measures). While J & J emerged from this tragedy being lauded for their quick response and willingness to put safety first, there are a few footnotes on how they handled it that show J & J in a less commendable way. The FDA's funds were limited due to a government shutdown, the majority of the investigation was left up to J & J. The FDA also didn't have the authority to demand or inspect records until 1997, which allowed J & J to hide not only the extent of the problem but also keep the FDA almost entirely in the dark.

After this, questions about the safety of the main ingredient of Tylenol came to light. Even when it was used as directed, Acetaminophen is one of the leading causes of acute liver failure. J & J's advertisement of being safe, fast pain relief, and that it was the pain reliever used by hospitals, has proved deadly time and again. The FDA asked them to examine the issue of alcohol and acetaminophen, and while they initially said it wasn't necessary, they finally put a warning on the packaging in 1994.

Part 2: Prescription Drugs

J & J began exploring the pharmaceutical industry in the 1890s when aspirin was discovered. It accelerated in the 1940s with the production of penicillin. It peaked in the 1980s when there was a massive breakthrough in the discovery of medicines that would see the average older adult take six or more prescriptions at a time. A rise quickly followed this in insurance companies, both private and public, which would begin to affect the prices of medication and make it profitable. Why? Because insurance companies were beginning to shift from paying only for in-hospital prescriptions to all prescriptions.

To chase the gold mine that this was proving to be, J & J decided to sift from the stiff-button-down company they had been to one with young, ambitious, attractive sales representatives who marketed the products to the doctors. To reach their sales target, these representatives would offer gifts, compliments, favors, and more, and encourage them to use these medicines more than necessary in a wide variety of patients who may or may not have needed them.

Procrit

Interest in a synthetic bone marrow protein that increases red blood cells rose in the 1980s with the creation of erythropoietin [ih-rith-roh-POY-uh-tin] (or, EPO). Scientists at Amgen discovered and cloned this gene, but in deep debt, they needed a wealthy partner for FDA approval. J & J agreed to partner, leading to FDA approval of EPO for commercial sales in 1988. Initial sales were slow, prompting a strategy shift to market EPO to cancer patients instead of just dialysis patients. However, as EPO became available, researchers found that some cancer cells had EPO receptors, stimulating their growth. Harris notes that when a researcher presented these findings to J & J, two members agreed they must "kill this work."

As time passed, troubling findings emerged. While EPO's successful effects generated excitement, concerning effects surfaced in the hearts of elite athletes. J & J planned to enroll 400 women with cervical cancer to compare EPO users with non-users. In contrast, Amgen enrolled 1,233 dialysis patients to study EPO's effects at various levels. Both companies claimed no evidence of harm. These reassurances later proved false.

In 2003, a study suggested that EPO might be harming rather than helping patients. This dissenting research challenged Big Pharma's narrative. Despite known cardiac risks and suspected tumor growth promotion from EPO, most oncologists believed benefits outweighed risks, unaware of the mounting data revealing dangers. Both companies repeatedly faced issues in

> *Harris says the most remarkable thing that may have come from the opioid epidemic was the blind spot the FDA had toward J & J.*

safely administering EPO in clinical trials. In 2004, the FDA announced a study to assess EPO's risks, meaning neither J & J nor Amgen could continue to conceal their results.

Risperdal

A surprising number of people experience psychotic breaks at least once or twice in their lives, and nothing has proven better to treat them than anti-psychotic medicine. For some, the medication has an immediate effect and allows them to lead everyday lives. For others, they experience side effects, such as weight gain, strokes, or dialysis. Still, in extreme cases, there are "extrapyramidal side effects." Those who suffer from those are often ostracized because of their uncontrolled facial movements. J & J sought the FDA's approval for a drug called Risperdal. This anti-psychotic was supposedly safer than its predecessors because it caused few tics and tremors. While approved, the FDA didn't allow J & J to compare it to a similar drug called Haldol. Hence, the executives decided to find a workaround and thus was born the selling to the symptoms.

Sales representatives would ask doctors if their patients suffered from specific symptoms, and a sales aid would list the same symptoms. If the doctors answered yes, the sales rep would tell them that Risperdal would effectively treat them. J & J would later say they knew this symptoms-based message was illegal. Still, this model had already been adopted across the industry. Despite serious red flags, J & J kept trying to meet its aggressive sales goals by marketing Risperdal to children and older people. Harris states that while there was no documentation stating J & J knew the decision to continue to market Risperdal would contribute to the deaths of millions of Americans and the disfigurement of thousands of young boys, they undoubtedly knew the number would be significant.

Duragesic

The opioid epidemic is said to have started in 1995 when the FDA approved the use of OxyContin. The delayed release effect wasn't new to J & J because they had created Duragesic. This patch was supposed to supply a supply of fentanyl over 72 hours. The problem with both of these drugs was that the slow-release mechanism could be easily bypassed, allowing for immediate and possibly fatal doses. Despite worries, Duragesic was approved, but even when it was used appropriately, it could prove fatal and addictive. J & J believed there was a market to be tapped. Since they had sales reps in this area, they started advertising Duragesic to relieve chronic pain.

Harris says the most remarkable thing that may have come from the opioid epidemic was the blind spot the FDA had toward J & J. They, along with other Big Pharma executives, had misled the regulators, doctors, and patients about its effects and potential abuse. The FDA had warned J & J to cease claiming that fentanyl was only minimally addictive, but did nothing when they didn't. No matter how hard J & J tried to find a workaround for medicines, it was clear they were the same as OxyContin; they were just given a different name.

Ortho Evra Birth Control Patch

The production of birth control revolutionized relationships and changed them forever. What isn't as well known is how it changed the FDA. Since J & J was already reaping rewards from the Duragesic fentanyl patch, they decided to apply the same technology to contraceptives. Still, they were quickly faced with problems, such as elevated estrogen levels and inconsistent doses being released. Based on these findings, J & J were facing several unpleasant options, and rather than go with any of them, they decided to willfully lie to the FDA about the patch's estrogen issues.

After the approval and subsequent release of Ortho Evra, reports started coming in of young women having surprise pregnancies, strokes, heart attacks, and, in some cases, dying. J & J had done extensive research and knew the dangers of the patch but chose to hide the evidence from the FDA and their consumers. A warning label was placed on Ortho Evra, but because of the need for as many contraceptives as possible, it has never been pulled off the shelf. Even though executives resigned, citing the lack of urgency for the deaths taking place and the dishonest research that was released, J & J chose to harm instead of protect their consumers.

Part 3: Medical Devices

J & J has been producing medical devices for several years, but deaths and injuries became more prevalent as these devices became more complex. Congress passed legislation stating that high-risk devices needed more extensive testing. Still, the FDA was so thoroughly captive to the companies instead of consumers that testing never fully occurred.

Pinnacle Metal-On-Metal Hip Implant

The day before J & J would apply for a Metal-On-Metal hip replacement called Pinnacle, they found one of the five pairs was falling apart in the simulator. They were again faced with less-than-ideal options: present their findings to the FDA and be forced to miss out on profits, perform trials on humans instead of simulators, or make an undisclosed change that could compromise the FDA's approval later. There was also

the dilemma of causing untold pain to those who received the device. So what could they do?

They decided to move from plastic to metal devices, thinking they would last a lifetime. Instead, the friction from the ball and cup joint causes metal shavings to kill the tissue and cause injury, strokes, or even death. J & J performed studies to see if they could solve the issue, but held back essential documents from the FDA, so they would assume that Pinnacle was working and not harming the recipients. But that was entirely untrue, and J & J was busy telling doctors who reported issues they were alone in having them, and they would see thousands of lawsuits related to Pinnacle pouring in.

Prolife Vaginal Mesh

Humans sag as they age, and J & J saw an opportunity to assist women with pelvic floor issues. Rather than doctors continuing to use women's tissue to strap down sagging organs, J & J created a plastic sling that would cinch around the bladder. However, the recipients would soon complain of painful, lengthy recoveries. To find an easier way to insert the anti-sag mesh, they decided to insert it through the vagina, which created a new set of problems. One of the mesh's inventors stated that because of the pain some women were experiencing, going back to the concept stages should be considered. He was not alone in his concerns, and while other surgeons expressed concerns, J & J ignored them and began selling Prolift without FDA approval.

Problems with Prolift continued to come forward, and rather than reveal the procedure risks to doctors, J & J decided to eliminate the problematic data they had found. An easy cure would have been not to promote or use Prolift, but instead, they continued moving forward until the FDA said that it was enough. First, they released a significant revision to its vaginal mesh alert. Still, they would finally ban the use of all vaginal meshes to repair prolapse due to recipients experiencing devastating results instead of the relief they sought.

Part 4: Vaccinations

As J & J's decades-long deceits came to the surface, they faced the wrath and lawsuits of the consumers they had knowingly harmed. From Johnson's Baby Powder to Risperdal, J & J knew that the results would be devastating if the emotional trust they had built with their customers were broken. Six out of their seven best-selling drugs would eventually be revealed to have been marketed using illegal tactics. However, the COVID-19 pandemic gave them a unique chance to save the world by creating a vaccine.

As the world began to shut down, J & J got to work, focusing on a single-dose vaccine that would set them apart from Pfizer and Moderna, whose vaccines would need a booster. They were confident it would work, but didn't have a manufacturing presence in the international market, so they partnered with Emergent BioSolutions to make it happen. However, they soon ran into serious issues, and the FDA demanded they do more extensive testing. They placed a mandatory pause on the administration of the J & J vaccine because of cases of rare blood clots, but before that, distribution sites that were only using J & J's vaccine were faced with supply issues. Slowly, nations worldwide started restricting access to the vaccine, and when the FDA finally revoked authorization for it, the company's effort to save the world officially failed.

Why was J & J allowed to continue this way for so long? Harris seems to propose that.

The FDA is being held captive by the companies it's supposed to regulate. J & J and others in the pharmaceutical industry perpetuate the myth of the FDA being a strict, powerful agency because it provides an essential defense against the legion of liability cases.

No More Tears: The Dark Secrets of Johnson and Johnson by Gardiner Harris is an in-depth look at how Johnson and Johnson went from one of America's most beloved, trusted companies to one riddled with lawsuits and scandals. It is an informative read that will help consumers understand and take more seriously the decisions they make regarding the health and well-being of themselves and their loved ones. Harris ends No More Tears by calling for several changes, including how the FDA is funded and an assessment of the system that allowed Johnson and Johnson to thrive.

Improving Decision Making through Noise Reduction

Everyone knows that humans are flawed by our very nature. Our inability to be absolutely perfect is a feature that is inextricable to our humanness. For the most part, this imperfection is neither positive or negative–it just is. However, one of the stickier ways it shows up is in how we make decisions and judgments. When it comes to leveling judgment, humans are susceptible to what the authors call "noise" and this noise can be extremely detrimental.

Two different medical doctors can review the exact same case, described in the exact same chart, with identical language and history. Those two doctors can, and often do, reach a different diagnosis. A judge overseeing identical evidence and prior convictions of an accused person can level a completely different judgment than a different judge in a different court. Similar examples are common in corporate customer service, human resources and personnel, forensic science, and more. To make matters worse, individuals' judgments or behavior can be vastly different from day to day and even from morning till night.

Authors Daniel Kahneman, Olivier Sibony, and Cass R. Sunstein define noise as "variability in judgments that should be identical." ***Noise: A Flaw in Human Judgment*** offers readers a fascinating look at this phenomenon, backed by research and illuminated with real scenarios, and "simple remedies" that can improve decision making through the reduction of noise. Both bias and noise contribute to flawed judgment, however most of the study in the subject has been focused on bias. In *Noise,* the authors attempt to "redress the balance" of both components of error so that organizational decisions can be made with limited influence by the noise factor.

Finding Noise

When looking for noise, we may be surprised to find how common it is. In fact, the authors propose that "wherever there is judgment, there is noise–and more of it than you think." One of the most prime opportunities for noise to reveal itself is in the realm of criminal sentencing. Judicial discretion is the idea that judges should and must be given latitude to take all factors

of a particular case and a particular defendant into account when determining an appropriate sentence for the crime. Defendants should be entitled to "draw attention to the details of their situation" rather than be treated the same as every other similar crime and similar defendant. The details matter, so we have always believed. That core value of judicial discretion was called into question in the 1970's when "startling evidence of noise" was made apparent.

Famous judge and human rights advocate Marvin Frankel made the public aware of noise in the criminal justice system with the release of his groundbreaking book and in his appeals to the United States Congress. He shined light on what he called "almost wholly unchecked and sweeping powers" of federal judges resulting in "arbitrary cruelties perpetrated daily." His book became "one of the most influential in the entire history of criminal law" and after its success, Frankel went on to chair large-scale studies that provided the empirical evidence necessary to affect change. The study recruited fifty judges from mixed districts to sentence hypothetical cases from identical documents and information. The results were astounding.

Sentences ranged widely for the same crimes by a factor of ten years and more. In sixteen of the twenty cases, there was not a single instance of unanimity among judges as to whether a defendant should receive incarceration at all and if so, what the length of the incarceration should be. The results were so eye opening that many similar studies followed. When the evidence was presented to Senator Edward M. Kennedy, brother to John F. Kennedy, the influential member of the senate was "shocked and appalled." After years of pressing the senate to act on legislation addressing the problem, Senator Kennedy was instrumental in the en-action of the Sentencing Reform Act of 1984. That act was both a recognition of noise within the criminal justice system and an attempt to reduce its impact and make sentencing more fair.

Judge Frankel and those who followed his pursuit for rebalancing the impact of noise on judgment effectively conducted a noise audit. A noise audit can be implemented in any organization, public or private, to determine the extent to which noise is clouding the judgment of decision makers. In the corporate world, this can expose opportunities to reduce costs and increase fairness.

A noise audit requires the gathering of decision-related data that can be compared to reveal "unwanted variability." This is accomplished by having "multiple individuals judge the same problems" and comparing the results. Whereas most of the decisions in a particular set should fall within a relatively small range, noise leads to a much larger than expected range. Once the existence of noise is clearly demonstrated, steps can be undertaken to reduce its impact.

A Practical Process for Improving Judgments

Now that the authors have laid down the research and evidence behind noise and how they impact judgment, they get into the more practical side of things. Through a technique they call "decision hygiene" readers will learn how to "improve judgments and prevent error" caused by these flaws. Efforts to eradicate the influence of noise are discussed in a variety of sectors including "medicine, business, education, government, and elsewhere." For lasting noise reduction and more reliable decision making, readers are offered a system the authors call "mediating assessments protocol," which is "a general purpose approach to the evaluation of options that incorporates several key practices of decision hygiene."

Once a noise audit has been conducted to ascertain the level of noise impacting judgments and whether or not the problem needs to be addressed, solutions can be attempted to solve the problem. "Replacing judgment with rules and algorithms" is an option that should be considered and can go a long way at reducing noise all together. However, rules are not perfect and algorithms are not "a universal substitute for human judgment."

Instead, leaders should work to improve the judgment capabilities of those engaged in decision making. The approach the authors have developed and that they recommend is "decision hygiene," which includes four strategies: judgment guidelines, shared scale grounded in an outside view, structuring complex judgments, and mediating assessments protocol, or MAP.

Judgment guidelines: In order to improve results from judgment, an organization must first ensure that they have the most able individuals in positions to make those judgments. Selecting the right people and providing the right training are major contributing factors to reducing noise. Beyond that though, criteria for making judgments should be established that can be followed by all decision makers. One prolific example from medicine is in the Apgar score, which was developed in 1952 by the obstetric anesthesiologist Virginia Apgar.

Prior to the introduction of this scorecard, a newborn baby's level of distress was a matter of personal opinion by the attending doctor or midwife. This led to countless errors in judgment and the loss of infant lives. The Apgar scorecard asks the evaluator to measure the baby's skin-color appearance, pulse, reflexes, muscle tone, and respiration. Taken together and assigned a numeric value, the evaluator and team of medical professionals can far more accurately determine if a newborn is in distress or stable. Tools like the Apgar "exemplify how guidelines work and how they reduce noise."

Guidelines do not eliminate the need for human judgment but they do assign a clear set of criteria on which a human judgment should be formed. They "decompose a complex decision into a number of easier sub judgments on predefined dimensions." Shared scale grounded in an outside view: Nearly every organization evaluates the performance of their people at regular intervals. The problem is that these reviews are frequently tied to a rating scale and those scales are inherently noisy. The rater's personal values, circumstances on the particular day the rating is conducted, and the relationship between the rater and the person being evaluated all impact the end result. On top of that, the modern knowledge-based workplace is tough to objectify. Different people in similar roles face variable challenges that must be viewed subjectively. These problems are

> Reduction of noise should not be reached at the expense of flexibility."

well recognized and result in most employees having a strong disdain for the entire performance-evaluation process.

There are a few common tactics to even the score when it comes to scale rating. Aggregation serves to get an average from a large amount of data rather than allowing a single rater to score the scale. This helps to reduce, but not eliminate, noise. Forced ranking is also employed, which asks raters to place those being evaluated on a scale that compares each individual to the others. This can reduce noise to some extent but the loss of morale makes the practice unpopular. A better strategy is to "ensure a common frame of reference."

Scales should be "anchored on descriptors that are sufficiently specific to be interpreted consistently." On top of that, "frame-of-reference training" should be provided to promote consistent scoring from rater to rater. Raters can be taught to compare their own ratings to an "anchor rating" that is viewed as the true rating, which becomes an anchor point on the scale. This serves as the "outside view" from which raters can more fairly assign their own rating.

Structuring complex judgments: The typical candidate interview for a position within an organization is a ripe opportunity for noise. Most interviews are unstructured in that the person conducting the interview asks the candidate a series of questions and allows the candidate to do the same. The main goal of the interview is to determine whether or not the candidate will be successful in the position but unfortunately, unstructured interviews fail miserably in that index. Assessing a candidate's viability in a position is a complex judgment call and therefore, it requires a more structured approach.

Aggregation comes into play but in order to be valid, the evaluation of each candidate must be performed independently without any knowledge or exposure to the evaluations of others. After evaluations are made independently the data can be aggregated to form a clearer and more accurate picture of the candidate's viability. Taking it further though, the process should include three principles of structure: decomposition, independence, and delayed holistic judgment. Decomposition "breaks down the decision into components" that aim the judgment to the most important cues, much like subjudgments do in guidelines. Independence "requires that each assessment be collected independently" to eliminate influence from one element to the other. Delayed holistic judgment allows the decision makers to rely on their intuition, as intuition is recognized as valid in decision making, but reliance on it should be delayed.

Mediating assessments protocol (MAP): An all-encompassing method that was designed to mitigate noise in organizational decision making is the mediating assessments protocol, or MAP. It includes the decision hygiene strategies already introduced and can be "applied broadly" and be adapted for use in various ways at organizations from a multitude of sectors.

MAP is a procedure that is "inspired by the similarity between the evaluation of a strategic option and the evaluation of a job candidate." MAP requires all decision makers to develop a complete list of assessments that must be made on all the different aspects of the strategic option in advance of any decision makers coming together to actually make the decision. Each assessment should be made separately and distinctly from one another to avoid influencing the other, just as is the case with a candidate interview. Only after these vital components are completed should the decision makers come together to discuss the proposal at hand.

This process has many key advantages. MAP "maximizes the value of information by keeping the dimensions of the evaluation independent of each other." When processing information with the end goal of closure in mind, decision makers are naturally inclined to formulate their debate based solely on first impressions. Independent evaluation makes sure that the conclusion reached is not impacted unduly by one aspect over another. Further, this method allows for divergent viewpoints to come forth, leading to greater discussion and debate before reaching a final conclusion.

At the heart of this pursuit to reduce the impact of noise is the idea that all people and all decisions that have significance to people should be made with dignity and respect. We all want to be treated fairly with the full picture of our human experience taken into account. Mercy is not bound by rules and therefore, it is noisy but it provides something invaluable. It "ensures that people feel that they have been treated with respect and that someone has listened to them." Noise-reduction strategies should not be crude in the attempt to make judgments more accurate or fair. Reduction of noise should not be reached at the expense of flexibility, which reflects the changing times, attitudes, or experiences.

In *Noise,* the authors set out to explain why so much noise exists and what can be done to minimize it. Noise will never be eliminated and that is not the desired effect. Noise is part of the human condition and rather than be stamped out, it should be mitigated for the highest good. Being human, most decision makers feel very confident in their judgments, whether they turn out to be accurate or not. Formalizing noise-reduction helps decision makers and the organizations they serve better able to come to sound, reasonable, fair decisions, to the betterment of all.

Management: Strategies

Nudge

Improving Decisions About Health, Wealth, and Happiness

by Richard H. Thaler and Cass R. Sunstein

THE SUMMARY IN BRIEF

Every day, we make decisions on topics ranging from personal investments to schools for our children to the meals we eat. Unfortunately, we often choose poorly. *Nudge* invites us to explore how we make those decisions and how we can be led to make better ones. By knowing how people think, we can design choice environments that make it easier for people to choose what is best for themselves, their families and their society.

Drawing on decades of cutting-edge behavioral science research, Richard H. Thaler and Cass R. Sunstein offer an insightful new perspective on how to improve the decisions we make in everything we do — from public policy issues, such as health care, to personal decisions, such as saving for retirement. They demonstrate how thoughtful, choice architecture can be established to *nudge* us in beneficial directions, a process they label "libertarian paternalism."

The libertarian aspect of their strategies lies in the straightforward insistence that, in general, people should be free to do what they like — and to opt out of undesirable arrangements if they so desire. Their approach maintains or increases freedom of choice by making it easy for people to go their own way.

Nudge is about choices. By learning about choice architecture, you will be able to successfully nudge people toward the best decisions without restricting their freedom of choice.

IN THIS SUMMARY, YOU WILL LEARN:

- How people make the choices they do.
- Why people make bad decisions.
- How government and companies can nudge people in the right direction.
- What you need to know how to design the best possible choice environment.
- When people need a nudge.

THE COMPLETE SUMMARY: **NUDGE**

by Richard H. Thaler and Cass R. Sunstein

The authors: Richard H. Thaler is the Ralph and Dorothy Keller Distinguished Service Professor of Economics and Behavioral Science at the Graduate School of Business, University of Chicago, and director of the GSB's Center for Decision Research.

Cass R. Sunstein is the Felix Frankfurter Professor of Law at Harvard Law School, where he directs the Program on Risk Regulation. As an author or co-author of more than 15 books and hundreds of academic articles, Sunstein has crossed academic borders throughout his career to offer unique insights on law, public policy, economics and psychology. Sunstein has taught at the University of Chicago for 27 years.

Introduction

Carolyn is the director of food services for a large city school system. She is in charge of hundreds of schools, and hundreds of thousands of kids eat in her cafeterias every day. One evening, she hatched an interesting idea. Without changing any menus, she would run experiments in her schools to determine whether the way the food is displayed and arranged might influence the choices kids make. In some schools the desserts were placed first, in others last, in still others in a separate line. The location of various food items was varied from one school to another.

Simply by rearranging the cafeteria, Carolyn was able to increase or decrease the consumption of many food items by as much as 25 percent. School children, like adults, can be greatly influenced by small changes in context. The influence can be exercised for better or for worse. For example, Carolyn knows that she can increase consumption of healthy foods and decrease consumption of unhealthy ones.

Carolyn is a *choice architect*. A choice architect has the responsibility for organizing the context in which people make decisions. Although Carolyn is an imaginary person, many real people turn out to be choice architects. If you design the ballot voters use to choose candidates, you are a choice architect. If you are a doctor and must describe the alternative treatments available to a patient, you are a choice architect. If you are a parent, describing possible educational options to your son or daughter, you are a choice architect.

Just as a building architect must eventually build some particular building, a choice architect like Carolyn must choose a particular arrangement of the food option at lunch, and by so doing she can influence what people eat. She can *nudge*.

'Libertarian Paternalism'

If you think that Carolyn should take the opportunity to nudge the kids toward food that is better for them, you would be welcomed into the *libertarian paternalism* movement.

When the term libertarian is used to modify the word paternalism, it simply means liberty-preserving. Libertarian paternalists want to make it easy for people to go their own way; they do not want to burden those who want to exercise their freedom.

Libertarian paternalism is a relatively weak, soft and nonintrusive type of paternalism because choices are not blocked, fenced off or significantly burdened. If people want to smoke cigarettes, eat a lot of candy, choose an unsuitable health care plan or fail to save for retirement, libertarian paternalists will not force them to do otherwise — or even make things hard for them.

Still, the recommended approach counts as paternalistic because private and public choice architects are not merely trying to track or implement people's anticipated choices. Rather, they are self-consciously attempting to move people in directions that will make their lives better. They nudge.

A nudge is any aspect of the choice architecture that alters people's behavior in a predictable way without forbidding any options or significantly changing their

economic incentives. Putting fruit at eye level counts as a nudge. Banning junk food does not. ●

Biases and Blunders

Most of us are busy. Our lives are complicated and we can't spend all our time thinking and analyzing everything. When we have to make judgments, we use simple rules of thumb to help us.

Rules of Thumb

Although rules of thumb can be very helpful, their use can also lead to systematic biases. This insight, was first developed decades ago by two Israeli psychologists, Amost Tversky and Daniel Kahneman (1974). Their original work identified three heuristics, or rules of thumb: anchoring, availability and representativeness — and the biases that are associated with each.

Anchoring. Suppose we are asked to guess the population of Milwaukee. We may not know much about Milwaukee, but let's guess that it is the biggest city in Wisconsin. To guess at its population, you typically start with something you know, which is the population of Chicago, roughly three million. So we might think, Milwaukee is a major city, but clearly not as big as Chicago, so maybe it is one-third the size.

Now consider someone from Green Bay, Wisconsin, who is asked the same question. She also doesn't know the answer, but she does know that Green Bay has about 100,000 people and knows that Milwaukee is larger, so guesses three times larger — 300,000.

The process is called "anchoring and adjustment." You start with some anchor, the number you know, and adjust in the direction you think is appropriate. The bias occurs because the adjustments are typically insufficient.

Anchors serve as nudges. We can influence the figure you will choose in a particular situation by ever-so-subtly suggesting a starting point for your thought process. When charities ask you for a donation, they typically offer you a range of options. These values are not picked at random, because the options influence the amount of money people decide to donate.

Availability. How much should you worry about hurricanes, nuclear power, terrorism, mad cow disease, alligator attacks or avian flu? And how much care should you take in avoiding risks associated with each? In answering questions of this kind, most people use what is called the "availability" heuristic.

They assess the likelihood of risks by asking how readily examples come to mind. If people can easily think of relevant examples, they are far more likely to be frightened and concerned than if they cannot. A risk that is familiar, like that associated with terrorism in the aftermath of 9/11, will be seen as more serious than a risk that is less familiar.

When "availability bias" is at work, both private and public decisions may be improved if judgments can be nudged back in the direction of true probabilities.

Representativeness. Another heuristic bears an unwieldy name: "representativeness." Think of it as the similarity heuristic. The idea is that when asked to judge how likely it is that A belongs to category B, people answer by asking themselves how similar A is to their image or stereotype of B (that is, how "representative" A is of B).

Use of the representativeness heuristic can cause serious misperceptions of patterns in everyday life. When events are determined by chance, such as a sequence of coin tosses, people expect the resulting string of heads and tails to be representative of what they think of as random. Unfortunately, people do not have accurate perceptions of what random sequences look like. When they see the outcomes of random processes, they often detect patterns that they think have great meaning but, in fact, are just due to chance.

Optimism and Overconfidence

People are unrealistically optimistic even when the stakes are high. Smokers are aware of the statistical risks, and often even exaggerate them, but most believe that they are less likely (than the average smoker) to be diagnosed with lung cancer and heart disease.

Unrealistic optimism is a pervasive feature of human life; it characterizes most people in most social categories. When they overestimate their personal immunity from harm, people may fail to take sensible preventive steps. If people are running risks because of unrealistic optimism, they might be able to benefit from a nudge.

People hate losses. Roughly speaking, losing something makes you twice as miserable as gaining the same thing makes you happy.

Loss aversion helps produce inertia, meaning a strong desire to stick with your current holdings. If you are reluctant to give up what you have because you do not want to incur losses, then you will turn down trades you might have otherwise made. Loss aversion operates as a kind of cognitive nudge, pressing us not to make changes, even when changes are very much in our interest.

Loss aversion is not the only reason for inertia. For

lots of reasons, people have a more general tendency to stick with their current situation. Most teachers know that students tend to sit in the same seats in class, even without a seating chart. But status quo bias can occur even when the stakes are much larger, and it can get us into a lot of trouble.

For example, in retirement savings plans, most participants pick an asset allocation and then forget about it. In one study, the median number of changes in the asset allocation of the lifetime of a professor was, believe it or not, zero. Perhaps even more telling, many married participants who were single when they joined the plan still have their mothers listed as their beneficiaries. ●

Resisting Temptation

Self-control problems can be illuminated by thinking about an individual as containing two semi-autonomous selves, a far-sighted "Planner" and a myopic "Doer." The Planner is trying to promote your long-term welfare but must cope with the feelings, mischief and strong will of the Doer, who is exposed to temptations.

In many situations, people put themselves into an "automatic pilot" mode in which they are not actively paying attention to the task at hand. When self-control problems and mindless choosing are combined, the result is a series of bad outcomes for real people.

Millions of Americans still smoke in spite of the evidence that smoking has terrible health consequences, and significantly, the overwhelming majority of smokers say that they would like to quit. Nearly two-thirds of Americans are overweight or obese. Many people never get around to joining their company's retirement savings plan, even when it is heavily subsidized. Together, these facts suggest that significant numbers of people could benefit from a nudge.

Self-Control Strategies

Since people are at least partly aware of their weaknesses, they take steps to engage outside help. We make lists to help us remember what to buy at the grocery store. We buy an alarm clock to help us get up in the morning. We ask friends to stop us from having dessert or to fortify our efforts to quit smoking. In these cases, our Planners are taking steps to control the actions of our Doers, often by trying to change the incentives that Doers face. Unfortunately, Doers are often difficult to rein in and they can foil even the best efforts of Planners.

Alarm clocks and Christmas clubs are external devices people use to solve their self-control problems. Another way to approach these problems is to adopt internal control systems, otherwise known as "mental accounting." Mental accounting is the system that households use to evaluate, regulate and process their home budget. Almost all of us use mental accounts, even if we're not aware that we're doing so.

The concept is illustrated well by an exchange between the actors Gene Hackman and Dustin Hoffman. Hackman and Hoffman were friends back in their starving-artist days, and Hackman tells the story of visiting Hoffman's apartment and having his host ask him for a loan. Hackman agreed to the loan, but then they went into Hoffman's kitchen where several mason jars were lined up on the counter, each containing money. One jar was labeled "rent," another "utilities" and so forth. Hackman asked why, if Hoffman had so much money in jars, he could possibly need a loan, whereupon Hoffman pointed to the food jar, which was empty.

Most organizations have budgets for various activities and it is always a source of frustration when an important purchase cannot be made because the relevant account is already depleted. The fact that there is unspent money in another account is considered no more relevant than the money sitting in the rent jar on Hoffman's kitchen counter. ●

Following the Herd

Humans are frequently nudged by other humans. Sometimes massive social changes, in markets and politics alike, start with a small social nudge. Humans are not exactly lemmings, but they are easily influenced by the statements and deeds of others.

Understanding how and why social influences work is important in this context for two reasons. First, most people learn from others. This is usually good, of course. Learning from others is how individuals and societies develop. But many of our biggest misconceptions also come from others. When social influences have caused people to have false or biased beliefs, some nudging may help.

The second reason why this topic is important is that one of the most effective ways to nudge (for good or evil) is via social influence. Choice architects need to know how to encourage socially beneficial behavior, and also how to discourage the opposite.

Social influences come in two basic categories. The first involves information. If many people do something or think something, their actions and thoughts convey information about what might be best for you to do or

think. The second involves peer pressure. If you care about what other people think about you then you might go along with the crowd to avoid their wrath or curry their favor.

The bottom line is that humans are easily nudged by other humans. Why? One reason is that we like to conform. ●

When Do We Need a Nudge?

For all their virtues, markets often give companies a strong incentive to cater to (and profit from) human frailties, rather than to try to eradicate them or minimize their effects.

Suppose you are told that a group of people will have to make some choices in the near future. You are the choice architect. You are trying to decide how to design the choice environment, what kinds of nudges to offer and how subtle the nudges should be. What do you need to know to design the best possible choice environment? Here are some kinds of situations in which people are least likely to make good choices:

Benefits Now — Costs Later. Predictable problems arise when people must make decisions that test their capacity for self-control. Self-control issues are most likely to arise when choices and their consequences are separated in time. At one extreme are what might be called "investment goods," such as exercise, flossing and dieting. For these goods, the costs are borne immediately, but the benefits are delayed. At the other extreme are what might be called "sinful goods": smoking, alcohol and jumbo chocolate doughnuts are in this category. We get the pleasure now and suffer the consequences later. Both investment goods and sinful goods are prime candidates for nudges.

Degree of Difficulty. We use spellcheckers and spreadsheets to help with hard problems, but many problems are quite difficult, and often there is no easy technology available to help.

Frequency. Even hard problems become easier with practice. Unfortunately, some of life's most important decisions do not come with many opportunities to practice. Most students choose a college only once. Most of us choose a spouse. Few of us get to try many different careers. We get one chance to save for retirement. Generally, the higher the stakes, the less often we are able to practice. Rare, difficult choices are good candidates for nudges.

Feedback. Even practice does not make perfect if people lack good opportunities for learning. Learning is most likely if people get immediate, clear feedback after each try. We usually get feedback only on the options we select, not the ones we reject. Unless people go out of their way to experiment, they may never learn about alternatives to the familiar ones. When feedback does not work, we may benefit from a nudge.

Knowing What You Like. It is particularly hard for people to make good decisions when they have trouble translating the choices they face into the experiences they will have. Take the problem of choosing a mutual fund for your retirement portfolio. When people have a hard time predicting how their choices will end up affecting their lives, they have less to gain by numerous options and perhaps even by choosing for themselves. A nudge might be welcomed.

People may need a good nudge most for choices that have delayed effects; those that are difficult, infrequent and offer poor feedback; and those for which the relation between choice and experience is ambiguous.

Markets: A Mixed Verdict

A natural question is whether free markets can solve people's problems, even under such circumstances. Often, market competition will do a lot of good. But in some cases, companies have a strong incentive to cater to people's frailties and to exploit them.

Most of the time, competition ensures that price serves as a good signal of quality. Usually (but not always) the $50 bottles of wine are better than the $20 bottles and irrational consumers will not alter the market as long as they do not predominate.

For irrational consumers to be protected there has to be competition. Consider the case of extended warranties on small appliances, typically a bad deal for consumers. Do market forces drive these unduly expensive extended warranties from the market? Or does competition drive the price of the extended warranties down to the expected value of the claims? The answers to these questions are no and no.

You might think that firms could educate people not to buy the warranty, and indeed they might. But why should firms do that? If you are buying something that you shouldn't, how do I make any money persuading you not to buy it? ●

Choice Architecture

Many people will take whatever option requires the least effort, or the path of least resistance. If, for a given choice, there is a default option, then we can expect a large number of people to end up with that option, whether or not it is good for them. These behavioral

tendencies toward doing nothing will be reinforced if the default option comes with some implicit or explicit suggestion that it represents the normal or even the recommended course of action.

Many organizations in both the public and the private sector have discovered the immense power of default options. Remember the idea of automatic renewal for magazine subscriptions? If renewal is automatic, many people will subscribe, for a long time, to magazines they don't read. Note that not all defaults are selected to make the chooser's life easier or better.

Expect Error

Humans make mistakes. A well-designed system expects its users to err and is as forgiving as possible. Consider that over the years, automobiles have become much friendlier to their operators. If you do not buckle your seat belt, you are buzzed. If you are about to run out of gas, a warning sign appears and you might be beeped. If you need an oil change, your car might tell you. Many cars come with an automatic switch for the headlights that turns them on when you are operating the car and off when you are not, eliminating the possibility of leaving your lights on overnight and draining the battery.

The best way to help people improve their performance is to provide feedback. Well-designed systems tell people when they are doing well and when they are making mistakes. Our laptops warn us to plug in or shut down when the battery is dangerously low. But warning systems have to avoid the problem of offering so many warnings that they are ignored. If our computer constantly nags us about whether we are sure we want to open that attachment, we begin to click "yes" without thinking about it. These warnings are thus rendered useless.

Understanding 'Mappings'

Some tasks are easy, like choosing a flavor of ice cream; other tasks are hard, like choosing a medical treatment. A good system of choice architecture helps people improve their ability to map and hence to select options that will make them better off.

One way to do this is to make the information about various options more comprehensible, by transforming numerical information into units that translate more readily into actual use.

Take the example of choosing a digital camera. Cameras advertise their megapixels, and the impression created is certainly "the more megapixels the better." What is really problematic for consumers is translating megapixels into what they care about. Is it worth paying an additional $100 to go from four to five megapixels? Suppose instead that manufacturers listed the largest print size recommended for a given camera.

Often people have a problem in mapping products into money. Think about credit cards, mortgages, cell phone calling plans and auto insurance policies, just to name a few. For these and related domains, a very mild form of government regulation, a species of libertarian paternalism, is suggested called RECAP: Record, Evaluate and Compare Alternative Prices. The government would not regulate how much issuers could charge for services, but it would regulate their disclosure practices.

Structure Complex Choices

People adopt different strategies for making choices depending on the size and complexity of available options. When we face a small number of well-understood alternatives, we tend to examine all the attributes of all the alternatives and then make trade-offs when necessary.

Social research reveals that as the choices become more numerous and/or vary on more dimensions, people are more likely to adopt simplifying strategies. Good choice architecture will provide structure, and structure will affect outcomes.

Many companies, such as Netflix, the mail-order DVD rental company, succeed in part because of immensely helpful choice architecture. Customers looking for a movie to rent can easily search by actor, director, genre and more, and if they rate the movies they

Save More Tomorrow

Although automatic enrollment is effective at getting new and young workers to enroll sooner than they would have otherwise, participants tend to stick with the default contribution rate, which is typically quite low. To mitigate this problem, consider a program of automatic escalation of contributions: Save More Tomorrow.

This program invites participants to commit themselves, in advance, to a series of contribution increases timed to coincide with pay raises. By synchronizing pay raises and savings increases, participants never see their take-home amounts go down, and they don't view their increased retirement contributions as losses. Once someone joins the program, the saving increases are automatic, using inertia to increase rather than prevent savings.

have watched, they can also get recommendations based on the preferences of other movie lovers with similar tastes, a method called "collaborative filtering."

Choice architects must think about incentives when they design a system. Sensible architects will put the right incentives on the right people.

Free markets often solve all of the key problems by giving people an incentive to make good products and to sell them at the right price. ●

Money

In 2005, the personal savings rate for Americans was negative for the first time since 1932 and 1933 — the Great Depression years. On average, American households spent more than they earned and borrowed more than they saved. Increased borrowing rates were fueled by substantial growth in home equity loans and in credit card debt. For many Americans, savings rates, especially retirement savings, are woefully low, if not zero.

Enrollment: Nudging People to Join

What can be done to help? An obvious answer is to change the default rule. As things now stand, the default is nonenrollment; you have to do a little work to get into a retirement program. Forms can be a headache and many employees just put them aside. An alternative is to adopt automatic enrollment. Here's how it works. When an employee first becomes eligible, he or she receives a form indicating that he or she will be enrolled in the plan (at a specified savings rate and asset allocation), unless he or she actively fills out a form asking to opt out.

An alternative to automatic enrollment is simply to require every employee to make an active decision about whether to join the plan. A related strategy is to simplify the enrollment process. One study tested this idea by analyzing a simplified enrollment form. New employees were handed enrollment cards during orientation with a "yes" box for joining the plan at a 2 percent saving rate and a preselected asset allocation. Employees did not have to spend time choosing a savings rate and asset allocation. As a result, participation rates during the first four months of employment jumped from 9 percent to 34 percent.

Credit Markets

Mortgage shopping has now become more complicated. Borrowers can choose from a variety of fixed-rate loans and also numerous "variable rate" loans. Borrowers might also consider such exotic products as interest-only loans. When markets get more complicated, unsophisticated and uneducated shoppers will be especially disadvantaged by the complexity.

Shopping for a student loan is nearly as complicated as looking for a mortgage. One helpful nudge would be to simplify the financial aid application. The complicated format of these forms can discourage students from applying for financial aid and cause them to seek price direct-to-consumer loans instead.

The credit card is a ubiquitous feature of modern life. The Census Bureau reported that there were more than 1.4 billion credit cards in 2004 — an average of 8.5 cards per cardholder. Currently, 115 million Americans carry a month-to-month credit card debt.

For mortgages, school loans and credit cards, life is far more complicated than it needs to be, and people can be exploited. Often it's best to ask people to take care of themselves, but when people borrow, standard human frailties can lead to serious hardship. Here, as elsewhere, government should respect freedom of choice; but with a few improvements in choice architecture, people would be far less likely to choose badly. ●

Health

Libertarian paternalists see countless opportunities for improving people's health. People who know obese people are more likely to be obese themselves; weight loss can be contagious, too. Framing matters: people are more likely to engage in self-examinations for skin and breast cancer if they are told not about the reduced risk if they do so, but about the increased risk if they fail to do so.

Doctors are crucial choice architects, and with an understanding of how people think, they could do far more to improve people's health.

Prescription Drugs: Part D for Daunting

The largest overhaul in Medicare's history, Part D created a half-trillion-dollar federal subsidy for prescription drug coverage. This was no laissez-faire system. The national government imposed a lot of structure. Before consumers could even begin to choose, the government set minimum coverage requirements and approved all private plans.

The system of constrained free choice might seem like a nice example of libertarian paternalism in action. As a health care delivery system, Part D met its planners'

expectations reasonably well. As a piece of choice architecture, however, it suffered from a cumbersome design that impeded good decision-making. It offered a menu with lots of choices, which is fine, but it had four major defects:

1. It gave participants little guidance to help them make the best selections from that menu.
2. The default for most seniors was nonenrollment.
3. It chose a default at random for 6 million people who were automatically enrolled, and it actively resisted efforts to match people and plans based on their prescription drug histories.
4. It failed to serve the most vulnerable population, specifically the poor and the poorly educated.

Do not misunderstand. Part D has done a lot of good. But there is plenty of room for better choice architecture. Maximizing choices is not enough to create good policy. The more choices there are, and the more complex the situation, the more important it is to have enlightened choice architecture.

Saving the Planet

In recent decades, governments all over the world have been taking aggressive steps to protect the environment. Most of the time, governments seeking to protect the environment and to control the harmful health effects of pollution have gone well beyond a nudge, and their steps have not been libertarian. Typically regulators have chosen some kind of command-and-control regulation. Catalytic converters for cars are one example.

More often, government officials do not specify technologies, but require across-the-board reductions in emissions. They might say, for example, on average, all new cars must emit 90 percent less carbon monoxide, on average, than they do now. Philosophically, however, such limitations look uncomfortably similar to Soviet-style five-year plans, in which bureaucrats in Washington announce that millions of people have to change their conduct in the next five years.

When incentives are badly aligned, it is appropriate for government to try to fix the problem by realigning them. In the environmental area, two broad approaches have been proposed.

The first is to impose taxes or penalties on those who pollute. In the domain of climate change, a tax on greenhouse gas emissions is a simple example.

The second approach is called a cap-and-trade system. In such systems, those who pollute are given (or sold) "rights" to pollute in certain amounts and these rights are then traded in a market. Incentive-based approaches are more efficient and more effective, and they also increase freedom of choice.

Especially when compared with command-and-control systems, economic incentives have a strong libertarian element. Liberty is much greater when people are told, "You can continue your behavior, so long as you pay for the social harm that it does" than when they are told, "You must act exactly as the government says."

Objections — Evil Nudgers and Bad Nudges

In offering supposedly helpful nudges, choice architects may have their own agendas. Those who favor one default rule over another may do so because their own economic interests are at stake, as in when companies offer you a special rate for the first month, then automatically reenroll you in the program at a higher rate after the introductory period.

Real architects can have conflicts of interest with their clients as well, but they should not necessarily stop designing buildings. Instead, we need to try to line up incentives when we can and employ monitoring and transparency when we can't.

The Real Third Way

You have been presented with two major claims. The first is that seemingly small features of social situations can have massive effects on people's behavior; nudges are everywhere, even if we do not see them. Choice architecture, both good and bad, is pervasive and unavoidable, and it greatly affects our decisions.

The second claim is that libertarian paternalism is not an oxymoron. Choice architects can preserve freedom of choice while also nudging people in directions that will improve their lives.

Understanding choice architecture and the power of nudges hopefully will lead others to think of creative ways to improve human lives in other domains. ●

RECOMMENDED READING LIST

If you liked *Nudge*, you'll also like:

1. ***The Heart of Change* by John Kotter and Dan Cohen.** Built around eight steps of change first introduced in Kotter's earlier works, this book gives straight advice on successful change.
2. ***The Speed of Trust* by Stephen M.R. Covey.** Trust is central to the success of every relationship. Covey demonstrates the best ways to establish trust or repair it in the event it has been broken.
3. ***The Hands-Off Manager* by Steve Chandler and Duane Black.** Offering an opposing view to *Nudge*, this book postulates that employees need gentle coaching rather than management by force.

Solving Problems and Building Leaders in Real Time

OPTIMIZING THE POWER OF ACTION LEARNING

THE SUMMARY IN BRIEF

Novartis, a Swiss-based pharmaceutical conglomerate with more than 72,000 employees in 140 countries, recently formed a consortium of six noncompetitive companies from different sectors. At the heart of the consortium are six to eight action learning groups formed of members from each of the six companies. The action learning groups work as teams on specific business projects of importance to their respective companies. The overall goal of the action groups is threefold: to solve the business problems of the companies, to develop leaders, and to build organizational capacity.

Around the world, writes George Washington University professor Michael J. Marquardt, companies and organizations of all sizes are using the action learning methodology to solve major problems and build productive and effective teams.

In Optimizing the Power of Action Learning, *Marquardt, an expert on the action learning process, details exactly how the methodology works and how it can be used for important problems impacting businesses large and small.*

What You'll Learn In This Summary

- ✓ The criteria for an action learning problem.
- ✓ The characteristics and roles of the group in action learning.
- ✓ The reflective inquiry process, a key component of action learning.
- ✓ The individual, team and organizational learning that can be achieved through action learning.
- ✓ The roles and responsibilities of the action learning coach.
- ✓ Twelve steps for introducing action learning.

OPTIMIZING THE POWER OF ACTION LEARNING

by Michael J. Marquardt

— THE *COMPLETE* SUMMARY

PART ONE: THE EMERGING POWER OF ACTION LEARNING

What Is Action Learning?

Action learning is a problem-solving tool that at the same time builds successful leaders, teams and organizations.

The action learning process has six components, which will be briefly explained below and then explored in greater detail in the rest of the summary.

The six components of action learning are:

1. A problem. Action learning centers on a problem or, more specifically, a project, challenge, opportunity, issue or task. The resolution of this problem has to be of great importance to the organization — action learning is not for minor issues. The problem must be significant and urgent.

2. A group. The second component of action learning is an action learning group or team. The ideal group has four to eight diverse members, who bring various perspectives and fresh viewpoints to the task of resolving a significant organizational problem.

3. Questions. A process of insightful questioning and reflective listening is key to the success of the action learning initiative. Action learning succeeds because the process focuses on the right questions, not the right answers. Questions build group cohesiveness, generate innovative and systems thinking, and enhance learning results.

4. Action. Action learning requires that the action learning group be able to take action on the problem to which it has been assigned. The group must either have the power to take action, or be assured that its recommendations will be implemented. If neither of these conditions is in place, raising the specter of recommendations sitting in the bottom of a drawer, the team will lose its focus and energy.

5. Learning. An equal commitment to learning is also essential for the success of action learning. While the short-term action steps needed to address the problem will be valuable to the company, it is the long-term learning gained through the exercise that most benefits the organization and its members.

6. A coach. To keep the group focused on the important as well as the urgent, an action learning coach is required. Through helping group members reflect on how they listen or how they may have reframed the problem, for example, the coach keeps the group focused on what they are achieving, what they are finding difficult, what processes they are employing, and the implications of those processes.

Action learning is at its peak if all six of these components are in operation, interweaving and reinforcing each other.

Solving Problems at National Semiconductor

Here's an example of what action learning can offer a company:

Executives at National Semiconductor's Portland, Maine, plant recognized that they were having difficulties providing quality service at AT&T (National Semiconductor is one of AT&T's major suppliers).

Their response was to create an action learning team called the Customer Request Improvement Team.

What Is Action Learning?

(continued from page 2)

Members of the Customer Request Improvement Team were pulled from the sales, marketing, engineering, manufacturing and planning functions of National Semiconductor. The team also included members from AT&T.

Over a period of three months, the team considered more than 40 ideas for improvement, which resulted in four specific action initiatives:

1. **Analyzing in new ways the delivery misses.**
2. **Increasing frequencies of lead-time updates.**
3. **Creating critical device lists.**
4. **Developing pre-alert reports.**

Following the implementation of these initiatives, AT&T recognized National Semiconductor as one of its "world class" suppliers. ■

For Additional Information on how action learning balances chaos and order, go to: http://my.summary.com

Ground Rules That Empower Action Learning

The power of action learning is built on two key behaviors: reflective inquiry and continuous learning. In order to ensure that the process doesn't stray from questioning and learning, all action learning initiatives must follow two ground rules.

The first is that *statements should be made only in response to questions.* In other words, participants in action learning groups must think questions first, not answers first. They should not enter the meetings prepared to make statements and judgments. They should enter the meetings prepared to ask questions.

This doesn't mean that action learning is against statements. In fact, since questions will elicit more than one response, there will be more statements than questions in the course of the action meeting. The goal is to prevent action learning participants from jumping immediately into statements to solve the problem.

The second ground rule of effective action learning is that *the action learning coach has the power to intervene.* This ground rule addresses the need for continuous learning.

The first important point to remember about action learning coaches is that they are not there to work on the problem. That is the responsibility of group members. The goal of the coach is to see the opportunities for learning that arise, and to pounce on those opportunities to increase the group's ability to solve the problem and develop innovative action strategies.

One can use the dichotomy of the urgent vs. the important. The group, trying to meet deadlines and reach solutions, will focus on the urgent. It's up to the coach to discern what's important and focus the group on those issues.

In order to make this happen, the coach must have the power to intervene, and, essentially, bring the process to a halt. The group stops working on the problem and instead listens to the coach's questions (questioning is the process by which the coach will advance learning). ■

For Additional Information on why action learning works so well, go to: http://my.summary.com

Action Learning At LG Electronics

With more than 55,000 employees and 72 subsidiaries around the world, Seoul, Korea-based LG Electronics (LGE) is a major global company specializing in electronics and telecommunications. Its "Global Marketer" program is one of LGE's numerous programs to develop executive and employee competencies.

The Global Marketer program uses the action learning approach to develop global leaders in marketing — leaders who will have the competencies to solve any possible problems that they may face in a constantly changing environment.

Each action learning team in the program is composed of three LGE managers, an MBA student from a foreign university, a Korean expert, a foreign expert, and an executive who has specific knowledge and experience.

The teams are given major marketing projects, such as "how to improve brand equity" or "how to launch a new product." The project will include seminars by Korean and foreign experts as well as on-site interviews and surveys with competitors, customers, suppliers and best practice companies.

Each project has an allotted time of two-and-a-half months — one-and-a-half months in Korea and one month overseas. At the end of the program, each team presents its recommendations to corporate sponsors and executives for implementation.

Through this action learning-based Global Marketer program, LGE improves its business performance while developing the problem-solving and global leadership skills of the participants, and reinforcing in those participants a global perspective.

PART TWO: APPLYING THE SIX COMPONENTS OF ACTION LEARNING

The Problem: Starting Point For Action Learning

The starting point for action learning is the problem — which can also be referred to as the project, challenge, opportunity, issue or task. Not all problems, however, qualify for an action learning initiative. Small, specific issues, such as how to deal with an unmotivated manager, hardly require the creation of an action learning team.

To optimize the power of action learning, choose your problems carefully. The best problems for action learning will have the following attributes:

1. Importance. First and foremost, the problem has to be important; it should make a significant difference to the individual or organization. A problem that is insignificant or too easy to solve will not motivate a problem-solving team, nor fully tap its potential.

2. Urgency. An action-learning problem must have a real time frame in which the problem must be defined and actions taken. The results of an action learning initiative are not meant to languish in a bottom drawer.

3. No existing solution. Action learning is not an exercise. In other words, the problem should be real and unsolved — it should not be hypothetical, and the solution for the problem should not exist somewhere in the organization or outside the organization. For example, top management should not look for an action learning group to reinforce a solution that it has already determined.

4. Feasibility. The group should be challenged but not overwhelmed. The problem must therefore be one that the organization has (or can acquire) the resources and time to resolve.

5. Familiarity. Some members of the group must be familiar with the context of the problem. On the other hand, it is often productive to have group members who do not have previous experience with the problem to bring a fresh perspective.

6. Significance. The problem must be significant and important to one or more members of the group. There must be stakes attached to the success of the group's strategies.

7. Learning opportunity. The best action learning problems provide excellent and important learning opportunities for the group. A fundamental premise of action learning is that we learn best when undertaking an action, which we then reflect on and learn from. If the problem does not offer an opportunity to learn, a great benefit of the action learning process will be lost.

8. Group authority. The group must have the authority to solve and implement action. The group will not be motivated to seek innovative strategies if it believes that suggestions may or may not be implemented. ■

Action Learning At New York City Transit

New York City Transit identified three major problems of the subway system to be resolved using action learning: 1) Increased ridership; 2) unintelligible announcements; and 3) lack of teamwork. Action learning groups were created to address these problems. Group members were chosen from a wide range of job functions in the New York City Transit organization; diversity based on gender, age and ethnicity was also emphasized. Each action learning group identified five to 10 solutions, and all but two were implemented.

For Additional Information on examples of action learning problems, go to: http://my.summary.com

The Group: The Power Of Diversity

The second component of action learning is the action learning group. The effective action learning group shares many of the same characteristics as effective teams: a commitment to solving the problem; a clear, common purpose; the willingness to work with others to develop strategies; and clear and accepted norms.

Selecting who will participate in the action learning group is key to the success of the initiative. As with the first component of action learning — the problem — action learning team members should meet certain criteria in order to create a group that will fully optimize the power of action learning.

The criteria for action learning group membership are the following:

1. Commitment. One or more group members must have a stake in the problem.

2. Knowledge. One or more members must have specific knowledge about the problem. Outside knowledge can be sought, but there should still be reasonable knowledge within the group.

3. The power to implement. Ideally, it is the members of the group who will have the power to implement

(continued on page 5)

The Group: The Power of Diversity

(continued from page 4)

the suggestions developed by the group. If this is impossible, the group must be assured that their suggestions will be implemented by the organization.

4. Familiarity. At least one group member should be familiar with the context of the problem, although, as noted above, new perspectives are also valuable.

5. Diversity. Action learning is questions-based, which opens the door for the inclusion of members from all levels of the organization. You do not have to be an expert on the problem; you just have to be in a position to ask specific questions that relate to the problem.

6. Member selection. If the organization selects team members, it should not take the task lightly. The selection should not be random; selecting people from different departments, for example, is an opportunity not only to bring fresh perspectives to the problem, but also to create new networks and connections that did not exist before.

7. Attendance. Attendance should be mandatory. It's better to schedule fewer meetings that people can attend than a large number of meetings that will always have absentees.

Group Size

The ideal size of the action learning group is four to eight members. With too many members, the participation of some members may be crowded out by their colleagues, communication is more complex, and reaching a consensus is more difficult. An action learning group that is too small, on the other hand, limits the number of perspectives and may also cause the group to either misunderstand the complexity of the problem, or be overwhelmed.

Roles in the Action Learning Group

Participants in action learning programs cover a number of different roles — both inside and outside the action learning teams. Within the team there will be a problem presenter (more than one if there is more than one problem being addressed by that team). There is also the action learning coach, of which we will learn more about later.

Generally, there will be a problem sponsor, who may or may not be part of the team. The sponsor makes sure the problem is given high visibility and ensures that the solutions developed by the team will be implemented.

Finally, an action learning champion, who does not participate in specific action learning groups, ensures that the organization is committed to action learning. ■

For Additional Information on the problem with experts, go to: http://my.summary.com

Questions and Reflection

Questions, or more specifically, a reflective inquiry process, is the third component of successful action learning. Questions help understand and clarify problems, and open up paths to innovative solutions. Questions are also key for individual, team and organizational learning.

Effective problem solving begins by getting a big picture perspective of the problem. The old Hindu tale of the seven blind men who encounter an elephant — the blind man who touches the trunk thinks the elephant's a snake; the blind man who grabs a leg thinks the elephant is a tree trunk; and so forth — is a good allegory for what happens when focus and convergence occur before divergence.

Before you start to zero in on solutions, you want a helicopter's view of the problem; questions (and reflecting on the answers) help you get perspective. In other words, if the blind men had been asking questions of the others, instead of making statements ("It's a snake!"), they would have a better understanding of the animal they were dealing with. Questions, especially challenging ones, help group members to think and to learn.

Listening Without Prejudgment

Reflection involves recalling, thinking about, pulling apart, making sense, and trying to understand. In order for real reflection to occur, group members must have the space to stand back and let go of their assumptions and presuppositions.

Listening without prejudgment to what others have to say is key, which is why it is critical that questions rather than statements are the primary means of communication. Forcing statements to be made only in response to questions dramatically changes the dynamic of the group's interaction: Listening takes precedence over talking.

Communication that emphasizes questioning and listening is the essence of dialogue, which is very different from debate or discussion. In dialogue, the goal is to learn through inquiry and disclosure. In debate, the emphasis is on persuading, selling and telling. ■

Action Strategies: Learning From Action

One of the axioms of action learning is that "there is no real learning without action, just as there should be no action without learning." Learning is significant only if we take some type of action as a result of that learning.

Action involves what occurs within the action learning sessions — problem reframing, establishing goals,

(continued on page 6)

Action Strategies: Learning From Action

(continued from page 5)

and developing strategies — as well as (and even more importantly) what occurs outside of the sessions — testing, gaining support and resources, and taking action.

Specifically, an action learning group will go through four stages from when it first examines the problem to when it implements strategies.

Stage 1: Understanding and Reframing The Problem

The first stage is understanding and reframing the problem. This is perhaps the most important stage — after all, the right solutions to the wrong problem don't really help. Yet, it's more common for teams to try to rush into solutions before they've fully clarified the problem.

As groups begin the questioning process, one vital and surprising development is often the discovery that the originally identified problem is not actually the real or most important problem. In other words, the group is able to dig past the surface or visible problem to uncover the hidden problem beneath it.

Another benefit of the questioning process is that it reveals and separates out the assumptions, expectations, biases, symptoms and limited perspectives that both the presenter and the other group members bring to the problem.

As the group better understands the problem, it also begins reframing the problem in one of two ways — either members see the *content* of the problem in a new way, or they see the *context* of the problem in a different way.

In the end, the group members must reach a consensus on the problem before moving on to the next stage. As one anonymous wit put it, "It's better to first put your finger on the problem before sticking your nose in it."

Stage 2: Framing and Formulating the Goal

The next action stage is to determine what the group, organization or individual is striving to achieve. Often, the formulated goal is different from the originally intended goal of the initiative. The reason is simply that the problem, as discussed above, was misidentified.

It is thus as important not to accept the given objective as it is not to accept the given problem. The group must select a goal that is the most strategic, has the most staying power, and will solve the real problem with easy-to-leverage results.

The ultimate goal may not be clearly and fully defined at this stage — it will become more refined as the group works on strategies. However, it's important that the group now shifts from a problem frame to an outcome frame, from an "it is impossible" frame to an as-if frame, and from a failure frame to a feedback frame.

Stage 3: Developing and Testing Strategies

Once the group has its goal, the next step is to develop and test strategies. In stage 2, you identified what you wanted or what you needed to do. In stage 3, you become more specific: What will work best and why? What resources do we need? What will be the impact of the action?

In forming the action plan, the group must keep two things in mind: first, whether this action is appropriate to the problem; second, whether this action is doable. Determining whether the action is doable also involves who will be responsible for the action — who has the insight, the power and the commitment to take the action identified by the group.

More than one strategy should be developed and, if possible, tested. Pilot actions are key to ensuring the success of the strategy once it is fully implemented.

Stage 4: Taking Action and Reflecting on the Action

Action is obviously an important element of any action learning group's work. Some concrete, specific action should be agreed upon and taken at the end of each session. It's up to the action learning coach to ensure that the team does not run out of time before agreeing on action items. If a session ends without any actions decided on, the time between sessions becomes lost time. ■

Developing Training at Fairfax County Public Schools

Eight staff members of the Fairfax County Public Schools, including principals, assistant principals and HR staff, had one two-hour action learning session to develop a long-term training program for principals and assistant principals.

Because of the tight time frame, some members were anxious to move to the third and fourth stages of action learning: developing strategies and an action plan. But the team kept the focus on determining the real problem and the real goals first; this process used up more than 60 minutes of the allotted time.

Once the real problem and real goals were identified, however, the team took just 30 minutes to identify strategies and develop the outlines of a training project — a project that ultimately led to a $5 million grant from the Reader's Digest Foundation for leadership development.

Individual, Team and Organizational Learning

Solving a particular reengineering problem may be worth $1 million to the company. Applying that knowledge throughout the organization may be worth $10 million. And if the team members apply the new leadership and team skills developed in the action learning program, that learning may be worth $100 million over the course of the team members' careers.

Thus, the learning that occurs in action learning is more valuable than solving the problem itself.

Group members are advised from the very first session that they have a responsibility for their own, their group's and their organization's learning. They understand that time will be set aside for learning, and that the action coach will carve out and manage this time. (In the next article, we will explore in greater depth the responsibilities of the action coach.)

How Action Learning Generates Learning

In action learning, the group creates knowledge through 1) concrete experience; 2) observing and reflecting on this experience; 3) forming generalizations from experiences; and 4) testing the implications of those generalizations.

Through these four stages of knowledge creation, the learning takes place at two levels: the first level is the level of the actual problem-solving task; the second level is the level of reflection on how the group worked together.

For example, the concrete experience mentioned above involves solving the problem. Clearly, the group learns as it finds the strategies to resolve the problem. But, at a second level, the group is also learning through the group experience required to resolve this problem. For example, the group learns how to interact effectively, overcome disagreements, and tackle other group issues.

At the observation and reflection stage, the group observes and reflects at the first level on the strategies chosen to resolve the problem. Will those strategies work?

But at this stage as well, the group reflects at the second level on the skills that they learned in the process: group skills, such as decision making and group interaction, as well as individual learnings.

Forming generalizations involves, at one level, generalizing the specific solutions developed in the group to address other problems. At the second level, it involves generalizing the group skills learned in the process.

Finally, the test and experiment stage involves testing the strategies to resolve the problem at one level, while at the second level, the group reflects on whether its new behaviors and values acquired in the action learning process will help them work on additional problems.

Team and Organizational Learning at GE

Through action learning, GE employees and managers learn and apply new skills — such as team building, conflict resolution, and understanding change management methodologies and tools — while working on real problems. Some of the achievements supported by action learning include: boundaryless behavior in which employees work easily across business units; greater speed in decision making and implementation; accountability at appropriate levels with less controlling leadership; and reduced impact of the burdens of hierarchy.

Competencies Developed in Action Learning

As mentioned before, the competencies developed in action learning involve individual, group and organizational skills and knowledge.

Individually, group members learn such skills as critical reflection, inquiry and questioning, systems thinking, active listening, self-awareness, empathy, problem solving, decision making, presenting and facilitating. The learning process leads to becoming aware of, and changing as necessary, one's beliefs, values and basic assumptions.

Leadership skills are another important set of skills learned through action learning. For instance, action learning initiatives help group members build what is now known as emotional intelligence, which consists of five primary abilities: self-awareness, managing emotions, motivating oneself, empathy and handling relationships. Every leadership skill just listed can be demonstrated and used in the action learning setting.

Action learning also develops group skills. Action learning groups quickly mold into high-performance work teams. For example, all high-performance work teams have certain characteristics, such as clear and common goals, a willingness to work with others, and the courage to question others. Action learning develops these attributes. Since the first stage of the action learning project is defining the goal, for example, the outcome is a clear and common goal for the team. And since one of the ground rules of action learning is that all statements are in response to questions, the courage to question others is quickly developed in even the shyest participant.

Finally, action learning builds learning organizations. Learning organizations have four components: increased learning skills and capacities, a transformed organizational culture and structure, an involvement of the entire

(continued on page 8)

Individual, Team and Organizational Learning

(continued from page 7)

business chain in the learning process, and enhanced capability to manage knowledge.

Action learning helps organizations construct these four components. For example, group members learn the principles and theories of effective learning, the different types of learning, and the key skills of learning. Action learning develops a culture and values that see learning as essential for corporate success. Action learning involves not only staff, but also vendors, suppliers, customers and even the community in learning. And action learning helps the organization learn to acquire, create, store and transfer knowledge. ■

The Coach: The Catalyst For Learning

The primary role of the coach is to help the group grow and learn. The focus of the coach must always be on enhancing learning, not solving the problem.

The principal tool of the coach is the inquiry process. Through questions, the coach helps group members examine and learn from their actions and interactions.

It's important that a person be specifically assigned to be the action learning coach. Otherwise, the learning process will be crowded out by the urgency of the problem to be solved. This does not mean that the role cannot rotate among members of the group — just as long as the assigned person gives up problem solving while serving as coach.

Building the Learning Climate

The action learning coach is not the teacher or expert or chairperson of the group. The coach does not tell others what to do; instead, he or she should assist them in discovering what needs to be done. This is accomplished through questions, not statements. Questions keep the coach from being seen as judgmental, controlling or even manipulative.

However, the coach must have the power to intervene when he or she sees fit — which means that the coach has the power to stop the group from continuing to work on the problem and instead focus on the question or questions that the coach is raising.

This authority, however, requires the coach to know when to ask and how to ask questions. In other words, knowing when to intervene is one of the most important skills of an effective action learning coach.

In general the coach should intervene at the beginning and end of each session, and one or more times during the session. Samples of questions that the coach might ask at the beginning and end of sessions include the following:

- At the beginning of the very first session: questions on the familiarity of group members with the action learning process and questions about the problem to be solved by the group.
- At the end of the first session: questions on what actions are going to be taken as a result of the session, questions about the performance of the team, and questions about the learning that occurred as a result of the session.
- At the beginning of subsequent sessions: questions on the actions and learning that occurred since the last session.
- At the end of the final session: questions on whether the goal was achieved, and on the individual, team and organizational learning acquired in the process.

The questions that are asked during the sessions will vary, of course, but could include the following:

- How are we doing as a team?
- Do we have agreement on the problem?
- Are we building on each other's questions and ideas?
- What is the quality of our ideas and strategies? ■

For Additional Information on why the coach should not be involved in problem solving, go to: http://my.summary.com

Introducing and Implementing Action Learning

Here's a checklist for introducing and implementing action learning initiatives:

Step 1. Gain support of top management.
Step 2. Conduct a preparatory workshop.
Step 3. Choose projects, problems or challenges.
Step 4. Select and prepare action learning coaches.
Step 5. Determine membership and establish the action learning groups.
Step 6. Orient and prepare the action learning group or groups.
Step 7. Carry out and implement the action learning sessions.
Step 8. Reframe problems and develop action strategies.
Step 9. Pilot test and recommend actions.
Step 10. Implement action strategies.
Step 11. Finalize activities and capture final learnings of the action learning group.
Step 12. Assess value and power of the action learning program and seek ways to expand it throughout the organization.

Creating Value for Your Business by Building Strong Alliances

PARTNERING INTELLIGENCE

THE SUMMARY IN BRIEF

Since the dawn of civilization, human beings have struggled to survive. Throughout most of history, mankind has prospered by banding together, acting in the group's self-interest and moving forward in partnership. But when the industrial revolution took hold, individual competition replaced widespread partnership. Forgotten was the importance of relationships that valued the "we" over the "me."

This thinking is all beginning to change. As society moves towards a global economy based on information and communication, today's business leaders are awakening to the fact that they need to partner in order to survive and prosper. To do so, leaders will have to rediscover and develop lost partnering skills. They will have to learn to be a smart partner and build smart alliances.

This summary will help you regain the lost skill of partnering by showing you how to recapture and develop what author Stephen M. Dent calls your "partnering intelligence."

To help you achieve this goal, Dent presents a tool he labels the Partnership Continuum. As shown in this summary, the Partnership Continuum offers a step-by-step process that offers specific methods for

- developing better relationships,
- developing more effective partnerships,
- trading in a past-oriented mindset for one that is turned toward the future.

A key focus of the summary is on the four stages of partnership development: assessing whether you need a partner; exploring potential partners; initiating the partnership on a limited basis; and committing to a full partnership.

In today's interdependent, hypercompetitive business environment, partnering intelligence offers a vital competitive advantage to companies in all industries. This summary will ensure that you can acquire that advantage.

PARTNERING INTELLIGENCE

by Stephen M. Dent

— THE *COMPLETE* SUMMARY

Rediscovering Partnering

It might be easy, in today's information age, to make the mistake of thinking technology alone will drive business success. Although technology may allow you to become more productive, it won't be long before your competitors replicate your technological advances. In the near future, what will drive business success is the ability to initiate, sustain and profit from interdependent relationships. The outcome will be innovative products, creative services and maybe even new technology. To get there, you will have to develop your partnership intelligence.

Why partner? Because creating business partnerships is essential to innovation, growth and customer satisfaction. Partnering allows you to expand resources without investing in new infrastructures, create greater customer satisfaction through increased availability of services, reduce expenses by using shared facilities and increase productivity and job security.

Examples of successful business partnerships abound. Take the case of a regional telephone company and PCS Wireless, a company that provides wireless telephone service. When the two decided to combine the best of both wireless and land line phone services, they offered customers features that neither could provide alone. The baby bell knew customers wanted only one number to keep track of, and PCS realized customers wanted the flexibility of taking the phone wherever they went. Together, the two companies partnered to provide combined wireless and land line service using only one number.

Another illustration of the power of partnership is the cooperation between KLM Royal Dutch Airlines and Northwest Airlines. As a result of their cooperation, travelers on both sides of the Atlantic enjoy greater flexibility in choice of destinations, reliability, coordinated scheduling and use of frequent flyer miles. Both airlines benefit from the use of shared facilities, ticketing and check-in counters. The partnership has saved both airlines many millions over the last few years.

Partnership Continuum™

The first step to developing your partnership intelligence is self-awareness. You must know and understand your own needs before you can expect to meet someone else's needs. Once both partners' needs are recognized, you become dedicated to success for the enterprise while at the same time you maintain separate identities.

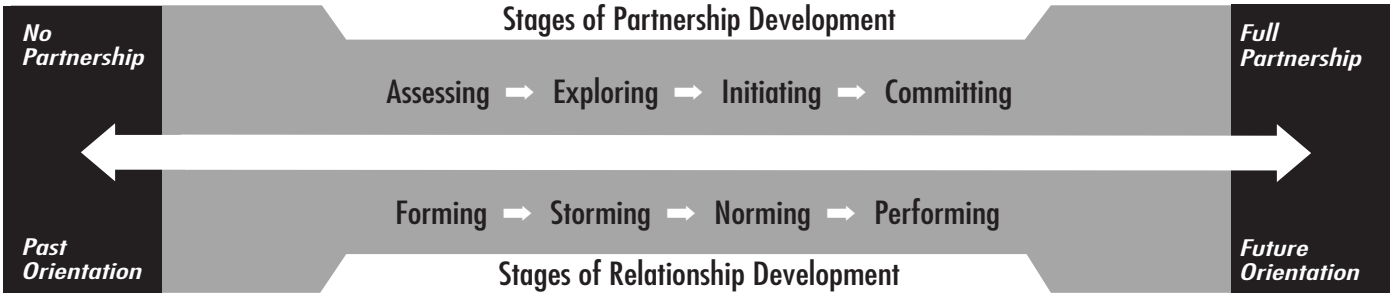
The process that allows you to develop your partnership intelligence is the Partnership Continuum. The Partnership Continuum is a deliberate, well-thought-out, scientific approach to creating partnerships. This approach allows you to move from no partnership to full partnership using a step-by-step approach. The Partnership Continuum presents a framework for partners to review and plan for successful partnerships.

To create a working partnership, you must understand that partnerships don't just happen; they are designed. The Partnership Continuum model is the blueprint for creating healthy, trusting and mutually beneficial partnerships.

(continued on page 3)

Partnering Intelligence

"Partnering intelligence" is an idea whose time has come. Just as mental intelligence and emotional intelligence are measures of ability and problem solving skills, partnership intelligence is a measure of your ability to succeed in partnership situations. It is a measure, specifically, of how well you are able to create and sustain healthy and mutually beneficial partnerships — both at work and in your private life.



You may be used to thinking that partnerships are something that naturally evolve. Nothing could be farther from the truth. Partnerships take work.

The author: Stephen M. Dent, a founding partner of the Minneapolis-based consulting firm The Partnership Continuum, Inc., is an award-winning organizational consultant specializing in developing internal and strategic partnerships. His clients have included AT&T, North West Airlines, GE Capital Services, the U.S. Postal Service and USWest Communications. Through his workshops, speeches and nearly 20 years of consulting assignments, Dent has trained thousands of managers, executives and consultants in the benefits of partnering intelligence.

The Partnership Continuum Model

Rediscovering Partnering

(continued from page 2)

As shown in the illustration above, the Partnership Continuum model has three components.

One component focuses on relationship development, another on partnership development and a third on past versus future orientation.

Each end of the model represents the extremes. That is, the far left side represents no partnership and an orientation to the past while the far right side represents full partnership and an orientation to the future. As your partnership intelligence grows, you move along the continuum to the right. The farther you move, the higher your partnership quotient.

The bulk of this summary will be focused on the partnership development component, that is on the step-by-step stages of developing partnerships. But first, let us look briefly at the other two components of the Partnership Continuum: relationship development and past versus future orientation. ■

Past versus Future Orientation

As shown in the Partnership Continuum illustration, companies with high partnership intelligence establish a future-oriented environment.

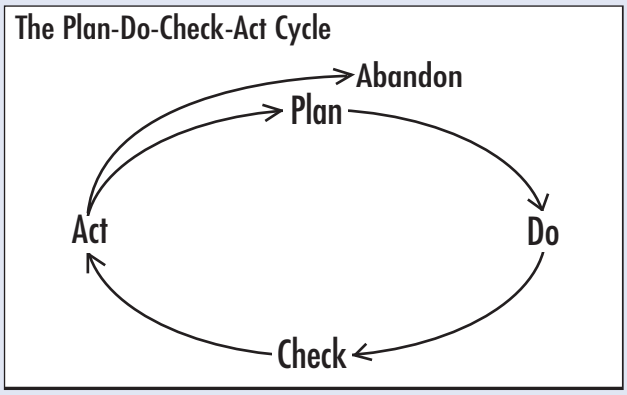
For example, imagine a friend who consistently shows up late for dinner at your home. If you continue to tell him to show up at a particular time, and act as if he will be late when planning dinner, you have a past orientation. If, instead, you discuss the consequences of his late arrival (i.e. when he's late, dinner is cold) and get him to promise to arrive on time, and then trust him to follow through, you have a future orientation.

In a future-oriented environment, the past is not used as a guide for decision making, conflicts are resolved with a win-win attitude and people display the ability and desire to trust others. Thus, establishing a future orientation requires certain traits and skills that are, as shown in the box at right, key in developing a high partnership quotient. ■

Partnership Attributes

As you move through the Partnership Continuum, you will acquire six fundamental attributes that contribute to you and your company's partnership intelligence. Developing and reinforcing these attributes is the key to increasing your partnership quotient (or PQ).

The first attribute is to be future-oriented in your decision making. This is essential in creating a future-oriented environment — a basic component of high partnership-intelligent companies (see article at right). Future-oriented decision makers don't base decisions on the past. They recognize that not everyone will repeat past behavior, so that past failure is not necessarily an indication of what will happen in the future. Conversely, they know that what worked in the past will not necessarily work in the future.



Increasing your comfort level with change is also important. Learn to embrace the possibility that change may be good, even if it is uncomfortable at first. The most effective way to deal with change is to break it down into small steps — just as a child learns to ride a bike a little at a time until the nervousness of the first day is eventually replaced by confidence.

A win-win orientation is another fundamental partnership attribute. Before potential partners can successfully cooperate, they must shed the desire to win at the other's expense and embrace solutions that are a win for both sides.

Another important attribute: You must be comfortable with the concept of interdependence rather than independence, with relying on another individual or company for support, assistance and success. One way to develop this comfort with interdependence is to move to a consensus decision-making style.

You must also develop your ability to trust. Focus on your behavior. If you are trustworthy, you will be more likely to trust. Over time, you will learn that, for the most part, your trust will be rewarded.

Finally, you must be willing to be open about yourself and your feelings to others. Learning to accept feedback (and learning how to give constructive feedback in turn) is a key component of self-disclosure.

The Plan-Do-Check-Act Cycle

To assure that a partnership is actually accomplishing what it intends to accomplish, you can use the Plan-Do-Check-Act cycle as a check. Originally developed by Walter Shewhart, a statistician at Bell Telephone Laboratories, its purpose was to reduce variation in the processes performed by workers.

Step 1 is to "plan" what it will take to accomplish a task. For a manufacturing process, you break down the task into specific steps. The components of a partnership — for example, how decisions are made, how conflicts are resolved, how communication will take place — should also be broken down. Partners should then agree on how to deal with each component.

Step 2, "do," means to carry out the plan — in other words, to solve problems, make decisions and communicate just as planned.

Step 3 is to "check" on how well the partners are accomplishing the plan. For example, is there a breakdown in the decision-making? Are the partners achieving the expected results?

In step 4, "act," the partners study the results of step 3, then decide what actions to take to make improvements and achieve the partnership goals.

One possibility: You might have to abandon the plan — if it is clearly failing — and make a new one.

As shown in the chart below, most successful partnerships spend one-third of their time in the planning stage (mostly on developing relationships); one-third in the doing stage (mostly on accomplishing the task); and one-third in the checking and acting stages (which is evenly divided between task and relationship activities).

Timeline for a Successful Partnership

Planning Stage	Doing Stage	Checking & Acting Stages
Task 33%	Task 67%	Task 50%
Relationship 67%	Relationship 33%	Relationship 50%

The Four Stages of Relationship Development

Before you can attain long-lasting relationships based on mutual trust, benefit and respect, you will move through four distinct stages of relationship development. This can happen quickly, or it can take many months, depending on the group.

The four stages of relationship development are *forming, storming, norming*, and *performing*.

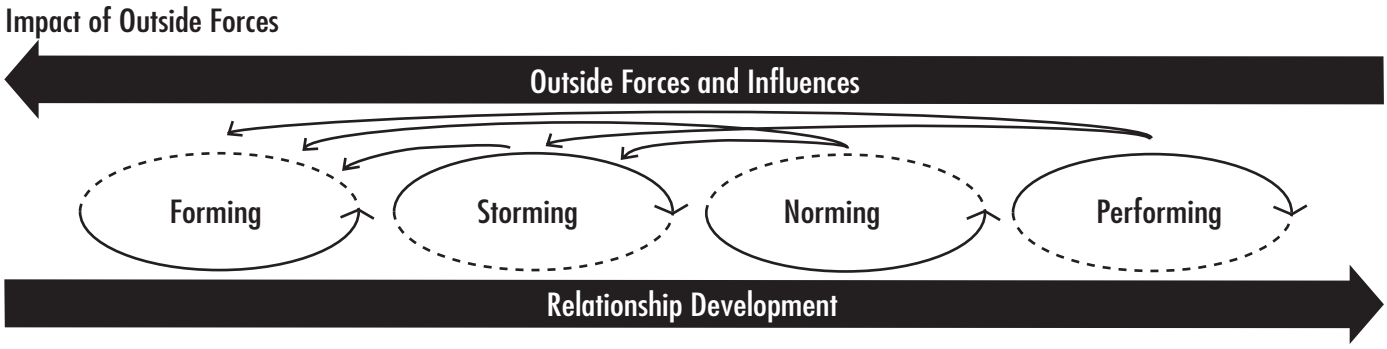
When the relationship is in the *forming* stage, people are generally polite to each other, and a bit reserved. Typically a group leader dominates activities. Others may sit back and take a wait-and-see attitude. This stage is the best time to clarify the issues that will need to be resolved. It is the time to establish trust within the group. Don't be too anxious to rush through this stage. It takes time to learn to trust each other.

Next comes the *storming* stage. Here a clash of ideas and behavior creates conditions ripe for conflict. Politeness gives way to aggressive behavior. The group leader finds himself or herself challenged. Group members test the limits of the relationship and see what they can get away with. In short order, the participants learn where the boundaries are and learn that they can trust each other as they express their needs.

Once group members have identified their needs and aligned them to the needs of the group, they are ready to collaborate to solve conflicts. The level of trust they have developed allows them to take risks and try new experiments. This is the *norming* stage.

Finally, the group reaches the *performing* stage. Now creative energies surface, increase and flow abundantly as partners generate synergy. The partnership can expect to achieve goals that far exceed their expectations at the outset.

Checking Progress



One way to check on the group's progress in relationship development is to give each member a relationship feedback survey. Have each member rate on a 1 to 5 scale whether they never (1) or always (5):

- Trust the other partners in this partnership,
- Think the other partners trust them,
- Feel comfortable expressing their ideas,
- Feel that their needs are being met, or
- Help others in the partnership meet their needs.

Outside Forces and Influences

Unfortunately, not every partnership moves smoothly through the

(continued on page 5)

The Four Stages of Relationship Development

(continued from page 4)

Partnership Continuum. Relationships move between stages in response to outside forces and influences. This is especially true if suddenly the goals of the group change. The group may then move back to the storming stage. Fortunately, if the group has already established a basic level of trust, it should be able to get back on track fairly easily. ■

Partnership Development: The Assessing Stage

For the remainder of the summary, we will focus on the partnership development component of the Partnership Continuum. Partnership development also takes place in four stages: assessing, exploring, initiating *and* committing.

Two Kinds Of Partnerships

Partnerships come in two varieties: external and internal. External partnerships can best be described as alliances between businesses. When Gary Wilson, chairman of Northwest Airlines recently spoke to the Press Club in Washington, D.C., he declared: "Mergers are out and alliances are in." The alliances he referred to are external partnerships between airlines, all designed to boost productivity, profitability and customer satisfaction. Gone are the days of mega companies. Instead, strategic alliances will continue to dominate business as companies learn to seek out opportunities for partnerships that capitalize on strengths and overcome weaknesses without the need for fundamental changes in company structure. It is the ultimate win-win situation for both business partners.

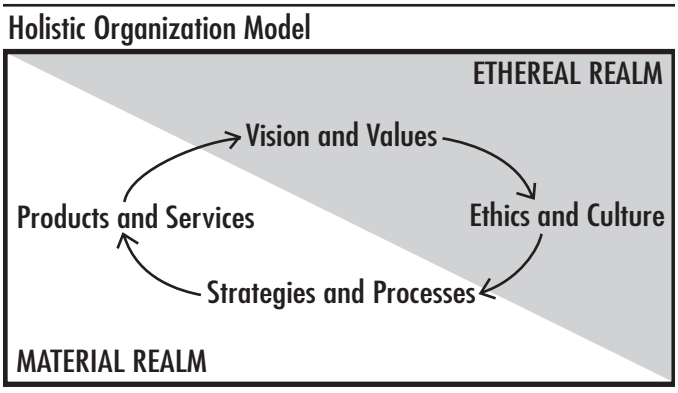
Internal partnerships are found within companies, and include the relationship between management and labor or the cooperative relationships necessary between departments and divisions.

Where Does Your Company Stand?

The first partnership development step is the *assessing* stage. The goal here is to determine where your company stands today and where it wants to go tomorrow. This internal assessment of your company will then allow you to decide whether you need a partner to achieve your goals.

The assessing stage should cover the ephemeral and material realms of your company. Both areas interact. They are referred to as realms because each sphere is separate yet interacts with the other just as the oceans of the earth interact with the atmosphere to produce our planet's weather.

The Ethereal Realm



The ethereal realm consists of the company's vision, values, ethics and culture. It is the heart and soul of the organization.

Let's start with visions and values.

Creating and articulating visions and values is a basic leadership role. But you must be careful to avoid the appearance that your vision is phony, especially in organizations still stuck at the far left of the Partnership Continuum. Remember that others judge future actions by past performance, so that you must act in accordance with your vision every day. The company vision and values must become part of the corporate culture.

Ethics are based on individual behavior. Organizations don't have ethics; the people in the organization do. The

(continued on page 6)

Ethereal Energies At Work

Consider this example of the impact of a company's vision, ethics, values and culture on the customer. An automaker was recently required to recall a pickup truck. The recall was necessary because management had left out a small and inexpensive part out of the manufacturing process. The omission saved the company only pennies per truck. However, had the part been included originally, it would have prevented gasoline from slipping back onto a hot manifold and possibly causing a fire.

The end result, of course, was a series of fires. Lawsuits followed, along with the expense of attorneys' fees and court costs. Finally, the company was forced to retrofit each truck with the part it had originally left out. Did the corporate culture place profits at the expense of people's lives? We may never know for sure, but countless customers may come to that conclusion and will refuse to buy the automaker's products in the future. The company's ethereal energies were reflected in the decision to leave the part out, with disastrous consequences.

The Assessing Stage

(continued from page 5)

ethical standards of an organization's people are often defined by the standards of the leader. In other words, if leaders demonstrate low ethical standards, other people will follow suit and sink to those standards. The opposite is also true. People will rise to the high standards of highly ethical leader.

Every internal assessment should also include a look at the company's culture. A questionnaire to employees and managers covering issues such as the ability to trust the leadership, level of feedback, past or future orientation and comfort with change will help assess the culture of your company.

In sum, vision, values, ethics and culture make up the ethereal realm of the company. The ethereal realm manifests itself through the morale of the organization. When morale is high, people show high productivity and creativity and solve problems easily. When morale is low, people struggle. The vision, values, ethics and culture of an organization determine the quality of its strategies and processes, and ultimately of its products and services.

The Material Realm

At the same time that you are assessing your company's ethereal realm — its vision, values, ethics and culture — you must also assess your company's strategies, processes, products and services. This is your company's material realm.

Start with your mission statement. It describes how your company intends to make its vision into reality. It outlines the strategic direction in which the company will focus its energies. Once the strategic direction has been identified, work processes are developed to implement these strategies. These work processes in turn deliver the products and services the company offers.

Is a Partner Needed?

Assessing your company's vision, ethics, values and culture — the ethereal realm — and your company's strategies, processes, products and services — its material realm — gives your company an updated view of what it is and where it is going. It will force the company to look at its vision for the future — and what it can and should accomplish in the years to come.

The next step is to determine whether a partner is needed to achieve that future.

Perhaps there are available internal resources to achieve the vision identified in the self-assessment. If the resources are available, the company may simply need to work on internal partnerships to better utilize those strengths. If appropriate resources aren't available within, the next logical step is to seek out a partner with the resources needed. The choice to seek partnership is not an easy one nor should it be undertaken lightly. Many companies will chose to go it alone rather than look for a partner. ■

The Exploring Stage

If your assessment revealed that you were ready for a partner, it's time to find one. You are now ready to enter the next stage of partnership development: the *exploring* stage.

The original assessment team should brainstorm as comprehensive a list of potential partners as possible. Build a matrix to help you visualize how each potential partner could satisfy your needs. In other words, list all your needs and check off whether and how each potential partner can meet the need.

Next, contact the companies you're interested in and be open with them about your needs. But just as important, find out what their needs are and how you can fill them. To sell a partnership, you have to identify what you can offer the potential partner.

A partner compatibility analysis is also important. Ask questions about the visions, values, ethics and cultures of potential partners. Also, what type of relationships and partnerships do they now have and how well have those partnerships been working? What strategies

(continued on page 7)

The Exploring Stage

(continued from page 6)

are they following to achieve their vision? These are some of the questions that will help identify a compatible partner.

Once you've identified the right partner, the next step is to secure commitments to work together. This commitment should be in writing. Include the reasons for the partnership, the scope of the commitment, its duration and the expected benefits for both parties. ■

The Initiating Stage

Once a partner has agreed to proceed with a project, you are ready to move onto the next stage of partnership development: the *initiating* stage. In this stage, you need to create the right atmosphere of trust, or it will never work.

Assuring Success With Accountability

For a partnership to work, both parties must be accountable to each other. Assure this by creating an appropriate partnership agreement. The agreement must cover the following areas:

- **Definition of the areas of interest for the initial activity, whether that will be marketing, sales, or product development.** Brainstorm a list of joint activities, and agree on one to start the relationship.
- **Document the start and stop of the activity, and set the boundaries.** There may be things the partnership should not try to accomplish yet.
- **Decide who will do what among the partners.**
- **Agree on what style decision-making will take**
- **Gain consensus on the strategy for resolving conflicts that arise.**
- **Allocate resources contributions and commitments in writing.**
- **Create evaluation criteria for both the initial project and relationship development.**
- **Define the expected outcome of the initial activity.**

Consider what happened when American astronaut Andy Thomas spent time living aboard the Russian MIR space station. He did not speak Russian very well, having only mastered the technical terms he absolutely needed. As a result, he was unable to establish any kind of meaningful personal relationships on board. The trip was a failure despite the clear goals and expectations that had been set for the partnership. When American astronaut Shannon Lucid, who spoke Russian, came onboard, she had no trouble establishing good rapport with the Russian crew. That partnership worked far better.

To make a new partnership work, take the time to get to know the partners. Building a partnership always takes longer than people anticipate. Therefore, you need to plan time for relationship development. Focus on team building exercises to cement the relationship. Make sure key leadership is there to kick off initial activities. If it isn't, you send the unconscious message that the partnership is not important.

Also, agree to partner in a small way first. That way, you can assess early on whether the relationship can work long term or should be abandoned.

Once you and your business partner have completed the initial joint project, it is time to assess the project and the continuation of the partnership. Remember that the first project was a trial run to see if the partnership can develop and evolve. There are three options available.

First, you can decide to abandon the partnership altogether. If the initial project proved too painful, unproductive, stressful or disappointing, abandon the effort and look elsewhere for more promising partnership material.

The second option is to take the information gleaned from the first project, and redesign the next activity together. Partners who still want to work together can revise goals, adjust responsibilities and redouble their efforts to accomplish worthwhile goals together.

The last option is to move on to a greater investment in the partnership. If all went well, and the partner is willing, commit greater resources to the joint efforts.

Launch an initial project that is almost guaranteed to succeed. It must be a win-win proposition. An example of this principle at work is what happened in Washington, D.C. when Lockheed Martin agreed to take over the maintenance and repair of city's parking meters before the partnership between the city and Lockheed, the city was losing revenue every time a meter sat broken. Lockheed agreed to repair and maintain the meters in exchange for a share of the increased revenues. As a

(continued on page 8)

The Initiating Stage

(continued from page 7)

result, both parties won. The city got meters in good repair and more revenue, and Lockheed got a cut of the collections and chances to bid on future work. ■

The Committing Stage

Once you've made the decision to move to the last stage of partnership development, the *committing* stage, the only task left to achieve full partnership is a joint strategic planning session. In this session, you solidify your future vision, spelling out the plans and how the two of you will achieve that vision together.

For example, KLM and Northwest Airlines do joint strategic planning for their marketing of the flight schedules. Coca-Cola and McDonald's joint strategic planning enables them to launch promotional activities.

The commitment to the partnership is further reinforced in the committing stage through the sharing of information and resources. As full partners, you should be ready to invest in the success of the other. For example, a french-fry producer liked the potatoes of a certain farmer in Idaho. However, the farmer did not have enough land to grow the number of potatoes required by the producer. The producer bought a nearby parcel of land and gave it to the farmer to use. After ten years, the land would become the farmer's property. Both sides of the partnership benefited. The producer increased his supply of potatoes, the farmer increased his production. ■

Case Study in Partnership: A True Story

Marty and Jean were employees at a large convention hotel in Minneapolis. Marty was maintenance supervisor and Jean was head of housekeeping. Marty had a staff of forty house engineers responsible for building maintenances and Jean managed about 100 housekeepers.

Neither Marty nor Jean could get along with each other. Separately they complained to the general manager. A major (and long-standing) source of conflict was Jean's contention that when the maintenance staff worked in a room, they didn't clean up after themselves. Thus, Jean's housecleaning staff had to completely redo the room. In addition, Marty and Jean disliked each other personally. Jean felt Marty was a bully; Marty felt Jean was oversensitive. Attempts by the hotel manager to resolve the disagreements between the two staffs and their leaders were unsuccessful. The manager asked author Dent for help.

The Assessing Stage

Dent began by meeting separately with Jean and Marty to understand their responsibilities and tasks. He then called them in together and asked each of them to explain their vision of what they wanted to accomplish for the hotel's guests. Their respective visions being similar, a joint vision was quickly reached: to assure that the guests had an orderly room and that everything worked.

Next came a detailed discussion on how each scheduled and accomplished their tasks. A scheduling problem was quickly revealed: There was no coordination between cleaning the rooms and maintenance work.

The Initiating Stage

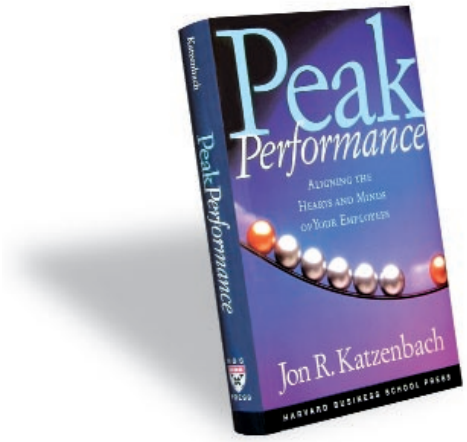
Jean and Marty developed an Agreement between Partners Checklist. Among the items on the checklist were agreements to coordinate the activities between maintenance and housekeeping (specifically by reviewing the schedule of rooms to be maintained and coordinating the maintenance and housekeeping rounds); to work on conflicts with a win-win attitude; to use a weekly report of the number of rooms cleaned before maintenance as a measure of their partnership development success; and to use the number of times they met per week and the number of times an unresolved conflict forced them to go to the manager as two measures of their relationship development success.

Over the next month, 237 out of 240 maintenance calls were taken care of before housekeeping had cleaned the room. And they were meeting at least once a day.

The Exploring Stage

There was no need for a search for partners; the two knew that they were the ones who had to work together. However, Dent asked them to complete a compatibility analysis as a team-building exercise. The result: an agreement that they both needed to work on the relationship.

The Committing Stage



The initial activity between housekeeping and maintenance was so successful that Marty and Jean decided to expand their partnership. Some of the ideas discussed included ways maintenance could help housekeeping move heavy objects, discussions about the installation of low-maintenance bathroom accessories and helping in the laundry service. One example: maintenance found a way to attach various housekeeping implements to the housekeeper's service cart that required less lifting and the reduced the number of back strains. ■

PEAK PERFORMANCE

THE SUMMARY IN BRIEF

In today's increasingly competitive marketplace, companies are sometimes finding it difficult to satisfy customer demands while struggling with record low levels of applicants for open positions. Unemployment is lower than at any other time in recent memory.

How can companies balance the need to satisfy customers in an environment where workers are hard to find?

The answer lies in developing the workforce you do have into a peak-performance workforce — and recruiting new workers who are eager to join an organization that has achieved a balance between *employee fulfillment needs* and *enterprise performance requirements*.

In this summary you will learn how some of the very best build exceptional levels of employee performance and commitment by consistently pursuing one or more of five distinct paths to peak performance:

The Mission, Values and Pride Path. This path is characterized by a noble purpose, a rich history, team spirit and value-driven leadership.

The Process and Metrics Path. This path is characterized by clear measures and focused processes designed to reflect worker perspectives and performance priorities.

The Entrepreneurial Spirit Path. This path is characterized by high-risk, high-reward opportunities for employees. Workers gain significant "ownership" of the business and thrive in an environment where management is largely "hands-off."

The Individual Achievement Path. This path focuses on creating personal growth and individual advancement opportunities.

The Recognition and Celebration Path. This path features integrated approaches that recognize workers for their performance and celebrate their success — thus spurring workers on to new heights.

Let this summary help you decide where and how to generate and maximize the emotional energy needed to propel your company along the path best suited for it — thus allowing you to develop a higher-performing workforce that can deliver superior customer benefits every time.

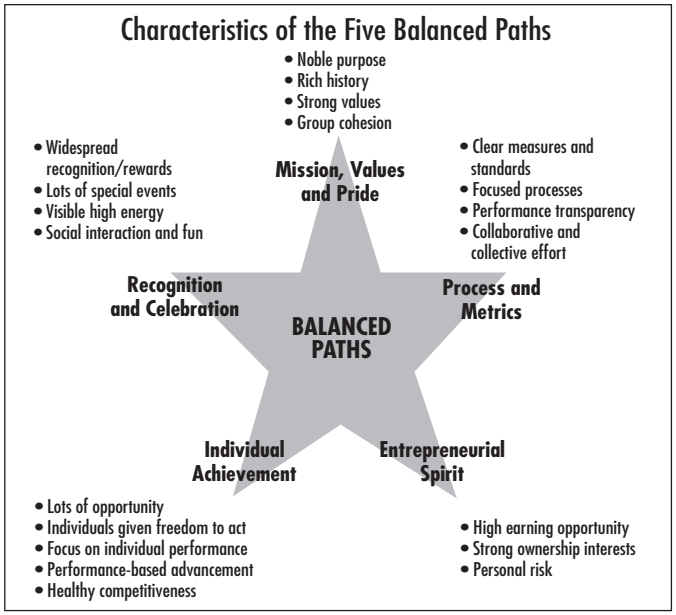
Balance the Needs of the Enterprise and the Worker

To qualify as a higher-performing workforce, a significant group of employees must demonstrate *emotional commitment* to the enterprise in ways that create a sustainable competitive advantage for the company. Your company likely benefits from a higher-performing workforce when:

- More than a third of individual workers consistently exceed the expectations of their leaders and customers.
- The average worker performs better than the average worker in the industry, usually because the company has a cohesive set of management systems, programs and motivating mechanisms.
- A strong emotional commitment to higher standards and aspirations is reflected across the workforce in ways that create a multiplier effect.
- The collective performance of major segments of the workforce, particularly the front line, forms the core of the company's competitive advantage and is extremely hard to copy.
- Leaders at all levels share the belief that front-line people are the key to success and engage their employees emotionally as well as rationally. Leaders also balance performance and personal fulfillment so that neither takes center stage — which is a lot easier said than done.

Achieving Emotional Commitment

The key to emotional commitment at the front line lies in maintaining a balance between *enterprise performance requirements* — such as shareholder return; market share; customer satisfaction; and work output and improvement — and *employee fulfillment needs* — including source of livelihood; social interaction; direction, structure and control; and identity, purpose and self-worth. While you can sometimes force performance through intimidation, insecurity and punishment, you can't expect the extra energy that comes only from employees who have a positive emotional commitment to perform.



In sum, the best companies cultivate higher performance workforces because they strongly believe in the value of the individual worker. The result? Attractive growth and great value for their shareholders. Examples include Home Depot, where employees of the rapidly growing home improvement warehouse enthusiastically embrace customer satisfaction, and Kentucky Fried Chicken, which has returned to its roots by focusing on such things as the "Colonel's Dozen" rules of restaurant service. ■

Five Paths That Work

There are five paths to an energized "peak-performance" workforce. Each allows worker fulfillment and performance to remain or come into balance. The paths are:

1. **Mission, Values and Pride (MVP).**
2. **Process and Metrics (P&M).**
3. **Entrepreneurial Spirit (ES).**

Five Paths That Work

(continued from page 2)

4. Individual Achievement (IA).

5. Recognition and Celebration (R&C).

Choosing the right path to a balanced workforce requires a careful analysis of your organization's style, leadership and history as well as your marketplace. The five paths, which will be explored individually in the following five sections of this summary, constitute a composite framework of options that allow top management to make choices about how and where to generate emotional energy and which "alignment" approaches to use in channeling that energy into higher performance.

For the most part, companies do not create this energy from scratch. Instead, they draw on *energy sources*, such as past heroes or fierce competitors. Your company probably already has one or more sources of energy on which you can draw. The key is to identify and tap into these sources effectively. The sources of the energy will guide you to choose the most appropriate of the five paths. ■

The Mission, Values and Pride Path

Those who succeed in energizing workers along a Mission, Values and Pride (MVP) path typically benefit from an existing legacy of accomplishment, reputation and history in which front-line employees can take pride. Another characteristic is the strong identification of employees with the corporate values of the company. These values are so deeply ingrained in the enterprise that those who cannot accept them invariably leave.

Also, employees believe in the importance of the company's mission, which allows them to place the team's or company's interests on a par with their own individual interests when performance requires it.

The U.S. Marine Corps: Mission, Values and Pride

The best example of the MVP path is the U.S. Marine Corp, which draws on a 200-year history of defending American values. Perhaps no other organization — military or civilian — better demonstrates the power of a noble purpose and core values.

The primary source of energy that motivates the Marine Corps is its history and legacy of winning against all odds.

Marines are prepared to handle a variety of missions around the globe, and to win decisively. They succeed by drawing on a history that goes back to its birth in Philadelphia in 1775. Over the years, Marines have become legendary for their bravery and enthusiasm. During World War I the Germans called them "devil dogs." They fought a fierce battle and raised the flag over Iwo Jima. One Marine division defended itself against eight Chinese divisions during the Korean War. Bangladeshi flood victims rescued in 1989 called their Marine saviors "sea angels." With every victory and heroic rescue, Marines draw on, as well as add to, their unique history.

Another source of energy was Commandant Al Gray, an "up from the ranks" general who was able to revive the discipline, values and commitment of the Marines after the debacle of Vietnam.

The Marines use three approaches or tools to tap into and channel this energy in order to inspire and sustain a peak performance workforce comprised of people many corporate recruiters would reject:

Distributing Leadership Broadly. The Corps has an unsurpassed commitment to developing superior leaders. It selects high-caliber individuals with different patterns of leadership potential, instills in them the basics of Marine philosophy, and develops each with a combination of practical experience and mentoring.

Articulating What Matters Most. The minute new recruits step off the bus at the processing center and step onto yellow footprints on the ground for their first

(continued on page 4)

Perpetual Innovators at 3M

Another successful company choosing the MVP path is 3M. The company is the $15-billion-dollar producer of everything from office supplies to medical devices and cleaning products. Innovation plays a large role in 3M's success. Take the invention of Post-it Notes. The sticky memo pages are one of the top five office products sold in the United States. They were invented by 3M researcher Art Fry in 1980 because he was frustrated that the pieces of paper he used to mark hymns in his song book fell out between practices. He remembered that another researcher had invented a glue that the company had rejected because it wasn't permanent and thought it would be great to have temporary glue on a bookmark. The idea was, of course, brilliant.

The corporate vision that allows inventions like Post-it Notes was first introduced in 1948 by the company. It states:

> *"As our business grows, it becomes necessary to delegate responsibility and to encourage men and women to exercise their initiative. This requires considerable tolerance. Those men and women to whom we delegate authority and responsibility, if they are good people, are going to want to do their jobs their own way."*

The Mission, Values, and Pride Path

(continued from page 3)

encounter with their drill instructor, they begin learning the values of the Marine Corps. The first day, each recruit is given a card to carry with the Marine mission statement, "Honor, Courage and Commitment." The bulk of effort during boot camp will then be focused on value shaping, not skill building. Most recruits enter the Marines with poorly formed personal values; the goal is to change those values. Those who don't take to heart the core values don't make it through basic training.

Spreading and Regenerating Collective Energy. For example, new recruits are energized by their role models, the drill instructors. These instructors, in turn, are energized by the positive changes in the new recruits. In addition, the Corps makes the most of both individual and team achievements. No accomplishment goes unnoticed. ■

The Process and Metrics Path

To some degree every good company pursues the Process and Metrics path. The path is based on sound principles of accountability and consequence management. Performance goals are set, and revenue, cost and profitability measures are established, tracked and compared. The company reports on its competitive position and market share regularly. If this all sounds very familiar, it should. This is how most companies have chosen to measure themselves. But higher-performing companies who rely on the Process and Metrics path don't lean on it exclusively. Instead, they pursue one or more additional paths at the same time. In addition, they involve employees more actively in shaping the processes.

One successful enterprise pursuing the Process and Metrics Path in its manufacturing facilities is beauty products giant Avon.

Process and Metrics at Avon

Avon is probably best known for its 2.6 million-member direct marketing sales force, but should perhaps be better known for some of its excellent manufacturing operations. The company's mission is to "deliver quality products and services, defect free, on time every time, and at the lowest total delivered cost to our sales representatives and customers."

At Avon, the Process and Metrics (P&M) path works well because the cosmetic industry demands close attention to quality as well as cost. Quality problems would erode customer confidence and hurt future sales. To produce quality products, Avon must engage its workforce so it is willing to be measured against precise standards. The cosmetic industry is also subject to rapid changes in preference and products, so Avon must be capable of meeting changing demands against tight time constraints.

The dynamic global marketplace for beauty products and the accomplishments of Avon in this field are key sources of energy for employees. To channel this energy, Avon takes a number of different approaches.

One secret to Avon's success in using the P&M path is that **leadership is distributed broadly**. Workers are called associates, and supervisors are advisors. There is only one additional level in the hierarchy: leaders. Input and innovation is expected from everyone, whether associate, advisor or leader.

Avon clearly **articulates what matters most** through carefully thought-out metrics and measures. Workers know what is expected of them. Just as important, they play an important role in determining which metrics should be used.

Performance transparency is also key. Workers are frequently and publicly rewarded for meeting goals — and performance metrics are charted as often as weekly. Every processing station, assembly line and packaging operation has huge placards that display the relevant metrics on daily and weekly production, quality and safety activities — an open display of performance information that not only provides direct feedback but also a sense of accomplishment and pride.

At Avon, workers value the feeling that they belong to a family, and they want the manufacturing facility they work at to be the best. Many Avon workers, in fact, fully expect to work at the facility until they are ready for retirement — at one facility, the average seniority is fifteen years. ■

The Entrepreneurial Spirit Path

Entrepreneurs are a special breed. Few of us have the determination, courage and creative attributes required both to envision a unique business opportunity and to incur the personal and financial risks required to bring it to fruition. It is a high stakes game full of pressure. People who pursue this path do so for more than wealth; many simply want to create their "own thing."

Today, there's much talk about developing entrepreneurial spirit in established business operations. Unfortunately, this is a tough task. One example of the successful transfer of entrepreneurial spirit to a corporate structure is venture capital firm Hambrecht & Quist (H&Q), a Silicon Valley leader in financing rapidly growing entrepreneurial companies.

H&Q has cultivated — and sustains — a higher-per-

(continued on page 5)

The Entrepreneurial Spirit Path

(continued from page 4)

forming workforce by creating a high-risk/high-reward environment — thus following the Entrepreneurial Spirit path to peak performance.

The Entrepreneurial Spirit at Hambrecht & Quist

H&Q concentrates on growth companies in four sectors: high technology, health care, branded consumer companies and professional services companies. Its approach to serving emerging companies is to purposely mirror the way the companies it serves operate. It builds its business by finding high-growth-potential companies at an early stage and offering them financial services throughout their growth cycle, from private placements to mergers and beyond. Its best-known initial public offerings include Apple, Amazon and Starbucks.

H&Q draws much of its energy from its customers: passionate companies in exciting cutting-edge business areas led by energized and committed entrepreneurs. These emerging companies are still small enough to be influenced by advisors, thus enhancing the direct contribution of H&Q to their success. H&Q employees are excited about working with companies that are changing the way business is done and are thrilled to have the opportunity to work directly with upper-level management.

The fast-paced Silicon Valley marketplace and the firm's dynamic leadership are other sources of energy.

H&Q channels this energy into a high-performance workforce first by **creating widespread opportunity**. The firm offers big opportunities early and allows people to take risks and make mistakes.

The firm strives to **generate collective energy**, encouraging collaboration and teamwork, preferring a collegial atmosphere over the macho competitive atmosphere of Wall Street investment banks.

Leaders at H&Q **value their people** and treat them with respect. There is a non-hierarchical, open-door atmosphere where even junior employees can walk into upper-management offices to discuss professional or personal issues.

Finally, H&Q **carefully selects its employees**, looking for a cultural fit with the firm's core values. Intelligence, attitude and an admiration of entrepreneurs are more important than investment banking credentials.

The company offers a unique opportunity for entrepreneurial people to take risks in a relatively low-risk environment. Workers are given opportunities to invest in some of the companies they advise as a way of building personal wealth without the high level of risk actually starting a new company entails. ■

The Individual Achievement Path

America was built on the principle of individual initiative. Horatio Alger's stories capture the essence of rags-to-riches dreams, in which those who work hard will become successful, wealthy and happy. These visions are part of our shared understanding of how things work. Individual initiative is what many believe holds the key to success for individuals and companies. The Individual Achievement (IA) path incorporates our culture's belief that everything is possible with enough hard work.

It isn't surprising, then, that many companies want to incorporate the cultural norm of achievement into their corporate culture. The IA path lets workers say, "This company offers opportunities that allow me to take initiatives and lets me be judged and rewarded based on my achievements."

In order to make the IA path work, you will have to make sure your company is deeply committed to developing people. Training, coaching and evaluation all take center stage on the Individual Achievement path. Along with that commitment comes a belief on the part of the leadership that every worker has the ability to contribute to the company's overall mission. IA path companies also are known for going to extraordinary efforts to help employees in need.

Home Depot is a good example of a company pursuing the IA path.

The Individual Achievement Path at Home Depot

Home Depot started as a local hardware store and within twenty years has grown into one of America's most successful ventures. Sales for the nearly 700-store chain topped $24 billion in 1998 — rather remarkable for a company started by two mavericks, Bernard Marcus and Arthur Blank, who had just been fired from their jobs at Handy Dan's, a Los Angeles-based hardware chain.

The affection generated by Bernie and Arthur, as most employees refer to the two friendly founders, is one important energy source for Home Depot workers. Also important: an obsession with the customer. The Home Depot approach to hardware is to offer superior customer service and low price on a vast array of merchandise.

One key to the success of Home Depot is instilling every associate with a sense of ownership. Every manager, for example, controls what is sold in the store, who is hired, what they are paid, and how much inventory to carry.

Home Depot emphasizes individual achievement, job

(continued on page 6)

The Individual Achievement Path

(continued from page 5)

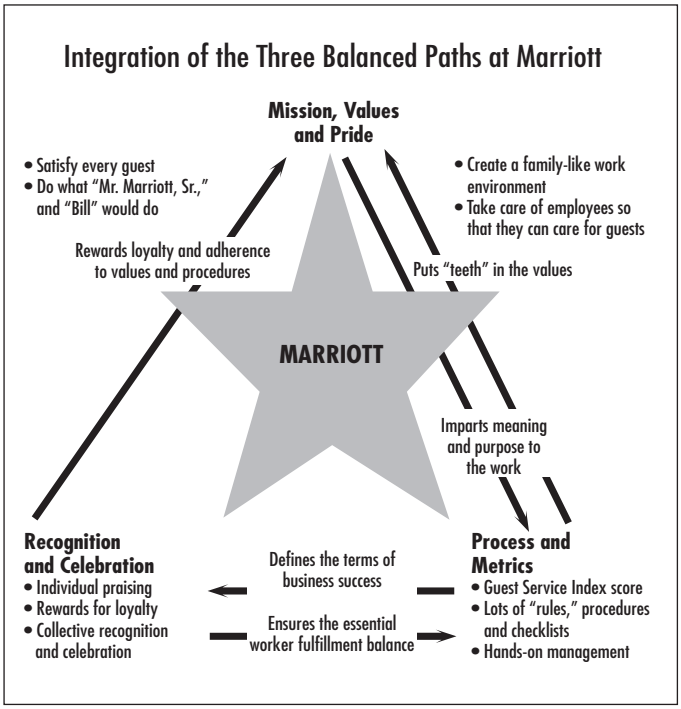
enhancement, and broadened personal achievement. For example, it gives its employees more freedom than is usual in retail to innovate in their responses to customers. Almost every promotion is from within. And employees can acquire real ownership of the company through the stock purchase plan.

In sum, Home Depot **shows people their true value**, **creates widespread opportunity**, **distributes leadership broadly** and **enhances the work itself** — four approaches key to pursuing the IA path.

Ask top Home Depot executives what their chief competitive advantage is and they will tell you it's their associates (the company's name for employees.) This sincere attitude explains why Home Depot has been successful on the IA path. ■

The Recognition and Celebration Path

Most good companies make a conscious effort to celebrate the accomplishments of their people with rewards that don't involve money. These efforts range from Christmas parties and picnics to employee-of-the-month awards, million-dollar sales clubs and handwritten thank-you notes from top management.



Those choosing the Recognition and Celebration (R&C) path to peak performance, however, go far beyond the annual picnic; they will use any excuse to celebrate employee accomplishments. Typically in businesses that offer few opportunities for monetary rewards and incentives — and for stimulating work — R&C companies nevertheless find ways to effectively motivate their employees.

It should be noted that R&C companies usually combine this path with other paths. Recognition and Celebration is almost never the primary path. Marriott International, for example, combines the Recognition and Celebration path with a strong Process and Metrics path as well as the Mission, Values and Pride path.

Recognition and Celebration at Marriott

Marriott started in 1927 as a root beer stand in Washington, D.C. From there it grew into a chain of restaurants, and finally into an international leader in hotel operations. The company places employees at the top of its value chain, creating a peak-performance workforce. The company's stated goal is to become the employer of choice in any market in which it develops a property or establishes a presence.

In an industry that can't rely on high financial rewards to attract workers, the company has chosen to praise a

job well done. This taps into people's insatiable desire for recognition. One example is the Marriott Pathways to Independence program, which trains welfare recipients into productive workers. At the end of training, participants get a framed certificate, a permanent nameplate and a job.

Like many other companies, the demographics of the Marriott workforce consists of untrained workers who need a job to provide for basic family needs. Because the company draws from a demographic group whose members may at times lead chaotic lives, there is a premium set on providing a clear sense of order, discipline and direction. People need structure for stability and consistency, which then enables them to gain fulfillment in other parts of their lives.

In addition, the workforce consists largely of first-level entrants who come from dozens of ethnic backgrounds. Marriott emphasizes the idea that workers are part of the family and assimilates them.

Marriott manages to integrate three paths successfully. The pursuit of customer satisfaction is the primary source of energy at Marriott. The Marriott culture is thus driven by customer reaction, which is measured and reported on relentlessly — reflecting the Process & Metrics path. For example, every associate gets regular reports on customer feedback through a performance measure nicknamed the "Guest Service Index" or GSI. Then there is the rich history of the company, which serves as the Mission, Values and Pride energizer. Finally, there is the recognition and celebration of associates who make it possible for customers to walk away satisfied. ■

Applying The Lessons Learned

Not every company needs or wants the kinds of higher-performing workforces described so far. Many enterprises can achieve success focusing on traditional consequence management and remain satisfied with average workforce performance. But if you see a lasting value in the pursuit of a strong emotional commitment within key segments of your company's workforce, you are ready to embark on one or more of the five paths.

Whichever path(s) you choose to adopt for your company, the most critical factor is the relentless determination to balance enterprise performance with worker fulfillment. Achieving that balance requires more than one source of emotional energy plus the desire to channel that energy into performance results consistently over time.

Generating the Energy

The most compelling sources of emotional energy for companies can be grouped into three categories:

Magnetic Leaders. Magnetic leaders often start with an impossible dream. Examples include Michael Dell's decision to sell computers without wholesalers or retailers in the distribution chain and Sea-Land Services founder Malcolm McLean's decision to transform global shipping by combining railroads, trucking and ocean shipping to create containerized shipping. Seemingly impossible dreams inspire.

One of the most notable characteristics of a magnetic leader who can tap into workforce energy is the ability to tell a compelling story. But a magnetic leader can't do it all for long. Such leaders often provide the jump start a company needs to get energized. However, over the long haul, other factors, including dynamic marketplaces, come into play — although the leader's "legend" will continue to galvanize employees.

Dynamic, Chaotic Marketplaces. Unpredictable and explosive marketplace dynamics can also provide compelling sources of energy. Responding to such a marketplace requires carefully listening to the customer. Indeed, an obsession with a satisfied customer is a characteristic of many high-performing workforces. A truly delighted customer can be a powerful source of energy for a workforce. In the same vein, explosive growth is also energizing. This is natural since growth means increasing opportunities for those who are delivering that growth for the company. But explosive growth eventually trails off, so don't depend on it for sustained energy. Fierce competition can also fuel high energy levels. Competition taps into the human desire to be a winner, and is essential for sustaining a competitive advantage.

Compelling Legacies. Legacies on which your workforce can draw are another source of immense energy. Take the Johnson Space Center. Long after the last moon landing, the workforce is energized by the legacy of those historic space events that captured the minds and hearts of millions around the world. Legends create pride in individual as well as group efforts.

Management Practices

Unfortunately, not all companies can tap into all three kinds of sources. Nor will every company with all three kinds automatically be able to transform the workforce into a high-performing one. Finding the source for generating emotional energy is only half the battle. To achieve higher levels of performance for your company, you must work at aligning the extra energy using the three techniques that follow:

Build Personal Self-Image. The first alignment tool is to build your workers' personal self-image. Workers must be constantly reminded that what they do matters to the company and its customers. They must be made to feel special, no matter how menial or routine their job. You must show people their true value to the company, the customer, their families and themselves. Mistakes are understood and accepted, and well-intentioned personal initiative is rewarded.

Employees need a complete picture of the context in which they work. When workers see the big picture, they understand the internal and external environment in which they work. Regular "town meetings," reports on customer satisfaction, and competitor tracking are essential.

Keep the Focus on Performance. Next, you must sustain the focus on enterprise performance. Focus on performance requires you to use a myriad of appropriate selec-

(continued on page 8)

Creating Strong Self-Images

Creating employees with great self-images requires you to invest heavily in training, development and the creation of opportunity and to always:

- show respect for all individuals at all times,
- place importance on **every** job in the company,
- encourage mutual trust and confidence.

Three Compelling Springs of Energy

- Magnetic leaders with impossible, larger-than-life dreams who capture the imagination;
- Dynamic marketplaces created by aggressive competitors and demanding customers; and
- Remarkable legacies of accomplishment, complete with legends, heroes and martyrs.

Applying the Lessons Learned

(continued from page 7)

tion, evaluation and recognition tools to inspire, develop and excite workers into world-class performance.

It all starts with *purposeful selection* of workers who fit the needs of the organization in skills and personality, and proper placement of those hired. Applicants must be screened carefully to ensure that the environment in which they will work is compatible with their skills, attitudes and beliefs.

Articulate what matters most so that workers know what to deliver. At NASA, it's crew safety; at Marriott, guest reaction; and at Avon, complete and on-time orders. Every organization must determine what it is that matters most and find a way to communicate that to the workforce. Don't let them guess at priorities. Instead, provide performance transparency so that employees know what is expected of them and how it will be measured. Workers are more likely to please if they know how they will be measured.

Make recognition and rewards meaningful. Don't reward average performance at the same level as superior performance and make sure rewards are meaningful to the recipient.

Open up options and opportunities. Let workers have a sense of personal challenge. You will succeed if you *create widespread opportunity.* If your company is in a high-growth stage, this will be relatively easy. If it is not, you will have to go out of your way to find ways to make jobs more interesting, challenging and exciting. Take the case of a typical manufacturing plant, Hill's Pet Nutrition. Workers are given the opportunity to do more than work in the line. Some even serve as part-time tour guides.

Distribute leadership broadly. A distributed leadership system will be essential to the organization of the future. Distributing leadership means that many people at many levels play leadership roles as needed. Leadership becomes everyone's responsibility and created opportunity.

Enhance the work itself so that specific jobs or work activities are enjoyable, meaningful and satisfying. People work hard at what they do when they get great personal satisfaction out of the work they do. ■

Enforcing Disciplined Behavior

While the sources of energy and alignment approaches may vary, one constant element runs through high-performing workforces. That principle is discipline where it counts. Enforcing disciplined behavior is the only way that an enterprise can hope to ensure a balance between enterprise performance and worker fulfillment. Self-discipline rarely occurs in large organizations without wise enforcement by top management.

Perhaps the best example of the use of enforcement to instill self-discipline can be found in the Marine Corps. With a combination of institutional and peer pressure discipline, Marines learn how to discipline themselves. Another example is the disciplined punctuality that characterizes Southwest Airlines. Meetings begin on time, not a minute late or a minute early. Planes are turned around in 18 minutes. Luggage reaches the carousel within 10 minutes. As a result of disciplined punctuality, the airline serves 2,400 customers per employee daily in an industry where the nearest competitor only serves half as many.

Higher-Performing Management

If you are going to create a higher-performing workforce, you must also create a higher-performing management group. Managers of higher-performing workforces face special challenges. Crucial to success as a manager is the notion that you must look for those "moments of truth" when something can be done for employees that will earn their best efforts and loyalty for years, even if it means making a decision contrary to company policy.

Finding and following your path to a higher-performing workforce is demanding and can be fearful. The challenge is not for every company, nor is the job ever done. Maintaining the momentum is like hitting a moving target. The dynamics of a competitive marketplace push market leaders to better their previous best efforts. But for those who choose to face the challenges, difficulties and inevitable setbacks along the way, the benefits are well worth it. ■

Disciplines

High-performing workforces are self-disciplined in a number of areas. These include:

- **Punctuality:** Employees arrive on time, meet deadlines and maintain schedules.
- **Cost:** Employees learn to provide the most with the least.
- **Customer Service:** Workers know it's the customer who matters most.
- **Recruiting and Training:** The right people are hired and trained even if that means operating without some key positions filled from time to time.
- **Common Language:** Companies develop ways of communicating that bond workers.

Platform

Get Noticed in a Noisy World

by Michael Hyatt

THE SUMMARY IN BRIEF

When there were three TV channels and two kinds of toothpaste, quality alone could sell itself. But, in a global economy crowded with millions of competitors, quality is just the beginning.

The real challenge is getting the attention of those who might buy your product or service. Two little words have combined to make this easier, less expensive and more possible than ever: social media. Websites, blogs, apps and social networks — used in concert and with savvy — can connect you with your global audience. No gatekeepers. No massive fees.

Michael Hyatt knows this from experience. An author, agent and publisher for more than 30 years, he has spent the past eight years creating an online following that numbers in the hundreds of thousands — all while leading the largest inspirational publisher in the world.

But a flashy website is not a platform. A Facebook page joins millions just like it. Creating an effective platform is the key to success, but it is not simple. In *Platform*, Hyatt condenses his expert knowledge into step-by-step plans for building your now virtual stage.

IN THIS SUMMARY, YOU WILL LEARN:

- How to create a compelling product and package it with the wow effect and a great name.
- How to create an elevator pitch for your product, service or cause.
- The elements of providing a wow experience.
- What common blogging mistakes you need to avoid.
- How to deal with the issues of not enough comments or too many.
- How to protect your intellectual property without shutting out your readers.

Part One: Start with Wow

More than four centuries ago, William Shakespeare wrote, "All the world's a stage." If you have something to sell — whether one-on-one, before a huge crowd or on the Internet — you are also on stage.

But the stage has never been more crowded — and simply being on it doesn't matter much if the lights are not shining on you, or if there is no one in the audience. There is something you need. It's called a platform.

Very simply, a platform is the thing you have to stand on to get heard. It's your stage. But, unlike a stage in the theater, today's platform is not built of wood or concrete or perched on a grassy hill. Today's platform is built of people. Contacts. Connections. Followers.

There are two critical parts of the success equation: a compelling product and a significant platform. There is no sense in wasting your time and resources trying to build buzz about a ho-hum product. As marketing guru David Ogilvy once wrote, "Great marketing only makes a bad product fail faster."

The purpose of marketing is to prime the pump. But if people don't want to use your product and — more importantly — if they won't recommend it to their friends, you're hosed.

To be compelling in this crowded marketplace, you need to do three key things:

1. Create products you would personally use. Your enthusiasm for your product must be real and believable. You're not just trying to sell something; you're sharing an experience.

2. Create products that solve problems in unexpected ways. Don't just create something with additional features. Rethink the solution.

3. Create products that exceed your customers' expectations. Never rush something to market with a sigh and a collective, "Well, I guess that will have to do. It's not great, but it's good enough." Instead, aim high and execute even higher.

If you create outstanding products, everything else becomes much easier.

Give Your Product a Memorable Name

You have to give your wow product or service a name that will help it connect with the prospect. What you call it is more than just a title; it's your No. 1 marketing tool.

This is arduous, time-consuming work. Yet nothing in the marketing mix is more important than a strong title. It's like a headline: If prospective readers are intrigued, they keep reading. If they aren't, they move on to the next thing that catches their attention.

Great titles are PINC (pronounced "pink"). They do at least one of the following:

- **P: Make a promise.** Example: *POWER 90: Tony Horton's Total Body Transformation 90 Day Boot Camp Workout* (DVDs).
- **I: Create intrigue.** Example: *Steve Jobs: One Last Thing* (movie).
- **N: Identify a need.** Example: Mommy I'm Here Child Locator (wireless GPS bracelet for kids).
- **C: Simply state the content.** Example: College Hunks Hauling Junk (service).

The bottom line: The right title for your product, service, website or blog can make or break you. It's worth spending the time to get it right. ●

Part Two: Prepare to Launch

Are you prepared to take full personal responsibility for building your own platform or are you thinking of hiring a "babysitter" — someone else to do it for you? If the answer is a wobbly "I guess I'll do it," then ask yourself why.

Are you afraid because you don't know what you're doing? You're not alone. It can seem a daunting and complex task. But there are four reasons you must take responsibility yourself:

1. No one knows your product better.
2. No one is more passionate about your product.
3. No one has more skin in the game.
4. No one is likely to do it if you don't.

Take a long look in the mirror. The person you are looking at is your new chief marketing officer. Take responsibility for your own success and invite others to join you in the endeavor.

Create an Elevator Pitch

Part of launching successfully is being prepared to present your idea — your product, service or cause — succinctly. To do that, you need an elevator pitch: a short summary (30 seconds to two minutes — the length of a short elevator ride) of your product offering, including your target market and your value proposition.

People with successful platforms have often spent hours honing and practicing their elevator pitches. The stakes are huge. If they're successful and connect with a potential customer, they win the opportunity to take the next step — a potential product sale or time to present their message.

An elevator pitch for an information product should consist of four components:

1. Product name and category.
2. Problem you're attempting to solve.
3. Proposed solution.
4. Key benefit of your solution.

Here's an example of the pitch for this book:

I'm writing a new [Component 1] business book called Platform. *[Component 2] It's designed for anyone trying to get attention for his or her product, service or cause. [Component 3] I teach readers how to build a tribe of loyal followers using social media and other new technologies. [Component 4] I explain that it's never been easier, less expensive or more possible than now.*

Pitches can vary widely, depending on your offering. Regardless, you want to create an elevator pitch that is clear and compelling. This is a prerequisite to attracting the partners and prospects you need to succeed.

Once you get your elevator pitch fine-tuned, don't deliver it like a mechanical parrot. Instead, do what Michael Port suggests in chapter 4 of his excellent book, *Book Yourself Solid*: use it as the foundation of a meaningful conversation.

Secure Raving Endorsements

Easy access to social media, review sites and product comments means we depend more on what other people say about a product or service before we make a purchase. Relying on endorsements has become commonplace in almost every area of life. Why? Because with so many options, few of us have time to do the evaluation ourselves. Instead, we rely on the opinions of people we trust.

This is why — if you're going to build a successful platform — you can't afford to ignore endorsements. Endorsements fall into one of two types:

1. Celebrity endorsements. These don't have to be movie or TV personalities; they may simply be the well-known experts in a narrow field.

2. User reviews. While a celebrity endorser may have all kinds of motives for endorsing a product or service, individuals are more likely to be candid.

Ten Elements of the Wow Experience

1. **Surprise.** It exceeds expectations and creates delight, amazement, wonder or awe.
2. **Anticipation.** As you begin to think about it, you begin to live the experience in advance.
3. **Resonance.** It touches the heart.
4. **Transcendence.** It connects you to something transcendent: a purpose, meaning or more.
5. **Clarity.** It creates a moment in which you see things with more clarity than before. You suddenly "get it" in a new way.
6. **Presence.** It creates timelessness — it puts you fully in the present.
7. **Universality.** Almost everyone will experience it in a similar way.
8. **Evangelism.** It has to be shared; you can't contain it.
9. **Longevity.** The shine never wears off this experience.
10. **Privilege.** It makes you proud to be associated with the experience.

Once you create a great product, follow these steps to get endorsements for it:

1. Create a great product. This advice is worth repeating. People who matter are not going to endorse a mediocre product. They can't afford to.

2. Make a prospect list. Don't be too quick to rule someone out because you don't think you have access. You may not know the prospective endorser, but you may know someone else who does.

3. Leverage one endorsement for more. Sometimes prospective endorsers need to see an endorsement from someone else in order to get comfortable with your product. Obtain an endorsement from someone who'd be willing to, based on your relationship, and include it with your other requests.

4. Ask for the endorsement. Get to the point and try to ask them when they'd be the most receptive.

5. Provide guidance, samples and a deadline. Include a brief description and perhaps a sample. Then offer to send them the entire product. Tell them the kind of endorsement you're looking for; the more specific, the better.

Part Three: Build Your Home Base

The planks to your platform include everything from Twitter, Facebook, your blog, your website, even traditional media. And learning how to weave all of these things seamlessly is an art unto itself. A good social media strategy has three components:

1. A Home Base. This is a digital property you own and control, where loyal fans gather. It can be as simple as a blog or website, or as complex as a self-hosted community. It's where you direct all Internet traffic.

2. Embassies. Places you don't own, but where you have a registered profile. You engage in conversations with those who congregate there. Examples include Twitter, Facebook, LinkedIn or other blogs you follow.

3. Outposts. These are places you don't own nor do you have a regular presence. Instead, you listen to conversations about you, your brand, your company or topics that interest you. Examples include Google Alerts and HootSuite.

Start a Blog (or Restart One)

For many of us, the heart of our home base is our blog, and starting one is easier than you may think. First, determine a theme: What will your content be focused on? Before you begin, ask yourself two questions:

1. Can you generate high-quality content on a regular — at least three times a week — basis?
2. Will your content attract a loyal and growing audience?

Don't invest a bunch of time and money until you can answer these questions with a resounding yes. The truth is, most people who start a blog quit within a few months.

If you can answer yes to both of the above questions, then move on to selecting a service, like WordPress.org, TypePad.com or Blogger.com, to host your blog. There are numerous free options, as well as highly customizable self-hosted ones. Next, set up your blog and select your design theme. Then it's time to write your first post! If you don't know where to start, a simple welcome post can break the ice and get you started.

As you continue to work on your blog and post content, you may want to look into an offline blogging client, which enables you to write when you're not online, then upload your post when you connect to the Internet. This isn't a necessity, but it will make blogging much easier.

Finally, be sure that you're writing regularly to ensure you build readership. If people like what you write, they'll come back.

Protect Your Intellectual Property

It's inevitable. If you're a successful blogger, people are going to steal your content — your intellectual property. So what do you do? There are eight ways to protect your intellectual property online:

1. Understand copyright law. Your post is protected from the moment you create it. You don't have to register it. It's your intellectual property and no one can legally reproduce it. However, the law only protects the expression of your idea, not the idea itself.

2. Publish an official copyright notice. This is not required to protect your work, nor does it grant you any additional rights. However, it reminds the world that this is your intellectual property. Consider using a copyright notice in your blog's footer so that it appears at the bottom of every page.

3. Create an explicit permissions policy. Create a separate page spelling out exactly what people may do with your content with permission and without permission. Be explicit. This will keep people from contacting you about every use of content, but it also will give you a published standard to refer to when someone violates it.

4. Give the benefit of the doubt. Not everyone who reposts your content does so maliciously.

5. Request that your post be removed. You can

do this via email or in a comment. Still, be gracious and assume the unauthorized user's motives are good. Point the user toward your permissions policy and suggest he or she post an excerpt instead.

6. Demand that the unauthorized user take down your content. If the offender does not respond to your previous request, escalate things by sending a "demand letter" or email insisting that the content be taken down.

7. Notify the infringer's hosting service. If there is still no cooperation, you need to do some research. Find his or her "WhoIs Record," using a tool like DomainTools. This will show his domain registration information, including who hosts the site. Send an email to the hosting service, requesting a "take-down" of the website and explain why. Legitimate services will investigate and, if they agree, send their own demand to the offender. If he or she doesn't comply, they will take down the site.

8. Hire an attorney to take action. If the service provider is shady, incompetent or offshore, you may need to hire an attorney. Remember, you have to weigh the cost of litigation against the damage you believe is being done.

Don't deprive your legitimate audience of your content because you have an occasional person who violates your copyright. It's just not worth it. In the end, the more people who reproduce your content — hopefully giving you credit and link-backs — the more people will be exposed to it. Ultimately this will benefit you.

Avoid Common Blogging Mistakes

Assuming you want to increase your blog traffic, there are certain mistakes you must avoid to be successful. If you commit these errors, your traffic will never gain momentum. These are the top 10 traffic killers:

1. You don't post often enough. You cannot build solid traffic without frequent posts.

2. You post too often. Yes, this is possible, too. You'd do better to focus on writing one really great post a day rather than several mediocre ones. The trick is to find your frequency sweet spot.

3. Your post is too long. Seth Godin is the master of the short, pithy post. His are usually in the 200-400 word range. You can even get away with longer posts — upward of 600-700 words — if they are scannable, using subheads, lists and other devices to keep people moving through your content. If a post is getting too long, consider breaking it up into multiple posts.

4. You don't invite engagement. Engagement is a combination of page views, reader comments and social media mentions.

5. You don't participate in the conversation. People want to have a conversation — with you.

6. You don't make your content accessible. Readers have shorter attention spans. They are scanning content, looking for items that interest them. You must remember this.

7. You don't create catchy headlines. Your headlines are the most important things you write. According to Brian Clark, who runs the popular site CopyBlogger, "on average, eight out of 10 people will read headline copy, but only two out of 10 will read the rest."

8. Your first paragraph is weak. This is critical. You must use this paragraph to pull readers into the rest of your blog post. The idea is to grab their attention and hang on to it. Many bloggers spend too much time trying to set up the post or provide content. Just get to the point.

9. Your post is off-brand. If you're trying to build a platform, you need to find an editorial focus and stick to it. A tighter focus leads to higher traffic.

10. Your post is all about you. Unless you are a megacelebrity, readers don't care about you. They care about themselves. They want to know what's in it for them. Your personal stories can be a doorway to that but, in the end, the best posts are about your readers' needs.

Develop Your Landing Pages

A website landing page highlights one specific product offering. The goal is to convert interest into action. In a sense, it's a salesperson who works for you nonstop. For example, the Speaking page on an author's blog would be designed to convince meeting planners to book the author to speak at events.

The problem is landing pages can be confusing. Visitors don't know what action to take once they get there. To combat this, here are seven characteristics of landing pages that get results:

1. Headline. You need a strong, compelling headline. Nothing else on your page is more important than this.

2. Sales copy. You need to write compelling sales copy that starts with your customer's problems and concerns, explains why your product is the solution, and makes a compelling offer.

3. Product photos. Software like BoxShot 3D gives you the tools to make your product the hero.

4. Testimonials. Nothing convinces people to buy like testimonials.

5. Guarantee. Make it easy for customers to trust you and take the risk out of the transaction. Promise to refund money promptly if they are not satisfied. If your product is good, it is not a risk.

6. An offer. You have to establish a price and make an offer. Remember that people often impute value based on price. If you charge more (within reason), they assume the product is worth more.

7. Call to action. You must ask for the sale. It must be clear, unequivocal and positioned in a prominent place.

If you're launching a new product, service or cause, you need a landing page that delivers results. This is essential if you're going to convert readers to customers, and, from there, to tribe members.

Part Four: Expand Your Reach

It takes marketing to build a powerful platform, right? Well, traditional marketing, while not dead, has morphed dramatically in the world of social media. Tribe-building is the new marketing. Marketing is no longer about shouting into a crowded marketplace; it's about participating in a dialogue with fellow travelers. It's no longer about generating transactions; it's about building relationships.

Building Up Your Blog

You're posting frequently, writing focused content and being engaged with commenters. What else can you do to improve your blog traffic?

• **Get your own domain name.** Make it easy for readers to pass along your blog. What do you think is easier: yourname.wordpress.com or yourname.com? This is the foundation of branding and it makes your blog memorable.

• **Include your blog address everywhere.** In your email signature, on business cards and on stationery. It should appear virtually everywhere your name appears, particularly in your social media profiles.

• **Make it easy to subscribe to your blog.** You don't want to depend on your readers to remember to come back to your blog. Instead, you want them to subscribe, so they get every post you write, either by RSS or email. Provide both options and position the buttons prominently.

• **Optimize your posts for Search Engine Optimization (SEO).** You want people to find you when they search one of your keywords or your name. There are tools such as All-in-One SEO Pack and Scribe that can help you do this.

• **Comment on other blogs.** As you read other blogs, leave comments — not spam invites to read your blog, but instead engage in the conversations that interest you and build credibility. Register with their commenting system so there's a link back to your blog.

• **Write posts for other bloggers.** Guest posting is great for search engines, introduces you to new communities (and them to you) and allows your ideas to spread more freely. Consider who you'd like to guest post for, read their guidelines and make sure what you have to write will be of interest to that audience. Contact that blogger and, if he or she agrees, write a post for his or her blog. Once it's published, promote it via email, social networks and such. Post an excerpt on your own blog and link to the whole article. And, of course, interact in the comments.

Watch These Metrics

When people try to get a feel for how meaningful your platform is, most look at specific social media stats as a proxy, including those specifically related to blogging, Twitter and Facebook.

To get accurate blog stats, you should sign up for a free Google Analytics account. This is the gold standard when it comes to reporting Web stats. Here are six stats that most people fluent in social media deem relevant:

1. Unique visitors per month. The key word here is "unique." One individual may visit your blog three times in one week, but this would only count as one unique visitor. Note: RSS and email subscribers do not count toward your total.

2. Page views per month. If you divide this number by your total unique visitors, you'll get the average number of pages viewed by each visitor. This number is important to prospective advertisers on your blog. Why? Because they're basically buying the specific number of impressions their ad will get on your site.

3. Percent change in the last 12 months. This is the rate of growth in the last 12 months. Here's the formula: unique visitors in the last 30 days, minus your unique visitors for the same period 12 months ago, divided by your unique visitors for the same period 12 months ago, multiplied by 100.

4. Average number of comments per post. This demonstrates how engaged your audience is with your content. Not all commenting systems keep track of this stat, but there are systems available, such as Disqus.

5. Total number of blog subscribers. The people who subscribe via email and RSS represent your most loyal readers or superfans. They've made the effort to sign up to receive your content. More importantly, they've given you permission to push content to them.

6. Total number of Twitter followers or Facebook fans. These are the two primary vehicles you'll use to get the word out about your new blog posts. While the total number of followers can be important, it's more important to show how engaged they are.

Embrace Twitter

One of the most important tools to expand the reach of your platform is Twitter, a real-time network that connects you to the latest information about what you find interesting, in 140 characters or less. Tweeting requires very little time, and can be done from a Web browser or mobile device.

Twitter offers an unparalleled opportunity for brand building, social networking and customer engagement. The service is free, but you must be able to devote the time. If you aim to tweet regularly throughout the day — sharing insights, informing followers of new blog posts, responding to replies and direct messages, etc. — you might spend 20-30 minutes once you add it all up. That's not a big investment of time, especially for the benefits you'll receive. The key is to be intentional and not allow it to become a huge time suck.

Get More Twitter Followers

Some argue that the number isn't important and that having quality followers — those who aren't spam bots and are real, engaged people — is better. So let's look at how you can build your follower base and make it a quality list:

• **Show your face.** The absence of a photo often tells others that the Twitter account is a spammer or newbie. You can use a headshot, company logo or some other image.

• **Create an interesting bio.** Don't leave this blank; it's one of the first things potential followers review.

• **Make your Twitter presence visible.** Make it easy for people to follow you — and for others to promote you. Display links to your Twitter account in your email signature, blog or website, business cards, etc.

• **Share valuable content.** Point people to helpful resources. Create content that others look forward to getting and want to pass on via retweets.

• **Post frequently, but don't flood your followers.** No one wants you hijacking their Twitter feed. You can use a service like Buffer to spread your tweets out throughout the day.

• **Reply to others publicly.** This shows you're listening and sociable (of course, send a direct message — DM — when appropriate).

• **Be generous in linking and retweeting others.** Twitter fosters a culture of sharing. The more you link and retweet others, the more people will reciprocate.

• **Avoid too much promotion.** You can promote blog posts, products, events and more on Twitter, but do not cross the line into looking like a spammer.

• **Don't use an auto-responder.** This is just more clutter and isn't personal.

Employ Consistent Branding

Whether you design your own pages for your blog, Twitter, Facebook and more, or have them designed for you, here are four elements you want to include on a consistent basis across all platforms:

1. **Your name.** Use it in exactly the same form in every instance.
2. **Your logo.** It also could be a type of font that is associated with your name.
3. **An avatar.** Have your headshot done by a professional photographer and use the same one in every application.
4. **A branding statement.** This could be a slogan, a sell-line or even the name of the product or service for which you are known — or would like to be known.

A consistent brand is vital for a strong platform and it should be one of your top priorities.

Part Five: Engage Your Tribe

One important word about building your brand via your platform: This isn't an opportunity to blast your message out to thousands of followers for free and sell them stuff. Social networks — Twitter, Facebook, Google+, etc. — are relational tools, not transactional ones. No one wants to be spammed. If you want to build a social media platform — one where people listen to you — then you have to be a giver, not a taker.

Comments: How to Deal With Not Enough or Too Many

There's hardly anything more discouraging than blogging about something you think is important and then waiting for comments ... just to hear crickets.

Conversely, there are few things more rewarding than having people comment on your post and engaging directly with your readers. Here are seven strategies to get your readers more engaged:

1. End your posts with a question. The more open-ended you make your posts, the better.

2. Use a threaded comment system. This allows readers to comment in-line and reply to others.

3. Display your comment count prominently.

4. Make it easy. Yes, comment spam is a problem, but most modern blog systems catch this. Don't require registration and don't use annoying technology like CAPTCHA to prevent robot spam.

5. Participate in the conversation. Your readers want to engage with you.

6. Reward your best commenters. You can list your top commenters in your sidebar and recognize them publicly. Be creative.

7. Don't overact to criticism. If people see you as sensitive, defensive or rude, they won't feel free to participate in the conversation.

Comments are also one major way in which blogging is different from all other forms of writing: You get near-instant feedback. This is gratifying, but it also can be a challenge to keep up with your readers.

Monitor Your Brand

It takes years to build a brand. Unfortunately, there aren't many shortcuts. You build a brand — like a reputation — one impression at a time.

Twenty years ago, if a customer had a bad experience with your company, it didn't quite matter as much. Sure he or she could tell friends and family and, eventually, it could catch up with you, but it wouldn't happen overnight.

But, today, digital communication has changed everything. Brands can be damaged in a few days. Whether you like it or not, people are talking about you, your brand or your organization online. Do you know what they're saying? Do you like what they're saying?

Here are four actions you can take to monitor your brand online:

1. Sign up for Google Alerts. It's fast, easy and free. Once you sign up, you can enter the names of those you want to monitor, such as your personal name, company name, brands, products, etc.

2. Use Twitter search. This is similar to Google Alerts and can be saved as a bookmark on your browser.

3. Engage in conversation. Thank people for positive comments. Respond to negative comments so your brand is represented.

4. Solve the problem. You'll get credit for listening and even more credit for responding. But your job isn't finished until you follow through and solve the person's problem. Granted, you can't satisfy everyone, but you should try.

If you are responsible for building or maintaining a brand, you need to know how to monitor your brand online, as well as defend it. Here are seven suggestions for defending your brand in the digital age:

1. Build an online presence. The time to build an audience of followers and fans is before you need it.

2. Monitor the conversation. You know precisely what is being said, by whom and how you can respond if you choose to do so.

3. Respond quickly to criticism. If you don't respond quickly, you lose control of the conversation.

4. Admit your mistakes. When you mess up the only acceptable response is to take full ownership.

5. Understand the lifetime value of the customer. Customers are worth more than a single transaction, especially if they come back to you for more. Do you know what the lifetime value of your customers are?

6. Empower your employees — or yourself — to solve problems. It's amazing how fast you can turn a bad customer experience into a good one when you empower a frontline employee to solve problems without delay. Nothing communicates to your customers that your company values them more than this.

7. Exceed your customers expectations. Every customer problem is an opportunity to create a wow experience.

Setting out to develop a platform can be overwhelming and scary. You worry about making a mistake, looking foolish or, worse, failing. But here's a secret: Forget all that. The key is to start. Once you take the first step everything else will take care of itself. ●

Power Listening

Mastering the Most Critical Business Skill of All

by Bernard T. Ferrari

THE SUMMARY IN BRIEF

Nothing causes bad decisions in organizations as often as poor listening. It often makes the difference between profit or loss; between a cohesive team or a fractured one; between a long career or a short one. Countless managers are told on their performance reviews to "become a better listener." But that's more easily said than done.

Bernard T. Ferrari, adviser to some of the nation's most influential executives, has seen firsthand why listening isn't a soft skill — it's the most powerful tool at any businessperson's disposal. He makes a compelling case that anyone can improve from a mediocre listener to a power listener. It just takes a commitment to practice some new skills and habits.

Anyone can learn how to shape and focus a conversation, make others feel respected, stay focused on what's really important and uncover the hidden pieces of information that can change everything.

Don't assume that power listening will take more time than your old listening style. On the contrary, you'll waste far less time in unproductive exchanges. You'll more easily sort through the informational chaos coming at you. You'll stop rehashing the same conversations over and over. Your decisions will be wiser and more effective. Perhaps best of all, you'll develop the reputation as someone "easy to talk to" — one of the greatest compliments for any leader.

IN THIS SUMMARY, YOU WILL LEARN:

- The six common archetypes of bad listeners and their communication habits.
- How to keep quiet and allow others to lead a conversation.
- The five questions that form the framework of effective, powerful listening.
- The best methods for turning listening into four problem-solving techniques.

PART I: LISTEN UP!

Listening Is Worth the Effort

When someone talks about a meeting they've attended, or recounts a conversation they've had, they'll often say something like, "At that point, I stopped talking for a moment. It was good to catch my breath and rest for a bit." It's an interesting comment, because it creates the impression that *talking* involves more effort than *listening*. In fact, just the opposite should be true. This misinterpretation — that listening is somehow equivalent to resting — leads people to believe that listening is a passive, rather than an active endeavor. From that false premise naturally flows the assumption that listening can be a time waster, rather than an effective means of advancing the ball.

There are four major reasons to view good listening in the business setting as a critical activity, and a strenuous one at that:

1. Listening is purposeful. A disciplined businessperson enters a conversation with a clear understanding of what the conversation needs to accomplish.

2. Listening requires control. Even when you're on the receiving end of a communication, you need to steer and filter the incoming information in order to accomplish your purpose.

3. Listening requires total focus and engagement. When you listen with intent, you must bring a heightened awareness to the conversation so that you can formulate the right questions, and generate the necessary interjections and interruptions to advance the conversation productively.

4. Listening is the front end of decision making. It's the surest, most efficient route to informing the judgments you will need to make.

Highly developed listening skills increase your focus and sense of control. You will see the change in your own performance and productivity. More important, good listening skills will enable you to bring forth more fully developed ideas from the people around you. In the best of all worlds, it can facilitate streamlined analysis, more focused planning and more sure-handed decision making. ●

What Kind of Listener Are You?

To improve your listening skills, you must first figure out exactly what is keeping you from seeking and hearing the information you need. Here are six of the more common archetypes of bad listeners:

The Opinionator. At the heart of an Opinionator's problem is the tendency to listen to others really only to determine whether or not their ideas conform to what the Opinionator already knows to be true.

The Grouch. Whereas the Opinionator's listening is limited by his belief that his ideas are right, the Grouch is blocked by the certainty that your ideas are wrong.

The Preambler. Television pundits have become the very embodiment of the poor-listening archetype, the Preambler. The Preambler's windy lead-ins and questions are really stealth speeches, often designed to box his conversation partner in. The Preambler uses this questioning technique to steer the conversation, send out a warning, or to produce a desired answer, as if the dialogue had been scripted.

The Perseverator. The Perseverator talks too much, in the way the Preambler does, but presets difficulties

that are more subtle but no less confounding. The Perseverator may appear to be engaged in productive dialogue, but if you pay attention, you might notice that he's not really advancing the conversation. As often as not, he's actually editing on the fly, fine-tuning what he is saying through constant reiteration.

The Answer Man. Everyone likes to be the problem solver. An extreme version of this is the Answer Man. This is the person who starts spouting solutions before there is even a consensus about what the challenge might be, signaling that he is finished listening to your input in the conversation.

The Pretender. The Pretender isn't really interested in what you have to say. Maybe he's already made up his mind on the subject; maybe he's distracted by other matters; maybe he has to put on a show of listening for political reasons. Whatever the reason, we'd all be better off if he would drop the pretense.

You are likely a good listener at times. However, if you are honest with yourself, you will recognize that many of these archetypes of bad listening apply to you at different times and in different situations. You might be a Grouch on certain subjects or at different moments in the business cycle, but act more like a benign Pretender in other circumstances. You need to be able to recognize the behavior of each of these types, in yourself as well as in others, as the first step toward improving your listening skills and raising the overall level of communication and decision making in your organization. ●

Respect Your Conversation Partner

Indra Nooyi, the CEO of PepsiCo, recalls in an interview with *Fortune* that the best advice her father gave her about working with others was, "Assume positive intent." If you do, she said, "You will be amazed at how your whole approach to a person or problem becomes very different. You are trying to understand and listen because at your basic core you are saying, 'Maybe they are saying something to me that I'm not hearing.'" Indeed, most people you work with want to do their job well — and to help you do yours better, too. Generally speaking, it's safe to assume that you chose your conversation partner (CP), or they have chosen you, because of that implicit covenant.

Of course, sometimes it is *you*, not your CP, who needs to provide the solution to a problem, and you engage your CP because you think he or she might be able to help. Here, again, the conversation depends on respect. Revelations and insights can come from unexpected places, so the best listeners solicit information from sources far and wide, knowing that any of their colleagues might have a surprising nugget of wisdom to offer. Managers often bucket their colleagues into certain roles and assume they can provide useful insight only into areas that are close to their expertise. Respect means taking seriously everything people say to you and giving them the benefit of the doubt. Even that quiet intern in the sales department might be able to offer a morsel of information that could help you arrive at a better solution.

The manager I encountered who demonstrated the most wonderful way of getting information and showing respect for those who gave it to him was the COO of a hospital. He remarked once that he simply couldn't run a place as complex as a hospital without soliciting information and ideas from everyone. He respected each and every employee and patient, and they all returned that respect.

This COO succeeded because he opened his mind to the possibility that everyone around him was smart in his or her own way and had a good idea or two. A great motivator, to be sure, but what made this COO a great manager was his ability to create concrete actions based on input he received during his walkabouts. Whether it concerned signage in the hallways or how staff greeted incoming patients, he made sure to mine every conversation for those pearls of insight. ●

How to Keep Quiet — Most of the Time

Chances are that you've heard someone invoking the 80/20 rule somewhere recently. It applies to listening as well. My guideline is that my CP should be speaking 80 percent of the time, while I speak only 20 percent of the time. Further, I seek to maximize my 20 percent. I can make my speaking time count by spending as much of it as possible posing questions, rather than holding forth with my opinions and observations.

People in leadership positions often feel a certain pressure to steer, direct or control conversations within their organizations. But don't be misled. Your choosing to listen more than speak does not mean you've ceded control of a conversation. Well-directed questioning and minimal but well-timed commentary can help people bring forward new facts, open their minds, think in new ways, and come up with better ideas. Ultimately, a good listener gains more control over the problem at hand and comes to better decisions.

Often, in business or organizational settings, our tendency to interrupt people in conversation arises from our impatience to seek closure, or our need to stroke our egos in conversation.

The first thing to do when you feel the urge to interrupt is to — keep quiet! You need to control your instincts and reflexes when you're listening. Don't say anything — no responses, no comments — before taking a moment to think about how it will affect the speaker and the course of the conversation. As a practical matter, when I consciously pause in a conversation, I like to count five beats in my head. Now, if you succeed in keeping still and quiet, you might create a moment or two of uncomfortable silence. Don't be afraid of that. Most people abhor silence and they have a natural tendency to fill empty silences with commentary. However, you could be very surprised by what insightful comments your CPs blurt out during these lulls. Sometimes I find it helps to simply nod a little, just so they know I'm not zoning out. ●

Challenge All Assumptions

Much of the time, we remain blissfully ignorant of the assumptions that govern our decision making. In many cases, we don't become fully conscious of them until they are challenged. And then, our natural stubbornness kicks in, and we often dig our heels in, certain of the correctness of those operating assumptions. The problem is that, unfortunately, this feeling of certainty does not guarantee that something is actually true. It's not necessarily the end product of infallible reasoning. Rather, certainty is a feeling, a good feeling — like calm or even joy. The neurologist Robert Burton tackles this phenomenon of feeling like you know something in his eye-opening book *On Being Certain: Believing You Are Right Even When You're Not.*

Burton assembles a wealth of experimental evidence to argue that the feeling of certainty is just that — a feeling, or mental state resulting from chemical reactions in the brain — and doesn't necessarily connect to actual facts. If these "certainties" prove to be false assumptions, they can be truly toxic to your business. Conversations provide occasions to examine and challenge our assumptions. Certainty and the assumptions it guards wreak havoc because they shut down our hearing. The refrain, "I know the answer already" is a sure symptom of all the pathologies exhibited by the Opinionator, the Preambler, the Answer Man, and the other archetypal bad listeners. ●

PART II: SORTING THE CHAOS

Any great listener must become the master of the question. Building an information framework will assist you in developing the right questions. It will allow you to sift, sort and classify the chaotic rush of incoming information, so that you can apply it to your decision making and get to actions that make a difference.

When I think about this framework I picture a set of file drawers representing the broad categories of business problem solving and action. The categories that work for me are mandate, plan, team, execution and personal. These are broad and general categories that, together, are comprehensive enough to cover most of the issues that managers face. ●

What Is the Mandate?

Most of the conversations you have in the work environment won't overtly confront such cosmic questions as whether a company should exist or how to improve education in the United States, but you would probably be surprised how often problem solving in business can be derailed by a simple misperception or misalignment about the mandate of an organization. What is the company's basic purpose? It's essential mission? Why are we all here?

You might think that this kind of question only concerns CEOs and others at the highest levels of management. Not so. In fact, I would go so far as to say that the most common factor I've witnessed in business failures is a lack of agreement about the company's mandate throughout the workforce.

Mandate discussions can be brief and much more specific than the grand, open-ended conversations triggered by a question like, "Why does the company exist?" Without doubt, however, agreement about the answers to those big questions should inform each nitty-gritty discussion. Whatever level you are working at in the organization, it's important to make sure you and the CP see success exactly alike.

Here are the questions that appear on the file folders in my "Mandate" drawer:

Question 1: Why are we here? This is a fundamental question, but a practical, not metaphysical, one. What are the enduring, overarching aspirations? What is the fundamental reason for being? On what does the organization base its identity? This is where you have to start. Use this question or your version of it to ensure that

you and any CP have a shared understanding of the group's mandate. Get clarity here, at this level of abstraction, and then proceed to the other questions.

Question 2: Are there any misalignments? Any lack of alignment or acceptance of a mandate can have disastrous consequences for a company or organization.

The best leaders listen to, monitor and then manage the complicated interplay of conflicting mandates, a fluid phenomenon that requires ongoing attention and regular reassessment. The dynamic tension generated by the multiple mandates of different stakeholders provides grist for the mandate discussion again and again, and can produce richer, more beneficial shared mandates when managed thoughtfully.

Question 3: Can we work with this mandate? It's one thing for a mandate to be inspiring on an emotional or intellectual level, but it also has to be practical. It must fertilize planning and execution. There are three component questions you need to answer to fill up this particular file folder:

- Does the mandate capture the imagination and energy of the leadership team?
- Can the mandate be communicated more broadly to all the stakeholders?
- Can the mandate be translated into a plan? ●

What Is the Plan?

Every business that seeks to improve its performance needs a plan to realize its mandate. Mandate is the destination, but without a well-drawn plan for getting there, even the most finely chiseled mandate becomes just an amalgam of moonbeams and vapors. A thoughtful and workable plan is formed and amended through many conversations about how to move forward. The headline question for a plan is simple: "What are you going to do now?"

The first folder in the "Plan" drawer that I generally seek to fill, and then to update as appropriate, concerns the concrete objectives that form the backbone of any plan.

Question 1: What are the specific objectives that begin to move a company toward its mandate? There are two components to the objectives question: First, we listen for how the objectives contemplated by the CP are aligned with the mandate. Then we listen for the clarity of the objectives, and carefully consider the process that generated them. I try to ascertain whether, when the decision was made, those responsible had covered all their bases, asked all the right questions, and been able to glean the most thoughtful, complete, honest, and accurate information from everyone involved.

Question 2: What are the specific initiatives that will help achieve the objectives? Steps must be described and understood in more practical detail the nearer you approach the time of actual execution.

I am ruthlessly exacting when it comes to listening and questioning about initiatives. What I'm really sensitive to is wasted motion. You would be wise to enter into conversations about planned initiatives with the presumption that they are likely to be too complicated or too numerous to be manageable. While listening for individual initiatives that are clear, simple and easy to communicate, a good litmus test is that the aggregate of initiatives undertaken by an organization add up to a plan that is both credible and achievable.

Question 3: What is the timeline? The thing that managers have the most trouble anticipating and predicting is pace. Planners and strategists in business need to challenge the timeline rigorously. Challenge the underpinnings by pointed questioning until you understand the complete sequence of events related to an objective or initiative, including relevant contingencies.

Fill this file folder until it's bursting, if necessary; it's the only way to schedule and sequence any plan with confidence. It will help you pay particular attention to milestones along the way. Are you and your CP in agreement about how often, and by what standards, you will mark your progress, in order to maintain confidence in your schedule?

Question 4: What assets are required, and are they available? Different types of initiatives require different types of assets to ensure that you keep momentum and get to the finish line successfully.

You and your CP should imagine there are subfolders to fill for all the items in the required inventory for carrying out the plan. Bear in mind that even after you've identified all the necessary assets, you still have only half the information you need. You must also determine whether those assets will be available when you need them. You don't want to be waiting for the cavalry when the time for battle is now.

Question 5: What are the risks we will be facing? When it comes to discussions about risk, I can turn to the writings of McKinsey colleague Lowell Bryan. Bryan suggested laying out multiple initiatives that would allow an organization to proceed with its strategy while regularly re-evaluating its commitment to any one initiative as it came closer to maturity. He illustrated this idea using a grid, with one axis representing risk, and

the other representing the proposed time frame, on which he laid out the initiatives under way. This allowed for spot assessments of which initiatives were in the pipeline and the level of uncertainty or risk associated with each. Later, Bryan added the dimension of the return anticipated from each initiative. ●

What Is the Team?

A "team" is any group of people working together with a common purpose, whether it is assembled by design or comes together organically. The team doesn't have to denote a formal work team designed and assembled by management. Even the hiring of a single individual for a job is an exercise in team building.

It's frighteningly easy to make a bad call about people, and the results of a misstep here can be disastrous. I was consulting to the CEO of a large health-insurance company who needed to replace the COO he himself had brought in only a year and a half before.

He chose a candidate from outside the company, a man I'll call Chandler, who was very much in the CEO's image. His hiring of Chandler — an executive so much like him — might have reflected the CEO's conviction that he could have done the COO's job himself, had he enough hands. As it turned out, Chandler was simply the wrong man for the job. The company's performance continued to deteriorate, and the new COO was removed after only 18 months.

The CEO needed to bring in a new COO quickly. One candidate, Larry, had virtually grown up there, starting out in the mailroom and working his way up through all levels of the operation over a 30-year career. The other man, Russell, had been with the company only a few years less than Larry, most of which he spent in the executive ranks. On the outside, Russell cut a somewhat more polished figure, as if he were more naturally suited to stand at the right hand of the CEO, but Larry was as competent and determined as Russell. Neither candidate was the obvious first choice.

Instinct and intuition, while undeniably relevant when it comes to assembling good teams or fixing dysfunctional ones, can only take you so far.

I encouraged the CEO to use the following questions to focus his listening as he interviewed the two candidates and sought feedback about them from other members of his management team:

Question 1: What capabilities do we need?

Question 2: What are the mind-sets of the team members?

Question 3: What are the roles of the team members?

Question 4: Will this assignment be good for the individuals on the team?

Question 5: What are the inescapable realities?

Question 6: How is the chemistry?

Question 7: What are the consequences of performance?

The CEO embraced this approach as he made the personnel decision. He sourced information and ideas about the two candidates from across his management team and his board of directors, ensuring that he had a deep reserve of data that could inform his decision. At the end of this process, I think he was surprised by the decision he came to: the position of COO went to Larry. Larry's commitment and his singular style proved to be the winning edge; 18 months into his tenure, the company had re-established its forward momentum and was looking toward the future with optimism. ●

How Will We Get It Done?

There are a few critical elements that are essential to successful execution. The labels on the file folders in my Execution drawer — decision-making, information, complexity, and rhythm — may be rather broad, but this is by design. Problems related to unanticipated complexity or a poorly defined chain of responsibility, for example, will arise at any level of an organization.

Question 1: How are we making decisions? Listening for how decisions are made and ensuring that everyone involved understands the chain of command and who has what kind of authority will, of course, increase any organization's odds of smooth and successful execution of its plan. This leads us to the second challenging decision-making question: What happens when unexpected stuff threatens to take us off course? Perhaps it sounds a little counterintuitive, but there must be clearly articulated procedures at the outset, so that people on the team can know what to do when seismic events shake the best-laid plans.

Question 2: Are we getting the right information at the right time? In an environment where a couple of keystrokes can produce a flood of data at any time, managers can be stymied by too much information as easily as by too little. If good execution depends on good information, it is incumbent on managers to ensure the integrity of the information on which they base their decisions. They need to qualify the sources. Just as important, they need to determine what data are

relevant and important to their ongoing assessments, and what merely constitutes noise.

Question 3: How do we manage complexity? A good leader assumes the job of defining the complexity of an operation. He makes sure the team understands what it is they need to be concerned about and what they can ignore. By carefully listening to his or her team, a manager can identify the developments and conditions that are outside the field of play, and then define the boundaries, thus reducing complexity.

Question 4: Do we have a rhythm? Managerial rhythm, to me, means a time-regular set of interactions; be they one-on-one discussions or larger meetings, managers must commit to maintaining a communications calendar. With regular and ongoing interactions you establish a discipline in a company that ensures the gathering of focused and timely information, and allows for precise measurements and calm decision making. ●

Is It Getting Personal?

The reality of business life is that in all our communications, we share some aspects of ourselves. Everything we communicate reveals something about who we are, how we think, what we feel, and what we think is important.

Much more intriguing to me, and relevant to good listening, is an individual's intrinsic personality, analogous to the more subtle secondary colors that decorate his or her life. These characteristics do not wax and wane with passing moods; they define a person's very nature.

It's not possible to open a file folder for every character trait that a person might display. Instead, I've developed a series of questions that enable me to tease out practical and useful information about the ways in which a person's character might govern his or her behavior and color his or her communication.

Question 1: What does this person value? The core values and beliefs of a person can come into play in the context of business discussions. For instance, some people commit themselves to peak personal performance, while others make the group ethos their primary concern. The point is that understanding the values at the core of your CP's nature will help you listen more accurately to the essence of his or her conversation.

Question 2: What are the individual's personal aspirations? The more you are attuned to an individual's personal aspirations — and the more sensitive you can be to the many ways in which those aspirations might run counter to the organization's plans for that person, or to the short-term needs of the organization, or possibly even to the overall mandate — the more effectively you'll be able to filter your listening.

Question 3: How does this person interact with colleagues and others? As tough as it is to work side by side with an abrasive personality, it's an even greater challenge to manage one. Conversations with problematic personalities demand that you filter your listening in an unusual manner. You have to be on guard. Every conversation has value, and you need to make the decision to listen past the unpleasantness so you can stay tuned in for the nuggets of gold that earned your CP a place at the table to begin with.

Question 4: What is the person's level of self-awareness? By determining your CP's level of self-awareness, you can understand how he may or may not be consciously filtering what he says to you. It can be a listening challenge — a little like having to listen through multiple layers of studio enhancement so that you can hear someone's true voice on a recording. ●

PART III: REAPING THE BENEFITS

I've observed that the best listeners in the business environment are able to access and utilize a handful of powerful problem-solving techniques more readily and more often than their peers. First, they are acutely aware of everything that their idiosyncratic filing system already contains or needs to contain. They move quickly to fill in the missing pieces of information, either from other areas of their stored memory or from an external source.

Second, they rapidly shuffle and recombine any or all of the stored information, constantly adding to the options and alternatives available for consideration. This compare-and-contrast technique, allowing them to dismiss a progression of inferior options, makes good decisions more likely. The process of comparing and contrasting allows leaders to distill the choices down until only the best options remain.

Leaders can then assess these options using a third technique. During the Renaissance, in Italy in particular, when patrons, magistrates or church officials had to select an architect or artist for an important project, they occasionally employed the principle of *paragone*, which translates literally as "comparison." Works of art would be placed next to each other so that their relative

merits could be weighed. What makes *paragone* particularly effective in the business world is that even though it involves comparing two efforts or two proposals side by side, it is not necessarily intended to force a simple either-or decision between the two. The assumption is that each of the options has value, so the observer — that is, the decision-maker — can take the best elements of each, and combine them into an entirely new option. In the best circumstances, the amalgam that results could have advantages over either of the two original options on its own.

You can think of the fourth approach to problem solving as the natural product of combining the first three techniques. The best business listeners I've observed — not coincidentally, some of the most effective business leaders as well — have honed their ability to call up an array of option sets at any decision point in their operation. Furthermore, they embrace the opportunity to test however many option sets are necessary before making any decisions. And they do some of this testing out loud through discussion with their colleagues. These executives understand the dangers of jumping too quickly to a point solution before test driving all the viable alternatives.

On occasion, this process of developing and comparing options falls short of surfacing a clear favorite. In such instances, the absence of an obvious choice may indicate that, for some reason, the timing isn't right for making a decision. Even in the fast-moving and fluid business environment, your first decision may be about whether or not a decision needs to be made and acted on at all or, alternatively, whether it needs to be made now or later. Delaying a decision can test the mettle of even the best of executives. ●

Changing Your Organization Through Listening

Not only can the quality of your listening determine your own individual performance, but it can also shape that of your organization.

Because it influences the performance of each individual, a business's culture is critical in determining how well a business performs in the collective. Yet what is culture actually built on? How does it evolve within an organization? At its essence, a corporation's culture is really the sum of all the many hundreds and thousands of personal interactions between its members. Face-to-face conversations, discussions, presentations, debates and meetings — these are the building blocks of culture.

Though cultures evolve organically more often than by design, there is no doubt that they are shaped, in large part, by company leaders. Managers set the standards within their organizations through their interactions with others. They use their conversations and discussions as tools, not only to better their own performance, but also to lead by example, to demonstrate what they believe to be or what they would wish to be, the acceptable norms and boundaries for behavior and performance.

Good listening means having productive and respectful interactions. You will find that as you listen better and your interactions with colleagues improve, you will actually begin to affect the behaviors of those around you and the culture of the organization or unit that you manage. Here's how, through good listening, you will make positive cultural change happen in your business:

- Foster a more discipline and productive organization.
- Ensure the free and open flow of information and ideas.
- Establish a reverence for fact-based discussions.
- Generate new insights and more creative solutions.
- Build an organization that excites and energizes its people. ●

Conclusion

My final message is this: There's no time like the present. Start your new listening journey right now, by trying to substitute one good listening practice that seems most natural to you for one bad one that you have identified.

As with so many efforts at self-improvement, half the battle is already won the moment you make the decision to try and the commitment to apply yourself. I hope you're excited by the prospect of the fuller and richer world that good listening can open up for you. I know I am. ●

Power of 2

How to Make the Most of Your Partnerships at Work and in Life

by Rodd Wagner and Gale Muller, Ph.D.

THE SUMMARY IN BRIEF

Many of the greatest accomplishments can be reached only by two people working together. Tenzing Norgay and Sir Edmund Hillary were the first to scale Mt. Everest; Karl Malone and John Stockton were the key to each other's success on the basketball court; Michael Eisner was never as effective at Disney without Frank Wells.

But while some partnerships reach great heights, others fall short. If you are like most people, you've had some good ones. You may even have a few of them now. Yet chances are you don't make the most of the collaborative opportunities all around you. Powerful partnerships — the kind in which you and a collaborator regularly work together, reach goals together you never could have accomplished apart, and gain the deep satisfaction only such an alliance can bring — are evasive.

Somehow our televisions, e-mail, headphones, cell phones, car radios, and personal computers trick our brains into thinking we are with other people, interacting, when we are, in fact, working in isolation. We are crowded in offices, airports, subways — frequently within arm's reach of dozens of people — but often on a very lonely pursuit. Wired? Yes. Networked? Yes. Collaborating? Not much.

Seeing these patterns at numerous client companies, authors Rodd Wagner and Gale Muller teamed up to lead a five-year endeavor to crack the code on collaboration and to discover what elements are crucial for two people becoming a successful team. *Power of 2* details the eight elements that prepare partners to succeed in their most important endeavors.

IN THIS SUMMARY, YOU WILL LEARN:

- Why some people click while others clash.
- What great pairs have in common.
- Why the adults you work with still need the playground rules of childhood.
- How to find the upside in a breach of trust.
- Why the quality of your partnership cannot exceed the quality of your communication.

THE COMPLETE SUMMARY: **POWER OF 2**

by Rodd Wagner and Gale Muller, Ph.D.

The authors: Rodd Wagner is a *New York Times* best-selling author and principal of Gallup. His books, speeches and consulting focus on how human nature affects business strategy. He advises senior executives in numerous industries on the best ways to strengthen their partnerships, increase employee engagement and improve profitability. Wagner is the co-author of *12: The Elements of Great Managing*, an American and Canadian bestseller published in 10 languages.

Gale Muller is vice chairman and general manager of the Gallup World Poll. He oversees a global team of researchers in more than 150 countries. He has worked with many of Gallup's key clients in the automotive, entertainment, telecommunications, health care and broadcast industries.

Complementary Strengths

Several decades ago, a junior high shop teacher wanted to impress upon his new students the dangers of the oxyacetylene torch. "Pay attention, class," he said, pulling a balloon from his pocket and holding it to the nozzle of the torch. "I am going to fill this balloon with oxygen." When the balloon was full, he lit a match under it, producing a strong pop.

He pulled another balloon from his pocket. "Now this time, I am going to fill the balloon with acetylene," he said. Following the same procedure, he made a short flare as the fuel caught fire.

The teacher pulled yet another balloon from his pocket. "You've seen what happens to each of these elements separately. Now let me show you what happens when I put them together." He repeated the procedure a third time, opening the valves for the oxygen and the acetylene as the balloon grew larger. "You might want to plug your ears," said the teacher, putting the flame to the latex.

BAM!

Was it the oxygen or the acetylene that caused the explosion? Neither. Or rather, both. Separately, they are impressive. Together, they create a mixture so hot it can melt steel. The power is in the combination.

Understanding Your Strengths

Your partnerships work on the same principle. The best partnerships happen when you and someone who has strengths that complement yours join forces and focus on a single goal. Your strengths cancel out your partner's weaknesses and vice versa. You accomplish together what could not be done separately.

Before you can forge a successful alliance, you must understand what you bring to the combination and, equally important, what you don't. Collaboration is more than doubling up — more than just twice the oxygen or twice the acetylene. The key to achieving success is not trying to be someone else or striving to be as good as your collaborator at whatever he or she does best or seeking to be universally proficient. It's in discovering your own exceptional abilities, recognizing your weaknesses and understanding how someone else's abilities complement your own.

A successful collaborator must resist the ego-gratifying temptation to take too much credit. If a person honestly recognizes that his or her counterpart does some things much better and that the other person is needed to get the job done, he or she is less susceptible to fall into to the trap of conceit. In a strong partnership, both participants are always promoting the abilities of the other. They constantly speak in terms of "we" or "us," rather than "I" or "me." ●

A Common Mission

Collaboration is more than friendship or collegiality, more than being in the same office or working for the same firm, more than proximity or mutual appreciation. It occurs only when you and an ally strive for a definitive accomplishment — passing work between your-

selves, "putting your heads together" or doubling up on a task neither of you could accomplish alone. For this reason, the relationship is unique. It exists to serve the goal. It lasts only until the mission is accomplished. Once the objective is reached, the partnership must adopt a new goal or it dissolves.

Although you and your collaborator must agree on your mission, you don't need to have the same reasons for pursuing it. Successful partners often have different motivations for making the climb. This usually does not hinder the alliance, particularly if both of you understand the driving force motivating the other and work to see those hopes fulfilled.

Sharing the Goal

Although a shared mission is essential, maybe even obvious, the lack of basic concurrence is where many pairs fail. Only one in four people in poor partnerships agree that they have a common goal or purpose with the other person. In many cases, both think they are on the same page, but when limits of time, money or attention force difficult choices, it becomes clear the two have conflicting priorities. Only 9 percent of those in poor partnerships say they were "very successful" at reaching their goal. It's difficult to do if you're not aiming at the same target.

Fairness

Particularly at the beginning of a working relationship, colleagues cannot avoid making comparisons between their own rewards and those of their counterpart as they decide how earnestly to maintain the collaboration. Even if you have no formal authority over the pay, promotion or recognition of your collaborator, you should make sure he or she gets a fair deal.

As logical as the need for fairness may be, feelings of being used are often at the heart of what destroys a working relationship. This is especially true when one of the two people has the ability to impose terms on the other.

Research indicates that we also disengage and retreat if we feel as if someone is taking advantage of us. People do irrational things when others violate their sense of justice. In a partnership, it's not what's smart or what's logical that matters, but what's equitable. The emotional reactions of collaborators drive them toward interacting fairly or not interacting at all.

Fairness and Equality

There are different, opposing forms of fairness that apply, depending on the situation. The most basic form is equality, a 50-50 division of the work and the rewards. Such a perfect split rarely occurs in practice. Any objective measurement of the work two people put into a project or the rewards they get from it would find at least a slight imbalance. Yet the symbolic value of an even division is often the assumed starting point and the ideal to which both partners aspire. It is the magnetic North Pole of most collaborations — intuitively appealing and difficult to argue, which is why it emerges in so many successful pairs.

However, a powerful partnership does not need to be equal to be fair. There are many times when one member of a dyad does more of the work, brings a rare talent, has far more experience or otherwise "deserves" — the term is unavoidably subjective — a larger share of the reward. Giving identical benefits to those whose workloads differ substantially is as unfair as giving vastly different rewards for the same work.

In successful partnerships in which there is an uneven division of responsibilities, a corresponding division of rewards also occurs. You and your counterpart do not need to divide the work evenly, but you must make the rewards proportionate to the workload. Productive working relationships can be built on a 70-30 division of the work if there is a corresponding 70-30 division of the rewards. In the strongest relationships, there is even a certain degree of latitude or wiggle room. For example, some partners are happy doing 60 percent of the work and receiving just half the rewards.

Fairness: What the Research Shows

Several statements about fairness proved crucial for successful collaboration. Respondents were asked how strongly they agreed or disagreed with each of these statements:

- We share the workload fairly between us.
- We do not have to keep track of who does what and who gets credit for what.
- We see each other as equals — one is not better than the other.

Your partnership has little chance of succeeding unless both of you believe it is fair. On a scale from 1 (strongly disagree) to 5 (strongly agree), it takes an average above 3.6 on these statements to reach the range considered "good." Only respondents who strongly agree to all three statements have excellent alliances.

Relative Contributions

To make your partnership fair, you will need to keep in mind that although you are aware of everything you do for the joint effort, much of what your partner does escapes your notice. If you are like most people, you also have an inflated opinion of the value of your contributions. Selfishness and the natural bias toward believing one has done more than a comrade creates a pothole in the road of many joint projects.

To be a great partner, you must continuously consider how much of the work your counterpart is shouldering and what he or she is getting for the effort. What rewards are most meaningful to your counterpart and is he or she receiving them? Would you be willing to trade your work and rewards? Are you truly working as equals? Addressing these issues requires candid conversations and a willingness, if needed, to take on more of the work for less of the rewards. Your collaborator needs to be similarly accommodating to you. Only when both partners are assured the other is more invested in the common mission than in a selfish pursuit do they not have to keep track of who does what and who gets credit for what. ●

Trust

Every partner needs to be able to depend on his or her counterpart. Every partner takes a risk that the other person might fail, intentionally or innocently. Every partner needs the dependable backup that is the difference between success and failure.

Trust is the linchpin of a partnership. With trust, both people can concentrate on their separate responsibilities, confident that the other person will come through. One brain-imaging study discovered that once trust is created, a person's brain will process his or her counterpart's cooperative move before it even happens.

The Partner's Dilemma

Without trust, it's better to work alone. Both people doubt whether the other will fulfill his or her end of the bargain. Both must verify the other's actions. Both must make contingency plans in case their counterparts fail. The frustration and inefficiency of not being able to count on someone is more hassle than the burden of handling the full load alone.

You face a dilemma every time you interact with someone new. If the person can be trusted, and if he or she learns to trust you, the two of you can be more successful working together than going it alone. But if one of you is not trustworthy, it's better that you never even try to collaborate.

In a working relationship, being trustworthy is not a matter of putting $100 in an envelope or hitting the right button. It is showing up for an important meeting on time, doing more than your share of the work, quickly returning e-mails and phone calls, giving all your creativity to a project, jumping in rather than having to be asked, not being a burden to your partner, fighting for the success of the project, working hard on physical jobs and smart on mental ones, and hundreds of other acts large and small.

In the early stages of a collaboration, both partners take a wait-and-see attitude, still in the clutches of the dilemma, not sure the other person is going to do his or

The Partner's Dilemma

Imagine you are paired with a stranger to play the following game. You receive an empty red envelope. The other person receives an empty blue envelope. The instructor tells both of you to secretly place either $100 of your own money or nothing inside your envelope. Then he will take both envelopes, double whatever money he finds in each, and return them, but only after switching them so that you get the blue envelope and your counterpart gets the red one.

Would you put $100 in the red envelope? The question starkly illustrates the issue of trust. Your answer cuts to the essence of who you are as a collaborator.

There are four outcomes to this experiment:

Mutual trust: If you both risk your money, you both double your investment. You make $100, and so does your ally. This is the only way you both come out ahead.

Your counterpart betrays you: If you risk your money, but the other person puts in nothing, you'll lose $100, and he or she will gain $200. Your trust is abused and you end up on the losing end.

You betray your counterpart: Should you fail to put in the money and the other person does, you gain $200 while risking nothing. This is the most profitable short-term strategy and, therefore, a real temptation, but you can employ it only by abusing the trust of your counterpart.

Mutual betrayal: If both of you risk no money, neither of you will lose any. But from your reticence or competitiveness, you both lose the chance to multiply your funds.

her part. But if one cooperative move is matched by another, solid reputations form. The fear of being taken advantage of fades. Trust removes doubt. Trust eliminates the dilemma.

Reaping What You Sow

The most important element in forming and maintaining a variety of strong partnerships is not your craftiness, but your willingness to take the risk of trusting numerous potential partners and your diligence in repaying the trust they place in you.

Your first moves, friendly or hostile, tip the balance for future interactions. When you exhibit trust, you will most often find trustworthiness. When you are selfish, you will most often find selfishness. When you compete, others must resort to competition. If you choose to play the game strictly for your own advantage, your attempts at collaboration will indeed be solitary, poor, nasty, brutish and short.

In the end, the degree to which you succeed in forming trusting partnerships is less a reflection of how much people trust you than how much you trust them — less a reflection of their trustworthiness than of your own. ●

Acceptance

One fact about partnerships is so uncomfortable that your first reaction is to deny it: You form partnerships fastest and easiest with people most like yourself. Deep-seated biases make you more trusting of those who look most like you, who think like you or with whom you have the most in common, whether you're from the same town, attended the same school, are fans of the same team or mirror each other on more controversial factors such as race, age, religion or sex.

Sociologists call the degree of similarity between people "social distance." Its consequences for collaboration are often more important than the physical distance separating two counterparts. Humans are tribal creatures, constantly drawing boundaries — sometimes prejudicial boundaries — between friends and foes.

This creates a problem, not only because it restricts your collaborative field, but because it makes you less likely to create strong ties with those who would bring something you lack to the partnership. Many of the potential collaborators you need most are those who will be, because of their differences from you, most difficult to learn to accept.

You don't need an identical twin as much as you need an opposite, a relative stranger who shares the common mission and the same sense of fair play, but whose approach to the challenge may seem quite foreign.

Egocentrism

Differences between partners can easily spark antagonism. Even if the social distance between you and your partner is small, incorporating his or her personality into your preferred way of working can be difficult. Mutual irritation is common in partnerships, particularly in the early stages. There is a natural propensity to believe you are normal and that the other person, to the degree he or she differs from you, is a bit off.

We tend to forget or disregard information that disagrees with us, but we remember what reinforces our own views. We are inclined to believe positive news about those we like and negative information about those we don't. We suffer the hubris of "egocentric infallibility," thinking what we believe must be true because we would not believe something unless it were true. And we are hypocrites, believing or professing one thing and doing another, sometimes not even noticing the contradiction in ourselves while having a finely honed sense for spotting it in others.

Egocentrism kills partnerships. It's impossible to work effectively with someone if you — blind to your own failings — spend too much energy finding fault with your comrade. Partnerships require both people to accommodate each other's foibles.

Coping With a Frustrating Situation

Collaborators look for ways to handle aspects of their opposites they would prefer to change.

One is denial, pretending the problem does not exist. Ignoring the issue, according to psychological research, is a poor strategy that has shown itself to be "clearly related to higher levels of stress and impaired psychological well-being." If your partner does something that bothers you, you need to recognize it before you can resolve it.

Another tactic is called "resigning acceptance." This attitude, although it recognizes the problem, also includes a feeling of cynicism or powerlessness in dealing with the issue. "Typical," say people who use this method. "These things always happened to me." This kind of approach is much like denial, leading to bitterness, decreased mental health and less control over your actions.

The best way to deal with a frustrating situation is called "active acceptance," neither denying the situation nor surrendering to it. "Active acceptance means acknowledging a negative, difficult situation and dealing with it in a constructive way," according to Gallup

researchers. "The individual dispenses with fruitless attempts to control what is neither controllable nor changeable."

In a partnership, it is epitomized by focusing on your partner's strengths rather than his or her weaknesses, accepting your partner as he or she is and being understanding when he or she errs. In the best collaborations, partners come to appreciate what they once found aggravating.

Forgiveness

When a partnership is going well, all kinds of wonderfully unselfish things happen. Partners change their goals to better match each other's objectives. They strive to be fair to each other. They focus on their counterpart's strengths. They overlook each other's foibles. At the zenith of collaboration, both partners make great personal sacrifices for the other's happiness.

But when things turn negative, a parallel set of emotions and reactions kicks in. The partners see themselves as pursuing opposing ends. Fairness becomes less about a considerate division of rewards and work and more about what one partner feels the other owes him or her. The counterpart's strengths don't seem so impressive any more. His or her personal ticks become full-fledged character flaws. At the nadir of collaboration, not only will the partners refuse to sacrifice for each other's benefit, they eagerly go out of their way to cause their one-time colleague pain.

The same emotional wiring that makes great partnerships so effective and rewarding creates corresponding and equally powerful negative forces if things go wrong. In a good collaboration, partners make statements such as "two heads are better than one." In a bad one, the two make comments such as "I would have been better off working by myself" or "I wish I'd never even met him or her."

Trust between two collaborators is like the rope between mountaineers on a snowy ledge. If the line is cut, the gravity of powerful negative emotions kicks in. The cord may have been separated one fiber at a time, as when a snide remark, showing up late for an important meeting or letting a shared project slide a little leads to a matching dereliction from the other partner.

How to Patch Things Up

One of the most difficult collaborative decisions you will face is whether to patch up a partnership if your counterpart violates your trust. There is no perfect answer. Anyone who tells you to just let it go is failing to consider the intensity of his or her own emotions under these circumstances.

Yet failing to continue working together can forfeit the benefits of what was otherwise a solid combination. Common sense indicates what needs to be done by the offender: Apologize. Make your good intentions clear. Make a peace offering. Be demonstrably more reliable to build trust.

The more intriguing question is what to do if you were the one betrayed. You need a tremendous amount of discernment, self-control, ability to give your counterpart the benefit of the doubt, and desire for a better outcome to turn a vicious circle into a virtuous one.

How you manage your own thinking is as important as the offense itself. In many cases, whether a person forgives the misdeed says less about the seriousness of the wrong than about the personality of the partner whose trust was abused.

Partnerships: What the Research Shows

As far as keeping a collaboration from going negative, two statements in Gallup's research differentiate good and bad partnerships:

- There have been times when either my collaborator or I have violated the other's trust.
- When either of us has violated the other's trust, we have been able to forgive each other.

Although minor disruptions occur in good and bad partnerships, serious violations of trust are rare in the best pairs. Only 18 percent of good partnerships suffer a real rift. Among poor partnerships, the number jumps to 40 percent. When something serious enough to require forgiveness transpires, 85 percent of those in good partnerships do forgive. Those in poor partnerships patch things up only 14 percent of the time.

Communicating

Most collaborators, even many of the best, do not realize the role communication plays in creating a powerful partnership. Of course, two people working together must synchronize their efforts to avoid getting their wires crossed. It's obvious that silence can breed misunderstandings. Two heads cannot be better than one if the two people do not talk enough to each other.

Rarely appreciated, however, is how communicating itself is collaborative, an issue of trust within the larger

partnership that surrounds it. Communication is more than a purely functional aspect of working together. Every time two counterparts talk, their relationship changes. What goes on beneath the surface is more important than the information exchanged.

Constant Contact

From a practical perspective, staying in contact with your partner allows the two of you to be aware of the other's next move, to make your intentions clear, to brainstorm or perhaps stumble onto an idea you would not have had separately, and to share your candid assessments with each other.

Silence creates the opposite effects. Suspicious counterparts administer to themselves a sort of mental Miranda warning, worried that anything they say can and will be used against them. But whether or not you intended to do so, failing to communicate creates a threat in your partner's mind that you are not committed to the collaboration, that you do not trust him or her, or that you just might make a run for the goal by yourself and claim all the credit.

It's much easier to vilify someone who has not explained his or her motivations, much easier to read into the silence the threat of an unpleasant surprise.

Recursive Thinking

Communication in a partnership is complicated by the unique and incredible human capacity for reading into a situation what the other person must be thinking. Scientists call it *recursive thinking*, the two- or three-layered awareness of what your collaborator is experiencing.

Recursive thinking is a double-edged sword. There is no sympathy without recursion. A great partner who understands that his or her colleague is struggling will shoulder more of the burden and offer support. It's impossible to understand how a collaborator's desire for the goal differs from your own unless you can mentally put yourself in his or her shoes.

Yet too much recursion and too little discussion inevitably lead to wrong assumptions. Rather than explain their rationale, collaborators routinely assume the other person knows the reasons. Rather than compliment the other person on a good job, partners assume their praise would be redundant. Rather than ask for more information and listen closely, people assume they already know what the other person would say.

Assuming without verifying is dangerous. We are not mind readers; we are mind guessers. Sometimes we guess wrong. This is the reason why in partnerships that involve a risk of death such as piloting an airplane, rock climbing and scuba diving, the most important messages are mandated and standardized to remove ambiguity.

Communication: What the Research Shows

Three statements about communication within a partnership from Gallup's research demonstrate the importance of both people keeping the other informed about what they are doing:

- We rarely misunderstand each other.
- We are good listeners for each other.
- We show appreciation for what the other does.

On a 1-5 scale, people in good partnerships average at least 3.6 on these statements, while excellent collaborators score a perfect 5. The most successful collaborators spend enough time communicating to know what the other is thinking and they encourage each other along the way. The implied motivations behind the messages are crucial.

Unselfishness

The sacrifices some partners make for each other don't make sense. A partnership is based on the assumption that by working together, both people will achieve heights neither could have accomplished alone. You and your collaborator are supposed to be better off than you would be without the working relationship. While looking out for the other person creates trust, endangering your life for him or her seems to miss the point. What good is a partnership to a person who gets him- or herself killed for someone else?

Scientists are not impressed by most partnerships. They usually find some way to explain that what appears to be unselfishness on the surface pays off for the one who did the good deed. "Instrumental reciprocity," they call it — a means to a self-serving end: If I can keep my partner happy, he or she will do what I need him or her to do for me.

Instrumental reciprocity is common and can be quite constructive. All partnerships begin as instrumental agreements. In the early stages, they could even be called mutually selfish. For many collaborations, the coming together so that both partners go away richer is enough to carry the partnership all the way to the goal.

Mutuality

Unselfishness changes everything about collaboration. When you value your partner's rewards as much as you

do your own, concerns over fairness either melt away or go in the opposite direction. "What's in it for me?" becomes "What is my counterpart getting out of this?" If a person values his or her comrade getting a reward as much as he or she does getting one, the optimal solution is always collaborative. ●

Looking Within

If you want to have great partnerships, be a great partner. Get beyond yourself. Give up the notion that you are well-rounded and stop expecting your colleagues to be universally proficient. Incorporate someone else's motivations into your view of the accomplishment. Put aside your competitive nature, your prepackaged view of how the thing should be done, and your desire not to be inconvenienced with imperfections of a fellow human being. Focus more on what you do for the partnership than what you get from it. Demonstrate trust in more people, and see if they don't surprise you with their trustworthiness. Be slower to anger and quicker to forgive. And along the way, communicate continuously.

As you do, incredible things will happen. You will discover more comrades among your colleagues. You will find greater strengths in yourself and in your collaborators. You will achieve greater heights than you thought attainable. Most important, you will not stand alone on these summits. That is the Power of 2. ●

Additional Insights for Businesspeople

For Managers

An employee's collaborative relationship with his or her supervisor is more than twice as likely to show up in the negative column than in the positive one, according to Gallup's research.

The most fundamental misunderstanding about partnerships between managers and the managed is that they should not exist at all.

The same attributes that make a good partnership between equals make a good alliance between managers and employees: complementary strengths, a common mission, fairness, trust, acceptance, forgiveness, communicating and unselfishness.

Although most employees understand that running the business requires some people to give direction and others to take it, they still value being treated as an equal by their manager. Executives, managers and other higher ranking partners do better when they build a partnership than when they exercise command.

With their managers as much as with their peers, people mirror what they perceive coming from the other person. To what's given begrudgingly, they return begrudgingly. To what's given generously, they reciprocate generously.

Workgroups headed by a "partner" have nearly twice the proportion of engaged employees compared to those led by a "boss."

For Leaders

In their eagerness for results, executives frequently allow or even encourage internal competition. They say they want salespeople to work together, but what they want most is the sale, and if elbows fly in the process, so be it. Companies give lip service to partnerships and then create financial incentives for beating the other guy. The result is often a defeat for the organization caused by two generals spending as much time outmaneuvering each other as they do pursuing the objective.

An enterprise that sets out to collaborate without building partnerships throughout will be worse off than one that never pretended to enter that dimension. The partnerships begin at the top. ●

Unselfishness: What the Research Shows

Three statements about unselfishness from Gallup's research proved to be the ultimate measures of the strength of a partnership:

- We take as much satisfaction at seeing the other succeed as we do from our own success.
- My partner will risk a lot for me, and I will do the same for him or her.
- My partner is like a brother or sister to me.

Good working relationships average at least 3.3 on these statements on a 1-5 scale. Those in excellent partnerships strongly agree with all three statements.

THE SUMMARY IN BRIEF

You can't avoid conflict. When there are problems to solve and people who care, you'll face conflict. And if you want to have more success, influence, and joy in your work, you've got to navigate it well. But conflict is hard. You weren't born knowing the perfect words to say when you're angry, dealing with a jerk, or when someone calls your game-changing idea "stupid." That's the reason for this book. ***Powerful Phrases for Dealing with Workplace Conflict*** will give you practical communication techniques to successfully navigate conflict at work. And when you do, you'll get better results, build trust, have more influence, and collaborate better with your coworkers.

You probably didn't learn practical, productive approaches to conflict in school. And, if you're like most of us, you grew up watching role models sometimes really screw it up. You've had some conflicts not go so well yourself, and you don't like how that feels. The Powerful Phrases you'll find in this book are words you can use exactly as written or find your own Powerful Phrase that carries the same meaning, creates the changes, and builds the relationship.

IN THIS EXECUTIVE BOOK SUMMARY:

- Determine how challenges of workplace conflict are influenced by new factors
- Tips to address conflict constructively through four key dimensions
- Practical "Powerful Phrases" and strategies to use to navigate and resolve conflicts
- Strategies for dealing with different types of difficult coworkers, bosses, and customers

What Makes Workplace Conflict So Challenging?

What's Making Conflict Harder Right Now?

People have had conflict with one another since, well, there have been people. But to give you the most useful tools, we wanted to find out what's happening now. So, we created the World Workplace Conflict and Collaboration Survey (WWCCS) to ask people around the world whether they're experiencing more (or less) conflict at work, what's causing those changes, and the effects of workplace conflict. We've heard from over five thousand people in more than forty-five countries and all fifty of the United States.

If it feels like you're experiencing more conflict at work over the past few years, you're not alone. Seventy percent of the people in our research say that they're experiencing the same or more conflict at work.

The pandemic sped up changes in the workforce. More than ever before, people want meaning in their work. And work itself is changing. The survey results citing continued overwhelm, economic instability, lower levels of motivation, and poor management are symptoms of this upheaval.

Take the increase in anxiety, stress, and depression, mix in the loss of human relationships, and you get more workplace conflict. And it's more intense.

We were sad to read WWCCS comments about alarming discrimination and lack of tolerance or inclusion. For many, these trends are getting worse.

When things change fast or change in big ways, people freak out. Rapid change, major change, and unexpected changes can all increase the likelihood and intensity of conflict.

Social media thrives on conflict. One of the easiest ways to get people to interact is to push their anger and outrage buttons.

We don't share these causes of conflict to discourage you. The point is to understand where the conflict comes from and why it's happening.

What Abouts: Frequent Concerns, Questions, and Why Old Approaches Don't Work

You may be thinking, "Powerful Phrases, really? I'm skeptical. You can't script this stuff."

So, you're right, in that there are almost no "perfect words" for every situation except maybe "thank you," "I apologize." Apart from those, it's what the words do that matter most—not the words themselves.

"I" statements, sandwich methods, and that nonsense is tired. It doesn't work.

There's a lot of traditional workplace communication wisdom that gets passed on but makes little sense—or just plain won't work in different scenarios.

"My [boss/coworker/customer] is a psychopath. There's nothing I can do that's going to help."

We've heard so many stories of conflict with managers in the WWCCS. We want to encourage you to know that there is hope.

Getting Started: Practical Approaches for Every Workplace Conflict

The Four Dimensions of Constructive Conflict

Every Powerful Phrase in this book addresses one of these dimensions.

1. Connection—Do We Know One Another as Human Beings?
2. Clarity—Do We Have a Shared Understanding of Success?
3. Curiosity—Are We Genuinely Interested in Other Perspectives and What's Possible?
4. Commitment—Do We Have a Clear Agreement?

The Twelve Greatest of All Time Powerful Phrases for Dealing with Workplace Conflict

CONNECTION

1. "I care about (you, this team, this project) and I'm confident we can find a solution that we can all work with."
2. "Tell me more."
3. "It sounds like you're feeling . Is that right? [pause for affirmation]. Thank you for letting me know how you feel."

CLARITY

4. "What would a successful outcome do for you?"
5. "Let's start with what we agree on."

6. "What I'm hearing you say is . Do I have that right?"

CURIOSITY

7. "I'm curious how this looks from your perspective."

8. "What do you suggest we do next?"

9. "What can I do to support you right now?"

COMMITMENT

10. "What's one action we can both agree to as a next step?"

11. "So, to recap our conversation, we've agreed to. Is that your understanding?"

12. "Let's schedule some time to talk about this again and see how our solution is working."

Courage Matters: Get More Confidence to Start the Conversation Everyone Wants to Avoid

It's so tempting to ignore conflict at work, but look at the top consequences of conflict from the WWCCS: stress, turnover, lower-quality work, lost productivity. No one needs more of that in their life.

Powerful Phrases to Ask Yourself and Build Your Confidence

"What do I want to happen because of what I say?"

"Why does what I have to say matter?"

"What's preventing me from saying it?"

"What's at stake if I stay silent?"

"What's the worst that can happen here?"

Powerful Phrases to Invite Others into the Conversation

"I'm concerned that we might not be talking about (X). And my hunch is that's because of (Y). Here's why I think we need to have the conversation anyway. What do you think?"

"What are your biggest hopes and fears for this project?"

Beyond Words Harnessing the Power of Body Language and Tone for More Productive Conflict

You can derail any Powerful Phrase with an eye roll, exasperated sigh, or sarcastic tone. When your face doesn't match your words, people believe your face before your words.

Beyond the Drama: How to De-escalate an Emotional Conversation

"I noticed that . . . What's happening for you?"

"You're right . . ."

"Please correct me where I'm wrong. Here's what I'm hearing so far."

"I appreciate you sharing that with me."

"I apologize."

Say Goodbye: How to Know When It's Time to Quit a Conflict

One heartbreaking finding in the World Workplace Conflict and Collaboration Survey was how often people said, "If faced with this conflict again," they would quit, or quit sooner.

"Have I tried?"

"What do I gain or lose by quitting?"

"Is this conflict affecting other areas of my life?"

"Do I feel good about how I'm showing up?"

"Is conflict a pervasive organizational problem, or is it limited to one or two people?"

"Is there another way to accomplish my goal?"

Rising Above: Tackling Tricky Workplace Situations

What to Say When . . .You Need to Say No (Even to Your Boss)

"I've studied this problem extensively. Here's what I know. . .

Does your data suggest something different?"

"I'm confident that we should take a different approach. Here's why . . . I'm curious about your perspective."

"Thank you so much for thinking of me! I'm honored. I'm so sorry I can't say yes to this right now."

How to Say No to Values Clashes and Ethics Violations

"Thank you for thinking about this. However, this clearly is (illegal, out of compliance, against this foundational policy). Let's think a level deeper about the outcome you want, and how we might get there."

Powerful Phrases to Say No to Your Boss

"I'm deeply committed to the success of the team and to this project. What you're asking me to do here would mean {x}. Which concerns me because of {y}. An alternative approach might be {a}."

"This project sounds so exciting. And I can't take on another thing—unless we reprioritize my current work."

"I always want to grow and contribute all I can to this company. I don't think I'm the best fit for the role you're suggesting because . . ."

What to Say When . . .You Feel Overwhelmed

"What's most important?"

"If I had to drop a ball here, which ball should that be?"

Powerful Phrases to Ask for What You Need

"I could use some help with this."

"I have an idea."

"Here's what I need."

Powerful Phrases for Supporting Your Overwhelmed Team

"This is not okay. That can wait."

"Let's figure out a different way to do this."

"I really appreciate you and all you are doing."

What to Say When You Feel Invisible or Ignored

Here are a few questions to spark your thinking.

"What do people not see that I wish they would? For what do I want to be known?"

"In what circumstances am I feeling invisible or underappreciated?"

"Is this a place where employee voice matters?"

Powerful Phrases to Share How You Feel or Ask for What You Need

"I'd love to set up some time to talk to you about {x}."

"Sometimes, I feel isolated in my role. I'd love to explore ways to be included in discussions about {x}."

"Would you like to grab a (real or virtual) coffee?"

Powerful Phrases to Get Your Voice in the Conversation

"I have an idea that will (insert strategic benefit statement here)."

"Before we leave this conversation, I have something important to add."

What to Say When Expectations Aren't Clear

"It seems that we see this differently . . ."

"Here's the challenge we face . . ."

"Let's decide how to decide."

What to Say When You Have Competing Priorities and Conflicting Goals

"I know we've had some challenges . . . and I'm committed to finding answers that will work for both of us. Can we talk?"

"What are your goals? What matters most to you and your team here?"

"My understanding is . . . Do you understand it the same way?"

"Will you come with me to talk with our manager so we can clarify what we're supposed to be doing?"

"How can we . . . ?"

What to Say When You Work in a Matrix Organization

"What does success look like (for this project, for our customers, and for each of us?)"

"Who are our key stakeholders and how will we involve and include them?"

"What is my role in this project? What's yours?"

Who are our key stakeholders and how will we involve and include them?

"Who owns this decision?"

"Who really needs to be in this meeting?"

What to Say When Your Team Lacks Accountability

Use the INSPIRE method.

Connection and Clarity

I—Initiate the conversation with your intent

N—Notice observable behaviors

S—Support with specific examples

Curiosity

P—Probe with open-ended questions

I—Invite their solution

Commitment

R—Review your agreement

E—Enforce with a scheduled time to revisit your agreement

What to Say When Your Remote or Hybrid Team Is in Conflict

"What does success look like?"

"How and when will we communicate?"

"How can we make the most of our time together?"

What to Say When Others See the World Differently

"My intent for this conversation is . . . so that . . ."

"I've noticed that we have different perspectives . . . and would love to learn more."

"So, what you're saying is . . . Do I have that right? That's interesting. And I see it differently."

"Have you asked . . ."

What to Say When a Team You Lead Can't Get Along

"What do you want me to know?"

"How might I help here?"

"Should the three (or more) of us talk together?"

"What I'm hearing is . . . What have I missed? What would you add?"

"We are approaching this with different values and styles. Let's see what we can learn from one another and build a way forward."

Managing Up When You're Feeling Down: How to Deal with Conflict with Your Boss

What Do You Say If Your Boss is a Micromanager?

ASK YOURSELF

"How am I doing, really?"

"Can I show or document my success?"

"Is it just me or everyone?"

"Has something significant changed?"

START A CONVERSATION WITH YOUR MICRO-MANAGING BOSS

"I care about our success and want to make sure I'm doing my part."

"Is there something I've missed?"

"Do you have a concern about how. . . ?"

ASK FOR WHAT YOU WANT

"I'm hearing . . . Can I commit to. . . ?"

"I want to try . . . Can you and I set a quick meeting to

make sure we're on track?"

What Do You Say if Your Boss Takes Credit for Your Ideas?

"I'm curious, do you think {x} understands my role in this project?"

"People seem to appreciate our work. Do you think {x} understands all that went into this and who was involved?"

"I'm sure this was an oversight, and I'd love your help in making it right. Do you think we could talk with. . ."

What Do You Say if Your Boss Won't Make a Decision?

"What's causing your hesitation?"

"Who else needs to be involved in this kind of decision?"

"I see two options for what to do next (explain options A and B). I recommend we go with option A because . Are you good with that?"

What to Say If Your Boss is a Moody Screamer or Dropper of F-Bombs

"I understand how frustrating this is. I'm deeply concerned too."

"I'm so sorry I screwed this up. Here's what I will do . . ."

"I'm observing a pattern where (specific observations) . . . and I'm wondering . . ."

"I've noticed that when you're frustrated . . . It makes me uncomfortable."

"How can I help?"

What Do You Say if Your Boss Gives You Lazy, Vague, and Frustrating Feedback?

"Thank you. What's working? How can I be more effective?"

"I feel proud about {x} . I'd love your perspective on that. Why do you think it worked well?

"What specific skills, talents, or behaviors have you observed that allow me to make the greatest contribution?

"Can we outline what I need to do this year to make 'exceeds' (or whatever your rating equivalent) the obvious rating?"

"I really appreciate your support. And I'm pretty frustrated. This affects my compensation too (if that's true). I'd really like to talk to HR to express my concerns about this."

"I appreciate your desire to help me improve. This is the first time I'm hearing about this. I'm wondering what we could do to set up a more regular cadence of feedback throughout the year, so there are no surprises next time."

"Can you please tell me more? I'd really like to get a better understanding of your concern."

What Do You Say if Your Boss Doesn't Appreciate You or See Your Genius?

"In the next three months, what do you see as one of my biggest strengths to build on, and what's one opportunity to grow?"

"What would an extraordinary year look like for my role?"

"I've been working on {x} and I know how important this is to our strategy. Can we use ten minutes in an upcoming staff meeting so I can update you and the team?"

What Do You Say if Your Boss Thinks You're Too Negative?

"I appreciate you thinking about . . ."

"Here's how we can make sure this succeeds . . ."

"I want to make sure I give your idea the positive attention it warrants. Can we talk tomorrow morning?"

Communicating with Difficult People: The Art of Wooing the Weary and Winning the Whiny

How to Deal With Lazy Coworkers

"Is everything okay?"

"Can we talk about how we can best support one another and the team?"

"I don't want to overs tep my role here, but I want to ensure you are aware of the impact on the rest of the team."

How to Deal With Know-It-Alls

"I'm sure your intentions are good. And sometimes, when you tell me what to do, it makes me feel like you question my expertise."

"How do you think that went? What did you notice about the others in the room?"

"If you were in my shoes, what would be your focus?"

"I could really use your help to draw others into the conversation. Do you think you could help me do that?"

"I want to ensure we hear from everyone, so I'm going to set the timer . . ."

How to Deal With Chronic Complainers

"That does sound frustrating. Do you want to make it better?"

"It sounds like you're concerned about . . ."

"How do you think we can address this?"

How to Deal With Bullies

"I could really use your help . . ."

"Is this the way we're going to work together?"

"That's not okay."

"Nope, I can't let you talk to me that way."

"I would like to discuss this issue with you in a private setting."

"I will not engage in this behavior."

"I would like to involve HR in this discussion."

How to Deal With . . . Workplace Gossips

"I've got to say that rumor is a lot more interesting than how I actually spend my evenings."

"Does this conversation feel fair to you?"

"What if we called (insert person whom the rumor is about) and asked for their perspective on this?"

"There's a lot we don't know about this. I trust we'll learn more soon."

You've Got This

Workplace conflict is an inevitable challenge, particularly in today's rapidly changing environment. This book offers valuable insights into why conflict has intensified and provides practical tools to navigate these complexities. By focusing on the four dimensions of constructive conflict—Connection, Clarity, Curiosity, and Commitment—you can transform challenging interactions into opportunities for growth and collaboration. The Powerful Phrases and strategies outlined in this book are designed to help you address conflicts effectively, build stronger relationships, and create a more harmonious workplace. Remember, mastering conflict is a journey that requires persistence, but with each step, you move closer to a more productive and positive work environment.

THE SUMMARY IN BRIEF

Great team results depend on tapping the incredible power of emotion. Negative feelings such as fear, anger and frustration can inhibit a group's performance. The most optimal emotions stimulate team innovation and productivity because they enhance such competencies as quickness, flexibility, resilience and the ability to deal with complexity. Your team's bottom-line performance depends on creating a work environment that respects and taps into the primal force that Mother Nature has hardwired into our brains: emotion.

You can't reason away or "fix" emotional states with rational thinking. You must deal with them directly. ***Primal Teams*** applies the latest principles of team psychology to the workplace, explaining how creating peak emotions naturally ignites team performances that transcend the talent and skills of your individual performers.

Drawing on the cutting-edge work of leading neuroscientists, ***Primal Teams*** provides practical tips and techniques to help you get measurably better results by generating optimal emotions in your team.

IN THIS SUMMARY, YOU WILL LEARN:

- Tap into the energy and clarity that optimal emotions naturally generate.
- Facilitate deep emotional bonds and incredible team spirit within your group.
- Manage your team's emotional dynamic in such a way that leads to expanded creative thinking, deeper inspiration, accuracy of intuition and higher motivation.
- Prevent fear and negativity from thwarting your team's performance.

Hidden Energy: Unleashing Maximum Potential

The success of an organization depends on those key moments when teams develop creative ways to provide greater value and perform more efficiently in increasingly demanding situations. Too often, a team under pressure falls prey to negative emotions like fear and anxiety. However, when they replace fear and anxiety with optimal emotions such as joy and playfulness, they find it a lot easier to dream up solutions that delight customers, rapidly deliver value and evolve along with the business.

Design for Creativity

You must instill creativity at every level. Whether your team must solve an internal design problem or invent the next disruptive breakthrough in your industry, they won't exceed your expectations unless you make it clear that creativity is Job One and develop an environment that fosters imaginative thinking. Don't leave creativity to chance; shape it by design. It takes time and effort, but you can encourage and develop a team's knack for creative thinking and problem solving.

In 2008, Carsten De Dreu, Matthijs Baas and Bernard Nijstad published an article in the ***Journal of Personality and Social Psychology*** about the impact of emotions on creativity, including an account of the authors' own comprehensive original research in which they measured the impact of mood on subjects' creative fluency and originality while performing brainstorming tasks. The scientists discovered that emotions play a major role in our ability to see new possibilities, or they can close down our minds in a way that keeps the same old thoughts swirling around in our brains. According to the article, optimal team emotions that spark creativity begin with positivity. Positive emotions come in different sizes, ranging from a low level of arousal to extreme passion. Low levels of arousal, such as contentment, promote inactivity, whereas extremely high levels of arousal, such as excitement, reduce our capacity to perceive and evaluate information. At moderate levels of arousal, people feel optimally motived to seek and consider multiple alternatives. Primal team leaders can take specific steps to help people experience the appropriate levels of arousal and the optimal level of positive emotions.

Pull the Strings of Heartfelt Emotion

Heartfelt emotion boosts our creative ability to an even higher level. Our heart has a unique ability to put us in our most creative state. Heartfelt emotions consume our attention and activate a strong sensation in our heart. Strong heartfelt emotions can halt our rational mental processes and connect us to people in a much more profound way than relatively mild feelings, such as relief or satisfaction or thankfulness.

Synchronize the Parts of the Brain

Your brain's complex system works best when all of its parts are synchronized in harmony. The Institute of HeartMath LLC, a research organization in Boulder Creek, California, has been exploring the connection between the heart and the brain for over 19 years. HeartMath uses the term "coherence" to describe the state in which all of the centers of the brain develop a logical, orderly relationship.

Let the Good Feelings Roll

The notion of inviting emotion into the workplace repulses many leaders because they find emotions so messy, sticky and frustrating. Unfortunately, the very way businesspeople think tends to diminish positive emotion in the workplace. When something happens at work that evokes happiness or joy, we often downplay those feelings. Psychologists use the term "ordination" to refer to this tendency to make exceptional events seem ordinary. Primal team leaders understand this human tendency and look for opportunities to encourage a team to revel in the joy of accomplishment. When your team does something wonderful,

- **Rejoice**. Stay emotional rather than minimizing the event with logical explanations.
- **Celebrate**. Commemorate the event.
- **Exclaim**. Show your emotion, telling people how it makes you feel.

Primal Emotion: Shifting Emotions at the Source

Our emotions spring from the primal parts of our brain. Basic and instinctive, they date back to the time when Mother Nature hardwired them into our brain as we learned what worked and what didn't in our ancient environment. Our primal emotional system plays a key role in one of the most crucial aspects of human behavior in business: motivation.

Bestow all those raises, protect your people's home lives, give them a chance to acquire exciting new skills, and you still end up with people suffering burnout or boredom who just can't handle one more straw on the camel's back. That's when a smart leader applies emotional solutions. Such solutions do not require more resources.

Seek Before You Find

You get a thrill out of pursuing or seeking a goal, but once you achieve it, it doesn't seem so attractive. You should bear in mind the extreme pleasure people derive from activating their seeking emotional system. When a stimulus arouses our seeking system, it activates our frontal neocortex, prompting us to work out innovative strategies and solutions. Logic doesn't make us do that; emotions do. A team that embarks on an exciting new journey not only feels strongly motivated to succeed but also works smarter.

Organize Work in Creative Cycles

The opportunity to pursue or experience something new jazzes people. Primal team leaders have learned to maintain a high level of enthusiasm by organizing work in creative cycles. No one suffers from tedium and boredom because the work occurs in patterns that keep it fresh. The clear beginnings and ending provide the excitement of starting something new and the fulfillment of completing the work. Any work involves certain patterns. A leader can use this fact to keep team energy running at a high level.

Playing For the Fun of It

The most effective type of play involves physical, repetitive actions with variations that challenge us enough to hold our interest but that do not overly tax our minds and bodies. Ideal play should enhance rather than sap our energy. Contrary to the old cliché, winning is not everything. The mere act of playing the game for the sheer fun of it, without excessive pressure to win, is everything.

A word of caution: Some team leaders try to turn the work itself into play. "I'll give a day off to the programmer who finds the most bugs in the software this week." That doesn't work because that sort of game involves significant consequences for the winner and losers. It can do the opposite of rejuvenating a team's emotions.

Rather than waiting until a team reaches burnout to pep them back up, primal leaders incorporate play (and laughter) into their daily leadership practices. There's a big difference between the sort of optimal play we're discussing and overly structured activities. Optimal play erupts spontaneously.

Sounding Off

Music can inspire accomplishment when fear or burnout threatens performance, but it can also "soothe the savage beast" during times of great stress. Listening to music affects a team's emotions, but playing music stimulates them even more. In a study led by Barry Bittman and reported in ***Alternative Therapies in Health Medicine***, researchers found that when people participate in a group drumming exercise, their bodies show significant signs of improved health. Merely listening to the drumbeats does not affect them as much.

Tapping on bongo drums and rattling tambourines bring people together physically, emotionally and mentally. If you think drumming in the office sounds nutty, think again. Employees at government, health care and community organizations and several big companies, including Toyota, Unilever, Raytheon and Oracle, regularly participate in drumming activities at work. Toyota has gone so far as to install dedicated "drum rooms" at the company's California locations. Music rejuvenates our basic emotional system, reinvigorates our urge to play and inspires our natural inclination to seek.

Laughing Out Loud

Laughter is not only the best medicine, it's the best measure of fun in the workplace. According to the Mayo Clinic, when you laugh, it doesn't just lighten your mental load; it introduces measurable physical changes in your body. You breathe in more oxygen-rich air, your heart beats a little faster, your muscles tingle and mood-enhancing chemicals called endorphins flood your brain.

The Scary Stuff: Processing Fear and Negativity

Business environments swarm with fear. When everyone competes for limited resources, both with other companies and with the person sitting in the next cubicle, every project turns into a win-lose contest. Our emotional system reacts to perceived threats to our survival by producing responses that maximize our chances to survive the threat. Knowing how to process fear and negativity can turn a damaging problem into an opportunity for positive team development.

Accommodating Negativity

Start capturing the benefits of negativity. The expression of negative emotions can spark a team from lifelessness to alertness. Without emotional arousal, we can fail both to notice important danger signals and to muster enthusiasm to address a threat.

Make room for negativity. Teams cannot capture the benefits of negative emotions unless they feel they can safely express them without getting criticized or punished. A leader must deliberately create this safe space.

Shining a Light on Fear

Our emotional system, the region of our brain called the amygdala in particular, continuously scans our surroundings of potential threats and then warns our conscious mind when it detects one. Not only does the amygdala warn us of possible danger, it also heavily influences our thinking. This can cause us to interpret every ambiguous event as a possible danger. We hear about another company outsourcing jobs and jump to the conclusion that the same thing is going to happen to us.

Acknowledging a threat surfaces it into our conscious mind where we can process it, which is why you can use this Acknowledge the Threat technique with your team. If our conscious mind acknowledges the threat and takes precautionary action or decides to let it slide, our amygdala can take a break and stop sounding the alarm. Although acknowledging a threat does not make it go away, it does allow room for a conscious intention to stop worrying about it now and resolve it later.

Creating a Diversion from Negative Thoughts

We naturally find it hard to replace a negative thought with a positive one because we're predisposed to latch onto the negative. It boils down to our hardwiring. Team leaders who wish to create positive emotions with the power to boot out the negative will find the Accentuate the Positive technique useful.

Arouse Positivity. The more vividly you can describe the positive impact of your work on people's lives, the more you will populate your teammates' working memory with positive thoughts. Identify the most compelling way in which your team makes lives better, and define it in a way that elicits strong positive emotion.

Keep It Visible. Once you've defined the best way to create positive emotions in the team, use symbols to keep them visible in their minds. Make the symbols vivid and tangible, so that people can picture them in their mind's eye.

Desensitizing Your Team to Fear

Reprogram the fear. This technique includes a tried-and-true four step Fear Prescription:

1. Face the full extent of the fear.
2. Avoid exaggeration or catastrophizing.
3. Conjure up the somatic effects (the way it makes the body feel).
4. Shift to the positive.

In our work lives, we fear the pain caused by complex negative emotions such as shame, guilt or embarrassment. We can also fear the pain of loss. We fear those emotions because we don't believe we can handle the pain they cause. However, when we face these fears head on, letting ourselves feel the full brunt of the emotions they ignite, we realize we can handle the pain. That knowledge robs the emotions of their power to scare and immobilize us.

It is recommended that you use the Get Real technique when fear runs rampant on a team. Keep a sharp eye out for exaggerations and outlandish consequences voiced by team members. Challenge their unwarranted fears, put them into perspective and lessen their negativity with a dose of logic.

Emotional Contagion: Spreading Coherence in a Team

You always need to deal with a wide range of emotions, both energizing and toxic, in your team. While you can't eradicate the negative ones from people's minds, you can learn how to keep them from overtaking your team and thwarting its potential.

Spawning Good Cheer

Lifting the mood of your teammates depends less on what you say than on how you feel when you say it. You must assume responsibility for instilling optimal emotions in your team. Make sure that you're truly feeling those optimal emotions before you stroll into the office or convene a team meeting. You set the emotional tone, and false displays adversely affect people just as much as negative ones.

As your teammates watch and listen to you, they automatically mimic other physiological expressions of emotions, such as rapid eye movements, gestures and perspiration on your upper lip. Unfortunately, people catch negative emotions much more easily than they do positive ones. You can ensure that optimal, rather than detrimental, emotions are spread throughout your team by intentionally making your emotions both optimal and highly contagious.

No emotional state is more contagious than coherence. Coherence occurs when you are experiencing intense heartfelt emotions. When you attain a state of coherence, you transmit emotions powerful enough to overtake any others that have cast their spell on your team. When your emotions authentically come from your heart, you will impress people with

the fact that you feel energized and centered and fully aware. Everyone will respond by taking you and your words to heart.

Making Coherence a Competency

Leaders need to value the emotional coherence of their people as highly as they do their technical or emotional skills. Bottom line: It may be easier to train for technical competence than for emotional competence.

First, add coherence to our job descriptions. You can say something like, "Candidate must demonstrate the ability to act as a positive force in a team, promoting high energy and a can-do attitude in challenging situations." Design interview questions that strike to the heart of the matter, such as, "Have you or a teammate ever hurt a team's performance with a poor attitude or low energy?"

Formulize coherence as a skill. Clarify the specific set of skills, knowledge and characteristics it entails, using clear, concise and concrete definitions and descriptions. When you do that, you can much more easily include and measure the skill in routine management and performance appraisals.

The Sixth Sense: Detecting Emotions

Emotion, unlike cognition, affects the body's entire nervous system, not just the brain. According to Vittorio Gallese, a professor of human physiology at the University of Parma, Italy, when we observe someone, our neural circuits automatically activate to match those of the person we're observing. Gallese attributes this neural synchronization to the mirror neurons he helped discover.

Hone Your Sixth Sense

According to one study, the people who most accurately detect others' emotions tend to experience and show their own emotions quite freely. If Rich plays the stoic, unmoved by joy or sadness or fear, he might lack the context to sense Monte's emotions. He may not feel them in his own body or recognize them when they arise.

To hone your ability to detect others' emotions, remain willing to experience whatever feelings arise, and then pay close attention to how they affect your body. If Rich stops resisting his emotions and becomes more familiar with the sensations of anger and anxiety, he will learn to tell the difference. That will help him detect the feelings of everyone on his team.

Letting yourself feel the emotions of others doesn't mean letting these emotions overwhelm you. That can cause another set of problems as you get swept off your feet by a flood of someone else's feelings. Fortunately, you can learn to sense another's emotions and observe how they affect your body without letting them emotionally hijack you.

Gradually, you will become a more skilled emotional diagnostician. Periodically, pretend you are an objective doctor by placing a stethoscope to your chest and taking your emotional temperature. Try to diagnose any symptoms of unusual sensations. What is causing those bodily reactions? Why has your heart begun beating a little faster? Do this in the company of your teammates. Scan their faces and bodies. Listen to their tone of voice. Has Rich caught your enthusiasm? Have you caught his dismay?

Since a person's expressions during conversation seldom last longer than 0.5 to 2.5 seconds, you must pay strict attention to their face, posture and tone of voice to be attentive. Also, bear in mind that people try to dampen their emotional displays in the office. Make sure you listen to your own body as well. Can you feel the physiological symptoms that tell you that you've caught someone else's emotions?

Enhance Your Team's Emotional Signature

When we interact with people, we automatically and unconsciously sense their emotions. People and teams develop unique emotional signatures. Think of a team's emotional signature as its basic "personality," which includes the unique way it feels.

When prospective clients and customers sense your team's emotional signature, perhaps unconsciously, they will include their perceptions in their decision-making process, whether they know it or not. Your team's emotional signature does not just matter to customers; it makes all the difference in the world to people considering whether to join and stay with your team.

Make becoming an expert emotional detector a lifelong project. You will never become clairvoyant, but you will learn to see and feel emotions that slip past less dedicated emotion detectors.

The Engaged Heart: Connecting to a Deeper Purpose

Some missions satisfy your intellect with their logic, but the most powerful ones touch your heart and ignite high energy and enthusiasm. An inspiring purpose drives us to do and accomplish more than we ever thought possible. An inspired team develops an expanded sense of their jobs and

their vital role in their company's success, and that makes them feel as though they can do anything. With optimism and high energy pulsing through their bodies, they can conquer the world, but only if you pull them above the realm of mundane thinking.

It takes more than encouraging words to get a team thinking beyond the ordinary. To get people to take a satellite's-eye view, you must help them redefine the purpose of their work with more expansive thinking. These purpose-driven questions encourage the team to think of providing value beyond the ordinary.

- What motivated the company's founders to create this company?
- What excites our customers?
- What difference has our company made in the world?
- What major contribution can our team make to the contributions and accomplishments?

Remember that the team's purpose needs to tie into the organization's overall purpose.

Make the Mission Top-of-Mind

For a great purpose to perform its magic, it must be in the forefront of people's consciousness. A weak, vague or emotionally neutral mission will not do the trick because it will not embed itself deeply enough in their conscious minds. Most importantly, you can keep your team's purpose top-of-mind by fully integrating it into your daily conversation.

Strike a Chord with Life Schemes

A life scheme is a cognitive representation of one's life, like a story. It organizes an individual's perspective on the world, represents that person's personal ideals and defines the events he or she deems most relevant to those ideals. It embodies a person's basic identity.

Individuals feel most inspired by a corporate or team purpose that fits snugly into their life scheme or that motivates them to shift their life scheme to encompass the purpose. Make sure you see a good fit between any prospective teammate's life scheme and your team and company purposes. Strong matches also instill loyalty.

Resonate with Core Identity

A great team purpose shouldn't just tap into your teammates' life stories; it should burrow deeply into the very core of their identity. When you define a team purpose with your team, dig deep below the surface. Get to core emotions. You want your purpose to stir the people's hearts and reverberate with their identity. Performance and financial goals won't do it. Values and meaningful contributions will.

Organize by Purpose

A team's purpose should profoundly drive the way team members do their work and provide daily inspiration for all team members to do their best. Use the questions in the following table to determine whether the functions performed on your team play an integral role in accomplishing your mission.

Here are three pairs of purpose alignment questions:

1. **A.** Does the purpose provide meaningful direction toward doing the best possible job?
   B. Do people really agree that the purpose helps me decide the best way to do my job?
2. **A.** Does the purpose inspire people to do an extraordinary job?
   B. Do people readily agree that I feel tremendously energized to get results that fulfill our purpose?
3. **A.** Does the purpose provide people with a meaningful reason for doing the job well?
   B. Do people readily agree that when I do my job well, it makes a substantial difference in how well we achieve our purpose?

If you answer yes with respect to a given function, keep it on the team. If your answer is no, look at a way to procure the function as a service from a team whose purpose better matches their work.

We have talked about the importance of mining beneath the surface of what we do to unearth why we do it. "Why does what we do matter to me, my team, my company and the world?" Continually asking this question can lead you to answers that ignite and sustain team energy. As you hammer out and refine a meaningful purpose, continually ask why what you're doing matters until you identify how your work fulfills a basic human need.

Primal IQ: Activating Insight and Intuition

The best breakthrough ideas don't spring from logical thinking, and the most spectacular innovators do not learn their tricks at prestigious business schools. All those intuitive gut feelings that defy logical explanation account for more

great ideas than all the comfortable couches, post-it notes and whiteboards in the world.

Get to Aha! By Letting Go

When we take on a challenging problem, we may spend a lot of time and effort clarifying the issue and trying out different solutions. This activity internalizes the problem into our subconscious mind, where it incubates without further conscious input. As it incubates, all that data may coalesce into a solution, which may dramatically burst our consciousness as an Aha! or Eureka! flash of inspiration. Then our conscious mind can take over again as we proceed to verify and work out the details needed to implement the idea and share it with other people. We let the conscious mind take a nap while the subconscious mind unveils amazing solutions to big problems.

Why does taking a break prompt creative solutions? Even the experts don't agree, although a few suggestions make sense. A time-out

- Helps your subconscious mind sift through all the possibilities.
- Allows your impatience and frustration to subside.
- Invites stimuli from new activities and situations into your consciousness.
- Makes it easier to shift to a different problem-solving strategy.

Breaks work best after a thinker has gathered comprehensive information pertaining to a problem and has thought fairly deeply about it.

Team Spirit: Building Emotional Bonds

What drives team spirit, and how can we intentionally create it?

Generate Mutual Care

A team grows strongest when each person feels a reciprocated emotional bond with each and every teammate. When your team members see each other as people worthy of compassion and concern, not just as co-workers sharing a workplace, they begin to bond. A team leader can do a lot to help the team take their relationships beyond the surface level of their work and connect at a more satisfying, primal level.

Extend the Trust

Paul Zak, a neuroeconomist, says that when our interactions with other people engage our emotions and make us feel compassionate or empathetic, the chemical oxytocin surges in our brain. Oxytocin (not to be confused with the prescription painkiller oxycontin) is a small molecule, or peptide, that serves as both a neurotransmitter, sending signals within the brain, and as a hormone, carrying messages in the bloodstream. When oxytocin surges, people become more cooperative, more generous and more caring.

A bond of trust lays the groundwork for other positive human emotions, including caring, cooperation, respect, admiration and even love. It also engenders creativity. Because creativity depends on taking risks, we tend to do it much more ardently when we totally trust our teammates for support and backup.

But how do you instill trust in a group? You begin by placing your faith in them. Whenever a leader shows a team that he or she trusts them, the team has seen fairly immediate results. People no longer show up late for work or meetings, and they don't need prodding to put in extra hours or to complete a project on time. According to Paul Zak, trust triggers oxytocin, and oxytocin prompts prosocial behavior. It turns out, however, that the care and trust it promotes do not apply to the world at large but only to a person's close associates. Some studies have even shown that oxytocin actually decreases collaboration outside the immediate team.

Avoiding Common Bonding Pitfalls

Bonding may lift up a team, but too much bonding can also bring it down. How do you reach a happy medium between too little and too much?

Candidly discuss major decisions. Researchers found convincing evidence that poor decisions can result from a team placing an overriding emphasis on consensus and mutual support. Teams can mitigate the negative effects by carefully considering various alternatives to achieving a goal or solving a problem.

Challenge each other. Debate and criticism stimulate rather than inhibit ideas. Dissent stimulates new ideas because it encourages us to engage more fully with others. Also, as you work to increase the bonding in your team, make sure that maintaining the bond doesn't overrule other important objectives. If you want to promote creativity in a team, you need to assemble and engage diverse people who offer fresh neural patterns to one another.

Use the Team Bonder to Provoke Deep Connections

You can get your team connected at a deeper level by set-

ting the stage for strong, healthy team bonding.

1. **Get Personal.** For helping people open up, understand and feel compassion for each other.
2. **Establish Team Norms.** For setting the team's basic operating policies and procedures.

The Balanced Culture: Restraining Runaway Egos

Nothing can diminish a team's bond and energy level as quickly as ego-based separation, where a gulf grows between an egotistical co-worker and everyone else on the team.

To promote better balance between ego-driven and group-oriented behavior, try forging a team agreement that guides people's interactions with one another. These steps will help you formalize "the way we do things around here."

1. **Agree on Norms for Team Interactions.** Gather the entire team and ask, "What behaviors do we require? What behaviors do we inhibit?" Make sure everyone contributes to the discussion. Here are examples of behaviors the team might discuss:
   - Conflict resolution, such as when it should be escalated to management.
   - Communication guidelines for speaking and listening. Prohibitive behaviors and language.
   - The best way to express disagreement with a teammate.
   - Acting with openness, honesty, transparency, ethics and integrity.
   - Methods for offering feedback and criticism.
2. **Memorialize the Norms in a Team Agreement.** Document the agreements, and post them where all team members can see them every day.
3. **Keep the Team Agreement Top-of-Mind.** Review the team agreement when new members join. Invite fresh perspectives, and make sure veteran teammates share stories that illustrate the team agreement in action.

A team agreement will help all team members maintain their individuality while cooperating with others.

Epilogue: When the Going Gets Tough

Today's complex and often frenetic business world can turn even the most died-in-the wool optimist into a staunch believer in Murphy's Law. Everything that can go wrong does go wrong, and at the worst possible moment. But that's when you stop in your tracks. That's when you listen to your heart. That's when you pick up your bruised confidence, dust it off and set it back on its feet. That's when you harness the incredible power of primal emotions.

When the going gets tough, the tough get primal.

Controlling Uncertainty in Product Development

PROACTIVE RISK MANAGEMENT

THE SUMMARY IN BRIEF

Though most companies use some variation of stage-gate product development, they still expend little effort on risk management. Project managers identify risks before the initial gate, but ignore them instead of managing them effectively. The project experiences needless surprises in schedule, cost, budget or market acceptance late in the game, when the same problems have happened many times before.

This summary will enable product development teams to enhance their management of project risks by identifying risks early and managing them to diminish disruption throughout the project. Using a practical, easy-to-use, fact-based approach, it will help developers manage all the risks associated with a project. Although this process is tailored to commercial product development, it is applicable to many other types of projects with some adaptation.

What You'll Learn In This Summary

✓ **How to integrate risk management into project management.** This summary provides a five-step plan for managing project risk effectively.

✓ **How to model a specific risk.** This summary illustrates and defines the Standard Risk Model.

✓ **Guidance on identifying drivers of risks.** You'll learn to manage root causes instead of symptoms.

✓ **Appropriate quantification of the key factors of a risk.** This summary illustrates specific quantification methods that allow you to prioritize risks effectively.

✓ **How to implement project risk management at your company.** You will learn which tools and strategies will enhance implementation and which organizational and cultural impediments can undermine implementation.

PROACTIVE RISK MANAGEMENT

by Preston G. Smith and Guy M. Merritt

— THE *COMPLETE* SUMMARY

Risk and Risk Management

Risk is a loaded term, so think of risks as surprises. This book is about managing surprises in a project environment. A surprise could be an engineering design that fails in field trials, an unexpected competitor or an accounting error. In this summary, risk is defined as the possibility that an undesired outcome — or the absence of a desired outcome — disrupts your project. Risk management is the activity of identifying and controlling undesired project outcomes proactively.

Risk management is an integral part of project management, and product development inevitably requires project management. Risk management should occur as naturally as managing a schedule, but generally it gets lost in the crunch to get the new products out the door. The goal of this book is to build innate project risk management methodology into an organization.

Every Project Decision Involves Risk

Risk is inherent in product innovation, and therefore every decision about a project involves risk because there is always information we will not have until further downstream. Businesses assume certain risks because of today's increased focus on time-to-market. But importance of time-to-market also makes the schedule delays caused by unmanaged risks less tolerable.

Risk management always deals with uncertainties, whether or not the risk will happen. You will only know for certain that the risk occurs when it happens — when it ceases to be a risk. Uncertainty cannot be eliminated, but it can be narrowed by:

- Clarifying the probability of occurrence of risk.
- Understanding the consequences or alternatives of the risk event happening.
- Determining what drives the risk — which factors influence its magnitude and likelihood of occurrence.

No matter how well you execute risk management, some risks will still occur. Uncertainty can only be reduced, not eliminated.

Do not confuse risk with issues, which are events that are certain to occur. Issues are just as important as risks, but you are aware of them before they arise and they are handled differently than risks.

What Is a Risk?

Risks always involve the possibility of loss. We manage risk because we do not want to suffer loss, even if it is a remote possibility. If there is no possibility of loss, there is no reason to manage the risk. Also consider the possibility that the outcome of certain risks might be a gain instead of a loss.

Be aware of the time component of risks. Eventually there comes a time when a risk no longer exists because you have suffered the loss, or the risk has been resolved to cause little damage. You must recognize when the risk is gone, so you can remove it from your agenda. Some risks have no time component and are ongoing. If that is so, they are more risks of being in business than risks of this particular project.

Risk and Risk Management

(continued from page 2)

Companies fail at risk management because they fail at one of the two fundamentals of managing risk well: **cross-functionality** and **proactiveness**.

Companies make the mistake of believing that innovation is only in R&D, and that is where most of the risk lies. However, most development project risks fall outside of R&D. Leaving all risk management in R&D will leave you wide open for most of your cross-functional risks.

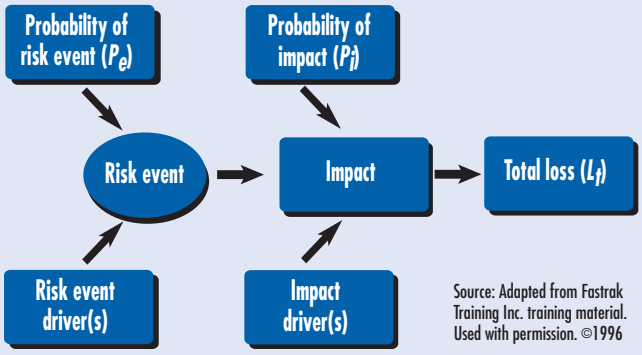
Companies that are not proactive about risk management make two mistakes. They wait until late in the project when risks start occurring, and they let risk management lapse. **Risk management should begin early in the project and proceed as a monitoring and follow-up effort throughout.**

The opposite of risk management is firefighting. Good firefighters are reactive instead of proactive managers. They are regarded as heroes because they pull the problems out of the fire and are usually rewarded for it. Good risk management is rather dull, but reward should come from fire prevention. ■

For a glossary of terms to use when discussing risk, go to: http://my.summary.com

Risk Models and the Standard Risk Model

Modeling risk allows you to quantify its magnitude so it can be compared to other risks to determine which ones need to be managed. It also points you toward root causes so you can effectively resolve the risk. Since people often disagree about what constitutes risk, models allow us to communicate risks to others and come to a common understanding. However, their weakness is that they show only a partial picture of reality.



When judging a risk model, be sure that it has a clear purpose, it is user-friendly to the intended audience, its framework is universal to maximize reuse potential, it allows independent users to develop similar results with the same input, and that output can be readily verified.

Components of the Standard Risk Model

The Standard Risk Model is the most helpful of the typical risk models for comprehending project risk and associated cost. The components of this model are:

- **Risk event:** the event that triggers a loss.
- **Risk event driver:** something within the project environment leading one to believe a particular risk event could occur.
- **Probability of risk event:** likelihood a risk event will occur.

The Standard Risk Model is the preferred technique to model project risks.

Source: Adapted from Fastrak Training Inc. training material. Used with permission. ©1996

- **Impact (of a risk):** consequence or potential loss that might result from risk event.
- **Impact driver:** something within project environment leading one to believe a particular impact could occur.
- **Probability of impact:** likelihood impact will occur, given that risk event occurs.
- **Total loss:** magnitude of actual loss value accrued when a risk event occurs.

The Standard Risk Model shows how changing the drivers of a risk event can lower the probability, and changing the impact drivers can mitigate the total loss. It also shows a cause-and-effect relationship: Effectively managing or removing the risk event can change or prevent the impact and thus the total loss.

Make sure you use very specific information when developing the drivers that are critical to risk resolution planning. Broad generalizations in drivers makes risk management difficult. ■

OVERVIEW OF RISK MANAGEMENT PROCESS

Managing risk is a five-step process. Even if you streamline or modify the process for your own needs, you will still need to go through these five steps. ■

Step 1: Identifying Risks and Impacts

The first step is to identify risks. Instead of a separate step, planning risk management should be a natural part of project planning.

The identification process involves a brainstorming session run by a skilled, independent facilitator. Gather in a large room with plenty of wall space, paper, mark-

(continued on page 4)

Step 1: Identifying Risks and Impacts

(continued from page 3)

ers and sticky notes. You should also have the business case for the project, product requirements or specifications, and any project-specific plans such as budgets, markets served and supply-chain partners.

Prepare a spreadsheet to log and track risks as you move through the five steps. It should include the following information, which will be filled in and tracked throughout the process: **risk identifier, risk owner, risk event, risk event driver(s), probability of risk event, impact, impact driver(s), probability of impact, total loss, risk likelihood, expected loss and priority.**

Include a diversity of opinions among team members, not just the engineers who will be designing your product. Representatives from sales, marketing, sourcing, production, quality and finance should also be involved in the brainstorming session. In addition to understanding your product development process, these people must understand the definition of risk and the components of the Standard Risk Model, so that they know to identify risks rather than issues. Each person must also understand the scope, features and novelties of both the project and the product before brainstorming begins.

Walk Through the Schedule

Get your group thinking creatively with some warm-up exercises that do not refer specifically to the project at hand. Then start identifying risks using whichever system works best for your organization over time. One effective way is to **use the project schedule as a catalyst**. Prepare a wall-sized version of the schedule that includes all departments, suppliers and partners involved and their respective steps in the process. Walk through the schedule constantly asking, "What could go wrong at this point in the project that would prevent us from achieving project success?" If everyone writes their risks on sticky notes and sticks them to the schedule you will not only see where the problems are, but where many risks pile up at one spot. Take all the sticky notes with risks and enter them in the database.

There are other ways to assess risks. The **development process-based method** is similar to the schedule-based system, but it uses a graphic depiction of the company's product development process on the wall, instead of the schedule. Because this is not specific to the project, it is important to be very explicit about the risks and their drivers through the process. For the **success-thwarting based method** have the team list five to seven characteristics that would describe success for the project, and then ask them what could go wrong to prevent these success outcomes. Be sure to assess the project from all angles. The **prompt-list based method** requires looking at past projects and determining the areas where you made repeated mistakes. Then develop a prompt-list of possible risks to consider at the beginning of every project.

The facilitator should fully understand the risk management process, and must be able to navigate between people who detect no problems, and those who see them at every turn. It is also important to thwart the firefighters. The facilitator needs to correct these unproductive trends. ■

For a list of questions that will help you identify risks, go to: http://my.summary.com

Step 2: Analyzing Risks

Most people end up with a long list of potential risks and then forget them, moving on to the "real work" of getting the project done. Then they are inevitably faced with risks they have already identified. The next step is to decide which risks are significant enough to manage actively. Ask the team to consider the following issues for each risk:

- Why do you believe the risk event and its impact will occur?
- What is the total loss if the risk event occurs?
- Why do you believe the total loss will be that amount?
- What are the subjective probabilities for the risk event and its impact?

It is important to understand the facts underlying a risk or you will be burdened with baseless risks and waste your time.

Establish the facts behind the risk drivers. A **risk driver** is something existing in the project environment that leads you to believe a particular risk event or impact could occur. The facts are the key to managing project risk successfully. A risk is that a prototype will be delivered late; the **fact** is that the prototype shop is overloaded due to an upcoming trade show. Do not try to manage a risk without understanding the facts that cause it.

Document Each Risk

Start your risk analysis workshop with the same facilitator and have each risk documented on the spreadsheet including **risk identifier, risk owner, risk event** and **impact**. The workshop will allow the team to understand which risks are real and what their consequences could be. The facilitator will ask questions to uncover all possible sources of risk events and impact drivers.

Develop risk event drivers by finding out why the originator of the risk event thought it was important.

(continued on page 5)

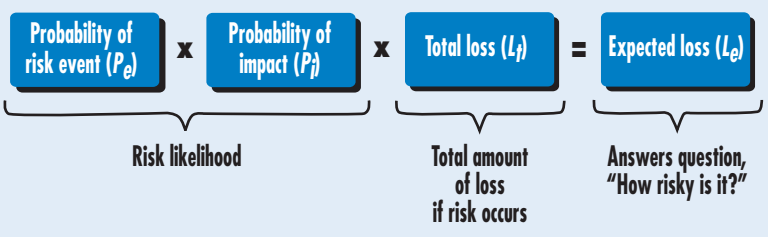
Step 2: Analyzing Risks

(continued from page 4)

Rely only on facts. If people can only provide opinions based on assumptions, consider the same risk event with different drivers. Enter true, factual risk event drivers into the spreadsheet. Next, **develop impact drivers**. They should answer which project facts make the impact more or less likely to occur and which project facts establish the magnitude of the total loss. The impact is the possible consequence if the risk event occurred.

Next, **quantify the total loss** — what would be the total amount lost if a risk event occurs. The total loss is measured in time or money. For instance an impact might be that "the delivery date will slip by 15 workdays." The total loss is 15 workdays. Be consistent with the loss unit through the entire process. If people find themselves disagreeing about the value of the total loss is it likely that you have not developed good impact drivers.

Since total loss will be used to prioritize risk, if you absolutely cannot determine a total loss for a risk on the critical path of your project, you must red flag that risk for special management. But this should be a rare occurrence. It is possible to use qualitative or quantitative measures to determine total loss, but most people can relate to time, so workdays are an effective measure. Qualitative measures will be hard to track and calibrate over the whole process.



Calculate The Risk

With the total-loss figures, it is time to estimate the risk more precisely than noting that a project seems "risky." Begin by calculating the **risk likelihood** by multiplying the probability of the risk event and the probability of its impact.

It is not necessary to be precise with probabilities. Make educated guesses. Assign a probability, usually subjective, to the risk event and to the impact of each risk. Remember that the probabilities refer to the risk event drivers and impacts, not the risk events. If a risk event driver has a 100 percent probability of happening, it is not a risk; it is an issue that needs immediate attention. Allow 100 percent probability for impacts, because it is completely possible for an impact to be a certainty.

Once you have your risk likelihood, calculate your expected loss for each risk by multiplying the risk likelihood by the total loss. This is the average loss you can expect from the risk (see below). ■

Factors entering into calculating expected loss, which is the prime criterion for prioritizing risks.

For sample questions to discover risk event and impact drivers, go to: http://my.summary.com

Step 3: Prioritizing and Mapping Risks

By prioritizing risks, you will impose order on the long list of risks, and will plan to address only those that pose the greatest threat to the project's goals.

You have already determined the expected loss for each risk, which is a measure of the overall severity. You can rank the expected loss values on the spreadsheet; keeping in mind that the risk data you developed was subjective. If you used different units for the expected loss, you will have to compensate for that in the spreadsheet. Some catastrophic risks might be considered higher priority. The team will then work together to prioritize which risks should be actively managed.

After sorting risks by expected loss, develop a risk map. A risk map is a graph that plots risks using total loss on the x-axis and risk likelihood (probability of risk event times probability of impact) on the y-axis. Then draw the curve threshold line of constant expected loss that divides the risks you will manage actively from those that will not be managed. If you quantified all risks on a single scale, the line can be plotted from the following formula where Le is chosen level of expected loss and Lt is total loss: **P = Pe x Pi =Le/Lt.** If you use qualitative measures, you will have to calculate different thresholds and draw an average.

Tolerance and Threshold

Place the threshold line on the graph with respect to your tolerance for risk. A higher tolerance for loss should move your line higher up, and you will have fewer risks above it to manage. The curve's location should take into account the trade-off between managing too few risks which could open the door for downstream surprises and managing too many, which will consume project resources.

You will manage the risks above the threshold, except in two cases. You may choose not to manage low-loss risks with relatively small impacts and you may choose to manage catastrophic risks that have likelihoods placing them below the threshold line. Designate which risks are **active** and **inactive** on the spreadsheet.

(continued on page 6)

Step 3: Prioritizing and Mapping Risks

(continued from page 5)

Now sort the spreadsheet by risk status (active or inactive) and then by expected loss. The inactive risks will simply be monitored with the implied acceptance that there will be some unmanaged risk events. However, you are managing actively the risks that could do the most harm to the project.

Using your sorted risk list and your risk map, you and your team should now determine a priority ranking, which will be listed in the spreadsheet. The number you can manage effectively is likely around 10.

The final step in prioritizing is to communicate the prioritized list to alleviate discomfort over the fact that you are leaving recognized risks unmanaged. Ensure that everyone connected with the project understands the team's decisions and why they were made. The best way to do this is with a risk management review including the project managers and design team. ■

For a risk map showing risks under active management, go to: http://my.summary.com

Step 4: Planning Resolution

With a top-10 list of your most critical risks, you are ready to formulate action plans to deal with each active risk, reducing the probability of the risk event and reducing its damage if it does occur. Action plans are designed to change the risk drivers to the point that they no longer drive the likelihood of the risks. Risk management is about dealing with risk drivers, not risks. These action plans become tasks within the overall project and are just as important as other project tasks.

When resolving risks you can develop an action plan, take no action — accepting the risk — or defer action until you have more information. If you defer, you should assign a deadline to make a plan, so it does not become taking no action.

Making an action plan is usually a cyclical process of forming plans and assessing them based on criteria such as effectiveness, implementation time, or political expediency. You will probably develop one plan and a contingency for each risk, but you might not even find a plan whose benefits exceed their cost. Then you have to accept the risk. If you accept a risk, you should establish a reserve of money or schedule slack equal to the residual expected loss.

Assign Task Owners

The facilitator should assign a risk owner for each risk, who will develop the action plan, often with a subteam. This team will likely take one of four steps to manage the risk:

1. Avoid the risk by reversing the decision that caused the risk, without becoming risk averse. Sometimes risks are unnecessary because they provide no benefit, so the decision to take them can be reversed.

2. Transfer the risk to another entity. This often happens when a team realizes it does not have the expertise to reach a deadline, so it transfers the project and the risk to someone with more experience.

3. Provide redundant paths to increase the likelihood of success. These are essentially backup plans in case the first plans don't work.

4. Mitigate the risk by developing prevention and contingency plans to make it less severe.

Mitigation

Mitigation is the mainstay of effective risk management. It directly counters the effects of risk events and impact drivers, and is usually quite obvious if high-quality drivers have been articulated.

Mitigation actions should define trigger points that start preparations and actions.The trigger points are key and can be dates, project milestones or conditions. They signal to everyone that an action is about to commence.

Mitigation actions include **prevention plans**, which decrease the probability of the risk event and the expected loss; **contingency plans**, which act on impact drivers to reduce the probability of the impact; and **reserves**, which guard against risks with unknown magnitude and perhaps even unknown existence. Setting reserve levels is hard, but history should be a good determinant.

Remember as you proceed with action planning that you will be spending resources, financial or human, to prevent or deal with risk. This is the point where you should explicitly analyze the balance between implementing and executing prevention and contingency and the benefits received. ■

For the criteria that mitigation actions should meet, go to: http://my.summary.com

Step 5: Monitoring Project Risks

This last step of the risk management process is ensuring that action plans are progressing properly, that successful plans are retired, and that any significant new or growing risks are taken under management. Here is where many organizations fail and let the whole process fall apart. In this step you will add two more risk status designations to active and inactive: **issue** and **closed**.

(continued on page 7)

Step 5: Monitoring Project Risks

(continued from page 6)

Risk status changes to issue when the risk event happens despite prevention plans. Issue management is implementation of contingency plans to mitigate total loss. Risk status is closed when the risk event has been prevented and the time has passed when it can occur or when it has become an issue and been managed with a contingency plan.

Throughout this project, the spreadsheet you began with will be very helpful to track risks and their changing status. The spreadsheet should include two summary worksheets: one to show the top-10 list of risks, another to show a "risk dashboard" of tactical metrics to track progress through the project. There should be one worksheet for each active risk and its action plan and one worksheet for each inactive risk without an action plan.

You can also use a Web-based tool to make it easier for team members to track. You should be able to look at the inactive risks and determine whether they need to be activated.

All action plans and contingency plans should be monitored by reporting on activity and status, and by keeping an overall map of progress. Do not allow this process to be ignored. Quantify progress by the change in the drivers and how they affect the risk's possibilities.

You should also consider when plans should be closed, because risk management costs resources. There is no point in continuing the plans beyond when they are necessary. If a prevention plan has eliminated the possibility of risk, then you can close the contingency. If you close a prevention plan that has reduced but not eliminated the risk, you must decide whether to keep the contingency plan.

Watch Out for New Risks

Always be on the lookout for new risks, especially if there are changes in the product requirements or specifications. These new risks often extend beyond the apparent change to disrupt completed parts of the project.

When the team discovers a new potential risk, it should be entered in the original spreadsheet, and a small group should use a condensed version of the process to determine whether it should be actively managed. Once you have discovered a new risk or decided that an inactive risk should become active, implement a new action plan by assigning a small team to deal with it, fit the plans into your task structure, and obtain additional resources.

Communication will be key in this step. Emphasize all elements of communication — sender, message, receiver and feedback — to ensure effective risk communications. Do not let all communication be about crisis situations. Communicate about preparing for the future and averted risks. The project manager should use meeting minutes, risk-tracking spreadsheet and the risk map as the primary communication tools.

Risk Management Metrics

Use metrics responsibly. They should not encourage distrust and cynicism. Collect them openly, share the results, discuss the implications, and take action on the findings. Once you start sharing metrics, people will naturally change their behavior to improve their numbers. Think about metrics carefully so they cannot be manipulated for individuals' personal objectives.

There are two types of metrics you should use: **strategic** and **tactical**. Strategy metrics detect long term changes and ensure improvements are not forgotten. They are also useful for measuring schedule and budget performance relative to plan. Use more specific metrics such as risks identified and averted due to risk management and risks that went unidentified but later occurred.

Tactical metrics are used throughout the project to track active and inactive risks and the losses accumulating from them. Only use a few and keep them on a risk management dashboard so they are easy to comprehend. ■

For specific examples of tactical risks to keep on a "risk dashboard," go to: http://my.summary.com

Risk Management Toolkit

As you move through the process of risk management, there are many tools that may help support the process.

Sticky density is useful for pinpointing risky areas in a process, project or organization. It was introduced in the risk identification workshop and can be used to find risks or to determine root causes. Using a large diagram of the process, have people write their issues on a sticky and put them on the model. The areas with the highest sticky density are areas for concern and focus.

Spreadsheets can be used in countless ways to organize, analyze and present your project risk data. In addition to tracking the entire risk management process, having all of the information in a spreadsheet allows you to make charts and graphs easily.

Decision analysis helps clarify situations involving uncertainty. Using a standard decision tree, you can think through a situation and break it down into various decisions and probabilities to determine which choice to make. Decision analysis is useful when:

- It is easier to estimate components than the composite.
- There is uncertainty, confusion or disagreement regarding underlying structure or options.

(continued on page 8)

Risk Management Toolkit

(continued from page 7)

- Consequences of an error in assessment could be catastrophic.
- You need another way to approach a situation when you have reached an impasse.
- You suspect you are not considering everything or have a bias.

Risk simulation allows you to see the overall effects of multiple risks. Instead of developing a total loss value with a single probability, risk simulation tools allow you to use probability curves for individual tasks. Commercially available computer programs pick numbers at random within your probability curves and plug them into all of the probabilities of risk you have created. After multiple simulations you will receive a representative picture of the many possible outcomes.

A **design structure matrix** (DSM) helps unravel the iterative processes that occur in product development where you don't have information until after you need it. It analyzes a sequence of project activities to manage the not-yet-available information. DSM helps you reduce iteration to a minimum. ■

Risk Management Approaches And Strategies

In order to implement the process, your company may need to make certain changes in attitude and behavior.

Learn to **avoid risk** when it is unnecessary. For example, have management encourage and reward designers who use standard parts or reuse successful part designs in new products to reduce design risk. **Plan on redundancy** or parallel design efforts if you can narrow a risk down to two possible solutions, but cannot make a decision. Obviously this is an expensive option to be used rarely, but keep both options open so that you do not make a wrong decision.

Maintain contact with customers to find out what they need before designing a product and during development. Either send design engineers into the field or use your customer service staff to gain this knowledge.

Though human nature is to begin with the easiest when faced with an assortment of tasks, **tackle the highest-risk items first**. These are the ones that will most likely derail your project, so if they cannot be solved, cancel the project before wasting resources on the easy issues. Also, try to **concentrate risk** in a few known areas where they can be watched carefully by your best developers. Spreading risk out over different steps or modules of a plan increases the overall chance that you will not achieve your final goal.

Test at the lowest possible level. Test components and subsystems to answer questions that arise from your risk action plans. Do not wait until the end of the project to find out if something works. And finally, **use failure to your advantage** by using product development as a learning process. Do not be afraid of failures along the way, because you will most likely learn something from them to improve this project or the next one. ■

Successful Implementation

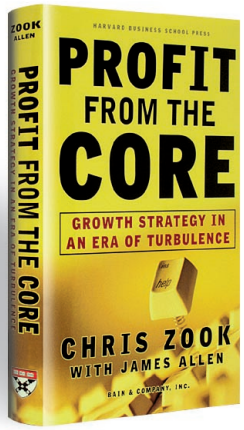
Do not expect to implement this process with one project and have it spread to the rest of the company. Proactive risk management will only take root if team members and management change their behavior.

If you are serious about implementing risk management, you must fit it into your entire project management process. A risk management workshop should occur some time during the project initiation phase, and continued management should be integral to all project phases and be treated just as seriously as project scope, budgeting, scheduling and resource allocation.

You will also need to provide data management tools for tracking the substantial amount of data as you move through the process. The tools should be uniform and consistent to make implementation easy. ■

For an implementation case study, go to: http://my.summary.com

Implementation Guidelines



- Train your people to use terms consistently, since everyone's perception of risk is different.
- Make risk a concern of management by training them to understand and interpret the prioritized risk list, the risk map and the risk dashboard.
- Take potential problems seriously, instead of only focusing on active problems.
- Risk management requires honesty.
- Do not let engineers run project risk management. Good risk management is cross-functional.
- Collect and publicize risk metrics.
- Jump right in while all of these techniques are fresh in your mind.
- Project risk management is not a cure-all, though it can make improvements in your projects' predictability.
- Consider risk as an opportunity for gain as well as a potential for loss.

Redefine the Core in Response to Industry Turbulence
Page 8

THE SUMMARY IN BRIEF

Have you managed to grow your business profitably recently, but find yourself running out of obvious paths to more profitable growth? Do you feel pressured to initiate business activity in the Internet economy, but find yourself worried about choosing the right activity to target, while also minimizing distraction from your core business? Do you feel your core business has untapped profit growth potential, but you're not sure where it is? Or is your industry changing in such a way that it might soon be time to redefine your business model to address new environmental areas and strategies?

If you answered "yes" to any or all of the questions above, you are not alone. An extensive 10-year Bain & Company study of more than 2,000 technology, service and product companies in a variety of industries yielded the following findings:

✓ **Many businesses fail to deliver value to customers and shareholders,** not because they're afraid to try new strategies, but often because they wander too far from their core businesses, where the bulk of their strengths lie.

✓ **Diversification from the core can actually destroy the value your company promises** and severely limit the amount and breadth of profitable growth possible.

In *Profit from the Core,* authors Chris Zook, head of Bain & Company's strategic management practice, and James Allen identify three essential factors that differentiate successful growth strategies from those that do not succeed:

1. You must make sure you are reaching your full potential in your core business or businesses.

2. Once your potential in your core is reached, you must then expand into logical adjacent businesses surrounding your core.

3. You must preemptively redefine your core business in response to the first signs of market turbulence.

Are you fully leveraging the strengths of your core business? This summary will show you how.

Desperately Seeking Growth

The most important issue faced by those in management is how to grow their companies. Even in times of economic strength, the odds against winning the growth game are considerable, and getting worse, for a number of reasons:

● **The value shareholders assign to companies — representing an average of 26 times their earnings — demands that companies grow at a rate three to four times that of the GDP.**

● **Investors are giving company management teams less time than ever to prove themselves.** Many investors shift in and out of stocks at five times the rate they did a few decades ago, demanding not only growth, but growth each and every quarter.

● **Analysis shows that 90 percent or more of management teams fail to grow their companies profitably.** With investor expectations so high, this fact is particularly troublesome.

Additional circumstances have made it difficult for management teams to put players on the field and keep them in the game:

● **Management has been hit with defections of the best and brightest in its talent pool —** a situation that, coupled with the increasing difficulties in attracting and retaining new talent, makes for extreme instability at the highest working levels of a company. The average tenure for someone in the information technology sector is now 13 months.

● **The people who coach those managers —** including CEOs and other executives — are remaining in a given job for only one-third the time they did as recently as a decade ago.

● **The rules of the business game are constantly shifting.** Turbulence in industries has increased by a factor of four, sparking a demand for new ideas for growth.

Many companies simply give up. If their current products or business approach do not result in the extraordinary growth their shareholders expect from them, they cut and run, abandoning their core businesses for the "promised land" of a new approach. While this is a dramatic move, certain to gain them attention, companies often do not find that such movement solves their problems. Indeed, it could even aggravate the underlying causes of inadequate profitable growth.

The Secret of Growth: Your Core Business

The foundation of sustained, profitable growth is a clear definition of a company's core business. A business can be defined from two related perspectives:

(continued on page 3)

Straying from the Core: The Bausch and Lomb Story

Strong core businesses lose momentum when abandoned prematurely, or when companies overreach in search of new growth. Take Bausch and Lomb. Throughout the mid-1980s, the ophthalmic giant developed and executed a brilliant strategy, leveraging its hold on the technology that created soft contact lenses to grab a 40 percent market share of new lens fittings.

Competitors began attacking its position with newer technologies. Bausch and Lomb responded by diverting its attention from its core business, spending its cash flow from its lens and solutions business in new areas, such as electric toothbrushes, skin ointments and hearing aids. It developed no obvious linkage between those endeavors and its core lens business, and watched that lens business flatten out as a result. When the next wave of lens technology (disposable lenses) arrived, Bausch and Lomb's market share had declined to 16 percent.

Bausch and Lomb has since tried to recover its position, divesting from those new areas, and switching focus and management teams; one can't help but think that it didn't have to come to this.

The authors: Christopher Zook is a director of Bain & Company and head of its Worldwide Strategy Practice. James Allen is CEO of eVolution Global Partners, a venture capital firm that helps launch new, internet-enabled businesses.

Desperately Seeking Growth

(continued from page 2)

● *Outside-in,* or from the point of view of the outside world, with natural business boundaries defined by underlying market economics;

● *Inside-out,* or from the point of view of those inside the company, with the company's business boundaries defined by its unique core.

To identify your core business, start by identifying the following assets:

- **Your most potentially profitable franchise customers.**
- **Your most differentiated and strategic capabilities.**
- **Your most critical product offerings.**
- **Your most important channels.**
- **Any other critical strategic assets that contribute to the above (patents, brand name, etc.).**

For some companies, defining the core business is not overly difficult; for others, it is extremely so. In either case, it is important to have the clearest definition possible. For the purposes of the discussions in this summary, core business is defined as that set of products, capabilities, customers, channels and geographies that defines the essence of what the company is or aspires to *in order to grow its revenue in a sustained, profitable fashion.*

To that end, the authors identify three basic issues management must face in seeking profit from core businesses:

1. **Build market power and influence in the core business, or in a segment of that business.**
2. **Having done that, expand into logical and reinforcing adjacencies around the core.**
3. **Shift or redefine the core in response to industry turbulence.** ■

Build Market Power and Influence in the Core Business

Achieving sustained and profitable growth is extremely difficult without having at least one strong and differentiated core business on which to build. The most enduring growth pattern is that of the strong, or dominant, core business that benefits from continual reinvestment, constant adaptation to circumstances or business environment, and persistent leveraging into new markets or geographies, applications or channels.

Three Steps to Leveraging Your Profitable Core

To develop, refine or reexamine your company's growth strategy based on a dominant core business, you must take the following three crucial steps:

(continued on page 4)

The Power of Focus

Companies that have a few, highly focused core businesses are more likely to exhibit sustained growth than companies that are diversified and more unfocused in their building of growth platforms. Ample evidence supports this viewpoint:

● **Most companies that sustain value creation possess only one or two strong cores.** A tightly focused, sustained value-creating company will usually pull ahead of a rival embedded in a diversified company with no clear purpose or core. Anheuser-Busch leads in the beer business over Miller, which is part of a packaging foods conglomerate. Nokia leads the cellular phone business over rivals like Motorola and Ericsson, both companies with many separate parts.

● **Private equity companies often achieve their greatest success by buying orphan businesses from diffuse conglomerates, thereby creating focus.** Many of the most successful leveraged buyouts stem from strategically undermanaged, noncore businesses (with profitable cores at their centers) that are purchased and revived by new owners who allow those companies to become freestanding businesses.

● **Spin-offs usually create both focus and value.** Before PepsiCo spun off its $14 billion restaurant business (which consisted of Taco Bell, Pizza Hut and Kentucky Fried Chicken), that business' deviation from the company's soft drink core was seen as an anchor, keeping Pepsi from mounting a firm challenge to the more focused Coke — and keeping the restaurant business from challenging McDonald's supremacy in the fast food market. Since the spin-off, both Pepsi and the restaurant business (re-christened Tricon Global Restaurants) have done well.

● **Diversified companies have lower average valuations than companies with focused cores.** Studies on diversification bear this out. One study of the top 100 U.S. companies from 1981 through 1987 showed that 65 percent of acquisitions were related to the core business, while 58 percent of divestitures were unrelated to the core. The study also found that a company's market value rises nearly 2 percent the day it announces it is refocusing.

● **The few companies that became smaller and still created value are those that restructured to focus on a strong core.** Guinness, the famed Irish brewery, had entered into more than 250 non-core businesses and watched its core business — its Stout beer — erode in market share. Once it sold 150 of those businesses, moving operations back toward its core, its stock increased in value more than 10,000 times in eight years.

Build Market Power and Influence in the Core Business

(continued from page 3)

1. Define your business boundaries and your core businesses.
2. Differentiate for unique power and influence.
3. Seek the full potential value of a strong core.

Step 1: Define Business Boundaries and Core Businesses

Clearly defining the *boundaries* and the *core* of your business is a critical starting point for growth strategy.

Without a clear point of view about business boundaries, it is difficult to determine competitive position, the relative importance of differently positioned competitors, or the relative strategic importance of different growth opportunities. For example, is Marvel Enterprises, the creator of Spiderman and other characters, in the comic book business, the superhero character business, the animation business, or the children's entertainment business? The answer has major implications for the management of the company's main properties — its characters. (Disney, for example, chose long ago to define entertainment as its core business.)

Mapping out the territory of your business has become more complicated by an increased blurring of business boundaries, due to several key factors:

- **outsourcing and the disintegration of key value chains;**
- **increased customer microsegmentation and new, more narrowly focused competitors;**
- **increased competition among different business models, rather than merely among versions of the same one;**
- **globalization's blurring of geographic boundaries;**
- **increasingly sophisticated supply chain strategies causing competition among supply chains as much as among companies.**

Defining the boundaries of your core business (that set of products, customer segments and technologies with which you can build competitive advantage) is as much a matter of making sound business judgments as of applying formulas or doing calculations. You must have a clear understanding of your core *customers* and *products* that are expected to yield a majority of your profits. You must also have an understanding of the segments of your market that radiate out from your core — each must be understood and prioritized.

Gateway, for example, might define its inner core business as the sale of PCs to consumers. PCs sold to businesses is not part of its core.

Not all noncore business areas should be treated the same. You should monitor gray areas — noncore business areas that are potentially core business areas — considering key issues, such as:

- **whether you need to expand your business definition to include a new segment or technology;**
- **how competitive dynamics in the gray areas are likely to affect the profit pool in your core business;**
- **whether there are gray area competitors that may make incursions into your core customers;**
- **whether there are capabilities or skills you must bring in-house to anticipate the dynamics adjacent to your core;**
- **whether there are alliances you can form to insulate and stabilize your core position.**

Step 2: Differentiate for Unique Market Power and Influence

You must identify and verify the sources of differenti-

(continued on page 5)

Business Definition: Survival Hinges on Subtleties

The need for a strong core business to support a growth strategy requires defining both what a business is and what it is not. Consider the following growth strategy decisions that hinge on subtle, and not always simple, issues of business definition:

✓ Is Coca-Cola in the cola business, the soft drink business, the beverage business, or some other business? The company appears to have defined its business success as share of liquid consumed, not share of cola. This definition has enlarged Coke's sense of its full potential and emboldened its investment strategy ("I'd like to buy the world a Coke").

✓ Does Amazon.com's business definition logically include just books and information, or does it extend into hard goods, consumer e-retail, or some other arena? Time will tell. Through its expansion into more generic Web retail categories, the company is betting its future on a more broad (and, consequently, more controversial) definition. One hopes Amazon's executives were careful in their business definition prior to their expansion.

✓ What must CBS do to strengthen its once dominant core? Should it focus on content production; extend the core by creating and controlling the largest number of cable channels; reinvigorate CBS News to compete more vigorously with CNN (as NBC has tried to do with CNBC and MSNBC); or try some other, completely different approach?

Build Market Power and Influence in the Core Business

(continued from page 4)

ation that will continue to create market power and influence over your customers, competitors, and industry profit pool. There are four basic ways that companies acquire market power and influence in a competitive arena in a core business:

● **Customer Loyalty.** The most robust form of market power derives from building a unique, high and structurally stable level of loyalty in a well-defined customer segment. Retention is key; by effecting a permanent, one-time increase in retention, a growing company can magnify its rate of growth by 5 to 10 percent.

USAA is the most stellar example of this strategy in action. The insurer of choice for many current and former military service personnel, the company has a higher than 98 percent retention rate, and sells 4.5 separate products to each of its customers. The company tracks its customers through 23 life stages, carefully choreographing its marketing and sales programs around these events.

● **Channel Dominance.** Establishing leadership in a new or existing channel of product or service distribution is the second most common model of building market power and influence, sometimes from a position of "followership." Online sales is a good example of how the Internet is providing many companies with the potential in their industries to enter and gain power and influence through the new, online channel. But there are literally hundreds of examples of new online consumer and industrial models for capturing the online channel for a number of other business activities, from the flow of goods ordered remotely (such as Amazon), to the flow of information over the Internet (such as Yahoo), to the flow of money or securities (such as Intuit).

● **Product Development Differentiation.** The power of differentiation through superior product development is the rarest form of market power and influence; fewer than 5 percent of companies polled rely on this method. However, those companies that do build superior product development engines are often able to enter new markets— dominated by incumbents — and to gain market share profitably.

A great example of success in this effort is Sony, which has built enormous growth (13.9 percent annual revenue increases and a whopping 48.9 percent annual profit increase) by leveraging a stream of innovative products. From the pocket radio to the Trinitron television to its home video game line, Sony routinely prototypes new products more quickly and gets them to market faster than any of its competitors.

● **Capturing Capital.** A final and dramatic way to capture market power and influence is through establishing such a high market value, independent of market share and the profit pool, that massive investment and even acquisition are possible. It is ultimately by deploying this "found" capital that companies establish market power and influence, even if they are initially a challenger or first mover.

For example, Critical Path and Mail.com are both providers of messaging and e-mail services; the former has a value of $3.2 billion, versus the latter's $730 million. If Critical Path takes advantage of this difference in value quickly, it can propel itself to a much larger industry role through acquisition.

Step 3: Seek the Full Potential Value of a Strong Core

Many companies have, or once had, the right ingredients to sustain long-term value creation in their core business. They failed, however, to recognize the potential of their profitable core, causing them to under-invest or to set performance targets too low. Indeed, companies consistently seem to have a built-in bias toward underestimating three dimensions of the core:

● **Returns on Investment.** How much should your business be earning? Where should you set profit and ROI targets for management? These are critical questions that executives must answer every year. Many, however, get the answers wrong by failing to recognize both the full potential of their core business and the potential for

(continued on page 6)

Dell Establishes Channel Leadership

In order to become the "growth stock of the decade" (in the words of the *Wall Street Journal*), Dell Computer Company used channel leadership to establish its market power and world leadership in PCs and workstations. Although computer parts, even assembled computers, had been available as mail order items for years, no one else saw the potential for selling direct, rather than through layers of value-added resellers, distributors and retail middlemen. Such an approach resulted in lower cost (due to lower overhead), lower pipeline inventory, and a channel tailored directly to the needs of each customer segment.

Today, 35 percent of computers are sold direct. While other computer companies, such as Compaq, have tried to emulate the Dell direct sales model, none have been as successful as Dell in meeting customer needs and increasing profitability.

Build Market Power and Influence in the Core Business

(continued from page 5)

increasing ROI in their core businesses' market position.

● **Reinvestment Rates.** Reinvestment rates can be calculated as the sum of capital expenditures, research and development and advertising relative to sales. How do your reinvestment rates compare to the reinvestment rates of your competitors? Relative reinvestment rates tend to be poorly tracked and analyzed, yet those rates embody a great deal of information about an industry's competitive dynamics and future. Planning a strategy without collecting and interpreting competitor reinvestment rates is like forecasting the weather without looking at wind speed or temperature.

● **Adjacent Profit Pools.** Think of a profitable core business as situated in the center of a complex network that connects direct suppliers, suppliers' suppliers, direct customers, customers' customers, complementary products, substitute products, competitors, and so. At the end of these economic connections will be, in most cases, a pool of economic surplus and profit. The extent to which a company possesses the power of leadership in its core business influences the degree to which it can shape or even share in the profit and surplus pools adjacent to its own core business. One example: Microsoft's controversial influence on Internet browsers — a business adjacent to its core software business.

In sum, you must comb through the core and assess whether it is operating at or near its full economic potential. There is a paradox at work here, however. Typically, the strongest core businesses are — relative to their full potential — under-performing the most. ■

Expand into Logical Adjacencies

Adjacency Expansion refers to a company's move into related segments or businesses that build on and reinforce the strength of the core.

The tension between focusing on the core and setting out for new territory (even related to the core) can be considerable. If you fail to anchor your efforts in your core and rapidly expand in spite of this fact — or to compensate for it — you run the risk of creating a business without lasting value. Indeed, the selection of new business adjacencies around the core business could either trigger a new burst of profitable growth, or create distraction and stagnation.

In order to make the correct decisions where adjacency expansion is concerned, you must take into account three topics critical to improving the odds of profitable, sustainable growth: identifying adjacent business opportunities, choosing the correct adjacencies for your business, and avoiding common pitfalls of adjacency expansion.

Identifying Adjacency Opportunities

The most common adjacencies to a core business include the following:

● **Interlocking customer and product adjacencies.** Perhaps the most common adjacency expansion is moving into new customer and product segments, using each move to reinforce the next. It involves constantly adapting a product to enter a new customer segment and drawing on the knowledge gained about that customer segment to develop new product ideas (which can, in turn, be applied to other segments).

DeBeers is an example of a company that engaged in just such an adjacency, using its marketing prowess to make diamond engagement rings a cultural imperative in Japan. When it began its campaign in 1966, the diamond engagement ring acquisition rate for all Japanese brides was six percent; by 1998, that rate had grown to 65 percent.

● **Share-of-wallet adjacencies.** By capturing most of the purchases your core customers make and then expanding their menu for purchases, you can forge a bond with your customers that increases their loyalty.

The Walt Disney Company first exhibited its skill at finding product adjacencies surrounding its core in 1929, with the introduction of the Mickey Mouse writing tablets. The success of that endeavor led eventually to the wider cross-promotion of Disney movies and characters that included Mickey Mouse Watches, the Mickey Mouse Club television show, and even Disneyland and Walt Disney World.

● **Capability adjacencies.** Capability adjacencies are moves outward from the core that are based on deep organizational know-how, grounded in either technology, business process or value management. A good example of a company with technology-grounded capability adjacencies is Reuters, the news agency that started when its founder first used carrier pigeons to fly stock prices between locations in the mid-1800s. Since then (particularly since going public in 1984), the company has grown in spurts by being quick to adopt new technologies for transmitting timely news and financial information — from cable to telephone to the Internet.

Choosing the Right Adjacencies

Management teams can quickly find themselves awash in interesting and potentially attractive options for adjacency investment. Before you spend resources undertaking a major data collection effort, step back and apply your strategic judgment and working knowledge of your

(continued on page 7)

Expand into Logical Adjacencies

(continued from page 6)

business to answer the following questions:

1. **Does this adjacency strengthen or reinforce the core (or a core, if you have multiple cores)?**
2. **Does this adjacency add value for our core customers?**
3. **Does this adjacency serve as insulation against potential competitors intent on attacking our core?**
4. **Is this adjacency positioned in the direction that the industry profit pool is likely to shift over time (growing segments, channels, needed capabilities)?**
5. **Do we have a chance of achieving leadership economics in this adjacency through outright leadership, a protected customer position, or shared economics with the original core?**
6. **Does this adjacency hedge against a major strategic uncertainty?**
7. **Does this adjacency lead to other successive moves that, in total, are essential to build or protect the core?**
8. **Does this adjacency move into the backyard of a new competitor?**
9. **Does failure to move into this adjacency turn out to render the core vulnerable several moves down the road? To what degree?**
10. **Have we fully mapped out all the competing adjacencies, or are we acting without fully calibrating our options?**

Once you've ranked and selected opportunities as a result of the answers you come up with, cluster the initiatives into distinct strategic scenarios. For example, one scenario can be built around a long list of initiatives for rejuvenating growth in a profitable but static business. A second set of scenarios can be centered on building mass and focus around several emerging customer segments. You'll likely have a whole lot of ideas come up as a result of these efforts — don't forget to narrow your focus, according to the particular needs and plans of your core business.

Avoiding Common Pitfalls

While investment in adjacencies is eventually necessary for any company to continue creating value, it is also one of the riskiest activities a company can undertake. Here are several pitfalls to avoid in your expansion efforts:

● **Expanding Toward an Entrenched Position.** Pursuing areas of a market in which you have relatively low odds of achieving leadership or building market power and influence can sap resources from the core and hamper growth in the rest of your business. To put it in military terms, armies that launch full frontal assaults on entrenched positions lose virtually 100 percent of the time.

● **Overestimating the Profit Pool**. The odds of achieving success are much greater when growth goes after an expanding and deep industry profit pool, rather than a shallow one. Since the profit pool is both a function of industry structure, as well as one of potential market size and customer value, it is essential to map out the current and forecasted profit pool prior to investing in an adjacency.

● **False Bundling.** Beware of companies that claim they want to be a "one-stop-shop" for customers' needs. Often, this all-things-to-all-people approach is a warn-

(continued on page 8)

Don't Undervalue Your Core by Overreaching

Determining which adjacencies to pursue and how much to invest in them relative to the core is one of the most difficult and seminal decisions your company will make in its quest for sustained growth. It is important to remember not to undervalue your core in pursuit of a far-reaching adjacency. Gillette, one of the great global brand names, made that mistake, and struggled to recover from it.

For its first 50 years, Gillette stayed close to its core, building a 70 percent market share and establishing a towering brand dominance in men's shaving products. The additions of new forms of shavers, shaving creams and women's shaving products — relatively minor upgrades of core products — have, in recent years, begotten more sweeping deviations, from the addition of Braun electrical appliances to the acquisition of other non-shaving product lines, such as Oral-B toothbrushes, Parker Pen writing instruments and Duracell batteries.

While some of these adjacency investments have worked out well for Gillette (Braun, in particular, has grown from $70 million in sales to $1.7 billion), most of the company's investments showed negative growth in sales and declining profits. Interestingly, razors and blades — the core focus of the business — were still Gillette's primary source of revenue and profitable growth nearly a century after the company's founding. Gillette has made big moves to divest itself of all but its core businesses and closest adjacencies, reacting to declining stock price by refocusing its resources on the business that helped it establish its dominance in the first place.

Expand into Logical Adjacencies

(continued from page 7)

ing sign of business boundaries that are too broad to be practical and that can lead to a dangerous overextension of resources. In addition, customers often don't *want* an all-in-one shop.

● **Invaders from Unexpected Fronts.** The discovery of new, uninhabited market territory frequently brings invaders from unexpected directions. Don't let your unfamiliarity with a competitive threat lead you to underestimate their strength, nature or angle of attack. ■

Redefine the Core in Response to Industry Turbulence

Industry turbulence is hitting more rapidly and powerfully than most managers have ever seen. Decision times are shortening, uncertainty is increasing, and the range of fundamental strategic choices is widening. Many of the changes faced by executives require partial or complete reconsideration of the fundamentals of their core business.

Companies should consider redefining their core in advance of industry transformations. There are five key threats to which you must pay close attention:

● **Erosion of Low-End Product Segments.** This turbulence starts with the disappearance of a low-end customer segment that was once deemed unprofitable. Often, a new technology with new, low-cost economics enters the market and makes those unprofitable customers suddenly profitable and interesting to a new start-up. Beware that simply ceding these customers to the new, low-end competitor might be akin to backing your business into a corner. Remember what happened when Merrill Lynch refused to take online trading seriously; e-traders like Charles Schwab erased years of market dominance in a short time.

● **Erosion of Customer Segments.** Sudden changes in customer defection rates spell trouble. Consumers in the automobile industry might indicate a 70 or 80 percent satisfaction rate for their current brand of vehicle, but more than half of them will switch brands the next time they buy a car. Defections or loyalty measures reflect actual consumer behavior, and stand as the true indicator of their satisfaction.

● **Erosion of Microsegments.** One of the most corrosive dangers for a company is the emergence of a new competitor that attacks under-served microsegments of a customer base with a superior and targeted model. This danger is difficult to detect and can signal a fundamental shift in the nature of competition. The erosion of audience from CBS News to CNN, for example, constitutes a microcosm of too-long-ignored opportunities unearthed by microsegmentation.

● **Erosion of Traditional Business Boundaries.** The most obvious and most often denied sign of change is the sudden erosion of traditional business boundaries, increasing exponentially the number of competitors vying for a space. Digital imagery, for example, continues to threaten Xerox in the market for reproduction.

● **New Intermediaries and New Control Points.** Some of the most profitable businesses over time have been those that were able to control a position within a larger system that others needed to use in some manner. Microsoft, for instance, exhibited an early, strangling dominance in the personal computer industry by virtue of the ubiquity of its proprietary DOS operating system.

When Is Redefinition Necessary?

Even though you arm yourself and your company with the knowledge of industry transformations, you still need a set of criteria against which to judge your need to redefine your core. Although no single formula can be applied to the complex issues involved, there are several litmus tests you can use for determining when serious consideration of redefinition may be in order. Among those tests are the following:

● Is a new competitor beginning to gain surprisingly rapid market share in a marginal segment of your business that you once controlled?

● Are steps in the value chain you once considered core now being unbundled and controlled by specialists?

● Are there fast-growing adjacent customer segments that you might once have been able to serve, but that you could not now target without adding a new capability?

● Are there potential legal or regulatory changes that could eviscerate your competitive position in the core, or your ability to compete for the next set of logical business adjacencies in your growth plan?

If you answered "yes" to two or more of the above questions, the odds are that you should seriously consider redefining your core. There are, of course, several caveats to consider when doing so:

● Do not redefine the core without a clear vision and set of strategic principles on which your management team agrees.

● Do not redefine the core without first establishing a common point of view on how turbulence might play out and what positioning in the marketplace provides the greatest competitive advantage.

● Explore the full range of structural options to balance the need for integration with the original core and for speed, which can be achieved with a separate entity.

● Over-invest in management capacity and management processes at the start of a redefinition. ■

Steering Towards Innovation
Page 3

THE SUMMARY IN BRIEF

Agility isn't a buzzword anymore. It's a tool that organizations of all sizes and types desperately need, but not all of them know how to achieve it. The key? Starting with purpose.

Many companies fail to treat their purpose like something that can be designed, but carefully designing your company's purpose will come to define everything that matters most about your organization—including financial success. Meanwhile, communication and leadership are essential at every level of your organization. Otherwise, employees become disengaged, leaders fail to lead, and your organization lacks direction and focus. This adds up to an organization that's anything but agile. In ***Purpose Driven People*** we learn that, in order to achieve that true agility, you must first identify the constraints standing in the way of your organization—even if those constraints are your own biases, weaknesses, or hangups.

IN THIS SUMMARY, YOU WILL LEARN:

- How focusing on purpose helps companies create sustainable growth.
- Why addressing barriers in the way of agility is essential to help your business reach its potential.
- How turning managers into role models can transform your company for the better.
- Why tools and systems should always be seen as means to an end, rather than the end itself.

Introduction

New technologies create new possibilities for all companies, whether they were founded today or a hundred years ago. Customers can order products when they want and get them faster than ever.

Companies that are tuned into what matters to their customers and employees are able to stay agile and hold the key to their own future. We're seeing companies emerge that provide products or services entirely in the digital space, and they focus entirely on the needs of their employees and customers.

The result? More success, more innovation, and happier people on both sides of the transaction. So what does that mean for us, as people and organizations who want to harness that power? It means we have to focus first on purpose, and let our businesses and organizations move forward from that vantage point.

Purpose

Automation is on the rise. Activities, tasks, and responsibilities are shifting. People either adapt to new roles, or they don't. Employees come and go. Customer and employee demands are changing. What do you actually know about the people who work in your organization?

The key is to move past surface-level questions about the people in your organization, and get down to the business of:

- Improving working relationships
- Defining an organizational, departmental, or team purpose
- Determining the influence of purpose on talent, jobs, roles, and agility
- Practical experiments and work methods for creating a purpose
- Design a Purpose in Four Steps

What exactly goes into formulating a purpose in actual practice, and is there a difference between formulating a purpose for your organization as a whole and formulating one for your team?

You can form a purpose in four steps, and they're the same for all levels of an organization. Regardless of whether you're working on a start-up, scale-up, major corporation, small business, department, or team, the steps are the same.

Step 1: Do research and collection as much information as possible.

Step 2: Create a storyline

Step 3: Test the storyline out on the target group

Step 4: Define the purpose

Communication & Awareness

As soon as an organization decides to communicate to its people that a change is needed, they start to think about the recipient of the message. Better yet, they start to think for the recipient. But how well do we know the recipient? Do we actually know the recipient's needs and how they will react? We often think we communicate clearly. But when we check in with employees afterwards, it turns out that everyone has interpreted the message differently or less than the whole message has come across.

Communication is the basis for creating awareness and interaction, which is why communication is the foundation of a self-organizing team.

Keep Communicating

When can we stop communicating? It is a frequently asked question. The question behind it is usually about when it is the right time to stop communicating about a transition. In today's complex world, you have to keep adapting and developing all the time. It is, therefore, not so easy to pinpoint when exactly a transition ends and the 'regular' work begins. In any case, it is true that transitioning organizations go through different phases, whereby each phase requires a different communication message.

The purpose doesn't change, but the path to get there does.

Identifying Constraints

Building agile organizations is like a game of Jenga. For years, we have built structure on top of structure. The larger the organization, the more extensive the job framework, the more complex the processes, the greater the number of separate departments and silos. When we change to more agile models, we basically break down those silos bit by bit. Will the tower stay upright or come tumbling down? It's vital to take constraints and barriers to progress seriously and understand what will happen if you don't. From structural

and visible constraints to invisible contractions, you need awareness of what stands in your way to enhanced agility.

What to Do with a Constraint

Eliminate constraints! While this is easier said than done, it is essentially the only thing you can do when you, as an organization or as a human being, want to achieve your goals and pursue your purpose.

In the previous paragraphs, you read how a constraint blocks progress and has a demotivating effect. It stops you and your organization from developing and making progress. The only remedy is to identify those constraints and do something about them.

Role Modelling

What do role models and leaders have in common? Are managers now all of a sudden leaders, or do we not need managers at all anymore? What exactly do those concepts mean? When are you a manager, and when are you a leader?

Our vision of leadership and what makes a leader has changed. As we head into the future of work, leadership takes on a different meaning. To succeed, we must all transform from managers to leaders, and from leaders into true role models. We must reduce the use of terms like 'manager' or 'superior,' instead focusing on the impact we have on the people around us and how we can inspire them to follow and excel.

How to Improve as a Leader

Everyone in an organization is part of the system and has a role to play in the transition to agility— perhaps even that of a role model. Like most people, you probably struggle to sow vulnerability or to admit to finding something difficult, or having overlooked something. But it's never too late to talk about difficult subjects or to tell your organization or team you made a mistake or misunderstood something.

What is your story? What example do you set or want to set? Do you have something you're passionate about, a purpose? How do you communicate it?

Leadership Journey

Rate yourself from a scale of one to ten on the following statements to assess were you stand as a role model:

- I have a clearly defined purpose that matches the work I do and my department's and organization's purpose.
- I actively share this purpose with colleagues through storytelling.
- I am aware of my biases, prejudices, and blind spots.
- It is important to me that we have role models at the organization and I regularly talk with colleagues about what a role model is.
- In the department and in the team, we have agreed on the kind of behavior role models should display and how we intend to challenge each other on that behavior.
- As a lead, I regularly seek feedback on my role from peers and employees.
- I encourage colleagues to keep engaging with each other.
- Whenever there are innovations that are interesting for our organizations and aligned with the purpose, I discuss them with colleagues and we look at how to integrate them into the organization.

There has to be a solid base from which to operate as a leadership team, and a shared understanding of what agility means for the organization, employees, and the leadership team itself. After that, space will emerge for further development. The basis lies at the heart of the People Journey Circle.

Steering Towards Innovation

The pace at which one employee works influences the overall pace of the team or even the department. The team is only as fast as its slowest member. The challenge lies in getting the slowest member to accelerate to the group's pace. Starlings have that ability. People do, too, provided you extend your feelers and are willing to listen to the people around you.

When teams pull together in delivering a product, each team will have an effect on the pace at which the other team works.

If one team gets stuck, the other team cannot proceed. The organization is one large system that everyone is a part of. Whether you work there or otherwise provide something to the organization, your behavior and way of working and thinking, as well as the speed at which you work, all have a bearing on the value and relevance of the system as a whole. To excel, we shouldn't be boosting our top perform-

ers—we should be elevating our lowest performers.

Learning Organization

Continuous learning has never been as important as it is today. New technologies follow each other in rapid succession. The online world creates new roles, such as 'influencer' or 'YouTuber.' Roles that emerge organically in generations growing up with the latest technology, and for whom these new roles are the most normal thing in the world.

It's vital for us to start thinking and learning differently, addressing the conditions and barriers that affect learning and finding ways to remove them. We must develop a learning mindset and always be willing to experiment in order to learn. This will help us make the leap to becoming a learning organization.

The Ecosystem

As human beings, we are selective. Our brain decides what we see and don't see, based on our worldview and our existing biases. As a result, we often don't see what we do not expect to see. You can either hide behind this comfortable wall or take it as an incentive to look beyond the obvious.

The things that impact how we perceive the world are our ecosystem, and it impacts the way we think, perceive, act, and behave. Our ecosystem isn't necessarily a bad thing, but if it's invisible to us, then we can quickly become blind to its effects. We can become blind to our biases or the comfortable half-truths we tell ourselves, which stands in the way of continuous learning discussed earlier.

Means and Ends

Tools matter. When you decide to paint your house, you would do well to buy quality brushes, rollers, and paints. Without the right materials, chances are your walls will not look impeccable when you're done.

That being said, it doesn't mean you always have to get the latest of the latest in tools and materials. Tools are a means to an end, not an end in their own right. True, working with the latest technology can be a lot of fun and make your organization feel like you're on the cutting edge. But all tools, even this book, should be used with questions such as:

Does it help you fulfill your purpose?

What does it deliver, and for whom?

Ensure that you have satisfying answers to these questions before adopting any new tool, system, or idea. Ideas are powerful, and they can transform your organization faster than you think.

Why Effective Collaboration Requires Lifelong Learning
Page 4

THE SUMMARY IN BRIEF

Reimagining Collaboration introduces a fundamentally different model for workplace collaboration and communication. You'll learn how to think about these subjects, as well as technology and business processes, in a holistic way. You'll then learn how to put this new model into action, and how to handle people that are stuck in their ways. The fulcrum of ***Reimagining Collaboration*** is the hub-spoke model of collaboration, which allows for the stitching together of different applications without any coding. As a result, you'll be able to minimize rework, automate tasks, and quickly get on the same page as your colleagues. You'll also communicate and collaborate much better, too.

At its core, ***Reimagining Collaboration*** is disruptive. It forces readers to think differently about work. It advocates adopting new habits and technologies. Organizations will have to rethink legacy business processes and confront problematic and change-averse employees. But you'll learn how to maximize the chance that a new collaboration hub will take root.

IN THIS SUMMARY, YOU WILL LEARN:

- How collaboration tools have evolved over time, and where things stand now.
- How technology can lead to enhanced collaboration power.
- How to move from the theory of collaborative perfection into actual practice.
- Why effective collaboration requires a spirit of lifelong learning, and how to instill it in your organization.

Introduction

When COVID-19 arrived, few companies and their employees were prepared to embrace remote work and, by extension, collaboration. The world of work is not returning to its pre-COVID-19 days. Effective remote work and the tools enabling it will become only more prevalent and critical for businesses to thrive. And more remote work increases the importance of collaboration.

So, are the current methods of collaboration meeting the needs of innovative, constantly evolving businesses? Not quite. Let's explore how collaboration really works in a work environment and how some of the things we think are enhancing our collaboration are already holding us back.

Collaboration in Context

We can't begin to effectively collaborate if we conflate different terms. In order to achieve this goal, it's essential that we fully understand collaboration first. Collaboration is not delegation or communication. It involves working, brainstorming, and problem-solving together— either physically in the same space or remotely.

Don't confuse collaboration with adjacent work-related terms, as this will only stunt your progress. Collaboration isn't some superpower encompassing all forms of work. Putting the adjective remote in front of it only makes it more difficult to attain.

Meanwhile, contemporary collaboration is multidimensional. One size doesn't fi tall. As such, doing it well is far easier said than done.

The Benefits of Reimagining Collaboration

Effective collaboration can confer a number of significant benefits, from creating more innovative products and building trust among employees to helping retain customers, retain employees, and communicate better across your entire organization.

That said, if you think collaboration is some sort of magic elixir that will cure all ills, you're bound to be disappointed. But effective collaboration allows organizations to become more transparent, healthier, and less-stressful places to work. Firms and teams that collaborate well will be more productive than their collaboration-challenged counterparts.

Why Email Inhibits Collaboration

People who rely on email to 'collaborate' introduce superfluous friction. They make it harder for themselves and others to effectively work together. The word suboptimal comes to mind. Often, these tools make collaboration downright impossible.

Why? Because email was never designed for collaboration. Despite its limitations, many people simply tolerated it because of inertia and the lack of viable collaboration alternatives for many years.

Employees have traditionally stored essential knowledge, decisions, and information in their inboxes— all which effectively disappear when they leave their jobs. And over the course of the day, email saps your brain to an extent that modern collaboration tools do not. It's time to say goodbye to the traditional way we think about email.

Reimagining Workplace Technology

Over the last 30 years, the applications that allow us to exchange information and work together have become far more powerful than their antecedents. The word supercharged comes to mind. The market for collaboration software was already exploding before the pandemic. Then it went supernova. Now, collaboration hubs are more powerful, affordable, extensible, and user-friendly than ever.

However, even the best collaboration hubs don't replicate the functionality of dedicated productivity, project-management and enterprise systems. So what's the solution? It's the hub-spoke model of collaboration.

The Hub-Spoke Model of Collaboration

On any given day and depending on your role, you probably use at least ten software programs, apps, or websites at work. The odds that you use only one or two are remote. Even small businesses today rely upon a wide array of technologies.

Slack, Zoom, Microsoft Teams, and their ilk are internal collaboration hubs. They allow people to easily connect to a wide variety of different applications, what you might call spokes. Put differently, hubs act as the home base for an organization, department, team, and even an individual employee. A hub can, and should, represent the default mode of internal communication and collaboration for all formal and informal groups. Which service acts as your 'hub' is up to you. Different activities, goals and situations require different tools. There is no magical application or technology that handles every conceivable work-related task or function and there never will be. The best formula-

tion of the hub and spoke model allows us all to automate many routine tasks with zero coding required.

How to Select an Internal Collaboration Hub

The introduction of a proper collaboration hub within an organization can represent a major turning point in a company's evolution. In many instances, it's no understatement to call it a step change, especially given the extent to which so many companies, departments, groups, and individuals have historically relied upon email.

Here are the questions to ask when choosing your collaboration hub:

- What specific business problem(s) does this software application attempt to solve?
- What business problem does this application not solve?
- Do your colleagues already use a similar tool?
- If so, then how does the new tool compare to the incumbent?
- Is now the right time to implement a new hub?

In cases where one hub meets most of your needs but is missing a killer feature present in another, don't panic. Chances are, the other collaboration hub platforms will quickly take notice and implement a similar or identical feature.

Among the most important factors that organizations should consider when selecting an internal collaboration hub are cost, security, compliance, company culture, and the need to collaborate with external partners.

Remember—all else being equal, it's easier to deploy a collaboration hub in a 'green field,'—a space that's already thriving or at least surviving.

Why Collaboration Hubs Can Disappoint

Success with any new enterprise technology is hardly a given. Internal collaboration hubs are no exception. But with rare exception, collaboration hubs disappoint or fail because of people-related issues, not from any deficiencies in the underlying technologies or applications themselves.

Looking to avoid these failings? Holding formal training classes signals to employees that the collaboration hubs is an essential workplace tool. If leadership takes it seriously, then everyone else is more likely to do the same.

Reviewing Implementation Strategies

Organizations that want to deploy internal collaboration hubs can opt for one of three approaches: bottom-up, top-down, and middle-out. You can either start at the top of your organization with adoption, or the opposite. You can also begin with middle management and expand from there as time allows—when the 'field is green.'

Each strategy inherits different costs and benefits. There is no single formula for determining which one is best. Experienced and tech-savvy change management consultants can help organizations choose and implement the best tool and approach. In turn, the firm will minimize the hub's downsides and maximize its benefits.

Reimagining Business Processes

Equipped with new tools, a new mindset, and collaborative colleagues, you can dramatically improve inefficient business processes at your company. Don't minimize the importance of transforming simple business processes like the way you collaborate. Companies have been transformed by far less. Plus, doing so sets an important example one that others will hopefully follow.

Remember—the older the process, the less likely that it has changed, and the more likely that the hub-spoke model can improve it. That means that your most entrenched processes aren't the ones that should be protected, they're the ones that may be the most ripe for a change.

Collaboration Killers and How to Handle Them

If you're going to initiate a transformation in the way you collaborate within your team or organization, you should be aware of the ways that it can go wrong. One of the worst? Pushing too hard, too fast. Trying to transfer your entire workforce over to an entirely new collaboration tool or series of tools all at once may backfire.

Remember that some very smart folks at your organization will probably still resist adapting to more collaborative methods and tools, no matter how nicely you attempt to make the transition. Meanwhile, micromanagers are generally allergic to true collaboration. The hub-spoke method won't change that fact on its own. Prepare to exhibit patience along the way.

The Myths of Collaboration

Collaboration isn't binary. There are degrees. It also may rise or drop over time. By itself, the use of an internal

collaboration hub guarantees nothing. In fact, companies can use Slack, Zoom, and Microsoft Teams in ways that are downright abusive.

Finally, it's important to note that small-scale collaborations tend to go more smoothly than larger ones because fewer people are involved. Sometimes, however, even one-on-one interactions don't go as well as either party hopes. Some people will invariably refuse to reimagine collaboration.

Reimagining Communication and Human Resources

Reimagining collaboration isn't likely to happen by itself. It may require changes to existing jobs and business processes. Fortunately, they need not be the big ones.

While the jury is still out, hiring a Head of Remote Work may help increase collaboration in an organization. If that seems like a superfluous job position, considering that in the fact of even minor scandals or employee dissatisfaction, companies will create the role of Chief Diversity Officer to ensure fair and equal hiring practices.

If employees won't willingly wean themselves off of email for internal communication and 'collaboration,' then companies may need to take drastic measures and enforce the use of specific hubs.

Why Effective Collaboration Requires Lifelong Learning

What, exactly, is the point of collaboration? At its essence, collaboration is about benefiting from the expertise, perspectives, and creativity of people other than yourself. So for collaboration to succeed, everyone involved must be open to the fact that another person's perspective has something to add to their own. If you believe that you've already learned everything you need to know about a given topic, then collaboration won't be of much use to you.

That's why a lifelong learning mindset is so important in collaboration, particularly when adopting the hub-spoke method. You should always be open to new ways of thinking, collaborating, and creating—even if you've been doing things a certain way for a while. If you're a manager or leader, this becomes doubly important. The openness and willingness to innovate that you display will inspire your organization to do the same.

The Future of Collaboration

What will collaboration look like five, ten, or fifteen years down the line?

Collaboration hubs will become smarter, more automated, and more immersive—allowing for even better collaboration and freeing up more human creative power to respond to complicated problems with novel solutions.

Meanwhile, plenty of innovation and useful collaboration features will stem from emerging startups.

Finally, the future of work will be even more remote and collaborative than its past. The sooner you, your colleagues, and your organization realize it, the better off you will be.

Phil Simon is a frequent keynote speaker, recognized collaboration and technology authority, and college professor-for-hire. He is the award-winning author of eleven books, most recently ***Reimagining Collaboration: Slack, Microsoft Teams, Zoom, and the Post-COVID World of Work***. He helps organizations communication, collaborate, and use technology better. Harvard Business Review, the MIT Sloan Management Review, Wired, NBC, CNBC, BusinessWeek, and The New York Times have featured his contributions. He also hosts the podcast Conversations About Collaboration.

THE SUMMARY IN BRIEF

From top to bottom, organizations will be compelled to change entire mindsets, attitudes, and assumptions about how they operate, how they can grow, and even the very reason for their existence as they address the unprecedented journey of change and *Transformation* driven by technology.

This change is as much an adjustment of mindset as it is a new set of tools that everyone must learn how to use. In ***Reinvent: Navigating Business Transformation in a Hyperdigital Era***, author Faisal Hoque introduces ideas, concepts, and practical step-by-step strategies with which you can better position yourself and your organization to reap the greatest number of benefits that digital transformation can afford.

It's a journey rich with promise that readers can embark on successfully with Hoque's guidance.

IN THIS SUMMARY, YOU WILL LEARN:

- The case for transformation in a hyperdigital era.
- The necessary steps to successful digital transformation.
- How to navigate transformation with LIFTS.
- How to evaluate your transformation as you take steps towards achieving it.

SECTION 1: THE CASE FOR BUSINESS TRANSFORMATION IN A HYPERDIGITAL ERA

Business transformation and digital transformation are essentially two separate ideas, but their close connection and synergy are undeniable. Further, any attempt at *Transformation* that lacks a significant digital presence might be compared with push-button phones that dial a split second faster - the best of intentions, but grossly outdated.

Your Customer Isn't What He or She Used to Be

It's no great epiphany to realize that the COVID-19 pandemic fueled consumers' interest in - and enthusiasm for - online shopping, nor is it shocking that any business whose *Transformation* doesn't incorporate a significant digital element likely risks alienating an enormous segment of the consumer population.

Furthermore, digitally enabled consumers are empowered like never before. The balance of power in any number of industries and markets has also been completely upended.

- Customers have changed drastically in recent years. They're more demanding and expect their feedback to be taken into consideration.
- The COVID-19 pandemic merely provided additional impetus to move to online shopping.
- Customer co-creation - where customers have a direct hand in developing new products - is increasing.
- The internet's ability to offer comprehensive comparison shopping is compromising consumer loyalty.

Your Workforce Is Calling for Transformation

Taking nothing away from the exploding influence exerted by consumers, they are anything but alone in advocating for *Transformation* with a digital component. Your employees, contractors, and anyone else with whom you work are likely every bit as vocal.

- Not only are remote working arrangements increasing, but employees are also taking them into consideration when choosing for whom they will work.
- Rather than distancing employees, research has found that remote work options have improved employee engagement.
- When considering remote work, it's essential to consider the issue of isolation and to develop strategies to counter it.
- Digitalization can promote efficiency, greater creativity, and innovation, not to mention increased organization productivity.

Security Is Also Changing - Transforming the Safety of Your Business

The more digitalization takes hold of nearly every aspect of life, so too does the issue of security become more central. Threats of all sorts are increasing and diversifying at the same time, which mandates digital transformation be characterized by proactive measures and the highest possible security awareness.

- While many are concerned that a digital workplace is more vulnerable, research has established that digitalization can bolster security.
- Tasks as simple as sending material to a remote printer are now vulnerable to security breaches - digital's capacity for encryption can offset this.
- As more companies incorporate remote work into their organization, it's imperative that security measures are strengthened.
- Digitalization isn't limited to security issues. It can also be used to combat misinformation.
- Countries can no longer ignore or dismiss digital security. National security demands a comprehensive and cohesive digital policy.

Transformation: The Added Punch of Artificial Intelligence and Machine Learning

To those shrinking few who have yet to get a handle on what all the excitement is about, it can prove exceedingly helpful to see how AI and machine learning working in conjunction with digitalization can drive meaningful evolution and reinvention in most every business and organization. Going digital is certainly never an unwise option. Couple that with AI and machine learning, and any form of change becomes that much more transformative - and the resulting advantages and benefits warrant serious attention.

- Artificial intelligence (AI) and machine learning can broaden digital's capacity for transformation.
- AI can greatly boost a company's revenue streams through greater productivity and efficiency.
- AI and machine learning can perform comprehensive analytics far faster and more accurately than human beings.

Transforming your business involves a great deal more than unplugging this and plugging in that.

- Automation through AI reduces boring repetitive work, freeing human employees for more challenging and rewarding tasks.
- AI and machine learning can also strengthen security while offering greater customer engagement and insight.

SECTION 2: TRANSFORMATION VIA DIGITALIZATION – NECESSARY STEPS

Transforming your business involves a great deal more than unplugging this and plugging in that. It takes careful thought and a good deal of introspection. That's because *Transformation*, however focused on technical aspects, also involves a sweeping reinvention of a great deal - if not most - of your organization, including aspects that you may not expect.

Recognize the Challenges

According to Forbes, around 84 percent of digital transformations outright flop. If you think that number is a gross outlier, other research also cites a frustratingly high level of struggles and missteps. That's in no way meant to be discouraging. The benefits of digital transformation, however challenging the journey, are decidedly worth it.

- It's essential to gain commitment and buy-in throughout an organization - from management to everyone impacted by *Transformation*.
- Make certain your goals for *Transformation* are clear, specific, and highlight how all members of the company may benefit.
- Expect some within your organization to be uncomfortable with disruptive change. Continue to emphasize the positive outcomes that a successful *Transformation* will foster.
- Don't get caught up in the technology. The impacts of Transformation on your people and culture are just as important.

Leadership Is Everything

Being an effective leader during and after digital transformation mandates more than a few tweaks and updates. Rather, it calls for a completely new way of thinking and acting derived from an appreciation of the magnitude of change taking place, as well as a new way of communicating with others involved in that effort.

- To become an engaged leader amid your business's digital transformation, know the distinctions between digitization, digitalization, and digital transformation. They're significant.
- A pervasive digital mindset is critical to transform any organization digitally, taking in everyone from leadership all the way through the entire group. Such a mindset is comfortable with change and urges experimentation and occasional failure - which are necessary steps to success.
- Collaboration is essential, even connecting groups and people who may not have worked together before. But such synergy is essential, not merely to encourage a diversity of opinion and feedback but also to move away from autonomous silos that can inhibit transformational growth.
- Take steps to ensure that your culture not only has changed but is also built to last over time. Encourage a prevailing mindset of attention to the issue of sustainability: What policies and procedures are sustainable, as opposed to others that may be less resilient to change?
- Ethics are paramount. The public has seen more than enough security lapses, ethical misbehavior, and other instances to make them jumpy about technology in general. An emphasis on ethics makes regulatory sense - taking it further than you're required builds an appealing organizational persona, one that genuinely means what it says, rather than merely looking good.

The Future of Your Organization

Examination of the scope and implications of change with a somewhat longer timeframe not only gives you a heads-up

on what to anticipate but also allows you to make decisions today that will nurture the environment you hope to create for tomorrow - for all the tomorrows that follow.

SECTION 3: WHAT TO DO: NAVIGATING WITH LIFTS

What undermines many attempts at Transformation is insufficient attention to everything else that has to change as well.

That's where the acronym LIFTS comes in. LIFTS stands for the following five steps:

1. L - Learn
2. I - Investigate
3. F - Formulate
4. T - Take off
5. S - Study

Learn

The first step in embarking on a successful *Transformation* is to educate everyone impacted as much as possible about the ramifications, benefits, and other aspects.

- Reemphasize that *Transformation* means more than technology. Talk about reasons for the initiative, any form of necessary culture change, and other outcomes.
- Stress the benefits of *Transformation* regarding individuals as well as the entire organization. Look for collaborative forms of benefit that take in more than just one group or individual.
- Take the time to understand why some teammates may be nervous about such significant change - or, for that matter, why they oppose it.
- Empathize with those holding out as much as you can, and work to help them better understand your support for *Transformation*. But make it clear that a "sorta support" attitude may not be sufficient and, as a result, might warrant an individual's consideration of moving on in a way that won't run counter to your transformative efforts.

Investigate

Before moving forward in any meaningful way, it's essential to gain a sense of where you are, what you and your company can bring to the situation, and any risks and potential pitfalls. This is a time characterized largely by potential and opportunity.

- Develop strong partnerships between technology and users. Increase levels of trust and understanding by providing forums for frequent interactions. Strong partnerships promote user involvement, permit requirements to be defined in a more cooperative climate, ensure that technology investments are aligned with business priorities, and boost overall sense of ownership.
- Educate executives and knowledge workers about the unique challenges of technology. In many firms, users have a limited understanding of the complex technologies and the effort required to implement complex systems. As a result, their expectations are not realistic.
- Craft a comprehensive sourcing strategy that articulates the desired mix of insourcing, domestic outsourcing, and offshoring - and further recognizes the long-term capability necessary to meet strategic objectives. A technology organization that's too lean and is also highly outsourced may inhibit the development of strategic applications, while too large an organization may not deliver desired business value in a cost-effective manner.
- Develop vendor management expertise that includes knowledge about location constraints, vendor performance, and vendor abilities. Such capabilities will facilitate careful vendor selection and help mitigate the multiple risks associated with outsourcing. Using pilot projects related to non-mission-critical applications is a low-risk tactic for learning the strengths and weaknesses of offshore locations.
- Instill a project management culture and imbue the technology organization with project management expertise. Project management is both a science and an art and needs to be formally learned and practiced on the job. Poor project management is one of the most significant risks that technology organizations face and can frequently spell the difference between firms that are able to exploit technology for business value and those that are not.
- Organize and manage based on value-creating processes. Do not set up committees for their own sake. Take stock of value-creating processes that these organizational structures will support. Remember that the level of complexity associated with an organizational unit will vary based on the sophistication of the governance network it supports. Apply a modular-organizing logic

Develop bottom-up change agents - rarely does change result solely from a top-down edict.

in designing critical technology organization structures. Consider explicitly assigning individual executives to each one of these modular organizational units.

- Recognize that organization design and change management are critical organizational capabilities. Organization design changes must be managed with care. Strong relationships need to be built with stakeholders. How can you promote "straight talk" in an environment that values commitment and relationships? How can you lead your team to accept that difficulties along the way are not failures, but rather a normal part of the change process? How will you resolve these rough spots and build on them to fuel the organizational change effort? Develop bottom-up change agents - rarely does change result solely from a top-down edict. Lower-level employees must buy in. Cultivating change agents can guarantee their support in selling their peers.
- Develop your communication strategy and management capability, which has significant implications for evolving organization structures. Therefore, communications strategy and management is the responsibility of the entire senior management team. They should be supported by expert communications professionals to ensure that the strategy is based on user feedback and goals; to define a path to move target audiences from mere awareness to understanding, commitment, and action; and to ensure that suitable research, timelines, and measurements of success are included.

Formulate

It's time to formulate, the step in which, having performed extensive assessment, you can begin selecting those objectives that you've determined to mean the most to your organization - those that are aligned with what you are and what you aspire to be and are adequately supported by technology, governance, and processes.

- Consider using a portfolio approach to make certain that all technology receives adequate financial support to remain aligned with core business objectives.
- Educate senior executives and start small. Begin to educate senior business and technology executives about the benefits of a portfolio approach. Consider developing a project portfolio management (PPM) capability for a small slice of the business to demonstrate the benefits and build consensus for embarking on an enterprise-wide effort.
- Establish management commitment and vision. Most of PPM implementation is not technical but managerial, and the commitment and strategic vision of top executives should be established and sustained. PPM involves many different people needing to do things differently within the organization and must be supported by senior management to achieve success.
- Address new organizational structures early on. Plan the creation of an Enterprise Program Management Office (EPMO), which in most cases owns PPM. The EPMO's responsibilities need to include educating the company on PPM processes and collaborating with key constituents to establish portfolio management approaches. This group will also provide the tools to analyze portfolios and gain access to the inventory of programs, initiatives, and assets. Additionally, create a Business Technology Council, the upper-level strategic decision-making body.
- Design information management processes explicitly. PPM will be an outright failure if the information gathering is not performed adequately from the outset and not kept up to date. Specific processes and responsibilities related to the creation, approval, and updating of information are critical.

Take Off

After what likely amounts to extensive planning, legwork, research, evaluation, and countless other tasks, you're ready to begin the actual implementation of your organization's *Transformation*.

- Understand the appropriate level of business agility for your organization. Refine and exploit competencies required to operate competitively in strategic

positions and strategically reposition your business into new product-market spaces through exploration. Understanding the appropriate level of agility has vast implications for how processes are modeled, configured across business networks, and then enabled by service-oriented architecture (SOA).

- Select modeling approaches for your business processes. New information technologies and architectures (for example, SOA), coupled with strategic enterprise architecture (SEA) and a mandate for agile design, require senior management to reconsider the firm's core processes.
- Create the appropriate level of agility for a business network.
- Processes must first be established to sense and capture customer requirements and translate them into specifications of outcomes.
- Second, processes are required to integrate information from the business network and add to the base of public and market information.
- Third, processes must enable tailoring of interactions, information sharing, and intellectual property protection.
- Fourth, processes are required for the management of activities associated with production and distribution of products and services, as they must be reallocated and coordinated based on changing conditions.
- Fifth, governance of relationships must be implemented to enable negotiation and monitoring across activities in business processes and networks. Given the process enablers that are required for the real-time enterprise, it is critical to establish the information services platform required by these processes.
- Develop your SEA functional area. This is absolutely necessary for an agile organization. Technology capabilities must be synchronized with the process requirements of real-time business networks. This synchronization requires senior executives to think primarily in terms of the services they provide and the key business processes and networks that enable, and are enabled by, these services. Senior executives must define the necessary leadership roles, structures, and processes.

Study: Evaluate Your Transformation

It's now time to evaluate your own *Transformation*, and build confidence that it was, in fact, all worth it and then some, and, just as valuable, sift through your experience to improve the journey forward.

- Establish the business purpose of each investment in technology: Is it to enable growth, maintain the infrastructure, or manage risk?
- Determine whether the metrics you use have changed along with changes in business processes and technology.
- Agree on new metrics that show how your organization creates agility, sense-and-respond capabilities, and digital options. This agreement will ultimately lead to metrics that accurately measure business value.
- Understand the business environment and how the firm adjusts its strategy to changes in the environment. This often requires continued real-time adjustments in operations, placing greater onus on technology executives to have an efficient system to gather information and present business alternatives.
- Leverage approval, prioritization, consolidation, and standardization to manage and define the information requirements to support a highly information-oriented culture.
- Translate business strategy into tactical plans for which information and communication technologies can be deployed. It is increasingly the role of technology executives to make this connection. Executives must take the lead in communicating areas where technology can add value. Employees must be made aware of how these opportunities relate to their jobs.
- Identify complementary investments necessary to get full value out of technology investments. Instill in employees the behavior and values that will lead to information for customers, suppliers, and partner relationships.

SECTION 4: FINAL THOUGHTS

Organizational Transformation is a journey that never stops. It's up to you to keep steering in the correct direction. Accordingly, staying on the right course with your organizational *Transformation* mandates your continued evolution as a leader as well.

Leaders of the future must embrace the following:

- *Follow the money.* They must focus on the business and understand how it creates value.
- *Know that managing technology is as important as the technology itself.* The next generation of leaders will understand

that they must invest in managing technology and the technology itself.

- *Understand what technology does.* Unless they appreciate that technology often plays a critical role in establishing or maintaining a strategic position, leaders may well spend inappropriately.
- *See through walls.* Tomorrow's leaders will be far more comfortable with deriving value through partnerships and other types of engagements.
- *Manage business and technology as one.* Executives will come to see that technology failure is often due to weak or non-existent business strategy or failure to create a business-driven technology strategy.
- *Scrap the org chart.* We are already seeing the blending of corporate roles.
- *Get underneath the hood.* Leaders must be able to discern business processes below the overarching posture of an organization that advances strategy.

As you and your organization move forward, so too must you continue to hone, sharpen, and, if need be, change elements of your leadership.

THE SUMMARY IN BRIEF

The ability of businesses to prosper in this uncertain environment demands a resilient mindset at all levels of an organization.

The book, ***Results, Not Reports: Building Exceptional Organizations by Integrating Process, Performance, and People*** unravels the framework for establishing lasting profitability and performance. The pages within lay out the roadmap to achieving solid improvement goals by deploying dynamic management of process, people, and performance.

Author Peter Follows encourages leaders to take their organizations to the zenith by offering an improvement cycle that involves three parts: Where to Look, What to Improve, and How to Get Results. His strategies help leaders and managers assess opportunities, replace nonproductive time with productive time, create a solid results strategy, improve processes, and more.

IN THIS SUMMARY, YOU WILL LEARN:

- How to assess performance opportunities.
- Where to look, what to improve, and how to get results.
- How to align process, people, and performance.
- How to implement valuable change.

Introduction: Why Change Requires Change

This book was written for senior leaders who need to execute their strategies. The intent is to provide a different way to frame and think about getting results and specifically how the integration of process, performance, and people is critical to develop and implement changes that stick. It is divided into three parts: Where to Look, What to Improve, and How to Get Results. We'll explore each of these areas and highlight how traditional management thinking leads to disappointing results and then contrast that with the benefits of thinking holistically about process, performance, and people.

Part 1: Where to Look

Chapter 1: The Results Equation

Results are the sustained elevation in the performance of a targeted indicator. Results can be achieved in any key financial or operating indicator, such as revenue, cost, quality, safety, or service. The key to achieving sustainable results is creating an environment that supports the ongoing, dynamic management of process, performance, and people.

All organizations are made up of processes. A process is simply two or more value-added steps that require a hand-off of material or information to create a finished product or service. The goal of every great process is to maximize productive time and minimize unproductive time.

Performance refers to the performance system that provides management with information. The objective is to align financial and operating indicators and all levels of management.

People refers primarily to management behaviors and employee skills. The objective is to improve the effectiveness of the time that managers spend planning, communicating, following up, and problem-solving, or what we call dynamic management.

Results don't just materialize through good intentions. They require an intentional and deliberate change in how you manage.

Chapter 2: Assess the Opportunity

Opportunity assessment links critical key financial and operating indicators to identify gaps in current performance and to identify recoverable opportunities. It provides a business case and an overall strategy to improve the organization's results. The three areas of opportunity assessment include:

Linking Finance and Operations. To understand the financial numbers and to determine what operating activities drive them, you need to create a profit driver model. At the highest level, focus on three financial areas that determine the profitability of the organization: revenue, cost, and capital efficiency. But the financial numbers on their own aren't overly helpful, so you need to dig deeper into the underlying drivers of those outcomes and connect the financial and operating worlds together.

Evaluating Operating Performance. Start by maximizing productive time and minimizing nonproductive time. Productive time is the time that the customer would be willing to pay for. Nonproductive time is the time people spend reworking, firefighting, expediting, or doing something because there's a breakdown somewhere else in the process. Next, study the alignment of the performance systems. Performance system challenges typically start with a basic disconnect between finance and operations. Key planning tools include budgets, forecasts, work plans, and work schedules. For all of these to be effectively integrated, you need accurate planning standards and reasonable mathematical relationships among revenue dollars, functional volume, and activities. The final step is to observe how managers interact with their staff.

Building a Business Case. For executives to determine whether it makes sense to pursue any improvement opportunity, the assessment needs to identify the expected value to the organization. The following steps can help build a solid business case:

- Assess potential improvement
- Develop an overall strategy
- Create a work plan
- Develop a cash flow plan

Chapter 3: Create a Results Strategy

The Results Strategy articulates how results will be achieved and how the impact will be seen in key indicators and financial statements. It identifies potential issues and complications, early in the initiative, that need to be considered. The strategy also sets expectations regarding what people should expect in terms of activities, focus, timing, and participation.

Creating a results strategy starts with identifying the focus areas. These include revenue-based initiatives, cost-based

initiatives, and capital-based initiatives. For each focus area, you need to articulate where and how measurable results will be achieved.

Next, determine how to measure results. This can be done by:

Ensuring savings are real. One of the heartbreaks of performance improvement is to generate legitimate gains in productivity only to discover they've had no material impact on financial results. This happens when a productivity gain in one area is offset by a productivity loss in another.

Getting the baseline right. A basic method to measure improvement is to compare the current period to a similar period. Companies make changes all the time that impact the comparison. The more volumes fluctuate, the harder it is to create a useful baseline – and the more important it is to find reasonably comparative periods.

Reviewing the link to incentives. Compensation incentives have a powerful influence on people's behaviors. For incentives to be effective, the expectations and measurements must be very clear so that people understand the way decisions are made.

Finally, develop a communication strategy by establishing solid stakeholder communication and employee engagement.

Part 2: What to Improve

Chapter 4: Improve Processes

Improving processes starts with understanding your organization's current challenges. Here are three reasons process challenges exist:

1. Can't fix external problems. Many managers don't believe there is a significant opportunity to improve. It's partly because they don't see it, but it's also because they think it's largely caused by forces beyond their control. However, even with legitimate external factors there is usually more ability to influence external departments than realized.

2. Experience gets in the way. Industry expertise is sometimes needed to solve technical problems, but for general change management, it can be a hindrance.

3. The way organizations are designed. The most common approach to organization design is to set up vertical functions like sales, engineering, operations, and distribution. Processes, however, tend to flow horizontally through different functions.

So, how do you identify process challenges? Here are four ways to go about it:

Look externally. Although not ideal for uncovering process opportunities, benchmarking can be useful to identify comparative pricing for similar items, salary levels for similar functions, or simply to learn from other industries.

Define the process. Finding opportunity starts with defining the process itself.

Analyze the process. People often don't really analyze a process. They create a wall map of activities, but they don't look at the detail hidden in volumes, capacities, and variation. Sometimes the mapped process reflects what people think should happen as opposed to what actually happens.

Follow the constraint areas. Remember, just because you can't see opportunity in a process, it doesn't mean it isn't there.

Finally, how do you improve a process? Start by understanding the real problem before implementing a solution. Attack the nonproductive time first. This involves improving the productive time by taking an existing process and reconfiguring it so that it's more effective. Give employees ownership of the changes going on around them by involving them while redesigning methods, or layouts in their work areas.

Chapter 5: Align Performance Systems

Performance systems are arguably the most important tool for aligning an organization. They translate the CEO's strategy into specific activities and accountabilities. The main challenge is trying to align levels of management that think differently and that have varied planning horizons.

But why do performance systems get unaligned? To start with, scheduling is often sequencing. The point of execution is sometimes not well managed. There's too much data available and measurement is often only used for evaluation, not information. So, how do you identify performance system challenges? Start with understanding the type of performance system. Next, map the system and begin to identify gaps. Finally, how do you align performance systems? Here are four quick steps to go about it:

1. Limit the key performance indicators. A useful technique to identify key indicators is to speak with leaders at various levels and to understand what

information they routinely look for. Eventually and through experience, you begin to learn what to focus on and how to ignore the noise.

2. Improve scheduling. Improving performance always requires better scheduling. Schedules are generated either forward from a starting point or backward from a due date. Improving the way you schedule leads to a better understanding of customer demand, order change management, resource productivity, service requirements, flexibility, and inventory management.

3. Make performance visible. Managers often get performance feedback sometimes after an event has occurred, which naturally limits its usefulness. Information that arrives in the day, for the day, allows managers to address issues while they are relevant and impacting workflow.

4. Make people accountable. Make sure your people are genuinely accountable for at least what they can manage.

Chapter 6: Develop People

The way people do things and the way they interact with one another are the result of years of patterning. To change people's behavior, you need to reshape their environment. Some of the most common people challenges include: Productivity is a management problem, Good intentions have unintended consequences, Problem-solving is often reactive, Work assignments are lacking, and Following up is not micromanagement.

The three best ways to identify people challenges include: Experiencing what the frontline staff experiences, Assessing manager behaviors regularly, and Observing how people interact with each other and the management.

Here are three ways to change behaviors for the better:

1. Improve manager-employee interaction. Your managers must possess skills like resource planning, work scheduling, assigning work and communicating expectations, following up, giving feedback, problem-solving, training, and coaching to improve performance and general administration.

2. Focus on how managers follow up. Most people want their work to have a purpose and enjoy being productive. When managers follow up in a meaningful way, the relationship between manager and employee changes from a reactive orientation to an active mutual collaboration.

3. Build a behavior model. To define what management needs to do to help support employees, it's vital to build a visual model that provides clarity as to what is expected from managers at different levels of the organization.

Part 3: How to Get Results

Chapter 7: Focus the Effort

The Focus Meeting is designed to energize the organization and to ensure that operating managers have ownership of the initiative. The purpose is to communicate what's changing, why it's important, and why this will be of benefit to people. The meeting also clarifies what specifically needs to happen, what people need to know, and what they need to do.

Always row in the same direction. Understand the emotional cycle of change. Transfer ownership to operations and pre-present ideas. It's easy to find yourself in a position where you don't have time to review with everyone before the meeting, but good ideas routinely go down in flames because of this error.

Communicate the vision and articulate what's in it for everyone. This includes presenting the base results (visual depiction of the financial and operational performance during the base period), current state, results strategy, and required results.

Chapter 8: Prepare for Change

The Prepare for Change phase is designed to get the system tools ready and to prepare management prior to a full implementation. There are two main aspects to focus on here: training managers and prototyping method changes.

Start by organizing for change. Always know what to expect and develop countdown schedules. Each key work stream requires a tailored plan identifying the nuts and bolts of the actual change migration. This includes performance planning, resource requirements, technology changes, management and skills training, and other related activities.

Train and coach managers. This includes crafting a solid training overview, implementing innovative social and management styles, planning, communicating, following up, and problem-solving.

Conduct prototypes. The prototypes your organization develops must help managers take theoretical concepts and apply them to real-world conditions. An example of a prototype could be increasing the throughput of a specific machine or group of machines where work is bottlenecking. Prototype creation involves focusing on three main areas: process considerations, performance system considerations, and people considerations.

Chapter 9: Implement Change

Implementing change is part of an evolution in management capability; it's not an event. The objective is not to put a temporary focus on operations, make a few method changes, and claim victory. It's a transition to a new way to manage the organization.

Start by cultivating implementation mindsets. For permanent and lasting change, everyone involved needs to understand what's changing and genuinely care about making those changes successful. Visible leadership can't be just symbolic. Leaders can't show up for the kickoff event and then disappear. They need to remain visible and reinforce the company message for as long as it takes for methods and behaviors to take hold.

Focus on getting results. For your organization to arrive at solid results, leaders need to lead, managers need to manage, and change agents need to support change.

Cement your gains constantly. Improved performance is quantified through a measurable impact on financial results for the area. But a common mistake is to get to this new higher level of performance and declare victory too soon. A great way of cementing your gains is to fix all broken windows or red flags. Broken windows are warning signs that a department is starting to return to former habits. These can seem relatively innocuous at first, but they collectively have a way of eroding performance gains over time. Finally, continue building a high-performing team to ensure your performance gains grow over time.

Conclusion

Organizations can never stop adapting and never stop learning. Every evolution has an impact on processes, the performance systems required to manage them, and the skills and tools needed by the workforce. The results equation provides a framework to help you manage these shifts as they occur. The aim of this book is to simplify a complex methodology and to outline its fundamental principles. It is a compilation of the valuable lessons we have gained from our clients, mentors, and partners.

Our collective experiences will hopefully provide you with practical insights to navigate any challenges you may face and assist you in creating an exceptional organization.

Reviving Work Ethic

A Leader's Guide to Ending Entitlement and Restoring Pride in the Emerging Workforce

by Eric Chester

THE SUMMARY IN BRIEF

Reviving Work Ethic is a guide for frustrated managers and leaders on how to instill a strong work ethic in the modern workforce.

Work ethic in America is fast declining, plaguing young and old alike. But in *Reviving Work Ethic*, renowned consultant, speaker and author Eric Chester shows that you do best to focus on your young employees — those whose habits and ideals can still be influenced. He presents an incisive look at the root of the entitlement mentality that afflicts many in the emerging workforce and shows you the specific actions you can take to give your employees a deep commitment to performing excellent work.

Chester's advice is crucial to a healthy bottom line: Too often, talented-but-difficult-to-understand younger workers stand between your company and profits. If business owners, managers and executives are not connecting with employees and modeling the key components of work ethic, employees are likely not connecting effectively with customers — leaving all kinds of money on the table.

Reviving Work Ethic is the culmination of years of research as well as presentations to more than 2 million youth. Chester's experience shows in his confident analysis of the seven components of work ethic and in his proven strategies for handing them down to young employees.

IN THIS SUMMARY, YOU WILL LEARN:

- Advice for leaders that is both practical and solid.
- How to get inside the heads — and hearts — of young people.
- How to get young people to take pride in their work.
- How to improve the performance of young people in today's workforce.
- Seven components of work ethic and proven strategies for handing them down to the emerging workforce.

THE COMPLETE SUMMARY: **REVIVING WORK ETHIC**

by Eric Chester

The author: Eric Chester is an expert in school-to-work transition. He has presented for more than 2 million youth at 1,500 high schools and colleges, and has spoken to hundreds of leading companies and organizations. Chester is the author four books, most recently *Getting Them to Give a Damn,* and has co-authored eight others. He's the founder of the Bring Your "A" Game to Work youth training and certification program, and is the president of Reviving Work Ethic, Inc., a speaking and consulting firm.

Introduction

A person's *qualities* lay the foundation for his or her *achievements*. It's hard to achieve anything worthy of merit without demonstrating qualities like reliability, determination, perseverance and integrity. And while *possessions* can make you happy, they won't fill you with pride if they've blown into your life without achievement.

There was a time when achievement meant more than possessions, and when character (a person's qualities) was valued more than achievement. Americans felt good about putting in an honest day's work for an honest day's pay. This was the time when "Made in America" was the best label any product could bear, quality was everyone's priority and companies made decisions to ensure long-term stability — not short-term gains for stockholders.

But young adults today have grown up in a world where most people work hard to find ways of avoiding hard work. They've heard stories telling how lottery winners, day traders, bloggers, dot-commers and Internet marketers have managed to beat the system and derive a huge bounty with little or no effort. They've been inundated with reality television that turns talentless fools into millionaires in the blink of an eye and with the greatest of ease.

Is it any wonder there is a burgeoning entitlement mentality among the new workforce?

Work has degenerated to little more than a four letter word; a necessary evil. It's no longer viewed as something to be proud of, but rather something to disdain, to shortcut or to elude all together.

If we do nothing to reverse this gross misconception, we will not only be doing our kids a great disservice; we will be allowing the further contamination of our labor pool.

Leaders can no longer stand idly by in hopes that parents and teachers will resume the responsibility for instilling work ethic. Parents now focus most of their attention on ensuring that their kids are healthy, happy and have a high self-esteem. Meanwhile, schools are facing widespread criticism and massive cutbacks, and are concentrating every available resource on increasing test scores and keeping students safe.

Therefore, the burden of developing work ethic within the emerging workforce has shifted to employers. Organizations that neglect this responsibility will continue to point the finger at parents and schools for the unsatisfactory product they are getting. They'll have no choice but to export labor overseas, replace human interaction with touchscreen technologies or churn-and-burn their front-line people, whom they see as an expendable commodity.

Leaders who accept this new reality and rise to the challenge will create cultures that promote the qualities and values needed. In doing so, they will develop talent pools that soon run deep with creative, energetic and dedicated individuals whose efforts boldly exclaim, "I'm proud of my work."

It's time to revive work ethic. ●

Rewinding the Game of Life

The Current State of Work Ethic

Somewhere along the way, Western culture has lost sight of the virtues that comprise work ethic — the very

things that helped build our country. The pursuit of happiness and the American Dream drove progress and innovation, but they came with unintended side effects. In many cases, for instance, healthy ambition has morphed into avarice. Urbanization and an emphasis on large-scale businesses means fewer and fewer kids are learning abut work in the natural course of family life. Technological advances that make life faster, more fun, more entertaining and easier to navigate are also consuming our time and energy while eliminating avenues for learning vital concepts about work. And pop psychologists have pushed parents to focus on building self-esteem in their children, creating at least two generations of me-centric workers.

America's emerging workforce — those in the 16-to-24 age bracket — finds itself uniquely positioned to turn this tide, both because of its size (50 million by some estimations) and because the young are the most moldable. A transformation — or at the very least, an introduction — to traditional work ethic within this age group will last for decades and influence the workforce and communities in positive ways for generations.

In February 2010, the Pew Research Center released an extensive report titled "Millennials: A portrait of Generation Next" that describes this generation (ages 18 to 29) as "confident, self-expressive, liberal, upbeat, and open to change." It is history's first "always connected generation," the report says, and it's on track to become the "most educated generation in American history." But this generation doesn't identify with work ethic.

Many of the negative habits, mindsets and attitudes embedded in the emerging workforce result from messages that have focused on how great young people are and how they are special enough to warrant success.

Fostering positive self-esteem seems pretty good on the surface; it's much better than promoting self-loathing, but the heart of the self-esteem message is to esteem the self, and eventually that creates a self-focused, entitled mentality. So while the emerging workforce has been taught the importance of saving the world, these individuals also feel empowered to do so strictly on their own terms. They can quickly change course and move away from the most high-minded agenda if it isn't meeting their personal, self-established needs.

Naturally, this mentality — esteem for self over others — finds its way into the workforce as a lack of respect for anything that doesn't please and satisfy the young employee's selfish desires.

Instilling a traditional work ethic into the emerging workforce can produce a seismic economic and cultural shift in America. We have an emerging workforce that embraces change, is better educated and more innovation-focused than any previous generation, and wants to change the world for the better.

All of the advantages, however, can become seeds lost among the weeds. To make sure they find fertile soil, take root, grow and bear fruit, members of the emerging workforce must shed their notions about being entitled to a job, and about reward coming before effort. ●

Coming to Terms with This Thing Called Work Ethic

When children are old enough to understand and comprehend basic commands, parents and teachers begin subtly and overtly programming their value systems. This begins shortly after birth and increases daily, all in an attempt to help the little tykes make good choices; their parents and teachers hope these good choices will help them live a happier and more successful life.

Sandbox Values

The common messages behind the values taught to children transcend cultural, ethnic, gender, religious and economic differences. Children all around the world are taught to:

- Smile and play nice.
- Be prompt.
- Look their best.
- Do their best.
- Obey the rules.
- Tell the truth.
- Say *please* and *thank you*.

Now compare those Sandbox Values to a sentence which summarizes hundreds of responses from business leaders who were asked what they are looking for in their employees:

Employers are searching for positive, enthusiastic people who show up for work on time, who are dressed and prepared properly, who go out of their way to add value and do more than what's required of them, who are honest, who will play by the rules and who will give cheerful, friendly service regardless of the situation.

As you can see, the work ethic that employers desire is rooted in the exact same lessons we learned as toddlers.

To bridge the Sandbox Values and the values that make up work ethic, here are seven terms — markers, if you will — that summarize the values that are common to both: positive attitude, reliability, professionalism, initiative, respect, integrity and gratitude.

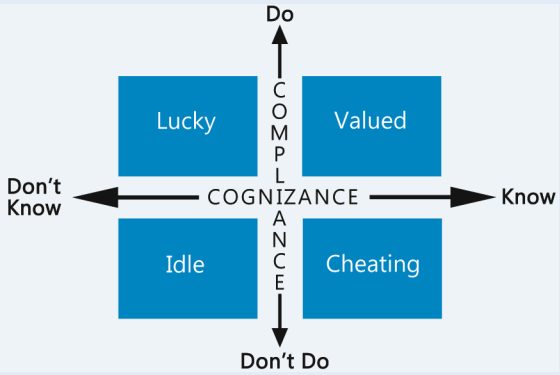
There are no negotiables in this list. By that I mean that there isn't any one of the work ethic markers to which you, as a leader, don't personally aspire and hold yourself accountable. Likewise, you expect these same core values to be evident in everyone you work for, work with and oversee.

But before we launch into a strategic discussion of how we can develop each of these markers — and perhaps even more elementary than that, why the challenge of developing these core values in the emerging workforce now rests with employers — let's take a look at our new definition of work ethic:

Work ethic is knowing what to do and doing it. It is marked by an individual's positive attitude, reliability, professionalism, initiative, respect, integrity and gratitude.

Instilling those seven attributes into the hearts and minds of the emerging workforce is the key to keeping our companies — and our country — stable and prosperous. For America's young employees, work ethic is the key to success, whether they are flipping burgers, roofing houses, checking a patient's blood pressure or piloting spacecraft for NASA. ●

Up and Over — The Leader's Challenge



Let's use a horizontal axis to represent a worker's knowledge or "cognizance," of how those seven work ethic markers affect his or her value to an employer. This is the "knowing what to do" part of the definition. So ignorance — not knowing what to do — resides on the left side of the axis. The more a worker learns about what he or she should do, the more he or she moves to the right, toward the "know" side.

We'll then overlay a vertical axis to represent an individual's choices, actions and behaviors as they relate to the seven work ethic markers. This is his or her "compliance" — the "doing it" part of the definition. Inactivity — not doing what he or she should be doing — resides at the bottom. The more the individual "does" — in other words, the more he or she demonstrates behavior proving knowledge of the core values of work ethic — the more he or she moves upward.

By dissecting the cognitive axis (*don't know* and *know*) with the compliance axis (*don't do* and *do*), we can begin to see four distinct quadrants and behavior:

• **The Idle Quadrant.** In the bottom-left quadrant are employees who don't understand work ethic (or any specific marker of it) and don't live it out. Quite simply, they don't know what any of these seven core values really mean or how they play out in the workplace. If they heard these values expressed when they were children, they left them behind in the sandbox or they were stripped of them in their adolescence. As a result, they don't demonstrate the behavior that is expected of them by their employers.

The Work Ethic Matrix

• **The Lucky Quadrant.** If you've ever played a game without understanding all the rules and won anyway, you've experienced blind luck. This is similar to a worker who has no real comprehension of the markers of work ethic, but takes action that coincidentally demonstrates a core work ethic value. Although the outcome is positive, the behavior is not fueled by commitment, so it's unsustainable.

• **The Cheating Quadrant.** The quadrant in the lower right is where we lose people who understand what they should do but choose not to live it out. This cheating behavior is the most dangerous to leaders, because it pits them squarely at odds with their people.

• **The Valued Quadrant.** Workers who possess a clear knowledge of the seven individual markers of core work ethic, and, as a result, make decisions and choices that demonstrate those markers are operating in an optimal state. These are the workers that make up the Valued Quadrant.

Workers, and not just those in the emerging workforce, move in and out of the four quadrants of work ethic all the time. We all move up and down and from side to side. If we aren't intentionally trying to stay in the Valued Quadrant, we inevitably move out of it.

Great leaders find ways to move people to the right and up on the Work Ethic Matrix and inspire them to operate in a valued state.

How do you move others (and yourself) into the Valued Quadrant? You do that by reaching into those other quadrants and pulling whoever is there up and to

the right. You teach them what they need to know, and you motivate and inspire them to do it. It's a role best defined as part teacher, part motivator. It's in this role that a leader distances him- or herself from being a mere manager by adding real value to his or her people and organization. ●

What Happens When You're Not Watching

Developing cognizance without working hard to gain compliance is akin to entering vast amounts of data into a computer and then unplugging it; it is a waste of time and resources. The computer has to operate to create any value from the data. So let's look at three key elements for generating buy-in for work ethic values.

• **Relevance.** Members of the emerging workforce need to know the why before they will take action on the what. "Don't just tell me what to do," they say (or think). "Tell me why I'm doing it." Explaining the relevance of the desired action is a way of connecting the dots between *what* and *why*.

• **Reward.** There are ways to build in incentives and rewards that encourage and reinforce positive behaviors and create habits that become the building blocks for excellence. Business leaders can create a reward structure that promotes a positive work ethic, not just incentives for those who achieve above-and-beyond excellence.

• **Radiate.** The most powerful values of an organization are radiated throughout the culture. *Radiate*, a transitive verb, means to spread something around as it emanates from a center. The key to radiating values is to spread them throughout teams and organizations. ●

Positive Attitude

Maintaining a positive, optimistic, enthusiastic attitude — regardless of the situation — is an essential component of every job description. That's why it's always the first thing mentioned when employers are asked what they are looking for in new hires. Without question, moving the emerging workforce up, over and into the Valued Quadrant begins with this foundational value.

If you want someone to display a positive attitude at work, you first need to make sure they know what you mean by a positive attitude and what it looks like in your organization. They need to see living examples of positive attitude in action when working for you, and they should be put into situations that allow them to shadow people who model the attitude you are trying to replicate in them. Attitude is contagious, so let them catch the right virus and go out of your way to make certain they aren't infected with the wrong ones.

Clarifying what a good attitude is begins with the hiring process. You need to be very direct about the duties involved in the job — the good, the bad and the ugly — so you can get the properly shaped pegs in the properly shaped holes.

An Infectious Culture

A positive attitude at work is infectious, so the more you call it out to others and encourage it in key employees, the easier it will be for you to radiate it throughout your culture. This starts with the small things you do, like calling out the guy who works a double shift or the receptionist who comes in when it's snowing, but it continues with how far you radiate those kinds of things each day.

To create a positive culture, talk to your young people about the good things that are happening throughout your business. If you can't share positive news about the company, shine the light on something good that's taking place in your community, the nation or the world. Make it your mission to be a purveyor of good tidings. ●

Reliability

If businesses depend on reliability, and reliability originates with employees, then business leaders need to infuse reliability into their company cultures. The best place to start is by focusing on the significance of being reliable and taking great strides to make certain all of your people understand how important reliability is to you, how it embodies the values of the organization and how it affects their future within the organization.

Reliability begins with showing up — being where you are supposed to be, when you are supposed to be there. That's a foundational expectation that your customers have of you and that you have of your team members.

Developing reliable employees requires helping them see through the myths of popular culture. To borrow the phrasing from the beginning of the old show *ABC's Wide World of Sports*, you need to figure out how to make them experience the thrill of victory (being able to rely on someone to come through) as well as the agony of defeat (when someone they rely on lets them down). Through role-playing, discussion or actual events that they experience while on the job, helping them see how reliability makes or breaks a business — and a career — is absolutely crucial.

Obviously, this starts with setting clear expectations for each worker and then holding tight to those standards. There always come times when good managers make exceptions to the rules, but boundaries are worthless if they aren't consistently enforced. That means you need to think through your expectations for reliability, including the consequences when people are unreliable and the rewards for those who prove their dependability. ●

Professionalism

A professional, quite simply, is someone who understands and represents the organization's best interests, even when that means sacrificing personal preferences. Sometimes preferences line up squarely with the organization's needs, but often, especially for the emerging workforce, they don't. A professional puts the job ahead of personal desires. That means respecting the employer's culture, but it also means acting in the organization's best interests in ways that typically aren't covered by company policy.

Professionalism isn't just what a worker does, but how he or she goes about doing it. How the individual conducts and presents him- or herself — the way he or she dresses, his or her body language, tone of voice, the words chosen, hygiene — all define the worker's persona and become a display of his or her professionalism or lack thereof.

The biggest frustration many leaders experience with the emerging workforce comes from a seeming unwillingness to dress and act like professionals.

With young employees, it's vitally important to clarify your expectations for professionalism even before hiring them. Don't hand them a book of rules; instead, have a conversation that gives you an opportunity to explain what it takes to succeed in your organization, and allows them the freedom to respond to make sure they are on the same page. ●

Initiative

Initiative is relevant to the company because it prepares the worker for additional assignments and makes him or her invaluable to the employer. It's relevant to the employee because it gives life to goals and ambitions, and is the component of work ethic that makes an employee feel the most proud. The employee with initiative can say, "I did that without being told, and I know it made a difference." Initiative will also put him or her in great demand by future employers.

Even though they might not come to you begging for more work, your employees want to know how they can contribute value to the company. When you let them know that you have a problem you'd like their input on, you'd be amazed at the initiative they'll take in trying to help you solve it. Whether or not they hit on the right solution, getting their minds working toward finding solutions to problems and inviting their contribution takes them out of the automaton state and moves them into an entirely different mindset: "This is my business, too, and when I have an idea for making something better, or if I see a problem that needs fixing, I can add value to the company — and also make myself more valuable in the process." That's right where you want them — fully engaged with head, heart and hands!

Reward Demonstrations of Initiative

When they demonstrate initiative, reward it. You can applaud it on the spot. You can honor it during team meetings. You can acknowledge it in front of employees, clients and customers. You can promote it in the media — both social and traditional. And you can straight-out pay for it by providing a bonus or promotion that says to your entire staff, "We're always on the lookout for people who put their mind — and elbow grease — to work around here." ●

Leave Nothing to Chance

When addressing something as important — and as controversial — as a dress code, don't simply describe it verbally or expect them to read it in the company handbook. Instead, show photographs of employees wearing both appropriate and inappropriate attire. This is inexpensive and very easy to do. Again, leave nothing to chance and don't surprise them with the specifics of your dress code after they've been hired and are making their way through your orientation.

Respect

The emerging workforce wants and needs rules and boundaries, but it doesn't respond well to fear-mongering managers.

Respect blossoms from well-nurtured relationships that are rooted in love, not fear. So the most important thing any leader can do when it comes to cultivating respect is to provide examples of respect. Display a respectful, sacrificial character — be positive, trust others, be polite, listen, be reliable, obey the rules, show mercy. In short, love others and the people around you will respect you for it.

Lead by Example

Fight the urge to demand workers' respect. Unless they're in a life-and-death situation, you're not going to get it. Instead, treat them with the same degree of respect you'd like from them and your actions will be mirrored. At the same time, don't let their definition of respect become yours. You are the boss and are in control. They know that and they'll respect you more for not immediately caving in to their demands. Instead, lead by example. They won't automatically respect you because you are older or because you have an important title attached to your name.

The good news is that your younger workers respect authenticity, accomplishment and competence. If you have a strong personality, let it out. They have strong personalities too, and they are very tolerant of other people's differences. Remember, though, that they can spot a phony in a heartbeat. If you are naturally quiet, then demonstrate to them that you know what you're doing based on experience. When they learn what you did to get where you are — and they see your hard work and character shine through — you will earn their respect.

Integrity

Real integrity becomes a part of a person's operating system. Real integrity requires a buy-in and commitment that's from the heart, not just the head.

You can help inspire that with encouraging words and by rewarding and recognizing integrity in the workplace. But to really get buy-in from the emerging workforce, you have to help these individuals value trust and honesty in a world that appears to promote and even celebrate the opposite. How?

First, ditch the punitive. Scare tactics don't work with the emerging workforce. These workers know that the odds of you filing charges against them are slim, because they know how much time and money that will cost you. If you do prosecute them, they know that even if you can prove your case, they'll probably get off with a slap on the wrist. They aren't easily scared by threats and you don't want people who are only honest because they're afraid of getting caught. That doesn't mean you shouldn't clearly communicate consequences. And, by all means, you should enforce those clearly communicated policies. But don't think punishments or the threat of punishment will significantly affect the behaviors of the emerging workforce.

Second, you have to trust them. It's hard, especially when you go back and read the statistics that indicate that this generation of workers, by and large, sees cheating and lying as acceptable. But this generation hates to be micromanaged. If you clearly describe your expectations and set high standards, but then constantly look over workers' shoulders, they will quickly feel like you don't trust them. This will likely make them live down to your expectations. You need checks and balances that protect your business, but give employees a chance to earn your trust. Start with small things and move forward. The greatest way to build trust in a young person is to show that you trust him or her.

Pull Them Out of Their 'Me First' Bubbles

Third, and this is the biggie, you have to pull employees out of their "me first" bubbles and let them see how dishonesty affects both the people around them and their own personal peace. For example, a young employee might think that hooking his buddy up with a free soft drink isn't really an integrity issue. He's been told that fountain drinks are a high-profit item and that it only costs the company a couple of cents for the syrup and the cup. He thinks, "This company makes millions, so it's not going to miss a few pennies here and there." He's thinking of himself, his friends and his reputation, and he doesn't see the connection between his behavior and the real cost to anyone outside his bubble.

This is where a leader can make a tremendous difference. By understanding the mentality, he or she can make certain his or her people know the real cost of the fountain drink — well beyond the cost of the ingredients — and share with them how heavily the company relies on every cent to keep people employed and maintain growth. He or she can also let them know that prices rise when waste of any kind occurs.

Granted, a three-minute lesson like this isn't going to dramatically alter the behavior of anyone and transform a dishonest kid into a boy scout, but it will go a long way toward removing some of the rationalizations the kid might be using to justify his or her actions. From that point forward, he or she will be forced to, at the very least, consider how his or her actions might adversely affect the company, his or her boss and co-workers, and even his or her peace of mind.

Gratitude

When the Grinch stole Christmas from all the Whos down in Whoville, he lacked a basic understanding of the spirit behind the holiday. The scrawny-limbed hermit with a nasty attitude and a foul grimace hated the world and everything in it, and he wanted everything and everyone to share in his misery. Of course, it was rumored that his heart was two sizes too small.

So what changed him?

Well, the good Dr. Seuss made the moral quite clear: The Grinch had to see for himself that Christmas wasn't about things, but about giving, loving and caring.

You might have a Grinch or two working for you. They don't solve many problems; in fact, they create them. Why? Because they lack gratitude — for their work, for the company, for their co-workers, for their boss and for their customers.

Unfortunately, you can't teach gratitude. You can define it and tell workers that they need to be grateful. You can tell them to smile, say *thank you,* and be nice to customers and co-workers. But, much like respect, they need to embrace gratitude internally to make it last and to make it truly effective.

Start with Increasing Cognizance

To do this, you still start with increasing cognizance. You can't assume that the emerging workforce arrives with an understanding of what gratitude is or what it looks like — especially in ways that are specific to your team and organization. So you have to assess each employee's understanding of the concept. What were their experiences before joining your team? What do they already know, or not know, about being part of a team? Have they been thankful for previous jobs, or do they take jabs at previous employers? Do they thank you for your time, write a thank-you note for the interview and thank you when they leave? Are they smiling as if all of their material possessions had mysteriously vanished — and then magically returned? Never underestimate the significance of hiring smiling, happy people who exude gratitude.

As a leader, you must make certain your people know what gratitude means to you and your organization. You have to describe the policies and procedures, and teach them the expected corporate culture. The more they understand the scope of your business and their role in bringing customers back, the less likely they'll be to feel lost, insignificant and unimportant. They'll worry less about immediate results and more about the ultimate results — the long-term results that really matter. ●

The Valued Proposition

William Mayes, senior vice president of sales and marketing for Senior Home Care, regularly hires from the emerging workforce. His sales team includes around 200 people, and many of the new hires are in their 20s. They have worked part-time jobs, made it through college and had success with one, maybe even two, previous full-time jobs. And they have, or can quickly learn, the skills needed for success as sales reps on Mayes' team. A few have the kind of work ethic required for success with this growing company, but Mayes will readily admit that many don't. As he points out, "Even when we find the people who *can* do the job, we don't know if they *will*."

So Mayes often meets personally with young hires or connects them to one of the veteran sales reps for some work on the values that are important to their organization. "We coach them and mentor them and give them extra time and attention," Mayes explained.

That time and attention requires focus, however. This is where the business of work ethic gets very personal. It's where you start connecting with the emerging workforce to find ways that help them align their personal needs and expectations with the greater good of the organization. It's where you discover the value propositions that an individual and an organization can share.

There were times when the boss simply laid down the law to the employees, and the employees, usually out of fear of losing their jobs, went along. If they went along for long enough, they learned to appreciate the values. As Mayes and so many other leaders have discovered, that strategy seldom works in today's marketplace.

'You Can't Motivate People by Fear'

"You can't motivate people by fear," Mayes says. "They don't have fear in their hearts. You have to figure out where they are, what they feel, what matters to them and then tie things together. Let's make it happen together — meeting them where they are and giving them a reason to move where they want to go, and where we want to go."

This type of connecting builds the work ethic you need in your employees. And in doing so, it shifts their mindsets away from a utilitarian view of work. When that happens, loyalty increases and turnover decreases. ●

RECOMMENDED READING LIST

If you liked *Reviving Work Ethic*, you'll also like:

1. ***The Power of Professionalism* by Bill Wiersma.** Wiersma outlines the seven key mind-sets of trusted professionals, offering a blueprint for both individuals and organizations interested in fostering a culture of professionalism.
2. ***Value Shift* by Lynn Sharp Paine.** Paine's insightful book argues that companies must become moral, as well as financial, members of the community.
3. ***In Good Company* by Laurence Prusak and Don Cohen.** Prusak and Cohen explain how to build up the human connections (based on trust, mutual understanding, and shared values and behaviors) that make up your company's social capital.

THE SUMMARY IN BRIEF

Companies in all industries experience patterns of success and failure. In fact, recent statistics show that 4% of businesses in the US ever surpass $10 million in revenue and almost 17,000 ever see more than $50 million. Patrick Thean talks about how the rhythm of success and failure need to be approached with a "Think Plan Do" process in his book ***Rhythm: How to Achieve Breakthrough Execution and Accelerate Growth***. With his experience helping numerous businesses over the years, Patrick's influence can be seen in companies like AvidXchange who used the rhythm of quarterly planning and has grown to over 1600 employees from 5 in the beginning.

With the help of his colleagues and customers, Patrick's book is a testament to what it takes to change the rhythm of your business and excel toward success. Patrick's Rhythm of Work™ provides the fundamentals necessary to implement the Think Plan Do approach successfully.

IN THIS SUMMARY, YOU WILL LEARN:

- The problems currently plaguing our communication today.
- Real-life scenarios where digital pollution has hindered communication.
- How to move toward a more human-centric communication.
- How humans are to blame; not the technology.
- How to correct the error and miscommunication we face.

Introduction

All growth companies encounter ceilings of complexity, usually when they hit certain milestones. Most of the tipping points vary based on the type of business, past experiences, and growth rates of firms. Things don't always go according to plan, but when there is a rhythm introduced, it can ensure long-term growth when making the right decisions.

When it comes to using rhythmic thinking to increase results, Think Plan Do, brings about changes that can ensure long-term growth and results.

- Think Rhythm: strategic thinking that creates a rhythm focused on the future of the business
- Plan Rhythm: the execution of planning to let all teams and individuals know what they are supposed to do
- Do Rhythm: the rhythm of doing the work to keep the plan on track

When the right rhythm is implemented, it gives you focus, alignment, and accountability – all factors that need to be considered for success.

Think Rhythm

The Secret To Growth Is Developing A Habit To Think

For some companies, the excuse of not having time comes up quite often. What this translates to is that taking the time to create a strategy for growth was not important enough. By being proactive about scheduling time to work on strategy and future growth within the business, big changes can begin to occur. All it takes is a weekly lunch meeting with your team to focus on strategy to begin seeing progress. It becomes important when your company wants to grow to take out the time necessary to think – but it requires developing the habit to ensure consistency and a rhythm that pushes toward success. When you clarify and communicate the elements of your strategy, it gives you a strong foundation to scale your company, which permeates to all operational priorities.

Winning Moves To 2x Your Business

Having clear winning moves is one of the most important things you can do when getting your team focused and aligned. These winning moves do not come from those one off eureka moments that occur from time to time. Winning moves drive revenue – more specifically doubling your business revenue in three to five years. If your company is growing slower than the industry, it means that you are losing market share to the competitor, despite your ability to grow. In order to grow, you have to think about how to grow, if you do not work on finding the winning moves through strategic thinking, you are missing out to the competition who is already utilizing this type of thinking. Developing the right winning moves requires thinking outside the box, especially if you find yourself stuck in the same old patterns. It requires looking outside the same routines to explore what others are doing if you want to differentiate yourself from them.

5 Steps To Developing Your Winning Moves

To craft the winning move, you have to make assumptions – which don't always pan out. The great thing about these assumptions is that you can adapt them and make them more focused on your winning outcome. Just because your winning move is good and the assumption doesn't work, you don't need to throw out the entire idea, but simply change the assumption and test it again. When developing winning moves within your company, you need to:

1. Name Your Winning Move – give your winning move a name that will help you better communicate the idea. The name helps to motivate your team, as well as clearly communicate the goals.
2. Find the "Who" – figure out who can accelerate your progress. Before you set up and execute a winning move, you need to set yourself up for success. How do you do this? Set yourself up with the right people who have the knowledge necessary to achieve the goals you set out for with this winning move.
3. Develop Revenue Projections – Your winning move should bring you revenue growth. Plan your growth ahead of time by projecting it into the next three to five years. While these projections will likely change, the objective is to view the strategy and adapt the revenue projection to help meet the targeted goals.
4. Identify and Test Assumptions – Your revenue projection will be formulated based on assumptions. You should document these assumptions so that you can test them in the real-world setting. Remaining open to the need to adapt assumptions will help ensure that each of the goals you plan to hit in terms of revenue are accounted for and adjusted to help meet those goals.
5. Adjust – Just because you have gathered information

and tested your assumptions doesn't mean that the winning move is perfect. It requires constant work and adjusting to maintain a rhythm that will set your company up for more growth.

Your "Stop Doing" List

When you find your growth becoming stagnant, you need to use Think Rhythm to regain clarity and focus on a few winning moves. When you find yourself with multiple losing moves, it can trap you. They take your energy, resources, and prevent you from developing winning moves. Nothing changes if nothing changes – meaning that if you don't stop your losing moves and develop a Think Rhythm to create winning once, you won't succeed in what you are setting out to accomplish. Stop trying to give excuses, when you are looking for focus, you have to recognize the excuses you use, change the outlook, and begin executing the strategies that turn into winning plays for your company. The best way to leave the losing moves in the dust is to stop, think, and execute.

Plan Rhythm

Get Your Team Focused And Aligned With A Great Plan

The Plan Rhythm is essential to great execution planning. This helps build alignment throughout the organization. The best ways to implement this is by meeting annually and quarterly to plan execution for the year and the quarter. You should be separating your execution planning from your strategic thinking. Your execution planning is to help figure out how you will get the work done to move the company forward during any given timeframe. This will require you to slow down and think, which results in faster executions with less waste. When there are good planning sessions, the team is inspired, and it prepares them for a great quarter.

Develop An Inspiring Plan

The plans you create with your team need to be inspiring and practical – one that connects with people's hearts and minds. This connection is what helps to push your strategy forward every year. Envisioning your main focus for your plan helps you with developing it, once you have that main focus you can begin executing on it. To keep your plan practical, it should have no more than five priorities in any given year, this allows you to focus on the main objectives and evaluate where you are with them during each quarter. Once you have your focus, make sure you are overcommunicating it. Keeping your plan a secret only limits what your departments can do if you don't include them. Make sure to keep communication open and even overcommunicate the plan so that everyone can be involved in making growth happen.

Every Quarter Is A 13-Week Race

Instead of seeing a quarter as something that happens four times a year, look at it as a 13-week race. You have a set of objectives to meet every 13 weeks if you want to win that race, which helps execute your overall annual plan. Before any race, you have to create the objectives and a strategy that will set you on course for a win – before the start of every quarter, set aside the time for a two-day execution-planning session to define the focus and priorities for that race. During this planning session you need to take the time to share and discuss priorities, including searching for any opportunities where you can provide assistance. Don't expect that one department plan will be enough, it should cascade to all departments because you are in the race together and it takes everyone working together to pull of a successful race that facilitates overall company growth.

The Power Of Leading Indicators And Dashboards

The recipe for a successful quarter, every quarter, requires establishing leading indicators with clear success criteria. You need to make it possible to track them publicly on visual dashboards so that everyone can monitor the success during the quarter. The two types of key performance indicators to focus on are results indicators (telling you what has happened) and leading indicators (predict the future). When you are looking for the right indicators, you should be asking "why" at least five times – this requires you to dig deeper and will drive you to better results in the long run. The red-yellow-green approach to your success criteria alerts members what areas need immediate improvement and where goals are on pace within your strategies. The use of the red indicator also helps drive team members to improve the areas necessary to bring the color level to a more attractive shade of success. Communicating amongst team members and management through dashboards allows for accountability without the drama – addressing areas faster and spread communication quickly throughout the organization to achieve higher rates of success.

Do Rhythm

Nothing Happens Until You Do The Work

Do Rhythm is the path to focused and aligned execution that

strives for achieving short-term plans and long-term strategies. Developing a Do Rhythm helps overcome the feeling of "doing work is hard, but nothing happens until you do the work." Setting up meetings is important with the Do Rhythm – meet with yourself, meet with your team, and meet with those critical to achieving the success you are looking for. You have to use this time to make adjustments and solve the problems that you may find within your quarterly strategies. During your meetings, use the success criteria and the red-yellow-green indicators as action-oriented tools meant to move toward success, not focus on individual faults.

Prepare To Have A Great Week

Preparation is a critical part of a successful Do Rhythm and sets you up for a great week. When scheduling your meetings, look for those bright spots that will help scale solutions across the company while developing the corrective action plans that overcome the obstacles you are facing. Another way to take on the obstacles is to get group input using an idea-generating session that allows for collaboration and the search for making critical adjustments to keep things on track. During your preparation, make sure you are including the victories and what was learned from the week prior, while also touching on the success goals for the next week that brings your company another step closer to keeping the quarterly priorities on track.

Make Adjustments To Keep Your Plan On Track

To have a great plan execution, you have to be willing to make the necessary adjustments – but in a smart way. The Do Rhythm can help you explore when and how to make these adjustments. Having weekly Adjustment Meetings allow you to review where you are and discuss what adjustments need to be made. These meetings can be used to focus on the specific problems and if you find yourself stuck, you can ask questions until you discover what levers need to be pushed to bring forth a solution. When plans begin to veer off track, it is best to pull the trigger early to ensure they regain their course and move forward instead of derailing altogether.

Conclusion

Implementing the Think Plan Do Rhythms is a process, not an event. These things take time to implement and successfully execute within your company. These rhythms help to keep your teams focused, aligned, and accountable. Having actionable plans allows you to stay on track as you grow your company. Even if you are doing good right now as a company, you can go from good to great through a rhythm plan – encouraging you to continue learning and improving no matter what level you are at.

Patrick Thean is a successful serial entrepreneur who has started and exited multiple companies. As founder and CEO of Metasys, Inc., he grew Metasys to a ranking of 151 on the Inc. 500 list. An international speaker, Patrick has spoken to thousands of businesses in the United States, Canada, Asia, and Australia. Currently a cofounder and CEO of Gazelles Systems, he is the creator of Rhythm Software. Patrick received his Masters of Engineering and Bachelors of Science in electrical engineering from Cornell University.

THE SUMMARY IN BRIEF

From morning cups of coffee to Wednesday team meetings, our lives are steeped in rituals. ***Rituals Roadmap*** combines cutting-edge scientific research with examples from the most human companies, like Adobe, LinkedIn, and KIND, to show how they establish rituals during meetings, employee onboarding procedures, and daily interactions among co-workers.

Whether you give new employees a "Kickbox" containing a Starbucks card and a $1,000 Mastercard, like Adobe does, or order pizzas on Friday from eight different pizza joints, like financial advice company Motley Fool does, or simply send welcome emails to new hires, rituals create community and change us in a way that conjures lifelong commitments.

If you're serious about employee engagement, ***Rituals Roadmap*** is your blueprint for creating a workplace full of engaged, connected employees who drive revenue and stay at their jobs long term.

IN THIS SUMMARY, YOU WILL LEARN:

- How rituals can drive business success.
- The Three Ps that make rituals meaningful and inspiring.
- To use rituals for everything from onboarding, to meetings, professional development, breaks, and more.
- Strategies to create rituals that work best for your organization.

Don't Stop Believin': A Business Case for Rituals

We tend to think of rituals as things we do to punctuate important life experiences—like baby showers, bat mitzvahs, weddings, and funerals.

But rituals don't need to be reserved for big milestones, and just doing something again and again does not a ritual make. The transformational power of rituals lies in both our intention and how these activities make us feel. Rituals are rituals because they mean something to the people enacting them.

Technology has changed absolutely everything about the world of work as we know it. We're able to work anywhere, anytime. We're abandoning the traditional office, we're transient, and we're in a constant state of "on duty."

In the midst of all this hyper-connection, as former surgeon general Dr. Vivek Murthy has been telling us, one of the biggest health risks facing our country is—no, not smoking, not secondhand smoke, and not even sitting, but rather—loneliness and isolation. Left to our own devices, we're just not connecting. And it's hurting us. And our businesses.

Gallup found that in 2019, "based on a random sample of 4,700 full- and part-time U.S. employees working for an employer from January to August 2019," 35 percent of employees are engaged.

Rituals: Tools of the Human Workplace

Rituals are elemental to our lives. Scientists say that one of the reasons we humans love rituals is to "maintain group cohesion." In this world of disparate disconnection, rituals come to the rescue.

The cost of most rituals is minimal, but their value is priceless. And the impact is significant: more connection (improved cooperation, social cohesion, and perceived social support), higher productivity (through regulation of top-down and bottom-up psychosocial processing in our brains), better engagement, and a decrease in anxiety and stress. In other words, a positive work culture.

The Three Ps of Rituals: Psychological Safety + Purpose = Performance

Rituals are so impactful because they harness two of the core elements every human needs to succeed: psychological safety (or a sense of belonging) and purpose. When we feel psychologically safe and connected to a purpose, our performance improves. This is the Three Ps of rituals.

Psychological safety. Sharing rituals at work is the perfect way to help us feel included, and thus safe from the threat of social exclusion. Harvard Business School professor Amy Edmondson found that study after study from around the world linked psychological safety to worker engagement.

Rituals are the tools to help accelerate that sense of belonging, gathering all kinds of people together. True psychological safety has never mattered more.

Purpose. A 2019 Gallup study on purpose in the workplace states, "Astute leaders increasingly understand the effect purpose has on business outcomes. But purpose can't be limited to just a slogan. To advance, inspire, and unite a company, purpose must be actualized in the day-to-day work." What better way to tie employees directly to a company's purpose than through rituals?

Performance. When we put psychological safety and purpose together, what do we get? Better performance. A study at Google found that rituals were the key to more effective teams.

The Three Ps are just a way of pointing out what rituals do for us—they help us feel connected in an increasingly disconnected world. Rituals are the tools of the human workplace.

The rituals roadmap that follows traces the employee lifecycle from the first day to the last and everything in between, as well as a day-in-the-life of employees today—meetings, eatings, and taking breaks.

All Aboard: Rituals for Recruiting, Hiring, and Onboarding

Our first stop on the rituals roadmap is—where else?—getting people on board. And in case you haven't heard, the race for talent is on. Getting it right from the beginning impacts everything else down the line.

A beginning isn't just another random moment in time. The beginning sets the tone for everything that follows. Kickoff rituals have a lot of power.

Because the Three Ps work together, it's crucial that we elicit a feeling of psychological safety and purpose from the very first touchpoints in the employee relationship.

One of the ways rituals work best is by creating a container around the most mundane activities, thereby elevating them.

Preboarding with rituals. Consider Zappos's approach to picking up potential hires at the airport. Someone from Zappos is assigned to fetch the out-of-towner in a Zappos-decorated van. The candidate is driven to the lobby for the interview, offered a drink of water and some snacks, and has some chitchat to help put him at ease.

Seems like pretty run-of-the-mill stuff, but here's the interesting part. The people at the front desk and the driver know that the recruiting team wants feedback, good or bad, about the potential hire, so they're all super-engaged, paying extra close attention to the personal behavior of the potential employee.

One of Zappos's core values is "Be Humble," so they want to know if their interviewee is treating certain employees one way and their potential new boss or colleagues another. This clever ritual helps to ensure that new hires are a good fit. Sometimes a ride from the airport isn't just a ride from the airport!

Day one rituals. The first day of school is an iconic experience for all of us. We can all relate to the butterflies, great expectations, and stress about what to wear and where to sit. Will people like us? The first day of work is no different. And it only happens once. Smart companies use rituals to get it right.

New employees at Adobe receive a "Kickbox" containing a Starbucks card and a $1,000 Mastercard. Adobe's box also comes with a checklist of what to do in order to start pitching new ideas to the company. This onboarding ritual is so popular, Adobe has created an online guide for other companies.

Simpler, low-cost welcomes work, too. John Deere employees receive a simple email from a buddy on the current staff, giving first-day tips about what to wear and where to park. Who wants to show up in a suit when everyone else is wearing Hawaiian shirts?! Or to circle the employee parking lot worrying about being late?

This first-day buddy later shows up at the newbie's desk with a welcome banner in tow.

March Through the Arch: Rituals for Beginnings

Okay, job seeker, you've got the job. Congratulations! And you, Manager—you've hired the next rockstar cohort. Well done! After the balloons have deflated, the music video has been viewed, and the empty bowl of candy has been moved from the new person's desk, everyone defaults to just showing up at work. Then what?

One of the ways rituals work best is by creating a container around the most mundane activities, thereby elevating them. There's the requisite business of being in business, and then there are the rituals that help us power up and through the day—the work of work. So this next stop on our roadmap shines a light on beginnings and endings.

Opening ceremonies. For most of us who report to an office, our opening ceremonies kind of naturally evolve—we walk out of the elevator into the office, grabbing a coffee along the way. For those who work from home, it's helpful to think about how to create personal opening ceremonies to help start the day and delineate home from work. Not an easy task! But rituals can really help us create the transitions that have never mattered more.

Jodi Kovitz is the founder and CEO of #movethedial, a company devoted to changing the story of women in tech. At 9:30 a.m. on Monday mornings, her team comes together for what Kovitz calls a "grounding ritual," in order to "connect on a human level, and to invest in the culture and connectivity of the team." Each person shares three things: (1) something they're grateful for, personal or professional, (2) something they're proud of, and (3) something that they're struggling with.

Wouldn't it make more business sense to launch the week with projects and bottom-line projections? Well, in case you haven't heard, the soft stuff is the new hard stuff. And for Kovitz, "It's more important for people to feel glued together, connected, grounded, valued—like they have a reason to be there. And to ease into Monday is really a beautiful thing."

Bookending rituals. Morty Schapiro made the move from the president of Williams College to Northwestern University

in the summer of 2009, and soon realized that Northwestern didn't have a ritual to welcome incoming students.

A colleague suggested, "Let's walk the kids through the arch that's on campus." A ritual was born. Schapiro and his team rushed to quickly organize a march through the arch in September 2009. They didn't bother getting permission from the city that first year, which turned out not to be a problem, since only about 20 kids participated, and they just dodged the cars to march through the arch.

By year three, every single incoming student—over 2,000 kids—marched through the arch. Today, it's a ritual not to be missed. The marching band leads the students through Weber Arch, so named by Schapiro for his predecessor and the fourteenth president of the university, Arnie Weber.

These days parents, told in advance where to find their kids in the sea of purple, line the streets and take pictures. The kids feel like they are part of something special as they walk through the arch like all those who came before them, and begin to come together as their own class.

Students said that the march makes them feel more connected to their classmates and the university. It's likely the same goes for the parents who are kvelling from the sidelines.

Meetings: Rituals for Gatherings That Matter

Before the COVID crisis hit, experts like Harvard Business School professor Nancy Koehn estimated that approximately 11 million formal meetings were held in U.S. workplaces each day. Average employees sat through roughly 62 meetings every month.

People frequently check out of these meetings. And when we're sitting through that many meetings a month, who could blame them? Doodle, the online meeting service, reported that meetings cost the United States over $399 billion in lost productivity in 2019.

We humans still love to meet, even when it's making us crazy and/or unproductive. That's why it's so important that we bring rituals to our meetings, making the most of the human urge to sit together, face-to-face, and collaborate. We can do this in two ways: first, by having a purpose, and second, by inviting presence.

More Than Assembly Is Required: Have a Purpose

The word "meeting" is defined as "an assembly of people, especially the members of a society or committee for discussion or entertainment." But here's the thing: "assembling" is for Ikea furniture. Mere assembling is not going to make magic happen. With rituals we can transform everyday assemblies into workplace magic.

In ***The Art of Gathering***, Priya Parker writes that in determining our purpose, "The more focused and particular a gathering is, the more narrowly it frames itself and the more passion it arouses." We ought not to have a meeting to discuss something that can be sent out in an email or viewed on a company dashboard.

Your Physical, Mental, and Spiritual Presence Is Requested

Now that you know that your meeting has to have a purpose, you have to be sure people actually show up, not just in body but in mind, and even spirit. Presence is a prerequisite for psychological safety and helps ensure that your purpose manifests.

The best meetings invite people to bring their presence into the room, and there are rituals to help us do that. Chiming in and chiming out of meetings is a way of waking people up and bringing them to the present.

Before jumping into the news and status-of-the-day part of your meeting, it's always a good idea to take a moment to gather people together, asking them to leave whatever they were doing before at the door. A chime is like an "Enter Here" signal.

Eileen Fisher, the fashion queen of comfy-chic, rings a literal chime at the beginning of meetings. The chime signals a minute of silence and meditation prior to a meeting commencing.

Fisher asserts, "I think when people start to pay attention to themselves, they start to pay attention to their relationships, to the people around them and how they treat each other, and they start to notice the people in the supply chain."

With one tiny ritual, people begin to feel psychologically safe and connected to purpose, which helps their performance.

Eatings: Rituals for the Most Important Meal of the Day: The One We Share

Four professors from the Cornell School of Management have found that eating together is strongly associated with

unit-level performance. Organizations that sit down for a meal together—even without cooking it together—strengthen "social glue." Yet, elevating the meal to ritual status is only applicable for situations "where cooperation, communication, and organizational citizenship [have] value." Eating together is only important for the kind of workplace that values the Three Ps: Psychological safety, a sense of shared Purpose, and increased Performance.

> Rituals can help companies bridge the personal and professional.

A Pizza Friday Like No Other

Motley Fool, the wild and wacky investment firm founded by brothers David and Tom Gardner, have turned an ordinary pizza day into a ritual to write home about. On the last Friday of every month, Motley Fool buys 80 pizzas for the office.

But what makes this Pizza Friday different from all other Pizza Fridays is that they buy 10 pizzas from eight different beloved pizza joints in the area. Describing how they make it dramatic, Lee Burbage, the chief people officer, says, "People are very passionate about their pizza. We open Pizza Friday at noon on the dot. If anyone tries to get pizza at 11:59, it's not there. The line curls around the corner, and at noon everybody floods in. It's chaos because everyone knows the pizza that they want."

On offer are all kinds of pizza, from gluten-free, to vegan, to a Mexican pizza, the most popular from a restaurant just down the street. According to Burbage, Pizza Friday is Motley Fool's oldest tradition.

As Burbage put it, "There is no employee survey that would get me that pepperoni preference and be able to deliver that to them." Which is to say that some rituals are so powerful they go way beyond the details and straight to the heart, as well as the stomach.

Rituals for Taking Professional Development Personally: Spotlight on LinkedIn's InDay

A sense of being linked to one's personal purpose and human potential is a must-have for people at work, and it's often ranked higher in importance than salary. Deep, relevant professional development is where it's at. For many employees today, growing on the job is a must-have, even more important than money. According to data collected by Culture Amp, a company devoted to developing software solutions for workplace culture, learning is more important than compensation.

Rituals can help companies approach professional development in a way that's engaging, inspiring, and keeps people coming back for more. Rituals can help companies bridge the personal and professional.

LinkedIn InSpires: Happy InDay!

LinkedIn's 16,000 employees take a day off every month for their personal-professional development. InDay began in 2010 when just 1,000 employees worked at LinkedIn. The company had been in such "insane hyper growth," LinkedIn's cheerleader/culture champion Nawal Fakhoury recalls, since its founding in 2003, that leaders were worried about burnout. The team searched for ways to keep their talent a number one priority. "The coolest part is that in 2010 we invented InDay, which is short for Investment Day.

InDay includes things like a mindfulness class for employees, guided by a leader from wise@work, the developers of an app that helps people learn the "soft" skills needed to succeed at work, one of which is mindfulness.

What we previously relegated or even disregarded as "people" skills are now front and center as we begin to see how important people's experience at work truly is. In today's complex, demanding workplace, it's more important than ever for everyone to be emotionally intelligent and self-aware.

InDay also offers the "Git Up Dance Class." Maybe you're wondering how on earth learning a line dance can be considered professional development. Mindfulness—maybe—but dancing? How does Steve Sordello, the CFO who envisioned InDay, justify paying employees to meditate and dance?

Mindfulness and exercise are two of the most important ways to stay healthy, happy, and engaged. According to a 2016 survey conducted by Limeade and Quantum Workplace, 88 percent of employees that report having higher

well-being feel engaged at work versus 50 percent of those with lower well-being. Since happy, healthy employees are more engaged, more productive, and less likely to leave, the bottom line sees a cumulative benefit.

#InDay

InDay is not just a ritual but maybe even a prototypical ritual. Not only does it pass the Three Ps test with flying colors, but people would lose their minds if it went away.

An interesting characteristic of rituals is that they have a cadence, a rhythm, a life of their own. Because InDay happens every month, it shapes life at LinkedIn—there's before InDay, InDay, and after InDay. There's life leading up to InDay, then life coming down and preparing for InDay, like a Friday Shabbat or a birthday or a weekly breakfast. It's a shared marker people and teams use to feel connected to their lives at work.

Christina Hall, LinkedIn's former head of HR, said that the cadence makes the ritual feel "elevated beyond a perk."

InDay is a ritual that helps people take professional development personally. Everyone can interpret and live InDay in their own way, without pressure or judgment. It's the truly human way to learn.

The No-Smoke Break: Rituals for Taking a Breather

You may not remember the days of the smoke break, inspiring people to gather a few times a day either in a lounge or outside, huddling together, offering each other a light, taking one big exhale in unison, then catching up on the latest gossip.

According to the director of the MIT Human Dynamics Lab, "Much of the important information about how to be successful and productive at a job is not going to be found in a memo or an employee handbook, but rather around the water cooler." So while we don't need cigarettes for social glue at work, we do benefit from rituals like water coolers.

It's been proven again and again that "downtime replenishes the brain's stores of attention and motivation, encourages productivity and creativity, and is essential to both achieve our highest levels of performance and simply form stable memories in everyday life." So what are some ways to turn a no-smoke break into a ritual?

Break With a Best Friend

Beauty and wellness company Moon Juice is a company on a nonstop mission to create a sustainable, healthy, beautiful world for all of us. When Moon Juice's director of e-commerce was hired, the company agreed to let her bring her dog to work. Now, her pup is the office dog.

Every day, around 2 p.m., the dog needs a walk. But here's the thing: When it's dog-walking time, it's not just the dog's owner who gets up and goes for a walk. A colleague or two or three always join in. As Moon Juice president Elizabeth Ashmun said during an interview, "I've never seen her go alone."

This ritual uses something as ordinary and necessary as a dog walk to unleash the team members to get up and move and connect. And what better way to get a jolt of joy than by walking with humans' best friend?

Another great way to create rituals that really mean something to people is to ride on the coattails of what's already happening in the office, especially if it's grabbing everyone's attention. Embracing cultural events, for example, is a powerful way for companies to gather together and bask in the glow of connection.

At Microsoft in Redmond, Washington, home to almost 40,000 Microsoft employees, Halloween has taken on supernatural proportions. Instead of people with small kids ducking out early for Halloween parades and to prepare for trick or treating, Microsoft invites spouses to load up the minivans with kids in costumes and descend on the campus in the afternoon. People decorate, give out candy—the whole nine yards.

We See You: Rituals for Recognizing and Rewarding

Millennials and Gen Zers have brought many things to the table that we all need. One of those things is an insistence on being recognized at work—for a job well done, for sure, but also feedback about what's working and what isn't. Ideally, feedback happens all year round and not just once a year at review time.

Here are three different kinds of rituals that can send the message "we see you": (1) rituals that reward individual performance, (2) rituals that reflect milestones, and (3) rituals that connect to the collective. Let's look at the first two.

Rewarding Kind Customers

If you ever see a man on the street or in an airport doling

Begin each meeting with a moment for employees to ground themselves or find their center.

out KIND bars from his backpack, don't worry. That's just Daniel Lubetzky, founder and executive chairman of KIND Snacks, philanthropist, Shark Tank entrepreneur, and lifelong devotee of being, well, in a word—kind. He doesn't just recognize customers through ritual, but he pays attention to his employees, too.

And kindness is always at the heart of it. Early on, Lubetzky launched a ritual and called it KINDOS, recognizing employees and rewarding them with KIND bars and cards of gratitude. He now has a long-standing tradition of awarding one employee every year with a KINDOS award.

Lubetzky continues to recognize kindness. Lubetzky told me, "So when I travel on a flight, I always bring 72 KIND bars, and I hand them out." Why 72? Each box has 12 bars in it, and six is the number of boxes he can carry with him.

Think about how seen these people feel when Lubetzky recognizes and rewards people for random acts of kindness from a brand that now has mass recognition itself. Through this ritual, the ordinary KIND bar becomes something else, something that connects people to Lubetzky's purpose of being kind.

We See You: Rituals That Reflect Milestones

Aimée Woodall asks people to create their own adventure on their first anniversary at the Houston-based marketing, strategy, and design agency Black Sheep. She and her team know how tough the first year can be, so they really go all out and take the entire 18-person company out for an evening "crafted around who they are, what they care about, what they like, and their personality."

Um. Wow!

As Woodall said, "It might be a very extravagant dinner, especially if they are a foodie. For some people, it's like, 'I want to go get hot dogs and go to the Astros game.' The greatest example of a totally different approach was when we brought picnic lunches and went to a bingo hall because that's what that person wanted to do."

Black Sheep, being the ones on the outside of the herd, have an interesting take on what it means to belong. They certainly know how to create a ritual that makes a lifelong impression! Making a ritual personal ensures that it won't be forgotten.

Design Your Own Roadmap

You might ask, what now? How can you use rituals as the tools to create a human workplace?

Start by creating your own unique map. Discover the rituals that your organization—however big or small—already has in place across the employee lifecycle, paying close attention to the following:

- **Recruiting and onboarding**: Chances are, your company already has a set of processes for all of these things. So think about how you can add a little TLC to them. Maybe every new hire receives a welcome pack with candy and snacks. Whatever you choose to do, make sure it fits with your company brand and sets the tone for how you want potential and new candidates to view your company from the very first impression.
- **Beginnings**: Start as you mean to go on. You can easily take something you already do in the morning with your employees and make it a beginning-of-the-week ritual. Remember that a ritual is 100 percent intentional. So even something as simple as sending a morning check-in email with intention at the beginning of each week can be made into a ritual.
- **Meetings**: Begin each meeting with a moment for employees to ground themselves or find their center. Start off with a round robin show-and-tell with everyone in the room. The important thing to remember for meetings is to make everyone feel like they can contribute if they want to.
- **Eatings**: Transform your meals into rituals. Remember, it doesn't matter what you eat or where you eat it. The most important meal of the day is the one we share.
- **Professional development**: The best professional development is personal. What better way to say, "We

appreciate you" than to give employees the opportunity to grow themselves professionally and personally? You don't have to dedicate a whole day to it like LinkedIn does, but think about what your company already does for professional development, and add in the personal touch necessary to make it a ritual.

- **Taking breaks**: Rituals that help us pulse our attention make us more productive. Whether it's a one-minute dance party, a few pushups, or a walk around the block to get some air, regular breaks are good for the health of your people and your business.
- **Recognition and milestones**: It's only human to want to feel seen and to feel recognized. Whether it's once a year or every week, rituals are an important tool in the human workplace to reward performance, celebrate milestones, and connect individuals to the collective.

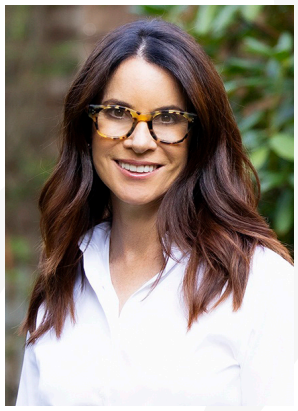
Perform a rituals litmus test to see—are they, in fact, rituals? Are the Three Ps at work?

- Do they provide Psychological safety?
- Are they linked to Purpose? If the first two are a yes, then you can be sure that your ritual is Performance-enhancing.
- Finally, would people Protest if it went away?

If you don't have rituals, then what? Look for opportunities for rituals through the employee lifecycle in these ways:

- If you want to create rituals, start with your company values. It's the best way to make rituals feel authentic and organic within your company.
- Remember that rituals can be top-down or bottom-up, so ask your team for ideas.
- Be willing to scrap rituals that aren't working, feel inauthentic, or feel like a box check.

The world of work is always changing. But human beings' needs remain the same. After food, water, and shelter, we need each other. Rituals, as the stories above show, are just the thread to sew us close.



In other words, this rituals business is not just a feel-good exercise. When we're engaged at work—through rituals, through connection, through psychological safety and purpose—we outperform those who let go of the rituals and traditions that keep us connected and feeling like we belong.

Whether you're facing a team, a global company, a day in your life, or an incredibly awkward task, rituals can turn your everyday routines into magic.

Once you experience the power of rituals for yourself and your company, you won't stop believing.

THE SUMMARY IN BRIEF

Rituals for Work shows how creative rituals can make our personal and business lives more meaningful and rewarding. Rituals are powerful tools: They reinforce good habits, motivate personal and professional achievement, create a common bond between co-workers, and build shared values. They can transform an organization's culture and provide a foundation to achieve common goals.

A ritual is only effective when its purpose is clearly defined. This book goes beyond simple analysis to provide actual recipes for individual rituals designed to promote specific habits, change negative behaviors, and instill values. Each ritual can be adapted to achieve a multitude of goals and tailored to fit your organization or team's specific needs.

An informative and inspirational resource for executives, managers, team leaders, and employees of every level, ***Rituals for Work*** provides a blueprint for building a culture of engagement, innovation, and shared purpose for organizations of all sizes, across industries.

IN THIS SUMMARY, YOU WILL LEARN:

- To change behaviors, form positive habits, and define shared goals.
- To build shared values, foster innovation, and encourage strong teamwork.
- To deal with conflicts effectively and engage others to find resolutions.
- To learn the fundamental concepts of ritual-building and share your knowledge with your team.

Why Bring Rituals into Work?

Companies and people face big challenges at work today. There are low levels of employee engagement, high levels of stress and fear, inhuman environments, and failed reorganizations. These problems at work require a multifaceted set of strategies to make more human-centered, values-driven, and creative workplaces.

Rituals can be one powerful strategy to improve our work lives—and help us act more like we aspire to be. They are practices that can bond people together, help us move through conflicts, amp us up to better performances, and assist us in adapting to change.

Rituals are actions that a person or group does repeatedly, following a similar pattern or script, in which they've imbued symbolism and meaning. They have unique factors that elevate them above normal experiences. Unlike a routine, rituals are not mindless. They are done with people recognizing that something special is happening that they are tuned into.

They involve some physical movement. There is usually a patterned rhythm of people moving that activates a sense of something special going on. There are symbols at work. They could be props, words, or actions that represent something bigger—usually a higher value. These symbols invoke a sense of the extraordinary that transforms the average into the special.

A good ritual tells a story, which often helps a person make sense of something that is going on, figure out what it means in a bigger picture, and deal with it.

Often, the culture of an organization is set by talking in the abstract. This could be through writing down a manifesto, core principles, or a constitution. Rituals are ways to bring these big, abstract ideas into daily practice. By default, they involve physical actions and concrete behaviors. A good ritual will take the underlying values and intangible beliefs of a company—all these valuable, invisible things—and make them visible, interactive, and lively real-world practices throughout the organization.

Part I: The Power of Rituals

Rituals for Better Work

Rituals give order and meaning. Foundational studies of rituals emerged out of the work of sociologist Emile Durkheim. When he studied religion, he discovered rituals as a central backbone to how belief systems operate. Rituals make beliefs concrete and graspable for people. People gravitate toward the function and structured behavior that rituals offer. This structure brings people a sense of things being in their control and a sense of meaning.

Rituals also give people a safe space to experiment. Anthropologist Clifford Geertz found that when people act out rituals, they can jump from what the "real" world is to another one that is more ideal. Rituals let people imagine other ways of behaving and living, taking a break from their everyday rules and routines. They give people safe, structured zones to build better ways of living.

A recent review of scholarship on rituals found that the actions of physically going through rituals help people feel satisfied. The ritual actions regulate people's emotions, keeping them calm. Rituals also regulate people's performance, helping them to act in a steadier and more focused way. Finally, rituals regulate people's sense of belonging, giving them a stable feeling of social connection.

Rituals involve four key principles:

- **Principle 1:** Rituals have a magical, je-ne-sais-quoi factor.
- **Principle 2:** Rituals are done with intentionality, with the person tuned into this being a special moment.
- **Principle 3:** A ritual carries a symbolic value that gives a sense of purpose and that's beyond the practical.
- **Principle 4:** A ritual evolves over time to better suit the people and the situation.

How to Bring Rituals into Your Work, Team, and Organization

You may have a hunch that rituals could make a difference in your work life—that you could have better ways of working day to day, that you could improve how your team functions, or inspire a better sense of community. As you think about which specific ritual might work best for your situation, there are some key mindsets to adopt—those of an anthropologist and those of a designer.

- **Anthropologist:** Be a keen observer of situations as they exist. Spot where there are sparks of "meaning" that already occur. Tune into when people are talking about their values, beliefs, and goals. And articulate people's everyday routines and aspirations.
- **Designer:** "Everyone designs who devises courses

Set a context for people to do the ritual in their own way, so they are supported with a structure but are allowed to decide exactly what it is and how to do it.

> of action aimed at changing existing situations into preferred ones," writes Herbert Simon, the Nobel Laureate, in ***The Sciences of the Artificial***. Embrace the designer role by trying new experiments to see what works—and by using your existing materials, like routines, spaces, and goals.

Here are several strategies to help you in deploying rituals:

Create a safe space. To bring rituals into a group, the most important thing is openness and transparency among participants.

Facilitate ritual design. To make your ritual successful, you need alignment and collective buy-in from your team members. Use design methods to facilitate conversations and create alignment.

Seed advocates. In every endeavor, you will have more interest from some who believe in the need and value of a ritual more than the others. Find those people and seed them inside a group.

Don't impose a top-down ritual. For a new ritual to take off, there's no way to command people to participate without sparking a backlash—and defeating the purpose of it. Instead, set a context for people to do the ritual in their own way, so they are supported with a structure but are allowed to decide exactly what it is and how to do it.

Don't call it a ritual. Particularly if you're trying to convince your colleagues who may be skeptical of culture-building exercises, you can simply do the new thing, or ask for them to humor you—without a formal label.

Keep it cheap and lightweight. You can create rituals without requesting a huge budget, arranging large time obligations, or putting too much effort into complicated arrangements.

Tap into the charisma of an instigator. Who in your organization has the ability to bring out others' creativity and playfulness? They should be involved in the launch. Find "early adopters," who are already keyed into doing things differently, and empower them to be leaders in the culture.

Don't mix it up with routine. Rituals can have routine qualities, but rituals are not routines. A ritual is an intentional act; it needs you to be present and committed when it's happening. Routines, on the other hand, are automated and often only get recognized when they're broken.

Rituals can be a means to build up habits. That said, building a habit is not building a ritual. Rituals carry a core of meaning and values, which can help an individual or group to get motivated or regulate their emotions in order to build a habit.

Get beyond the "fun." Not all rituals are positive. Participants can go beyond just the most obvious rituals—which tend to be around creating "fun" energy and structuring the day. That means looking for low points in our working lives.

Make the rituals your own. Don't use the examples below as strict recipes. Adapt them to your own work culture by drawing from your own history, values, in-jokes, routines, and symbols.

Know they don't always live forever. Rituals are not always meant to be permanent institutions.

Don't overwhelm people at first. You have to introduce a ritual in "the sweet spot"—where the experience feels new but not too new.

Now let's look at a few rituals from each of the five types of workplace rituals: creativity and innovation rituals, performance and flow rituals, conflict and resilience rituals, community and team building rituals, and organizational change and transition rituals.

Part II: Rituals for Work

Creativity and Innovation Rituals

Creativity and innovation happen when people break the script and make non-obvious connections. Rituals can provide a structure for people to switch to a creative mindset and push the boundaries of the ordinary. They can also help teams develop a culture of experimentation.

The Daily Drawing. Use this ritual when you need to fire up your right brain right before creative work or any kind of serious work. Once a person sits down at their desk, they take out a card or a notebook sheet and then spend exactly one minute doodling anything they like. It can be something they will work on, something they are thinking about, or a random sketch. The only rule is that it must be a drawing and it must take one minute—not more, not less.

The goal of the Daily Drawing is to be loose and easy with creative work. Rather than start the day at the desk with the computer and emails, this ritual starts the day with a small creative challenge. It doesn't have to be good; it just has to happen. If it's done every day, it becomes a low-barrier activity to jumpstart creativity without too much thinking or planning.

The Surprise Ride Along. Use this ritual when you need to charge leaders with more empathy for users and find sparks for innovation. The Surprise Ride Along is a way to disrupt a project, with leaders whisked away from offices and boardrooms and into the field. They are challenged to set aside their preconceived plans and spend the day listening, watching, and observing the people the project is meant to benefit. It's a ritual that's about radical empathy and finding new paths for creativity.

The organizers should arrange the Ride Along like a surprise party—the team members shouldn't know it's coming, and they should think that they'll be going about work as usual. Then they'll be told that they're actually going to be spending the day shadowing a customer or serving as front-line staff.

The Ride Along has both a symbolic and functional purpose. The act of spending the day listening and observing should reinforce the value of empathy. And the face-to-face experience can catalyze better work by focusing leaders on specific problems and empathetic understanding of others' experiences. The Ride Along demands a high degree of planning, just like a surprise party.

The Skill-Share Fest. The Skill-Share Fest is a day off from the normal work routine, where team members share their maker skills with one another in a festive environment. Everyone can teach the rest of their team how to cook a certain dish, build something, perform a dance, make a craft, or some other skill that they've developed. It's structured like an "unconference" where individuals can set the agenda by proposing sessions they'd like to offer or those they'd like to attend.

The company Pinterest developed this ritual around one of their core values of "knitting." They run a Knit Con that lets all of the employees share projects and skills they've developed, so people can learn from one another and create new things. It's a way to encourage employees to bring their "whole self" to work and find hidden connections among team members—appreciating the talents they don't usually get to share at work.

Performance and Flow Rituals

Performance and flow rituals help people to deal with high-stakes work situations, cope with anxiety, and focus on getting to their goals. They can bring a sense of control in times of uncertainty—like during a big meeting, in the middle of a pitch or a trial, or when overwhelmed with too many deadlines.

Rituals' use of repetition and physical action help develop a sense of flow and confidence. Research shows that performing rituals helps people to regulate their emotions, decrease anxiety, and get into a flow state. Following the pattern of a ritual can also help people to block distractions and set rules for themselves about how to work better.

The Moment of Reverence. The Moment of Reverence is a short ritual that occurs right before an important event, meeting, or talk. It is taken from a hospital team practice at the Beth Israel Deaconess Medical Center. Right before a surgery begins, the whole team of doctors, nurses, and others stop what they are doing. They take a short moment to remember the person on whom they are going to conduct the surgery.

The goal is to ensure that everyone remembers the humanity of the situation. It's about breaking the routine procedures, pausing to recognize the importance of what's happening, and appreciating the people involved. The moment can also reinforce the mindfulness that everyone should be proceeding with—to encourage care, precision, and empathy.

At Beth Israel, before operating on a patient, the team pauses right after completing the pre-surgery checklist for a moment of reverence. The circulating nurse reminds everyone who the patient is, if they are someone's mother, father, sister, or brother, and to be considerate of the patient's needs. Everyone is silent during the moment. Once the set time is over, the team continues on with the medical work.

Six Daily Questions. Six Daily Questions is an individual ritual to remind yourself of your goals and life priorities on a daily basis. Business educator and coach Marshall

Goldsmith designed this ritual to keep himself focused on his primary goals. Every day, at the same time, he arranges for someone to call him. They ask him the same six questions every day (that he wrote himself, for himself):

- Did you do your best to set clear goals?
- To make progress on those goals?
- To find meaning?
- To be engaged?
- To be happy?
- To build good relationships?

The person on the other side just listens without judgment, and says encouraging words before hanging up. Behavior change is hard. It needs goal-setting, awareness, and a persistent attitude. Six Daily Questions is a daily reminder ritual to help individuals get there.

> Rituals can be strategies to navigate conflicts, to manage anger and frustration, and to move towards a more constructive relationship.

Silent Disco Thursdays. Silent Disco Thursdays is a group ritual for employees who want to do heads-down work without meetings and distractions. During a set time, everyone is silent and listening to their favorite music. The ritual is meant to rescue teams from meetings and the fatigue that comes with interruptions, distractions, and small interactions.

Every Thursday, employees who want to join can come to the silent disco area, grab their headphones, and do their work as if they are at a party. Just like at Silent Discos in other contexts, the central organizers can broadcast a few channels of music, and everyone can choose on their headphones which channel to listen to.

Conflict and Resilience Rituals

Conflicts are an inevitable part of work life—as are failures. Both can bring intense emotions and possibly destroy relationships. Rituals can be strategies to navigate conflicts, to manage anger and frustration, and to move towards a more constructive relationship.

Ideally, they can structure spaces for more candid, transparent communication—as well as personal resilience to deal with mistakes. They bring awareness, reflection, and mindfulness to increase people's ability to manage negative things at work.

Burn the Argument. Burn the Argument is a ritual to move people past a conflict that flared up. After a conflict has arisen among team members, have them release their emotional energy by symbolically burning their feelings.

Instead of hoping that the people will be able to move on after the argument, have them explicitly write down what they were arguing about and what their feelings are. Make sure that they hear each other's point of view. Once everyone is done, ask each person to silently reflect on how they might move past the argument. Give them one minute, and then ask them to let it go silently.

Then have them put these written-down accounts and emotions into a shredder—or have them tear them up. Then, combine their scraps together, and burn them in a heatproof container. The goal is to have the symbolic actions translate into real forgiveness, in which the people agree to move forward and to acknowledge each other's points of view.

No Rehash Rule. If, during meetings, there's a tendency for people to circle around the same complaints or discussion topics, the No Rehash ritual is a small prompt to move past them.

The ritual is a short one, built around a No Rehash rule that you must establish in your organization. During a meeting, anyone is empowered to invoke this rule when they feel the meeting is being derailed or getting repetitive. They can hold up a "No Rehash" paddle, card, rubber chicken, or other symbol. They don't need to say the word—the action should be a signal for the people talking to come back to the point and to leave the topic that has been exhausted.

The ritual should be a short, humorous reminder to keep meetings more focused and to let people feel they are able to cut off unproductive lines of conversation in a direct but not confrontational way.

The Small Moments Jar. The Small Moments Jar helps teams build a healthy culture by instilling a habit of recog-

nizing contributions of all shapes and sizes. When a teammate does something great—whether it's helping out on a deadline, giving a great presentation, or bringing in fancy cupcakes—another teammate can write it down on a small slip of paper and put it in the jar. The jar should be emptied regularly, such as at the end of the weekly all-hands meeting.

The Small Moments Jar should be integrated into the team's day-to-day, with a low threshold of what can be recognized. The jar should grow week to week, with all kinds of small appreciations. After there are at least 25 to 30 notes in the jar, you can start pulling notes out to feature them. The trigger to open them could be a weekly meeting, a team lunch, or another regular activity where everyone is together. The goal is to spotlight small, positive moments.

Community and Team Building Rituals

A community ritual can help build a shared identity through symbols, stories, and history making. These then can become reference points for people to draw on core values and feel connected.

Rituals can also be key for better meetings. They can bring humor, surprise, and meaning to routine work, to bring the best out of co-workers. They can help bring people into sync, get more productive, and build stronger empathy.

The Remote Holiday Party. Holiday parties are not easy to run when team members are in many different locations. The Remote Party is a ritual meant for distributed teams, so that people can get to know each other and relax together virtually. It's a way to develop work relationships beyond just connecting around work videos or conference calls.

When it's holiday season, the facilitator can set a holiday party deliberately for distributed teams. They will set a theme and schedule a party time where everyone can join comfortably, across different time zones. The celebration can be structured with in-person time to mingle, eat, and drink—and then times for virtual connection for gift exchanges, awards and thank yous, and other more formal activities.

Depending on the level of technology, there can either be videoconferences set up inside a party room—for whole groups to be calling in to other groups—or it can be individual to individual. The facilitator should set up a shared music list, so that the different offices can play music for each other. If they want, they can also encourage people to dress up in special clothes.

Walking Meetings. The Walking Meetings are a simple ritual that has people walk together, along a route, when they are trying to talk through a problem or brainstorm new ideas. It shifts typical meetings or seminars from static, sedentary face-to-face gatherings to side-by-side active experiences.

A Walking Meeting is particularly powerful if a group has been in a long conference or working session, sitting with their computers in front of them for a long stretch. By changing how people are arranged, giving them a common destination, and having them walk alongside each other, the group can develop new connections and gather more inspiration during the meeting time.

Research shows that walking boosts creativity and convergent thinking. As people move in sync, their minds can also synchronize as well. Walking together can foster bonds between people. And when moving side by side, rather than facing off across a table, people can operate with less hierarchy and develop more peer-to-peer conversations.

Our Year in Pictures. This ritual adapts a family photo wall to an organization. It creates a visual shared history of the people in the organization. At the end of the year, for a holiday party or otherwise, the team shares photos of the past year.

These images can be from work events, parties and offsites, screenshots of their daily computer life, or pictures of their work product. Everyone must share at least one photo. One person, with graphic design skills, then takes the images and assembles them into a huge collage poster. They can either print it out as a large poster to be framed and hung up, or even as a large vinyl wall covering to take up an entire wall. The visual can help form work into a narrative and also bring a sense of family to the organization.

Organizational Change and Transition Rituals

Individuals, teams, and organizations have life cycles, just like in our personal lives. At work, there are arrivals, departures, mergers, advancements, divorces, retirements, demotions, and more.

During all of these transitions, rituals can be an effective way to help people deal with change. Rituals can give people back a sense of control, helping them make sense of what's happening, get used to new roles and routines, and maintain stability during times of change.

Crash the Desk. Crash the Desk is an onboarding ritual for a new employee's first day of work. While the person

Rituals can give people back a sense of control, helping them make sense of what's happening, get used to new roles and routines, and maintain stability during times of change.

is away from their desk on a tour or lunch, all of their new teammates leave a personal item on their desk. Then, when the person comes back and discovers their desk full of objects, they must go around with each item to find who it belongs to. When they find the right person, they can chat about what the object means.

This ritual is a welcome tour mixed with a game. It structures a way for a new person to interact one-on-one with different team members, so they can begin to build relationships and don't feel that there's a one-against-many dynamic.

Smashing the Old Ways. Smashing the Old Ways is a ritual ceremony for an organization to officially break from a previous strategy or a dysfunctional practice. In it, the leadership calls the organization together. It sets up a stage where some big, breakable symbol of its "old, dysfunctional ways of working" are set up. Then, when people gather together, the leaders announce, "We are going to destroy these together."

Each person gets a turn with a sledgehammer to smash the old thing. It's like a piñata game—collectively destroying the thing until it's in smithereens. This is adapted from a Zipcar ceremony, in which employees were invited to smash desktops to reinforce the push for a mobile-first business.

It marks the transitional moment, from one large-scale company strategy to another one, in a strong way. Additionally, it creates a cathartic moment where the negative energy and anxiety about change can be released through controlled destruction. It's also a story for people throughout the organization to hold on to and tell others.

The Name Seeker. Name Seeker is a naming ritual for a temporarily formed project team. When people come together for a short collaboration, often it's hard to get them to feel like they share an identity or to get them to invest in the team.

This ritual has new teammates kick off their collaboration by picking a name together, using their favorite books. They randomly choose words from the books and then work together to make them into a name and form a shared story around the name.

The key of the Name Seeker ritual is to get teams to create a name together that will not last forever but that will work for as long as the temporary team is operating.

Part III: Designing Rituals With and For Teams

After reading about other rituals, perhaps you are interested in creating one that would fit your context and goals. The basic process of creating a new ritual has three big phases: Discovery, Design, and Deployment.

In the Discovery phase, you explore potential moments, inspirations, and intentions that could be at the heart of your ritual. Then in the Design phase, you switch to experimenting with various elements to create the right experience. In the Deployment phase, you think more strategically, about how to roll out your ritual so that it is nimble, low-barrier, and likely to be adopted and adapted by your community.

Step 1—Discover: Set Your Intention. Set an intention to be at the heart of your ritual. What is the point that you want it to make or the emotion you want it to embody? An intention can be based on your or your organization's values, beliefs, goals, motivations, or aspirations. For example, it could be about being a better colleague, inspiring more creativity on your team, or creating a sense of welcome to new employees.

Step 2—Discover: Find a Hook. A trigger is an opportunity moment around which you can build a strong ritual. Some triggers might be when a colleague gets promoted, a product is released, a team kicks off a project, a conflict arises, or a product fails. Once you identify the trigger context, pick a specific situation within this larger context to anchor your ritual. It could be at a weekly meeting, at a coffee break in the lounge, or at a goodbye dinner. This specificity of time and place will make your ritual more likely to stick.

Step 3—Design: Ideate. Brainstorm ritual ideas that would bring your intention to life. Ideally, you can do this with others, to combine your insights. To get inspired, try ritual-specific prompts that draw on what we know from

scholarship about what works, like drawing from Isabel Behncke's work on social technologies:

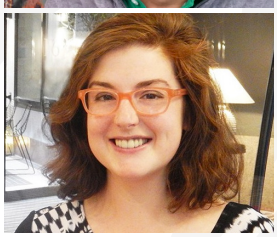
- **Prompt 1:** Share food and drink.
- **Prompt 2:** Use special costumes—especially things on your head.
- **Prompt 3:** Involve rhythm and movement.

Step 4—Design: Define a Symbolic Prop or Act. After a first round of brainstorming, see if there's any key moment and symbolic prop or act that you can build your ritual around. There are some exercises that can help you iterate upon your initial ideas.

- **Iteration 1:** Add a magic prop—give extra powers to a prop for your ritual. For example, for an athlete you could give the sneaker a special aura.
- **Iteration 2:** Add a reward moment—of physical, emotional, or social payoff.
- **Iteration 3:** Add a catharsis moment—that would be a particular action to release negative emotions and energy.

Step 5—Design: Refine It into an Arc. A good ritual has a narrative arc with a beginning, middle, and end. Take your selected idea and make it into a full arc. You can do this with storyboarding, drawing out the new ritual in steps. Try to refine the ritual based on the ritual principles mentioned above.

Step 6—Deployment: Act Out. Now act it out, to test whether the ritual works in practice. This will be like a second round of brainstorming—but less intellectual and more physical. By acting it out—and taking it as an improv project in which you can change exactly what you're doing—you can refine your ritual into something that feels comfortable, playful, and meaningful.



Step 7—Deployment: Codify. Define the essential script and props, and detail the arc's beginning, middle, and end. List your intention and context trigger to make it complete. Think about how best to involve others and scale up your idea into regular practice. Be open to your designed ritual being adapted. It's an experiment that may fail to catch on in its original plan, but people can improve upon it to make it the right fit for their work life.

We spend so much of our lives at work—whether in a big company, a small startup, or on our own projects. But how much do we invest in making our work lives better? When it comes to our relationships, our creativity, our focus, our life transitions, and the ups-and-downs of our organizations, rituals can help create a more intentional, connected, and meaningful work culture.

THE SUMMARY IN BRIEF

It's no secret that the world has gone remote in the steepest, fastest, most disruptive way imaginable. But where and when people work are not even half the story. That's why this book isn't merely about remote work. It's about a whole new way that any company can work. It unveils a philosophy and methodology first discovered and developed by organizations well before COVID-19 hit. These organizations were the first to embrace the remote challenge, posing a simple question: What if you could work with people all over the world, but you could never meet with anyone in person?

The answers they uncovered were groundbreaking, counterintuitive, and will likely transform the way we work–that is, the way everyone works–for all time. The accent has shifted toward the centrality of deep focus–the stuff that creates productivity, clarity, measurability, scalability, and yes, even human happiness. The rapid adoption of the Async Mindset is not just a trend, it's one of the major reboots in human history. In ***Running Remote: Master the Lessons from the World's Most Successful Remote-Work Pioneers***, organizations will learn how to take this giant leap toward greater work sanity for everyone.

IN THIS SUMMARY, YOU WILL LEARN:

- Three principles of the Aysnc Mindset
- Why this time marks the end of cities
- How to hire and on ramp the remote worker
- How to transition from colocating to remote

Part I: The Spaceless Office: Mastering the Fundamentals

Lies We Learned in Silicon Valley

For the last decade or so, many organizations have operated under a few "soft" but not unharmful myths that grew out of Silicon Valley. Here are just a few:

The Myth: Workers are granted maximum freedom by instilling a culture of previously unheard-of perks like nap pods, snacks, self-focus time, and the like.

The Truth: Perks aren't culture or true freedom. Real autonomy recognizes the individual's sovereign and unique needs and wants–no matter how personal or specific. There are as many different human situations as there are humans.

The Myth: Interconnected Silicon Valley culture boosts creativity by affording workers more time to play and interact with one another outside the realm of actual work duties.

The Truth: Water coolers don't spark creativity, individuals do. Lounge culture is not only less effective than previously imagined, it can prove to be the undoing of an otherwise strong company by setting up a petri dish of uniform thinking and entrenched office politics.

The Myth: Remote work means unhappy employees and deteriorating productivity.

The Truth: Autonomous, asynchronous work delivers both quantifiable employee satisfaction and measurable growth.

It should go without saying that these Silicon Valley myths are no longer trendy news. They've become dangerously entrenched. But once you get the myths out of the way, it's possible to understand just what makes the Async Mindset different.

Asynchronicity fosters a true culture of cooperation, respect, and self-respect. By cutting out long commutes and fast-food lunches, remote work has the power to bring greater health to everyone involved. It also grants each team member the time and space to put their life focus where they want it, when they want it. But most important, the Async Mindset encourages each person to explore, embrace, and reveal his or her truest self. That's a perk beyond measure.

Remote-first founders and companies in transition have encountered every frustration there is. The remote pioneers discovered the hard way that remote work and on-premise office work are not parallels.

If you're trying to recreate the office, you've already lost.

To thrive in a contemporary, digital context, you need to throw out almost everything you know about what makes an on-premise office tick. You must make a mental shift to build a successful remote team.

This fresh mindset is rooted in three reliable, recurring, and overlapping principles: *deliberate, purposeful communication*; *democratized, open processes*; and *detailed metrics*.

Deliberate Async Communication

As even first-graders now understand, all work communication can be divided into synchronous and asynchronous activity. However, even many sophisticated grown-ups can barely grasp the powerful but subtle differences between these two modes. Those steeped in the traditions of face-to-face, workplace communication are especially prone to get it wrong.

Deliberate communication is a whole lot more than just choosing to go sync or async. Being deliberate means infusing every form of communication with intentionality and purpose–and that requires deep focus.

Most people instinctively prefer synchronous communication or at least think it's better. After all, humans are, at their core, synchronous beings. We move through space *in time* facing all the inevitable distractions that real life delivers by the second.

Paradoxically, though, it is this very unorthodox state of being that makes asynchronous activity so special and so useful from an organizational standpoint.

As author Cal Newport brilliantly argues in ***Deep Work: Rules for Focused Success in a Distracted World***, the really meaningful work can only be done by working deeply–in a state of high concentration, without distractions, with all your energies hunkered down on a single task. For people to achieve the extended flow state of deep work, they'll need an environment that subtracts as much "normal life" as humanly possible, while keeping present all the tools necessary to accomplish their task.

The great pity of it is that most synchronous communication between workers–in other words, the vast majority of interruptions–can and should be consumed asynchronously.

Synchronous, on-premise work life is a distraction machine, a brutal chain of false starts that destroys the flow of every individual, all day long.

Metrics, presentations, updates, and even brief messages are all much better on your time, when you're ready. Synchronous, on-premise work life is a distraction machine, a brutal chain of false starts that destroys the flow of every individual, all day long.

Async demands maximum informational granularity, recorded for all time. Deliberate async communication is directly related to open, democratized processes, because it can allow multiple players to participate, edit, rethink, and spot-check one another's work, moving a process toward maximum accuracy.

It may be better–sometimes–for blue sky creativity and group problem-solving, but when productivity is at stake, synchronous communication is rarely preferable. Moreover, it often comes with a heavy price–power-mongering, micromanagement, office politics, and snuffing out of valuable input. Here's the cold, hard truth: Communicating synchronously is mostly a big waste of time.

Democratized Workflow–The Power of Process

The promise is this basic: the Async Mindset leads to nothing short of virtual, autonomous meritocracy. For this meritocracy to function, however, strong *process documentation* is required at every level. The term may sound dry, but it does not mean mere "rules" or musty "guidebooks" of the old-style office variety. Process documents are a living, growing thing, an all-hands-on-deck work-in-progress that opens channels of communication and makes way for healthy remote functionality…and serious growth.

In fact, one of the greatest remote pioneer discoveries is this: The more dialed in your process, the fewer emails and meetings you actually need.

By conceptualizing a company remote first, the trailblazers learned to streamline the chain of events that makes an organization most productive, eliminating everything that made office life wasteful, dreadful, and drudgeful along the way. It's important to note that process is itself a form of over-communication. But laying out the minutiae helps free each of us to use our processing power to focus on more complex problems and get the work done right. In a nutshell, process is the ultimate "ounce of prevention that's worth a pound of cure."

Processes free up the organization for creativity. Once you've thrown a lasso around everything that's repeatable, you're ready to grow. Process is not just about the lines of digital communication, it's about the way your company translates directives into real-life action. In remote-first organizations, all knowledge is recorded and categorized, so that any single individual can consume that information and perform any role in the organization, without synchronous explanations of any kind.

Building processes is a unique adventure for every department of every organization, but some basic principles guide the way.

- Discover: Ask questions, explore, observe, research
- Design: Do it once for yourself, write it down thinking of and for others
- Deploy: Test, apply, use, get feedback
- Debug: Refine, review, re-apply, re-discover

Detailed Metrics–Multidimensional Proof

One die-hard principle the remote pioneers all agree on: Setting and measuring crystal-clear KPIs are at the heart of remote sustainability. In fact, remote work has changed the very definition of metrics, because–counterintuitively–it takes vivid and specific, quantitative directives to set workers free from their managers, so that they can perform at their best.

The remote difference is that metrics do not merely function as "grades" or "scores"–they are the signals for instantaneous understanding of the situation at hand. When your data is in order, you can act accordingly inside a week or even a day versus a month or a year, course correcting where necessary while becoming much more nimble than your competitors.

The outcome of all these hard measures is that old-school management metrics like yearly reviews and generalized

feedback are rendered even more redundant than we already knew they were. In the optimized remote environment, every activity is now its own review, and you know where you stand long before some middle manager tells you so.

Every individual contributor inside a company should know exactly what his or her performance is without having to talk to a manager. If someone is unclear about the target or unclear about how quickly to get to that target, both manager and employee have failed.

When you're asynchronous and remote, metrics are the only thing that can differentiate your performance from the performance of others. Charisma doesn't matter, looks don't matter, office politics don't matter. The only thing that matters is how well you perform on your metric–it's the ultimate meritocracy.

Traditional companies usually don't have actual metrics. They have tertiary data or conversations about metrics. Real metrics, when set properly, require no explanation. You can't talk your way out of bad numbers when you're facing remote-first metrics.

You must absolutely free yourself from explaining your metrics. If you have to extrapolate from them, then they are either not simple enough to understand, or, even worse, they're likely vanity metrics–useless puffery that you'd be wise to get rid of anyways. The way async works is different.

Every single person in the organization must have at least one metric that they report on weekly. Not biweekly or monthly or seasonally. It's got to be weekly. Every single one of those reported metrics must have an intended target with a significant chance of failure.

The most important job of a remote-first manager is finding the right metric. Once you find the right metric, you've got your instrumentation to get the company where it needs to go, and the meaning is nonnegotiable.

Which leads to another key dimension: Every metric is quantitative in measurement, not qualitative. "Write a book you feel will help people transition to an asynchronous work style" is not a strong metric. "Writing a book that consistently gets a 4.5 star rating or higher on Amazon" is better.

A metric in its purest form need never be discussed–it is simply reported. If you need to course correct going forward, so be it, but the data is the data.

Every team member in a department needs to be responsible for presenting his or her own metrics and reading the relevant metrics of others each week. If there is a corollary issue that's stopping you from achieving your metric, you must bring up that issue, separately and preferably asynchronously, with a request for the help or resources you need to get your metric on track. In other words, let the metric stand alone, separate from excuses and reasons.

In addition to weekly reports, it's important for top brass to audit these metrics and ask themselves: *Is this really the most important thing we need to talk about inside this business, department, or team? Can two existing metrics be combined to produce a single, stronger indicator? Are there any vanity metrics measuring things we don't really care about?*

If you can't demarcate success or failure, then there is no point in having that metric. Good metrics don't happen by chance. This high-level clarity quickly divides the wheat from the chaff and bypasses the bad mix of vanity, charisma, and bruised feelings that make in-person work ambiguous.

Part II: The Timeless Team: Building Remote/Async Culture

The End of Cities

To be sure, the Async Mindset is not just a technical matter, or even just a work matter. In a development that nobody could have predicted even twenty years ago, the network of collaboration and company culture has moved into a totally digital realm, and the implications for cities–especially tech hubs like Silicon Valley, New York, Toronto, and Austin–are enormous. Just why do we hang on to the primacy of the city office anyway?

In the world of business, the push for innovation is constant–in products, in services, in brands and styles… but ironically, *not in work itself*. For all its great strides and advances, Silicon Valley's business model is fundamentally flawed, in no small part because it is highly dependent upon a series of *homogenizations*: venture capital funding, uniform culture, top-down thinking, and the never-ending yearning for a big exit. This deadly combo sets the tone.

VCs would not invest in remote-first companies because they believed that the only way to build tech unicorns is to have the entire operation under one roof. Fast-forward ten years, and VCs are now tripping over themselves, investing in remote-first companies. They finally discovered that, yes, you really can build and scale a business *not* under one roof.

No longer can you attract top talent through expensive lunches and swankier offices. The Silicon Valley Epoch has served its historic purpose.

Keep in mind–the VCs didn't embrace the Async Mindset because it finally seemed fun to them. They learned that it is very quickly becoming the only viable model for what they love most–hyper-growth.

It might have once been true that you'd find the best people in San Francisco or New York, but no more. As the very highest-level talent leaves big cities, the new concentration of labor is in a place less easily defined–anywhere and everywhere. Several studies of the Silicon Valley exodus demonstrate the idea that no city is safe from labor loss, but consider the following: Remote work never loses labor due to migration.

What we're experiencing is not merely a seasonal variance. It's the transformation of a generation of workers who are willing to exchange less pay for greater sanity. With that in mind, employers will have to wake up to the changes or find themselves adrift. No longer can you attract top talent through expensive lunches and swankier offices. The Silicon Valley Epoch has served its historic purpose.

The word *global* might sound grandiose, but stepping outside Silicon Valley and putting your business in the cloud is simply the most obvious step a company can take to prepare for hyper-growth. If you need to hire fast, if you need to scale horizontally, if you need 5x or 10x on processes that are already in place, you need to "go out of town"–the planet will always have a talent capacity advantage over your home base.

On-ramping the Remote Worker

Among the many challenges of building and sustaining a remote work environment, none is more pressing than mastering hiring, on-ramping, and nurturing the new employee. Finding new employees and getting them onboard is no longer a job that an entrepreneur can leave in someone else's hands–old-school human resource models have proven ineffective for the kinds of organizations the remote pioneers built.

To draw in the best people, the remote manager or team leader must go past the usual criteria and understand each potential employee's unique life challenges, including time management issues, work-life split, higher goals, and more. Paradoxically, it's a process that's a lot more personal than the traditional hiring practice.

Obviously there's no single path to hiring remote, but the following are a couple of indispensable advantages to deploying the Async Mindset when you get down to business.

- **Remote allows you to search for the *most precise fit* imaginable.** Looking for somebody who has had exactly thirteen months of experience counting chickens and is also an expert juggler and a pescatarian? That person is likely out there and remote allows you to find and bring that person on board. Be demanding. You don't have to settle for "close enough" anymore.
- **Gazing at the employee's curriculum vitae won't give you even half the story.** Google them, figure out what they're really about, identify proof of work. Good work leaves evidence, and that evidence is almost always easy to find.
- **People are no longer looking for jobs, they're looking for projects.** Smart managers and workers alike know that projects can turn into jobs and even careers, but remote allows all involved to let the relationship grow at its own pace. Don't cling. Let the talent enter and exit your company as easily as possible.
- **Actively seek out self-starters who are ready to act independently without direction.** Employees who are dependent upon synchronous collaboration to complete their jobs generally won't survive in an async organization. It's a self-starter's game and the industrially needy are often weeded out quicker than they would be in an office.

To find remote workers and help them onboard, do the following:

1. **Build a pipeline.** Utilize job boards as well as your internal customers and friends of employees
2. **Implement an asynchronous job interview.** Al-

ways ask for a CV, but focus on the applicant's proof of work rather than explanations of previous roles.

3. **Invite your second round to a video interview.** Keep these video interviews brief as you should already know if the person you're interviewing can do the job before the interview starts. Synchronous meetings are where you try to find out who they are.

4. **Bring in a second interviewer to collaborate.** Don't discuss the candidates until you've both completed the process, so that you can separate signal from noise. If you both have the same conclusions, great. If you don't, you may need another round of interviews.

5. **Whenever possible, hire on a trial basis.** Hiring remote allows you to actually work with someone right away, before you really start to *work* with them. A few months in, have a "speak now or forever hold your peace" meeting with managers, stakeholders, coworkers and even subordinates to decide if someone is a good fit.

The very act of implementing remote work creates a bellwether within organizations. If you have somebody who's not doing the job, you'll find out far sooner that you would in a traditional office. That speed is doubled in the remote hiring process, where weak links can often be spotted before the person is even seriously considered.

The Perils of Going Remote...for Companies in Transition

Transitioning companies–those that have previously existed for some time in a colocation office–often find that going remote will be scary. Allow your organization and yourself to evolve into an Async Mindset, and you will see creativity, productivity, and profits grow faster than you ever imagined possible.

Often, the problem is that companies in transition focus on the wrong elements at the beginning. Their line of inquiry tends to reflect a basic misunderstanding about the nature of remote work and, by extension, asynchronous work.

Things like:

- What kind of tools are best for remote?
- How do you deal with conflict in a remote meeting?
- How do you make sure employees stay engaged?
- How do you build company culture in a remote team?

The uncomfortable fact is that these are the wrong questions to ask. When the pandemic pivot happened, there were three giant mistakes many made right out of the gate, all of them interconnected.

The first was not understanding how differently you must communicate in a remote organization. The second was continuing to manage by presence. The third was failing to recognize that the old-school manager has no place in a proper remote-first organization.

As so many of the remote pioneers agree, these companies have put the cart before the horse. A deep Async Mindset and methodology are the first things to work on.

If you don't get a handle on how it's done, you're probably going to get blown right out of the twenty-first century marketplace. From a helicopter view, here are the broad elements you'll need to master for a sound, remote-work transition:

1. **Build an asynchronous communication model before you get started.** How can you annoy your team less so they can do more? It's a question you should be asking yourself ten times a day.

2. **Poll and align your entire team, front-loading them for working in an asynchronous model.** Get everyone on the boat by showing them the real value of the process.

3. **Build and digitize all of your company's processes**. This is tedious at the onset but is the only way to achieve scalability in an office or not.

4. **Develop a reporting structure that allows all workers to report their core numbers to everyone in the organization.** Empower employees with all the data at their fingertips so they can all think like an owner.

5. **Heavily reduce or cancel all meetings about metrics.** Meetings should discuss issues that come out of the numbers, not a place to discuss the numbers.

6. **Measure the rate at which your employees embrace all the adjustments that async work entails**. Provide course corrections as quickly as possible.

The autonomous organization is intertwined through communication, process, and measurement. Regardless of role,

every party is connected to the whole. By being radically transparent and measuring everything inside the organization, and then giving back those measures to everyone, every party is empowered to make independent decisions that move the operation forward.

Going forward, every job that can be made remote will be. It's an operational technological inevitability. It's cheaper, faster, clearer, and smarter.

What this means for the future of work cannot yet be known, but at the very least, it must be accepted that the global landscape is changing, very fast. The old office is just that–old–and it's slated for extinction. The world and its myriad companies are going remote, without a doubt.

Will you be on the winning side or the losing side? That all depends on your willingness to let go of the old ways.

Work is no longer a place–it's something you can take with you, wherever you go. Top-tier talent are becoming digital nomads en masse. They will no longer be set up in one city, state, country, continent, or hemisphere. The sooner you get used to it, the better.

Liam Martin is Chief Marketing Officer at Time Doctor. As the mouthpiece for Time Doctor, Liam has become a remote work ambassador of sorts, featured in Forbes, Inc., Entrepreneur, Business Insider, and Fortune. He speaks at conferences around the world, including SXSW, SaaS Stock, Nomad City, HR of Tomorrow, and The Digital Workplace, and he's consulted with more remote first-founders and operators than probably anyone on the planet. Rob Rawson is Chief Executive Officer of Time Doctor, a workplace solutions firm focused on allowing customers to build distributed teams that can work wherever and whenever they want, so the business can focus on allocating their office-running costs elsewhere.

THE SUMMARY IN BRIEF

According to *Harvard Business Review*, "most studies still show a 60–70 percent failure rate for organizational change projects—a statistic that has stayed constant from the 1970s to the present." When all is said and done, a lot more gets said than done.

In ***Ruthless Consistency***, author Michael Canic identifies the three surprising reasons most strategic change initiatives fail: Leaders unwittingly send mixed messages that demotivate their people and undermine those initiatives. Leaders focus on what they do instead of what their people experience. Leaders are not as committed as they think they are or need to be. The antidote to these problems? Ruthless consistency.

Following this principle, Canic introduces an intuitive yet comprehensive model for success. Simply put, leaders who develop the right focus, create the right environment, and build the right team—consistently—are leaders whose organizations win. ***Ruthless Consistency*** is a must-read for every leader who wants to implement change successfully.

IN THIS SUMMARY, YOU WILL LEARN:

- Three principles you need to succeed.
- To stop strategic planning and embrace strategic management.
- How to be a coach, not just a manager.
- To overcome the three enemies that undermine commitment.

Introduction

When All Is Said and Done, a Lot More Gets Said Than Done

If you want to play the odds, bet on failure. That's what's likely to happen when you execute strategy or implement organizational change. Published failure rates for strategic planning, for example, range from 70 to 90 percent.

It's not just strategic planning. The same is true of any strategic change initiative (SCI). Mergers and acquisitions? Up to 90 percent fail. Lean Six Sigma? Between 60 and 90 percent fail. Software and systems projects? Over 70 percent fail.

And how costly is all this failure? For IT projects alone, the worldwide cost has been estimated at up to *$3 trillion* a year.

It gets worse. When SCIs repeatedly fail, you create a track record of failure. You create an expectation of failure. You create an acceptance of failure. And you create a culture of failure. Failure becomes the norm.

You might be thinking, "Hold on. It's not like our efforts have been a total failure. We've made progress. We've gotten some things done."

That's it? That's your reaction? And you're the leader?

The tragedy of repeated failures is how they poison organizational culture. It becomes easy for people—starting with you—to rationalize anything other than success. And it becomes all but impossible to get people to believe in and support the next SCI. The culture of failure becomes self-perpetuating.

Bad News and Good News

If you've decided that this travesty has to end, and you're intent on getting to the root of the issue, then take a look in the mirror. It's you. It's what you as a leader haven't done but need to do to execute strategy, implement change, and build an organization that wins.

Here's the good news: There are principles to help you win. But you have to supply the commitment. It won't be easy and it won't happen overnight. Anyone who tells you otherwise either is lying or hasn't lived it.

Let's start with three surprising principles you must embrace to succeed.

Part I: The Reality

Most SCIs fail, but why? It's because leaders don't have a complete picture of reality: what it takes to execute strategic change, their role in making it happen, and the level of commitment required.

If you're fed up with failure, then first you need to understand the reality of why things fail.

First Principle: What Matters More Than Anything You Do Is Everything You Do

The difference between success and failure is ruthless consistency. It turns out that's true not just for continuous quality improvement; it's true for any SCI. Successful implementation requires more than just a pinch of training, a dash of resources, and a dollop of communications. It requires a systematic approach to aligning *everything* with the desired outcome. Everything matters. The whole truly is greater than the sum of its parts.

Think of it this way. It takes only one misaligned wheel to make your car undrivable, one misaligned vertebra in your back to incapacitate you. One misaligned element in any system can undermine everything.

Ruthless consistency is the key to implementing strategic change.

Saying that everything needs to be consistently aligned is one thing, but doing it is another. To be ruthlessly consistent you have to do three things: Develop the right focus. Create the right environment. Build the right team. Continually. That's it. Every SCI always comes down to those three things.

Developing the right focus means identifying and articulating why your organization must change, what you intend to achieve, and how you intend to achieve it. Creating the right environment means aligning every organizational touchpoint, so that your team can and will execute on the right focus. Building the right team means securing the right collection of talent to make it happen.

But let's be clear. Ruthless consistency does not mean robotic repetition. It's not about mindless and mechanical activity performed without variation simply for the sake of being consistent.

Ruthless consistency means that everything you do—as creative and innovative as that might be—is consistently aligned with your purpose, your intentions. Ruthless consistency not only allows for creativity and innovation, it

> If there's one thing to sear into your mind about leadership, it's this: It's not about you. It's *through* you.

demands it. Why? You're operating in an ever-changing environment. New technologies emerge. Customers' needs change. Processes become obsolete. Practices get stale. What made your organization successful in the past could kill it in the future. Creativity and innovation are requirements of ruthless consistency, not enemies.

Second Principle: What You Do Is Not as Important as What Your People Experience

Leader thinks he does a good job communicating. Employees think otherwise. Leader concludes that communications aren't the problem; employees are the problem.

Reframe your thinking. It doesn't matter that you're telling if they're not hearing. Just like it doesn't matter that you're training if they're not learning, or that you're empowering them if they don't feel empowered. What matters is what they perceive, what they believe, and what they feel.

Why? They're the ones doing the real work. They're providing the service; they're making the product; they're engaging the customer. Implementing strategic change depends on them. Ultimately, it's not about you. It's about them.

To be fair, we haven't been trained to view the world from our employees' perspective. We've been trained to view it from a leader's perspective. Countless books have been written, presentations delivered, and workshops conducted on leadership: what great leaders do; how great leaders became great leaders; how you, too, can become a great leader.

Yet, if there's one thing to sear into your mind about leadership, it's this: It's not about you. It's *through* you. What you do is validated only by what they experience and, as a consequence, what they do.

For people to do what you need them to do and perform at their best, first you have to understand their perspective. Ultimately, this is about empathy. Seeing through their eyes. Thinking in their minds. Feeling with their hearts. And then taking the right actions.

Third Principle: You're Not as Committed as You Need to Be . . . Yet

It's one thing to say you're committed and another to be committed.

Think of a failed SCI you've experienced. Now, write down all the reasons why it failed. Be brutally honest. Were you as committed as you needed to be to successfully execute that SCI? Did you set specific goals? Did you regularly communicate them throughout your organization? Did you communicate why you needed to achieve them and how you intended to achieve them?

Did you provide your people with the knowledge and skills needed to achieve the goals? With sufficient resources—materials, budget, and time? With sufficient authority to make decisions and take action in support of the goals?

Did you provide them with ongoing feedback and guidance about their performance? Did you recognize and reinforce them for the right behaviors and right outcomes? Did you hold them constructively accountable when needed?

Did you redesign whichever processes needed to be redesigned in support of the goals? Revise whichever policies needed to be revised? Change your org structure as required?

Were you committed enough to identify, examine, and align every touchpoint with your goals, so as to overwhelmingly tilt the odds in your favor? Did you persevere when the change wasn't happening or wasn't happening quickly enough?

Many of us have the will to win. We love the feeling of winning. We want to be associated with winners. But do we have the will to do what it takes to win?

Part II: The Right Focus

It starts with the right focus. A focus that articulates, "What must we achieve? Why must we achieve it? How will we achieve it?" Without a concise "what," there is no focus. Without a compelling "why," SCIs are merely should-dos, not must-dos. And without a clear "how," the "what" is nothing more than a dream.

You're committed to winning? Then start by developing the right focus.

Stop Strategic Planning

To develop and sustain the right focus, strategy has to be a process, not just an event. The goal isn't just to develop a plan or even implement a plan. The goal is to institute a system that ensures strategy is an ongoing, managed process.

The Strategic Management Process has four phases: Assess, Position, Plan, and Implement. In the Assess phase you develop a compelling Case for Change—the strategic "why." It emerges from a solid understanding of the strategic context in which your organization operates, context that spotlights gain and pain—the consequences of changing versus not changing.

In the Position phase you concisely define your strategic positioning—the strategic "what." What are we driven to achieve, what business are we in, what makes us desirably different in the marketplace, and what must our culture look like to win?

In the Plan phase you clearly outline the critical few SCIs that must be accomplished for your organization to win—the strategic "how." This phase charts the course from strategy to reality.

In the Implement phase you sustain focus by (1) instituting mechanisms to systematically manage implementation, (2) creating an environment that consistently points people in the right direction, and (3) securing the capabilities that can and will make it happen.

How does strategic management stand apart from strategic planning? In short, strategic management is strategy + execution.

Embrace the Joy of Pain

Your objective in the Assess phase is to attack your assumptions, understand the strategic context in which your business operates, and develop a Case for Change—the strategic "why." It must be compelling enough to overcome the four poisons that inhibit organizational change: complacency, arrogance, the fallacy of extrapolation, and psychological inertia.

Organizations are far more likely to change when they have a strong drive to achieve a desirable outcome (gain), coupled with a strong drive to avoid an undesirable outcome (pain).

Here is an example of paired Case for Change statements:

"If we don't optimize our product portfolio, then revenues and margins will continue to shrink, and our future will be at risk" (pain).

"If we optimize our product portfolio, then revenues and margins will grow, which will help secure our future" (gain).

With a well-thought-out Case for Change, it becomes almost unthinkable that you wouldn't take action. Each pair of statements offers you and your Strategic Leadership Team a stark choice. Pain or gain. Your choices will determine your legacy. Choose well.

Climb the Right Mountain

You're clear about why your organization needs to change. Now, what would it look like for your organization to win?

An unfortunate consequence of the popular view that you should dream big and pursue your passion is that it implies any dream is worth pursuing. It isn't.

It's not that you shouldn't dream big. It's that before you commit to pursuing your dream, you need to understand the three Rs—rewards, risks, and requirements. Understanding these allows you to answer the question, "Is this a dream I am truly committed to pursuing or not?" There's no wrong answer, as long as it's an informed answer.

Once you conjure up your next big dream, ask yourself these questions: Why that dream? Why not some other dream?"

"What rewards make it uniquely worth pursuing?"

"What risks and consequences are associated with pursuing it? Am I willing to accept them?"

"What is required to fulfill the dream? Am I willing to meet those requirements?"

Do Less, Use More Resources. . . No, Really

You've identified why you need to change. You've determined what you need to achieve. Now, you need to plan how. How are you going to realize the gain and avoid the pain outlined in your Case for Change? How are you going to win? How are you going to live up to your Brand Commitment and Cultural Commitments?

Through your SCIs.

You're going to take on too many SCIs because you're ambitious, you see the opportunities, and like the proverbial kid in a candy shop, you grab at everything. What happens? Resources get diluted, people get stretched too thin, and

before you know it, instead of everything being a priority, nothing is a priority. Failure.

Do less, and you'll accomplish more. As Tim Cook, CEO of Apple, once explained, "We say no to great ideas in order to keep the amount of things we focus on very small so we can put enormous energy behind them."

Let's say you've come up with a list of potential SCIs. How do you prioritize them?

- Conduct targeted research into the most promising SCIs.
- Identify criteria for evaluating the relative merits of each, such as resource requirements, length of time to complete, payback timeline, organizational trauma, probability of success, return on investment, and so forth.
- Determine if any criteria should be weighted and if any should be immediate disqualifiers.
- Discuss and rate each potential SCI against each criterion (using, for example, a 1–5 scale); total the ratings.
- Compare the overall ratings for each option and ask if they pass the "gut test." Does your assessment of their relative merits seem fair and reasonable?
- If yes, select the very few top-rated items that the organization has the means to strongly support. If no, then revise the evaluation model and go through the first five steps again.

Put the "Exec" in Execute

Now comes the hard part—making it happen. Everyone's energized. You've come out of your annual strategy session with a clear focus and a set direction. But then reality starts to seep in. Your plate is already overflowing. How are you going to find the time to get it all done?

Clear your plate. All of us spend time on activities that, if we're honest, add little or no value. Eliminating those activities allows us to free up time for the strategic work.

Operationalizing your SCIs requires Execution Plans. An Execution Plan outlines the time-linked milestones and associated resource requirements (material, financial, and people) for each SCI. It identifies the Executive Sponsor—the Strategic Leadership Team member ultimately responsible for the SCI, the Champion—the person entrusted with managing its execution, team members, and periodic contributors. Finally, it documents the ROS—the expected return on strategy that justifies the SCI.

The goal isn't just to develop a plan. And it's not just to implement the plan. The goal is to institute a robust, repeatable process for assessing, developing, and implementing strategy.

How do you sustain the process and make sure nothing falls through the cracks? Develop and manage a control document such as a Master Calendar. Use it to matrix all the key strategic activities against the months of your fiscal year. Then review the Master Calendar at monthly Progress Tracking meetings, and look ahead to what needs to be done in the coming months.

Doing this, nothing gets overlooked or forgotten. It ensures the Strategic Management Process becomes the overarching management process for your organization.

The goal is to institute a robust, repeatable process for assessing, developing, and implementing strategy.

Part III: The Right Environment

You've developed the right focus. Now you need to create the right environment, one in which every touchpoint is aligned with your intentions. An environment that your people experience as ruthlessly consistent.

Why the right environment before the right team? Because most leaders have a team in place. And until you create the right environment, you won't know for certain whether you have the right team. When you create an environment in which people are aligned, equipped, coached, supported, and valued, you create a culture of engagement, a culture of performance.

Everything Starts with Heads and Hearts

Implementing strategic change depends on people. You can have plans and goals and timelines and meetings, yet none of it matters unless you engage the hearts and minds of your people and align them with what you want to achieve. It's not about buy-in; it's about want-in.

Most leaders think about engaging their employees once they've identified their SCIs. Too late. The decisions have been made. And the employees weren't involved in the process.

There are three times to engage your employees: before, during, and after you've developed your Strategic Framework. It starts with getting their input—their perspective on the issues, opportunities, and challenges facing your organization—before you make any strategic decisions. An anonymous, all-employee survey as well as focus groups with select employees are good first steps.

Then, once a draft framework is developed, get their feedback. An effective way to do this is to conduct a half-day One Team Meeting involving all your employees. Seat them at round tables, present the draft Strategic Framework, and then have them discuss and flip-chart what they like about it, what concerns they have, and what questions they have.

Have each table present their highlights to the entire team. Collect their outputs and review them later with the Strategic Leadership Team. Be open to modifying your Strategic Framework, and if you do, give the employees credit for it, acknowledging them for their ideas.

Once you've finalized your Strategic Framework, engage your employees again. Involve them, when appropriate, as members of your SCI teams.

For all that's been said and written about having a sense of purpose—as important as that is—what's even more important is that you connect the dots between purpose, goals, and each person's role—what is expected of them. What ignites purpose is when they clearly see how what they do as individuals contributes to the big picture, to success.

You're Not a Manager; You're a Coach

There's a critical distinction between being a manager and being a coach. Coaches take responsibility for the performance of their team and each team member. Coaches view their role as helping team members perform at their best, helping them learn, improve, and grow.

Rarely will the coach of a team sport talk to individual players about winning. Instead, the coach will talk about performance and improvement, focusing on what each player can control because if each player does what she can and should do, then the team result will take care of itself.

Two people are responsible for a team member's performance. You and the team member. You're responsible for creating an environment in which each team member can perform at their best. Each team member is responsible for performing. Both you and the team member play a critical role; both of you must be committed.

You don't motivate people. You create an environment in which the right people will be motivated. And that doesn't mean the same environment for everyone. The Golden Rule of Coaching is that different approaches have different effects on different team members at different times. Great coaches are adaptive.

There's also a common misconception about performance. It's that by repetitively doing something, we automatically get better. That experience translates into improvement. But we don't learn simply by doing. We learn by processing the feedback we receive from doing. And not just any doing. The doing has to be focused and intentional.

- Don't review performance; improve performance. Coaches provide SMART feedback and guidance—specific, meaningful, actionable, real time.
- Great coaches are "performance doctors." Much like medical doctors, they diagnose the factors that are influencing performance and then prescribe what's needed to improve.
- Great coaches ask incisive questions. You don't want a team of mindless order takers; you want a team that continually learns, grows, and improves. Strong coaches promote this by asking incisive questions.

Part IV: The Right Team

You have to have the right team. How do you build it? It comes down to processes. Yes, processes. Robust and rigorous processes for attracting strong talent and selecting the best candidates. Not necessarily the most capable individuals but the most capable team members. Then, having a process to evaluate and strengthen those processes.

Don't Just Recruit; Compete

Many organizations are finding that the standard approaches to attracting talent just aren't good enough. It's time to rethink recruitment.

Adopt this mindset, and you'll have a fighting chance: Compete for talent. You're no longer simply recruiting; you're competing for talent. You're not just hiring; you're

There are enemies conspiring against your commitment. Fortunately, you're able to confront them. They're in the mirror.

competing for talent. And you'd better compete for talent as fiercely as you compete for customers, because prospective employees have choices, and they're asking the same questions as prospective customers: Why you? Why not your competitors? What makes your organization special? What's in it for me? How will you help me grow? What opportunities will you provide?

How can your organization compete for talent?

Develop relationships. Increasingly, companies are competing for talent by hosting events that interest prospective recruits. Know your target audience, and design events that appeal to their interests, both work related and personal.

Look for the opportunities in the obstacles. Changing workforce trends provide you with opportunities, not just obstacles. The growth of the gig economy and the desire for more flexible and varied work schedules are examples of such trends.

Uhhh, about your hiring standards. Having a hard time finding talent? Lower your hiring standards, but do it selectively. Make sure not to lower your performance standards. And never compromise your organization's values or the individual traits that are critical to success. But you may want to reconsider your requirements for education, experience, and skills. Are your educational requirements nice-to-haves or must-haves? Can experience be gained? Can skills be developed?

Be Selective in How You Select

If building the right team is critical to your success, then you'd better have an effective, efficient, and evolving selection process. How confident are you that your current selection process meets those criteria?

Which assessment method can give you the confidence that you're selecting the best candidate? The reality is, no one method can do that. Look for converging evidence. The more that evidence from different methods converges on the same conclusion, the more confident you can be in that conclusion.

Start by identifying the assessment methods that are most relevant for the position.

Qualification screening. First, you need to identify what success looks like for the position you're filling, and then you need to determine the basic requirements for success (skills, experience, values, and traits). Don't erect false barriers. Distinguish between must-haves, should-haves, and nice-to-haves.

Interviews. You want multiple interviews conducted by various people, including the candidate's future boss, peers, and, if applicable, direct reports.

Role-plays. When a position you're hiring for requires strong interpersonal skills, such as sales or customer service, role plays can be helpful.

Trait profiles. Trait profiles can provide you with insights into a candidate that might be hard to determine from an interview. How conscientious is the person? Does the person prefer a more- or less-structured environment? While many assessment instruments are available, the High Potential Traits Indicator evaluates traits that have been extensively validated as linking to workplace success.

Job simulations. If you're hiring for technical skills, consider having the candidate demonstrate them. If making presentations is critical to the role, for example, then have the candidate deliver a presentation to your team.

Part V: The Right Commitment

Right focus, right environment, and right team—that's what it takes to win. But it's all theoretical unless you embody the motive force that drives it: the right commitment. At first glance it seems easy enough. Be committed. Of course, it's not so easy. There are enemies conspiring against your commitment. Fortunately, you're able to confront them. They're in the mirror.

The First Enemy You Must Defeat

As a committed leader, the first enemy you must defeat is complacency. Yours.

Are you constantly looking forward? Is your work your passion? Are you immersed in it? People who don't just achieve success but sustain success always have an inspiring next goal.

Develop a Personal Case for Change, a case compelling enough to ensure you're ruthlessly consistent in developing and sustaining the right focus, creating and recreating the right environment, and building and rebuilding the right team.

First, determine what you need to do differently to drive strategic change in your organization. Next, document both the pain that will result if you don't do what you need to do and the gain that will result if you do.

The Enemy That Grows Stronger By the Day

Distractions. It's like you're at the Grand Bazaar with a thousand vendors yelling at you, pulling at you, enticing you with their wares. And it's never-ending.

Yet, distractions don't torpedo strategy execution; distractibility does. Distractions are what lure your attention; distractibility is how you respond. Manage yourself by prioritizing your priorities, taking breaks, and committing to being 100 percent present.

The Enemy That Poses as a Friend

The third enemy you must confront is the most insidious. It makes you feel good and good about yourself. It poses as a friend. Left unchecked, it will lure you along the path to failure. Ego.

Let's be clear. To be an effective leader you need a strong and secure ego. You have to be able to confront tough situations, make painful decisions, overcome massive challenges, and take risks that, even if well calculated, could lead to severe outcomes. And you must have and project confidence through all of it.

Yet, it's possible to have a strong ego and not be an egomaniac. To control your ego, understand that vulnerability can enhance your credibility; acknowledge others' strengths and accomplishments; admit mistakes; and be more concerned with learning than knowing.

Leadership expert Jim Collins wrote, "The signature of mediocrity is chronic inconsistency." Yes, and the signature of excellence is ruthless consistency.

What drives all of it is the right commitment. Ask yourself this one question: "Do I have the will to win or the will to do what it takes to win?"

There will be many challenges—obstacles, setbacks, and frustrations—but they won't determine your success. Because in the end, it's not you versus those challenges. It's you versus you.

The Summary In Brief

How can businesses expect to thrive if close to three-quarters of the workforce shows no passion—or even interest—for the work? And, if we aren't ALL IN at work, how can we expect to be ALL IN at home and in our personal lives?

Shift the Work explores the emerging science around each of our three brains—our head brain, our heart brain, and our gut brain. As we understand ourselves as a whole, we can move away from a work world that is designed solely to meet the needs of the brain in our head. Each part of the book offers a new perspective on work as well as exercises to reconstruct your thinking about the workplace.

Author Joe Mechlinski draws from personal experience, stories from businesses, and the latest in neuroscience to bring us hope about the future of the workplace. We do not have to accept a 70 percent disengaged workforce as a fact of life. Applying these ideas can help you improve your attitudes about work. You can become a leader in improving workplace engagement and the personal lives of those you influence.

In This Summary, You Will Learn:

- How to embrace gratitude through a shift in language.
- To read the signals sent by your three brains—head, heart, and gut.
- To recognize purpose in work as more meaningful than money.
- Ways to elevate relationships as a workplace motivator.

Work On Purpose

Recent discoveries in neuroscience reveal that at every moment, your body's neural network, which connects the brains in your head, heart, and gut, is sending signals about what it finds helpful or harmful. People claim, "I don't live to work; I work to live." The statement ignores the fact that people spend a majority of their waking day at work.

Change Your Language, Change Your Life

Working on purpose begins with a change in attitude. You may think that starts with the heart, but change can begin with head-driven action. Change the way you talk about your life. Try phrases such as these: I don't ***have*** to be with the people I love. I ***get*** to be with them. I ***get*** to bathe my children. These obligations toward loved ones are opportunities to hug them a little tighter and deepen the bond. Take the same approach with work obligations: I get to answer email. I get to have a client meeting. Small changes reconnect you to your priorities, passion, and purpose. They empower you to shift your work.

Adopt an Attitude of Gratitude

High levels of serotonin, the neurotransmitter that regulates feelings of happiness, are released from the gut when people express gratitude or perform acts of generosity. Our language has a biological impact. Studies have shown that the more we practice gratitude, whether through journal writing or sending thank-you cards, the more thankful we will feel months later.

Gratefulness can cause you to turn off your phone at night and spend quality time with the significant people in your life. This attitude drives you to treat the smallest clients the same as the largest accounts, grateful and humbled that they selected your company over all the others.

Every morning, write in a journal three things you are grateful for, three things that would make the day great, and an affirmation of how you see yourself. The ***five-minute journal*** is an excellent tool to enhance your optimism and to build stronger relationships. At the end of the day, list three amazing things that happened, and one way the day could have been better. Articulating your dreams and desires has the power to make them reality.

Know With Your Head

We readily acknowledge the brain in the head. It's where synapses, electrical impulses, and hormones talk to each other, which is what allows for consciousness and awareness. Most importantly, it's what gives us the ability to identify patterns and make sense of the world.

Use Your Brain to Set Your Priorities

Think of your day as an airline flight, and you are the captain. Most of us wake up in the morning and take off as quickly as possible. We shower and dress, and eat a bagel in the car, or grab a coffee on the way. This is the equivalent of taking off and waiting until you're in the air to think about a flight plan. Forget preparing for a meeting. We're lucky if we manage to show up on time. As the pilot, take control. Examine every instrument before takeoff to make sure it's in good working order. Identify the destination before the plane speeds down the runway.

Every moment is an opportunity to execute your vision. Don't waste it on what came before, or let it pass you by because you're too fixated on what comes after. Throughout the day, constantly do everything possible to stay in the moment.

Use Your Brain to Know and Explore Your Path

Workers are like drivers heading down a dark road, and the company's values and mission are the headlights that show us the path. Even if the headlights are only strong enough to show us what's fifteen feet ahead, we still feel confident continuing down the road because we have faith that the company's mission will keep guiding us through the darkness. To have any chance at engaging the head brain, we need clear vision and mission. We must feel that we are provided with the space to use our frontal cortices to innovate in our jobs.

A deli in Michigan has what they call their "Three Bottom Lines." They are great food, great service, and great finance. Every worker is supplied with detailed information about the company's finances. This effort at educating the workforce treats everyone like adults and partners in the mission. Employees who know the profits and losses connected to their specific job are more likely to innovate. In this environment, the person who cleans the trays is more likely to bring up how customers throw out a lot of unused napkins and ketchup packets.

What gets you up in the morning? What keeps you awake at night? Schedule one hour in your day to sit comfortably and think. No smartphone. No laptop. No conversations. Quietly spend time with the thoughts in your head brain.

Engaging the brain in the head allows us to process information, notice patterns, and take away blind spots that

Annie O'Dell exuded passion. She stood out for having a unique point of view, one that was shaped by her connection with the brain in her heart.

prevent us from seeing a different future. Once engaged, we can begin innovating at work and in our own lives.

Own With Your Heart

The brain in the head has us checking off boxes, keeping us on a path, and sticking to a process. The brain in the heart allows us to experience the moment and connect to our actions in an emotional way. When we face adversity and aren't feeling great about our direction, it's the heart that steers us and decides whether the commitment is worth it.

The brain sends orders to the heart, but the heart also sends orders back to the brain. Research shows how signals sent from the heart impact our attention, perception, memory, and problem-solving. It's why we tell people to take a deep breath before they decide on the next step to take.

When making decisions, we are cautioned not to let feelings get in the way, as if emotional choices have less value. A major function of the heart is to regulate blood pressure, which will rise with passion, excitement, or stress, and may fall with feelings of depression. We know something in the head, but we own it in the heart. The term "speaking from the heart" implies that what is being said has authenticity.

The head can devise all sorts of strategies for putting you in front of an audience, but it depends on the heart brain to make the connection.

The head brain will notice if the person standing across from you is happy, but it's only once the heart brain receives the message that it releases the oxytocin and pumps the blood at a faster rate. It will change your voice and the way the muscles in your face move. The person standing across from you will observe and absorb these changes.

Working from the Heart Releases Passion

The level of passion speaks to the question of whether you own what you do in your heart. Does your belief in the company make you want to do a great job at work, or are you completely indifferent to the company's success? A group of employees was surveyed in order to learn whether, if knowing what they now know, would they accept the job again if offered it today—72 percent answered in the affirmative. This sounds high, but is it really? Would you go to a restaurant if a quarter of the diners said they'd never come back? Not every task we are asked to do at work is glamorous or fulfilling, but if we believe in the overall mission, we are willing to accept the tasks as part of the job.

Motion Creates Emotion

Annie O'Dell exuded passion. She stood out for having a unique point of view, one that was shaped by her connection with the brain in her heart. Annie noticed that in company meetings, everyone was dividing their attention between the proceedings and their phones. She took a trash can, covered it with green felt, decorated the lid like a frog face, and called it Kevin. As a new rule moving forward, everyone would deposit his or her phone into Kevin at the start of meetings. She had this natural ability to light people up, whether it was her colleagues, clients, friends, or strangers.

The heart brain is about inspiration and ownership. It is an energy field. Working from the heart takes practice. If we want to connect with people, we need to stand where they are standing, to see the world through their hearts.

Take your eyes off yourself and consider what it means to walk in the shoes of a co-worker. Own their place for a moment to see what it will take to encourage enthusiasm and excitement in your workplace.

Drive With Your Gut

Empathy is a drug. It releases dopamine in the brain, oxytocin in the heart, and serotonin in the gut. This biochemical reaction is the body's way of connecting us to the greater good and prompting us to act on that feeling. It's the body's way of asking, "What are you going to do about this situation?"

The brain in your gut regulates your serotonin level, which dictates your mood and behavior. Intuition, inspiration, and sixth sense refer to sensations from the gut. The gut produces 70 percent of the stress hormone, cortisol. It does more than turn our stomachs at anxious moments. The gut brain is responsible for processing information during sleep. Seventy percent of serotonin—the neurotransmitter responsible for relaying signals across the brain to help us think clearer—is produced in the gut. The gut is also responsible for 90 percent of our immune system, keeping you healthy!

Having the Guts to Lean In

When we talk about finding greater purpose, we are talking about the gut intelligence center. When we are faced with a crucial decision, and we appeal to our intuition, we feel a tightening in our stomachs. Those butterflies-in-your-stomach feelings before giving a big talk, sitting down to an interview for a dream job, or walking down the marriage aisle is the gut brain's way of talking to us and telling us what's important. It is directing us towards purpose.

Guts for Purpose and Principles

Harley Davidson struggled mightily back in the early 1980s when Japan's manufacturing took the upper hand. After several buyouts, the company was down to a 15 percent share of the marketplace. A new CEO took over, and the first thing he did was leave his office for an extended period. He traveled the country, visiting dealerships and hosting Harley-sponsored road rallies, which brought thousands of bikers together to celebrate Harley Davidson. This new strategy was about reconnecting customers and dealers to this product. His idea was that Harley riders thought of the motorcycle as more than a bike. They thought of it as a community, one that is based on principles of patriotism and the independent spirit. In less than fifteen years, market share has climbed to 85 percent.

The gut brain is about impact and greater good. Want to consider your purpose? Take a moment to write your obituary. What would you like people to say about the path you took?

Shift to Make it Work

It's time to shift our thinking from dogma to data, from story to science, as we seek purposeful engagement with work. When we care for ourselves enough to transform our work, we take the crucial step in beginning to properly care for others and our planet.

The business world clings to the fallacy that money is the chief concern of workers when survey after survey refutes this claim. Feeling there is no room to grow, poor leadership, a desire for a better work culture, and a wish for more challenging work are the top four reasons people leave their jobs; better pay and recognition at work are reasons five and six.

The diagnosis is clear. More than two-thirds of the workforce is not engaged, and unless we begin listening to the three brains in our bodies, we will fail at finding the greater purpose to shift these numbers.

The science tells us we can integrate our head, heart, and gut into the work world by thinking a deliberate way, using certain words, and creating habits and patterns of behavior. If we can use the three brains to become fully engaged for the eight hours a day we spend at work, if we can generate passion and purpose and establish constructive patterns, then we'll return home as better spouses, parents, children, and citizens. This is how we'll get rid of the current apathy and workers across the country can say, "Yes, what I'm doing is worth it!"

Joe Mechlinski is a *New York Times* bestselling author speaker and entrepreneur who believes that an engaged workforce is the key to unlocking human potential. To transform the purpose of business, Joe founded SHIFT, a collective of businesses spanning consulting, executive membership, and venture capitalism. All focus on one idea: Better you. Better us. Better all.

Joe's podcast, Shift Happens, features inspiring guests such as *New York Times* bestselling authors Dan Pink and Tucker Max.

A Leadership Fable About Destroying the Barriers That Turn Colleagues Into Competitors

SILOS, POLITICS, AND TURF WARS

THE SUMMARY IN BRIEF

The concept of "silos" has become synonymous with the barriers that separate work teams, departments and divisions — causing people who are supposed to be on the same team to work against one another. These maddening factions breed the office politics and in-fighting which ultimately kill productivity, squash profits and push the best people out the door. Silos cause stress, exasperation and disappointment by forcing employees to fight unwinnable battles with people who should be teammates.

In this summary, New York Times*' bestselling author and acclaimed management expert Patrick Lencioni presents a dynamic leadership fable that reveals how organizations can overcome the "silos" that divide work units and paralyze performance. This summary also offers solutions to a key leadership issue — the impact of turf wars and political infighting on organizational effectiveness.*

Written in the form of a realistic but fictional story, this summary tackles a tough business issue in both an entertaining and instructive way.

In addition, this summary will also show you:

- ✓ ***How to recognize the signs of the devastating power of silos.***
- ✓ ***Why it is necessary to take steps to start knocking down the walls that divide departments.***
- ✓ ***How to create a rallying cry or an over-arching thematic goal.***
- ✓ ***How to determine an organization's defining objectives and standard operating objectives.***
- ✓ ***Why it is important to measure and monitor your organization's performance against these goals.***
- ✓ ***How employees can survive the confusion that is often found in matrix organizations.***

SILOS, POLITICS, AND TURF WARS

by Patrick Lencioni

— THE *COMPLETE* SUMMARY

THE FABLE

Part One: Entrepreneurial Ambition

Honeymoon

Five months. That's how long it took for Jude Cousins' entrepreneurial passion and excitement to fade into anxiety and panic. While it was true that he had never started a company before and didn't know exactly what to expect, five months just seemed like too short of a honeymoon to Jude.

To be fair, Cousins Consulting wasn't really a company. Just a consulting practice operating out of a spare bedroom in Jude's home. No employees. No politics. Just Jude, his passion and his three clients. Two of which, unfortunately, were already in jeopardy.

Hatch

For the seven years prior to starting his consulting firm, Jude had received nothing but encouragement and recognition in his career, which only served to magnify his frustration as an entrepreneur.

After an unsatisfying post-college stint in journalism, Jude took a job in the marketing department at Hatch Technology, a fast-growing company that developed financial software for consumers and small businesses. Beginning his career at Hatch as a copy editor, Jude worked his way through every department in the marketing division, with detours into product management and operations.

Given his work ethic and general curiosity about whatever he was doing — not to mention the rapid growth of the company — promotions came frequently for Jude. At the age of 28, four years after joining Hatch, he was named director of corporate communication.

Jude knew that the secret to his success had everything to do with his insatiable passion for learning. As he liked to tell his friends, he felt like he was being paid to go to business school. Even still, he was not content to have his education limited to one company. So Jude began volunteering to sit on a variety of advisory boards for small but growing companies in the area, all of which were happy to have someone of his talent providing advice, especially when that advice was free of charge.

Jude was eagerly soaking up everything he could and forming strong opinions about how he would run a company one day, which he had come to believe was his ultimate goal. From a professional standpoint, Jude had everything he needed. Between his responsibilities at Hatch and the variety of companies he was being exposed to as an adviser, he had no complaints. His work was interesting enough and his workload, though substantial, was manageable. Jude certainly had no intention of changing his career.

Until the merger.

Batch

Though it had been announced to the press as a merger of equals, anyone with a sense of the market knew that Hatch was on the losing end of the acquisition by its slightly larger competitor, Bell Financial Systems. Carter Bell, the company's brash CEO, had a much higher profile in the industry and wasn't about to lose control of his company in a merger.

But because he didn't want to rock the new boat too soon after the deal was closed, he chose to build something of a Noah's Ark management team with two heads of sales, two heads of marketing, etc. As a result, the seeds of discontent were planted within the new organiza-

(continued from page 2)

tion that would cleverly be called Batch Systems.

As for Jude, his duties and title were divvied up between him and his counterpart from Bell, so he took on a slightly diminished role as director of advertising. With every passing week, Jude was finding it harder and harder to get things done. Infighting had risen to a new level and attention had shifted drastically inward, away from issues such as customers and competitors, and toward battles over budgets, titles and responsibility for mistakes.

And while it could be expected that these feuds might develop between employees of the two former companies, new levels of inter-company conflict were rising in other areas, too. There was the headquarters versus field office split. And marketing versus engineering. And even within engineering, researchers and developers seemed to be at war over who warranted more head count, budget dollars, and recognition for the success of products.

Politics

Because of his narrower and more divided duties, Jude realized that his political capital at Batch was not particularly high. Which is why he decided to ignore the tornadoes swirling around him. But he was smart enough to realize that avoidance and denial would probably not be the best course of action, and that problems don't usually go away on their own. And besides, he was not the kind of person to stand by and watch things unravel.

So, with the security of a nice little nest egg in hand — thanks to the company's rising stock price — Jude decided to go sniffing for another job. Given the growing economy and his network of friends in the industry, it wasn't surprising to Jude that he quickly had a full slate of interviews and that many of them yielded offers. But each time he started to consider a job change, he'd get sucked back into his "day job" by an urgent project and the idea would go dormant.

The Leap

Then it happened. The company's stock, defying the chaos that was driving its employees crazy, hit a level that was three times the merger price. Now Jude's nest egg began to feel like a full-grown bird, and even if he didn't stay long enough for all of his options to be vested, he'd have the stock equivalent of two years' worth of salary. Deciding the time was ripe for a change, he left Batch and started his own consulting business. ■

Part Two: Roller Coaster

Low-Hanging Fruit

Jude settled on the name *Cousins Consulting* for his new business. Though he sold himself as a general consultant with expertise in marketing and operational effectiveness, it seemed clear that his ability to land clients had more to do with his reputation, the relationships he had with executives, and the rapport he developed during sales calls.

Clients

The clients Jude worked with included the following:

The Madison Hotel. The Madison is San Francisco's oldest, largest and most prestigious hotel. Dante Lucca, the hotel's CEO, had overseen a massive and expensive renovation of the 300-room facility, restoring it to its position as the jewel of Nob Hill. He also received some recognition within the industry for flattening the management structure of the hotel. Recently, occupancy had begun to drop in the face of mounting competition and there were rumors that employees were entertaining overtures from organized labor. Dante hoped Jude would be able to provide him with advice around market positioning and strategic clarity.

JMJ Fitness Machines. JMJ is a manufacturer of high-end consumer and institutional exercise equipment. The company's CEO, Brian Bailey, was trying to figure out how to reduce his company's costs to compete with cheaper labor overseas, but without hurting quality or productivity.

Children's Hospital. Not only did Brian hire Jude as a consultant, he referred him to Lindsay Wagner, president and CEO of the Children's Hospital of Sacramento.

Sacred Heart Church. Finally, Jude agreed to help Father Ralph Colombano, the pastor at Sacred Heart Church in Walnut Creek, Calif.

Exactly how Jude would ultimately add value to these clients was still somewhat unclear to him. But based on his advisory board experience and his observation of the parade of consultants hired by Hatch over the years, he was confident that he would be able to justify the cost of his services.

Candy

For the first three months, Jude was a kid in his own candy store. In any given week he might find himself walking the factory floor at JMJ, touring the operating room at Children's Hospital, or doing customer research at The Madison. More than the novelty of these activities, Jude loved observing real business problems and trying to solve them. In those first months alone, he found ways to make meaningful contributions to almost every one of his clients.

The first setback was the devaluation of his Batch stock, driven primarily by the ongoing loss of key talent just below the senior executive level. Then Brian Bailey called.

"Jude," he said, "I just wanted to call and thank you for the work you did with the assembly team earlier this month. We're going to take what we learned there and apply it in design and procurement, and I think we'll be able to save considerable money before the end of the year. So let's wrap up your consulting gig at the end of the month."

(continued on page 4)

Part Two: Roller Coaster

(continued from page 3)

Analysis

Jude saw that he had two problems. First, he needed more clients. Though he had enough money to pay the bills for six months, beyond that he had been counting on the Batch stock to rebound, which was fading a little more every day. Second, he needed something to sell to those clients. Until now, Jude hadn't felt the need to be so specific.

Determined to power through the problem, Jude did what he would advise any other businessperson to do. He asked his customers what they wanted. What really kept them up at night? What made them want to quit sometimes? A few of the executives mentioned quality. Two talked about labor problems. All of them referred to technology changes.

Discovery

Going through his notes for the third time, Jude spotted it. Silos. Everyone but Brian had complained about it at one time or another. Some called it *departmental politics*, or *infighting*, or *lack of divisional cooperation*.

Lindsay described the problem at Children's Hospital where doctors and staff members seemed to be almost at war at times. At his hotel, Dante couldn't get the front office staff to cooperate with housekeeping and maintenance. Father Ralph surprised him most of all when he explained that the Parish Council and the Parent-Teacher Committee were at odds over how to use the school facilities. Then Jude remembered Batch. Headquarters versus the field. Sales versus engineering.

It had been right in front of him all along and yet he hadn't realized how universal the problem was and how much pain it caused. This silo thing was exactly the issue he needed to build his practice around. He decided to approach his old clients and even his old company. And, to his surprise, almost everyone was interested. Everyone, that is, except Brian, the CEO over at JMJ Fitness Machines. ■

Part Three: Rally

Jude wanted to know why. So he made an appointment. "I want to know why it is that you don't think you have a silo problem around here," he asked. Brian invited him to ask the employees themselves.

Snooping

Jude felt like a plainclothes police officer as he roamed the company's halls and the factory floor asking questions. Deciding that it would be best not to bias the people he questioned, Jude always asked the same two open-ended questions: What's going on that's good? What's going on that's not so good? Then he probed in a more direct way. He might ask a factory floor worker, "How do you like working with people from finance?" Or he'd ask someone in sales, "Do you think that marketing is doing enough to help you sell products?" He got nothing that would indicate a silo problem.

Then he began asking a host of more direct, somewhat desperate questions that he thought might elicit some indication of departmental stress. "Which department do you dread working with the most?" "If you had to take resources from one department within the company, which would it be?" Most of those questions provoked looks of confusion more than anything else.

Jude couldn't figure out why Brian's company didn't have a silo problem.

History Lesson

One day, he got the break he was looking for. He discovered that a health club in Los Angeles had purchased 15 treadmills from JMJ, and one of its customers, a minor celebrity, had a serious accident while using one of them. The story hit the press, the health club blamed the manufacturer, competitors took advantage of the situation, and JMJ's lawyers gave the executive team the horrible advice to avoid making any public statements that might hurt them in court.

Within a week, customers began canceling orders and returning recently purchased equipment. Sales dried up, and the company was staring at a major layoff and possibly a shutdown within six months.

And that's when Brian made the most enlightening comment of all. "You know, sometimes I think that was the best thing that ever happened to this company."

Puzzle Pieces

Brian said, "I pulled my team together and told them that we had six weeks to restore our reputation. That meant we had to demonstrate that our products were safe, to rebuild our reputation, to fix our relationships with key customers, and to rebuild morale. We decided that the only way to salvage morale was to get everyone involved, even a little pissed off, about what had happened to us."

Jude was now starting to get excited. "Tell me the truth, Brian. Before all of that happened, was there a silo problem around here?"

Brian thought about it. "Well, I did fire a few department heads because they didn't seem to care as much about the company as they did about their own little fiefdoms. And before I arrived, the incentive trips were limited to people in the sales organization."

Armed with this new intelligence, Jude returned to his former company where, in front of its executive team, he asked the question, "Has anyone here ever worked for a company in crisis?" After hearing several examples from the executives, he suggested Batch could fix its silo problem by finding a way to rally its people around a common cause *before* a crisis hits. ■

Part Four: Moments of Truth

Test Number One

Several days later, Jude continued to flesh out his theory with Lindsay and her team at Children's Hospital. After forcing its executive team out of their departmental silos, he was able to get them to agree that improving patient service was the rallying cry or, as he decided to call it, the ***thematic goal***.

He then asked everyone to write down the handful of things that needed to happen "if we're going to accomplish our thematic goal of improving patient service."

Jude surveyed the room, pointing to each executive for a response. By the time everyone had spoken, Jude had written these four different subject areas on the board:

- **Better patient throughput**
- **Integrated clinical information systems**
- **Improved case management**
- **More joint planning**

After listing these ***defining objectives***, he decided not to wait for someone to ask the next inevitable question: *What about our day jobs?* "Rest assured that we're not forgetting about the fact that we have to continue doing surgery and treating patients and paying bills and collecting insurance," he said. "Those things are and will always be critical. But if that's all we're thinking about, then every month and every quarter and every year that goes by won't make this a better hospital."

Deeper

He then pushed the team to figure out how to measure each of those areas and then to come up with a short list of ongoing operational objectives they needed to track. The team opted to keep the measurements simple by using the color green for objectives that were on track, yellow for not quite there, and red for definitely not there.

The team settled on the following measures for ongoing measurement:

- **Occupancy of Beds**
- **Clinical Outcomes**
- **Operating Income**
- **Staffing Ratios**
- **Cost per Discharge**

This overall structure would help to keep the team focused. If anyone were to argue for something that is good for his or her department or functional area but that doesn't have a meaningful impact on any of these things, then the team would all be able to explain why it shouldn't be a priority.

Fast Forward

Within months, Jude's business grew rapidly through word-of-mouth and strong client references. Over the course of the next three years, his firm had grown to seven consultants and two office staff, and now had a Web site.

On the eighth anniversary of the firm's founding, Cousins Consulting had grown to more than 15 consultants and five staff members handling marketing, finance and client support. Vertical markets had been established in health care, technology, education and nonprofits.

And then one day it happened. It was during a staff meeting. Jude asked for input about how to allocate marketing dollars for the upcoming year. One of his health care specialists responded first. "We think it's about time that we received our fair share of the budget."

Jude frowned. "Excuse me?"

The consultant started to repeat himself. Jude interrupted him. "Who is we?"

"Me and Fred. We think that the health care vertical deserves more money this year."

There it was. The first real silo to sprout at Cousins Consulting. Though he was tempted to dive in and crush it immediately, Jude decided to let it sit there in the open for a moment so he could appreciate it in all its destructive glory.

Then he crushed it. ■

THE THEORY

Introduction to Silos

Building a cohesive leadership team is the first critical step that an organization must take in order to give it the best chance of success. However, even when leadership teams become cohesive, there is another, more structural issue that often thwarts their efforts and creates unnecessary politics within an organization. That issue is silos.

Silos are nothing more than the barriers that surface between departments within an organization, causing people who are supposed to be on the same team to work against one another. And whether this phenomenon is called departmental politics, divisional rivalry or turf warfare, it is one of the most frustrating aspects of life in any sizable organization.

In most situations, silos rise up not because of what executives are doing purposefully, but rather because of what they are failing to do: provide themselves and their employees with a compelling context for working together.

Without context, employees at all levels — especially executives — easily lose their way. Even the most well-meaning, intelligent people get distracted and confused

(continued on page 6)

Introduction to Silos

(continued from page 5)

amid the endless list of tactical and administrative details that come their way every day. Pulled in many directions without a compass, they pursue seemingly worthwhile agendas under the assumption that it will be in the best interest of the organization as a whole.

But after a while, employees in different divisions begin to see their colleagues moving in different directions, and they begin to wonder why they aren't on board. Over time, their confusion turns into disappointment that eventually becomes resentment — even hostility — toward their supposed teammates. And then the worst thing of all happens — they start working against those colleagues on purpose!

The Silo Mentality

This maddening problem exists, to different degrees, in most companies. And in too many of those companies, leaders who are frustrated by the silo mentality mistakenly attribute it to the immaturity and insecurity of employees who somehow just refuse to get along with one another.

But the fact is, most employees deep within an organization have a genuine interest in working well across divisions. That's because they feel the daily pain of departmental politics as they are left to fight bloody, unwinnable battles with their colleagues.

If there is a place where the blame for silos and politics belongs, it is at the top of an organization. Every departmental silo in any company can ultimately be traced back to the leaders of those departments who have failed to understand the interdependencies that must exist among the executive team, or who have failed to make those interdependencies clear to the people deeper in their own departments.

There is a simple and powerful way for leaders of any organization to create context around that interdependency: They must establish, for the executive team as well as the rest of the organization, a thematic goal. A rallying cry. ■

The Thematic Goal

A thematic goal is a single, qualitative focus that is shared by the entire leadership team, and ultimately, by the entire organization, and it applies for only a specified period of time.

To avoid politics and turf battles, executives must establish an unambiguously stated common goal, a single overriding them that remains the top priority of the entire leadership team for a given period of time. In turn, this thematic goal serves to align employees up and down the organization, and provides an objective tool for resetting direction when things get out of sync.

Key Elements

A thematic goal is not a long-term vision or, as Jim Collins and Jerry Porras refer to it in their book *Built to Last*, a BHAG (big, hairy, audacious goal). Nor is it a tactical metric or measurable objective. While it is important that companies have both a vision to motivate people and a set of tactical objectives to guide their daily activities, the thematic goal lies somewhere in between them, and may be more important. That's because it bridges the two by making the vision more tangible and by giving the tactical objectives more context. The key elements of a thematic goal include:

Single. There can be only one true thematic goal in a given period. That is not to say there aren't other desires, hopes and objectives at play, but none of them can be attempted at the expense of accomplishing the thematic goal. When a company is tempted — and most always are — to throw in one or two more, they defeat the purpose of the thematic goal, which is to provide clarity around whatever is truly most important.

Qualitative. The thematic goal is not a number, and it is not specifically measurable. It is a general statement of a desired accomplishment. It requires a verb, because it rallies people to do something. Eventually a thematic goal will indeed be supported and clarified by metrics, numbers and target dates. But this comes into play two stages later in the goal-setting process and should not happen sooner.

Time-Bound. The thematic goal does not live beyond a fixed time period, because that would suggest that it is an ongoing objective. To the contrary, it is a desired achievement that must occur during a set period of time — usually between three and 12 months, depending on an organization's business cycle and its unique situation.

Shared. The thematic goal applies to everyone on the leadership team, regardless of his or her expertise or interest. While it is true that some thematic goals will more naturally fit within one particular executive's area of responsibility, it is critical that all team members take responsibility for the goal and for doing anything they can to move the company, not just their department, toward the accomplishment of that goal.

This means executives must remove their functional hats, the ones that say *finance* or *marketing* or *sales,* and replace them with generic ones that say *executive*. And not only do they have to avoid being parochial in their advocacy, they must dare to make suggestions and ask questions about areas other than their own, even when they know relatively little about those areas. That's because the most insightful questions and ideas often come from people with a more objective — even naive — viewpoint than those who live and breathe an issue every day.

But a thematic goal, on its own, will leave an organization confused about what exactly to do. And that's where *defining objectives* come into play. ■

Defining Objectives

Once a thematic goal has been set, a leadership team must then give it actionable context so that members of the team know what must be done to accomplish the goal. These are called defining objectives because they are the building blocks that serve to clarify exactly what is meant by the thematic goal. It's also worthwhile to look at these three required elements of a defining objective:

Qualitative. It is tempting for executives to want to over-quantify defining objectives because it gives them a sense of closure and certainty, especially after struggling with the notion that the thematic goal was not quantified. However, assigning numbers and dates to defining objectives only serves to limit the involvement of leadership team members who cannot see how they might directly impact a numerical target.

Shared. Even when a clarifying objective seems to be geared specifically to a member of the leadership team with functional expertise, it is critical that all leaders assume a very real sense of accountability and responsibility for achieving it. And even if a given executive has no technical knowledge about that objective, he or she must play a critical role in ensuring that every angle is explored and every distraction is avoided. Often the best ideas about an issue come from people not closely involved in that issue.

Time Bound. When the thematic goal is no longer valid, the defining objectives also disappear. ■

Standard Operating Objectives

It is critical to acknowledge the existence of other key objectives that a leadership team must focus on and monitor. These are the regular, ongoing objectives that don't go away from period to period.

Standard operating objectives include topics such as *revenue* and *expenses*, as well as other items such as *customer satisfaction*, *productivity*, *market share*, *quality*, etc. The danger for a company lies in mistaking these critical objectives for a rallying cry, because most employees struggle to rally around "making the numbers" or "cutting costs."

But that's not to say that a thematic goal cannot involve one of these categories. If a company's biggest area of focus in a given period is accelerating revenue growth, then that could be the leadership team's thematic goal. Or maybe in the face of the loss of many key customers, the executive team decides that increasing customer satisfaction is the rallying cry for that period. Fine.

But leaders must resist the temptation to say, "If we don't make our numbers, then nothing else matters." While that may be true in the most literal sense, it doesn't qualify as a thematic goal if it isn't unique to a given period. Instead, call it what it is: a critical but standard operating objective.

By using these standard operating objectives as rallying cries too often, executives engage in the "boy who cried wolf" syndrome, provoking cynicism and lethargy among employees. Calling revenue a standard operating objective shouldn't diminish the importance of achieving it. ■

Metrics

Once the thematic goal, defining objectives and standard operating objectives have been established, a leadership team can now start talking about measurement. Without these three other areas, metrics have little or no context, and employees, including executives, will not be nearly as motivated for hitting those metrics as they could be.

Keep in mind that even metrics are not always quantifiable numbers. Often, they are dates by which a given activity will be completed. Trying to artificially assign specific numbers to immeasurable activities is unwise because it encourages the achievement of arbitrary outcomes that may or may not contribute to the thematic goal. ■

Case Studies

The best way to understand all of this is to look at examples because there are many different kinds of thematic goals and related objectives. Here are two examples:

Example #1: A Global Pharmaceutical Company

Situation: As two of its bestselling drugs went generic, the company purchased a smaller but sizable competitor in order to acquire a host of early stage drugs in the emerging anticholesterol market and related categories.

Thematic Goal: Complete the merger.

Defining Objectives: Establish a comprehensive strategy for the new organization, create a single, unified marketing message, establish a single look-and-feel (logo, collateral, etc.), eliminate redundant and underperforming products, and merge back-office systems and processes.

Time Frame: Nine months.

Standard Operating Objectives: Revenue, market share by product category, profitability by product, employee turnover, and adherence to new product development and approval schedule.

Example #2: A Two-Year-Old Software Company

Situation: Sales have increased faster than plan, along with the number of employees and customers.

Thematic Goal: Establish an infrastructure for continued growth.

Defining Objectives: Install a more scalable and comprehensive accounting system, upgrade the customer tracking system, establish polices and procedures for human resource management and hiring, hire a chief administrative officer, and outsource IT support.

(continued on page 8)

Case Studies

(continued from page 7)

Time Frame: Six months.

Standard Operating Objectives: Make revenue numbers, maintain cash flow, retain key customers, achieve positive assessments from market analysts, and get positive marketing/PR hits. ■

Managing and Organizing Around the Thematic Goal

Once a leadership team determines its thematic goal, defining objectives and standard operating objectives, it needs to keep that information alive in the course of running the organization. The place where it needs to be reviewed and discussed is during regular staff meetings.

There are two steps required to establish a real-time agenda, and the process should take no longer than 10 minutes.

First, go around the table and give every member of the team 30 seconds to report on his or her three top priorities for the coming period. Then, review your team scorecard, which is nothing more than a to-be-graded list of the items that make up the defining objectives and the standard operating objectives. Rate the objectives by color — red, yellow or green — based on the judgment and intuition of the leadership team members.

Once the ratings have been done, the team members are ready to decide where to spend their time and energy. This is the time to challenge someone on the team who is planning to spend time on an issue that is either unimportant to the thematic goal, or related to an area that is already doing well. This kind of peer accountability about how team members are prioritizing their precious time and resources is key to an organization's ability to focus, and it is the thematic goal that provides the context for doing this. ■

Thematic Goals and Long-Term Context

When a thematic goal runs its course and is largely accomplished, an organization must come up with another, and then another. Successful organizations achieve a delicate balance between predicting what is going to happen over the long term and responding to unexpected circumstances along the way. This calls for a planning approach that provides the right amount of context without unnecessary restrictions.

A thematic goal provides that context because it exists within the framework of six to 12 months: a time horizon that can be accurately managed. Organizations find that their plans become irrelevant or stale. Shorter-term goals don't provide enough time for people to get their hands around something difficult.

Does that mean we should abandon weekly metrics? Absolutely not. But they should be established within the context of longer-term thematic goals. And what about three- and five-year plans? They're fine too, as long as you don't lead yourself to believe that they're going to last.

When a thematic goal is clearly established and communicated, employees should be able to look up from their work at any given time and see how they're contributing to an outcome that is far enough away to give them the ability to succeed, but not so far away that they cannot imagine ever being finished. ■

Matrix Organizations

Matrix organizations are forums for confusion and conflict. They have certainly not contributed to the breakdown of silos; they've merely added an element of schizophrenia and cognitive dissonance for employees who are unlucky enough to report into two different silos.

But the matrix is here to stay, and so it is critical that we understand how to make thematic goals work within it. Ironically, a thematic goal is exactly what is needed to transform a matrix reporting structure from a tool of confusion to one of collaboration.

The real problem with matrices is that they put employees in difficult situations by asking them to please two leaders who are not aligned with one another. By achieving clarity about the number one priority in an organization, and by clearly identifying the defining and standard operating objectives that contribute to it, an employee will have far less reason to fear being pulled apart at the seams.

And if that employee does start to feel some pull, it is a great opportunity for elevating an issue to the leaders in charge, because, like a canary in a coal mine, it is an indication that alignment is breaking down. ■

THE SUMMARY IN BRIEF

Complexity is wreaking havoc on organizations and individuals at an increasing rate. Organizations and the people in them are paralyzed by controlling and energy-sapping rules, processes, and transactional expectations, all of which are giving rise to a sense of hopelessness and holding organizations back from delivering breakthrough innovations and executing at speed.

Simplify Work promises to reveal the typical drivers of complexity in our organizations and in our lives and provides a practical method for simplifying work. Author Jesse W. Newton shares his experience and research regarding how to go about simplifying work in a careful and sustainable manner. This information will benefit anyone that believes there could be a better way to run our businesses in the 21st century.

IN THIS SUMMARY, YOU WILL LEARN:

- To identify the key drivers of complexity in your organization.
- How to use design thinking to identify and solve top complexity problems.
- To rethink strategy, structure, and systems to simplify work.
- Personal steps to take to become free of burdening complexity.

Complexity is wreaking havoc on organizations and individuals at an increasing rate. We are on the front step of a new industrial revolution but are still using 20th-century methods of organizing how work gets done. Consequently, many organizations cannot realize the phenomenal performance potential this new revolution promises.

Also, individuals are unhappy, unhealthy, and burning out at an increasing rate. The time is right to rethink how work gets done.

Bogged Down in a Spaghetti of Structure

An epidemic of debilitating complexity is affecting businesses large and small. This disease restricts innovation, limits productivity, disengages the workforce, and eventually leads to organizational failure. Debilitating complexity takes the form of unnecessary and complicated structures processes, systems, rules, metrics, and checks and balances. Businesses traditionally add more and more of these things as they grow, which stifles innovation and entrepreneurship.

So many people are stuck wasting a significant part of their day doing low value, non-core activities. The implication for business is that things move too slow, people think and act in silos, it's hard to get anything done, decision making is poor, innovation is missing, risk-taking is low, and it all leads to increasing costs and being left behind by more nimble competitors.

Today we are of the front step of the fourth industrial revolution. We are living in a digital era where artificial intelligence, big data, and the internet of things are revealing big opportunities for us to finally step out of transactional, repeatable work and focus our time, energy and capabilities on the activities with the greatest value. It is now critical to refocus teams and strip out and simplify unnecessary work.

While getting to simple may take a lot of hard work and persistence, there are some core components or ways of "getting to simple" to help in this important endeavor.

Get Clear on Purpose: There has to be a clear sense on the strategy, mission, or vision so you can begin to remove the things that are cluttering the business.

Organize: A comprehensive picture of the current state should be obtained so themes can be extracted and used to group and organize the minutiae.

Reduce: Prioritize, reduce, and remove those things that are not essential.

Using Design Thinking to Simplify Work

There is a bigger process that more effectively guides simplification beyond the common methods of getting clear on purpose, organizing, and reducing: Organizations can use design thinking to simplify work.

People take for granted how their lives are shaped by design, from the physical feel of a seat to the convenience of an online shopping experience. Design is everywhere and is constantly seeking to improve human experience. Design thinking has a number of defining characteristics that set it apart from traditional problem-solving methods.

One is taking a human-centered approach versus a purely analytical approach. Designers put themselves in the shoes of the people who will be using the product or experiencing a service. Through this they reveal critical problems to be solved or opportunities to enhance the design. When pursuing simplification, truly immersing oneself in the world of the worker reveals all kinds of contextual insights that would never be gathered purely from a survey or data analysis.

Design thinking is also highly participative. There is a focus on engaging clients and impacted teams throughout the simplification process as there is so much value in doing so. When they're engaged in the process, it fosters buy-in and ownership, which is essential if the solutions are to be embedded into the business and sustained over time.

The design thinking method can be sequenced in three steps:

1. **Empathizing and Illuminating:** Capture information about what people actually do and how they do it through stakeholder interviews, workshops, observations, and surveys. The key is to ask great questions, often the same question multiple ways, and truly listen to reveal opportunities. Make sense of the "current state" information by quantifying the amount of work spent on various activities and aggregate sources of frustration.
2. **Ideation:** Bring together small teams of diverse areas of expertise to brainstorm and explore any and every avenue to solve the top problems. If someone comes up with an interesting idea, others should feel energized to build on it, tweak it, evolve it, or explore tangents. The team will begin to converge on the ideas, grouping

them into themes and from that, a prioritized list of the top three to five solutions should be generated.

3. **Prototyping and Iterative Implementation:** With prototyping, the solution ideas coming out of the ideation process are rapidly designed and tested. The intent is to learn as much as you can through experience and then iterate the design based on lessons learned. The learning, adjusting, and evolving never stops. This promotes a culture of continuous improvement, curiosity, and reflection which then reduces the risk of failure mentality that can stymie innovation.

Common Simplification Focal Areas

Many parts of a business can create confusion, cloud focus, and absorb time and energy but some specific areas generate the lion's share of this muddy state.

Simplify Strategy: As organizations grow, they often expand into new business units and geographies or acquire other businesses. All of this expansion has traditionally resulted in more complexity. More structures, processes, rules, and responsibilities are defined to maintain control of the expanding workforce, and strategic focus gets hazy.

Interestingly, there is one common tactic that leaders deploy to successfully turn around a business: they shed all extraneous business units and return clarity and focus to the business. They simplify strategy. Sometimes organizations need to pare down the number of initiatives they have running at one time to regain strategic clarity.

Another method for simplifying strategy is to simply ensure that everyone knows what the strategy actually is. It is surprising how often employees are not truly clear on what is most important in their business. Without a clear understanding of an organization's strategic priorities, one cannot make decisions that align with what the company needs to do to win.

An effective communication campaign can play an important role in building collective understanding and buy-in for an organization's strategy. All the complex elements of a strategy need to be distilled into a pithy, succinct statement or visual. Language is crucial, so each word needs to be carefully selected. The simpler the language, the better.

How the communication is delivered is also critical. The messages need to be displayed or delivered in a way so that it is rapidly understandable, energizing, and easily attainable. This is often done by carefully visualizing complex content, using metaphors, and storytelling. Metaphors paint a picture for us, which speeds understanding. These metaphors, when used in a story format, are remembered more easily.

Rethinking Organization Design: How a company is organized is often a significant driver of complexity. Structural design directly affects how people get work done, how goals are met, how decisions are made, how communications flow, and how the degree of control influences accountability and autonomy.

The most common organization structure type that most large businesses have today is a matrix. It caters to complex organizations that have multiple business units operating in markets around the world. Back-office functions are integrated into regional shared service centers and business units are organized by market, product, or service.

The challenge with matrix organizations is that people get lost in the web of functions, product groups, customer segments, and geographies. They become territorial with resources and talent, coordination becomes a nightmare, and more approvals are required to ensure oversight of performance.

Companies are starting to explore new ways of operating that are counter to the traditional models. Instead of assuming that people cannot be trusted and therefore need to be controlled, the emerging designs serve to liberate the intelligence of their people by empowering them with the autonomy to work, decide, and execute as they see fit. This autonomous team structure, otherwise referred to as an agile organization or holacracy, is getting more and more attention.

The major differences that this relatively new structure embodies include:

- **Clarity from the top:** Vision, mission, and strategy are set and clearly articulated by leadership.
- **Removal of layers of management:** Vertical reporting lines are removed and replaced with pods of small teams.
- **Category pods:** Pods are established for each product, service, or market.
- **Small autonomous teams that are focused on a particular opportunity:** Each team determines how they solve problems and make decisions, when to execute, and how to incorporate lessons learned.
- **Coordinating nodes:** Teams are closely coordinated through ongoing check-ins.
- **Managers become coaches:** Traditional managers

are redeployed as coaches, and their role is to enable effective teaming, mitigate conflict, and provide feedback and coaching.

There is a lot of value in evolving an organization model to empower people, but each company needs to carefully create a model that will work in their unique commercial environment.

Stripping Out Bureaucratic Practices

Bureaucracy acts like an anchor, prohibiting efficiency and killing momentum. An important contributor to bureaucratic practices is unwieldy processes. Identifying better ways of doing a repeatable process has been a core management task for a long time and has delivered tons of value to businesses over the past century.

Examples of processes that are unwieldy and inappropriately time consuming include: performance management, budge setting, travel booking, expense processing, and compliance.

Schedule a bi-annual or annual review of core processes and take steps to reduce or remove low value processes. The more we can redesign or remove non-core, low value activities and enable space and focus, the more likely we are to free the performance potential of people.

Making Sense of Systems

Too many employees struggle to find the information they need within their company's information system. IT functions need to deliver simple and user-friendly solutions for employees, so the complexity is contained as much as possible and people get the right information or connectivity when they need it, in a form that is digestible and usable so that focus and energy can be used on problem solving and innovating.

Simplify You

People have more and more work to do, are spending less and less time with their families and are not taking time to disconnect and recharge. The go-go-go mindset reduces one's ability to think strategically and operate in a proactive manner. Steps can be taken and skills can be built to smash complexity in your life, take control, increase your energy, be more productive, and be happier. It's time to begin to live simply.

Here are the steps you can take to simplify you:

1. Reduce clutter: It is mentally liberating to get rid of things that are not needed. With a simplified environment, we feel less stress and mentally scattered.
2. Get clear on what is most important: With clarity on what truly matters most you can say no to the various things that pop up during the day that are not your highest priorities.
3. Plan effectively: Annually, quarterly, and weekly plans should be completed for your professional and personal life. Put all plans, including date nights and taking your kids to school, on your calendar and adhere to it.
4. Avoid distractions and interruptions: Turn off phone notifications, designate time for email, and avoid low-value meetings.
5. Nurture and protect energy: Learn to meditate, practice positivity, prioritize quality sleep, and remain active.

The image of what work could be like when simplification takes hold is an inspiring one. The idea of people rapidly learning and developing, using all their creative potential, and positively throwing all of their energy into work that matters is a beautiful image. We can get there. We just have to take the first step to simplify work.

Jesse W. Newton is the founder and CEO of Simplify Work, a global consultancy that specializes in unburdening organizations from paralyzing complexity. In his work with clients, Newton advises across the spectrum of simplification focal areas, including rethinking organizational structure, transforming culture, and building smart skills in individuals and teams. Clients include Mondelez International, McDonald's Corporation, and PepsiCo.

Management: Strategies

Single Point of Failure

The Ten Essential Laws of Supply Chain Risk Management

by Gary S. Lynch

THE SUMMARY IN BRIEF

It is mind-boggling to consider what it takes to produce the products we depend on — critical drugs like blood thinners, plastic-based products such as syringes, isotopes for medical imaging and milk-based formula. Or maybe your livelihood depends on having access to your online order entry system or on the timely receipt of parts from your suppliers on the other side of the world. The occurrence of a single point of failure — whether a product contamination, labor strike, trade credit crunch, earthquake or health crisis — can interrupt the flow of goods and cause total systemic failure.

In *Single Point of Failure*, internationally recognized industry veteran Gary Lynch reveals the 10 vital laws you can use to successfully identify, measure, mitigate and finance risk. Lynch offers guidance for establishing your organization's supply risk management program, avoiding bad decisions and gathering better information and data to make good decisions.

You need to learn the root causes of problems and decide whether you have the proper systems in place to mitigate risk. Addressing risk from several points of view, this summary shows you how to remain agile to avoid risk, be resilient to absorb risk, develop sustainable methodologies and maintain risk solutions.

IN THIS SUMMARY, YOU WILL LEARN:

- How to establish your organization's supply risk management program.
- Why no risk strategy is a cure for bad decisions.
- What causes supply chain risk management demand to trump supply.
- Why managing the parts does not equal managing the whole.

Introduction: Getting to the Truth

The supply chain represents the ecosystem of flows, relationships, infrastructure, labor, assets, technology and processes that drives a business. For most, it is the business — excluding the market and clients. As the supply chain concept evolved over the past decade, so did the opportunity to improve productivity, eliminate overhead, and speed the flow of goods and services.

Supply chains and supply chain management have matured and now represent the "business network" or "value chain" needed to support the innovation, creation, manufacturing, assembly, distribution, service and disposal of product.

Risk

In an overseas product factory, a contract manufacturer actually is not dealing with unique or segregated problems; the processes at that plant exist as part of a complex supply chain, and an enlightened manager recognizes that the level of risk passes from there all the way up the chain — from the manufacturing floor in Taiwan to the customer in New York. Marketing managers, accountants and mailroom supervisors (as well as those who are directly engaged with the operations of supply chain such as logistics, procurement, production and transportation personnel) all face the same issues; they may not have the same control demands, but the concept is identical. All processes consist of a series of steps and functions that equate to a chain. But it takes only a single weak link, the *single point of failure*, for the entire chain to fail; so the risk-conscious culture must be agile, resilient, sustainable and adaptable. This premise applies everywhere and to everyone, and the simple truth of this problem cannot be ignored.

More alarming, perhaps, is the very real possibility that a supply chain could contain many weak links, and failure can (and will, based on Murphy's Law) happen at the worst time, in the worst conditions and more than once — such as a pandemic.

Remember, *believing* that all is well may be a self-deception. You need to continually analyze and evaluate the risks to your supply chains and business networks, determine and learn from the root cause of problems and decide whether you have the proper philosophy, culture and systems in place to identify, measure, mitigate and finance risk. Good business strategy dictates that you must:

- Remain agile to avoid risk.
- Be resilient to respond, adapt and absorb risk.
- Develop methodologies that are sustainable to scale and maintain risk solutions.

The Laws of the Laws

Risk is a parasite that resides in every process. Thanks to globalization, the risk parasite can quickly weave its way through the logistics, sourcing and production processes that support long-tailed supply chains. The parasite can lie dormant in these processes, undetected by the organization. Then an event unleashes the parasite, creating a single point of failure, a broken link in the chain. The catastrophic outcomes can affect any stakeholder in the supply chain regardless of geographical or organizational boundaries. Whether an explosion at a natural gas plant or the availability of a single part, today's interdependent and lean supply chains as well as a fiercely competitive global marketplace leave little space, or time, for error.

No Boundaries

Think of the risk parasite as a metaphor to remind us how to address existing vulnerabilities and anticipate future challenges throughout the supply chain before they become catastrophic. The risk parasite knows no boundaries. It resides in every resource and attaches to every process flow.

You need to define exposure to uncertainty in terms of impact: the cost of the loss, and what that loss means in terms of stakeholders, your brand and reputation, and even to the basic ability to provide goods and services to your customers. With this definition in hand, you can better understand the practical realities, or the Laws of the Laws, to guide you with the execution of your own supply chain risk management. Consider these four concepts:

Law of the Laws #1: Everyone, without exception, is part of a supply chain. We live in an age of interdependency; small ripples upstream cause tidal waves downstream. Ultimately, you are responsible for risk itself (risk accountability).

Law of the Laws #2: No risk strategy is a substitute for bad decisions and a lack of risk consciousness. Almost all adverse impacts can be traced back to a bad decision somewhere in the chain. Bad decisions are made without accurate or relevant information (uninformed decisions), significantly influenced by emotion and not made fast enough.

Law of the Laws #3: It's all in the details. The details are needed to understand and manage risk in the flow of products, services, information and cash. Broad generalizations can be costly by over-allocating resources to the wrong priorities.

Law of the Laws: #4: People always operate from self-interest. Operating in self-interest yields short-term gains and long-term risk. The need for collaborative tools, rewards and communications vehicles and an iterative learning process is essential to migrate away from self-interest. ●

Law #1: If You Don't Manage and Lead Change, You Have to Surrender to It

In today's world of complex global supply chains, uncertainty itself is certain since there are so many contributions of resources (labor, technology, physical assets and relationships) that are exposed to a broader scope of threats. It is for this reason that the supply chain must be viewed in its entirety and in a level of detail that has never been analyzed before. New operating assumptions must be applied. The operating assumptions must include:

- "Expect the unexpected" now should be considered the norm. The impact must be better understood, measured and monitored, as well as viewed in its aggregate.
- The risk of low-frequency/high-impact events and high-frequency/previously perceived impact events should not be managed separately; the consequences of both can be one and the same.

For an organization to be prepared for the unexpected, it has to identify potential triggers (whether individual events or the aggregate of warning signs), listen to the risk-conscious culture (and move qualified information quickly), rapidly escalate issues to those in authority and take action. It must also leverage existing risk programs, such as business continuity, crisis management, disaster recovery and emergency management.

A Moving Target

Managing supply chain risk is a matter of never-ending vigilance because change is your only constant. True risk management often occurs only when you are confronted with the unexpected. The looming catastrophe sharpens your response time and often, in the direst of circumstances, you perform best. Of course, avoiding catastrophic situations is the real goal, and it is not an easy one considering the nature of change itself.

We need to revolutionize our way of thinking at the core. This new thinking is characterized by the concepts of collaboration, visibility, consciousness, measurement (quantification, modeling, prioritizing), diversity, continuous improvement, embedded monitoring, decision modeling and expedited qualified information flows. With this new and enlightened, holistic approach, risk can become truly manageable. Without it, organizations end up applying 20th-century thinking to 21st-century problems. And that will not work.

Change is the constant, and if you're not out front leading change and shaping it, then you will forever be behind trying to catch up. ●

Law #2: The Paradigm Should Destroy the Parasite

If your organization is like most, your supply chain risk management practices are fragmented across organizational functions and defined internally by a variety of functional or departmental managers. However, the real-

ity of managing supply chain risk in today's constantly changing, complex global environment is that there is simply too much to manage and not enough resources to do it with — a single point of failure.

Additionally, the absence of industry and organizational policies, processes and protocols for prioritizing supply chain risk represents yet another significant single point of failure. How can the organization apply the basic principle of economics to get the greatest return from the least investment?

Establish Priorities

The process begins by establishing priorities. Today, supply chain risk activities are typically driven by, first, functional risk groups (security, environmental, health and safety, continuity) within an organization, working with business or operational stakeholders (security group and the head of distribution work together on managing a security risk such as product shrinkage or theft); and second, executive management via an executive mandate, normally defined at the top and communicated down through the organization by a senior executive such as the chief executive officer (CEO) or chief financial officer (CFO).

While both are important, there is yet another often-overlooked source for prioritizing the organization's supply chain risk. It is the owners of the risk, more commonly referred to as the external stakeholders. These owners represent customers, investors, regulators, underwriters, rating agencies and, in some instances, the government. They have the most to lose; they are responsible for setting the risk priorities or what might be referred to as the *risk paradigm*. The external stakeholders *define* the risk expectations that the organization must *execute*. This is a subtle but critical distinction that, if not conformed with, can lead to significant operational inefficiency or, worse, to a single point of failure.

A Risk Paradigm

A risk paradigm set by the stakeholders rather than the organization yields more aligned, efficient and resilient supply chain risk management.

The risk paradigm is non-negotiable and represents a contract between the owners and the custodians (those who will execute). When managing supply chain risk, the organization has little say in setting risk thresholds and priorities.

The internal priorities are established once the external stakeholders set their risk expectations.

Engineering efficiency into the supply chain is mandatory and so is the effective and efficient allocation of risk resources. The identified risk paradigm will receive the investment benefits of resources, capital, management attention and time. ●

Threats and Vulnerabilities

Effective supply chain risk management requires not that you focus only on the functional stages of the supply chain, but that you also understand the threats and vulnerabilities relevant to your extended supply chain — the market, value drivers, flows, processes, functions and resources that make up your organization.

Your supply chain risk (and its reliance on the process of Define, Narrow, Act) has to be viewed, and continuously re-reviewed, through a macro-threat lens. You need to pick apart the entire DNA of the risk parasite and destroy its effectiveness, remove it or neutralize its destructive force in minute detail.

Law #3: Manage Your Business DNA in a Petri Dish of Evolving Risk

Just as billions of human DNA collectively create a living being, the big picture for the organization relies on infinite supply chain configuration possibilities.

To map supply chain DNA and to truly understand behaviors that form the basis of how risk is being managed throughout your supply chain requires an understanding of the beginning and the end.

A New Definition of DNA

DNA can be redefined to create a model for aggressively mastering the risk challenge. Remember, your supply chains are your business in every sense of the word, so you need a three-pronged attack to get rid of the risk parasite within the chain itself. This new kind of DNA is: **D**efine, **N**arrow, **A**ct.

The three-pronged attack — *Define, Narrow, Act* — has to be applied systematically on multiple tiers of your and your supplier's organizations. The problem in many situations is that each function, department, segment, company and even individual operates within its own defined universe. The solution to supply chain risk management is to be able to view the entire organizational chromosome and then understand how your own universe fits into the larger picture.

The *Define, Narrow, Act* approach encompasses not

only the immediate responsibilities and routines, but it is holistic and inclusive of every piece of the supply chain from end to end. The supply chain is everything in this regard, because it is the route along which everything — product, information, cash and the risk parasite — travels. But while the supply chain is everything, it can also be nothing without a dynamic, effective and insightful series of initiatives.

Everyone managing supply chain risk needs to develop an appreciation for the larger organizational universe. Once that is understood, then the collective priorities — *Narrow* — can be pursued. It is a form of multidimensional thinking. ●

Law #4: In Supply Chain Risk Management, Demand Trumps Supply

Supply chains are slaves to demand. As demand unexpectedly increases, supply is depleted. In response to the shortage of demand, the organization will seek other means to fulfill and move supply and the network design of the supply chain will be permanently altered.

Extreme volatility in demand over short time intervals will have magnified effects not just to supply but to the strategic design of existing supply chain configuration, such as the location of key suppliers and warehouses. On the other side of the equation — if the threat is there and the market and/or customers lose confidence, then demand evaporates.

Two other demand factors have a significant and permanent effect on supply chains: product obsolescence and loss of confidence.

Organizations will need to establish greater visibility and transparency into the supply side of the chain. Just as critical, organizations need to begin the demand view by establishing visibility downstream — into the demand side.

Specifically, the organization should establish a clear line of sight and better understanding of:

- Customer and demand
- Market trends (local and global) and competition
- Distribution and sales channels (ability to get the product to the market)
- The external environment and the macro economic, cultural and geopolitical factors that impact it, such as a financial downturn, protectionism/trade restrictions and geopolitical instability.

Design

The design of an effective risk management system requires that the supply chain be completely understood, from source to final destination. This of course must start with an understanding of demand. This requires that everyone in your organization:

- Question their own basic assumptions about the business
- Broaden their organizational view to include not only the immediate environment but also the remote environment of suppliers, vendors and even customers
- Evolve this level of comprehension to understand where demand comes from
- Engage all parties, upstream and downstream, to collectively manage risk.

Everyone's Customer

Remember that the customer, whom a majority of employees never meet and whom few even understand, is the original driver of the entire supply chain; and all of the risks that your organization faces as part of that supply chain are traced directly back to the customer.

Risks that threaten the customer perception of your company and its presence in the market are risks you cannot afford to suffer. ●

Law #5: Never Set Up Your Suppliers for Failure

Failure at the genesis of the supply chain moves throughout the entire system, and failure can mean a specific delay, damage or price increase; or it can mean overcapacity problems that could last for years. Failure can be caused by, but is not limited to, poor economic and financial conditions. The failure of the environment in which the supplier operates, such as an infrastructure problem caused by a natural hazard or a geopolitical event, can also result in severe consequences.

Trust but Verify

In the mood of creating an effective partnership with your suppliers, you need to get your organization thinking in a different way about the whole supplier relationship. For example, your suppliers are not really *outside* of your supply chain or your organization.

An enlightened and holistic view accepts the simple reality: You cannot separate your organization from its suppliers. It's part of the same risk paradigm and cross-reliance.

In this newly recognized partnership between yourself and your suppliers, you need to adopt a new view of the entire system. A "trust-but-verify" concept has to replace one of the two more common points of view: trying to completely control suppliers and imposing restrictions on them without corresponding compensation, or ignoring the risks entirely and considering those risks as belonging to someone else. Neither of these models work, however "trust but verify" is more likely to help make the supply chain operate more smoothly, with less risk, and in a win-win environment.

Two Reform Ideas

Here are two ideas for reform going along with this:

1. Financial consolidation. Create joint venture partnerships, rather than strict vendor relationships, with suppliers demonstrating strong financial positions. By entering into relationships with solid companies, rather than with questionable suppliers offering low cost but low stability, you avoid the unpleasant surprises that are most likely to come up during recessionary times.

2. Increased exposure for customers. You may need to contend with the problems of recessionary times by simply requiring customers to live with longer lead times for some products. This affects your ability to compete and may also directly affect your markets, notably when your products are sole-sourced. But unless you can solve the problems of sole sourcing and financing issues, this could be the only alternative left to your organization. ●

Law #6: Managing Production Risk Is a Dirty Job

What are the risks relevant to the manufacturing, fabrication, construction, assembly or subassembly production processes, resources and systems, such as the enterprise or manufacturing resource planning applications? Here are a few: labor strikes, workplace violence, cyber attacks, rising water, wind damage, machinery failure, obsolete technology and inventory, failed relationships, shifting earth, sabotage, pandemics, intellectual property theft, material and product shrinkage (theft) and infrastructure failure.

We must also take a closer look at all that can be exposed to uncertainty (vulnerabilities). The scope of resources includes labor, intangibles (knowledge, experience, corporate memory), process, technology, data, communications networks, machinery, boilers and physical assets, hand tools, vital records and public filings, inventory and relationships.

External Risks

What about the risks that the manufacturing process presents others in the community? In December 1984, a Union Carbide (now part of the Dow Chemical Co.) plant in Bhopal, India, leaked 42 tons of toxic gas. The actual death toll has been disputed, but Greenpeace cites a conservative number of 20,000. In the end, the presence of this manufacturing facility in Bhopal resulted in significant loss of life and damage to the environment. Sites that support production operations — especially manufacturing, processing and construction — are ground zero for environmental disasters and the rapid reproduction of the risk parasite.

A possible way to reduce production and labor risk may include shrinking the size of the supply chain while, at the same time, creating diversification in the routes of the chain itself. The solution should be based on where vulnerability exists and how big a priority the organization assigns it. That solution has to include, at the very least, these six absolute requirements:

1. Don't centralize warehouse and manufacturing or single point of failure manufacturing processes.
2. Never outsource without knowing where and who is involved, and without inspecting thoroughly and regularly.
3. Don't sleep. Don't assume you can fix the problem and then walk away; you can't.
4. Don't assume that you are the most important player in your suppliers' supply chain. This may occur in regions where prices are low, but the countries involved are piracy-friendly.
5. Never assume that insurance will make you whole or protect your reputation after a loss; it won't.
6. Expect to be on your own locally for the first 24 to 48 hours after a disaster, and longer if the disaster involves regional outages as well. You need an emergency plan to offset the down time and loss of productivity, protect valuable assets and ensure worker safety. ●

Law #7: The Logistics Risk Management Rule

Managing the parts does not equal managing the whole. Logistics management involves the integration of information, transportation, inventory, warehousing, material handling and packaging, safety and security. A ripple effect of missing a logistics target never diminishes in severity; it always increases as it spreads throughout your supply chain.

Movement and Uncertainty

The movement of goods creates uncertainty and logistics is all about movement. Before goods become final product, raw materials are extracted from the ground, forests, water and fields and then transported to suppliers. The goods (materials, components, liquid) are later shipped to manufacturers, assemblers or refineries. The goods are typically converted into work in progress or finished products. These goods are constantly moving through the product life cycle, with an occasional stop in a warehouse, distribution center or factory. The speed, frequency and size in which the goods move through the supply chain are dictated by demand and controlled and coordinated via logistics networks.

During the journey, goods are exposed to a continuous barrage of risks, including theft, destruction, delays, spoilage and even obsolescence; thousands of vulnerabilities, single points of failure, are presented throughout the life cycle of global supply chains.

Managing logistics risk requires an integrated view, one that parallels the flow and goods, cash and information across the supply chain. Functional risk management is still essential, as in the case of managing cargo security. But the functional elements must be integrated into the risk intelligent supply chain. One technique for managing product risk is to conduct a root-cause analysis to identify sources of risk. The organization can then assign responsibility to the appropriate functional unit for additional analysis, measurement and resolution.

Once the risk analysis is completed, successful practices can be implemented.

Priorities and Economics

Keep in mind that the goal of logistics risk management is not to try to eliminate the insurmountable number of risks that exist throughout the supply chain network. Instead the goal is to effectively and efficiently allocate precious risk resources against the greatest priorities — the single points of failure that will have the greatest impact. Simply stated, it's a case of economics — getting the greatest return from limited risk investments (resources allocated to the task). ●

Law #8: Mitigation

If supply chain risk management isn't part of the solution, it will become the problem.

The concept of *mitigation* — reduction of risk to a manageable level — is central to your supply chain risk management program. This idea may be thought of as managing the risk parasite to a level where it can no longer continue to damage the body of your organization. Like an actual parasite, you many not be able to remove it, but you can neutralize its damaging effects.

Building an Action Plan

Those managing risk in the supply chain should have systems for capturing and escalating these risk decisions or, more to the point, for forcing a risk decision. The range of choices in response to any risk includes avoid, accept/retain, mitigate, transfer or finance — but the choice has to be made. Second, a system for monitoring the action and ongoing exposure is essential to make sure the risk is managed in the desired way; this is especially important if you decide to mitigate a specific risk.

Although multiple views may be brought to bear, supply chain risk must be viewed from one vantage point, and it involves a short list of two critical questions:

1. *Who is responsible for understanding and managing threats?* You need to identify not only functional methods for mitigating risk, but also to decide how to communicate the importance of these steps to the decision makers.

2. *How can my organization build the required attributes and change its traditional view of risk?* The key to avoiding or reducing risk in the new, interrelated world is to develop the intelligence and the flow of information — anticipating, avoiding through agility and flexibility, or reacting to warning signs, containing and responding. The resiliency of your organization is going to be defined by how effectively you are able to identify, seize and build on these required attributes. ●

Law #9: Financing

Financing risk exposure takes many forms; uninsured risks can be catastrophic if your organization has failed to ensure that its true exposures are adequately covered.

Insurance as a supply chain tool for managing risk is a crucial and important element of any program, and has been for centuries. In fact, for more than 500 years, insurance has made logistics possible when it would otherwise have been too risky to take a chance on losses. The expansion of supply chains both geographically and technologically makes insurance more important than ever.

Insurance and Its Role in Supply Chain Risk Management

Risk financing and insurance can be categorized in five dimensions, each of which has significant impacts on your organization. Examples of these are:

1. *Disruption of the supply of goods or services and inadequate coverage levels*, which causes a failure to satisfy a customer's requirements on time and exposes the organization.
2. *Price volatility* may result in difficulties in passing on price changes and impact profits.
3. *Poor quality* of products or services, either upstream or downstream, which impact on the customer's financial satisfaction and include future financial consequences.
4. *Reputation damage*, which arises from problems within the supply chain, such as environmental threats. There is insurance for reputation risk; however, coverage is not broadly available and is expensive.
5. *Unnamed perils (in the absences of physical damage)*. In most policies, unnamed perils are not covered. For example, in 2009, the Influenza A (H1N1) outbreak was probably not covered unless your policy included a very specific clause specifying coverage for infectious or communicable disease outbreaks. ●

Law #10: Your Supply Chains Are All Independent but Unique

We all live with risk. Risk doesn't exist at a distant port or in a warehouse in another country; it is everywhere. However, risk is manifested in a unique way for every industry, geography, organization and individual.

If you apply the rules of organizational supply chains to your own behavior, you reduce your own risks and the risks to the organization of which you are a part.

Questioning Old Assumptions

What if the premise on which your organization is built is no longer valid? The point is not that it is a troubling idea, but that it is not asked often enough. The same thing applies to you personally. We humans do, indeed, need to continually evaluate and reevaluate our premises, the assumptions on which we operate and the beliefs that drive our activities.

On a personal level, risk is not meaningless nor should it be ignored, as it has been by so many people on the organizational level. But there is a danger. Just as organizational risk has lost its association as a negative or even as a threat, it has become easy for us as individuals to ignore or forget the supply chain risks we all face.

You can mitigate and eliminate risk only by (1) being aware of it, (2) measuring its impacts, (3) recognizing the course of events, materials and information, (4) deciding what steps have to be taken today to avoid future exposure and (5) constantly monitoring it.

Unavoidable Reality

The unavoidable reality of the globally connected supply chain means that single points of failure are found everywhere and not just within organizations. All of the troubling aspects of supply chain risk that we face are better managed by awareness and cooperation with other stakeholders. This is the most important point of all. Risk does not exist in isolation or elsewhere in our personal or organizational lives. We cannot escape it, but we can manage and mitigate it.

The degree to which you can manage risk ultimately determines how well you identify single points of failure and then pinpoint the steps you can take today to avoid dangers in the future. ●

Introducing Supply Chain Insurances

The idea of developing products specifically to address modern threats is being actively considered by a number of insurers. A new product needs to be designed in such a way that it derives exposure limits, retentions and the premium calculation parameters directly from the insured's profit and loss statement, but also in response to the realities of today's global markets — while also addressing the specific requirements of the modern supply chain and realistically addressing the threats faced within it.

Insurers have historically been reluctant to offer realistic forms of protection because insufficient data have been available to reliably assess the financial risks that accompany the launch of a new supply chain insurance (SCI) product. The reduction in value suffered by a number of companies from a supply chain failure minus the price for SCI insurance represents the value added by such an insurance product.

The Breakthrough Management Strategy Revolutionizing the World's Top Corporations

SIX SIGMA

THE SUMMARY IN BRIEF

The Six Sigma Breakthrough Strategy is one of the most compelling and successful management strategies of the last quarter century. Using examples of successful implementation of the Six Sigma Breakthrough Strategy at such companies as General Electric, AlliedSignal and Polaroid, Mikel Harry, Ph.D., and Richard Schroeder (both of the Six Sigma Academy, Inc.) lay out in detail the theory and practice of achieving the astounding level of quality (3.4 defects per million opportunities) at the heart of this approach.

The Six Sigma Breakthrough Strategy is compelling and successful because it focuses on business processes and the components that comprise those processes. Among the lessons the authors impart in this summary are the following:

- What factors and business needs lead companies to implement Six Sigma.
- How to benchmark performance and use statistically constructed metrics to measure progress.
- How to break down a process into its elemental components, then find and correct the disconnects and variables that lead to errors, problems and dissatisfaction.
- How to structure your Six Sigma project teams, from the top down, and motivate them to succeed in their project-related endeavors.
- How to implement the Breakthrough Strategy at the business, operations and process levels.
- How to prepare your organization for the challenges, changes and ultimate rewards of Six Sigma.

There are also confirmations of Six Sigma's worth by no less a pair of executive-level experts than GE's Jack Welch and AlliedSignal's Lawrence Bossidy. They, among others, both note that in spite of the tremendous effort required to achieve Six Sigma quality, the Breakthrough Strategy is well worth every drop of sweat, every moment of frustration, every minute of training it requires.

The rewards of extreme quality can be yours, too. Turn the page to begin the process ...

Why Six Sigma?

What drives companies to implement Six Sigma? Quality alone is not the most important motivating factor. Six Sigma is about improving profitability — each sigma shift provides a 10 percent net income improvement (see "The Cost of Quality" table below), a 20 percent margin improvement, and a 10 to 30 percent capital reduction.

Why Else Do Companies Implement Six Sigma?

It Sets Different Standards. Past definitions of quality focused on *conformance to standards* as companies strived to create products and services that fell within certain specification limits. If companies produced quality products and services, their performance standards were correct regardless of how those standards were met — even, for example, if a part had been reworked extensively to meet the standard. Six Sigma broadens the definition of quality to include (for both company and customer) expected standards of *economic value* — for example, the costs to produce a product — and *practical utility*.

It's Process-Oriented. Companies use thousands of processes (activities that take an input, add value to it, and produce an output) to create their products and services. Those processes can be industrial (involving machinery coming in physical contact with delivery materials) or commercial (involving human intervention, such as processing payroll or orders, that support industrial processes). Six Sigma creates specific improvement goals for every process within an organization, allowing companies to understand and incorporate new technologies for improved process performance.

It Stands for Quality. For some companies, the cost to deliver a quality product can account for as much as 40 percent of the sales price. For a company whose annual revenues are $100 million, and whose operating income is $10 million, the cost of quality is approximately 25 percent of revenue, or $25 million. If that company could reduce its cost of achieving quality by 20 percent, it could increase its operating income by $5 million — or 50 percent of current operating income. No wonder former Motorola CEO Bob Galvin was once quoted as saying that leaders must take quality to a personal level in order to create lasting improvements. ■

The Cost of Quality

Sigma Level	Defects Per Million Opportunities	Cost of Quality
2	308,537 (Noncompetitive companies)	Not applicable
3	66,807	25 - 40% of sales
4	6,210 (Industry average)	15 -25% of sales
5	233	5 -15% of sales
6	3.4 (World class)	<1 of sales

Each sigma shift provides a 10 percent net income improvement.

What Is Six Sigma?

- It is a business process that allows companies to drastically improve their bottom line by designing and monitoring everyday business activities in ways that minimize waste and resources while increasing customer satisfaction.
- It guides companies into making fewer mistakes in everything they do, from filling out purchase orders to manufacturing airplane engines, eliminating lapses in quality at the earliest possible occurrence.
- It doesn't merely detect and correct errors; it provides specific methods to recreate processes so that errors never arise in the first place.

The author: Mikel Harry is founder and CEO of the Six Sigma Academy, Inc. Richard Schroeder is president of the Six Sigma Academy. They implement Six Sigma programs at major corporations around the world.

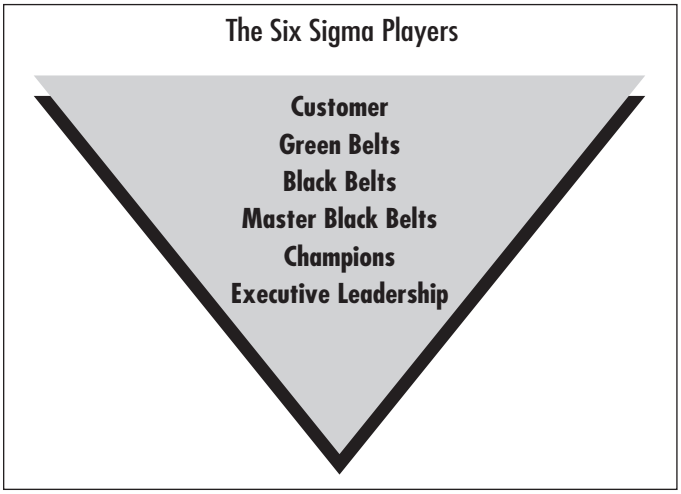
The Players in Six Sigma

Before we examine the Six Sigma Breakthrough Strategy in detail, let us first review the different players in your company who will be involved in the process.



The inverted pyramid is a powerful metaphor for the support Six Sigma requires to succeed. At the bottom of the pyramid, supporting and balancing the structure, is the executive leadership, whose vision and values form the foundation, and without whose commitment the entire enterprise would crumble. At the top of the pyramid is the customer, around whose expectations Six Sigma quality is built. Between the executives and customers are the four types of players in Six Sigma: champions, master black belts, black belts and green belts.

Champions

These key leaders fall under two categories: Deployment Champions (who function in executive capacities, with the added responsibility of nurturing Six Sigma) and Project Champions (who function at the business unit level and nurture Six Sigma at the project level). These individuals organize and lead the initialization, deployment and implementation of Six Sigma — choosing the specific projects and implementing the required strategies and tactics.

Master Black Belts

These individuals are selected by Champions to act as in-house experts for disseminating the Breakthrough Strategy knowledge throughout the organization. They devote 100 percent of their time to Six Sigma — training and coaching Black Belts and Green Belts and communicating overall progress and status of projects within their areas or businesses.

Black Belts

These individuals, working under the tutelage of a Master Black Belt, apply the tools and knowledge of Six Sigma to specific projects. Like Master Black Belts, Black Belts devote 100 percent of their time to Six Sigma projects. They undergo extensive training in statistics and problem-solving techniques, and should pass that knowledge on by training 100 Green Belts every year. Indeed, the bulk of executing the Breakthrough Strategy falls to Black Belts.

Green Belts

These employees execute Six Sigma as a part of their overall jobs. Although focused on the day-to-day projects that comprise their work, they are still given two primary tasks under the Breakthrough Strategy: deploying the success of Six Sigma techniques and leading small-scale improvement projects within their respective areas.

Breakthrough Strategy Training

Training for roles under the Breakthrough Strategy need not be limited to people within your organization; you can also leverage the training to improve your business partnerships. At GE's Travel Center, a unique cross-training program enables collaborative Six Sigma training between Travel Center management and managers at Carlson-Wagonlit Travel, the company that handles GE's company travel. A Carlson-Wagonlit executive achieved Champion status, then worked closely with the Travel Center's Master Black Belt to train Black Belts and Green Belts at both companies, cementing their business relationship, not to mention their collective commitment to quality. ■

AlliedSignal: Six Sigma Players in Action

AlliedSignal's Champions have created an infrastructure that supports Six Sigma training and deployment company-wide. Champion candidates must attend three and a half days of Six Sigma executive overview and participate in the traditional four-month Black Belt training process. Master Black Belts are selected from the best of the Black Belts; each Master Black Belt, in turn, must train and mentor 10 Black Belts. Those 10 Black Belts are then asked to train and mentor 10 Green Belts.

As a result, Six Sigma has been deployed across the company in a rapid fashion. Until 1998, Green Belt training was an optional program available to interested parties. The company has since made it a requirement for all salaried employees to undergo the 26 hours of training required for Green Belt certification.

This move to mandatory participation and the improvements that have resulted from the rapid Six Sigma deployment have helped AlliedSignal save $1.5 billion since the program was implemented in 1994.

The Six Sigma Breakthrough Strategy

There are eight phases involved in applying the Breakthrough Strategy to achieve Six Sigma performance in a process, division or company: **Recognize, Define, Measure, Analyze, Improve, Control, Standardize** and **Integrate**.

Each phase is designed to ensure the methodical and disciplined application of the Strategy, the correct definition and execution of Six Sigma projects, and the incorporation of results in day-to-day business endeavors.

These eight components of the strategy fall into one of four categories:

Identification. The *Recognize* and *Define* phases fall under this category, in which companies begin to understand the fundamental concepts of Six Sigma and recognize the Breakthrough Strategy as a problem-solving methodology with a unique set of tools. These phases allow companies to recognize how their processes affect profitability, then define what the critical-to-business processes are. The key component for companies to address in these two phases is variation across processes — how much of an impact variation has on results in terms of cost, cycle time and defect rates.

Characterization. *Measure* and *Analyze* fall into this category, which considers where a process is at the time it is measured and points to the goals to which a company should aspire by establishing baselines and benchmarks — thus providing a starting point for measuring improvements. Leadership creates an action plan to close the gap between current and desired processes, in order to meet goals for a particular product or service. It entails breaking down every product into its key characteristics, creating a detailed description of every step in a process, and measuring short- and long-term process capabilities.

Optimization. This category (comprised of the *Improve* and *Control* phases) identifies the steps required to improve a process and reduce the major sources of variation. Key process variables are identified through statistically designed experiments, and the "vital few" that have greatest impact are isolated. The knowledge gained from these steps is then used to improve and control a process, ultimately improving profitability, customer satisfaction and shareholder value.

Institutionalization. The *Standardize* and *Integrate* phases that comprise the Institutionalization stage address the integration of Six Sigma into the way a business is managed on a day-to-day basis. More than just a focus of projects through to completion, this stage offers a way to step back and look at how collective results of smaller projects affect the large, high-level processes that run the day-to-day business. ■

The Three Levels of Breakthrough: Business, Operations and Process

Almost every organization can be broken down into three basic levels. The highest level is the *business* level — the umbrella level that encompasses everything related to the company. The next level is the *operations* level, while the lowest level is the *process* level.

The success of Six Sigma is defined as the extent to which it transforms each level of an organization to improve that organization's overall quality and profitability. The fluidity of the methodology allows it to work up and down the different levels of the organization.

The Breakthrough Strategy is applied to each level of the organization as follows:

Business Level

The business-level application of the Breakthrough Strategy focuses on making significant improvements to the informational and economic systems used to steer your business, such as customer feedback or supplier quality. It requires a three- to five-year commitment from executive leadership to consistently do the following:

● ***Recognize* the true states of your business.** Do you really know the states (or conditions) of your business — for example, how well your company is doing in customer service (see box below)? You cannot

(continued on page 5)

Business "States" and the Systems that Support Them

The states of your business are the global business conditions created by the systems used to guide and manage your business. For example, you might focus on the state of your company's customer satisfaction. Customer satisfaction depends on 1) delivering a product or service that is free of defects; 2) delivering a product or service on schedule; and 3) delivering a product or service at the lowest possible price.

Each of these elements of customer satisfaction can be linked to specific systems in your company. For example, to deliver defect-free products or services, you need reliable quality measurement systems. Reliable scheduling systems are required to deliver products on schedule. Finally, good accounting and management systems are needed to deliver products or services at the lowest costs.

With Six Sigma, you'll identify the business states you need to improve, then work on the underlying business systems that will lead to that improvement.

The Three Levels of Breakthrough: Business, Operations and Process

(continued from page 4)

improve what you do not measure; identifying the various states of your business help you properly focus on what must be improved.

● ***Define*** **what plans must be in place to realize improvement of each state.** Creatively consider how to achieve a higher level of performance and relate those things to customer satisfaction.

● ***Measure*** **the business systems that support the plans.** Know what you need to measure and how to properly measure it, and get executive commitment to pursue the correct measurements.

● ***Analyze*** **the gaps in system performance and benchmarks.** Diagnose capability measures and assess performance gaps, through analyzing benchmarks and uncovering the "secrets" of how businesses operate at higher sigma levels.

● ***Improve*** **system elements to achieve performance goals.** Define your measuring system, collect the necessary data, analyze that data and prioritize your efforts for improvement.

● ***Control*** **system-level characteristics that are critical to value.** Monitor those efforts and their elements over a period of time, conducting regular "audits" of performance and controlling these critical-to-value characteristics.

● ***Standardize*** **the systems that prove to be best-in-class.** Compare the optimal performance of your business systems with similar examples elsewhere. When appropriate, apply these findings to other business units, capitalizing on the potential savings of your system-level analysis and control.

● ***Integrate*** **best-in-class systems into the strategic planning framework.** Roll the improvements out to all pertinent business units, folding these improvements into critical business strategies and tying the initiative to compensation as an incentive for full cooperation.

Operations Level

The Breakthrough Strategy helps expose "operational issues" for what they are: a collection of higher-level problems that become confounded. The Strategy helps break apart the "issue" into its components, allowing you to define problems, formulate plans and take positive actions. The Project Champion's role in this effort is as follows:

● ***Recognize*** **operational issues that link to key business systems.** Often, the tactical solution to an operational issue is masked by the underlying support system. For example, imagine a company's quality information system (QIS) which provides statistical data on product defects. The problem is that the defects are not identified until after the fact. Thus, while specific problems can be fixed, defects continue to appear sporadically over time. The company will not be able to improve its quality until it has identified the systemic problem: a QIS that delivers a posteriori data. Once it recognizes that the issue is system-dependent, it can find a solution (for example, an in-process quality measurement system).

● ***Define*** **Six Sigma projects to resolve operational issues.** Choose projects carefully. Six Sigma projects are usually identified and selected based on whether the project will save costs, is connected to operational issues with larger critical-to-quality (CTQ) issues, is connected to the operation of a business support system, and can proceed in a time-efficient manner.

● ***Measure*** **performance of Six Sigma projects.** Quantitatively gauge how well projects progress, in both an absolute and a relative sense, collecting and analyzing data at the appropriate business levels.

● ***Analyze*** **project performance in relation to operational goals.** Compare the performance of a number of Black Belt projects with the operational goals of your business, and investigate the relationship between cycle time and quality.

● ***Improve*** **the Six Sigma project management system.** Say, for example, that a business is tracking the savings generated by a project. At this point, it might start comparing projected and actual project costs. Or it might want to track other variables, such as net savings or project completion time.

(continued on page 6)

The Importance of Benchmarking

Six Sigma makes ample use of benchmarking — a continuous practice of comparing your organization's processes with those of your competitors, noting what it takes to be the best and what it takes to get there. Companies must determine which type of benchmarking they wish to perform:

● **Internal:** Comparing common processes among diverse functions within a single company (for example, how effectively orders are processed).

● **Competitive:** Looking at direct competitors and their processes, measuring levels of customer loyalty, customer service and market share. This reveals what customers value most about your goods and services and how well your customers think you are doing in the areas that matter most to them.

● **Functional:** Focusing on the process itself, and organizations with similar processes, regardless of industry.

The Three Levels of Breakthrough: Business, Operations and Process

(continued from page 5)

● ***Control* inputs to the project management system.** Institute regular audits of the project management system, ensuring standards are established and consistently met.

● ***Standardize* best-in-class management system practices.** Once you have uncovered a best-in-class management practice, make it a standard and transfer that standard to all relevant sectors in the business.

● ***Integrate* standardized Six Sigma practices into policies and procedures.** Institutionalize your Six Sigma practice into the fabric of day-to-day operations, interweaving the practice into operating policies and procedures and reinforcing them through rewards and recognition.

Process Level

Black Belts focus on processes, working to recognize poor processes that result in problems, additional costs and eroded quality. Their role in applying the Breakthrough Strategy is as follows:

● ***Recognize* functional problems that link to operational issues.** Break down errors in an effort to recognize the interrelated problems that cause them. Note the hierarchical nature of these process problems — in other words, how *process* problems connect to *operational* issues, which are, in turn, tied to support systems that link to *business* issues such as customer satisfaction and profitability.

● ***Define* processes that contribute to the functional problems.** Determine whether the functional problems you have are related to products, services or transactions. Create process maps, breaking down necessary processes into individual steps, events or activities, to effectively search for solutions to problems.

● ***Measure* the capability of each process that offers operational leverage.** Express how well each process is performing, in the form of a measurement, noting the CTQ characteristics of each element, and its impact on the business.

● ***Analyze* the data to assess prevalent patterns and trends.** Determine the relationships between the variable factors in the process and determine the direction of improvements.

● ***Improve* the key product/service characteristics created by the key processes.** The Black Belt must focus on CTQ characteristics inherent in a product or service and then find ways to improve the capability of those characteristics. This is done by screening for variables that have the greatest process impact and establishing operating specifications for each.

● ***Control* the process variables that exert undue influence.** Process improvement is sustained by implementing measures that control the key variables. Note the difference between controlling the variables and merely monitoring them — you must address these variables *before* they contribute to problems, not after the fact.

● ***Standardize* the methods and processes that produce best-in-class performance.** Promote and standardize the Six Sigma methods that produced optimum results, as well as the optimized processes that result in exceptional performance.

● ***Integrate* standard methods and processes into the design cycle.** Don't create new processes for every new design or evolution in an existing design; make changes to the design itself to maximize efficiency.

The Breakthrough Strategy is designed to ensure that companies apply its precepts in a disciplined, methodical way; doing so at all levels ensures "leveraged" success. ■

Implementation and Deployment of the Strategy

To achieve Six Sigma, companies must determine how to focus and deploy the Breakthrough Strategy so that

(continued on page 7)

What Black Belts Need: The Psychology of Six Sigma

Black Belts, who shoulder the bulk of the responsibility for Six Sigma project work, must be properly motivated to reach the levels of achievement expected of them. Here are some ideas:

● **Compensation.** Compensation and reward mechanisms send a message to employees about the worth of the Black Belts to your organization and its Six Sigma endeavors. GE's Jack Welch ties 40 percent of bonus compensation for managers to the intensity of their efforts and measurable progress toward Six Sigma quality in their operations.

● **Promise of Promotion.** GE's ranks of general managers, directors and vice presidents are full of Six Sigma leaders — Black Belts who proved their worth to the organization and were rewarded accordingly.

● **Recognition.** Motivation is highest when success is acknowledged. Verbal and written recognition is inexpensive and simple, whether done privately or in an open and public manner.

● **Permission to Fail.** Most Six Sigma-conscious CEOs view mistakes as tools for the personal growth of both the Champion or Black Belt, and the organization, as it works toward Six Sigma status.

Implementation and Deployment of the Strategy

(continued from page 6)

key business priorities and strategy issues are sufficiently addressed. The approach that one company takes in this endeavor might differ from the approach another takes, but one component is constant: All implementation and deployment strategies must flow down from the executive leadership. Six Sigma is not a "grassroots" initiative.

Among the many factors you will need to address prior to implementation and deployment are dependencies, structure, focus and project selection.

Deployment Dependencies

Successful implementation of the Breakthrough Strategy depends on an interaction of several principles, among them:

- Active, visible, top-down leadership.
- Metrics that accurately track the progress of the initiative, weaving accountability throughout and providing a tangible picture of the company's efforts.
- Internal and external benchmarking that provides an honest assessment of the organization's true market position (the recognition of which may be termed a "significant emotional event").
- "Stretch" goals that focus on significantly changing, rather than "tweaking," existing processes.
- Sufficient and pertinent training at all levels of the organization.
- Champions and Black Belts that promote and carry out the initiatives at all levels of the organization.

Creating Focus

How a company decides to focus its Six Sigma projects directly influences the way Six Sigma is deployed. Companies can focus their efforts on any number of factors, including the following:

- **Cost Savings.** Using this factor, a company can determine the number of projects it needs to complete to save a specific dollar amount. There are limitations inherent to this approach; it is, for example, difficult to establish a new mindset about quality within the company when the dollar figure is the focus.
- **Deliverables.** Identify the product family or system that is both of utmost importance to your company, as well as being the greatest cause of poor customer satisfaction. The danger in this focus is that your defects become more important than the processes or systems that create the product.
- **Processes.** This is the best way to attack the root causes of defects and customer concerns. It requires strong cross-functional coordination — correcting a process in one division almost always has applications for other divisions within the company.

GE: A Six Sigma Success Story

When GE CEO Jack Welch first considered implementing the Breakthrough Strategy in 1996, he discovered the company's operations were running at somewhere between three and four sigma, or about 35,000 defects per million — a number consistent with the defect levels at most successful companies. At a company the size of GE, that translated to a cost of $7 billion to $10 billion each year in scrap, reworking of parts, and correction of inefficiencies.

Welch committed the company to reaching Six Sigma status (3.4 defects per million) by the year 2000. Recognizing that the initiative would go nowhere without training and vision, he committed an astounding $450 million in 1996 and 1997 to train 5,000 executives and managers and 80,000 engineers and other employees in the Breakthrough Strategy. Welch also made Six Sigma training a requirement for any kind of advancement at GE.

The company used Six Sigma strategies to poll customers on the most critical-to-quality (CTQ) measurements of their business. It also used the Breakthrough Strategy to raise the quality of their service divisions, such as Capital Services (where Six Sigma efforts helped achieve a 62 percent reduction in turnaround time for repairs) and international divisions like GE Aircraft Engines (the Canadian division that reduced border delays by 50 percent through following the Breakthrough Strategy).

The result: In 1998, revenues rose 11 percent, to $100 billion; earnings increased 13 percent, to $9.3 billion; working capital turns rose from 7.4 percent in 1997 to 9.2 percent. Even more encouraging, though, is the company's continued eagerness to invest in its most important asset — its intellectual capital — and the resulting dedication from its employees to achieve each new challenge and objective.

Structural Elements

How a company organizes the personnel involved in Six Sigma projects depends on how it's focusing its deployment, as well as how Six Sigma is integrated into the organization — whether resources are freed up to focus solely on Six Sigma concerns. There are a number of concerns that must be discussed and decided upon prior to launching Six Sigma projects:

- **Black Belt selection.** Who chooses Black Belts and what criteria must be used? How many Black Belts does the endeavor require? How will Black Belts be recog-

(continued on page 8)

Implementation and Deployment of the Strategy

(continued from page 7)

nized and rewarded for their efforts?

- **Project selection.** What criteria must be met to engage or terminate a project? Who will sign off on projects, and what criteria will they use?
- **Metrics.** Which metrics will be standard across the company? What improvement goals will the company set?
- **Coordination.** How will Six Sigma be coordinated with other organizational endeavors?
- **Budget.** How will the company handle budget issues, such as whether the salaries of Black Belts are categorized as direct or indirect costs?
- **Training.** How will the company train its Master Black Belts to deliver Black Belt training? What guidelines will be used for Black Belts to select and/or mentor Green Belts?

Project Selection

The key to good project selection is to identify and improve those performance metrics that will best boost your company's financial success and impact its customer base. Projects can be measured through the following key metrics:

- **Defects Per Million Opportunities,** or the total number of defects per unit divided by the total number of opportunities for defects per unit, multiplied by 1,000,000.
- **Net Cost Savings,** or the verifiable reductions in fixed or variable costs.
- **Cost of Poor Quality,** or the cost (in scrap, rework, warranty claims or returned material) of failing to produce 100 percent quality the first time through.
- **Capacity,** or the number of good units a process is able to produce in a given period of time.
- **Cycle time,** or the length of time it takes to produce a product or service. ■

Preparing an Organization for Six Sigma

One thing Six Sigma mandates above all else is change — the movement from often deeply held behaviors that do not deliver quality to different behaviors that all but guarantee it. This often clashes with company cultures and subcultures that are resistant to change, when the old, paternalistic ways of doing business fall in direct conflict with a new reality. Individuals who have done the same job successfully for many years may feel the need (or the entitlement) to cling to the past. If it ain't broke, the thought goes, why fix it?

To achieve Six Sigma, your company must endure extensive psychological changes, entrenching the quality improvement efforts into a progressive corporate culture over an extended period of time (at least five years, as the authors have discovered). Your company might be using traditional metrics (such as first-time or final yield) to measure quality, but those metrics often focus on previous performance, rather than proactively preventing mistakes from recurring.

Six Sigma shows companies how inadequate such metrics are to get to the heart of problems and disconnects that cost significant amounts of money without management even realizing it. Often, it shows companies just how "average" they are.

As is the case with so many other aspects of Six Sigma, one of the best illustrations is that of GE. Jack Welch believes only true believers and visionaries ("A" players, in company parlance) have any business being in leadership positions in GE. In order to get people involved in Six Sigma — to cultivate Green Belts and Black Belts — you must first have forward-thinking executives and senior managers on board in leadership roles, to evangelize the Breakthrough Strategy and motivate people to implement its precepts, and to embrace change at every level. ■

Polaroid's Project Selection Criteria: A Snapshot

Polaroid's endeavor to reach Six Sigma quality levels by 2001 is one of the most remarkable case studies in implementation of the Breakthrough Strategy. One reason for this is the criteria by which Polaroid Black Belts (or, in the company's parlance, "Variability Reduction Leaders") select projects. The company breaks its criteria into three primary categories:

- **Low Yield Rate.** When one or more of the company's processes produce low yield on a continual or unpredictable basis.
- **Cost of Poor Quality.** This criterion measures products and processes that require continuous and unusually high levels of inspection or quality-related intervention in order to deliver products or services to the consumer. This factor can be compared against revenues to determine the need for a Six Sigma project.
- **Capacity.** Undercapacity means that a company does not have the facilities, tools or human resources to produce products on time. While this hasn't been a concern for Polaroid to date, the company feels it is an appropriate criterion for selecting a Six Sigma project.

Getting Past Burnout, Busywork And the Myth of Total Efficiency

SLACK

THE SUMMARY IN BRIEF

Change has become the organizational mantra in today's fast-paced and increasingly global marketplace. But too often this need to change and adapt is confused with keeping employees busy all of the time and achieving total efficiency.

Constant overtime and aggressive schedules are symptomatic of the "Hurry Up" organization. Efficiency is pitted against effectiveness, minimizing cost against minimizing time. Middle management has been squeezed so that there is less management and more "on task" efforts.

What gets lost in this "Hurry Up" organization is the time it takes to think up new procedures or products; in other words, slack. In today's knowledge-based economy, unlike the factory-based model of prior centuries, creative management of slack is essential for a healthy, growing organization. In this summary, Tom DeMarco explores some of the most common, die-hard management theories (Total efficiency, Management by Objective, Internal Competition) and shows how they are inappropriate for today's knowledge-worker-based economy. He then shows how to create productive slack in your organization.

What You'll Learn In This Summary

✓ **To be truly agile, corporations must manage slack at all levels.** By sacrificing a little bit of efficiency, you can make your organization a lot more effective.

✓ **The true cost of stress on the organization.** Constant stress might cause your employees to work faster, but it doesn't mean they'll work smarter or get more done; in fact, they often react by slowing down.

✓ **How to become a learning organization.** The knowledge economy is here. Is your company a learning organization?

✓ **The importance of middle management.** Here is the crucial level where re-invention occurs.

✓ **Rethinking risk and risk management in the knowledge economy.** Risk is a given in today's fast-paced economy.

What's Wrong with Efficiency?

Not too long ago, efficiency was the catchword for defining the successful corporation. A project arrived on an employee's desk or station and he or she attended to it immediately. When finished, he or she immediately accepted the next piece of work. Efficiency experts were hired to fill in any gaps in workflows to assure employees were as productive as possible.

Today's economy is based on knowledge workers; their needs are fundamentally different from the factory work force, or even the office work force of more stable or predictable times. Forcing knowledge workers to conform to an overly efficient work flow system is detrimental to their effectiveness — and, eventually to the overall ability of a company to be as flexible as needed to meet the demands of a constantly changing, increasingly global market.

The Task-Switching Penalty

Here's one way overefficiency results in reduced effectiveness:

In a typical day, employees change tasks any number of times. With downsizing, fewer employees are expected to do more work, thus increasing the amount of daily task-switching. While fewer employees may look cost-effective at first glance, what is often overlooked is the true penalty that task-switching incurs with knowledge workers. Usually, this task-switching penalty is higher than any projected cost savings.

Take the example of a typical knowledge worker: a graphic artist. After a downsizing effort, her workload is increased from four to six projects at a time. Every project requires at least 10 minutes to physically prepare — getting the right materials, reviewing notes from the last group meeting, etc. Thus, the task-switching penalty for this person's work is 10 minutes.

Creative work also involves a few intangible phases, such as conceptualizing and immersion.

For example, imagine the graphic designer is conceptualizing an ad campaign or developing in her mind an interesting mix of images to convey a point. This process is interrupted as she is called on to do another task. Once she returns to her conceptualizing, how much time would she need to get back to the same point in her thinking? If she returns the next day, chances are she will have to go through some of the same mental steps she went through today.

The *immersion* phase is another of these intangible phases. Immersion involves the time writers, researchers, inventors, analysts or programmers need to mentally prepare themselves for their work. Think of a salesman building up confidence before a big presentation, for instance.

Interruption of these intangible phases adds to the task-switching penalty.

The Myth of Fungible Resource

The reason task-switching penalties are ignored is because employees are seen as "fungible resources." Fungible can be described as follows:

> **fungible:** *adj*. (especially of goods) being of such nature or kind as to be freely exchangeable or replaceable, in whole or in part, for another of like nature or kind.

Money, for example, is fungible. If you take some of it out of one pile and put it another (say move it from "maintenance" to "groceries"), you do not lose anything in the transfer. Dollars out of maintenance equals dollars into groceries.

Employees, however, are different. Time taken from one task cannot be transferred to another task without losing something in the transfer.

In other words, people believe that a writer or graphic artist who is "busy" only 57 percent of the time has 43 percent of her time free to devote to other projects from different departments, for example. But knowledge workers aren't fungible. To do their work effectively, they

Benefits of Slack

- ✓ Flexibility that allows for ongoing organizational re-design
- ✓ Better people retention
- ✓ Better responsiveness of employees

What's Wrong with Efficiency?

(continued from page 2)

need slack time to cover the task-switching penalties as well as the immersion and conceptualizing phases. The more tasks given to the employee, the more of the 43 percent in "free" time is lost in the transfers. ■

Knowledge Workers Need Control Slack

Besides time slack, knowledge workers also require "control" slack. Unlike previous blue-collar work forces of a generation or two ago, today's knowledge workers value challenges in their jobs as much as pay. They want to be constantly growing their careers (as well as their paychecks). Managers need to find ways (other than monetary) to motivate these workers. One way is to give them more control over their careers, or at least appear to.

Think of a non-profit institution. What motivates people to "work" for no pay? In many such situations, volunteers are given total control over projects. If they are micro-managed, they quit.

Of course, in commercial enterprises, managers need to assert some control. Some, but not all. Managers need to give some leeway to knowledge workers — and that means allowing time for experimentation, and, sometimes, mistakes.

Managers need to find ways to offer knowledge workers choices that will not only achieve the corporation's goals, but also their own growth needs.

Controls Encourage Busywork

Many managers believe knowledge workers still need to be kept "on task." Let's look at how knowledge workers actually respond to factory-like efficiency controls.

Under such control models, workers are seen as individual stations along an assembly line of tasks. Information or parts move from one worker to another, each adding his or her own piece to the eventual finished product. One bottleneck in this assembly line slows others down.

But in today's much more dynamic and fluctuating workplace, things are not as smooth or predictable as in a factory. Deadlines or projects change direction halfway through, and work flows become uneven. Those with less work worry about being seen as less productive. To balance out the unevenness, knowledge workers actually slow down, so that they always have something to work on, or to "look busy" with whenever the boss happens to stroll by. ■

What Human Capital is Worth

As mentioned earlier, knowledge workers have an intrinsic need for slack time for the conceptualizing and immersion process phases. Using slack to give knowledge workers room for these intangible needs is nothing less than an investment in your human capital. Without slack, your employees won't have time to adapt to changes in the marketplace, and your company can lose its inventiveness.

In the knowledge-based economy, all employees matter. Of course not every employee is a star performer and some employees will always need to be re-assigned or even fired. But the costs in time and money of replacing any employee can be staggering.

Consider this formula to calculate the worth of your company's human capital:

Human capital =
(Time to get up to speed x Salary + Overhead) x 50%

Imagine employee A announces he is leaving. You replace him with employee B, who needs six months to get to the same level that A was when A left. Your investment in B's domain knowledge is 50% of 3 months' worth of B's salary and overhead. In other words, when A left, the company lost three-person months.

Extrapolated to show aggregate human capital over the long-term shows how damaging steady turnover can be. Existing employees must spend time teaching the new hires the routine, leaving less time for flexibility or slack in their own jobs. And if workers are constantly stopping their own work to help others, their frustration levels can lead them to leave. Thus, even when your non-star performers leave, the effect can be as damaging as when a star employee leaves. Everyone matters. ■

The True Cost of Stress and Healthy Internal Competition

It's not uncommon for workers today to be under enormous deadline pressures. Such "aggressive" schedules, which often lead to overtime on a regular basis, are meant to get results faster and cheaper, but what they mostly end up creating is unhealthy stress. Across the

(continued on page 4)

The True Cost of Stress and Healthy Internal Competition

(continued from page 3)

organization, such constant stress results in reduced effectiveness, employee burnout and increased staff turnover. As the saying goes, "people under time pressure don't think faster."

Too Many Cooks…

Although it's easy to understand the stress understaffing places on the rest of a project team, overstaffing can be just as much a problem. How does this happen?

Let's say top management has leaked an impossible deadline for a radically re-designed product that your department is in charge of producing. You know the deadline is a farce and try to convey this to your boss. Now you're both in a bind. The usual solution you're offered is twice the number of staff you actually need, to try and make up for the tight schedule.

This puts you in the position of the nine pregnant women in one room who still can't produce a baby in one month. The early conceptual phases of a project take time — and, in fact, are better managed with just a few key people. More people doesn't quicken the conceptual of a redesign — it just requires you to spend more time thinking up essentially busy work to occupy them.

Aggressive Deadlines Are Not a Sign of Success

Managers need to accept responsibility for setting these aggressive deadlines. It's become almost a rite of passage for managers to brag about the incredible deadlines they've made (or almost made).

However, there are detrimental effects of aggressive schedules. Today's knowledge workers by definition spend a lot of their time thinking. Routinely staying late to meet an unrealistic deadline robs them not only of needed sleep, but also their own private time. Tired, grumpy employees just can't think as sharply as well-rested employees. In fact, studies have shown that longer days (say 12 hours instead of 8) do not accomplish more than shorter ones. Stressed workers feel used and begin looking for new jobs.

Unhealthy Competition

Finally, top managers need to look at what kind of competitive message they are sending to their middle and lower level managers. Do you encourage managers to compete against each other, or to combine their competitive efforts? By definition, knowledge work is collaborative. Rewarding individual managers based on their performance relevant to other managers sends a very non-collaborative message. Collaboration—and learning and reinvention—take time. In a knowledge-based economy, "healthy" internal competition needs to go the way of the punch-clock.

Characteristics Of a Culture of Fear

- ✓ It is not safe to voice doubts
- ✓ Goals are so aggressive that there is virtually no chance of achieving them
- ✓ Power trumps common sense
- ✓ The consequence for not "knuckling under" to aggressive schedules is ridicule and abuse
- ✓ Those who are fired are generally more competent than the people who aren't
- ✓ Everyone is terrified of confronting their manager

Stressed Managers Aren't Effective

So much for stressed workers. What about stressed managers? Unfortunately, most of us have at one time or another witnessed a managerial tantrum—inappropriate, verbal abuse. Often it is just chalked up to "one of those things," and no one confronts the manager. If this behavior is allowed to continue, it pervades the corporate culture and creates a fearful environment—a "Culture of Fear" (see box above). Needless to say, such a culture is extremely detrimental to productivity, effectiveness, flexibility and re-invention. And most of time, this culture evolves through aggressive schedules and other organization-wide stress. ■

A Word About Litigation

One symptom of a "culture of fear" run amok is litigation. By one estimate, about one-tenth of U.S. corporations are involved in some sort of litigation — a situation that degrades morale among all employees (not to mention wasting time and money). A company involved in a court case doesn't have time to spend on re-invention and innovation.

Often, litigation arises from a flawed contract that neither side should have agreed to in the first place. Healthy companies, on the other hand, know that allowing someone to fail in an effort is not the same as finding blame. Writing a good contract requires slack. Imagine two vendor companies with identical contracts, the only difference being that the cheaper one has eliminated any wiggle room (or slack) into the deadline. Ultimately, writing contracts that both sides feel good about signing is the aim. ■

Management Models to Avoid

No one wants to operate in a culture of fear, but we all have pressures and deadlines. How we deal with these pressures determines what kind of atmosphere we create for our employees. In this section, we examine four common management models.

The First Law of Bad Management

Consider the manager as a sense organ, always considering his or her effect on employees, and constantly adjusting his or her focus as needed. But unfortunately many managers approach their job from the opposite point of view — by imposing an external framework or "management model of the week." If one model doesn't seem to provide instant results, they assume the fault is with them and keep trying. It's easier to keep trying something rather than to admit we failed. If we read a book about the great success of one management model, then we'll do whatever it takes to get those same results at our companies. Thus we have *The First Law of Bad Management*: If something isn't working, do more of it.

The Second Law of Bad Management

Without any slack in your company, it is almost inevitable that managers will commit the second law of bad management: "Put yourself in as your own utility infielder."

There is an almost unconscious belief that since managers do not directly perform any services or make any of the products for the customer, their role is "less essential" than others. But management does matter, and good management is the backbone of a healthy organization.

Management is not easy because it involves slippery issues such as interacting with people, motivating people, and resolving conflicts. Management is more nuance than science. Because of this, it is psychologically soothing to step in as a "pinch hitter" for an employee here and there. We can relieve ourselves of the management challenge and do something with which we are familiar.

There is another reason why managers fall into the second law of bad management: safety. In organizations that have trimmed staff to the bare minimum, as well as ones that operate under a culture of fear, only work directly related to making product and bringing in revenue is safe.

Process Standardization

Everyone benefits from product standardization. No matter which company manufactured our telephone, we can make and receive calls at will.

However, people — in particular, knowledge workers — are not products. Trying to standardize the procedures for knowledge workers is counterproductive and ignores the human capital value of knowledge workers. Taylorism, which grew out of Frederick Winslow Taylor's 1911 book, *The Principles of Scientific Management*, set out to create "interchangeable parts" for the human aspect of factory work. Even within the

(continued on page 6)

Standardization Is Not an Answer

One study at Bell Laboratories set out to identify the work procedures of its best engineers. Specifically, the study sought to isolate the different work habits of the most effective engineers. Surprisingly, the study did not find that many differences in procedures. Where differences were apparent, though, was in how these star performers managed their network of connections. These star employees, for example, had their phone calls returned on an average of 20 minutes while other employees waited four hours.

By trying to standardize knowledge workers' work procedures you focus too much on the mechanics of the task, rather than the rich connections that they have with their colleagues.

When a Corporate Quality Program Goes Too Far

The dedication to quality movement (with close to $1 billion a year in sales of conferences, books and seminars on quality, this model can certainly be called a movement) is unfortunately more bark than bite and has had the curious effect of making true quality harder to achieve. Why? Because quality takes time. Sadly, most corporate quality programs focus almost exclusively on eliminating product defects, and in doing so ignore other, perhaps more important attributes — such as uniqueness, usefulness and integrity. And to actually ensure real quality, companies need to scale back on quantity. What if a company ranked its products in terms of usefulness and only focused on those that were deemed the most useful? It is risky to challenge long-standing product lines.

The drawbacks of quality obsession can be summarized as follows:

- ✓ Defect prevention and removal efforts add too much overhead and time and become unresponsive to market trends.
- ✓ A new technology or process may at first be too defect-prone and thus abandoned instead of being used to create innovative new products.
- ✓ Anything deemed too risky may be squashed, leading to less and less creative re-invention.

Characteristics of a Powerful Visionary Statement

To be effective, a Visionary Statement needs:

- ✓ **an element of present truth;**
- ✓ **an element of proposed future truth;**
- ✓ **to be balanced between what is and what could be, with the could-be part wonderful but not impossible.**

Management Models to Avoid

(continued from page 5)

factory setting, however, examples abound of how manufacturing organizations have "gone beyond Taylorism." One example is Volvo's "team" configuration of workers. Each team follows one vehicle all the way through the production process, rather than each employee doing one specialized task on thousands of vehicles passing along an assembly line.

Management by Objective

Another popular management method (dating to the 1950s) is management by objective. In this model, individual departments within a corporation select a few quantitative measures, or objectives with which to gauge their success each quarter. Managers are responsible for moving each indicator toward a selected target. Each department's objective is a piece of the overall organization's strategic goals.

The problem with management by objective is that it is based on maintaining the status quo, and reaps only incremental changes. It also depends on stable market and business conditions, and in today's business environment, something is always changing. Thus, if one department's objective is to increase output, it may do so at the expense of another department — say human resources, which may face increased turnover due to the increased output. ■

The Role of Slack In Change and Growth

Organizations can't grow if they refuse to change. And while change is possible without learning, what would be the point. Change is often sparked by what you learned — and depends on new skills to become a reality.

More than anything, change, learning and growth require vision, leadership and timing. Slack is the lubricant that makes all of these possible.

Vision

If an organization hasn't clearly articulated what it is and what it stands for, then it cannot change. It can only react to external changes. Vision is essential for a healthy, growing organization. Companies with a well-defined vision also tend to have a well-established culture, which is what Peter Drucker considers the foundation for any constructive change.

People want to be led, but they need to know where they're going. Therefore, a powerful visionary statement, such as President Kennedy's "Ask not what your country can do for you but what you can do for your country," is essential for any meaningful change. The power of this statement is its implicit message that we are a country of achievers, that we are about doing what needs to be done.

Leadership

Crafting an effective visionary statement is only the first step of leadership. At its core, leadership is the ability to get people to sign on to your own agenda. And there is no one-size-fits-all formula for becoming an effective leader (but there are unfortunately lots of formulas for poor leadership!).

Because humans tend to be short-term thinkers, the challenge for leaders is to clearly define a long-term goal so that the short-term pain required for achieving it is seen as worthwhile.

Nokia offers a good illustration of effective corporate leadership. Throughout the 1950s this wood pulp and paper company had few acquisitions, such as transmission cable. Then in 1960 two of its engineers envisioned a future company in high tech—which is where the company is today. How was this achieved? By engaging every manager at Nokia to implement the necessary steps to transform their departments.

Top management orchestrated the overall direction, and gave encouragement. Part of this encouragement involved giving managers the slack they needed to lead their departments in new directions.

(continued on page 7)

Give-and-Take Leadership

Companies that allow open give-and-take, including respectful disagreement, are in effect letting leadership be seen as a rotating function. Employees feel safe in sharing their inspirations. What these companies are doing is showing that they trust their employees, which is a very powerful gesture. What inevitably happens is that once companies give this trust, employees return the feeling of trust.

The Role of Slack in Change and Growth

(continued from page 6)

Timing a Change Initiative

Even the best leadership can flop with poor timing. Corporations, like individuals, tend to resist change. In addition to following a set of sensible, step-by-step approaches, you need to time your change initiative carefully.

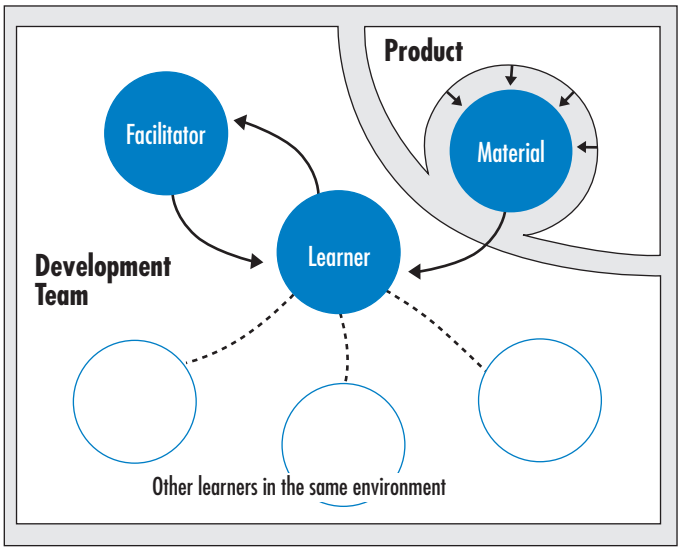
All too often, companies initiate change only when revenues start to decline. However, this is the worst time to try something new. Already, employees are feeling under pressure to improve productivity, and introducing new procedures will only heighten their anxiety. Instead, look further ahead to anticipate the slowing of a growth cycle, then introduce a change while employees are still experiencing success.

How Middle Management Makes Change Happen

Where does change happen? It doesn't happen at the top: Top managers may give the direction of change, but they are not involved in the day-to-day tasks that make it happen.

It doesn't happen at the bottom: Front-line employees don't have the overall perspective to reinvent — nor do they have the authority to carry out reinvention.

The answer: Change happens in the middle. The key role of middle management is to lead the company through change.



Those companies that flattened their hierarchies have flattened themselves in more ways than one.

Middle management has mistakenly come to mean mindless bureaucrats doing nonessential tasks that merely maintain the status quo. While change initiatives do need direction and support from the top office, if managers at the next level down are not empowered to work together or are not given the time to work on the change, change will wither on the vine.

Managers who are isolated and overworked on day-to-day tasks cannot lead change initiatives and help the company to reinvent itself. Companies need to allow some slack time for managers to devote to reinvention.

Or, to put it another way, those companies that flattened their hierarchies have flattened themselves in more ways than one.

To understand why slack time and the freedom to interact with other managers is so important to reinvention, we need to look at the core activity of reinvention: learning.

Where Learning Happens

Without learning, the organization cannot know what to change and how to change. Learning and change go hand in hand.

In companies, the team is an ideal configuration for creating a learning environment. Teams have common goals and objectives, and being in a group satisfies people's need for community.

The learning environment that a team supplies is shown above. It includes a facilitator or coach, material (a doable piece of project work carved off for you to learn on), and co-learners. Learning tends to happen best in an environment in which knowledge workers are learning together.

Learning Without Teams

The problem is that in many companies, managers are not learning in a team environment, but rather in isolation. While many new managers often are offered help in learning the mechanics of their job, most get no guidance in the areas that really matter: people selection and motivation, team jelling, listening, promoting and choosing correctly when to entrust new responsibility. After a one-week session of learning abstract concepts about management, the new manager is thrown back into his or her cubicle and expected to "manage."

This isolation of managers might be masked by the existence of the company's management "team." However, a management team is usually no team at all. Think about the format of your management meetings: Is it a working meeting, where issues get decided and directions are focused in a give-and-take among the managers? Or is it merely a "status" meeting, made up of individual managers taking turns talking to the boss?

Taking turns talking to the boss is not a team activity.

(continued on page 8)

The Role of Slack in Change and Growth

(continued from page 7)

Real teams are given real responsibility — and accountability — for their actions. It is at this team level of middle managers where important organizational learning can happen, but only in an environment that encourages joint communication, participation and responsibility. ■

Getting Comfortable with Risk

Without any risks, there would be no possibility of profits. Managing risks costs money, and spreading your risk tends to decrease the amount you need to spend to protect against it. But the problem for managers — as opposed to insurance executives — is that often your risk is concentrated in one project.

How much control do managers really have as to whether or not the project will be completed on time, come in on budget, or deliver enough value? You have only limited control over retaining the key employees through the projects' completion, for instance. And the tools you do have for controlling these other risks are by nature counterintuitive.

For starters, risk management asks you to quantify an uncertainty, and in most corporate cultures, managers are not allowed to be uncertain. By applying risk management techniques, however, you can better quantify the probability of certain risks occurring. Once you have considered all of the negative possibilities, you are better prepared to predict an accurate deadline.

The basics of any risk management approach must include:

- **Listing of each risk.**
- **A process for uncovering new risks.**
- **Quantification of each risk's potential impact and likelihood.**
- **Identification of a transition indicator, an "early warning" of a risk beginning to materialize.**
- **An action plan for coping with the materialization of each risk.**

This is a dynamic process, and includes elements of risk containment and mitigation.

Containment

Once an identified risk actually occurs, you need the flexibility to keep the project moving forward with minimal delays. If, for instance, your lead engineer leaves and you need to hire another, you draw on a risk reserve pool of funds for the hiring and training costs. This same reserve is drawn upon when unforeseen things happen (i.e., such as a natural disaster or terrorist action). Having a reserve set aside at the beginning reduces the interruption time.

Mitigation

Even before a risk occurs, you need to prepare for it. If a fire breaks out, you'd need to have thought of purchasing and installing a fire extinguisher well before the actual event. Before beginning any project, you need to write a plan of action in case each risk actually materialized. Mitigation planning is essential to effective risk management.

Risk-taking has replaced maintaining the status quo in today's business environment. Business leaders must constantly be developing new markets or exploiting new technologies that will transform their companies into growth engines. If you can't identify and name the risks you face in each project, you may be practicing risk-avoidance.

Below is a checklist of questions to ask about your company's most important project. The answers you give will determine whether you are managing or avoiding risks.

Managing Risks

1. **Is there a written list of risks?** Does it contain major causal risks and is it available to everyone working on the project?
2. **Is there a method for discovering new risks?** Is it safe for employees to signal new risks?
3. **Are any of the identified risks potentially fatal?** These are the ones that need your attention first.
4. **Is each risk quantified as to probability and cost and schedule impact?**
5. **Are there transition indicators identified for each risk, and are these indicators being monitored?**
6. **Is there a single person responsible for risk management?** (Generally, assigning this responsibility to one person is more effective than dumping it on the entire group. When the group is responsible, it's too easy for each member to assume someone else is looking out for risks.)
7. **Have you identified 'conditional' tasks on the breakdown structure?** This shows that you have considered the possibility of risks occurring, and have planned for it.
8. **Have you split the project's goal and schedule?** Remember that the earliest date by which the work could be done makes an excellent goal but an awful schedule.
9. **Is there a real possibility of finishing before the estimated date?** If not, the schedule is merely a goal, not an estimate. ■

THE SUMMARY IN BRIEF

Organizational change can be scary. While we don't particularly look forward to it, it is something we must understand, acknowledge, and embrace.

By helping us travel across the past, present, and future timelines, the book ***Speak Up or Stay Stuck: Get Your Voice Heard When Fast and Forced Change Happens in the Workplace*** helps us identify our change identity, find our voices, expand our influence, and become change resilient.

Author Pam Marmon lays out a roadmap to help us face organizational change head-on without getting negatively impacted by it. Through compelling stories and powerful actionable steps, she helps us leverage our voice and make change our choice.

IN THIS SUMMARY, YOU WILL LEARN:

- How to identify new organizational change growth mindsets.
- To determine appropriate ways to advocate for what you need.
- To discern what you can control and influence.
- To enlarge your change capacity.

Introduction

Change is inevitable. But change does not happen to you. It happens for you.

This book is for every leader who believes there is a better way. It is for every mid-level leader, manager, and influencer who has been told to "go make this organizational change happen," and yet feels voiceless, unrepresented, and stuck.

One of the central themes of this book is to use your voice and see change as a choice; not an act that you're forced to perform.

In Part 1, I address your view of how organizational change impacts your identity and experiences. In Part 2, you explore how the LESS (listen, empower, speak, solve) model helps you find your voice and grow your influence among senior leaders. In Part 3, you learn to expand your organizational change capacity and cultivate your personal change experience.

Part 1: The Past

Chapter 1: Your Change Identity: Below the Surface

Many of us experience pain in our lives without properly grieving hurtful and harmful experiences. The first step to overcoming grief is to acknowledge what has happened. If you've been in the workplace long enough, you've likely experienced poorly executed organizational change. If you want to move beyond the feeling of being stuck, grieving is necessary because it acknowledges the past, the hurt, and the loss, and then it frees you to accept the future. To view organizational change on a deeper level, ask yourself:

- How have my past workplace experiences shaped me into who I am today?
- What am I holding onto that I need to let go of?
- How can I position myself to be part of the solution in the future?

While grieving is necessary, it is important to not stay there for too long. Once you get past the grieving phase, it's time to forgive. Recognize past failures and hurts and extend grace to your leaders and to yourself so you can heal and move forward. Remember, you cannot control most changes in life or the workplace. You can, however, control your own expectations, your own behavior, and how you perceive the world.

Practice gratitude to change your attitude. A posture of gratitude offers you a perspective that enables you to turn difficult workplace circumstances into growth.

Chapter 2: Your Mindset: The Lies We Believe

What we believe about ourselves will manifest in our lives. If we pause and reflect, each of us will recognize that we have limiting beliefs. Those are thoughts and ideas that subconsciously drive our behaviors and ultimately direct the outcomes in our lives. Unless you're intentional, recognizing and correcting these beliefs is challenging. A few of the many limiting beliefs you might face during organizational change include:

- You are fearful of the fact that your leaders don't care about you. But the truth is, your leaders do care about you.
- You are worried that if you speak up, you will lose your job. If doing the right thing for the right reason causes you concern for your financial stability, it's time to determine how you want to invest your time and talent.
- You lack confidence because you feel what you think doesn't matter. The reality is, in some way, your contributions are making a difference and you are important to those around you.
- You have limited experience which makes you think you don't have much to add. The fact is, we are all on a learning curve, and we all have something to add.
- You feel a sense of resignation because you believe it won't matter if you speak up. You may be right, but you'll never know for sure unless you act. Sometimes it's your ideas that will shift the experience of others.
- You blame your senior leaders for not knowing how their decisions impact you. They may not know how the decisions made impact the people doing the work. If you can, try to speak the truth in a timely manner.
- You experience feelings of regret. You think you can't speak up now because you didn't speak up before. Living with regret doesn't change the past. If you seize the moment and act today, you can change the future.

Once you understand and acknowledge the lies you may have believed regarding your senior leaders, it becomes endlessly easier to adopt the positive mindset that change happens for your benefit and there is always something you can learn. Practice being the hero of your story by not giving your power away but instead taking responsibility for your life.

Part 2: The Present

Chapter 3: Listen: The Great Exchange

Listening is a required first step before formulating and offering valuable perspectives. Listening is synonymous with gaining understanding. People can only listen when they're ready to hear. Active listening can position you to understand the reason for the workplace change. It can help you and your team prepare to achieve the desired results.

Being on the receiving end of communications requires active listening. But how can you become a skilled listener and find your voice during organizational change?

Acknowledge that listening is the first step to understanding workplace change initiatives. Adopt a posture of curiosity and inquisitiveness, and assume the best intentions for your senior leaders. Practice patience and build trust as the impact of the workplace becomes clearer and more tangible with each phase of the initiative. Three of the most important messages to truly listen to include:

- Why is this change taking place?
- How will this change impact me and my team?
- What is expected of me to make this change successful?

Remember, once the change officially happens in your organization, you will be held accountable to deliver results that are directly linked with the change. So, voice your questions and listen to the responses before the change initiative is in full swing.

Chapter 4: Empower: Expand Your Influence

When rolling out a large organizational change, senior leaders rely on influencers to take the first step and demonstrate support. You have a choice: you can use your influence to propel the vision forward, or you can use your influence to slow down the progress.

Your influence is powerful. Empowering others means connecting to others by inviting them into the conversation. Acknowledge that you have the power to influence how workplace change is implemented in your organization. Allow adequate timing for others to accept the change. Empower senior leaders to help you understand and connect to the strategy of change, and then impart the understanding to others.

Leverage emotional intelligence as you empower and connect to your people. Make sure you invite them into the conversation when possible and consciously project a positive attitude. Finally, practice negotiations to advocate for creative solutions that benefit your organization.

Chapter 5: Speak: Find Your Voice

How effective you are as a communicator within your company is greatly impacted by its ecosystem. Low trust is a symptom of a broken culture. People who trust their leaders openly and respectfully share what is on their minds, but people who are fearful of their work environment often hold back.

If you want things to change in your organization, go first. Make the culture better. Be trustworthy, be kind and considerate, and become a better leader. Remember, your presence and position carries a responsibility regardless of the size of your sphere of influence.

Observe and consider how your immediate supervisor or senior leader wants to be communicated with. Communication is often divided into two categories: direct and indirect. Direct communicators prefer to communicate facts over feelings, be succinct, present clear and precise information, and ask specific questions.

Indirect communicators prefer to observe what is said as much as what is not said, read between the lines, avoid demands, and provide space for a proper response. Matching the communication style of the person you communicate with increases the likelihood of being heard.

Knowing what your senior leaders value helps determine how you can present your message in a way that will resonate with them. Leverage influencers in your organization to channel your message if your senior leaders prefer receiving communication from them. Finally, practice communicating during the optimal timing for your messages to be heard.

Chapter 6: Solve: Get Results with Minimum Friction

If you want your voice to be heard, you must deliver the right results because that is what is top of mind for your senior leaders. Think of results as your microphone. You can yell and scream to get attention, or you can use an amplifier and a microphone to confidently whisper your message.

If you want to stand out, you must deliver the results your senior leaders want. Some of the most important areas of interest to your leaders include: maximizing profit, achieving strategic goals, outperforming competitors, minimizing expenses, cultivating a healthy organizational culture,

establishing financial stability in the organization, attracting and retaining qualified talent, increasing customer satisfaction, and more. Ask them to define their desired outcomes. Stay empowered to define the processes that will lead you to the solutions for those outcomes. Leverage data and stories to communicate how you and your team are supporting the organizational strategy and the change in your workplace. Practice achieving and communicating metrics that your senior leader values to optimize your messages being heard.

Part 3: The Future

Chapter 7: Becoming Change Resilient: You and Us

Change resilience is about an entire ecosystem that nourishes, challenges, encourages, supports, and then surprises each of us. But here's the hard truth: change resilience is not about you; it's about us, together, because our interdependency and connection are precisely at the heart of resilience. The purpose of growing your change resilience is so you can discover the strength to uplift and refuel yourself, give yourself endurance, and propel yourself beyond your perceived limitations.

Aside from deploying collective efforts to build change resilience, you can expand on your own personal resilience to help you with organizational change specifically in the areas of your mind, body, and soul.

The best way to build your mental resilience is to feed your mind new ideas and new challenges and to create new thought patterns. On the other hand, the worst thing for building resilience is stress. Replace limiting thoughts with uplifting thoughts. Remember, the greatest weapon against stress is our ability to choose one thought over another. Choose to reframe your thoughts in a positive light instead of letting stress take over.

A healthy body is always better equipped to handle stress. Drink plenty of water, eat healthy foods, exercise, and do breathing exercises to build a resilient body. Nurture relationships and your spirituality to build a resilient soul. Practice reappraising your circumstances to grow your change resilience.

Chapter 8: Your Resilience Blueprint: Beyond the Horizon

The Resilience blueprint is a personalized document that will help you become more resilient and agile in the face of unpredictable circumstances, such as organizational change, so that you feel grounded and unwavering. it will help you move from your comfort zone, where you feel safe and in control, into your growth zone, where you achieve your purpose.

A resilience blueprint begins with a daily declaration to inspire you, center you on your vision, and guide you along the path forward. Following the declaration are your thoughts on these eight components:

- Daily declaration. In this section of the blueprint template, write a few encouraging and motivating sentences that will serve as a daily reminder of the way you are choosing to live your life.
- Gratitude. When you begin to count your blessing regularly, gratitude oozes out of your heart and you realize that life is full of joyful micro moments. An attitude of gratitude has the power to change you in a positive and long-lasting way.
- Mindset. Your mindset shapes your behavior, impacts your results, and carves out your influence. The most important voice defining your identity is yours. Describe the mindset you strive for and include the phrases you can say to yourself when negative thoughts arise.
- Guiding principles. Your guiding principles are how you live your life. These principles will consistently direct your behaviors

Conclusion

When facing organizational change, have you been the hero or the victim? Have you been marginalized and made to believe that you are "not enough" in some way? Have you believed lies that have caused you great harm? What story did you tell yourself when workplace changes failed? What story did you believe?

Pause here just for a moment with me. Close your eyes, take a deep breath, and pause. This pause has the power to change your life. This pause represents your choice. I want to remind you that change is not happening to you. It is happening for you. That said, keep on growing, adapting, and transforming our world for the better. Our future is in your hands.

No one ever suggested that guiding a company is easy. But the capacity you have to lead change in your company can also change lives for the better. That's a worthy goal. And remember, inside every challenge lies an opportunity.

Pam Marmon is the CEO of Marmon Consulting, a change management consulting firm that provides strategy and execution services to help companies transform. From executives at Fortune 100s to influencers at all levels, Pam helps leaders achieve lasting organizational change with minimal disruption. Pam is the bestselling author of *No One's Listening* and *It's Your Fault.* She is also the creator of the LESS change management framework.

STRATEGIC RENAISSANCE

THE SUMMARY IN BRIEF

Do you have confidence in your corporate strategy? Is it succeeding in today's hyper-competitive world? If your company needs to develop a more scientific strategic approach, one that's sophisticated and creative, yet rigorous and results-oriented, then this summary is for you.

You have probably discovered that the old strategic approaches, including the pet concept of sustainable competitive advantage, just aren't working anymore. Your company is probably falling short because it is relying on imitating your competitor's strategies, brainstorming in dead-end circles with consultants, or seeing great ideas smothered by your corporate culture and the old way of doing things.

This summary offers a better way to develop strategy, showing you how to set your own course by systematically creating and exploiting opportunities. You will first be introduced to four guidelines for developing strategy: creating a strategic hypothesis; creating the if-then statement; using the Pivot and Hammer strategy; and understanding the principal of complementarity. You will learn, especially, how the military strategy of the Pivot and Hammer can be applied to business.

Next, you will learn why sustainable competitive advantage (SCA) doesn't work and how it should be replaced with opportunity creation and exploitation (OCE). You will then learn how to test and exploit the most promising strategies you created, expanding on the strategy until you have used it to its full advantage and it is time to start the cycle all over again. You will begin creating flexible asset bases that allow for continual redeployment into new strategies.

Finally, you will learn the importance of an effective top management team to harmonize your company's strategy and culture.

By applying the techniques you will explore in this summary, you will create a strategic renaissance for your company as we enter a new era of business where the old rules no longer apply.

Don't Let Case Studies Decide Your Strategy

Business leaders, executives and strategists have looked for years to business books for strategic success. These books tout both the latest and the oldest business strategy concepts, usually using well-known companies as examples of how the strategy the author is touting works. The problem is that most of the time the companies used to illustrate the author's theory were hand-picked to prove why the author's theory is right. We don't know how many other successful companies the authors ignored because their strategy didn't fit the author's theory. The writer espouses a theory and then goes looking for confirming evidence.

Consider this example. When a well-known expert on logic and the scientific method, Professor Bob Cane, agreed to appear on television to debate the validity of horoscopes with a professional astronomer, he expected to squash the astrologer like a bug on the windshield of the scientific method. Instead, it was the astrologer who squashed him. The astrologer had truckloads of supporting facts at his disposal. He cited case after case in which the stars had predicted natural cataclysms, wars and the deaths of famous people. He had hundreds of confirming examples.

What the audience didn't hear about, of course, were the millions of predictions that never came true. But the astrologer was using the same logic as most strategy book authors. They provide as evidence lists of companies in which the strategy worked, but leave out any mention of companies in which the strategy didn't work. The premise that examples are proof is simply wrong.

There is a better way. It isn't the amount of evidence that can be marshaled to support a theory, such as examples of life happening according to horoscopes, business surging according to prescribed strategy, and weight dropping because of diet. Instead of proving a theory, we must go about disproving it. If you intend to prove the business strategy you want to pursue is right, you must pose the question in a way intended to prove it wrong — in other words, in a way that it is falsifiable. Here's how.

If-Then Statements

A business strategy is a prediction about what markets, customers and the competition will do in the future and how that will change depending on the action you take.

The best way to make a strategy falsifiable is to put it in the form of an if-then statement; the "if" clause sets out the conditions and the "then" clause sets out the expected results — precisely. The more precisely you state the conditions and the results, the more testable the strategy becomes.

A Tale of Two Theories

Wal-Mart has steadily been taking retail discount store market share from Kmart. The last decade has been a tale of two strategies. Kmart focused on upgrading its merchandise and store atmosphere. Wal-Mart focused on reducing inventory costs through sophisticated inventory management, improved vendor relations and lower transportation costs.

Each company's strategy was and is a testable hypothesis. Wal-Mart bet that overall lower prices would let it gain market share while Kmart bet that an upgrade would increase its market share. Their assumptions might have looked like this:

Kmart: If store atmosphere is upgraded through a $200 per square foot investment, and selection is upgraded by 2 percent per item on average, and a $50 million ad campaign focused on value and selection is launched, then in markets where we compete with Wal-Mart and Target, our market share will increase five points and average gross margin will increase at least 10 percent.

Wal-Mart: If prices are lowered storewide by an average of 2.5 percent, and we maintain gross margins at their current levels by reducing logistics costs, then market share in areas where we compete with Kmart will increase by at least 5 percent compared to stores without price reductions.

Don't Let Case Studies Decide Your Strategy

(continued from page 2)

For example, the statement "consumers will like lower prices" isn't good enough. A business strategy statement would be "If we can reduce average prices below competition by 3 percent, our market share will grow 10 points." That hypothesis can be tested — in other words, can be proven true or false. After you reduce prices by 3 percent, measure whether your market share grew 10 points. That's much easier than trying to assess whether consumers like lower prices. ■

The Four Key Elements of a Successful Strategy

There are no cookbooks for strategies. Because of the many variables involved in the success of a company, strategies will always differ in some ways from company to company.

The four elements in this article, therefore, do not represent a formula for a successful strategy for your company, but rather four guidelines to help in the development of a strategy. These four guidelines are as follows:

1. The Strategic Hypothesis

The first guideline is to create a strategic hypothesis that is about something vital, crucial and central to the company. Ask yourself, "If this strategy were adopted, would it be vital to the company?" If the answer is yes, ask what would be even more vital to the company. If you do, you will be cutting to the core of what your company needs to create a winning strategy.

2. The If-Then Statement

The second guideline is to recognize that the strategy must be conditional, an if-then statement. The "if" part of the strategic hypothesis sets the conditions for the expected result. The "then" part sets out the results, or at least what we hope the result will be. Don't confuse a strategic hypothesis with a goal. When GE says it plans to be number one or number two in every market it serves, it is stating a goal, not outlining a strategy. A computer company competing with Compaq might state, "*If* we focus resources ($x millions, y engineers) on new product development, *then* we will be able to match Compaq in time to market, beating them on price by 3 to 5 percent. The result will be $x million in cash flow and $x reduction in inventory."

3. The Pivot and the Hammer

Successful armies have long concentrated their force at an identified "decisive point." The place where you decide to concentrate your effort is the Hammer. The Hammer is where you play offense versus your competitors. But the Hammer depends on the Pivot. The Pivot is where you play defense, where you are already strong enough to hold the line while you channel resources into the Hammer.

How does the Hammer and the Pivot work? Since the Pivot is largely defensive, it relies on the idea that it takes much less effort to defend a position on the battlefield or a brand on the shelf than attacking or creating a new brand. Thus, as shown in the example above, Microsoft was able to play defense with its operating systems — where it was already strong — while moving on the offensive in other software sectors.

This is the power of defense. Armies that use the Hammer and Pivot to their advantage pull forces from their defensive positions (the Pivot) to their offensive position (the Hammer) and strike with overwhelming force. Businesses can do the same.

The next article explores the Hammer and Pivot strategy in more detail.

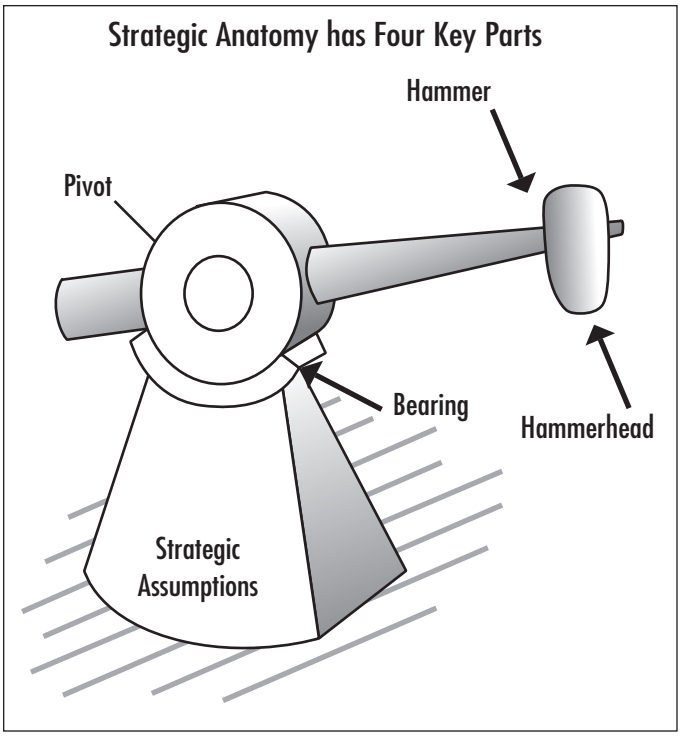
4. The Principal of Complementarity

A sound business strategy needs to consider complementarity. That is, the elements of the strategy must complement what your company already does. Consider Costco, for example. It sells to its customers in larger than normal qualities, thus complementing its strategy of buying larger than normal quantities at low per unit cost. Another example: Requiring vendors to package their items to fit Costco's specific, standardized warehouse pallet dimensions complements its marketing message that consumers can find items at Costco not found anywhere else. ■

Microsoft Uses Hammer and Pivot Against Netscape

In the 1980s and 1990s, Microsoft used its market power in operating systems as a Pivot point on which to Hammer one software sector after another — Lotus in spreadsheets and office suites and WordPerfect in word-processing. It hammered and hammered away until it fully dominated the office suite software market. Then came Netscape and the Internet explosion. When Microsoft realized it needed to get into the browser business, it pivoted using its now dominant office suite Office and developed a clunky browser it gave away free. And resources that could go into improving Office now go into Internet, e-commerce and multimedia development.

Strategic Anatomy: Strategy's Hammer and Pivot



One strategy stands head and shoulders above the others. If you can fashion a robust Pivot and a powerful Hammer, half the battle is won. However, it's easier said than done. To do it right you must understand what lies behind the strategy. That means understanding what or where your Pivot is.

What is a Pivot? It's those aspects of your current business that you can rely on to hold their own while you shift resources to create the conditions called for in your strategic hypothesis. Those aspects of business can be:

- ✓ **functional areas like finance, control, manufacturing or sales;**
- ✓ **main business units that are steady money-makers;**
- ✓ **a brand name prominent in consumers' minds; or**
- ✓ **a geographic business unit.**

For example, Chrysler's brand name is synonymous with cars, but the automaker is marshalling its resources into trucks and SUVs. Thus, for Chrysler, cars represent the Pivot while trucks and SUVs represent the Hammer.

Once you identify the Pivot, you should continue to dig deeper, looking for a *Bearing*. Often you will find that there is one crucial element that makes the Pivot a Pivot; this is the Bearing. It might be something like a crucial asset, skill, culture factor or even in some cases an individual like a brilliant engineer or researcher.

Let's take the example of a large retail chain. The cash flow of its successful stores allowed it to move into new markets. The stores are the Pivot of the company's strategy. But why were the stores so successful? Location and pricing were important, but the true key to the success of this retail chain was the chain's team of competitive and savvy retail buyers that was successfully mobilizing every day the right mix of merchandise to a customer base whose demographics changed constantly. The team was managed and motivated by an energetic veteran of several department store chains. This veteran was the Bearing.

For the strategic Hammer, the counterpart to the Bearing of the Pivot is the Hammerhead. The Hammer is where the force of a strategy is focused; the Hammerhead is the part of the Hammer that transmits that force.

Tupperware's Hammer is its sales force. The Hammerhead: the ability of Tupperware representatives to recruit hostesses and sell effectively to the parties' participants. Those few minutes of the sales pitch are when the full force of the Hammer is deployed.

Using the Hammer and Pivot

To develop a competitive strategy using the Hammer and Pivot, you must identify your competitor's Hammer and Pivot and decide which of the two you will attack, when and how.

(continued on page 5)

Hammerheads in the Music Industry

The music industry is undergoing a revolution, and the turmoil illustrates that no business can take the anatomy of its Hammer and Hammerhead for granted. Record labels are being threatened by the advent of digital music transmission and the downloading of tunes to computers and portable players. For years, the industry's Hammer has been to field talent scouts to spot acts and artists with potential. Once found, the Hammerhead had been huge amounts of money spent on publicity, media events and advertising. Awareness created music store demand, driving less recognized artists off the shelves.

The digital revolution is a direct attack on the Hammerhead. It lets artists bypass the publicity machine and get right to the consumer, wherever he might be. No doubt music industry moguls are getting nervous and working to develop a strategic plan of their own.

Strategic Anatomy: Strategy's Hammer and Pivot

(continued from page 4)

For example, you might develop a hypothesis in which you decide to use your company's Hammer to go head-to-head with the competitor's Hammer. Thus, if a competitor grows its sales force by 800 people, you grow yours by the same amount.

Another strategy: Attack the Pivot. Blockbuster developed exclusivity deals with motion picture studios, thus attacking the Pivot of the independent video stores: their ability to get product in their stores. ■

The End of an Era: The Twilight of Sustainable Competitive Advantage

To develop a winning strategy, you must focus on finding what you can do *differently* than your competitors. Being different makes a difference — but only if you choose the right aspects on which to be different.

When McDonald's faced declining same store sales and stiff competition from other fast food chains, it did what most businesses do: It reduced the price on its flagship sandwiches, the Big Mac and Egg McMuffin, to a mere 55 cents, if bought as part of a "value meal." Apparently McDonald's couldn't think of any way to be different from Burger King, Wendy's and other competitors other than on price. But competitors quickly retaliated with their own "value meals."

McDonald's then tried to offer different food, notably the "adult" sandwich, the Arch Deluxe. The new product failed.

McDonald's succeeded only when it returned to the tried-and-true strategy of focusing on kids, in this case by developing new movie tie-ins. The difference was no longer in the food or the pricing. Instead, food was redefined as a form of entertainment rather than nourishment.

The Problem with Sustainability

Being different gives a company a competitive advantage. Sustainable competitive advantage — finding an advantage and then making sure that no competitor can match that advantage — is the traditional approach to strategy. The problem is that sustainability is becoming impossible to achieve.

Today, no new product is likely to be without imitators for more than a few months. Low prices are also no guarantee of a sustainable advantage for a number of reasons. One example: With consumers comparing prices on the Internet, only the absolute lowest cost producer wins. And even if you are the lowest cost producer and can somehow make a profit, someone else can come along and offer irrationally low prices. The Internet will now let someone who was able to get an item for a nickel on the dollar reach your customer — and take business away from you.

In sum, this is the era of the twilight of the sustainable competitive advantage. Most of the differences used in the past to erect sustainable advantage are disappearing due to technology, transportation, communication and the globalization of culture. Sustainable competitive advantage should no longer be the touchstone for the quality of strategic thinking. ■

Stress and the Finch

Stress has become a byword for people everywhere in the industrialized world. And recent studies into the evolution of animals may carry clues to how stress can be a useful response encouraging change and innovation in the animal kingdom and the business world. How finch face and respond to environmental stress is instructive.

When faced with stresses like El Nino or drought, finch populations become more and more differentiated as they respond to stress and adapt. Within years, not generations, they are so different they can no longer interbreed. If the rapidly changing business climate we face as we globalize is anything like the stress finch suffer and adapt to, businesses would be well advised to emulate nature by creating and trying out as many strategic hypotheses as they can. Some will fail, but others will carry the key to success.

Making Strategy Dynamic: The Dawn of Opportunity Creation and Exploitation

What will replace the concept of a sustainable competitive advantage (SCA)? Companies can turn instead to *opportunity creation and exploitation* (or OCE) as an alternative. Unlike SCA, OCE is a cycle of activity rather than a single state to be reached.

Creation and Discovery

The first phase of the OCE cycle involves **opportunity creation and discovery.**

In most companies, the best approach is to generate many strategic hypotheses, test them, modify them to make them more precise, and winnow out the likely winners from the losers. This, of course, is the exact

(continued on page 6)

Making Strategy Dynamic: The Dawn of Opportunity Creation and Exploitation

(continued from page 5)

opposite of what most companies do. Typically, a company and its consultants seek one perfect strategy for the company and decide which one to pursue without any testing. What the planners really need to do is become a laboratory of strategic experimentation and testing. That's the only way to avoid the astrologer's trap of only paying attention to confirming evidence and ignoring everything else.

Recognition, Breakthrough and Exploitation

The next step in the cycle — **opportunity recognition, breakthrough and exploitation** — begins with an analysis of each tested hypothesis to determine which was a success, a near success or a failure. Resources must then be allocated to create a breakthrough, or first measurable success from the strategic hypothesis.

Consolidation

Next comes **opportunity consolidation**. At this stage, the strategy takes hold and begins to earn a return on investment. It's time to turn the project or products over to less-experienced managers. Meanwhile, those who created and exploited the strategic opportunity can prepare for the next phase. They will be responsible for making the links between the "if" and "then" portions of the strategy as definitive and predictable as possible.

Dismantling and Recycling

The final phase is characterized by **opportunity dismantling and recycling.** Even the most brilliant, well-tested, and thoroughly implemented strategy must someday come to an end. Instead of trying to keep it alive as long as possible, a healthy approach is to probatively dismantle it. Here's the approach to take:

First, continually test the current successful strategy until its boundaries are revealed, anomalies begin to occur, and breakdown is just over the horizon.

Then, account for all assets — physical, financial, human and emotional — committed to the strategy, and withdraw these assets from the old strategy so they can be redirected into a new one.

Remember, testing the current strategy and attempting to falsify it is never over. Also remember that opportunity creation and discovery must be continual. Don't wait to start opportunity creation until your current strategy is wearing down! The world is moving too fast for even the most successful companies to stop pushing their strategic functions. ■

Better Tools for Better Strategies: Creating, Testing and Falsifying Strategic Ideas

The first stage of opportunity creation and exploitation is opening your mind to strategic hypotheses or opportunities and then choosing among them. Later, you will have to close your mind through testing and falsification of the hypotheses. But what does it take to open your mind up to new opportunities for exploration? After all, in today's world of fierce competition, the most important criteria for hypotheses generation is beating your competition to the best ideas. To do this, you must:

✓ **Be intellectually productive and produce lots of hypotheses.**

✓ **Have a broad range of strategic hypotheses.**

✓ **Get those hypotheses from the right sources.**

This may all seem logical, but the reality is different in most companies. Rather than explore lots of ideas, most will scrutinize all new ideas and eliminate most before they see the light of day. Another major problem is that in most companies the same people develop ideas over and over again. Yet the key to creativity is to start with lots of ideas, not a few. It also helps to use the right tools. There are three good tools for idea generation.

The Executive in the Parking Lot

First, it's essential to get your top management out of the executive office and into the parking lot and field. Most executives are bright, industrious and very capable of generating great ideas. Brought face to face with real customers, most executives readily come up with reams of ideas. Left in the corporate suite, they lose touch with what customers need and want. If you can't get them out in the field, at least make sure they hear audio or see

(continued on page 7)

The Wrong Tools

Don't use the wrong tools for idea generation. First, forget about most standard market research. The problem is that researchers don't know what questions to ask. Surveys only measure past experience and can't get at unknown desires or needs. Another problem with market research is that it eliminates serendipitous discoveries because it only answers questions that are asked. You won't fare much better using the other standard idea generator, a consultant. Most consultants come prepared to find the strategy they think the company should follow, which is hardly conducive to testing multiple strategies at the same time.

Better Tools for Better Strategies: Creating, Testing and Falsifying Strategic Ideas

(continued from page 6)

written feedback from real people.

The Focus Group

Another great tool if used properly is the focus group. Focus groups are great for generating ideas, pushing your thinking, ruling out nonstarter hypotheses, and providing raw materials for idea generation. Don't use them to test live hypotheses, though.

There are some rules for using focus groups.

The first is to format group sessions so that responses are anonymous. This can be done using group decision software and letting participants type their responses at their workstations. Everyone can "talk" at once, no one or two group members monopolize the conversation, and all responses are recorded for later review. An electronic boardroom can mean the group is three to five times as productive as it would be in the usual group setting. Focus groups also do well using props and simulated shopping experiences.
